Bibliometric studies draw on scientific literature and associated information (abstracts, keywords, authorship, institutions, journals, etc.) to explore patterns and changes in the knowledge creation process as formally expressed in publication. The most common approaches concern the analysis of citations and co-authorship. Any bibliometric study's results is highly influenced by the data collection criteria applied, and keywords are a key part in this query-based process.

In this paper we explore the impact of current archaeological publication keywords on structuring bibliometric results. We apply this to the specific archaeological subdiscipline of archaeological network research: publications using network theories and methods, and their associated authors. This is done through a comparison of bibliometric data from two sources reflecting different data collection processes: (1) keyword-based queries through the complemetrix.net platform on the OpenAlex bibliometric database, an open collection of hundreds of millions of scholarly works where the related authors, institutions and keywords are all indexed; (2) a manually collected dataset of relevant publications including non-indexed material, largely based on a snowball sampling starting with known publications and authors (the archaeologicalnetworks Zotero library by Brughmans and Peeples (2017)). Our analysis focuses on comparison of the results of authorship and co-authorship structures. The comparison of results based on keyword-queries in a bibliometric database with those of a highly qualitatively curated selection of relevant literature by members of the community studied, allows for an assessment of the usability, effects and challenges of current archaeology keywords for guiding targeted bibliometric studies.

8 MOVING BEYOND HERITAGE DATA VOCABULARIES - LINKING RESEARCH FRAMEWORKS WITH BROADER SOCIO-CULTURAL RESEARCH TOPICS

Abstract author(s): Miles, Daniel (HE - Historic England)

Abstract format: Oral

Research Frameworks have traditionally been produced as publications (printed or PDF) which set out research questions and strategies that help coordinate research and fill gaps in our understanding of the past. The static document format means that it has been difficult to link across the different thematic and geographical frameworks, and to quantify what contributions have been made to specific research questions.

Recently a new model has been developed, and English and Scottish Research frameworks are now being published online and in one place on the Research Frameworks Network (<https://researchframeworks.org/>). The questions and strategies are managed in a database and each question is tagged with terms that relate to the subject matter of the question. By tagging with controlled vocabularies, users can search across the different research frameworks. The frameworks can also be connected to other online resources, such as the OASIS online investigation reporting system, creating direct links between the reporting of archaeological research results and the questions used to frame these investigations.

Controlled heritage related vocabularies, published by the Forum on Information Standards in Heritage (FISH), are used to tag the questions which are related to specific monuments, objects or scientific techniques, etc.... However, many research questions are not directly associated with archaeological terms but cover broader socio-cultural-eco-

conomic aspects of past societies, such as migration, poverty, disease etc..., and we need to be able to use different vocabularies to describe these research topics. By having agreed research topic terms, users will be able to search across broader research themes and it will enable the Research Frameworks Network to expand out and link up with different research areas and subjects and engage new research communities.

9 REFLECTIONS ON EXPERIENCE WITH ARCHAEOLOGICAL CONTROLLED VOCABULARIES IN INDEXING AND RETRIEVAL

Abstract author(s): Tudhope, Douglas - Binding, Ceri (University of South Wales)

Abstract format: Oral

In the STAR project investigating semantic integration, we employed thesauri from the Forum on Information Standards in Heritage (FISH) and word lists from Historic England recording manuals. Semantic integration allowed search across both archaeological datasets and grey literature reports via data extraction and NLP (Tudhope et al. 2011; Vlachidis & Tudhope 2016). The ARIADNE and ARIADNEplus European Infrastructure projects confronted multi-lingual issues in seeking to integrate archaeological data and reports written (and indexed by CV) in various partner languages. We developed tools to help map partner CVs to a central 'mapping hub', the Getty Art and Architecture Thesaurus (AAT), allowing search across partner data and reports in different languages and also query expansion using the AAT's hierarchical structure (Binding & Tudhope 2016). We have also provided tools to express English, Scottish, Welsh (including Gaelic and Welsh language) FISH vocabularies as Linked Open Data (HeritageData) facilitating programmatic use. We are currently collaborating with the Archaeology Data Service (ADS) on CV based NLP tools to make automatic indexing suggestions for the OASIS online index of fieldwork events and their unpublished reports, drawing on FISH vocabularies (Monuments, Objects, Periods) employed in OASIS subject indexing.

Reflections from this experience are discussed. These include the potential of mapping between CVs, possible need for an enhanced entry vocabulary (synonyms etc) in CVs when used in NLP and the challenge of compound phrases that combine concepts, possibly meriting a faceted approach. There may be a need to draw on standard CVs from other domains (eg for scientific areas). It is possible to index with multiple CVs. It is important to consider use cases; the indexing requirements of grey literature may differ from academic journal publishing. CVs should be continually maintained and evolve, alert to potential gaps or bias of different kinds.

10 THE FUTURE OF BIOARCHAEOLOGY: CONTROLLED VOCABULARIES, ONTOLOGIES AND ETHICALLY MINDED DATA GOVERNANCE FOR HUMAN REMAINS IN THE ARTIFICIAL INTELLIGENCE AGE

Abstract author(s): Ulguim, Priscilla (Vrije Universiteit Brussel; BB-LAB)

Abstract format: Oral

Bioarchaeology and Archaeoethnology address fundamental questions regarding the human past through the most direct evidence of past people: their remains. Data are vital in the interpretation of individual life histories, population dynamics, as well as variabilities in space temporal funerary practices and broader questions of cosmology, society, identity and technology. Yet, despite advances in both archaeological and life sciences data management, bioarchaeology suffers from a myriad of ill-defined terminologies, taxonomies and a low maturity data infrastructure. Furthermore, bioarchaeological data presents significant complexities. Bioarchaeologists require standardised biological descriptors alongside taphonomic information. Funerary contexts are often poorly defined. Meanwhile, researchers work with sensitive data and must account for CARE as well as FAIR principles while ensuring that data governance adheres to ethical guidelines. I argue that the broken links in bioarchaeological data imply broader issues concerning sustainable, replicable and reproducible data analysis as well as stewardship, curation and long-term preservation with significant impacts on ethical data usage and the representation of historically marginalised groups.

To address these gaps, I propose a novel methodology, toolkit and digital roadmap to better describe, reflect, reconcile and visualise bioarchaeological data while accounting for FAIR and CARE principles. The model encompasses a controlled vocabulary for digital bioarchaeology and ontological model, extending from best practices including CI-DOC-CRM, SKOS and Dublin Core. Importantly, all vocabularies and ontologies are, by definition, living documents. Therefore, I propose a roadmap for git-based version control and code sharing together with AI-driven approaches to extract relevant data from archaeological literature and support reuse. The workflow includes a collaborative framework to engage multiple academic and public stakeholders for the implementation of ethically minded data governance. In conclusion, I advocate for a sustainable and ethical approach to bioarchaeological data governance, emphasising that there is no separation between humans, remains and data, only "human remains data".

11 A CONTROLLED VOCABULARY AND SPECIALIST BIBLIOMETRIC DATABASE: A MECHANISM FOR LEVERAGING THE RESEARCH VALUE AND SUSTAINABILITY OF ARCHAEOLOGICAL RESEARCH

Abstract author(s): Aitchison, Kenneth (University of Liverpool; Landward Research Ltd)

Abstract format: Oral

Two linked projects are in development that could significantly impact upon the effectiveness of the research infrastructure of archaeology both academic and professional. The first project relates to the development of a controlled vocabulary ('thesaurus') that will shape the way in which the nature and outcomes of archaeological research in all its forms can be described through keywords and index terms. The second project relates to the creation of a specialist bibliometric database that will record the metadata for all documentary outputs that result from archaeological research providing a common online search mechanism for all these documents - facilitated to a significant degree by the controlled vocabulary developed in the first project.

The proposed projects will necessarily be international and multi-lingual in nature, and multi-partner / multi-team-based to ensure effective updates across academic and professional research, as well as coverage of the many forms of archaeological research.

For both parts of the research programme (vocabulary and database) we propose an initial pilot project to be followed by a larger rollout of the project in order to demonstrate proof of concept prior to seeking later funding, and to provide a contained 'venue' in which to resolve initial issues. The extent of the larger rollout will certainly include Europe, and - depending on making contacts during the pilot project possibly beyond.

12 THE ONTOLOGY OF ARCHAEOLOGICAL OBJECT NAMES IN FINLAND: A CONTROLLED VOCABULARY FOR CATALOGUING ARCHAEOLOGICAL OBJECT FINDS

Abstract author(s): Rohiola, Ville - Kuitunen, Jutta (Finnish Heritage Agency)

Abstract format: Oral

Controlled vocabularies form an essential basis for archaeological collection management. In 2019, the Finnish Heritage Agency initiated an ontology work of archaeological object names. The work was done in cooperation with the Finnish Terminology Centre TSK and expert group of archaeologists. The aim was to develop a controlled vocabulary that standardizes the catalogued metadata of archaeological object finds and enhances digital management of archaeological collections. The ontology of archaeological object names is machine-readable, hierarchical group of concepts and the concepts are formed with individual identifiers. The goal of the ontology is that information of archaeological objects, such as object name, dating, material, and spatial information, is reported and digitally catalogued using the ontological concepts.

The aim of the study is to demonstrate the potential of controlled vocabularies considering the archaeological object finds. In this study, we present that ontologized object metadata provides a possibility (i) to enhance the study of archaeological objects, (ii) to use semantic technology and Linked Open Data that makes the data more accessible, (iii) to do semantic elaboration and linking with other metadata using standardized vocabularies, and (iv) to make data integration with collaborative data portals/platforms. The study also presents a case study of developing a cataloguing tool for archaeological objects that uses controlled vocabularies. As a conclusion, the study presents how controlled vocabulary is a necessary requirement to form the basis for the digital collection management of archaeological objects.

13 CONTROLLED ARCHAEOLOGICAL VOCABULARIES IN UK DEVELOPMENT INFRASTRUCTURE PROJECTS OVER 30 YEARS. LOOK AHEAD TO A NEW DATA EXCHANGE FORMAT

Abstract author(s): Carver, Jay (4AD Consultants Ltd)

Abstract format: Oral

In 1996 Dr. Robin Boast of Cambridge University Museum of Archaeology & Anthropology was commissioned by Rail Link Engineering (RLE), project managers delivering the Channel Tunnel Rail Link project (UK), to produce a dataset structure and controlled terms dictionary for the digital recording of archaeological investigation on the project. The datasets were envisaged to provide "maximum flexibility of access to independent sets of archives for the widest possible audience", and most importantly, be independent of software, hardware or operating systems. They would also be fully interactable with the then emerging geographic information systems (GIS) being deployed to analyse archaeological data.

The RLE initiative was in part influenced by similar goals in the geotechnical industry to develop a method for the transfer of digital records between industry organisations. In 1991 the Association of Geotechnical and Geoenvironmental Specialists published the first AGS data format, which today is in its 4th Generation (AGS 2022). Also

emerging at that time was the Draft International Core Data Standard for Archaeological Sites and Monuments (CI-DOC 1995), which was followed in 1998 by the first edition of MIDAS – A Manual and Data Standard for Monument Inventories (RCHME) which included the wide ranging FISH thesauri (currently at Version 25 <https://heritagedata.org/live/schemes.php>). Recently the High Speed 2 rail project in the UK has utilised FISH as the common data dictionary for production of electronic records, together with some project specific custom dictionaries.

How have these standards have been applied in practise? We propose that to contribute to the development of a sustainable research output that allows effective synthesis of research data, a new data exchange format needs to address not only common terminologies but also a data structure standard for spatial and assemblage datasets that is easily exchanged between organisations, following the lead set by the AGS.

14 LURKING ON THE EDGE OF PRACTICE: VOCABULARY INSTINCTS FROM BETWEEN ARCHAEOLOGICAL RESEARCH, MUSEUM DOCUMENTATION AND DEVELOPMENT-LED ARCHAEOLOGY

Abstract author(s): Maurer, Jakob (University for Continuing Education Krems, Center for Museum Collections Management) - Pieler, Franz (State Collections of Lower Austria)

Abstract format: Oral

Working in an institution that conducts archaeological research, documents archaeological collections and deals with huge finds-corpora stemming from development-led archaeology, “controlled vocabularies” (or their lack) are an issue that you stumble upon quite frequently. The subject, however, is multi-layered; the desires/needs you have sometimes contradict each other. And in some cases, the subject is only a side issue (if there was a sustainable vocabulary and an easy way to implement it, you could use it, as there is not, you can’t).

The contribution aims to present an overview of individual observations and thoughts related to this topic, and on selected initiatives towards archaeological vocabularies (with a focus on the situation in Austria). The aspects brought forward stem not only from daily work & personal experience (e.g. within the research project “United by Crisis?” on the Early Neolithic site of Schletz), but also from stakeholder consultations done within the feasibility study “Dig-Finds” on archaeological demands concerning “digitalization” methods. The contents of the lecture should be useful as a basis for a broader discussion. However, due to e.g. different requirements and issues of legacy, granularity & institutional jurisdiction, they do not suggest an easy way towards a broad implementation of a single controlled vocabulary.

15 WHAT’S IN A NAME? CONTROLLED VOCABULARIES FOR EUROPEAN RESEARCH IN THE ARIADNE RESEARCH INFRASTRUCTURE

Abstract author(s): Richards, Julian (University of York)

Abstract format: Oral

The ARIADNE Research Infrastructure provides a single point of access to four million archaeological resources drawn from four continents, over 40 countries, and ranging in date from the archaeology of the earliest humans to the Cold War. The resources encompass national sites and monuments records, fieldwork reports and archives, and individual artefacts and they include scientific analyses, dating evidence, 3D models and GIS.

The online resources are available Open Access, and they are drawn from the national datasets of over 30 organisations. In their native format, each follows different database schema, different vocabularies, different period terms, and they are in different languages. However, after a decade of development we have achieved a high degree of data interoperability by the informed application of mapping the various schema to the shared ARIADNE ontology (itself a subset of the CIDOC CRM ISO standard). We have mapped native subject vocabularies to a common spine, using the Getty Art and Architecture thesaurus, which facilitates multilingual and hierarchical search and browse. We have applied the PeriodO online application to provide a timeline search using absolute years, or a cross search using cultural period terms. The data and vocabularies are held as Linked Open Data and can now be used in multiple applications, such as the UK’s “Unpath’d Waters” maritime heritage project (<https://unpathd.ads.ac.uk/>), as well as accessed via the ARIADNE portal (<https://portal.ariadne-infrastructure.eu/>).

This paper will discuss some of the challenges to providing international data interoperability on a large scale in the heritage sector, the importance of controlled vocabularies in achieving this, and it will introduce some of the new research questions that have been opened up via our infrastructure.

CALABRIA BEYOND THE CLASSICAL PERIOD: THE LONGUE DURÉE OF A MEDITERRANEAN REGION

Session theme: 6. Contested Pasts & Presents

Session organisers: Attema, Peter (Groningen Institute of Archaeology) - Citter, Carlo (University of Siena) - Mazza, Michele (Soprintendenza Archeologia Belle Arti e Paesaggio per la città metropolitana di Reggio Calabria e la provincia di Vibo Valentia)

Session format: Regular session

Over the last decades Calabria has become the core of several research projects ranging from prehistory to the present challenging the dominance of the study of the classical periods and of classical archaeology. This new focus on Calabria's long term cultural heritage, especially evident in regional archaeological projects, is paralleled by a growing interest in public engagement and dissemination of the outcomes of such research. The results of recent landscape archaeological and anthropological

fieldwork carried out by research groups and national heritage services suggests that continuity and gradual change rather than events shaped the long term history of Calabria.

This session aims to collect papers from academics, national heritage service officers, local units, museums and archaeological parks to debate the historical outcomes of research beyond the classical period and the methods to contribute to the *longue durée* of Calabria. As such the case study of Calabria may have relevance for comparable regions in the Mediterranean whose cultural hallmark has been foremost their classical past.

ABSTRACTS

1 PREHISTORIC HUMAN ENGAGEMENT WITH THE UNDERGROUND REALM: THE CASE OF THE GROTTA DI SANT'ANGELO OF CASSANO ALLO IONIO (CALABRIA, ITALY)

Abstract author(s): Carloni, Delia (Groningen Institute of Archaeology, University of Groningen; Centro di Ricerca speleo-archeologica 'Enzo dei Medici') - Larocca, Felice (Gruppo di ricerca speleo-archeologica, Università degli Studi di Bari Aldo Moro; Centro di Ricerca speleo-archeologica 'Enzo dei Medici') - Attema, Peter (Groningen Institute of Archaeology, University of Groningen) - De Benedetto, Giuseppe (Dipartimento di Beni Culturali, Università del Salento)

Abstract format: Oral

Since the 1990s, Calabria has gradually become an important testing ground for speleo-archaeological research, repeatedly attracting scholars from all over Italy and abroad willing to take part in scientific missions in underground environments. These fieldworks had the virtue to combine speleological exploration of caves with multidisciplinary archaeological investigation, in some cases paying special attention to the relationship between underground topography and accurate location of prehistoric findings. Noteworthy, specialized research was attentive to raise the awareness of local archaeological resources among the general public made of non-professionals – local residents in particular – especially with regard to prehistoric times.

This paper presents preliminary results from a new research project focusing on the archaeological deposit of the Grotta di Sant'Angelo, located in the territory of the municipality of Cassano allo Ionio (Calabria, Italy). The site is part of a larger underground system developed in the Monte San Marco massif. Evidence of prehistoric human presence was found in many areas of the underground chambers and galleries, developed over different levels, and suggests a multi-purpose and multi-period use of the hypogean spaces. In particular, the area known as "Trivio", a sort of junction between different galleries, seems to be of special interest. The cave floor is disseminated with a series of fractures of various depths hosting abundant archaeological material: pottery dating to the Copper Age (4th-3rd millennium BC), stone tools, faunal remains, and some human remains. Ceramic containers, suspected to have hosted ritual offerings, will be the object of an in-depth taphonomic, chronological, and functional study. This, along with the contextualization of data in the light of hypogean topography, will contribute to the understanding of how prehistoric people engaged with caves and of the social and symbolic aspects of their way of living.

2 BEFORE MEDMA: THE AREA OF ROSARNO (RC) IN THE PREHISTORIC AND PROTOHISTORIC TIMES

Abstract author(s): Scaravilli, Marco Stefano (Soprintendenza Archeologia Belle Arti e Paesaggio RC. VV.) - Quondam, Francesco (University of Vienna)

Abstract format: Oral

Paolo Orsi's discoveries in Rosarno (RC), at the beginning of the 20th century, put an end to the vexed question of the localization of Medma, the main Locrian colony on the Tyrrhenian coast, mentioned by literary sources and started a long season of research on the site, which continues to this day. This phase of study, although characterized by a certain discontinuity, has made it possible to acquire numerous elements of knowledge on the organization of the ancient town. Above all thanks to a renewed protection activity, started in the late 70's, and to the planning of a more organic research program, in the 2000's, it was possible to partially reconstruct the urban topography of the Greek settlement and the arrangement of its sacred areas. Nevertheless, since the researches focused mainly on the Greek phase, the settlement dynamics of the pre-Greek age remain largely unknown. In recent years, the reports of accidental discoveries and the monitoring activity of the agricultural and building works, carried out by the Soprintendenza Abap RC-VV, allowed to acquire significant, albeit fragmentary, data which highlight a population of the low hills near Rosarno and the lower valley of the river Mesima, dating already in prehistoric and protohistoric times. The aim of this paper is to collect and review the available data to outline a preliminary framework of the human settlement related to these phases.

3 THE CULTURAL LANDSCAPE OF THE CROTONIATIDE: DEVELOPMENT AND ORGANISATION FROM A LONGUE DURÉE PERSPECTIVE

Abstract author(s): Stümpel, Anna-Elisa (University of Melbourne; University of Groningen) - Attema, Peter (University of Groningen)

Abstract format: Oral

In recent years, the region of Calabria, located in South Italy, has increasingly become a focus of (landscape) archaeological research, with special attention to its role in the Greek colonisation of South Italy and the formation of 'Magna Graecia'. Archaeological surveys and excavations continually shed new light on the longue durée history of Calabria. The archaeology of some areas, such as the Sibaritide, have been researched and published extensively, while other areas, though likewise offering rich data, have seen less synthesis of scattered and not always easily accessible publications. An example of this circumstance is the Crotoniatide, situated in the northern part of Calabria on the Ionian Sea. While the first evidence of human frequentation dates back to the Palaeolithic and settlement is well-documented for the Neolithic periods, the majority of research has been dedicated to the Greek occupation of the Crotoniatide during Antiquity, which began with the foundation of the apoikia of Kroton at the end of the 8th century BC.

In this contribution, we present the development and organisation of the (cultural) landscape of the Crotoniatide taking a longue durée perspective, starting with the protohistorical landscape and following its development into the Hellenistic Period. To study the indigenous organisation of (cultural) landscape organisation and the impact the arrival of the Greek settlers had on this over time, we compiled a database of published data of surveys and excavations. The collected evidence is discussed in light of theories regarding the Greek diaspora and ancient Greek ideas of landscape perception in terms of spatial concepts as chora and eschatia and current ideas on the (political and ritual) demarcation between the 'colonial' coast and 'indigenous' hinterland.

4 IDENTIFICATION AND STUDY OF ARCHAEOLOGICAL SITES IN ASPROMONTE NATIONAL PARK

Abstract author(s): Consoli, Riccardo (Università degli Studi Mediterranea di Reggio Calabria) - Castrizio, Daniele - Manariti, Alessandro - Arcudi, Antonio (Università degli studi di Messina) - Gambino, Antonio (Università degli Studi Mediterranea di Reggio Calabria) - Gennaro, Andrea (Superintendent of Archeology, Landscape, and Fine Arts for the metropolitan city of Reggio Calabria and the district of Vibo Valentia) - Licari, Lino (Superintendent of Archeology, Landscape, and Fine Arts for the metropolitan city of Reggio Calabria and the district of Vibo Valentia) - Puccio, Antonio (Università degli Studi Mediterranea di Reggio Calabria)

Abstract format: Oral

Aspromonte is a mountainous massif that dominates the district of Reggio Calabria, grafting itself in its centre, and gradually descending towards the sea, so much so that its territory extends from the coast to approximately 2000 metres. Such characteristics

place it inevitably within the historical events of the area. Moreover, in the local studies tradition about Aspromonte, traces of an early attempt to recognise a land that was lived in and anthropised can be found. This is in contrast to the collective imagination that saw it as wild and detached from everything else, especially the coast. In reality, archive documents, historical sources, and in situ archaeological realities show that the idea of the mountain as an inaccessi-

ble, untamable and dangerous place is an invention of the last fifty years. During this time, there has been a progressive disinterest and abandonment of various realities (economic, cultural, military, etc.), which on several occasions, and with different cultural models, occupied the foothills of this unique and ancient mountain.

Recent disclosures have also offered a broad chronological overview, allowing room for future in-depth research. In particular, ten days of non-systematic survey were undertaken in specific areas. The results of this research, which involved a team of 8 people with different professional skills and covered a rather large overall area, but limited to the abovementioned points, will be presented during the meeting session.

5 THE BRIATICO PROJECT: RESEARCH ON A MEDIEVAL CITY AND ITS LANDSCAPE THROUGH A DIACHRONIC PERSPECTIVE

Abstract author(s): Mazza, Michele (Ministry of Culture) - Citter, Carlo (University of Siena)

Abstract format: Oral

The aims of this contribute is to explain the results of a research conducted in the site of the ancient town of Briatico Vecchio. The original settlement of Briatico developed as a medieval fortified centre on a rocky outcrop naturally defensible by overhanging walls. It used to be bordered to the north-west by the Fiumara Murria and to the east by one of its tributaries. A settlement of considerable size, with a large portion of buildings still visible, despite the 1783 devastating earthquake. In particular, we mention the castle and simple houses, with traces of human presence since the Middle Bronze Age. The research saw the collaboration between the University of Siena, the University of Calabria, the University of Basilicata, the municipality of Briatico and the Superintendency of Archaeology, Fine Arts and Landscape for the Metropolitan City of Reggio Calabria and the Province of Vibo Valentia engaged in an in-depth study of the Briatico Vecchio site and the surrounding area. The investigations began in 2021, and continued in 2022, deepening the research in relation to the data collected during the field seasons. In this period, the three research groups focused on different aspects of the landscape thus having a more complex vision of the dynamics active in the territory over time. The activities will continue during 2023 with an insight of the study area.

6 THE MEDIEVAL ARCHAEOLOGICAL MAP OF THE REGGIO CALABRIA'S DISTRICT. TOOL FOR PROTECTION, RESEARCH AND ENHANCEMENT

Abstract author(s): Bini, Sara (Ministry of Culture)

Abstract format: Oral

This paper was created with the aim of summarizing the project concluded during the PhD years and which had as its objective the collection, within a georeferenced system, of the archaeological sites identified within the administrative boundaries of the province of Reggio Calabria. In particular, the research has focused on deepening the data concerning the post-classical age, i.e. starting around the fifth century AD. until the earthquake of 1783.

The collection has led to the identification in particular of more or less preserved architectural complexes (churches, monasteries, castles, towers) and a few archaeological data, mainly due to the lack, in the history of Calabrian studies, of investigations aimed at the knowledge of the medieval age, a lack that is being filled only in recent years thanks to preventive archeology investigations and limited investigations for research and non-emergency purposes.

The final product therefore led to the creation of a tool that can be implemented with more and more new data useful for the protection, research and enhancement of the post-classical archaeological heritage of the province of Reggio Calabria, providing a collection of historical, archaeological, archives and bibliographies that will be useful to start or carry on, hopefully, more and more investigations aimed at the knowledge of the numerous contexts that have arisen along the coast and in the internal territory from the fall of the Roman Empire up to the seismic events before 1783 but not less than 1908 which caused a drastic change in the anthropic landscape both on the coasts and on the slopes of the Aspromonte.

7 ANCIENT MILETO (CALABRIA, PROV. VIBO VALENTIA): NEW CONTRIBUTIONS TO THE KNOWLEDGE OF THE SETTLEMENT IN THE MODERN AGE

Abstract author(s): La Serra, Cristiana (Freelance) - Lico, Fabio (Freelance)

Abstract format: Oral

The archaeological site of the Ancient Mileto (Italy, Calabria, Vibo Valentia) has had a long settlement history, since the Byzantine age, when a fortified center was formed, until the earthquake of 1783 -or few decades after- when a systematic plundering activity affected the entire ancient centre.

Between 2021 and 2022, two excavations were carried out under the scientific direction of SABAP for the metropolitan city of Reggio Calabria and the province of Vibo Valentia: one of the service areas of the SS Trinità abbey complex was investigated and an area unexplored part of the Norman village.

The interventions, born from the need to improve the visits to the Archaeological Park, offered the opportunity to stratigraphically investigate the last phases of the life of the settlement, definitively obliterated by the plundering works carried out until the mid-1800s. The contribution, through the presentation of excavation data and recovered archaeological materials, intends to constitute a starting point for the economic, social and urban planning knowledge of the city during the modern age, also in relation to the relevant medieval pre-existences and the practice of reuse. For the first time, material data relating to the most recent phases of life are presented, until now known almost exclusively through written documentation.

8 THE FORTRESS OF ARENA: HISTORY OF CASTLE THROUGH EXCAVATION DATA AND LANDSCAPE ANALYSIS

Abstract author(s): Felicioni, Camilla - Patacchini, Andrea (MA University of Siena) - Martini, Marco - Ricchiuti, Daniele (MA Sapienza - University of Rome) - Lico, Fabio (MA University of Calabria) - Molaioni, Elena (MA Sapienza - University of Rome)

Abstract format: Oral

The Norman castle of Arena, located in a village in southern Italy (Calabria), has been populated since the high middle ages up to the 1783 devastating earthquake, showing a continuity of attendance in the long term cultural heritage.

This paper aims to relate the castle with the surrounding area in order to understand its importance and role. So far, literature on the region for the second millennium CE is scarce. Despite this odd, we will provide a short overview of the archaeological data concerning the castle. We are undergoing a survey in the whole county with attention to the former “Feudo of Arena”, a larger juridical district focused on the castle. Finally, everything will be loaded on the QGIS software.

The reconstruction of the history of the castle is strictly bound to the local culture and heritage, which is the reason why we started a public engagement project to improve the relation with local community.

9 EXPLORING THE PAST OF THE DESERTED VILLAGE OF SAN LEO VECCHIO. A PRELIMINARY RESEARCH

Abstract author(s): Coleschi, Alessandra (Università di Siena) - Paciotti, Ylenia (Università di Genova)

Abstract format: Oral

San Leo Vecchio, in the municipality of Briatico, is one of the key sites detected within the “Briatico Project” by the University of Siena. Its importance lays mainly in its position close to the ancient town of Briatico Vecchio, that was abandoned after the 1783 earthquake. They used to be connected by a straight route, which is an exception in the neighbouring area. Furthermore, the position of San Leo is suitable for exploitation of the countryside.

This contribution aims to analyze the changes of the site over time. We will study the historical maps, the aerial and satellite photographs, the LiDAR and the survey data. The site was abandoned after the 1908 earthquake. This helped to freeze the buildings and the structures of the village long before the major changes occurred in Italian countryside in the last fifty years. The comparison between this area and the near coast makes this difference crystal clear.

10 ROCK MILLSTONES AND LANDSCAPE EVOLUTION BETWEEN LATE ANTIQUITY AND EARLY MIDDLE AGES IN THE IONIAN COAST OF REGGIO CALABRIA (ITALY)

Abstract author(s): Cottica, Daniela (University Ca' Foscari Venice) - Bini, Sara (Soprintendenza Archeologia, belle arti e paesaggio per il Comune di Venezia e Laguna)

Abstract format: Oral

The so-called „rock millstones“ are an interesting and peculiar feature of several municipal territories along the Ionian coast of Reggio (Calabria, Italy): they are structures dug into the outcropping rock and were intended for winemaking. Their origin sometimes could date back at least to the early imperial era, however, it is believed that they may have developed more consistently in the transitional period comprised between Late Antiquity and the Early Middle Ages. Indeed, in that period of time, various regions had to increase the production of their local excellences. As far as Calabria is concerned, one of the local excellent products was undoubtedly wine, as confirmed by Cassiodoro and testified by the presence of Keay LII amphorae (manufactured in Calabria) at several emporia around the Mediterranean. Moreover, the rock millstones can be placed in relation with other known archaeological features such as kilns, villas and, later, monasteries: altogether the available evidence adds significant details to the evolution of the regional socio-economic landscape between Late Antiquity and the Early Middle Ages. This latter theme is of high relevance also for long term protection of the local archaeological heritage. Furthermore, since wine production is still one of the regional excellences of modern Calabria, research on the origin of winemaking can be linked to development of vine-growing and ampelographic heritage of this region. Therefore, analysis of archaeobotanical data will be part of

the project “Viticulture and wine production in ancient Calabria. The production structures: the rock millstones of the southern Ionian coast of Calabria”, a new interdisciplinary project, in collaboration with Ca’ Foscari University of Venice, the Superintendency of Reggio Calabria and Vibo Valentia. Our presentation will illustrate this project, within the general framework of winemaking and vine-growing ancient and modern Calabria.

A. THE CHORA OF S. LEONZIO (CAMINI-RIACE-STILO, RC). HISTORICAL EVOLUTION OF A RURAL LANDSCAPE ACCORDING TO A LONG-TERM PERSPECTIVE

Abstract author(s): Hyeraci, Giuseppe (Istituto di Studi su Cassiodoro e sul Medioevo in Calabria)

Abstract format: Poster

The definition of the limits of the Tenimento of S. Leonzio (Carthusian grange of S. Stefano del Bosco), included in the ancient district of the city of Stilo - as described by the Grande Platea of 1532 - , and its stability until the late 18th century, allow for the identification of a sample territory which lends itself well to a long-term historical micro-geography analysis. From the formation and subsequent structuring of the territory pertaining to a peripheral cell formerly of the Byzantine Metropolis of Reggio and then dependence of the land lordship of S. Stefano del Bosco in the Norman age, the contribution intends not only to analyze its internal structure and the social and economic connections, but regressively it will try to highlight the presuppositions of this rooting, including the entire structure inherited from the Roman age, so as to interrogate problems relating to the central centuries of the early Middle Ages not otherwise classifiable; finally it will focus on some salient themes, from the evolution of the settlement network, to land geography, to the agricultural landscape, taking advantage of the information potential of the „territorial GIS“.

324 INTERCONNECTIONS BETWEEN METAL AND NON-METAL ASSEMBLAGES AND METAL AND NON-METAL OBJECTS IN HOARDS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Maciejewski, Marcin (Institute of Archaeology, Maria Curie-Skłodowska University in Lublin) - Tarbay, János Gábor (Department of Archaeology, Scientific Directorate, National Institute of Archaeology, Hungarian National Museum) - Nowak, Kamil (Institute of Archaeology, Nicolaus Copernicus University in Toruń)

Session format: Regular session

In continental Bronze Age archaeology, the widely accepted definition of a hoard, according to W.A. von Brunn, is that it must contain at least two metal objects. R. Bradley presents a completely different perspective. He speaks of deposits, not hoards, and significantly expands the catalogue of behaviours to be part of a trans-European and longue durée process.

For decades, hoards research has focused exclusively on metal objects. On the one hand, this was the choice of scholars; on the other hand, many finds were discovered haphazardly and taken out of context, destroying or leaving behind less spectacular and durable items such as potshards, organic elements, stone objects, etc.

However, these items were also part of metal hoards. We also know of similar assemblages consisting of artefacts from other raw materials, as well as food deposits, human sacrifices and other relics of similar practises. All these acts are known from many periods, at least from the Mesolithic to the Modern Time.

We would like to discuss some questions together:

- To what extent were the deposition practices of various goods (metal, stone, pottery, food, human and animal remains, etc.) similar?
- Can we speak of a single phenomenon or behaviours that seem - from the perspective of 21st-century archaeology - similar?
- What do the non-metallic elements discovered in these assemblages tell us about the metal hoards?
- What interactions occurred between deposits containing and without metal artefacts by the same societies?

Deliberately selected artefacts and ecofacts deposited over an extended period (e.g. structured deposition) should be interpreted differently from a single act of deposition (like hoards)?

Societies with and without monetary systems perceive the value of goods differently, so we would like to focus on just one of these groups. We invite all scholars of the Stone, Bronze and Iron Ages to take part.

1 MESSAGE IN A BOTTLE - METAL AND NON-METAL ARTEFACTS FROM THE MIDDLE BRONZE AGE HOARD OF JÁSZDÓZSA (EASTERN HUNGARY)

Abstract author(s): Kiss, Viktória (Institute of Archaeology Research Centre for the Humanities) - Csányi, Marietta - Tárnoki, Judit (Damjanich János Museum) - Jaeger, Mateusz (Adam Mickiewicz University, Institute of European Culture)

Abstract format: Oral

Systematic excavations at the Jászdózsa-Kápolnahalom Bronze Age tell-settlement were conducted between 1966 and 1975, led by Ilona Stanczik and István Bóna. Three main periods were distinguished within the 5.40 m thick occupation layer with 16 levels: 3 m thick layers of the Hatvan culture (from 16 to 11 levels), the Füzesabony period (levels from 10 to 6) and the upper 5 levels of the Koszider period. During the first season in 1966, in level 11, the upmost level of the Hatvan culture a hoard was discovered dug into the floor of House 1 (dated between ca. 2000-1800 BC). Among the finds 37 gold hair rings, 30 small gold studs, one gold disc (gold finds altogether weighing more than 150 g), a bronze axe, a flanged axe, an amber necklace (consisting of 168 beads), four star-shaped faience beads, as well as animal teeth and crawls were found, hidden in a vessel. Thanks to new analyses of hoards from the region (e.g. from Spišský Štrvok) a more detailed picture can be drawn about Middle Bronze Age settlement depositions in the area of the Carpathian Basin. One of the main question of the interpretation of these hoards is the ritual or profane purpose of their hiding. The hoard from Jászdózsa, yielding claws of a crow and of a buzzard, beside the dog's tooth drilled as an amulet and other jewellery, suggest a ritual interpretation. In our paper recent investigations of the gold and amber finds of the hoard will also be presented.

2 METAL - POTTERY - BONES - FLINT - STONE. A COMPLICATED BIOGRAPHY OF A SINGLE SPOT

Abstract author(s): Maciejewski, Marcin (Institute of Archaeology Maria Curie-Skłodowska University) - Hałuszko, Agata (Institute of Archaeology, Maria Curie-Skłodowska University; Archeolodzy.org Foundation) - Wilczyński, Jarosław (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences) - Mączyński, Piotr (Institute of Archaeology, Maria Curie-Skłodowska University) - Chachlikowski, Piotr (Faculty of Archeology, Adam Mickiewicz University) - Bartmiński, Piotr - Siłuch, Marcin (Institute of Earth and Environmental Sciences, Maria Curie-Skłodowska University) - Przybyła, Marcin („Dolmen“ s.c. Marcin Przybyła Michał Podsiadło)

Abstract format: Oral

A hoard of metal items dated to the late Bronze Age was accidentally found in Kaliszany (north Greater Poland) in 1943. Its first descriptions and a brief note on the find circumstances originate in the 1950s and 1960s. According to the note, the metal items came to light „during the levelling of the hill”. The term „hill” unambiguously suggests a natural landform. At the same time, the archival documentation kept in the Archaeological Museum in Poznań shows that it might have as well been anthropogenic. It is particularly intriguing in Greater Poland's post-glacial, agriculturally transformed landscape. The find context, however, did not receive much scholarly attention. One of the potential interpretations was that the hoard had been deposited in the mantle of an earlier barrow.

Investigations at the selected spot in Kaliszany were triggered by the discovery in Rosko, located ca. 100 km to the west. There, the late Bronze Age hoard rested in a stone-and-earth structure which had most likely been raised specifically for the deposition. We wondered whether the hoard from Kaliszany could have a similar structure. Our non-destructive surveys, excavations and archival documentation indicate a tangled site biography. It was not merely the act of depositing a bunch of metal items in the hill or barrow slope that it witnessed.

Besides metal artefacts, the spot yielded a complex stone structure, deposits of pottery vessels, flint artefacts, and human and animal bones.

The obtained results show how sophisticated the scenarios for metal item deposition were. They also articulate the un-obvious relationship between the various find categories which we so willingly separate in our archaeological practice. Paper is financially supported by the National Science Centre, Poland (project no. UMO-2021/41/B/HS3/00038).

3 CONNECTING ORGANIC AND INORGANIC MATERIALS IN THE VIKING-AGE GALLOWAY HOARD

Abstract author(s): Goldberg, Martin (National Museums Scotland)

Abstract format: Oral

Research into hoards has often focused on metal objects and while the Galloway Hoard contains over 5kg of silver, and more gold objects than any extant hoard surviving from Viking-Age Britain and Ireland, it is the other materials that make it outstanding. Wood, leather, and textile (silk, linen and wool) wrapping and bundling were also preserved

within this hoard and beyond the precious metals a lidded vessel also contains glass, rock crystal, mineral elements and even two curated balls of dirt.

The non-metallic elements of this assemblage tell us about the structure of this hoard and different ages of associated materials. The lidded vessel and some of its contents were curated for centuries before being deposited. On a macro-scale there are four clear groups and on a micro-scale there is a structure to the packing of the wrapped and lidded vessel and the bundles within it.

The Galloway hoard bears similarities to many contemporary silver bullion hoards but the differences are also many and significant and bear comparison to other types of complex deposit from other time periods (burials, treasuries, relic collections etc). Within this one hoard we seem to have several motivations for hoarding, collecting and curating a variety of materials as well as evidence for how the parts came together as an assemblage.

4 IN AND OUT OF CONTEXT. BRONZE AGE POMERANIA FROM HOARD STUDIES PERSPECTIVE

Abstract author(s): Slusarska, Katarzyna (Uniwersytet Szczeciński)

Abstract format: Oral

Bronze Age hoards from Western Pomerania were subjects of many studies starting from the dawn of prehistorian interests in this region. However, due to the turbulent history of the 20th century, some of those finds are lost in museum collections. Some are known only from draft archival reports, frequently lacking basic information on the location, context, etc.

The deposits from Western Pomerania contain objects (e.g. hanging vessels, plate fibulas, razors) corresponding with the Nordic or Northern German style of metallurgy. Of the total number of over 70 collective deposits from the Szczecin Lowland, almost 1/3 provide information about the wet context of finding (swamp, peat bog or lake bed). Meanwhile, archival data on dry context deposits often provide information on ceramic or wooden containers in which the items were deposited. Among those finds, at least some could be destroyed graves. This hypothesis seems plausible because cremation graves from the early phases of the Lusatian culture contain vessels and sets of metal objects (e.g., the so-called princely grave from Banie). Some deposits, e.g. from Wołczkowo, Community Police, have the ambiguous description “grave or hoard”. The information on the wooden container or other non-metal finds accompanying metal objects also brings new perspectives to discussing hoarding as a cultural practice, especially regarding deposits found on bronze age cemeteries.

This study aims to reanalyse archival data on period IV to VI hoards from Szczecin Lowland to verify their status (a hoard, not a hoard) and set them in the broader context of settlement patterns. That can provide a deeper insight into the land use and meaning of hoard deposition in the Late and Final Bronze Age Lower Oder region.

5 THERE'S MORE THAN MEET THE EYE - WOOD, BARK, STRAW AND HONEY IN A DANISH LATE BRONZE AGE DEPOSITION

Abstract author(s): Beck, Malene (Østfyns Museer) - Frost, Lise (Moesgaard Museum, MOMU)

Abstract format: Oral

In 2020 a deposition of female ornaments from the Late Bronze Age was discovered and excavated on the island of Funen, Denmark. The find has produced new information about the Bronze Age tradition for depositions in springs as well as the use of organic materials deposited together with the metal objects.

Favorable preservation conditions for organic material, has provided information about how the ornaments were used, how they were packed in connection with the deposition, as well as knowledge about the landscape in which the deposition took place. The paper underlines the necessity of scientific analyses when investigating metal depositions, in order to shed new light on the otherwise invisible elements of the finds.

The ornaments were stored in a bark bucket and carefully packed with patches of straw, when they were deposited. Pollen and NPP (Non Pollen Palynomorphs) analyses help provide a reconstruction of the landscape in which the deposition was made. Thereby the find makes a valuable contribution to our knowledge about the Bronze Age communities' use of landscapes located in border areas or completely outside settlements and fields. The NPP analyses revealed remains of bee hairs and combined with a high amount of pollen from herbs of the Bracciaceae family this indicates, that honey or more likely honeycombs were a part of the deposition, either as an element chosen specifically for the deposition or as the content of a hanging vessel.

Based on the stratigraphic observations from the excavation, the preserved organic materials in the find and the scientific analyses, a chaîne opératoire is presented for the various sub-elements and phases of the depositional act. The chaîne opératoire incorporates observations from older finds of metal hoards, making comparisons of similar patterns or elements possible.

6 ABOUT NON-METAL OBJECTS IN THE HOARDS OF THE “BÎLVĂNEȘTI-VINȚ” SERIES FROM MODERN ROMANIA AND THE IMPORTANCE OF THE DISCOVERY CONTEXT

Abstract author(s): Bors, Corina (National History Museum of Romania - MNIR)

Abstract format: Oral

Given the topic about the non-metal objects in hoards, this paper will present newer (Tărtăria I and Tărtăria II) and older (Vaidei, Blandiana, Alba Iulia – Partoș, Vințu I – III, Bîlvănești etc.) finds assigned to the “Bîlvănești-Vinț” series (DFS VI), the First Iron Age, from modern Romania, the last series of bronze & iron objects deposits of this kind, certain containing also non-metal elements like pottery and organic material. The comparative analysis with other type of depositions (such as vessels assemblages or funerary inventories) from the period of Basarabi culture (ceramic style) gives a better understanding about the structure of the (bronze & iron objects) hoards, as well certain similarities, but also obvious differences with the other contexts of depositions. Considering two types of non-metal objects from such assemblages, namely pottery and organic material further understanding can be achieved as regards the metal hoards. Last but not least, a series of observations will be made about the patterns of deposition for such finds, but also about the importance of the discovery context and their proper documentation by archaeological excavation and not by illegal retrieval made by non-archaeologists.

7 WHAT DID THE BRONZE AND IRON AGE HOARDS IN SOUTH BOHEMIA CONTAIN?

Abstract author(s): Chvojka, Ondrej - Šálková, Tereza - John, Jan (University of South Bohemia)

Abstract format: Oral

In South Bohemia, more than 150 Bronze Age hoards and about 20 mass finds from the Iron Age are known today. The vast majority of these are hoards of metal (bronze, copper, iron or gold artefacts), with only two sets representing hoards of ceramic vessels. No hoards of artefacts made of organic materials have been recorded so far, which may, however, be due to the poor soil conditions in the region, which, with few exceptions, do not allow the preservation of organic materials. Nevertheless, the presence of ecofacts or parts of artefacts made of organic materials has been recorded in several hoards. In the Early Bronze Age, we can mention some hoards of copper ingots that were tied with grass strings. Remains of organic strings or wrappings also come from other hoards of the Early to Late Bronze Age. Their identification has subsequently resulted in a number of radiocarbon dates. Pollen grains have been preserved on the surface of some metal artefacts, allowing the local natural environment at the time of the depot to be reconstructed. Human bones were also recovered from a deposit of six bracelets and a glass ring from the Early Iron Age at Spolí, allowing the situation to be interpreted as a sacrifice. In addition to organic materials, some of the metal hoards contained ceramic vessels in the role of containers, and exceptionally amber beads. However, in terms of finding environments, no distinction can be made between hoards of metal artefacts and hoards with objects of other materials. We believe that the absence of ceramic, amber, or organic materials in most South Bohemian hoards is primarily due to the way they were deposited, found, and preserved, not to a different type of prehistoric human behavior.

8 SPECIALLY PLACED CERAMIC ASSEMBLAGES FROM THE LATE MIDDLE BRONZE AGE IN THE CARPATHIAN BASIN

Abstract author(s): Szabó, Nóra (Institute of Archaeology Research Centre for the Humanities) - Szilas, Gábor (Budapest History Museum Aquincum Museum)

Abstract format: Oral

The complexity of the deposited assemblages in the Carpathian Basin displays a significant increase during the Bronze Age. In the Early Bronze Age pottery depositions were limited to simple deposits consisting of small mugs. This tradition continued in the Middle Bronze Age (MBA) when metal objects were also hidden in ceramic vessels. In the Late Bronze Age there is significant quantitative and qualitative growth in the character of deposits: by this time, we can clearly distinguish several types of deposits based on the function and number of the vessels.

When and what changed the practice of ceramic deposits and the composition of the contained vessels? The answer may be found at the end of the MBA, when structured depositions consisting mainly of containers and pots, often with secondarily, heavily burnt fragments, appear hidden or placed inside the features of settlements, showing a quite different phenomena from the simple storage pits. The number of these types of features has grown in parallel with the large-scale excavations, and several such features have been discovered in Budapest and its surroundings.

The aim of this presentation is to introduce these unknown phenomena and to attempt to reconstruct the social practices behind them. Beyond typo-chronological and functional analyses, it is the exploration of the human thought behind the specially treated objects that may explain the pottery deposition activities that evolved during the Bronze Age. In the case of the metal-, ceramic-, and mixed deposits (metal objects placed in vessels) at the end of the MBA, it is not only the differences in the composition of the objects, but also the ritual act behind each type, as revealed by the spatial differences and the fragmented or otherwise manipulated objects that can be observed.

9 CERAMIC AND SPECIAL DEPOSITIONS DURING THE LATE BRONZE AGE GÁVA CERAMIC STYLE

Abstract author(s): Kósa, Polett (Eötvös Loránd University; Szent István Király Múzeum)

Abstract format: Oral

Metal and ceramic hoards were the most well-known phenomena during the Late Bronze Age in the eastern part of the Carpathian Basin. The Ha A1–B1 ceramic hoards were collected and sorted into three main groups based on their inclusions by Gábor V. Szabó. They could either contain some large and medium-sized storage vessels (e.g. Tiszacsege); lone standing, decorated large storage vessels (e.g. Tiszaladány); or drinking and serving sets consisting of several pieces of cups, bowls, and food or beverage containers (e.g. Tiszapüspöki).

Furthermore, some special depositions can also be mentioned from this period. Two examples from Baks-Temetőpart, a classical Gáva ceramic style settlement, should be highlighted. One of them is a ritual posthole deposition, while the other is a pit that contains the remains of a probable feast. Posthole depositions were known since the Early and Middle Bronze Age from the western territories (e.g. Austria), but not from the Gáva culture area. However, storage pits were more commonly used for special depositions since the pre- and proto Gáva periods.

In my presentation, I would like to give a comprehensive picture of the ceramic vessel hoards of the Late Bronze Age in the East Carpathian Basin and present some combined (ceramic and animal remains) special or ritual depositions for the first time. It will also be briefly addressed what the similarities and differences are between ceramic and metal vessel hoards from this period.

10 BEYOND WETLAND AND PYRE. APPROACHING EARLY IRON AGE CERAMIC VESSEL DEPOSITS IN WESTERN HUNGARY

Abstract author(s): Soós, Bence (Hungarian National Museum; Eötvös Loránd University)

Abstract format: Oral

Research of the Early Iron Age (EIA) in Transdanubia, i.e. western Hungary, still heavily focuses on the funerary evidence, so much so that the few EIA metal hoards in the region have regularly been seen associated with funerary customs. In light of the large number of excavated settlements in recent decades, one begins to feel uneasy about the funerary character dominating depositional practices and ritual customs of the Hallstatt Period communities. The increasing evidence from the domestic sphere of the period strongly suggests that depositional practices of the Hallstatt communities could have been multi-faceted and more complex than previously thought. Intentionally deposited ceramic assemblages discovered within settlements, in the region largely unknown to previous research, are crucial in this regard.

In my paper, I focus on these assemblages. First, I evaluate them in the context of the settlements where they were unearthed. Secondly, the question of their funerary character has to be addressed. Vessel sets comprising elaborate ceramics are characteristic elements of the EIA burial customs and burial assemblages. Hence, looking at ceramic vessel deposits, comprising similar vessels, found within the domestic sphere gives us insight into the relationship between the mortuary ritual and the depositional practices directly not associated with burials. In addition, comparing ceramic deposits in settlement contexts to metal hoards of the period offer a new angle in interpreting the latter category of deposits. With this, my aim is to provide an overview of Hallstatt Age depositional practices in Transdanubia and the possibilities of interpretation.

11 MANIPULATIONS OF WOODEN SPEARHEAD PARTS IN LATE BRONZE AGE HOARDS FROM HUNGARY

Abstract author(s): Tarbay, János Gábor (Hungarian National Museum - Magyar Nemzeti Múzeum) - Maróti, Boglárka (Nuclear Analysis and Radiography Department, Centre for Energy Research)

Abstract format: Oral

Hundreds of bronze spearheads were discovered in metal hoards in Hungary during the Late Bronze Age (1450–850 B.C.). However, only a handful of them contained organic parts, such as wooden shafts or wooden pegs, due to the unfavourable preservative conditions of this region. Since spears are essentially composite weapons, their organic and metal parts are equally important in respect of their function and symbolic meaning.

When the metal head of such a weapon is found in a hoard either intact or in a manipulated (bent, broken, burned) state, one should also consider what could have happened with the wooden parts. Were these objects dismantled prior to the hoard selection, and only the metal heads manipulated and deposited? Was only the wooden part manipulated and the metal head left untouched, which would render the category of 'intact' an incorrect term during the analysis of fragmentation patterns? Is the positioning of the spearheads evidence that they could have been deposited in a hafted state? Is it possible that a spear thrust into the ground (vertical position of spearheads) marked and made the metal hoards reversible?

Our paper elaborates on these questions and possibilities with examples from Hungary, showing that data on context, documentation of technological and wear traces, and Neutron Imaging technique could provide us with valuable information on this topic even in the least favourable region for the preservation of organic parts.

The paper is part of Project No. 134910, which has been implemented with the support provided by the National Research, Development, and Innovation Fund of Hungary, financed under the PD_20 funding scheme (Project 134910).

12 DEPOSITS OF CASTING MOULDS. THE „REAL“ HOARDS OF METALLURGISTS?

Abstract author(s): Nowak, Kamil (Institute of Archaeology Nicolaus Copernicus University in Toruń)

Abstract format: Oral

Researchers often take topics related to the so-called hoards of metallurgists. Linking specific hoards with the activity of metallurgical workshops dates back to the end of the 19th century.

The term 'hoards of metallurgists' is mainly used for deposits containing characteristic metal equipment (raw material, tools). Hoards of metal objects are marked with many levels of meaning – from economic ones related to the raw material value (number of objects and their weight) through the importance of craftsmanship (involvement of a highly qualified specialist), place of deposition (dry and wet area, sacred-profane), the presence of local objects or imports. However, they are always metal objects. It is difficult to determine which hoard was only a raw material stock for further processing and which could have a broader pool of meanings related to the traditions, rituals, or rites prevailing in a given community.

During my speech, I would like to discuss the phenomenon of depositing the stone casting moulds, which I understood as a 'real' hoard of a metallurgist. In the case of most deposits of this type, they contain casting moulds made of the same type of stone material. The moulds in the hoards bear use-wear traces, meaning they were fully functional tools. Also, the number of tools in this type of deposit is diversified. There is a noticeable tendency to deposit multi-sided and multi-negative casting moulds.

Depositing only tools related to the pyrometallurgical transformation of metal is a rare phenomenon. As part of my paper, I will characterize the preliminary research results in the context of Central Europe.

My research is financially supported by the National Science Center Poland (project no. 2021/40/C/HS3/00097) and by Nicolaus Copernicus University in Toruń under the University Centre of Excellence programme.

13 CARPENTER'S HOARDS IN MINOAN CRETE, METALLIC TOOLKITS ? REASSESSMENT OF THE CONTEXTS AND ASSEMBLAGES OF A SPECIFIC KIND OF DEPOSIT

Abstract author(s): Loescher, Valentin (Paris 1 Panthéon-Sorbonne; UMR 7041 ArScAn Protohistoire égéenne; EUR ArChal)

Abstract format: Oral

Hoarding practices of metal tools within the settlements are known during the Bronze Age in Crete (3000 – 1050 B.C.). Thirteen of them have been referred to as "carpenter's hoards". A first synthetic study identified a larger panel of 26 hoards or "tool kits" potentially related to woodworking. These attributions, which are based on typology and associations within the assemblages, have been done considering exclusively metallic tools. This is partly due to the publication of the archaeological objects separated by materials, consequence of their study by different specialists.

However, newly published data and a return to first hand publications shows that there were often stone tools associated, and sometimes bronze vases or ceramic artefacts left out of the previous analysis of these hoards.

Thus this presentation aims to interrogate what can be learned about these deposits when considering non metal objects related to the assemblage. It will put in perspective the terms used to describe them (hoards, deposits, toolkits) by analysing the various contexts in which they were found. By doing so, it will also underline the intertwined relationship between different kind of tools and different kind of materials.

14 LUXURY OF THE FEW – SPECTACLE FOR THE MANY. BRONZE AGE HOARDS WITH AMBER FROM NORTHERN HUNGARY

Abstract author(s): Guba, Szilvia (Hungarian National Museum – Forgách-Lipthay Castle Museum) - Tankó, Károly (ELTE - Eötvös Loránd University)

Abstract format: Oral

Hoards are one of the most characteristic phenomena in the cultural landscape of the Bronze Age in NE Hungary. In Nógrád County numerous hoards dated from the late Bronze Age to the Early Iron Age were collected in the past 150 years, while a systematic research (including field survey, aerial and LiDAR imaging) in the surroundings of the sites has only just begun.

As a result, in the past two years several bronze hoards were identified, of which two of the most important are presented here. Both bronze hoards were found undisturbed, in their original position, thus making a micro-stratigraphical excavation within a laboratory setting possible. Seemingly, the first hoard contained only bronze jewellery, such as pins, arm and neck rings, and only the meticulous restoration work revealed remains of fabric in which the objects were neatly and carefully wrapped in. In the second hoard nearly 1300 artefacts were uncovered, of which the non-metal finds are predominant: the large amount of amber beads makes this assemblage to one of the most spectacular deposits of the region. Besides various shapes and sizes of beads, the metal finds are of extraordinary quality and value as well. In our presentation we not only discuss the connection between metal and non-metal artefacts and their importance within depositions, but also the possible non-metal covers or containers of the hoards (textile wrappings, composite bronze and organic vessels).

325 TRACING THE HISTORY OF MEDITERRANEAN HUMAN-ENVIRONMENTAL SYSTEMS USING BIOMOLECULAR METHODS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Coccozza, Carlo (Max Planck Institute for GeoAnthropology; Università della Campania) - Soncin, Silvia - Tafuri, Mary Anne (Università di Roma) - Fernandes, Ricardo (Max Planck Institute for GeoAnthropology; Princeton University; Masaryk University)

Session format: Regular session

The Mediterranean basin lies at the crossroads of three continents. Throughout its rich history, it has been the stage for a succession of political and socioeconomic organisations, the intermixing of ethnic groups, and the emergence and spread of cultural practices intertwined with heterogeneous environmental conditions. This makes the Mediterranean region fertile ground for the study of complex human-environment relationships.

During the past decade, there has been a spectacular rise in the use of biomolecular methods within Mediterranean archaeology. These have been employed to study paleoenvironmental conditions and to reconstruct various aspects of past human lifeways and socioeconomic activities. Multiple case studies using isotopic, proteomics, ancient DNA, and ZooMS biomolecular methods plus their combinations have showcased the immense research potential that these offer to the study of Mediterranean history. The increasing availability of sizable datasets is allowing for Big Data meta-analyses that offer insights into diachronic and regional variations. There is also a growing pursuit, extendable to other archaeological contexts, for wider employment of analytical and modelling techniques that allow for higher resolution descriptions of past phenomena (e.g., compound-specific isotopic analyses, Bayesian modelling, etc.). The future of biomolecular methods in Mediterranean archaeology is assured and important developments in our historical knowledge provided by these should be anticipated.

In this session, we aim to offer an up-to-date overview of the use of biomolecular methods in the study of the relationships between past societies and the Mediterranean ecosystem. We welcome both contributions that introduce methodological improvements employable within Mediterranean contexts and the presentation of case studies.

ABSTRACTS

1 INVESTIGATING THE BRONZE AGE DIET AND MOBILITY IN MENORCA, SPAIN: AN ISOTOPIC ANALYSIS OF THE BINIADRÍS CAVE POPULATION

Abstract author(s): Marciales, Mauricio (SFB1070 “Ressourcenkulturen“ Eberhard Karls Universität Tübingen) - Diaz-Zorita Bonilla, Marta (Institut für Ur- und Urgeschichte und Archäologie des Mittelalters, Eberhard Karls Universität Tübingen; SFB1070 “Ressourcenkulturen“ Eberhard Karls Universität Tübingen) - Alarcón García, Eva - Moreno Onorato, Auxilio (Department of Prehistory and Archaeology, University of Granada) - Timm, Monice (SFB1070 “Ressourcenkulturen“ Eberhard Karls Universität Tübingen) - Escudero Carrillo, Javier (Department of Prehistory and Archaeology, University of Granada) - Ramis, Damiá (Museu de Menorca) - Baten, Jörg (Economic History Department, Eberhard Karls Universität Tübingen)

Abstract format: Oral

The Mediterranean region has undergone extensive research on diet and mobility throughout various time periods. However, the majority of these studies have been concentrated on the Eastern Mediterranean. Investigations on the coasts and islands of the Western Mediterranean have only been conducted in recent decades, and mostly in specific regions of the Iberian Peninsula and Italy. This research aims to address this gap by exploring the Balearic Islands and their relationship with other Western Mediterranean contexts during the Late Bronze Age and early Iron Ages. The Biniadrís Cave in Menorca, Spain, serves as a valuable archaeological site for this investigation, providing a comprehensive chronology for the study of the Talayotic and Post-Talayotic population's diet, subsistence strategies and mo-

bility. Stable isotope analysis on human and animal collagen, including $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$, will be utilized to uncover the dominant sources of food, made possible by the increased resolution provided by Bayesian Models. The study will also incorporate preliminary results of $\delta^{18}\text{O}$ stable isotopes using intraindividual serial sampling from animal tooth enamel from domestic sites in Menorca to shed light on the livestock handling practices of the time, such as transhumance activity and seasonality. The use of a multiproxy stable isotopic analysis will enlighten the interplay between diet and mobility through the use of resources and the landscape. This research aims to fill the gap in the understanding of diet and mobility in the Western Mediterranean and contribute to a broader understanding of the Bronze and Iron Ages populations in Menorca.

2 THE ISOTOPIC LIFEWAYS OF THE INHABITANTS OF ANCIENT PERGAMON

Abstract author(s): Fernandes, Ricardo (Max Planck Institute for Geoanthropology; Masaryk University; Princeton University) - Coccozza, Carlo (Max Planck Institute for Geoanthropology) - Doğan, Turhan (TÜBİTAK MAM) - Tee-gen, Wolf-Rüdiger (Ludwig-Maximilians-Universität München)

Abstract format: Oral

The ancient Kingdom of Pergamon, located at a strategically advantageous crossroads between East and the West, was under the rule of the Attalid dynasty, of Greek descent. This dynasty was largely responsible for the strong promotion of Hellenistic culture making Pergamon a renowned centre of learning, with a famous library. In 133 BC Pergamon was bequeathed to Rome. Although there were attempts to resist Roman dominion it eventually became an important Roman city by the mid-2nd century AD. The city experienced a decline in the 3rd century when it was badly damaged by an earthquake and attacked by the Goths.

To gain an understanding of the dynamics of human lifeways in the ancient city of Pergamon throughout its history, we conducted a carbon and nitrogen stable isotope study of individual human remains. This technique offers us important insights into the main sources of dietary protein consumed by the ancient inhabitants of Pergamon and is indicative of their socioeconomic status, cultural affiliations, and religious practices. In addition, our analysis included radiocarbon measurements to place human lifeways in their chronological context. In this presentation, we will present the preliminary results of our research.

3 INVESTIGATING HUMAN LIFEWAYS IN THE COLLINE METALLIFERE DISTRICT (TUSCANY, ITALY) WITH A MULTIDISCIPLINARY APPROACH: THE CASE STUDY OF MONTIERI CASTLE

Abstract author(s): Mantile, Noemi (Università degli studi della Campania; Mediterranean bioArchaeological Research Advances - MAREa - centre) - Coccozza, Carlo (Max Planck Institute for GeoAnthropology; Mediterranean bioArchaeological Research Advances - MAREa - centre; Università degli studi della Campania) - di Cicco, Maria Rosa - Altieri, Simona (Università degli studi della Campania; Mediterranean bioArchaeological Research Advances - MAREa - centre) - Tafuri, Mary Anne (Sapienza Università di Roma; Mediterranean bioArchaeological Research Advances - MAREa - centre) - Bianchi, Giovanna (Università di Siena) - Lubritto, Carmine (Università degli studi della Campania; Mediterranean bioArchaeological Research Advances - MAREa - centre)

Abstract format: Oral

Our research aims to investigate potential historical connections between subsistence practices and the emergence and decline of Montieri, a castle settlement located in southern Tuscany, Italy. To this scope, we are utilizing a multidisciplinary approach that incorporates the use of stable isotope carbon and nitrogen analysis, radiocarbon dating, Bayesian modelling, and archaeological evidence.

During the 9th-10th centuries, the construction of fortifications was widespread in Europe and the Mediterranean basin, largely for the purpose of exploiting local resources and maintaining military dominance. An example of this is Montieri, a castle that was built to take advantage of the local silver mines and was under the control of the bishop of Volterra. The castle also had a mint and a parish church dedicated to Saint Niccolò. This latter was in use from the 10th to 14th centuries and the skeletal assemblage from this study was recovered from here. Our dataset contains 61 human individuals and 16 faunal specimens.

Preliminary results suggest that the Montieri population had an agro-pastoral economy, and that there was no evidence of sex-based dietary differences. Additionally, the results indicate a moderate intake of marine resources, which could point to economic activities involving trade with coastal Tuscanian settlements. Given the higher economic value of marine-based proteins in comparison with local terrestrial resources, this could be evidence of a flourishing economy based on silver extraction.

This contribution illustrates the efficacy of utilizing a multidisciplinary approach to deduce historical and economic changes and suggests further research on the interplay between humans and the local environment in the Mediterranean region.

4 DIET AND MOBILITY IN NORTHERN ITALY DURING THE NEOLITHIC THRU MEDIEVAL PERIODS

Abstract author(s): Tykot, Robert - Eck, Christopher (University of South Florida) - Maxwell, Ashley (Washburn University) - Temkina, Anastasiia (University of Kentucky) - Vianello, Andrea (University of South Florida)

Abstract format: Oral

Scientific studies of >300 human skeletal remains in the northern part of Italy have been conducted, providing data on dietary changes over time that may be associated with technological, economic, and/or sociopolitical developments including population movements. Presented here are results of stable isotope analyses from archaeological sites in northern Italy near Rome, Florence, Ravenna, the Po Valley, and in the Veneto, representing the Middle Neolithic, Bronze Age, Roman, and Early Medieval time periods. The research questions addressed are the importance of seafood or freshwater fish in the diet; the introduction of millet, a C4 plant; and mobility from childhood to later life. In addition, analyzing individuals allows comparisons to be made based on age, sex, and status. Carbon, nitrogen, and oxygen isotopes on bones and teeth were obtained using established preparation methods and analyses on stable isotope mass spectrometers. The results, integrated with faunal and floral studies, contribute to our understanding of the diet and mobility of individuals in Northern Italy.

Our results suggest that seafood was rarely a dietary staple, even in coastal zones, despite the extensive maritime travel involved by Roman times. Freshwater fish, however, were important in locations near rivers or lakes. Millet, a C4 plant often considered a low status food source, was of minimal use in the Neolithic, but more widely spread by the Bronze Age, and became a staple in the Late Antique period when there was political instability, migration and invasion of Langobard tribes that also had a traditional high-meat diet including pigs as a staple. One hypothesis tested was whether there was hybridization or segregation of cultural practices, with consistent or variable diets among individuals. Mobility is also examined through comparison of tooth (child) and bone (adult) values, with potential differences between males and females based on marital and/or migration practices.

5 DIET IN THE NEOLITHIC TAVOLIERE (PUGLIA, ITALY) USING STABLE ISOTOPE ANALYSIS OF AMINO ACIDS

Abstract author(s): Soncin, Silvia (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances - MAREa - centre, Sapienza Università di Roma) - Craig, Oliver (BioArCh, Department of Archaeology, University of York) - Talbot, Helen (BioArCh, Department of Archaeology, University of York) - Robb, John (Department of Archaeology, University of Cambridge) - Tafuri, Mary Anne (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances - MAREa - centre, Sapienza Università di Roma)

Abstract format: Oral

There is a general consensus that domesticated plants constituted the staple of early farmer diets in Italy, followed by a certain, but not well defined, portion of animal products and almost a total lack of either freshwater or marine fish. In the past few decades, a number of studies have applied stable isotope analysis (SIA) of bone collagen as direct evidence to either confirm or complement this scenario. However, SIA fails in discriminating well between animal products and cereals. In addition to this, it has been shown that the marine isotopic signal is less distinguishable in the Mediterranean compared to other settings, therefore making it difficult to assess the contribution of this source. Recently, Compound Specific Stable Isotope Analysis of Amino Acids (CSIA-AA) has proven to be successful at better defining the diet across Mediterranean individuals. Here, we apply CSIA-AA to explore dietary habits of Neolithic individuals living in the Apulian Tavoliere, Italy. The individuals analysed come from two middle Neolithic sites, Masseria Candelaro and Passo di Corvo, located approximately 10 km from one another in the Apulian Tavoliere. The Tavoliere is an alluvial plain of northern Puglia south of the Gargano promontory, characterised in the past by extensive wetlands and lagoons with freshwater discharges. Thanks to CSIA-AA, we are able to show that the majority of individuals have predominantly plant based diets, although animal products and fish were more dominant for some individuals, suggesting that the Neolithic diet was more variable than some have suggested. More broadly, we show that CSIA-AA is a powerful tool in disentangling diet-related questions in past Mediterranean contexts.

6 THE EXPLOITATION OF LIGNITE IN THE BRONZE AGE AEGEAN REVEALED THROUGH BIOMOLECULAR ANALYSIS

Abstract author(s): Spiteri, Cynthianne (Dipartimento di Scienze della Vita e Biologia dei Sistemi; Institute for Prehistory, Early History and Medieval Archaeology, Eberhard Karls University Tübingen) - Buckley, Stephen (Department of Archaeology, BioArCh, University of York; Institute for Prehistory, Early History and Medieval Archaeology, Eberhard Karls University Tübingen) - Power, Robert (University College Dublin, School of Archaeology) - Eisenmann, Stefanie (Faculty of Theology, Humboldt Universität zu Berlin) - Fletcher, Joann (Department of Archaeology, University of York) - Hallager, Birgitta (The Swedish Institute at Athens) - Maran, Joseph (Institute for Prehistory, Protohistory and Near Eastern Archaeology, University of Heidelberg) - Andreadaki-Vlazaki, Maria (Excavation House "Sevach") - McGeorge, Photini (The British School at Athens) - Stockhammer, Philipp (Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University Munich; Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

Here we present new data on the earliest archaeometric evidence for the use of lignite (brown coal) in Europe, shedding new light on the use of combustion fuel in the 2nd millennium BCE Eastern Mediterranean. Dental calculus of 67 individuals from several sites in the Aegean, Egypt and the Near East was analysed using Sequential Thermal Desorption/Pyrolysis-Gas Chromatography-Mass Spectrometry and Polarizing Microscopy. We identified scant evidence for the use of combustion markers in the calculus from Egypt, however all other individuals showed clear evidence for the burning of Pinaceae wood, hardwood (e.g. oak and olive), and dung. Significantly, individuals from the Palatial Period at the Mycenaean citadel of Tiryns and the Cretan harbour of Chania showed evidence for the inhalation of smoke from lignite, a thousand years prior to the mention of the use of this resource by Theophrastus (374/369 – 288/285 BC) in his work, *On Stones*. We suggest that lignite was exploited at the time in connection with the manufacture of metals, ceramics and glass, which were important and highly traded resources during the Bronze Age. Significantly, we find evidence for the inhalation of lignite in both males and females, suggesting that both biological sexes were involved in crafts production.

7 GROUPING GROUPERS: USING COLLAGEN PEPTIDE MASS FINGERPRINTING TO DEMONSTRATE 4000 YEARS OF EPINEPHELUS AENEUS ABUNDANCE IN ISKENDERUN BAY, TURKEY

Abstract author(s): Winter, Rachel - de Kock, Willemien (Groningen Institute of Archaeology, University of Groningen) - Mackie, Meaghan (The Globe Institute, University of Copenhagen; School of Archaeology, University College Dublin; Department of Life Sciences and Systems Biology, University of Turin) - Ramsøe, Max (The Globe Institute, University of Copenhagen) - Collins, Matthew (The Globe Institute, University of Copenhagen; McDonald Institute for Archaeological Research, University of Cambridge) - Taurozzi, Alberto (The Globe Institute, University of Copenhagen) - Çakırlar, Canan (Groningen Institute of Archaeology, University of Groningen)

Abstract format: Oral

Groupers are large-bodied, solitary predatory fishes found globally in tropical and subtropical coastal rock reef ecosystems. Within the Mediterranean Sea they are ecologically and commercially important, with high ubiquity in archaeological contexts. There are six species of groupers indigenous to the Mediterranean, with four species belonging to the *Epinephelus* genus. While the dusky grouper, *Epinephelus marginatus*, is the best studied and most emblematic species in the Mediterranean, data regarding species abundance and distribution prior to the commercialised fishing of the 20th century is largely unknown. In this study we have set out to test the viability of using Zooarchaeology by Mass Spectrometry (ZooMS) for intra-genus, species level identifications to inform the past biogeography of Mediterranean groupers. Using LC-MS/MS data, collagen type I amino acid sequences were de novo reconstructed for four *Epinephelus* spp. and subsequently species-specific collagen peptide biomarkers were identified and validated. With these novel biomarkers, we analysed Middle to Late Holocene grouper bones (n=23) from the archaeological site of Kinet Höyük located in the northeastern corner of Iskenderun Bay, Turkey. The successful application of ZooMS revealed a past abundance and dominance of one species, *E. aeneus*, in Iskenderun Bay which is consistent with current grouper species abundance in the region. Due to the small home ranges of groupers, this finding suggests millenia long, local population persistence of *E. aeneus*. Our case study highlights the future potential for species level reconstructions of past fisheries and biogeography in the Mediterranean using ZooMS.

8 INFANT FEEDING PRACTICES AT THE CORE OF THE ROMAN EMPIRE. BAYESIAN INCREMENTAL DENTINE STABLE ISOTOPE ANALYSIS FROM POMPEII AND OSTIA

Abstract author(s): Coccozza, Carlo (Max Planck Institute of GeoAnthropology; Università della Campania) - Lubritto, Carmine (Università della Campania) - Rossi, Paola Francesca (Parco Archeologico di Ostia Antica) - Amoretti, Valeria (Parco Archeologico di Pompei) - Mantile, Noemi - Altieri, Simona - di Cicco, Maria Rosa (Università della Campania) - Tafuri, Mary Anne (Sapienza University of Rome) - Fernandes, Ricardo (Max Planck Institute of Geo-anthropology; Princeton University; Masaryk University)

Abstract format: Oral

The study of infant feeding practices in human lifeways is widespread and variability in exclusive breastfeeding and weaning systems can be attributed to anthropic behaviours. This has enabled delving into cultural traditions and socio-economic strategies, as well as the impact of local resources on the process of nourishing infants. Multiple archaeological, anthropological, and biomolecular techniques have been employed to disclose these practices. One of the most effective was revealed to be stable isotope analysis of dentine increments in combination with Bayesian modelling of data.

In our presentation, we will discuss infant feeding practices at the Roman sites of Pompeii and Ostia investigated using incremental dentine stable carbon and nitrogen isotope analysis. Bayesian modelling of measured data was used to determine dietary shifts during infancy, including the timing for exclusive breastfeeding and the end of weaning. We interpreted obtained results in view of cultural, environmental, social, and biological aspects.

Obtained results suggest that the weaning process in Pompeii and Ostia followed the recommendations of Graeco-Roman physicians, starting around six months and ending at two years of age. Similar results were previously found for Roman Thessaloniki (Greece), although in Bainesse (England) some time-extended weaning processes, up to four or five years of age, were observed. This suggests variability in infant feeding practices within the Roman world and in particular between Mediterranean and northern settlements.

9 ABOUT ISOTOPES, REMAINS, AND CLASSICAL ANTIQUITY: IDENTIFYING DATA GAPS IN MEDITERRANEAN BIOARCHAEOLOGICAL RESEARCH USING THE ISOTÓPIA DATABASE

Abstract author(s): Formichella, Giulia - Soncin, Silvia - Tafuri, Mary Anne (Sapienza University of Rome) - Lubritto, Carmine (Università degli studi della Campania “Luigi Vanvitelli”) - Craig, Oliver (University of York) - Fernandes, Ricardo (Max Planck Institute of Geoanthropology; Princeton University; Masaryk University) - Coccozza, Carlo (Max Planck Institute of Geoanthropology; Ludwig-Maximilians-Universität München; Università degli studi della Campania “Luigi Vanvitelli”)

Abstract format: Oral

Our contribution aims to review potential data gaps in isotopic research for Classical Archaeology through the creation of Isotópia, a database of stable isotope measurements for antiquity. Over the centuries, the legacy of the Greek and Roman civilisations has been studied by generations of antiquaries and historians. Their primary focus was the elite portion of these societies, with research mainly involving historical reconstruction of the gestae of given politicians and the assessment of visible art and monumental remains. In recent decades, a more anthropology-based approach has offered new angles of investigation, such as the application of stable isotope analysis to gain information on subsistence practices and mobility of ‘illiterate’ society, plus novel environmental perspectives.

Large volumes of isotopic data can provide a different research overview at different scales and resolutions. When combined with multidisciplinary sources of evidence (e.g. written documents, archaeological record, etc.), this approach has proven to be highly effective. Furthermore, the collection of isotopic data across a large spatio-temporal span can be used for a meta-analysis of research gaps. Isotópia highlighted where additional isotopic research in Classical archaeology is needed. It was found that there is a striking disparity in the number of faunal and plant specimens compared to human individuals. This review also revealed a main research focus on 5th Century BCE Greece and in Italy and Britain for the Roman imperial period, with isotopic data for other regions such as Gallia, Pannonia, Dacia, North Africa, and Asia Minor being scarce. This is likely due to a combination of current political circumstances and a disproportion of funding interests for certain locations and periods.

A. GLUTAMINE DEAMIDATION RATES OF BONE COLLAGEN AT THREE LATE PLEISTOCENE SITES IN ISTRIA (CROATIA)

Abstract author(s): Vidas, Lia (Centre for Applied Bioanthropology, Institute for Anthropological Research) - Silvestrini, Sara (Department for the Cultural Heritage, University of Bologna) - Lugli, Federico (Department for the Cultural Heritage, University of Bologna) - Sommella, Eduardo - Salviati, Emanuela - Crescenzi, Carlo - Campiglia, Pietro (Department of Pharmacy, University of Salerno) - Janković, Ivor (Centre for Applied Bioanthropology, Institute for Anthropological Research) - Benazzi, Stefano (Department for the Cultural Heritage, University of Bologna)

Abstract format: Poster

In the last decade, palaeoproteomics has been increasingly used in studies of archaeological material, especially for taxonomic identification of highly fragmented faunal assemblages. Yet, the mechanisms of protein conservation, or rather decay, require better understanding. Therefore, the efforts to correlate these processes with posttranslational modifications (PTMs) in protein, most commonly collagen, are under way. Glutamine deamidation is one of the most common PTMs and has been proven to indicate the state of preservation of collagen in osseous tissues. The deamidation of glutamine to glutamic acid results in a mass shift of +0.984 Da that can be calculated from mass spectrometry data, a key step in all proteomic analyses. These do not rely solely on their position in the collagen chain, but also on the age of the tissue, the characteristics of the sediment, microclimate of the site and other taphonomical agents.

In our analysis, we compare glutamine deamidation rates of faunal samples from three Late Pleistocene sites from Istria, Croatia: Romualdova pećina (Middle Palaeolithic cave site), Abri Kontija (early Upper Palaeolithic rockshelter) and Ljubičeva pećina (late Upper Palaeolithic cave site), as a part of the PREHISTRIA project (HRZZ IP-2019-04-7821) and iNEAL Cost Action (CA-19141). Bone collagen was extracted with ammonium bicarbonate and analysed through MALDI-ToF mass spectrometry. By examining glutamine PTMs at these sites and comparing the results with published data, we infer about the influence of site features, antiquity and other taphonomic factors, on the preservation of collagen in bones. This approach can be used as a low-cost prescreening method, helping to plan further biomolecular analyses (aDNA, radiocarbon dating, isotopes etc.) but also be a valuable contribution in understanding protein decay dynamics related to different contexts, periods and diagenetic processes.

327 VARIATIONS ON 'THE ISLAMIC': ALTERNATIVES, RESISTANCE AND CONTESTATION IN ISLAMIC ARCHAEOLOGY

Session theme: 6. Contested Pasts & Presents

Session organisers: Carvajal Lopez, Jose (University of Leicester) - Shingiray, Irina (University of Oxford) - Govantes Edwards, David (Universidad de Cordoba) - Hernandez Robles, Alicia (Universidad de Murcia) - Dikkaya, Fahri (TED University, Ankara)

Session format: Regular session

Islamic societies have been all too often portrayed and analysed from the perspective of orthodoxy, towns and elitism. Groups within Islam that did not participate in mainstream religious practices and beliefs or who lived beyond the networks of interest of urban elites and dominant dynasties are usually considered 'heterodox' and 'outsiders'. Following recent criticism by Shahab Ahmed, the perspective on "what is Islam" needs to be widened to fit the variations on 'the Islamic' within. Islam is not a programme or a set of principles imposed from the top, but a medium and a vocabulary from which the hermeneutical engagement of the believers generates multiple meanings connected by a shared commonality.

In this session we search to shed light on this variation by focussing on processes and communities belonging to 'the Islamic' but working in the margins of, or against established powers and structures. We aim to get to know and to discuss case examples of social groups that contested states and institutions within the Islamic world, that offered alternative or dissident social, economic or religious organisations to those that were hegemonic.

We invite colleagues to present case studies, for example, about groups considered 'heterodox' in their context, and even about non-Muslim groups as long as they expressed their faith in Islamic terms. Another possibility is the analysis of groups weaving alternative forms social organisation to those usually considered 'central' by mainstream approaches: nomads, peasants, gendered groups, ethnic minorities, etc.

This session continues a successful chain of sessions in EAA on Islamic archaeology, where different regions and their connections have been considered in the past.

1 HEADS OR ALTARS: AN ANALYSIS OF SASANIAN RELIGIOUS CULTURE IN EARLY ISLAMIC NUMISMATICS

Abstract author(s): Ouellet, Jonathan (Leiden University)

Abstract format: Oral

The silver coinage of the Sasanian Empire with its iconic shah on the obverse and the fire altar with its priests on the reverse is one of the key pieces of material culture and numismatic data to understanding the economy of the Late Antique and Early Islamic period. The religious nature of the Shah and his fire alter interestingly does not change in the Islamic period until a new coinage is minted entirely under ,Abd al-Malik. It is the intent of this presentation to examine what role religious designs play in the usage of coinage in Central Asia during the fall of the Sasanian Dynasty and the Early Islamic Period. This question will help us in our understanding of religious traditions and economic policies that defined Islam during the period in question. The answers can be found by looking at urban centres such as Bukhara (in modern-day Uzbekistan) which contained a large number of non-Muslims who had to adapt to the emergence of the new power in the region. Examining the coinage from Bukhara during this time period reflects a religious and economic Persian(ate) tradition and shows how coins took a role beyond their monetary value. The coinage of Bukhara also shows an example of how religious imagery can sometimes be modified to suit a new system of governance without being resistive in nature.

2 THE ISLAMIC BAYDHA PROJECT: INVESTIGATING A RURAL ISLAMIC COMMUNITY IN THE HINTERLAND OF PETRA

Abstract author(s): Sinibaldi, Micaela (University of Warsaw; Cardiff University)

Abstract format: Oral

The Islamic Baydha Project, launched in 2014, researches an Islamic-period village in the hinterland of Petra, Jordan. It is a project of archaeological investigation, training and community engagement. Research has revealed what is so far the most extensive evidence of an Islamic community, as well as the only two mosques ever found and excavated in the Petra region until now. The settlement phases associated to the Islamic mosques were preceded by earlier phases of habitation or frequentation of the area; results therefore support the conclusions, already established on the basis of the growing archaeological evidence at the center of the Late Petra Project, that the Petra region was never completely abandoned after the Nabataean and Byzantine periods—contrary to the widespread, traditional narrative, that sees a complete lack of stable settlement in Petra during the Islamic period, only interrupted by a short revival during the Crusader period.

The Islamic settlement at the village, probably consisting of a few hundreds of inhabitants, was built on the structures of the Nabataean and Byzantine periods, but the village would probably have been inhabited by Muslims only from the Middle Islamic period; the majority of the population in the overall region was Christian until well after the Crusaders controlled the area in the 12th century.

The study of stratigraphy suggests that one of the mosques was probably built after the other was damaged by an earthquake. The structure of the rural mosques is extremely simple; both artifacts and architecture offer very scarce material to support an understanding of chronology, connection to the nearby village and ritual, and reveal a very simple life standard and building techniques for the community of worshippers, whose economy was largely based on agriculture.

3 ORDINARY PEOPLE INHABITING THE CITY: INSIGHTS FROM MADINAT QURTUBA'S WESTERN SUBURBS

Abstract author(s): González Gutiérrez, Carmen (University of Córdoba)

Abstract format: Oral

This contribution will present, share and discuss the conceptual and methodological bases of DYĀR: Vivienda y ar-rabal: espacios domésticos e iniciativa privada en un sector occidental de Madīnat Qurṭuba (Universidad de Córdoba). This research project focuses on the archaeological analysis of a particular sector of the former Qurtuba dated roughly in the IX-X centuries, fully and extensively excavated in the last years but barely published yet. The objective is twofold: First, we want to address how life was developed in the neighbourhood after the first Umayyad planning by exploring the relations established between singular infrastructure and facilities for the community -an almunia and a secondary mosque- and dwellings. Secondly, we introduce the gender perspective for a closer examination of the relationship between women -perhaps the most unknown human agent in the creation of the city-, domestic spaces and the activities that they carried out in and outdoors. From these premises, we aim to better understand the

influence and scope of regular individuals in the creation, configuration and modification of urbanism and domestic spaces, as well as clarifying historiographical stereotypes about female activities in houses and in the city. This emphasis on particulars builds towards bottom-top approaches to identify the influence and scope of private initiative in the design and evolution of urban space and to sketch a social profile of the inhabitants of the city beyond the already well-known elites.

4 HOMOGENEISATION, MOVEMENT AND RESISTANCE: CREATING GENDERED ISLAM IN ISLAMIC HOUSEHOLDS

Abstract author(s): Herran Subinas, Mikel (University of Leicester)

Abstract format: Oral

In the study of domestic environments in Islamic Iberia, the courtyard house has often been posited as the model of Islamic living. Based on pre-Islamic Mediterranean models, the courtyard house with a bent-axis entryway is regarded as epitomizing values often associated with Islam such as gender segregation, privacy and control of women (Cañavate Castejón 2012). Yet far from a linear development towards a particular model, the early centuries of Andalusian archaeology are filled with different approaches to domestic life. Moreover, the so-called standard of the courtyard house is not characterized by control, but by mobility and multifunctionality. While specific spaces and the control and segregation of activities may be a symbol through which only some enact their socioeconomic position, in most households, the courtyard, or individual rooms are continuously transformed throughout the day for differing activities and domestic labour. This, however, is not reflective of a lack. The continuous dynamic between the attempts at homogenisation and the lines of flight, the resistance to singular movement enable the house to become the scene for the creation of meanings of Islam, and Islamic livings.

In this paper, I will analyse households in urban contexts that have been classified as courtyard houses. At the crossroads between status and gender, movement allows us to further nuance the landscape of how gender was enacted in the private and often unseen context of the house.

5 ISLAM(S) OF THE HORN OF AFRICA: AN ARCHAEOLOGICAL APPROACH TO DIFFERENT ISLAMIC MATERIAL EXPRESSIONS AND SPACES IN MEDIEVAL PERIOD

Abstract author(s): Gómez, Carolina (Incipit - Institute of Heritage Sciences)

Abstract format: Oral

Islam first arrived in the Horn of Africa around the 10th century and expanded throughout the region through several routes. One of these axes run north-south through Ethiopia and branches out and extends into other neighbouring areas of the Horn of Africa. This process gave birth to a series of sultanates that will be the ultimate expression of the establishment and adoption of Islam in the region. However, although a particular 'form' of Islam emanates from these sultanates, the implementation and development of Islam in the Horn of Africa was a disparate and diverse process. Thus, different human groups, in different regions and over several centuries, expressed the principles of Islam through different religious traditions, ways of professing the faith and even new and different material expressions. This paper aims to provide an archaeological approach and analysis of case studies in which these various expressions of the new faith are reflected in the materiality of the medieval Muslim Horn of Africa. It will analyse spaces in which structures, funerary elements and objects of material culture express the adoption and incorporation of Islam into the culture and beliefs of the inhabitants of the region while, at the same time, they are also symbols of the non-complete rupture with previous traditions, giving rise to expressions that are not conceived as orthodox of the new Muslim faith that has recently arrived in Africa.

6 FROM "BAD" CHRISTIAN TO "BAD" MUSLIM. RELIGIOUS CONVERSION TO ISLAM AT TUNGUL (OLD DONGOLA), SUDAN IN THE 14TH-18TH CENTURY

Abstract author(s): Obluski, Artur (Polish Centre of Mediterranean Archaeology, University of Warsaw)

Abstract format: Oral

The presentation is a case study of conversion of once Christian community of Tungul, the capital city of Makuria to Islam marked also by the collapse of Makurian state. The official date of conversion is placed in year 1317, when the first Muslim king established a mosque in a prominent building in the city. Yet, Gullam Allah, one of the first Islamic missionaries to the region, noticed in the late 14th/beginning of the 15th century that the Muslim community of Tungul "was in extreme perplexity and error". The presentation will narrate the process of conversion to Islam which took place in the shade of Muslim Egypt which converted seven centuries earlier and which installed the first Muslim ruler over the Nubians. How this process unfolded in Tungul; what were the factors and forces shaping the Islam in the city. The main question would be however what was the nature of Islam at the fringes of the Muslim world but still so close to the holy cities.

7 RURAL POTTERS AND THEIR WORKSHOPS IN OTTOMAN CYPRUS: RESISTING A CHANGE

Abstract author(s): Živkovic, Jelena (The Cyprus Institute)

Abstract format: Oral

The Ottoman conquest of Cyprus in 1571 exposed the island's population to institutions of an Islamic state. This change mostly affected major urban centres and the Orthodox church while the majority of population that lived in villages remained on margins of this new political network. The extent of their interaction with an Islamic state is vague, but it is known that they paid taxes and followed socio-economic regulations. This paper discusses the agency of rural potters who belonged to the community that was marginalised by both class and religion. It focuses on two rural ceramic production centres in Cyprus that showed conservatism in technological approaches and repertoire of vessels throughout the Ottoman period (the 16th-19th centuries). The presented data came from the archaeological study of three assemblages as well as the scientific assessment of over 300 samples. The scientific approach included petrographic and chemical analyses of ceramics, slips and glazes that aimed to reconstruct the production technologies and traditions of pottery making. The dynamic of rural ceramic workshops will be compared to other archaeological contexts, such as urban centres and monasteries, for the demonstration of differences.

8 A BEKTASHI DERVISH HERDER IN THE UPLANDS OF ORTHODOX ZAGORI (NW GREECE, 19TH C.): BETWEEN THE SELF AND THE OTHER

Abstract author(s): Moudopoulos-Athanasίου, Faidon (Catalan Institute for Classical Archaeology)

Abstract format: Oral

This contribution offers an insight into the phenomenon of religious coexistence in the Ottoman-era Balkans, through a combined investigation of textual evidence, survey and archaeological ethnography. It tells the story of Hasan Baba, a Bektashi dervish herder whose activities are recorded in the archives of Koukouli, a Christian village in Zagori (NW Greece). The documents reveal the interest of Hasan Baba to build a small 'mansion' (koulia) in the summer pasture he rented from the community. It describes the reluctance of the Christian community, fearing that this action would lead to the seizure of the land by the Bektashi herder. The archive offers a 'plot twist' when Hasan Baba promises to the community that he is building the 'mansion' only for his spirit and personal joy. Upon his retirement from the mountain, Hasan left the structure as an endowment (vakf) to the village church: any herder subsequently renting the summer pasture would have to pay extra to the church, to light the candle of Virgin Mary.

Recent scholarship has revealed instances of coexistence between Christian and (heterodox) Muslim communities in the Ottoman Balkans, in the shape mostly of shared sacred spaces. The time is ripe to consider the footprint of these practices in the broader archaeological 'record' of Ottoman-era Balkans. Recently, the remains of the small 'mansion' were located alongside the 'fountain of Baba', in the highland plateaus of Zagori, following an extensive archaeological survey. This endeavour was followed by ethnographic investigations into two different ethnolocal groups of Zagori: the last Sarakatsani pastoralists residing in the mountain and the Kostas Lazaridis Zagorisan archive.

This contribution places the 'mansion' and its surrounding landscape at the core, considering it as a factor uniting textual and ethnographic evidence, assisting in the investigation of the material traces of the other.

9 THE PERMEABILITY OF THE BOUNDARIES: THE ARCHAEOLOGY OF THE ANATOLIAN BEKTASHI-ALEVI ISLAM

Abstract author(s): Dikkaya, Fahri (TED University)

Abstract format: Oral

The Bektashi-Alevi tradition in Anatolia is unique in its unusually heterodox character. In fact, Bektashi-Alevi contexts are identified often through the co-presence of Anatolian and Central Asian shamanistic symbols along with local Christian iconography within the context of Anatolian Islam. This heterodox relationship that emerged in the 13th century still preserves its exclusive and connective nature in our common era. Elements from different systems of belief come to light in the material culture within the same physical space of Bektashi-Alevi contexts. These contexts vary in nature. While some are built environments of worship, others are burial shrines (türbe). Natural, historical and even archaeological contexts were used and reused as places of worship. This continuity exists similarly in a wide range of areas, from Cappadocia to Konya in central Anatolia and even to Uşak in western Turkey. This paper will focus on this particular heterodoxy in its unique Islamic context highlighted by the remains of material culture, architecture and places for worship in both built environments and in nature. An archaeological survey will greatly contribute to our understanding of current state of Islam in Anatolia, which is in fact far from homogenous.

10 ISLAM IN THE “LAND OF DARKNESS”: NOMADIC COSMOPOLITANISM IN THE NORTHERN CASPIAN REGION (10TH CENTURY)

Abstract author(s): Shingiray, Irina (University of Oxford)

Abstract format: Oral

By the 10th century, Islam was spreading among the inhabitants of the North Caspian Lowland, and further north, among the Khazar, the Oghuz, the Bulghar nomads and other people of the steppe and forest-steppe regions. Under the influence of Islam, sacred and popular Islamic geography and lore were also transplanted to those northern territories—often known as the “Land of Darkness.” Their inhabitants adopted Islamic beliefs and practices on their own terms based on their own interpretations of the religion—the ways more suited to mobile nomadic lifestyles. The nomads’ outlook on Islam often provoked derogatory comments among the traditionalist literati from the Islamic heartlands, who either refused to accept nomads as Muslims (calling them polytheists) or denigrated them as being people of extremism, innovations, and infirm believers. Few extant written records mention nomadic Islam, and those that do are rife with such prejudices. Thus, archaeology plays a paramount role in understanding nomadic Islam in the Caspian Steppe; it often presents the sole path to uncovering individual and collective Muslim lives (and deaths) as they can be reconstructed from material remains of that time period from the distant northern frontier of Islam. This paper explores the nature of nomadic Islam by weaving together narratives and material culture derived from burials, landscape studies, personal objects, and materials of exchange. The paper also focuses on issues of nomadic contestation and cosmopolitanism with regard to Islamic views and practices in the Northern Caspian region and their long-term influences on the rest of the Islamic world.

11 CULTURAL CODE OF THE MAUSOLEUM OF JOCHI KHAN IN CENTRAL KAZAKHSTAN

Abstract author(s): Usmanova, Emma (Buketov Karaganda State University) - Panyushkina, Irina (Laboratory of Tree-Ring Research, University of Arizona) - Uskenbay, Kanat («Institute for Humanitarian Studies ABDI» LLP) - Kozha, Mukhtar (Scientific Research Institute of Archeology of the International Kazakh-Turkish University H.A. Yasavi) - Gyul, Elmira (The Fine Arts Institute of Academy of Sciences of Republic of Uzbekistan)

Abstract format: Oral

The mausoleum as a burial complex is a cultural phenomenon that communicates in time. Its existence demonstrates the emerging priorities of the religious behavior of the Golden Horde population entering the Islamic culture. This monument contains rituals and material signs-symbols denoting the collective memory and behavior of the people of past societies. Folklore designates the mausoleum as the burial place of Jochi, the eldest son of Genghis Khan, who died in 1225. In 1946, archaeological excavation of the mausoleum uncovered two burials completed with clay slabs and wooden boxes. Grave goods, human and animal bones were disturbed by robbers. 14C dating of wood collected from the mausoleum building outlined two construction phases in the late-13th and mid-14th centuries. 14C date of burial-1 plank (mid-13th century) happened to be older than the building, yet after Jochi’s death. The mausoleum architecture depicts the iconic code of Islam. Yet architectural features such as the double dome, 17-ray star-shaped drum, blue glaze of tiles, green ceramic pommel with shaped bull horns, white ganch on interior bricks are unique in Central Kazakhstan. The blue-green-white color code known in pre-Islamic culture became the main code in the architecture of Islam, its „typescript“. We contemplate that the blue dome with a green pommel is manifesting the status of the buried person: a bearer of Islam among nomads and a descendant of Jochi. Beside that the mausoleum includes the elements of pre-Islamic code. Animal bones, a camel skull from the burials, and the symbol of the bull horns reflect the pre-Islamic outlook. This is the code of collective memory for the mausoleum built in the pre-Islamic landscape of the Great Steppe. Therefore, the cultural code of the mausoleum manifests an amalgam of the pre-Islamic and Islamic religious traits of the Golden Horde population who embraced Islam.

12 THE ROLE OF KHANQAH ARCHAEOLOGY IN THE STUDY OF KHALWATIYYA SUFI CENTERS IN AZERBAIJAN

Abstract author(s): Khalilli, Fariz (The Institute of Archaeology, Ethnography and Anthropology of Azerbaijan National Academy of Sciences)

Abstract format: Oral

Khanqah archaeology is one of the important directions of Islamic archaeology. A large number of Sufi khanqahs in the world and in Azerbaijan have been destroyed and turned into ruins due to the influence of natural and human factors. During the Soviet period, the communist regime in Azerbaijan created atheist societies and destroyed most religious monuments. Although these acts of vandalism hurt the Islamic heritage, the number of believers increased precisely because of the conversion of such destroyed khanqahs into sacred places.

Our expedition, which is currently engaged in Khanqah archaeology under the guidance of Prof. Dr. Gafar Jabiyev, identifies the remains of hermitage houses and carries out excavations there. Research was conducted in 2013–2014

in Shikhmazid Khanqah (Aghsu city), in 2018 around the tomb of Sheikh Dursun (Aghsu city), in 2019–2021 in Sheikh Mohammad Khanqah (Basgal settlement), in 2020 in the tomb of Pir Omar Avakhili Shirvani, the founder of the Khalwatiyya sect (Avakhil village, Shamakhi region), and in the Kelekhana tomb complex (Kelekhana village, Shamakhi region) in 2022.

As a result of the archaeological excavations conducted in the remains of khanqahs, a large number of material and cultural samples related to the creation, formation, and spread of the Khalwatiyya sect have been revealed. The obtained examples allow to conduct a comparative study with Khalwatiyya centers in different parts of the world and to present new objects of religious tourism.

In this lecture, the latest scientific results of Khanqah archaeology in Azerbaijan, their generalizations, and comparative analyses will be discussed.

331 THE EXPERIENCE OF STONE: MATERIALITY, LANDSCAPE, EXPRESSION

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: D'Alisera, Alexander (Boston College) - Cowart-Smith, Christina (Durham University)

Session format: Regular session

Stone is a durable, lasting medium. Even in its fragmentation, it exudes permanence, solidity, and symbolism. For millennia, humans have shaped stone, fashioning it into architectural wonders, sculptured monuments, objects of lived religion, and things of everyday use. At the same time, natural stonescapes, from caves and mountains to canyons and valleys, have played indisputable roles in the shaping of human experience and expression. Natural and hewn stone has long been used, reused, repurposed, and recycled in myriad contexts, at local, regional, and global levels. To this end, this session explores human relationships to stone from both historical and archaeological perspectives. It invites scholars of all time periods and geographies, but especially those working from the prehistoric to the medieval periods, to contribute papers exploring the experience of stone. Possible subjects include, but are not limited to: stone and the landscape; a phenomenology of stone; agentive stone; stone and lived religion; the theology of stone; the materiality of stone; the reuse of hewn or sculptured stone; the relationship of stone artifacts to ecofacts; stone and memory; or, shaping stone into space. Above all else, this session seeks to open a dialogue between eras, disciplines, methodologies, and geographies, with the particular aim of bringing archaeologists and historians into further conversation with one another.

ABSTRACTS

1 STONE-COVERED HILLOCKS AND STONES AS BEARERS OF MEANING IN PREHISTORIC WORLDVIEWS

Abstract author(s): Lönn, Marianne (Retired)

Abstract format: Oral

In my research on what we call stone-covered hillocks I have come to wonder if not stone in itself - stones, blocks, hillocks - are bearers of meaning in at least some prehistoric worldviews.

On the Swedish west coast there are some strange monuments, hillocks clad in stones and sometimes blocks. Every crevice, every depression is filled with stones and around some of the hillocks is a brim of stones. These constructions can be of considerable size, the largest is 60x40 meters including the brim. It seems like people has remodeled the hillock and made it smoother and rounder. On this hillock and stone-packing are graves, a house-foundation, heaps of fire-cracked stones, hearths, postholes, possible votive sites and some more. At the highest part of the hillock a grave-like cairn is built. There are no traces of a burial though, just a depression filled with sand, earth and stones made into a top. Among the stones in the packing are different finds, mostly flint and ceramics. This construction has been in use from around 1000 BC to AD 500, i.e., 1500 years. There are all together nine sites like this in the area of investigation, all looking different but all having manmade stone-packings on or at a hillock or mountainside in common. The stone-clad hillocks are interpreted as cultic sites even though some of them look like cemeteries.

In the area of investigation there are also graves, cairns, built in the same way but on higher mountains. Often all crevices around the grave are filled with stones.

The easy access to stones in the area might explain the common use of stones, but it does not explain the way these constructions are formed.

2 BEHAVIOURAL PATTERNS OF FLINT PROCUREMENT IN SOUTH-EASTERN ITALY DURING LATE PREHISTORY

Abstract author(s): Vilmercati, Melissa (Sapienza - University of Rome)

Abstract format: Oral

South-Eastern Italy is a pivotal case-study for the understanding of lithic procurement during Late Prehistory, due to the presence of high quality flint sources, among which stands out the one of the Gargano Promontory. This latter geological formation is located in Apulia and, together with the Tavoliere plain, characterise the northern area of the region. Since its high quality, Gargano flint circulated throughout Southern and Central Italy and on the opposite side of the Adriatic. Prehistoric human groups exploited this flint source through the excavation of at least twenty mining sites from the Early Neolithic to the Early Bronze Age. Starting from this latter period, a significant change in the raw material procurement strategies occurred: the mines were not active anymore, so flint wasn't collected by quarrying, but picked up in secondary deposits.

This presentation aims at reconstructing the phenomenon of flint procurement in South-Eastern Italy by taking into account a specific case-study: the North-Eastern Apulia region, encompassing the Gargano promontory and the Tavoliere plain. The study will be carried out in a diachronic perspective to overview the changes in flint procurement strategies between the Neolithic (6th mill. BC) and the Bronze Age (2nd mill. BC). The main questions to be answered are: what was the relationship between human groups living at a close range from the Promontory and its flint sources? How this interaction affected both the economic strategies of the communities and the Gargano stones-cape? How this relationship changed through time with the emerging of new materials and technologies?

The main objective of this paper is to highlight the importance of the study of stone raw material in archaeological contexts for a global reconstruction of the behavioural patterns of past societies.

3 SACRED STONES IN THE NEGEV AND SINAI DESERT: THE BIBLICAL MAŞŞEBOTH

Abstract author(s): Avner, Uzi (The Dead Sea-Arava Science Center and The Negev Rock Art Center)

Abstract format: Oral

The Negev and Sinai deserts are extremely rich with prehistoric and later cult sites. Hundreds of them, of various types, are presently recorded, including over 450 shrines with standing stones (maşşeboth); 20 shrines have been excavated.

The desert maşşeboth are natural, unshaped stones of various sizes, set up as singles or in groups of repeating numbers (2, 3, 5, 7, 9 and groups of many). They first appeared ca. 11000 BC, they became prevalent from ca. 7000 BC, while in the fertile lands of the Near East they became common only after 2000 BC. Two principle types of maşşeboth can be distinguished, based on the stones' setting (numbers in groups, relative sizes and proportions), on written sources and anthropological studies. One represented deities, another- the ancestors. Study of the maşşeboth illuminates four main points:

1. The desert maşşeboth present a specific theology, avoiding figurative representation of the gods. This principle is eloquently worded later in the Bible (Exodus 20:21).
2. The repeating numbers of maşşeboth groups are directly paralleled by numbers of deities in groups across the ancient NE, as known from figurative art and from texts. Therefore, it is suggested that the desert maşşeboth represented a complex and hierarchic pantheon, as early as the 7000 BC, while in the fertile zones a complex pantheon appeared much later.
3. Maşşeboth were originally a desert cultural element, that later spread to the fertile NE. This implies that the desert people, although inferior in material culture, had the power to influence the peoples of the sown-lands in the spiritual sphere.
4. The Bible often condemns the cult of maşşeboth in Iron Age Israel. However, a careful examination of the biblical texts, inscriptions and archaeological remains, demonstrates that they were actually common, and even represented the Israelite deities, Yhwh and Asherah.

4 READING PICTISH STONES AS THEOLOGICAL SYMBOLS: SYMBOL FREQUENCIES ON CROSS STONES AND CHRISTIAN USES OF PICTISH SYMBOLS

Abstract author(s): Osborn, Sam (Boston University)

Abstract format: Oral

Among the fifty to sixty distinct ideograms carved on over 300 Pictish stones and stone fragments, the cross is the third most common symbol. The cross – of obvious Christian theological significance – tends to be underemphasized in Pictish symbol analysis because it is neither regionally unique, nor does it excite the same mysteries of untranslatability that the other ideograms present. This paper argues that the near-ubiquity of the cross in the Pictish symbolic

lexicon allows us to position the other symbols, and their interpretation, in a distinctly theological context. Comparisons of symbol frequencies on Pictish stones show that the ideograms were not only compatible with Christian religious artwork, but also descriptive of unique modes of material religious authority during and after the Christianization of the Picts. Furthermore, rates of use on stones with and without Christian iconography show that there is little adjustment in ideogram information as these symbols are appropriated by artists newly engaging with Christian imagery. Far from being regional accessories to Christian iconography, these symbols, and the mysterious information they contain, should be read as participating in the distinct theologies of their context.

5 THEOLOGY, STONE, ROCK AND RELIGIOUS PRACTICE IN THE ROCK MONASTERY OF ST PEDRO DE ROCAS. HIEROPHANY OF A NATURAL LANDSCAPE

Abstract author(s): Figueiras Pimetel, Natalia (Universidad Complutense de Madrid) - López Quiroga, Jorge (Universidad Autónoma de Madrid)

Abstract format: Oral

The monasteries of the first Christian communities, notably the hermitage sites, established an indissoluble relationship between mountain and ascetic life, rock and worship, nature and religious practice, stone and death, the interior of the rock and the idea of the Resurrection. From the time of the Essenes, in the caves of the Judean Desert, to the sites of monasteries such as Sinai, we find a complex and broad symbolic meaning that sinks its roots in the first Hebrew communities and the Judeo-Christian tradition, acquiring a series of meanings derived from contemporary theological approaches and religious practice associated with these natural elements. The rock and the mountain are materials that confirm the strictest theophany and show the hierophanic reality of what they represent as a manifestation of the sacred. In the northwest of the Iberian Peninsula is located the rupestrian monastic complex of St Pedro de Rocas, a hermitage from the 6th century that maintained the practice of anchoretic life until the Modern Age. The settlement of the first hermit monks is determined by the unique landscape existing in the surrounding mountain systems. Its topography, morphological characteristics and the monumentality of the granitic ridges showed an evocative appearance and similar to the sacred mountains described in the Old Testament, as well as to the places of origin of the first hermits in the form of slender and conical peaks. This mountainous complex is located very close to Via XVIII of the Antonino Itinerary, allowing accessibility to this rocky landscape, something that was maintained throughout Late Antiquity and the Middle Ages. The hermits established in this place a direct relationship between the natural landscape and its transformation, forming the rock at the same time a space for habitation, worship and prayer. A perfect symbiosis between matter (the rock), theology, death and resurrection

6 LIVING WITH STONE AT VIGGBYHOLM

Abstract author(s): McGinnis, Meghan (Stockholm University)

Abstract format: Oral

In the summer of 2020 contract excavations at the site of Viggbyholm, in Täby parish north of Stockholm, brought to light the remains of an ancient settlement located on what had once been a wooded height overlooking a cove of the Baltic Sea. A settlement consisting of a sizeable farmstead, encompassing an array of dwellings, outbuildings, and workshop areas which had evolved and expanded from the time of the first signs of habitation in the Migration Period until the site was finally abandoned at some point during the Viking Age. The buildings, artifacts, and ecofacts uncovered at Viggbyholm provide a wealth of information for any archaeologist interested in investigating any number of aspects of the lived experiences of the people who resided and worked there over the course of these several hundred years of activity. In this paper, I will concentrate on discussing just one of these -- how varied experiences of stone clearly formed an enduring, important, but also everyday part of the landscape of lived religion at this late Scandinavian Iron Age settlement. In particular, I will be exploring both the differences and striking similarities evidenced in a series of contemporaneous ritual practices centered on a constructed stone altar (or harg) at the center of the settlement, and a natural stone mountain at its edge. And in turn what these practices reveal about relational interactions weaving together stone, metal, and human bodies, the connections between 'Norse' and 'Saami' practice, and the centrality of special stone places as a facet of late Iron Age lived religions deserving of more scholarly attention.

7 DEER, STONE, AND DEATH-LIFE SIMULTANEITY AT EARLY MEDIEVAL DOG HOLE CAVE

Abstract author(s): D'Alisera, Alexander (Boston College)

Abstract format: Oral

Dog Hole, a vertical cave in Cumbria, contains extensive archaeological evidence for human use from at least the late Iron Age to the medieval period. The Romano-British layers—containing myriad adult, neonate, and fetal burials alongside animals and extensive material culture—have drawn the most recent scholarly focus. However, the cave also contains evidence for early medieval human presence, including deer antlers that have been radiocarbon dated between 881 and 1013 CE. These deer antlers were discovered atop the late Romano-British burial site in the cave's

main chamber, and the implications of this early medieval deposition remain profoundly underexplored. I thus begin this paper by contextualizing deer antlers within the broader lifeways of early medieval Britain. Drawing upon evidence from both the material and literary records, I argue that deer antlers carried connotations of death-life simultaneity and liminal guardianship, making them ideal ritual objects to place among the stones of an ancient burial site. I conclude that, like Sculptor's Cave in Scotland, Dog Hole's dangerous geomorphology and remote location would have played a significant role in the cave's attraction as a locus of ritual behavior well into the middle ages. By exploring this early medieval deer antler deposition in its archeological, historical, environmental, and phenomenological context, I seek to demonstrate new ways in which scholars may explore underground ritual practice in times and places often considered inaccessible by single-discipline approaches.

8 STONES FOR THE DEAD: VARIETIES OF RELIGIOUS EXPERIENCE IN THE DEATH RITUALS OF EARLY MEDIEVAL ENGLAND

Abstract author(s): Mason, Austin (Carleton College)

Abstract format: Oral

Stones have a strong association with death in many religious traditions, from the rock-cut tombs of the ancient Mediterranean down to modern-day rituals of erecting Christian headstones or leaving visitation stones on Jewish graves. Early medieval England was no exception, even if the religious symbolism of the use of stones in funerary rites can be harder to decipher, since 'mundane' stones have only recently been deemed important enough to warrant detailed analysis in archaeological reports. Where we have good data for the use of stones in burial, it is increasingly clear that people across Britain often chose them carefully and placed them in graves with deliberate intent, whether in sub-Roman or newly converted Christian areas or in communities that followed Celtic or Germanic pagan practices in the chaotic centuries after Roman authority in Britain collapsed c. 410 CE. That purposeful choices lay behind the burial of stones can be inferred from patterns in their placement at several scales, from the regional (in the similarity of practices between different cemeteries), to the local (in their regular distribution within any given cemetery), to the personal (the positioning of stones in relation to individual bodies). Stones incorporated into the death rituals of early medieval England fall into three main categories: 1) structural features used to line the grave before the body was interred, 2) slabs and cairns used to mark the grave after burial, and 3) stones and pebbles placed in close proximity to the deceased, whether over, under, or beside the body. Examining the material makeup and structured positioning of these objects reveals that our inclination to dismiss them as ordinary belies the significance that they encoded in the funerary rite for those who chose to bury with them, and allows us to begin to unpack the symbolic grammar of stone burial.

9 ANCHORING THE PERIPHERAL: STONE AND THE FRONTIER LANDSCAPE OF THE FIFTH TO EIGHTH CENTURY Lothians, SCOTLAND

Abstract author(s): Wiley, Trevor (Boston College)

Abstract format: Oral

The frontier is often conceptualized as mutable, a zone of hybridity and innovation. However, amidst the traditional historical interpretations of the comings and goings of triumphant armies, the landscape has maintained a deeply-written record of human activity, of memory and reuse. At the heart of such landscapes lay stones, which anchor place, invoke memory, and channel movement: Neolithic standing stones, long-cist stone linings, ruined Roman forts and medieval carved monuments. The interaction between human and stone within the frontier forces us to confront the meeting of the timeless and the ephemeral, as people attach new and negotiated meaning to ancient geological reality. This paper explores a case study region along the Firth of Forth to think about how stone – primordial, prehistoric, and contemporary – shaped human interaction with the landscape in the frontier north across several centuries.

The early medieval Lothians, often examined through historical analysis as a zone of raid and conquest dominated by broadly-defined Britons, Bernicians, and Picts, have seen recent fruitful analyses which consider post-colonial material frameworks. Such methodologies, which prioritize questions of adaptation and complex identity, have the potential to restore agency to the peoples who lived along the early medieval Forth. This paper turns these questions toward the broad stone corpus of the Lothians, and explores how such ancient geological artifacts were viewed, carved, moved and buried to express peripherality and centrality in an ever-changing world. Ultimately, I argue that the changing use of various types of stone within this period can give us a glimpse into changing concepts of the Lothians' peripherality in the crucial period between the decline of Roman military frontiers and the advent of the Bernician and Verturian kingdoms of the early medieval.

10 **DIVORCED FROM THE LANDSCAPE: COLLECTIONS OF EX SITU EARLY MEDIEVAL CARVED STONE AND THE RECONSTRUCTION OF POTENTIAL SEEN CONTEXTS**

Abstract author(s): Stoner, Heidi (Canterbury Christ Church University)

Abstract format: Oral

The study of individual monuments versus groups of monuments in the early medieval insular world is fraught when considering the way in which much of the early medieval sculpture is found and displayed today. Sculpture can be found, fragmented, through excavation or built into later churches as either spolia or recycled material. A vast majority of the sculpture is thus found ex situ, these sculptures have been moved, damaged or destroyed, and the sites that likely housed these objects or provided their backdrop have been rebuilt and the landscapes that they might have inhabited have completely changed. Sites that have multiple pieces of sculpture present unique research questions into the viewed context. Were these sculptures displayed together, at what point and how does this landscape of multiple objects at a single site inform how these monuments interact with one and other. This paper will address the seen context of these monuments looking at locations where multiple sculptures might have co-existed within the same viewing experience rather than defining individual objects outside of their immediate context. Moreover, it will address how we study suits of sculpture at sites with a lost context and explore the potential for reconstructing seen context and landscape contexts in the early medieval insular world through an interdisciplinary approach.

11 **TO COME ACROSS A CROSS: CONSIDERING THE SOCIAL AND PHENOMENOLOGICAL IMPLICATIONS OF BRITAIN'S 'HIGH' CROSSES IN LANDSCAPE CONTEXTS**

Abstract author(s): Smith, Christina (Durham University)

Abstract format: Oral

In early medieval Britain, carved stone crosses were found in a variety of environments. Incised crosses were pecked onto natural boulders. Cruciform stones were shaped from blocks of rock. Relief crosses were fashioned onto large upright hewn slabs or carved onto the face of smaller recumbent monuments. These stone crosses played counterpoint to a variety of crosses in other media: cross-carpet folia in manuscripts, processional crosses of wood or metal, and pectoral crosses worn to the grave, to name but a few cross-objects. In the eighth-century, however, the carved stone cross in Britain took on an innovative new form: the 'high' cross. These free-standing, monumental, cruciform stone sculptures—that is, stone crosses in the round—would be erected by communities across the island for the next 500 years.

This paper engages with those fragments in the British 'high' cross corpus which have, or might reasonably have had, landscape findspots. It establishes a data set of such monuments through cross-disciplinary means, relying not just on archaeological data but also historical (textual) and place-name evidence. Cross-bases still in situ in the landscape, as well as fragments which do not come from sculpture assemblages, are particularly considered. From here, the distribution of 'high' crosses in landscape contexts is discussed with an eye to both its chronological and socio-political implications. The paper ends with a selection of case-studies exploring the phenomenological impact of 'high' crosses in a landscape setting.

12 **THE CULT OF HERCULES IN THE CONTEXT OF STONEMASONRY IN ROMAN DALMATIA**

Abstract author(s): Banovac, Ivana (Archaeological museum of Split) - Jadrić-Kučan, Ivana (University of Zadar)

Abstract format: Oral

The cult of Hercules (Heracles) has been worshiped in Croatia since the time of the Greek colonization of the Adriatic coast, as evidenced by archaeological data such as reliefs, altars, inscriptions, statues, etc. During Roman rule, the worship of Hercules increased rapidly, and the main bearers of his cult were Roman soldiers, stonemasons, and workers in quarries. His figure was very often associated with stone carving, which is why we find a large number of finds dedicated to that deity inside the quarries. Namely, Hercules was the most famous mythological hero, the personification of physical strength and endurance, which is why he was considered a kind of protector of stonemasons whose hard work of quarrying and processing stone required the same qualities. Since the Roman soldiers were in charge of overseeing construction and masonry projects, they, apart from the workers, were among those who worshiped him and erected shrines and monuments to him. Monuments of such character in the context of stone carving were found in quarries in Trogir, Salona, and Brač.

13

RECYCLING COLOUR. LAPIDARY PRODUCTION AMONG THE DIAGUITAS FROM NORTH-CENTRAL CHILE (1200-1540 CE)

Abstract author(s): Armstrong, Felipe (Museo Chileno de Arte Precolombino; Universidad Alberto Hurtado; FONDECYT 11221116) - González, Rolando (FONDECYT 11221116)

Abstract format: Oral

During the Late Intermediate Period in North-Central Chile, we have evidence for the emerge of a fully agricultural society, the Diaguitas. These communities have been characterized in detail by previous research, offering information about their economic, social and even political developments, up until the Spanish conquest, and considering their previous incorporation into de Tawantinsuyu or Inca empire.

Despite all the research within this period and for the Diaguita material production (mainly their strikingly decorated pottery), little has been said about their lapidary production. The use of different kinds of stone for the production of body ornaments mainly in the form of beads and pendants has been recorded but not studied, as well as the use of similar stones for producing elaborated spindle whorls. Based on the study of these objects, we can argue that colour was one of the attributes looked after in these stones, but more interestingly, we found evidence of reuse and recycle of stone objects. Some of them seem to have been used by previous populations inhabiting this region prior to the Diaguitas, in the manner of labrets, which were later transformed into beads or pendants.

In this paper we aim at discussing how stone and stone objects presented themselves with specific affordances that made it necessary for the Diaguita to recycle and repair them, considering that they lived in a highly mineral region, with a wide diversity of stone relatively easy to access. Stone, we argue, was one way in which the Diaguita brought colour and memory to their own bodies.

14

POWER AND CONSTRUCTION: ASHLAR MASONRY IN EARLY MEDIEVAL ARCHITECTURE IN THE EBRO BASIN (7TH-10TH CENTURIES)

Abstract author(s): Mias, Nicolas (UPV-EHU)

Abstract format: Oral

The aim of my thesis is to make a social history of power through architecture and building techniques using the Ebro basin in the Early Middle Ages (7th-10th centuries) as a case study. The starting hypothesis is that there is a correlation between the sophistication of building techniques and resources and the different morphologies of local and central powers. For this reason, the aim is to analyse large ashlar architecture in certain urban and rural contexts from a perspective that values forms of social ostentation, production systems and the social value attributed to the different constructions. The specific objectives will be (1) to identify a corpus of buildings relevant to the study of early medieval building techniques; (2) to carry out a detailed and analytical archaeological study using new dating techniques, such as OSL; (3) to analyse the architectural phenomenon from the perspective of operational chains; (4) to study this manifestation of central and local power from the point of view of social history. The interest of this study lies in the fact that the Ebro Valley was a frontier territory between the Andalusian State and feudal political formations during these centuries, where conditions were created for political experimentation and the use of a language of domination that found its maximum expression in architecture. Furthermore, the aim is to compare the use of a prestige architecture made with complex techniques with other territories of the Iberian Peninsula and the Maghreb.

15

A MONUMENT CONSTRUCTED IN STONE FOR ETERNITY: THE SO-CALLED TEMPLES OF "MILLIONS OF YEARS" OF THE EGYPTIAN NEW KINGDOM

Abstract author(s): Chapon, Linda (Équipe Égypte Nilotique et Méditerranéenne - ASM – UMR 5140, University Paul-Valéry Montpellier 3)

Abstract format: Oral

Ancient Egypt is the paradigmatic example of relationship of past societies with stone as a material expressing permanence and solidity. Kind of stone, colour and provenance of the quarry played a key role in the symbolic, ideological, practical and political use of stone. Monumental architecture in stone increase particularly from the beginning of the New Kingdom (ca. 1539-1075 B.C.), when the so-called temples of "millions of years" developed. In this sense, the name of these monuments conveys altogether their materiality, their ideological background and the way they were conceived and perceived. Numerous New Kingdom examples of inscriptions refer to kings having constructed cultic buildings with durable stone to last for eternity.

Furthermore, in Ancient Egypt, natural stonescapes and man-made monuments made of stone combined to create a unique relationship between humans and stone through the prism of religious and ideological concepts. Particularly well explored is the Theban landscape which specific east-west orientation governed monuments and ritual processes. In western Thebes, the stone pyramid was an important geographic and theological reference. During the New

Kingdom, conceptions surrounding the Theban landscape was combined with an inherited use since the Old Kingdom of a conceptual landscape, from real man-made stone pyramids of the Old Kingdom (ca. 2700-2200 B.C.) and Middle Kingdom to the Theban natural pyramid which integrate stone monuments, and in particular tombs and temples of “millions of years”.

We will focus as case study on Western Thebes, exploring how the development of temples of “millions of years” there (but also elsewhere) may have responded to a renewed model and understanding of monumentality, stone and memory. Here the exploration should be two folded: how kingship by means of architecture, decorative programs and statuary made of stone conceived itself and how society perceived or received this monumentality and hence royal performance and memory.

16 **A NATURAL AND ARTIFICIAL SEASCAPE: MATERIALITY AND PHENOMENOLOGY OF COASTAL VOLCANIC ROCKS**

Abstract author(s): Marangou, Christina (Archaeologist)

Abstract format: Oral

In the Northern Aegean Sea, on the western coast of Lemnos island, the Kastro headland has been occupied at least since prehistory, during antiquity and in Medieval till modern times. Besides some impressive natural features and still preserved petroglyphs, volcanic rocks of the peninsula have been hewn into different spaces. According to current research, vestiges still preserved in various sectors and altitudes, as well as surface and subsurface mobile finds, indicate that early human presence in large parts of the seascape would date from the Bronze Age, the Iron Age and the main periods of antiquity. Moreover, the maritime character of this rock-cut seascape is obvious by its geographical location and implied by some carved features, as well as by a number of mobile finds.

It can be presumed that, at the outset, the materiality of rocks as natural forms perceived within the landscape led to their selection, enhancing and shaping them into human spaces, thus modifying the observers' view and relationship to their transformed surroundings. At the same time, utilitarian objectives of some spaces are not always obvious, relative evidence possibly suggesting symbolic patterns, sometimes either attested in other regions, or testified by ancient written sources. It seems meaningful that outstanding rocks on the island also bore significance in much later periods, including in the recent past.

In the framework of an anthropological approach of the archaeology of both natural and anthropogenic places, the paper will consider possible concrete and symbolic/ritual human behaviours and processes within the Kastro rocky spaces and seascape.

17 **CONSTRUCTING MUSAWWARAT ES-SUFRA (SUDAN): THE EXPERIENCE OF STONE FROM MONUMENTAL CEREMONIAL ARCHITECTURE TO EXTRAORDINARY AND EVERYDAY OBJECTS**

Abstract author(s): Kleinitz, Cornelia (Deutsches Archäologisches Institut, KAAK)

Abstract format: Oral

This contribution addresses the experience of stone at Musawwarat es-Sufra (Sudan), a circular valley surrounded by low table mountains, which was once a major ceremonial centre of the ancient Kingdom of Kush. Various facets of using and experiencing stone are currently investigated as part of a multi-sensory study of (indigenous) cult at Musawwarat. Here, the first known (stone-built) temple dedicated to the local gods of the hinterland of the Nile is found as well as the unique, labyrinth-like, building complex of the Great Enclosure. The landscape of the valley was partially shaped by quarrying the sandstone that was used in the numerous monumental structures at the site. The buildings were either decorated with reliefs and architectural sculpture or served as canvases for incised textual and pictorial graffiti. Sandstone was also used for the construction of offering places and the manufacture of offerings, such as figurines. Apart from contemporary worked stone, naturally occurring stone nodules, strangely shaped stones and petrified wood were deposited at offering places together with prehistoric artefacts, such as polished stone axes or 'stone rings'. In contrast to these extraordinary items in temple contexts, a broad range of grinding and crushing tools in the valley of Musawwarat points to the day-to-day lives of local pastoralists. These stone objects are among the few material traces of local pastoralist populations, whose wood-based mobile architecture left little trace in the archaeological record. Current research in collaboration with today's local community at Musawwarat explores the use of stone by pastoralists, allowing us to form a fuller picture of the role(s) of stone in the lives of the people of Musawwarat over time.

18 'SEEING IS BELIEVING' ON THE MOURNE GRANITE DOWNPATRICK HIGH CROSS

Abstract author(s): KING, Michael (Independent)

Abstract format: Oral

Close study of the late 9th/early 10th century Mourne granite Downpatrick High Cross, prior to its conservation and move inside the neighbouring Down County Museum for long-term preservation, resulted in a comprehensive re-evaluation of its scheme of figural carving, and a holistic interpretation of the iconography of the cross, which demonstrates a sophisticated theological plan behind its design and carving. While the east side reveals an abbreviated history of Redemption from the Fall to the Last Judgement, the west side presents five scenes, each with Christ represented centrally, and including six examples of Him being literally recognised, or spiritually seen for who He is, challenging the viewer also to recognise Christ in a similar fashion in order to achieve salvation. The viewer is also challenged to recognise, in the hard and apparently 'eternal' G2 (56 million-year-old) Mourne granite sparkling with quartz inclusions, a radiant jewelled cross, imitating the cross set up by the Emperor Theodosius II in Jerusalem in 418 AD, and as described in the poem 'The Dream of the Rood'. Viewers could also see meaning in the original orientation of the cross, and the heavenward direction of its biblical narratives on both east and west sides. Finally, we, as modern viewers, can gain an insight into how the community saw the stone cross, as encompassing their vision of the history of salvation, through a record of a coffin being processed around the cross prior to Christian burial in the year 1617, a custom still seen to occur around the High Cross at Arboe in the present day.

19 LIFECYCLE OF STONE(S) - ON THE REUSE OF HEWN STONES AS MARKERS OF REMEMBRANCE IN CLASSICAL ANTIQUITY

Abstract author(s): Schwake, Florian (ROOTS - Cluster of Excellence; Christian-Albrechts University Kiel)

Abstract format: Oral

A societies memory and identity are intimately connected with certain sites, objects and places. With his work in the 1980s and 1990s, picking up the torch on collective memory from Maurice Halbwachs, Pierre Nora introduced the notion of *Lieu de mémoire*. This can equally apply to individual components of buildings which may receive a new semantic meaning and change of function by becoming *spolia* in secondary (re-)use. Thus, they can be testimony to the transition or continuity of societies and their identities, thereby functioning as markers and symbols of remembrance. In combining written evidence - inscriptions and literary sources - with the substantial archaeological record this paper aims to examine the visible transformation of the cultural and material environment in Classical Antiquity with a focus on Greece in the Classical and Hellenistic period. Prior to Late Antiquity, the reuse, repurposing, and recycling of hewn stone is scarcely studied and often attributed to purely economic factors. This demands a closer look: Were stones reworked to fulfill a new function or simply translocated? Were architectural pieces (re-)used in different later phases as markers of remembrance or merely used as invisible and unrecognizable elements. If and how might they have been perceived or experienced? These questions will be tackled by presenting two case studies from my PhD project Reuse and Spoliation in Greek Sanctuaries from the 5th to the 2nd century BCE.

20 A TALE OF STONE REMOVAL

Abstract author(s): Cantoni, Maria (University of Birmingham)

Abstract format: Oral

The purpose of this paper is to bring together archeologists, religious scholars, and social scientists to consider stones in their many facets through the common practice of walkscales. My case study on the Apuan Alps aims to highlight the stories stones have traversed: from Bronze Age cave carvings to marble debris, from sacred peaks to extraction sites.

The Apuan Alps are made of marble; the white precious stone that built ancient Rome, the stone carved by Michelangelo and Donatello. The quarries are now anthropocene symbols, revealing ecological disasters and our role on Earth. The auto-ethnographic research is achieved through walking because it is the most effective and direct way of getting out of a motionless postcard scenario, and into a dynamic and complex whole, and photography delimits a piece of land through framing and composition, revealing common patterns among stones and mountains.

Walking functions as a boundary object that allows different actors to discuss the relationships between the interzones in contemporary topographies; between archeological sites and surrounding environment, or the interactions among hikers, pilgrims, and quarry workers. Focusing on walking allows us to understand the liminality between what is found, what is yet to be found, and what is actually there, opening an array of questions. By taking the steps that retrace all the steps that led from sacred monoliths and to contemporary working quarries, we try to decolonize the gaze and can focus on liminality - the intermediate zones as perceptual phenomena of an embodied topography -

21 I SPEAK RUINS. ON MEDIEVAL SCULPTURE AND PERSONAL NARRATIVE

Abstract author(s): Woodcock, Alex (Independent)

Abstract format: Oral

How can we write about the experience of working stone and the sculpture and architecture of the past in an engaging and accessible way? Following my PhD on medieval sculpture I trained as a stonemason and worked at Exeter Cathedral in Devon, England, for six years. It was a jump into a highly practical life that forced me to reassess everything I had studied up to that point. My new perspective as a practitioner put me in an interesting position and I wanted to try and communicate how medieval art, specifically Romanesque sculpture, had led me here.

In 2019 my book *King of Dust: Adventures in Forgotten Sculpture* was published. This wove the history of Romanesque in the southwest of England around my experiences learning to become a stonemason and was my attempt to write a personal, narrative-based, creative non-fiction account of the work that had motivated me for years. In this talk I will explore how I went about writing the book and the challenges of being in your work, as well as the impact that it had, both on me as a writer and on how it was received.

22 SENSORY PERCEPTIONS OF MEGALITHS IN THEIR LANDSCAPE IN NAGALAND

Abstract author(s): Imchen, Shisachila (Independent Researcher)

Abstract format: Oral

The Naga of Nagaland, northeast India, are among the few societies in the world that subscribe to the practice of megalith building in present times. In a number of villages, megaliths dot the landscape: they can be found located next to houses, in the fields, along the footpaths and by the roadside. Megaliths have profound relationships with their makers and to the places in which they are set, their placement the result of careful and strategic consideration by those involved in their installation. They are thus imbued with meanings by the people who build and live with them, and at the same time derive power from their landscape to convey meanings to the people who encounter and engage with them. This paper adopts a phenomenological perspective to explore the interrelationships between the people and the megaliths and their landscape. It demonstrates how the sensory experience of the megaliths and their landscape is a means by which the people transmit meanings and understand the world in which they live.

A. STONE CARVED AND SCULPTED - MENHIRS FROM THE ALGARVE (PORTUGAL) AND THE "DIMPLES"

Abstract author(s): de Oliveira Teixeira, Luisa (Universidade Autónoma de Lisboa)

Abstract format: Poster

Stone is one of the landscape elements that has most stimulated the human imagination. Its origin, texture and colour would have a symbolic value that would determine its selection. Menhirs were carved from the chosen rock, but only a few were chosen to become the support and canvas for a larger work of art. The characteristics (hardness and irregularity) would determine the typology and extension of the engraving. Gestures and memories that reveal knowledge and planning in the selection of raw materials and techniques used in megalithic monuments and iconography. The stone was used by different peoples as an object of worship and ritual. The decorative motif of „dimples“ in open-air rocks, as identified in the menhirs of the region under study and in different cultures, has led to various functional and symbolic interpretations. Numerous ethnographic studies, not only in Portugal but also in other countries, confirm the importance of these marks. The stones containing them are recognised as „fertilising stones“, associated with socio-religious practices and connoted as places of access to the supernatural, subterranean or celestial world, allowing contact with the transcendental.

B. MEMORIES IN STONE - COMMEMORATION OF THE PRIVATE LIFE OF DECEASED WOMEN ON SEPULCHRAL MONUMENTS FROM SALONA

Abstract author(s): Jadric-Kucan, Ivana (University of Zadar) - Banovac, Ivana (Archaeological museum of Split)

Abstract format: Poster

In Roman times, as today, the depictions on sepulchral monuments differed depending on the deceased's social status and their personal wishes. Certain people's lives were filled with various characteristics that their loved ones wanted to show in a picturesque and unique way in the place of their eternal resting place. Thus, individual examples of tombstones, often alongside the portrait of the deceased, contained relief representations that represented their daily life. On this occasion, we have decided to dedicate ourselves to the women whose tombstones, regardless of whether they belonged exclusively to them or to their families, bring exactly such representations and help us unravel interesting things from their lives and the customs of Roman society. These are primarily stelae and sarcophagi with depictions of objects that women used on a daily basis, such as toiletries or tools for spinning wool, but also depictions of animals

in the context of pets. All the monuments come from ancient Salona, once the capital of the Roman province of Dalmatia (today Solin), and date from the 1st to the 4th century.

334 (IN)VISIBLE WOMEN IN HISTORY OF ARCHAEOLOGY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Gutmiedl-Schuemann, Doris - Boesl, Elsbeth (Universität der Bundeswehr München, Historical Institute, project AktArcha) - Mahal, Ammandeep (University of Southampton. Beyond Notability) - Hjørungdal, Tove (University of Gothenburg) - Coltofean-Arizancu, Laura (German Archaeological Institute, Research Cluster 5: History of Archaeology)

Session format: Regular session

Women have always been part of archaeology, but have often remained invisible. Women have constantly contributed to the evolving fields of archaeology and heritage, but their parts often have not been recognised. In this session, we would like to shed some light on the roles of women working in and contributing to archaeology and heritage in the history of archaeology. We would like to discuss these questions:

- Why are some early female archaeologists still known today, while others have been forgotten and just recently rediscovered?
- What roles did women have in the early days of archaeology, and how did they contribute to shaping and developing archaeology and heritage as we know it today?
- Which methods can be used to research the history of women in archaeology?
- What kinds of sources and archives can be used to illuminate/reveal the history and networks of women in archaeology, history and heritage?
- In which archaeological settings and corresponding archives should we search for forgotten female archaeologists?
- How can we harness Digital Humanities methodologies to connect women across sites and organisations?
- How can we best represent women's mobility as archaeologists both nationally and internationally?
- What are the particularities of female archaeologists' research and interpretations of the past?
- Why is it still relevant to study the history of female archaeologists today? Why is this research unequally distributed across Europe?
- How can we communicate our findings to increase women's discoverability?

We welcome papers about individual biographies as well as overviews and comparisons of women and their work in a particular area of archaeology. We are also interested in discussing methods and approaches to research the history of women in archaeology and heritage, and in best-practice examples for communicating women's work in archaeology and heritage to the public.

ABSTRACTS

1 (IN)VISIBLE WOMEN IN HISTORY OF ARCHAEOLOGY: INTRODUCTION TO THE SESSION

Abstract author(s): Gutmiedl-Schuemann, Doris - Bösl, Elsbeth (Universität der Bundeswehr München, Historical Institute) - Mahal, Ammandeep (University of Southampton. Beyond Notability) - Hjørungdal, Tove (University of Gothenburg) - Coltofean-Arizancu, Laura (German Archaeological Institute, Research Cluster 5: History of Archaeology)

Abstract format: Oral

Women have always been part of archaeology, but have often remained invisible. Women have constantly contributed to the evolving fields of archaeology and heritage, but their parts often have not been recognised. In this session, we would like to shed some light on the roles of women working in and contributing to archaeology and heritage in the history of archaeology.

As a starting point for our session, we want to look back on past projects and publications about women in archaeology and heritage as well as on history of research of the discipline. We will highlight past focuses of research on early female archaeologists, and summarize the approaches, methods and tools that had been used so far for this research.

The aim of our introduction is to set a common ground for the upcoming paper and poster presentations as well as the discussions between speakers and participants in this session.

2 A FORGOTTEN ARCHAEOLOGIST: CAROLINE AMY HUTTON

Abstract author(s): Rovira Guardiola, Rosario (Institute of Classical Studies Library)

Abstract format: Oral

When Caroline Amy Hutton died in 1931, the *Journal of Hellenic Studies* published a laudatory obituary in which her role as a scholar, secretary and librarian was praised. Soon after that Hutton was forgotten even by the very institution that she had kept up and running during WWI. A period of crisis during which she held a position that until then had been reserved for men.

The aim of the paper is to revive the role of Hutton as a pioneer in the field of Classical archaeology. Having studied Classics at Girton College, she went on to give lectures at the British Museum where she also wrote a book on terracotta statuettes based on the institution's collections. A discipline that was then still uncharted territory. At the British Museum she also worked along Cecil Smith with whom she co-authored the catalogue of the Wyndham Cook collection. They also worked together at the British School at Athens, editing the *Annual of the British School at Athens*.

Hutton carried on with further administrative positions both at the British School at Athens and the Society for the Promotion of Hellenic Studies, where she collaborated in the running of the library. It was thanks to her that the library continued to be open during WWI and was able to provide one of its most valued services, the postal loans. However, Hutton never abandoned her research and continued to publish articles not only on her expertise, Greek archaeology but also on other topics such as the Wood archive; a invaluable source for the study of the city of Palmyra. Despite her active career and invaluable contributions, Hutton always published under her initials as she was advised very early on that her work would be taken much more seriously if her gender was concealed.

3 ANNA APOSTOLAKI AND THE HISTORY OF FEMALE ARCHAEOLOGY IN 20TH CENTURY GREECE

Abstract author(s): Pateraki, Kleanthi (Freelance Archaeologist)

Abstract format: Oral

The aim of the oral presentation is to highlight the case study of Anna Apostolaki (1881-1958) as a typical example of a "visible", internationally recognized early Greek female archaeologist.

Apostolaki was a celebrated expert in ancient textiles, preservation of ancient patterns and Greek weaving traditions. She was the first woman to direct a museum in Greece, specifically the National Museum of Decorative Arts of Athens (NMDAA) in 1935-1954. She contributed to the emergence of modern museology in the country. She also appears to have been the first woman to conduct archaeological research at a professional level in 20th century Greece. Furthermore, she is considered today as one of the first Greek folklorists.

Attention will be focused on her work in the NMDAA, which she promoted with all the means at her disposal; also, on her work, as a member of the administrative board and curator of the philological department, at the Lyceum Club of Greek Women, whose purpose was to promote Greek culture and preserve Greek customs. In addition, any existing information (e.g. from sources and archives), regarding Apostolaki's contribution to shaping archaeology and heritage in Greece will be presented. Furthermore, her works (essays, catalogues, etc.) that hold a prominent place in the international literature and gave her substantial recognition from the international scientific community will be referred. Moreover, her collaborations with renowned foreign researchers will be mentioned.

4 WOMEN IN ISRAELI ARCHAEOLOGY: BETWEEN HEGEMONY AND MARGINALIZATION

Abstract author(s): Katz, Hayah (Kinneret College on the Sea of Galilee)

Abstract format: Oral

The status of women in archaeology has been discussed broadly, mainly in regard to the USA and England. In contrast, in Israel, this subject has not been dealt with so far. Similarly to other countries, during the second half of the 20th century, most women were engaged in areas of archaeology that were seen as ancillary in that period and which required expertise in specific topics related to material culture (e.g., ceramic analysis as well as expertise in glass and beads). At this time, men conducted large-scale excavations. However, analyzing the main research areas of the women who have engaged in field archaeology indicates a unique phenomenon. The only areas of archaeology that are exceptions in this context are prehistoric research and the study of the Islamic periods, in which women were integrated as archaeologists leading significant excavations from the early 1980s onwards. It seems that this phenomenon must be linked to hegemonic and marginal relations in Israeli archaeology. Hegemonic archaeology deals mainly with the biblical (Bronze and Iron Ages) and classical periods. These periods have occupied and still occupy a central place in the archaeological research taking place in Israel and have gained prominence both among the archaeologists themselves as well as in Israeli society in general. Therefore, due to the fact that the prehistoric and Islamic periods are less „attractive“ in the Israeli research, they allowed women to integrate into this field more easily.

5 THREE WOMEN IN LITHUANIAN ARCHAEOLOGY: LIFE AND WORK ON TWO DIFFERENT SIDES OF THE IRON CURTAIN

Abstract author(s): Valotkiene, Šarune (National Museum of Lithuania)

Abstract format: Oral

The middle of the 20th century was a specific period in Lithuanian archaeology: up until then, the field had been an exclusively male profession. All of a sudden, three female archaeologists emerged—Regina Volkaitė-Kulikauskienė (1916 - 2007), Rimutė Jablonskytė-Rimantienė (1920) and Marija Alseikaitė-Gimbutienė (1921 - 1994). This presentation will explore possible reasons for this abrupt shift.

All of these women were students of Jonas Puzinas, Lithuania's first professional archaeologist. Might this association explain why they were quite suddenly accepted in a male-dominated discipline? Or could the explanation be a simpler matter of timing? What, if any, influence was contributed by the women's liberation movement? And the changing roles of women in the family unit? Or did the fact that all of these women came from families that valued academic pursuits carry additional influence?

In addition to these questions, this presentation will also explore the differences that these women archaeologists experienced while living on two different sides of the Iron Curtain. M. Alseikaitė-Gimbutienė moved to the USA in 1949 and developed her scientific career there, while R. Volkaitė-Kulikauskienė and R. Jablonskytė-Rimantienė remained in soviet-occupied Lithuania and pursued their scientific activities there.

6 THREE PILLARS OF A TRIPOD: A TRIPARTITE CASE OF THE FIRST FEMALE CHINESE ARCHAEOLOGISTS

Abstract author(s): Shi, Yun (Leiden University)

Abstract format: Oral

A British trained archaeologist, a Marxist archaeologist, an epigraphist, who is the first female archaeologist in China? Google search in English and Chinese yields different answers. In fact, there is no straightforward answer to the question. This paper examines three early female Chinese archaeologists:

Zheng Zhenxiang (1929-), internationally renowned for excavating the tomb of Fuhao, the first named and archaeologically attested female individual in China. The curious tale of a modern woman digging up an ancient woman brought her instant fame and made her a poster girl for the Maoist slogan "Women hold up half the sky".

Zeng Zhaoyu (1909-1964), studied archaeology at University College London and later worked at the Nanking Museum under both the Republican and the Communist government. She committed suicide in depression due to political and personal pressure.

You Shou (1906-1994), a traditionally trained epigraphist, paleographer, and calligrapher. She alienated herself from the center of academia at an early age, but resiliently survived various political turmoil over decades.

Their careers and fates are inextricably interwoven with the tumultuous 20th century Chinese history and politics. By comparing their biographies, this paper sheds light on the role of women in archaeology and society at large in 20th century China.

7 WRITING INSTITUTIONAL SEXISM INTO OUR HISTORIES

Abstract author(s): Teather, Anne (Bournemouth University; University of Highlands and Islands) - Pope, Rachel (University of Liverpool)

Abstract format: Oral

We will present on the survival of gender inequalities in the UK archaeology sector across 1990-2020. We will demonstrate how an early equality and diversity agenda (Morris 1992) was systematically dismantled by the late-1990s, and explore the impact of this on women's careers, to the present day. We argue that a refusal to modernise the professional sector in line with legal requirements for women workers' needs, underpins ongoing economic precarity in the sector. We detail the work of those volunteers lobbying for equality, alongside data from the Chartered Institute for Archaeologists' employment surveys, to show how and why many women, often reluctantly, were leaving archaeology in their 30s, in a continual 'leaky pipeline'. We frame this work as institutional ethnographies. We find core issues linked to this 'sector exodus' as a gendering of tasks/under-employment, a lack of support around parenting, and aspects of gendered promotion, leading to pay disparity.

8 INTERVIEWING THE INVISIBLE: A METHODOLOGICAL APPROACH TO KNOW OUR RECENT PAST

Abstract author(s): Zarzuela, Paloma (Universitat Autònoma de Barcelona)

Abstract format: Oral

The history of archaeology is no longer an area of expertise for eminent professors and retired professionals. As a field of study, it is already well established and have made a major contribution to Archaeology as a whole. Consequently, in order to make further progress, it is necessary to continue developing methodologies that allow us to obtain accurate data. In my view, oral history offers numerous advantages to understand the recent past of the discipline, particularly if we pretend to integrate a feminist vision of it. In this communication I explain why interviews are a crucial tool to transcend the traditional narratives about the history of archaeology and go beyond the renowned main characters. The interviews have an inherent vast and so far, unexploited potential. They open a whole range of possibilities for knowing aspects of an individual other than strictly scientific ones. In this sense, the path of a career might be compared to personal events and decisions that affect the professional life of an archaeologist. In the case of women, it is especially relevant as many studies highlight the importance of mentoring, marriage, motherhood, etc. in terms of career development and professional growth. In addition to that, interviewing women might also serve as the due recognition that many female archaeologists do not receive for their (in)visible work.

9 EARLY WOMEN IN PREHISTORIC ARCHAEOLOGY: THE CASE OF BERLIN, 1880S TO 1930S

Abstract author(s): Bösl, Elsbeth - Gutschmiedl-Schumann, Doris (Universität der Bundeswehr)

Abstract format: Oral

Between the 1880s and the 1930s, more women were active in prehistoric archaeology in Berlin than in any other city in Prussia and the German Empire. The earliest women, such as Julie Schlemm (1850-1944) were self-taught, since women were not admitted to regular university studies in Prussia until 1909. The Berlin Society for Anthropology, Ethnology and Prehistory (BGAEU) was their forum, and a place for them to engage in research and science communication. Among the female prehistorians of the following generation such as Elisabeth Bellot (1881-1956) and Gertrud Dorka (1893-1976), were many teachers who trained in volunteer courses lead by prehistorian Albert Kieckbusch at the Märkisches Museum, also located in Berlin. Some of these women went into voluntary archaeological preservation and heritage management, some went later to university, studied and made archaeology their profession. While we present our findings on these exceptional women in their socio-political and historical contexts, we discuss our historical-biographical approach and its limitations and we point to the sources of our research.

10 WOMEN ARCHAEOLOGISTS OF UKRAINE: CONSTRUCTING A NEW PROFESSIONAL IDENTITY

Abstract author(s): Shabelnikova, Irina (Oles Honchar Dnipro national university)

Abstract format: Oral

In modern society the women have a problem of finding a personal identity. This is directly related to the problem of professional self-identification and new professional identification as «women in archaeology». The empowerment of the living space of women led to a search for their own place in the socio-cultural, intellectual and professional sphere in the second half the 20th and 30s of the 20th century. In short, during this period she is creating her own identity. From this point of view, the problem of the appearance of a woman archaeologist, is actual and insufficiently studied. The integration of the «female element» into archaeological science indicates that women began to master an intellectual and professional field atypical for their gender. Because archaeology has long been considered a male-dominated field. This is confirmed by attempts to recreate the life and creative paths of some women archaeologists of this period, such as: P. Uvarova, K. Melnyk-Antonovych, A. Kartsova-Miklasheska, A. Skrylenko, N. Polanska-Vasulenko, V. Kozlovska, I.Fabrytsius, N.Viazmitina, etc. However, it should be noted that the phenomenon of the appearance of the «woman archaeologist» is a prime example of a search and construction of their own professional identity.

The theoretical and methodological basis of the study is the concept of ego-identity statuses by Canadian psychologist J. E. Marcia, which is based on E. Erikson's identity theory. Based on two criteria («occupation» and «ideology»), J. E. Marcia identified and characterized four identity statuses: identity diffusion, moratorium, foreclosure identity, identity achievement. The use of J. E. Marcia's concept of ego-identity in combination with the results of R. Josselson's research gave us the opportunity to highlight the issues, such as: motivation, professional self-identification of women archaeologists and constructing their own identity, as well as to outline the ways of their entry into the archaeological academic community.

11 USING WIKIDATA TO MAKE THE INVISIBLE VISIBLE

Abstract author(s): Mahal, Ammandeep (University of Southampton)

Abstract format: Oral

WikiData enhances discoverability on Google, therefore it is important women are adequately represented on WikiData. Historically few women held salaried professional positions or formal occupations, which are privileged on WikiData, thus how can we integrate women's work effectively?

In October 2021 the Beyond Notability Project team began constructing a WikiBase to record women's work in Archaeology, History and Heritage from 1870-1950. We are using linked open data principles, which are based on triples, to construct statements about women's activities and where relevant link them to WikiData properties. While WikiData properties are useful for reflecting women's work they do not necessarily map onto the full range of women's activities in Archaeology, History and Heritage therefore the team are constructing an ontology that is inclusive and reflects women's activities and networks in a more nuanced way. For example, whilst WikiData already has a property for 'Director of Excavation', the project has created property for 'Member of Excavation' which has enabled us to incorporate more women within the context of archaeological work.

I will present case studies to explore how we can use and add to WikiData properties to represent women's activities and roles in archaeology and beyond. From information in the archive, augmented by research into other primary sources, we are developing detailed entries on women's lives and linking them to organisations and fields of work that demonstrate their public visibility, in their lifetimes. We are also connecting these women to larger databases such as the Archaeological Data Service (ADS) through linked open data. In some cases we have been able to add more detail than was originally available.

Overall, this presentation will explore how we use WikiData as a basis from which to capture women's activities and challenge the value we place on certain forms of formal work.

12 WOMEN IN CROATIAN ARCHAEOLOGY

Abstract author(s): Solter, Ana - Balen, Jacqueline (Archaeological museum in Zagreb)

Abstract format: Oral

Until the middle of the 20th century, there are no records of female archaeologists in Croatia, either professional or amateur. Amateur archaeologists were not an uncommon phenomenon in Croatia. They were usually part of a network of trustees who collected archaeological finds and carried out excavations. During the one hundred years of the existence of this network, all the trustees were men. All Croatian professional archaeologists of the 19th century studied in Vienna until 1896, when the Chair of Classical Archaeology was established at the Faculty of Philosophy of the University in Zagreb. Women were allowed to enrol as full-time students in the fall of 1901. Before World War II, however, there were no women archaeologists employed in Croatia. Women studied archaeology in almost equal numbers to their male counterparts, but could only find employment as teachers in secondary schools. In this presentation we will try to find out the reasons for this lack of female presence in Croatian archaeological history and what caused the rapid and sudden change in the second half of the 20th century.

13 BACK TO THE SECOND ROW: PETROGLYPH ARTIST ERIKA TRAUTMANN BETWEEN RESEARCH AND POLITICS

Abstract author(s): Perschke, Reena (University of Leicester)

Abstract format: Oral

Since its beginning, the historiography of rock art involves mainly male scientists. Female researchers were just painters, drawers, assistants, travel companion, secretaries or "lovers" in field. Naturally, one of the reasons was that women were largely denied access to academic studies. With no formal training, they were left with only a supporting role. Often ignored, however, these women made a significant contribution to the discovery and documentation of rock art.

The life of Erika Trautmann (1897-1968) presents one example of a female researcher which fell into shadows despite an impressive lifetime achievement in active fieldwork. As trained rock art copyist from the Frobenius-Institute (Germany), Trautmann went to several field trips before she successfully managed to get her own expeditions – first from the Frobenius-Institute, since 1938 together with her partner, the classical philologist Franz Altheim, from the so-called "Ahnenerbe". She was the only woman with research projects in this pseudo-scientist national-socialist society of the SS.

Her excellent political connections brought her even foreign travel possibilities during World War II. Trautmann's and Altheim's ideological interpretation of the petroglyphs contributed severely to National-Socialist science. After the end of the war, however, only Altheim was able to continue his career successfully, while Trautmann only received

minor editorial commissions for photographic works. Her life was similar to that of so many women who had to step down into the second row in favor of the returned partners.

What remains of a female scientist's life? Her estate was thrown away after her death, so only her publications as well as her rock art copies and travel reports in the archives survived. Only recently, the new digitalization of her rock art copies, the publication of a biography and some exhibitions from the Frobenius-Institute increase the knowledge of her achievements and pull her back into the light.

14 **VISIBLE WOMEN - THE TRADITION OF SWEDISH FEMALE ARCHAEOLOGISTS IN MEGALITH RESEARCH**

Abstract author(s): Hjorungdal, Tove (Department of archaeology and ancient culture)

Abstract format: Oral

Among Swedish scholars contributing new approaches in megalith investigations, the majority were, and are women. This paper has its background in an anthology chapter I was invited to write on female archaeologists' work in Sweden. The real pioneers among megalith explorers, Professors Lili Kaelas (1919-2007) and Märta Strömberg (1921-2012) are focused. They took up their careers in the 1940s, a time when women not frequently were engaged in paid field work, and often experienced gender biases. Both were, however, salaried from their early careers, and had important positions. Their professional lives were compared and seen on a political and social background. They contributed new methods in field work, in ceramic classifications, and were active in European contexts, but disagreed on vital aspects of megalithic environments.

Iberian archaeologists, Vera Leisner and Philine Kalb seem to have been of importance to subsequent generations of female megalith-explorers. But Kaelas and Strömberg initiated new paths. Their contributions will stay among the standard reference works on megalith contexts. Therefore, an interesting paradox is that to neither of them had the profession of the archaeologist been the dream of their youth.

An overview shows a tradition of female scholars in megalith investigation, comprising construction details, placing the dead, equipment, chronologies, economy, ritual and astronomic aspects, and issues on environment and settlement. Characteristic to the work of present female scholars is a focus on other aspects than the tomb construction itself. This is much due to new scientific methods; frequently developed and improved by themselves. Analyses of equipment in the graves, together with bio-molecular analyses make much of the base for their interpretations. In my Gothenburg environment, female colleagues recently have presented new approaches to chronology and to the use of megalithic graves in a long-time perspective.

15 **WOMEN IN THE ARCHAEOLOGY OF WESTERN CENTRAL SARDINIA**

Abstract author(s): Puddu, Mauro (Ca' Foscari University of Venice)

Abstract format: Oral

Sardinia is an island where the local population is constantly in contact with archaeological features. The women and men of the rural areas in particular are very familiar with the archaeological structures that emerge regularly while they undertake agricultural activities on the fields. While this has brought several men to become renown figures in Sardinia's archaeology (both as professionals and as popular experts of the territory), the same has not happened with women. Some of these women have gone on pursuing their interest in archaeology by studying it and working as archaeologists, others have contributed to the archaeology's safeguard from their stance as active citizens. This paper focuses on a few of those women who contributed to the development of archaeology in Marmilla, the most fertile of the rural regions of Sardinia both now, and in antiquity. This is not only meant to mechanically look for women in the history of Sardinia's archaeology. The aim of this paper is to test if recollecting the fragmented narratives of ancient Sardinia offered by women can contribute to a solid reassessment of the generic colonial paradigm that dominates in the island based on the so-called "fathers of Sardinian archaeology".

Their voices will be heard directly by the audience of this session, as the methodology used in this paper involves sharing the interviews of those protagonists of local archaeology while contextualising them within the gender equality landscape in Italy.

TRACING FEMALE ARCHAEOLOGISTS - (IN)VISIBLE WOMEN IN THE HISTORY OF THE RÖMISCH-GERMANISCHE KOMMISSION (RGK)

Abstract author(s): Rasbach, Gabriele - Hofmann, Kerstin - Schröer, Sandra (RGK - Romano-Germanic Commission DAI)

Abstract format: Oral

The archives of the RGK contain numerous traces of female archaeologists and women involved in archaeology. They appear as former employees, travel fellows, correspondence partners, leaders or collaborators of research projects but also as illustrators and organizers supporting the institute's research. They appear in letters, manuscripts, administration forms and photographs of events and excavations. The diverse range of documents makes the RGK archives a valuable resource for tracing both the visible women in archaeological research and committees as well as those that remained invisible. The biographical information system Propylaeum-VITAE (https://sempub.uni-heidelberg.de/propylaeum_vitae/de) provides a tool to make these women, their associated archival records and other sources like publications more visible. It makes it possible to display scattered holdings and reconstruct the various networks and impact of these women on archaeological research.

Using four women from our archives as examples, we will highlight and explain the different ways in which women are (in)visible in archaeological research: Renate Feubel (1908-1989), a classical archaeologist whose archaeological career ended after her marriage; the art historian Maria Bersu (1902-1989) who was a crucial supporter of her husband Gerhard Bersu's research and was well-known in the research community at the time - but is largely forgotten today; Thea Elisabeth Haevernick (1899-1982), a prehistorian archaeologist who was established in academia but never held a leading position; and Maria Radnoti-Alföldi (1926-2022), who has been visible as a scholar as well as a leader and member in scientific committees. Accordingly she left a wide variety of traces not only in archives but also through numerous publications, her students and their work inspired by her.

SOCIAL NETWORKS AND KNOWLEDGE PRODUCTION: HUNGARIAN FEMALE ARCHAEOLOGISTS AND THE RÖMISCH-GERMANISCHE KOMMISSION IN THE TWENTIETH CENTURY

Abstract author(s): Coltofean-Arizancu, Laura (Archaeology and Gender in Europe - AGE, EAA Community)

Abstract format: Oral

Research devoted to women in archaeology has increased considerably in the last thirty years, confirming the previously unrecognized role they played in the development of the discipline. Most of this research has focused on reconstructing the intellectual biographies of female archaeologists in their socio-political and cultural contexts, with little emphasis on the various networks that they were part of and the roles that these might have had in their archaeological pursuits. This paper examines the social networks – e.g., personal, professional, scientific collaboration networks – in which women archaeologists have engaged. It does so by analyzing the connections between four Hungarian female archaeologists – Éva Bónis (1919-1999), Gizella Erdélyi (1906-1970), Ilona Kovrig (1912-2007), and Amália Mozsolics (1910-1997) – and representatives of the Römisch-Germanische Kommission (RGK, Frankfurt am Main) of the German Archaeological Institute in the twentieth century, based on their correspondence which can be found in the archives of the same institution. The paper discusses the ways in which the links with the RGK supported these women's work and knowledge production, from book exchanges and research stays to publishing and applying interdisciplinary methods and techniques to analyzing archaeological artefacts, as well as the roles and positions of these women in the RGK's own networks and knowledge exchange processes.

INVISIBLE WOMEN OF ROMAN FRONTIER STUDIES: THE STORY OF A PHOTO

Abstract author(s): Ivleva, Tatiana (Newcastle University) - Jones, Rebecca (Heriot-Watt University)

Abstract format: Oral

During the preparation of a publication on the History of the International Congress of Roman Frontier Studies (Limes Congress) to mark its 25th meeting in Nijmegen, Netherlands, we came across a photograph from 1949. The image shows the delegates of the first Congress held in July 1949 in Newcastle-upon-Tyne, UK. Whilst only one female speaker is known to have delivered a paper at that meeting, the photo shows eight more women, which were initially assumed to be the spouses of the delegates because of the Congress's nature as one of military history dominated by male scholars, particularly in the early years. The search to identify these women has turned into discoveries of biographies of many now largely forgotten early female archaeologists engaged in different aspects of Roman frontier research. The women we have been able to identify have nearly all turned out to be professional archaeologists, very prolific writers and, in their heyday, respected members of the academic community, from early career scholars to those in their 60s. Why are they not better known? Why do we know the publications and contributions of many of the men we have identified on the photo, but know less by the women?

In this paper, apart from briefly presenting a few individual biographies of these female trailblazers, we will touch upon their roles in and contributions to the early heavily male dominated Roman frontier research community. We will also present our search methods and strategies, and some of our ambitions for the future to increase the visibility and understanding of the work of these pioneers in our discipline.

19 **ENGENDERING FIELDWORK PRACTICE DURING FRANCO'S DICTATORSHIP: WOMEN AND THE INTERNATIONAL SUMMER COURSES OF AMPURIAS BETWEEN 1947 AND 1975**

Abstract author(s): Santos Retolaza, Marta (MAC Empuries) - Díaz-Andreu, Margarita (ICREA; Universitat de Barcelona) - Hernández Pastor, Elisa (MAC Empuries) - Oliveras Llovera, Carme (Independent researcher)

Abstract format: Oral

In the 19th and early 20th centuries archaeological fieldwork was almost exclusively the preserve of men. At this time field training for the first university students was undertaken on an unofficial basis, and women were not welcome. This obviously had consequences in their disengagement from the networks of influence – the invisible colleges – that were behind many of the new appointments in the discipline. Spain was not an exception: the only women who had been able to undertake fieldwork prior to the Spanish Civil War (1936-1939) had been self-taught (and sufficiently well-off), or had been trained by their relatives. Thus, the acceptance of female students in the International Summer Courses of Ampurias since their creation in 1947, which combined lectures, travelling to visit sites and some excavation training, was key for the future of women in the archaeological profession.

In this article our aim will be to examine in what ways the Ampurias courses made possible for women to become visible in archaeology. We will analyse what happened with the women who had first-hand experience visiting archaeological sites for approximately two weeks, and also had some (initially short) training in excavation techniques from 1947 until 1975, the latter date the year of the end of the dictatorship. Questions that we will endeavour to answer include: from the more than 50 women attending the course in the first decade, a period in which a fascist-style gender ideology predominated, how many of them became professional archaeologists? Was there a difference between the majoritarian Spanish participants and their foreign counterparts, particularly from Italy? What happened with their followers in the ensuing periods of the regime? Did their role change throughout the different periods? Why some of them are still known today, while others have been forgotten? And, finally, what can we learn from rediscovering them?

337 **VISUALISING MOBILITY: BEYOND ARROWS ON MAPS**

Session theme: 6. Contested Pasts & Presents

Session organisers: Kay, Kevin (University of Leicester) - Houghton, Mark (Aarhus University) - McFadyen, Lesley (Birkbeck, University of London)

Session format: Regular session

Archaeological interest in migration, individual mobility, long-distance 'trade' and the spread of technologies has revived in the past decade, bolstered by new scientific techniques. This interest has been accompanied by a distinctive visual language: the production of maps (often at a continental scale or greater) showing the whereabouts of genetic 'peoples' or material 'types', and arrows representing their movements. Many archaeologists are rightly uneasy at the return of such images to the forefront of our narratives, warning of seductive simplicity and ethno-nationalist baggage. What visual tools might serve a more nuanced archaeology of mobility?

This session invites reflections on the link between illustration and conceptualisation in mobility studies, and propositions for better visual practices. We ask whether illustrations have played a role in shaping and confining our narratives: it is easy, for instance, to 'draw a line' between military maps of troop movements and archaeological visions of migration as a violent and masculine affair. It is critical to consider how we open up new imaginative spaces, and we welcome bold papers exploring the possibilities. We are also interested in the other forms of movement – seasonal, circuitous, or slow – which have proven difficult to visualise, and welcome papers contending with illustrating these movements at various scales. Although contributions that assess specific mobility 'events' in prehistory are welcome, we are especially interested in discussing the theory behind (or in) visualisations of mobility. Creative 'spitballing' and experimentation with images are encouraged; polished end-products are optional.

1 USING STRONTIUM BASELINE MAPS TO MODEL AND VISUALISE MOBILITY

Abstract author(s): James, Hannah (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Dalle, Sarah (Department of Archaeology, Ghent University; Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Cheung, Christina (Department of Anthropology, Chinese University of Hong Kong; Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Griffith, Jacob - Gerritzen, Carina - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel)

Abstract format: Oral

Bioavailable strontium baseline maps are critical for interpreting strontium isotope analysis of archaeological materials. Visualisations are crucial for both producing usable forms of this strontium baseline data and for illustrating archaeological mobility patterns, and they need to be flexible and easily adaptable to the various research questions.

The first part of this talk will focus on how to model strontium isotope variation across a landscape (an isoscape), aided by different visualisation techniques. With these different approaches, such as extrapolated surfaces using Empirical Bayesian Kriging with Regression and median per geological unit, how these modelling techniques can greatly influence the predicted isotopic values will also be discussed.

Secondly, using archaeological examples from Corsica and Portugal, this talk will consider how we can use a baseline to first model and then visualise short-term or long distance mobility patterns. Integrating variables such as terrain, soil type, climate details, plant or animal habitat ranges, food preferences and any archaeological evidence of mobility, trade routes or borders, helps limit and guide the probability assessment of potential mobility patterns. Methods such as network analysis will also be used to assist in visualising potential mobility on both an individual and population level.

2 NOMADIC MOBILITY IN NORTHERN QATAR (AND BEYOND). FROM SITE TO TEXTURE AND FROM EXCHANGE TO EXTROVERSION

Abstract author(s): Carvajal Lopez, Jose (University of Leicester)

Abstract format: Oral

This presentation will focus on the results of the Crowded Desert project, a multiperiod survey with excavations in Northern Qatar that ran between 2015 and 2019. The project aimed to document the linkage of nomadic and sedentary communities in an area of 25 km² in the northern part of the Qatari peninsula.

It soon became apparent that traditional concepts of site and mobility could not be applied to research on the nomads, whose conception of the space is not bounded by the same limits as those that we conceive in our modern societies. Interestingly, the research suggests that sedentary groups in Qatar, related to nomads in origin and in social links, share some aspects of this boundlessness.

In the paper I will present two vignettes coming from the research project. The first one relates to the discarding of the concept of site (at least as a basic unit of archaeological understanding of the landscape) and my focus on textures at different scales of time and space. The second vignette will focus on the abandonment of the idea 'finds relates to exchange' and the use instead of sets of material culture to evaluate the 'extroversion' of the groups under study. My use of 'extroversion' in this context is designed to enhance the disposition of the nomads "to direct interest to things and places outside their own groups" (to paraphrase the online definition of the word that can be found in Dictionary.com).

These two vignettes aim to show that mobility of nomads is deeply ingrained in their ontologies, and that it plays an essential role in any process of social change (as I will show when I speak about Islamization).

3 NOTHING TO SEE HERE: MAKING ABSENCE VISIBLE IN NEOLITHIC MOBILITY NARRATIVES

Abstract author(s): Kay, Kevin (University of Leicester)

Abstract format: Oral

The spread of settled farming life is one of the defining debates of Eurasian prehistory. Radically different archaeological positions orbit a common visual core: maps showing the 'first arrival' of farming settlements sweeping across regions and continents. Such images create binary opposition between Neolithic and Mesolithic spaces and lifeways;

extend colonial logic of terra nullius; and draw attention disproportionately to ‘firsts’ and away from longer trajectories of social process. Perhaps more subtly, ‘first arrival’ maps frame the Neolithic as a questions of what is present, where, and when? This experimental paper seeks to inject new concepts and opportunities into the study of Neolithic mobility by inverting the logic of presence. Can we visualise the absences in Neolithic and Mesolithic worlds that set people in motion? What new narratives might arise from letting needs, lacks and deficiencies structure our visual space at various scales? Several experimental visuals, focusing on Turkey and the Aegean, help to reorient visual spaces, and narratives, of Neolithic mobility.

4 DRAWING DRUMADOON

Abstract author(s): McFadyen, Lesley (Birkbeck, University of London) - MacGregor, Gavin (Archaeology Scotland)

Abstract format: Oral

This talk is about a new project located at Drumadoon Farm, Isle of Arran, Scotland that brings together archaeology, art, ecology and geology in group drawing exercises with students. More broadly, it is about drawing our thinking and drawing together. It looks at how we account for patterns of inhabitation in our archaeological drawings, and, in particular, the ebb and flow of these forces with, against, and often in spite of the architecturally bounded. Initially, from walking-drawing through a particular area of the landscape, we explore the relationship between building and not-building in landscapes, and how tensions between the past, present and future of place are revealed. We then gather around a large table on which we roll out a length of paper in order to draw and mark together. The work that follows on from this opens up discussion on how we draw the everyday performance of lively space, and it explores ways in which to value the human and the non-human in landscapes. It is a mark-making process, and a critical way of thinking through drawing, that leads to a different kind of account of memory and place.

5 VISUALISING ANCESTRAL COMMONS: CYCLICAL SEASONAL ENTANGLEMENTS OF HUMANS AND OTHERS

Abstract author(s): Haughton, Mark - Løvschal, Mette (Aarhus University)

Abstract format: Oral

Much of prehistoric life was occupied with repetitive movements and actions – not least the seasonal movement of herds between pastures, often accompanied by significant human and animal collaborators/enablers, and various activities of care, control and craft. Representing such cyclical movement visually is challenging. It is difficult to achieve without rendering the cyclical year in linear time, whereupon cycles of different duration are a particular challenge and eternal time must vanish entirely.

This paper is based in the pastures of prehistoric Denmark. We will attempt to trace the cyclical becomings of people, sheep, cattle, heather and the ancestral dead. Repetitive movement and action forges links between these elements to create landscapes of expected return: the ancestral commons. We explore different ways of representing these cyclical rhythms through a variety of modern (and some not-so-modern) methods – from medieval books of hours to every academic’s favourite American diagram: the Gantt chart. Ultimately, we find that visualising the ancestral commons requires experimenting with different ways of seeing, just as much as different ways of drawing.

338 SETTling WATERSCAPES IN EUROPE II: PREHISTORIC SUBMERGED SITES IN LAKES, BOGS AND RIVERS - PART 1

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Hafner, Albert - Heitz, Caroline (University of Bern) - Pranckėnaitė, Elena (Klaipėda University) - Piqué, Raquel (Universitat Autònoma de Barcelona) - Dworsky, Cyril (Kuratorium Pfahlbauten)

Session format: Regular session

Prehistoric submerged sites in lakes, bogs and rivers of Europe have been intensively studied for more than 150 years. They mark the beginning of settlement archaeology, and wooden architectural elements could be recognized for the first time. Due to the outstanding preservation under waterlogged conditions, prehistoric submerged sites also stand for the dawn of interdisciplinary archaeological research and the positioning of prehistoric archaeology between the humanities and the natural sciences. The first ‘Settling Waterscapes in Europe’ session was successfully organized during the EAA 2016 Annual Meeting at Vilnius, Lithuania. The lectures have been published as volume 1 of the ‘Open Series in Prehistoric Archaeology’ (<https://www.sidestone.com/books/settling-waterscapes-in-europe>). This upcoming session of 2023 can be understood as a follow up discussion that extends and enhances the topic.

Although evidence of submerged prehistoric sites became known early in many regions of Europe, research focused for a long time on the pile dwellings of the Alpine space. These sites have been inscribed as a serial object on the

UNESCO World Heritage List in 2011. It is very encouraging that in the last 20 years research on the phenomenon of submerged sites in lakes, bogs and rivers has intensified in numerous European regions. It thus reveals the amazing diversity of adaptations of settlement activities related to inland water bodies.

The session organizers consider it important to present and discuss new data and hypotheses on the evolution of building structures, settlement patterns, and regional chronologies of waterscapes with clusters of submerged sites in Europe. We especially welcome interdisciplinary contributions that address environmental and economical adaptations to flooding, rising water tables, and other hazards associated with living near water.

ABSTRACTS

1 THE PHYSICAL EFFECTS OF THE REGULATED LAKES ON THE DISCOVERY OF MESOLITHIC SITES IN THE HIGHLANDS OF SOUTHERN NORWAY

Abstract author(s): Sayej, Ghattas - Kutschera, Morten - Bruun, Theodor - Norbakk, Emma (Agder County Council)

Abstract format: Oral

After the melting of the Scandinavian ice shield in the Holocene, the Norwegian coast became visible for the early pioneers around 9200 Cal. BC, and hundreds of Mesolithic and Neolithic sites were discovered along the coastline and the submerged areas. A very little focus was directed toward the less-populated highland and the mountainous areas, particularly around the freshwater lakes.

The dry Norwegian-summer of 2021 and 2022, has led to a shortage of water supply to the freshwater lakes, of which 1200 are regulated as hydropower reservoirs. Some of these lakes were as low as 20 meters below the highest regulated water level. This unique opportunity has uncovered many archaeological sites along the lowest regulated water level. Agder County Council's staff grasp this opportunity and surveyed the shores of three lakes called: "Epte", "Leland" and "Nesper". Dozens of Mesolithic and Neolithic sites were found along the shorelines. These discoveries have given us a new opportunity to find out and document the settlement patterns as well as the movements of these early pioneers. They were well familiar with the harsh inlands' areas and manage to utilise the natural passage between the coastline with its marine resources, and the inlands' area with its freshwater fish and wild games.

This paper will present the results of our new discoveries and will highlight the necessity to cooperate with the hydro-power companies, to rescue the hidden sites which are spread along the shores of the regulated lakes. This opportunity is unique and should be implemented all over the country, in order to be able to document and understand the movement of the early pioneers in the highlands and mountainous regions.

2 CONSTRUCTING CRANNOGS: THE CASE OF ARTIFICIAL ISLAND BUILDING IN NEOLITHIC SCOTLAND

Abstract author(s): Blankshein, Stephanie (University of Southampton)

Abstract format: Oral

Following the remarkable discovery of Swiss pile dwellings in the mid-19th century, antiquarians in Scotland became fixated on the curious artificial islands, or crannogs, built in their own extensive waterscapes. What ensued was a long and intense period of Scottish crannog research and ultimately the establishment of their predominately Iron Age origins. In the past few decades, however, several crannogs of Neolithic origin have been discovered in the Outer Hebrides, pushing the date for crannog construction and use back at least 3000 years. Following on from these discoveries, the Islands of Stone project was created with two primary aims: (1) to investigate one Neolithic crannog and its surrounding environment in detail to understand its construction, setting and use and (2) to determine if Neolithic crannog construction and use was a wider spread phenomenon beyond the few known examples in the Outer Hebrides. These aims have been addressed through a variety of methods including linguistic data mining, machine learning analysis, prospective field surveys and integrated terrestrial-underwater surveys and excavations. This paper will introduce these methods along with the preliminary results of the project, which reveal growing evidence for the complexity and intensity of Neolithic artificial island building in the dynamic waterscapes of Scotland.

3 BLACK LOCH OF MYRTON; AN IRON AGE WETLAND SETTLEMENT IN SOUTH-WEST SCOTLAND

Abstract author(s): Crone, Anne - Cavers, Graeme (AOC Archaeology Group)

Abstract format: Oral

Our understanding of Iron Age settlements and the societies that built them in Britain and Ireland is severely limited by a) a lack of surviving structural elements that allow an appreciation of the form and layout of individual buildings, b) a general lack of surviving floor deposits that could be analysed with a view to reconstructing activity areas and c)

a lack of chronological frameworks sufficiently refined to allow durations of activities and structures to be resolved at a finer grain than decadal-scale radiocarbon years, at best. Excavations carried out over the last decade at Black Loch of Myrton, south-west Scotland, however, have provided unprecedented quantities of new data in each of these problematic areas. Constructed in the late 5th century BC and reused intermittently until the 2nd century BC, the Black Loch settlement was sited in a marshy lake-side location in a manner similar to crannogs (lake dwellings built in Scotland and Ireland), but in a format indistinguishable from the defended enclosures that are found in large numbers in dryland locations in this period; the wetland conditions, however, have resulted in exceptional levels of preservation not only of timber structures and their associated floors, but of artefacts, ecofacts and proxy evidence such as sterols and other biochemical indicators. The approach taken to the Black Loch project was multi-disciplinary by design and as a consequence the excavations have produced a highly detailed record of the development of the settlement from establishment, through expansion, reconfiguration and eventual abandonment.

Black Loch is one of a cluster of well-dated Iron Age wetland settlements in south-west Scotland. This paper will present the evidence from the site and explore the chronology, development and function of these wetland sites within the context of the Iron Age landscape of south-west Scotland.

4 **WATERTIGHT ARCHAEOLOGICAL SOURCES IN LAKE PEIPSI**

Abstract author(s): Roio, Maili (Estonian National Heritage Board)

Abstract format: Oral

Lake Peipsi is the largest transboundary lake in Europe, lies on the border between Estonia and Russia. The lake is the fifth-largest in Europe and represents a remnant of a body of water which existed in this area during the Ice Age. There are archaeological findings from the sunken prehistoric settlements of Lake Peipsi almost along the entire coastline of the Estonian side. It can be assumed that in the Mesolithic and Neolithic the water level of the lake was almost 4-5 m lower than today, and the shoreline was located further towards the lake. So far, archaeological items have been found mainly up to 400 meters from the shore, which have been exposed either as a result of erosion during low water level or as a result of dredging the mouths of the rivers flowing into Peipsi.

The archaeological finds of Peipsi are quite diverse and rich considering the fact that no archaeological excavations have been carried out so far. For example, bone artefacts, refuse of bone working industry, as well as unworked animal bones, fish and bird bones, some human bones, and sherds of various pottery were found. These findings suggest that Lake Peipsi has been an important waterway since the Stone Age, with permanent settlements sites along its shores, the oldest of which dates back to around 7100 BC.

5 **SURVEYING A PILE DWELLING AT THE BOTTOM OF LAKE VALGJÄRV IN SOUTHERN ESTONIA**

Abstract author(s): Virtanen, Kalle (University of Helsinki)

Abstract format: Oral

My PhD study focuses on the remains of a pile dwelling at the bottom of Lake Valgjärv in southern Estonia. The site is situated on a shallow underwater ridge in the middle of the lake, where the depth ranges from 1 – 4 m. Valgjärv is so far the only known pile-dwelling site in Estonia. The 14C samples taken from the piles and timber structures resting on the bottom of Lake Valgjärv give evidence of three separate phases of settlement or other activity (3500BC–3100BC, 410BC–150BC & 560AD and 980AD). One of the major objectives in my research has been to explore the various ways to document and chart the extent of the underwater archaeological site in Lake Valgjärv. Simultaneously I have endeavoured to develop digitized methods to survey archaeological remains which extend over a large area and rest in shallow water, such as on Valgjärv site. To encounter the many challenges our specialized working environment brings about, I have combined total station measurements and photogrammetry, in order to document the structures in Valgjärv. One aim of the work is to produce a 3Dmodell of the site. Creating an as accurate documentation of the submerged structures as possible, also enables the comparisons between Valgjärv structures with building structures and settlement patterns of similar sites in the Baltic region and also in a wider perspective. It also gives us a better insight in understanding the need for this type of an adaptation on living by the water.

6 **NEW TYPE OF LAKE-DWELLINGS OF THE EARLY METAL PERIOD IN EASTERN LITHUANIA: INITIAL RESULTS AND INTERPRETATION**

Abstract author(s): Kraniauskas, Rokas (Klaipėda University) - Čičiurkaitė, Ingrida (Vilnius University; NGO Kultūros vertybių globos tarnyba) - Pranckėnaitė, Elena (Klaipėda University)

Abstract format: Oral

In 2021, underwater archaeological investigations were carried out in the inland waters of the Eastern part of Lithuania, in a specific area of a watershed linking the two major eastern Baltic rivers, the Nemunas and Daugava. Underwater survey in Lake Bėlis (Švenčionys district) recorded wooden piles surrounding a small isolated island. Archaeological

excavations were carried out in the years 2021–2022 on the island and underwater slope of it. The excavations revealed a prehistoric settlement on the island, according to C14 data dated back to the 6th century BC – 2nd century AD., fortified by a triple wooden fence.

Till now Lake Luokesa settlements from Early Metal period were known in Lithuania, which were built as a raised structure over the dump ground on the lake shoal. The new data broaden the understanding of settlement patterns and contribute to the analysis of environmental and economic adaptations in the Baltic region.

The presentation will provide interpretation of obtained data during the excavations (on land and underwater), results of interdisciplinary research and prospects of investigations.

7 THE LAKE FOLK. NATURAL AND ARTIFICIAL ISLANDS' OCCUPATION IN THE FIRST MILLENNIUM BC MASURIAN LAKELAND

Abstract author(s): Mileszczyk, Malgorzata - Nowakowska, Magdalena (Faculty of Archaeology, University of Warsaw) - Filoc, Magdalena (Department of Palaeobiology, Faculty of Biology, University of Białystok) - Pawlak, Jakub (Faculty of Archaeology, University of Warsaw) - Gackowski, Jacek (Institute of Archaeology, Nicolaus Copernicus University)

Abstract format: Oral

Many areas densely covered with lakes have been subject to specific settlement patterns in the past. Masurian Lakeland is no exception to this rule, as far as living on the islands, both natural and artificially constructed, is concerned. Especially interesting in this sense is the 1st millennium BC, when the latter, so-called lake grid dwellings were built, but simultaneously to the inhabitation of the natural islands. Although many such sites were registered since the 19th century, it is expected the majority of them have been devastated beyond the possibility of gaining further information; however, there are presumably many more waiting to be discovered. At the same time, data is still far too scarce and hardly any patterns have been appointed so far, not only due to the state of research but also a limited set of methods used in the previous study. In the latest decades, an interdisciplinary programme for research on the Masurian paleo-landscape has been introduced, but the applied resources are still very limited. Especially important is the creation of the chronological database as well as paleo-biological analyses, which have revealed rather interesting inferences when compared with the earlier study's results. Previous experience shows that the preservation of these exceptionally valuable archaeological sites was and still is endangered because of both natural and anthropogenic causes. Low awareness of the cultural heritage value along with the lack of preservation programme of said sites does not allow for optimistic future perspectives. In this matter, Poland differs significantly from many countries where similar sites are covered by the vast research and protection programme.

8 RE-EVALUATION OF THE PILE DWELLINGS IN THE WETLAND OF THE DÜMMER AREA IN LOWER SAXONY, NORTHERN GERMANY

Abstract author(s): Heumueller, Marion (Lower Saxony State Service for Cultural Heritage) - Brozio, Jan Piet - Feeser, Ingo - Wunderlich, Tina (Institute of Pre- and Protohistoric Archaeology, Christian-Albrechts-University of Kiel) - Schoon, Reinhold (Göttingen) - Wordtmann, Kimberly (Institute of Pre- and Protohistoric Archaeology, Christian-Albrechts-University of Kiel)

Abstract format: Oral

Already since the end of the 19th century the archaeological potential of the sites preserved in the sea ground and wetlands around the lake Dümmer in Lower Saxony, in front of the foothills of the low mountain range, was recognised. Until the middle of the 20th century, research and rescue excavations concentrated on the sites around the lake. Some of them were extensively excavated over a period of years. These results are still important milestones in archaeological research in the Central European lowlands in terms of reconstructing neolithisation or the structure and architectural design of Neolithic domestic sites. Later systematic field surveys showed that the domestic sites were oriented less towards the lakeshore and more towards the river Hunte, which crosses the Dümmer from north to south.

Three wetlands sites studied in the 1930s–1940s have been re-examined in recent years by new interdisciplinary analyses. The results show that the Lake Dümmer apparently had a key position in the settlement structure of the Swifterbant culture groups, which has so far been localised mainly in the Netherlands. For the 3rd millennium BC, settlement sites and temporary camps can be proven. The most recent investigations show further phases of activity in the late pre-Roman Iron Age and during the Roman and medieval period. Furthermore, the prospections and excavations show the vulnerability of the valuable wetland sites, which are currently severely affected by desiccation, agricultural use and even construction projects in the bogs for nature conservation.

9 MIDDENS AT THE WATER'S EDGE: SHIFTING SALINITY, ESTUARINE HABITATION, AND SUBMERGED DEPOSITS IN SOUTHWESTERN FLORIDA, USA

Abstract author(s): Holland-Lulewicz, Isabelle (Pennsylvania State University) - Thompson, Victor (University of Georgia) - LeFebvre, Michelle (Florida Museum of Natural History)

Abstract format: Oral

Sea-level rise on the Gulf Coast of southwestern Florida, USA throughout the Holocene has inundated archaeological sites at varying scales. The fluctuations within the past 1,000 years have produced water-logged portions of sites located along the modern-day shoreline, preserving usually taphonomically sensitive materials while also creating unique deposits for evaluating past environmental conditions and the over nature of these complex socio-ecological systems. This process of partial inundation contributes unique perspectives to the complex relationships between people and their environments, particularly in relation to estuarine resource management strategies. Recent research at a large shell midden-mound site in southwestern Florida, USA revealed a very well-preserved water-logged midden. The Pineland Site Complex (8LL33, etc.), located right along the water's edge, was occupied by the Calusa from around AD 50 up through contact with Spanish colonizers. In this paper, we will discuss the partially water-logged midden and how it provides new insights into the relationship between resource management strategies and environmental conditions at the onset of the Little Ice Age (ca. AD 1250-1850) through a combination of zooarchaeological analyses and Bayesian statistical modelling of radiocarbon dates. The water-logged materials, including remnant fishing nets and abundant unburned plant and animal remains, have significantly contributed to our understanding of not only past human-environmental interactions at this site but how we conceptualized the broader complex socio-ecological systems of the region and beyond.

10 SPATIAL LAYOUTS AND SOCIAL ORGANISATIONS OF SETTLEMENTS IN WATERSCAPES

Abstract author(s): Spring, Markus (Institute of Prehistoric Archaeology, Zurich University)

Abstract format: Oral

Modern cities are complex spatial systems, catering for a wide range of needs. Whether through micro-economically motivated foreground networks of e.g. 'central business districts', encouraging the emergence of 'generative' land uses, such as retail, or movement-poor socio-culturally influenced background networks of 'conservative' residential areas, the emergence of spatial patterns in today's cities is seen by urban morphologists as instrumental for the flow of peoples and the way we meet and interact.

Prehistoric settlements in waterscapes, on the other hand, may at first sight be considered a far cry from modern cities. They were not the first urban structures, often rather small and – quite similar to modern space stations – built into for human habitation basically hostile environments. However, since their spatial layouts had first to be artificially created, they offer the unique opportunity to gain an insight into how physical space may have influenced the mindset of prehistoric societies. Spatial understanding reflected not only their social organisations but was also a prerequisite for the emergence of geopolitical meta-structures such as 'chiefdoms' and finally states.

The paper employs Space Syntax, a bundle of geometrically and mathematically based methods, primarily used in modern architecture and town planning. It explores the influence; open spaces of these specifically designed built environments in waterscapes had on human movement and interaction. Did these prehistoric settlements follow the same spatial laws as modern cities? And how did their spatial layouts reflect or influence the social organisation of the society who built and lived in them? Although the study concentrates on late Neolithic and Early Bronze Age examples in the circumalpine region, the proposed approach is neither limited to settlements in waterscapes nor any chronological period or cultural background.

11 MOVE - SPATIAL MOBILITY AND RESILIENCE CAPACITY OF LAKESHORE SETTLEMENT COMMUNITIES AT THE END OF THE 4TH M BC

Abstract author(s): Hafner, Albert - Heitz, Caroline (University of Bern; Oeschger Centre for Climate Change Research)

Abstract format: Oral

Understanding change in early societies is a longstanding key question in Prehistoric Archaeology, but the decisive parameters of societal vulnerability and resilience are still poorly understood. In the northern Alpine Foreland, one of the most striking societal transformations of the Late Neolithic occurred at the beginning of the second half of the 4th millennium BCE: the emergence of the «Horgen» cultural sphere – named after its enigmatic coarse pottery – dating from between 3400 and 2800 BCE. Numerous outstandingly preserved dendro-dated Neolithic lakeshore settlements provide a promising source material to study the phenomenon. The SNSF research project MOVE (2021–2024) aims to gain a deeper understanding of the formation as well as the end of the «Horgen» cultural sphere and its environmental and societal conditions. Our pilot study conducted for the time around 3400 BCE shows that

at the beginning of the respective cultural transformation coincides with a climatic deterioration that led to rising lake-levels. They destroyed former settlement areas on the lakeshores and led to temporal interruptions of settlement activities. By using archaeological information on settlement features as well as various global and regional paleoclimatic proxy data we inferred that especially the longer-term lake-level rises of higher magnitudes hit the agricultural communities hard but did not lead to any form of social collapse. On the contrary, the immediate repopulation of the lakeshores after the lake floods suggests that spatial mobility and the temporary relocation of settlements to the hinterland were a successful social coping practice in dealing with these challenges. Since the frequent relocation of settlements was already immanent to these communities' social practices, their capacity for residence-based spatial mobility served them as resilience capacity.

12 “MUNTELIER, PLATZBÜNDEN”, SWITZERLAND, RETHINKING THE ARCHITECTURAL STRUCTURE OF A 4TH MILLENNIUM BC LAKE SHORE SETTLEMENT

Abstract author(s): Gottardi, Corina (University of Bern) - Bolliger, Matthias (University of Bern; Archeological Service Bern) - Hafner, Albert (University of Bern)

Abstract format: Oral

Numerous lakeside settlements from the Neolithic and the Bronze Age from the Alpine foothills were added to the UNESCO World Heritage List in 2011. Thanks to the excellent preservation conditions and the many available dendrochronological chronologies, settlement developments can often be determined with annual accuracy. The lakeshore settlement of Muntelier, Platzbünden, with over 4500 documented wooden piles, is perfect for reconstructing the development of a lakeshore settlement at the end of the 4th century. Although the settlement was already excavated between 1978 and 1982 and the dendrochronological evaluation was completed in 1999, there have been hardly any reliable published reconstructions of the buildings and the settlement development. As part of the SNSF MOVE project (Mobility, Vulnerability and Resilience of Middle European Neolithic Societies at the end of the 4th millennium BC), the complete dendrochronological data between 3229 BC and 3110 BC was re-evaluated and allowed to distinguish several settlement phases.

13 TECHNICAL INNOVATION AND SUSTAINABILITY OF NEOLITHIC STONE AXE PRODUCTION IN THE WATERLOGGED SITE OF MUNTELIER-PLATZBÜNDEN (SWITZERLAND)

Abstract author(s): Scherrer, Adrian - Heitz, Caroline - Hafner, Albert (Institute of Archaeological Sciences, University of Bern)

Abstract format: Oral

The extensive excavations in Muntelier-Platzbünden (3229–3110 BC dendro.) at Lake Murten produced one of the largest collections of neolithic stone axe components in the Three-Lake-Region of Western Switzerland, which is known for its many UNESCO World Heritage certified waterlogged pile dwelling sites. The exceptionally large number of stone axe finds, including more than 500 axe heads, 1000 antler sleeves and a few wooden handles allowed for a large scale typological and statistical study into the technical development of these products, which may shed light on questions about neolithic craftsmanship and solutions to technical difficulties as well as provide insight into ideas of parsimony and effort management during the production of these tools.

By contextualizing these finds it can be shown that during the 4th millennium BC, transformations in stone-axe production were driven by technological innovation that targeted a more time efficient production by making smaller axe blades, a greater durability of the wooden shafts by using antler sleeves and a more sustainable raw material management of the latter over time. Furthermore, the fact that unusually large quantities of stone axes and antler sleeves were found at the site of Muntelier-Platzbünden raises the question of another transformation, one of socio-economic nature: the likely emergence of specialized settlement communities.

14 MOBILITY, CONTINUITY AND TRANSFORMATIONS - NEW RESULTS FROM THE NORTHERN ALPINE WETLAND SITES AT LAKE BIEL CH (3400 -2700 BC)

Abstract author(s): Schiess, Delphine - Bolliger, Matthias - Hafner, Albert - Heitz, Caroline (University of Bern)

Abstract format: Oral

The MOVE-project at the University of Bern focuses on settlement interruptions, cultural continuity, and transformations as well as spatial mobility as resilience capacity of lakeshore settlement communities in circum-Alpine region at the end of the 4th M BC. Three sites located in Sutz-Lattrigen, at Lake Biel in western Switzerland are of major importance, “Sutz-Lattrigen, -Neue Station; -Hauptstation Aussen; -Kleine Station”. The dendrochronological data from the three lake shore settlements encompass the so called “Horgen” and “Lüscherz” tyochronological units dating between 3400 and 2700 BC and gives precise information about the duration of the occupations as well as the interruptions between them. For example, the settlement layout of “Neue Station” makes it possible to reconstruct

a horizontal stratigraphy and to separate the material by phase. We are thus able to study the phases independently of each other but also in an interlinked manner to identify similarities and differences between them. Our study deals with ceramics, stone axe blades and deer antler sleeves, as well as flint and textiles, but ceramics lend themselves particularly well to this exercise and can give us indications of changes in terms of pottery production practices. The biggest changes in terms of pottery typology comes after the long interruption of settlement activity between the “Horgen” and “Lüscherz” period. The typological changes are radical, but is this also the case at the technological level? Are the production habits completely different? On what points? Have the modalities in terms of mobility also changed? How is resilience reflected in these changes? These are all questions that this MOVE project seeks to answer.

For more see: MOVE-project – Cultural Transformations and Spatial Mobility as Resilience Capacity of Lakeshore Settlement Communities at the end of the 4th M BC. <https://data.snf.ch/grants/grant/197383>

15 **SPATIAL MOBILITY, CROSS-CULTURAL EXCHANGE, AND THE MEANING OF ORNAMENTED POTTERY FROM LATE NEOLITHIC WETLAND SITES OF THE NORTHERN ALPINE FORELAND**

Abstract author(s): Andriiovych, Marta (Institut für Archäologische Wissenschaften)

Abstract format: Oral

An abundance of Neolithic wetland sites in the northern Alpine Foreland of the second half of the 4th M BCE can be dated to the exact year using dendrochronology thanks to the preservation of wooden architectural remains. Besides organic artefacts, the pottery found at these sites is well preserved. This offers an opportunity to study their regional stylistic diversity and related aspects of mobility and social relations in a high temporal resolution. The ornamentation of pottery might have played an important role as a symbol of attribution to the community and communal forms of social belonging and differentiation. The pottery vessels examined here were usually decorated with scratched or smoothed lines, nails or wooden tools imprints, or embossed ornamentation. However, there is a certain regional variation in the pottery deriving from Lake Zurich, Lake Constance, the Jura Mountains, or Upper Swabia. Furthermore, there are some vessels with an ornamentation pattern that derives from the typical local or regional one. For example, decoration styles of plots consisted of simple rows of one type of ornamentation, mainly in the upper part of the vessel on the rim or the neck. But some of the vessels have an ornamentation that covers most of the surface or is composed of small ‘design pictures’.

Were these pots ‘one-offs’ representing individual creativity? Did they have a special symbolic meaning? Or could they just be seen as an attempt to create a new pottery ornamentation style? Are they non-local vessels that are typical for adjacent regions? Based on such findings, what conclusions could be drawn regarding spatial mobility and social configurations? I will present the first results of these uniquely ornamented pottery vessels and discuss if they should be seen as the phenomenon linking communities that lived in the different respective regions in the northern Alpine Foreland.

16 **“WHAT’S THAT BROWN STUFF?!” – MICROMORPHOLOGICAL OBSERVATIONS AT THE COPPER AGE LAKESHORE SETTLEMENT OF MOOSWINKEL (MONDSEE, UPPER AUSTRIA)**

Abstract author(s): Zambaldi, Maurizio (University of Coimbra, Centre of Studies in Geography and Spatial Planning - CEGOT) - Cereda, Susanna (Institut für Archäologien, Universität Innsbruck) - Dworsky, Cyril - Pohl, Henrik - Seidl da Fonseca, Helena (Kuratorium Pfahlbauten) - Leskovar, Jutta (OÖ Landes-Kultur GmbH, Linz) - Trebsche, Peter (Institut für Archäologien, Universität Innsbruck)

Abstract format: Oral

The “Mondsee Group” belongs to the earliest copper-using horizons in the Attersee-Mondsee region. This region is among the richest for copper objects and casting crucibles in 4th millennium BCE Central Europe. Studies have suggested a provenance of this metal from south-eastern Europe, but its exact origin, as well as the role of the Mondsee Group and the whole Attersee-Mondsee region within the Alpine, Perialpine and Balkan networks, must be further investigated. Since 2015, the Kuratorium Pfahlbauten and the Upper Austrian Provincial Museums have given new impulse to research in this region through a program of underwater excavations and integrated bio- and geoarchaeological investigations at the lakes Mondsee and Attersee.

This paper focuses on one of the most promising archaeological sites recently excavated at lake Mondsee, the Copper Age pile dwelling settlement of Mooswinkel. A sediment core was collected underwater and analyzed through micromorphological observations. Eight undisturbed samples were extracted from the core and used to prepare thin sections, later observed under a petrographic microscope. The studied sediments consist of thick, dark-brown organic layers alternating with thin calcareous lacustrine deposits. The microstratigraphic analysis aims to understand the formation processes of the archaeological site, and to reconstruct the depositional environment and water level fluctuations at the lake. Micromorphological observations led to identifying the biogenic, geogenic and anthropogenic inputs and better characterizing the nature of the organic components preserved within the sediment core. Further-

more, it was possible to correlate some layers with distinct occupational phases, as proposed based on the recovered archaeological record. Ultimately, this approach has led to new insights into the study of the lakeshore settlement of Mooswinkel and helped to correlate the different scales of the investigation conducted at the site.

17 **ARCHAEOBOTANICAL EVALUATION OF CULTURAL LAYERS FROM THE EARLY IRON AGE LAKESHORE SETTLEMENT AT TRAUNKIRCHEN (UPPER AUSTRIA)**

Abstract author(s): Außerlechner, Marlies (Universität Innsbruck, Institut für Archäologien)

Abstract format: Oral

Coaly layers from the Early Iron Age from two sediment cores sampled during underwater prospections in Lake Traunsee at Traunkirchen (Upper Austria, Austria) were analysed archaeobotanically as part of an interdisciplinary research project of the Kuratorium Pfahlbauten, Management Vienna, Austria and the Universität Innsbruck, Institut für Archäologien, Innsbruck, Austria. The aim was to evaluate the presence of plant macro-remains in the layers and provide insights into the local plant food and environment, focusing on carpological remains. Therefore, two cultural layers with a total volume of ca. 270 ml or total weight of 207 g were extracted from the cores. The samples were prepared by using wash-over and wet sieving techniques with mesh widths of 2.0, 1.0, 0.5 and 0.25 mm. The fairly divers charred and uncharred plant macro-remains were preserved well. Cereals such as barley (*Hordeum vulgare*), emmer (*Triticum dicoccum*) and broomcorn millet (*Panicum miliaceum*), and legumes such as probably *Vicia faba* (broad bean) were consumed. Wild fruits and nuts, such as Cornelian cherry (*Cornus mas*), hazel (*Corylus avellana*), wild strawberry (*Fragaria vesca*), sloe (*Prunus spinosa*), rose (*Rosa*), blackberry (*Rubus fruticosus*), raspberry (*R. idaeus*) and black elder (*Sambucus nigra*) were also part of the plant diet, suggesting a local gathering economy. These and other wild plants, for example, fir (*Abies alba*), grey alder (*Alnus incana*), sedges (*Carex*), pondweed (*Potamogeton*), wild marjoram (*Origanum vulgare*), spruce (*Picea abies*), common verbena (*Verbena officinalis*) and horned pondweed (*Zannichellia palustris*), reflect fresh, alkaline and nutrient-rich soils, frequently visited, rich deciduous forests, glades and forest paths, and the littoral zone.

339 **SETTLING WATERSCAPES IN EUROPE II: PREHISTORIC SUBMERGED SITES IN LAKES, BOGS AND RIVERS - PART 2**

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Heitz, Caroline - Hafner, Albert (University of Bern) - Pranckėnaitė, Elena (Klaipėda University) - Piqué, Raquel (Universitat Autònoma de Barcelona) - Dworsky, Cyril (Kuratorium Pfahlbauten)

Session format: Regular session

Prehistoric submerged sites in lakes, bogs and rivers of Europe have been intensively studied for more than 150 years. They mark the beginning of settlement archaeology, and wooden architectural elements could be recognized for the first time. Due to the outstanding preservation under waterlogged conditions, prehistoric submerged sites also stand for the dawn of interdisciplinary archaeological research and the positioning of prehistoric archaeology between the humanities and the natural sciences. The first 'Settling Waterscapes in Europe' session was successfully organized during the EAA 2016 Annual Meeting at Vilnius, Lithuania. The lectures have been published as volume 1 of the 'Open Series in Prehistoric Archaeology' (<https://www.sidestone.com/books/settling-waterscapes-in-europe>). This upcoming session of 2023 can be understood as a follow up discussion that extends and enhances the topic.

Although evidence of submerged prehistoric sites became known early in many regions of Europe, research focused for a long time on the pile dwellings of the Alpine space. These sites have been inscribed as a serial object on the UNESCO World Heritage List in 2011. It is very encouraging that in the last 20 years research on the phenomenon of submerged sites in lakes, bogs and rivers has intensified in numerous European regions. It thus reveals the amazing diversity of adaptations of settlement activities related to inland water bodies.

The session organizers consider it important to present and discuss new data and hypotheses on the evolution of building structures, settlement patterns, and regional chronologies of waterscapes with clusters of submerged sites in Europe. We especially welcome interdisciplinary contributions that address environmental and economical adaptations to flooding, rising water tables, and other hazards associated with living near water.

1 A FLUCTUATING ENVIRONMENT: NEW RESULTS FROM CORE DRILLINGS ON LAND AND UNDER WATER AT TRAUNKIRCHEN, LAKE TRAUNSEE IN UPPER AUSTRIA

Abstract author(s): Seidl da Fonseca, Helena (Kuratorium Pfahlbauten) - Trebsche, Peter - Außenlechner, Marlies - Cereda, Susanna - Staudt, Markus (Institute of Archaeology at University Innsbruck)

Abstract format: Oral

111 from almost 1000 known wetland and underwater sites around the Alps are part of the UNESCO World Heritage “Prehistoric pile dwellings around the Alps”. Among them are settlements from the Neolithic Age (5000 BC) to the Iron Age (500 BC). Iron Age lakeshore settlements are the exception rather than the rule. In Austria, for example, only two such sites are known.

One is located at Lake Traunsee. On a peninsula of the lake are remains of settlements from the Hallstatt period, which protrude from land into the shallow water area. In addition to the settlement remains, graves from the Hallstatt period are also known from the nearby area. Due to the rich grave goods, the settlement was quickly associated with the transport of salt. The topographical location of the settlement suggests this trade, as the Traunsee is connected to Lake Hallstatt by waterways and enables transport via the Traun to the Danube and thus to a wider European area. However, little is known about the settlement structure of this possible trading post.

Since 2020, new investigations have been carried out on Lake Traunsee on behalf of the regional association ARCHEKULT. The University of Innsbruck, in cooperation with the Kuratorium Pfahlbauten, carried out drilling from the land side to the underwater area in Traunkirchen. The boreholes show a massive preservation of cultural layers in the monastery garden and can be detected, in their foothills, down to the shallow water area on the peninsula in Lake Traunsee.

These deposits indicate strong changes in the prehistoric landscape. There is definite evidence that once there was a natural bay in a well-protected area. This shallow bay could have served as a natural harbour and a perfect landing place for boats before it was filled with sediments during the Hallstatt period and virtually disappeared.

2 THE FORGOTTEN ARCHAEOLOGICAL LAKESCAPES OF THE ALPE-ADRIA REGION CARINTHIA, PREHISTORIC PILE-DWELLINGS IN SOUTH-EASTERN AUSTRIA

Abstract author(s): Ries, Marie-Claire (Universität Innsbruck)

Abstract format: Oral

Austria’s province of Carinthia encompasses more than 1200 bodies of water. The landscape has similar natural and cultural features like neighbouring regions of the perialpine zone, where several well-preserved and culturally rich pile-dwelling sites from prehistoric times (Neolithic and Bronze Age) have been investigated. Unfortunately, our cultural knowledge of Carinthia itself, is severely limited. This poorly investigated region represents a missing link for understanding the relationship between the alpine lake-dwellings and parallel developments in south-eastern Europe (the Balkans). Though, recent underwater archaeological surveys aim to re-evaluate the current situation. A newly launched project has taken on the task of achieving a significant contribution by assessing basic site inventories in three study areas. Archaeological remains are recorded systematically via scientific diving, fieldwork campaigns in wetlands and archival research. Preliminary results, including interdisciplinary microarchaeological investigations, which allow a better contextualisation of this important key-region in the pan-European archaeological discourse, are presented in the paper.

3 FILLING OUT THE GAP ON THE MAP: PREHISTORIC PILE-DWELLINGS IN CROATIA

Abstract author(s): Jerbic, Katarina (University of Bern, Institute of Archaeological Sciences)

Abstract format: Oral

European prehistoric pile-dwelling research represents one of the most developed interdisciplinary fields within archaeology. What started in the 19th century with the famous Alpine lake sites later extended both West to Britain and Ireland and Spain and East to the Baltic wetlands, northeastern European riverlands, and in the 21st century to the central Balkan lakes. When all these sites are visualised on a ‘prehistoric map’, it becomes apparent that they spread in clustered formations with gaps in between that are sometimes hundreds of kilometres apart. It wasn’t until recently that the paucity of sites between clusters was explained with different historical backgrounds, political occurrences, and/or regional trends in scientific interest rather than as an accurate picture of prehistoric reality. One of these apparent gaps is visible in Croatia and this paper presents a map of currently known and confirmed and/or potential prehistoric pile-dwelling sites there. It shows that the research history of pile-dwellings goes back to the original ‘Pile-dwelling fever’ times in the late 19th and mid-20th centuries. Back then these discoveries were compared to

Swiss and Italian sites, presented on conferences and even discussed in handwritten correspondence between famous archaeologists. Unfortunately, the interest in the topic faded due to a complex combination of aforementioned reasons but with the 21st century chance discovery in the Northern Adriatic Sea the Croatian pile-dwelling discussion re-emerged. Although the discipline now needs to be significantly developed, especially dendrochronology, with a long and prosperous history of scientific archaeological research and a reputable SCUBA diving culture, Croatia holds a uniquely high potential to develop its prehistoric pile-dwelling research very quickly and effectively. The author's SNSF project on the topic will therefore serve as a means for capacity building and a significant developmental stepping stone towards achieving this goal.

4 UP AND DOWN: LAKE BOLSENA WATER LEVEL VARIATION IN THE BRONZE AGE AND IRON AGE

Abstract author(s): Di Giamberardino, Giulia (University of Rome La Sapienza) - Bulian, Francesca (University of Groningen) - Sevink, Jan (University of Amsterdam) - Maurer, Arnoud (University of Groningen) - Vanzetti, Alessandro (University of Rome La Sapienza) - Alessandri, Luca (University of Groningen) - Barbaro, Barbara (Soprintendenza Archeologia Belle Arti e Paesaggio per la provincia di Viterbo e per l'Etruria Meridionale)

Abstract format: Oral

Lake Bolsena is located in the Bolsena caldera, part of the Vulsini Mountains complex which consists of multiple volcanoes and craters. The lake is now located 305 m above sea level, covers an area of about 114.5 km² and has a maximum depth of 151 m. It is most likely in equilibrium with an aquifer in the pyroclastic permeable rocks that make up the basin and has a natural outlet - the river Marta - that is active all year and drains to the Tyrrhenian Sea.

A range of evidence clearly indicates that in ancient times the lake level was much lower. Starting from the Middle Bronze Age, a series of settlements, including the Gran Carro, were in fact located along the 297m isobath. It is still unclear whether their abandonment was driven directly by rising waters and the associated shift in the lake shoreline or by earlier socioeconomic factors.

To address this issue, several studies were performed on the evolution of the lake shore over the centuries, using the available archaeological data, historical sources and geological information. In this study we analyze a sediment core (Bolsena-1) taken in the lake near the Gran Carro settlement, using mineralogical and geochemical analytical techniques. Our aim is to better understand the lake level fluctuations during the life of the settlement. Statistical analysis (PCA) of the analytical data and archaeobotanical data obtained for the Bolsena-1 core allowed the recognition of four phases of Lake Bolsena water level fluctuation within an overall rising trend: two cycles of raising and submersion, alternating with lowering and relatively dry habitat. The temporal pattern and magnitude of these cycles are compared to earlier published results for the period concerned.

5 DISENTANGLING NATURAL FROM ANTHROPIC SIGNALS IN WOODEN PILES FROM THE EARLY NEOLITHIC SITE OF LA DRAGA (5300-4700 CAL BCE)

Abstract author(s): Domínguez Delmás, Marta (DendroResearch; Autonomous University of Barcelona) - López Bultó, Oriol (Autonomous University of Barcelona) - Gassmann, Patrick (Laboratoire de dendrochronologie de l'Office du patrimoine et de l'archéologie de Neuchâtel) - Piqué Huerta, Raquel (Autonomous University of Barcelona)

Abstract format: Oral

The Early Neolithic pile-dwelling site of La Draga (5300-4700 cal BCE), located by the shore of lake Banyoles in the northeast of the Iberian Peninsula, represents a first-farming occupation in a formerly inhabited region. Excavations carried out in the past 30 years have provided a wealth of wood samples from pile-dwelling structures. Dendrochronological research on 136 piles and planks made of deciduous oak (*Quercus* sp.) has delivered a well-replicated floating tree-ring chronology spanning 265 years, revealing a main construction phase and a minimum occupation period of 28 years in which repairs have been identified. Furthermore, typological differences in the growth rates and the presence of sudden growth reductions in some samples suggest that anthropic activities may have taken place in the area before the settlement. But was it so? Was there a previous settlement nearby that has not yet been discovered, and whose inhabitants' activities started shaping the woodland around Banyoles lake? Or did fluctuations in the water table for example, induce changes in the growth patterns of the oaks around the lake? We have explored these signals embedded in the growth patterns to disentangle whether they were caused by natural events, or respond to anthropic interventions instead. These results are discussed in the context of the region and their significance is assessed within the process of Neolithisation.

6 SUBMERGED SETTLEMENTS OF ALBANIA, NORTH MACEDONIA AND GREECE. INTERMEDIARY REPORT OF THE ARCHAEOLOGICAL RESEARCH IN THE ERC EXPLO PROJECT

Abstract author(s): Hostettler, Marco - Maczkowski, Andrej (University of Bern, Institute of Archaeological Sciences; University of Bern, Oeschger Centre for Climate Change Research) - Reich, Johannes - Bolliger, Matthias (University of Bern, Institute of Archaeological Sciences; University of Bern, Oeschger Centre for Climate Change Research; Archaeological Service of the Canton of Bern) - Francuz, John - Ballmer, Ariane (-) - Tinner, Willy (University of Bern, Institute of Plant Sciences; University of Bern, Oeschger Centre for Climate Change Research) - Kotsakis, Kostas (Aristotle University of Thessaloniki, School of History and Archaeology) - Bogaard, Amy (University of Oxford, School of Archaeology) - Hafner, Albert (University of Bern, Institute of Archaeological Sciences; University of Bern, Oeschger Centre for Climate Change Research)

Abstract format: Oral

In the border triangle of Albania, North Macedonia and Greece are located numerous lakes surrounded by mountains that reach up to 2600 m in altitude. The first waterlogged sites were already discovered in the early 20th century but not intensely investigated. Systematic research of the settlement sites under water and the use of dendrochronological methods to date them has only been applied since 2018. Since then, several waterlogged settlements have been excavated and studied. The new archaeological material and dendrochronological data show that the oldest submerged settlements date to around 5600 BC. More recent phases belong to the middle of the 5th millennium and to the period between 1800 and 800 BC. The presentation gives an overview of the documented sites, their chronology and first models of land use in the research area. The new research contributes to a better understanding of the prehistory of a so far poorly understood, but important region of Europe.

7 SETTLEMENT DYNAMICS AT LAKE OHRID FROM A WETLAND PERSPECTIVE. RESULTS OF THE EXCAVATIONS AT LIN, ALBANIA, 2022-23

Abstract author(s): Hinz, Martin - Brunner, Mirco (Institut für Archäologische Wissenschaften University of Bern) - Anastasi, Adrian (Institute of Archaeology - Academy of Albanological Studies, Tirana) - Anastasi, Kristi (Université Lumière Lyon 2, Laboratoire HiSoMA - Histoire et Sources des Mondes Antiques) - Hafner, Albert (Institut für Archäologische Wissenschaften University of Bern)

Abstract format: Oral

Since 2019, the EXPLO project has been investigating lakeshore settlements in the southern Balkans, specifically around Lake Ohrid. Since 2020, the shore of the lake in the area of the Albanian Lin, near Pogradec, has also been investigated. First with drillings, since last year also with a wetland excavation, which has yielded material of the Middle Neolithic.

In this lecture we would like to present the results of this excavation, which complement the underwater results in an exciting way. Thus, we could probably identify an earlier phase in the area that is no longer part of the lake today. In addition, flood layers as well as an alluvial horizon, which mainly contains material of the later phase, indicate a changing dynamic of lake levels and thus of settlement activity. This seems to have been concentrated further seaward in the later Middle Neolithic. First dendro- and radiocarbon dating confirm these assumptions. Furthermore, this alluvial horizon indicates that the components were formed by rapid, violent events. In addition, ¹⁴C data from 2022 could support the existing chronology for Dunavec, an important site for the Albanian Neolithic. We want to verify and contextualise these results again in the 2023 campaign.

Due to the excellent preservation conditions under water, but also on land, we can document unique finds and features from the excavations. These allow us unique insights into neolithic lakeshore settlements, as we know them so far only from circum-alpine space.

8 THE NEOLITHIC SITE OF DUNAVEC IN THE FOCUS OF NEW RESEARCH

Abstract author(s): Anastasi, Adrian (Centre of Albanological Studies, Albanian Institute of Archaeology) - Brunner, Mirco (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research, OCCR, University of Bern)

Abstract format: Oral

Dunavec is a prehistoric site, one of the most important in Albania and belongs to the Middle Neolithic. It is located in today's Maliqi field, which was once covered by the lake with the same name, in the territory where the river Devoll joins the river Dunavec.

It was discovered during the drainage works of the area in the mid-sixties of the last century. Archaeological excavations were carried out in two seasons, in 1971 and 1973 by the Institute of Archeology in Tirana. Along with the very rich archaeological material, two clearly separated occupation horizons were also identified. The oldest cultural layer

of the site belonged to a pile-dwelling settlement, while another, more recent layer showed that at a later stage the settlement was built on the ground.

Recent geomorphological, palynological, tectonic and archaeological studies applied to Lake Maliq have highlighted the need for a new interpretation of the Dunavec site. Ongoing research, discoveries, and studies of four new pile-dwelling sites in Lake Ohrid and Lake Prespa, intertwined with new research and interpretation methodologies, have directed the team from the Institute of Archaeology in Tirana to resume research at this site from 2019. New topographic studies and the results of C14 samples taken last year from the trench in the Dunavec River escarpment, which is part of the site's perimeter, are providing additional interesting data.

9 (RE)CONTEXTUALIZING LEGACIES: NEW RESULTS FROM THE STUDY OF THE ARCHITECTURE OF THE NEOLITHIC DISPILIO LAKE SETTLEMENT

Abstract author(s): Giagkoulis, Tryfon - Kotsakis, Kostas (Department of Archaeology, Aristotle University of Thessaloniki) - Maczkowski, Andrej - Francuz, John - Bolliger, Matthias - Hafner, Albert (Institute of Archaeological Sciences, University of Bern)

Abstract format: Oral

The Neolithic lake settlement Dispilio in Lake Kastoria is the only wetland habitation in Greece that was systematically investigated since the 1990s' by the Department of Archaeology of the Aristotle University of Thessaloniki. The outcome of several excavation campaigns forms a rich legacy of archaeological materials reflecting many aspects of the activities of the Neolithic community.

The general chronological framework of the multi-layered diachronic development of the habitation from the mid-6th to the late-3rd mil BC was established by a series of radiocarbon dates. However, until recently the reconstruction of the stratigraphic sequence, the interpretation of concrete concentrations of artifacts, bioarchaeological remains, and building materials, and - above all - their absolute dating, were missing.

The participation of AUTH in the ERC-funded EXPLOR Project provides the necessary framework for developing a state-of-art multidisciplinary approach to these research objectives. The detailed examination of the records, the archive of digital photos, and the excavation plans, combined with critical information deriving from the classification, the stratigraphic and spatial distribution of the settlement's whole vessels have led to the specification of built and open spaces, mainly in the deepest wet archaeological layers.

Moreover, the systematic sampling of structural wood and the dendrochronological analysis of more than 800 samples led to the robust dating of several oak and juniper posts (57th - 53rd centuries BC). The spatial distribution of these dated dendro-groups combined with stratified material concentrations facilitates the recognition of buildings' plans and allows the discussion of certain aspects of Dispilio architecture and its diachronic development.

A. WHEN ARCHAEOLOGY MEETS HYDROLOGY: INVESTIGATING THE ARCHAEOLOGICAL POTENTIAL OF THE JIZERA RIVER THROUGH INTERDISCIPLINARY APPROACHES

Abstract author(s): Machová, Barbora (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic)

Abstract format: Poster

In the riverbeds and along the banks, we find individual items, archaeological artifacts, but also diverse evidence of activities or entire structures of various origins and ages. However, most of these components can only be identified and interpreted from land with great difficulty. The presented contribution aims to familiarize the reader with a pilot project focused on identifying sites with archaeological potential in the Jizera River. The combination of bathymetry, geophysical prospecting and archaeology allowed us to define the areas of interest, where the river bottom was explored. Based on all available information, we attempted to define the so-called contact zones - places where the aquatic environment intersects with the terrestrial environment. Around 50 such places were defined in the area of the middle and lower flow of the Jizera River. As case studies presented in this contribution, two micro-regions with rich evidence of archaeological sites located close to the water flow were selected.

MEDIEVAL MONASTIC SETTLEMENTS IN THE NORTH: ARCHAEOLOGICAL AND ENVIRONMENTAL STUDIES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Kristjansdottir, Steinunn (University of Iceland) - Walser III, Joe (National Museum of Iceland) - Jakob, Tina - Montgomery, Janet (Durham University) - Sundman, Elin (National Historical Museums, Sweden)

Session format: Regular session

Monastic houses became one of the leading institutions in northern Europe throughout the medieval period. The successful ones, female and male monasteries alike, became well-staffed with both religious and lay members who provided a broad range of social services to their local communities. In them, it was possible to gain education or training as a student or a novice, or even live a comfortable life as a corrodian or temporary lay worker. Some of the monastic houses took care of the sick, the poor, and the elderly, besides providing shelter for occasional travellers and pilgrims. Likewise, monastic houses played an important role in gardening and ran large farms in order to provide their inhabitants with subsistence, ranging from medicines to food. Their miscellaneous manufacturing similarly required ample natural resources.

This session will be associated with MERC, since it deals with matters concerning the diverse ways the medieval monastic settlements in northern Europe synchronized with their environment while faithfully keeping their dedication to their diverse orders. The aim is to discuss the role of the landscape in everyday monastic life and the associated land-use in the long run. The discussion includes the diverse ways the religious houses responded to periods of prosperity and hardship, such as caused by the Plague, famines due to volcanic eruptions, or the cooling climate in the Little Ice Age. With contributions from archaeology, natural sciences, and environmental studies, the session is likely to provide innovative insights into current debates about human/nature coexistence due to epidemics such as Covid-19 or climate change.

ABSTRACTS

1 BETWEEN MAN AND NATURE

Abstract author(s): Kristjansdottir, Steinunn (Department of Archaeology, University of Iceland)

Abstract format: Oral

The project, Between Man and Nature, the Making of Benedictine Communities in Iceland, was launched in May 2022. The aim of it is to investigate the role of the surrounding landscape in everyday monastic life and the associated land-use in the long run with examples taken from two Benedictine settlements in Iceland; the female monastery at Kirkjubæjarklaustur and the male monastery at Þingeyraklaustur. These two monastic houses operated for centuries, but both were closed down due to the Protestant Reformation in the mid-16th century. The main themes of the project focus on 1) The extensive production of textiles and manuscripts within these two settlements, which required ample natural resources. 2) The role of the landscape in everyday life and in engagement with liturgy and prayer, for example through water management and timekeeping. 3) The diet of the religious and lay inhabitants in the monastic houses and its associated land-use. Some recurring questions within these themes concern the ways in which the religious houses responded to periods of hardship, such as caused by the Plague or the Little Ice Age, the significance of gender in their operation, and the diverse ways in which they synchronized with their surrounding environment while faithfully keeping their dedication to the Benedictine customs. In the lecture, an overview will be given on the progress of the project, at the same time as the latest results from it will be presented.

2 NORDIC NOIR: BENEDICTINE LIVING IN THE ENVIRONMENT OF NORTHERN EUROPE

Abstract author(s): Clark, James (University of Exeter)

Abstract format: Oral

Benedictine customs were the first regular form of monastic life to be established in the far north of Europe. They also came to be the most widespread. Of course, the source of Benedictinism lay far to the south in the Italian province of Benevento; although the scale and scope of its influence was most conspicuous further north, still the pattern of life it prescribed was marked by its original southern setting. The schedule of religious observance, the recommended forms of labour, whether cultivation or craftwork, and the regulation of diet, dress and personal hygiene remained an expression of the first, pioneers' response to the climate and natural resources in and around Monte Cassino. How those that chose to follow Benedict, and adopt the rule attributed to him, adapted this form of life to their entirely different environments is not well understood. Discussion among historians has concentrated on the legislative corpus, that is to say, precept rather than practice. Archaeological investigation of the evolution of Benedictine living conditions in northern Europe has been limited by the general loss of sites and any visible material remains. This paper, from the

team responsible for the Rannís-funded project Between Man and Nature, will draw on fresh data connected with the Benedictine colonies in Iceland, to offer a fresh perspective on the interpretation of monastic tradition in the climate and ecology of medieval Europe's outermost northern regions. The challenges and opportunities of the Nordic natural environment may have encouraged and enabled the realisation of the Benedictine vision for the monastery's internal economy. The negotiation between custom and context was perhaps most pronounced not in the nature of the Nordic lands but in their social dynamics, where structures and cultures of social order, lordship and kinship were set in conflict with the Benedictine concept of *communitas*.

3 **MONKS, MERES AND MIRES: MEDIEVAL LAND USE AND VEGETATION CHANGE AT ÞINGEYRAR (ÞINGEYRAKLAUSTUR) AND HELGAFELL (HELGAFELLSKLAUSTUR), ICELAND**

Abstract author(s): Riddell, Scott - Erlendsson, Egill (University of Iceland) - Eddudóttir, Sigrún (University of Uppsala; University of Iceland) - Gísladóttir, Guðrún - Kristjánsdóttir, Steinunn (University of Iceland)

Abstract format: Oral

Latin monasticism was a feature of Iceland from the late 11th century but it was not until the 12th century that it became properly established along the lines of such institutions elsewhere in Europe. Here, utilising both palaeoecological data and historical records, the impact of two Icelandic monasteries upon their immediate landholdings are investigated. Palaeoecological data is derived from both wetland and lacustrine sediments with chronologies, for the most part, constructed from known and dated volcanic ash layers present within the sedimentary strata. High resolution pollen sampling in hand with a refined chronology for Þingeyraklaustur allowed for a direct comparison between palaeoecological data i.e. sediment properties and pollen, and the historical record, primarily the *Diplomatarium Íslandicum*. The arrival of the monastery in the landscape is coincident with *Betula* scrub clearance and potentially sheds light upon conflicting historical accounts over its foundation date. A pastoral landscape subsequently evolves, the only setback arising due to the plague epidemics of the 15th century. The chronology for Helgafellsklaustur is less refined but the arrival of the monastery in the landscape in association with an expansion of grazing land is just as clear as that of Þingeyraklaustur. The pollen record also seems to corroborate the minimal impact of plague at Helgafellsklaustur.

4 **BEYOND THE GRAVE: THE POST-MONASTIC RESIDENTS AT ÞINGEYRAKLAUSTUR**

Abstract author(s): Jakob, Tina (Department of Archaeology, Durham University) - Walser, Joe (National Museum of Iceland) - Kristjánsdóttir, Steinunn (University of Iceland) - Montgomery, Janet (Department of Archaeology, Durham University) - Einarsdóttir, Sandra (National Museum of Iceland)

Abstract format: Oral

In the summer of 2021, the grave of Jón Þorleifsson (b. ~1657, d. 1683) was excavated from the cemetery at Þingeyrar. He was the government official presiding over properties belonging to the former monastery at Þingeyraklaustur, known as a *klausturhaldari*. Just 26 years old at the time of his death, he was buried with remarkable grave goods and items of clothing, including a golden signet-ring, ornate silver-thread adorned hat, and a psalm book. Aside from the objects, cranial fragments, several teeth, and even brain tissue were recovered from the burial. Although the skeletal remains were in poor condition, these were preserved, possibly due to their proximity with the silver thread used to decorate the hat. Two well-preserved teeth were sampled for isotope analyses and future ancient DNA analyses. In the research presented here, we discuss the results of multi-isotope analyses and the information revealed about his diet, geographic provenance, and health. Furthermore, we provide a detailed review of his occupation and the objects he was buried with as contextualized within post-Reformation Iceland. As will be discussed, the grave and written sources about Jón Þorleifsson's life and death may even provide perspective on the altered responsibilities of the *klausturhaldari* vs. the abbots who previously served as governors of their monastic houses. At the same time, the supposed distinction of secular and sacred spheres that were introduced with the Reformation and the Enlightenment is discussed in the light of this remarkable grave.

5 **KIRKJUBÆJARKLAUSTUR - A BIOGRAPHY OF PLACE**

Abstract author(s): Hannesdóttir, Sigrún (University of Iceland)

Abstract format: Oral

The importance of landscape has long been recognized within monastic studies, both as an economic and spiritual resource; land management was not only necessary to sustain the monastic community, but was also central to religious life and work. Moreover, former monastic sites continue to influence local narratives to the present day. This paper focuses on the surrounding landscape of a single monastic site, that is Kirkjubæjarklaustur (S-Iceland), one of the two female monasteries established in Medieval Iceland. Through written sources, legends and place names the aim of the paper is to reconstruct the biography of the landscape from before the founding of the monastery to modern days. In particular, the paper considers how the perceived sacredness of the site of Kirkjubæjarklaustur may have been shaped

by stories of Christian settlers prior to the monastic foundation, and how the monastic memory informed the way in which the landscape was experienced after the Reformation and beyond.

6 MONASTIC BEASTS - THE ANIMAL BONES FROM SKRIÐUKLAUSTUR

Abstract author(s): Benkert, Helene (University of Iceland)

Abstract format: Oral

Between the 12th and 16th century, Iceland became home to a number of Christian monasteries, founded by the Benedictine and Augustinian Orders. The island's geomorphology and volcanic activity must have had some impact on people's lives and perhaps inspired a unique interpretation of monasticism. Zooarchaeology is well-placed to provide insights into how people lived at and managed monasteries in the Middle Ages, from daily diet to mobility and animal husbandry but also trade and crafts. It can also help understand the relationship between man and nature

The abandoned monastery at Skriðuklaustur was excavated between 2002 and 2012. Amongst other finds, a large number of animal remains have been found at the site, bearing witness to the daily lives of the monks and other inhabitants of the monastery. This paper will present preliminary findings from the zooarchaeological evidence excavated at Skriðuklaustur between 2008 and 2012. It is part of the project 'Between Man and Nature – The Making of Benedictine Communities in Medieval Iceland' led by Steinunn Kristjánsdóttir.

345 STABLE ISOTOPE ANALYSIS OF ARCHAEOBOTANICAL REMAINS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Gröcke, Darren (Durham University) - Bishop, Rosie (Arkeologisk Museum, Universitetet i Stavanger) - Styring, Amy (University of Oxford) - Szpak, Paul (Trent University)

Session format: Regular session

Understanding the ancient diet of humans and animals using stable isotope analysis (e.g., carbon, nitrogen, sulphur) fundamentally requires knowledge of the baseline ecology. However, many archaeological studies using stable isotope analysis primarily focus on animals and humans. Stable isotope analysis of archaeobotanical remains is becoming more popular, but there is still a long way to go before a complete picture of the environmental, ecological and social interaction between flora and fauna is constructed. Currently, nitrogen isotopes in cereals and pulses have been shown to relate to soil amendment strategies, such as manuring and bio-fertilisation. Strategies like these will elevate the baseline nitrogen isotope value and impact reconstructions of palaeodiet if such ^{15}N -enrichment is not taken into account. Carbon isotope values from cereals primarily relates to water use efficiency/availability and can therefore provide information on watering/irrigation practices. On the other hand, sulphur isotope analysis of modern plants has not been methodically investigated and thus, our interpretation of ancient sulphur isotopes is uncertain. We encourage researchers conducting stable isotope analysis of modern and archaeological plants to attend and present their findings: whether their study represents a modern plot experiment, or a case study from an archaeological site. We particularly invite researchers who are analysing both archaeobotanical and zooarchaeological remains for stable isotope analysis to constrain and understand ecological base levels.

ABSTRACTS

1 A CALL FOR ETHICAL BEST PRACTICE IN ARCHAEOBOTANICAL ISOTOPIC ANALYSIS

Abstract author(s): Stroud, Elizabeth (University of Oxford)

Abstract format: Oral

Isotopic analysis of archaeobotanical remains has grown over the past 20 years, with the method now a common tool for investigating cultivation conditions of past crops, and human/animal dietary inputs. This growth in use has stimulated investigation into the impact of contamination, charring temperature and sampling size on isotopic values. However, we are still at the cusp of fully understanding these fundamental topics. This raises the questions: has the growth in archaeobotanical isotopic analysis outstripped consideration of best ethical practice and just how ethical is archaeobotanical isotopic analysis, given its destructive nature?

Isotopic analysis of archaeobotanical remains is a destructive process, and unlike its archaeozoological or osteological counterparts, in most cases, all of the seed is lost or altered in the process. Literature from the last 20 years was reviewed to understand how archaeobotanical items were documented prior to destruction, the accessibility to such documentation, and the proportion of the assemblage destroyed. Such research indicates that more consideration is needed regarding the destructive nature of archaeobotanical isotopic analysis within published papers. Explicit stating of the recording steps employed, and the publishing of such records, is needed to future proof current and past archaeobotanical isotopic analyses. Furthermore, sampling strategies need to ensure material is preserved for future

generations, given the rapid development in technology and our developing understanding of factors influencing the isotopic values of plant remains.

2 THE CONTRIBUTION OF C4 PLANT STABLE ISOTOPE ANALYSIS FOR RECONSTRUCTING PAST WATER MANAGEMENT IN DRYLANDS

Abstract author(s): Varalli, Alessandra - D'Agostini, Francesca (CASEs–Culture, Archaeology and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra) - De Benedetto, Giuseppe Egidio (Laboratorio di Spettrometria di Massa Analitica ed Isotopica, Department of Cultural Heritage, University of Salento) - Fiorentino, Girolamo (Laboratory of Archaeobotany and Palaeoecology, Department of Cultural Heritage, University of Salento) - Madella, Marco (CASEs–Culture, Archaeology and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra; ICREA) - Pennetta, Antonio (Laboratorio di Spettrometria di Massa Analitica ed Isotopica, Department of Cultural Heritage, University of Salento) - Lancelotti, Carla (CASEs–Culture, Archaeology and Socio-Ecological Dynamics Research Group, Department of Humanities, Universitat Pompeu Fabra; ICREA)

Abstract format: Oral

Plant remains from archaeological sites are the most direct evidence of ancient cultivation practices and they allow us to understand how agricultural systems changed over time according to climatic and environmental variations. In arid environment, C4 plants like millets are widespread as their physiology makes them tolerant to drought. Nevertheless, the sensibility of these crops to water availability is not well understood, with the general assumption that the isotopic values do not vary much under different hydrological conditions. Within the framework of the ERC-Stg project RAINDROPS, we investigated the isotopic variability of C4 plants by combining data from experimental crops, grown under controlled hydric conditions, with data from plants cultivated according to Traditional Ecological Knowledge and where the environmental factors are known but not controlled. We analyzed carbon and nitrogen stable isotope values of grains of two C4 species, pearl millet (*Pennisetum glaucum*) and sorghum (*Sorghum bicolor*). The results obtained from the experimental fields show that sorghum is more sensitive to irrigation than pearl millet. This is likely due to their different physiology, as they belong to two different C4 subtypes (NADP-ME and NAD-ME). The results obtained from the ethnographical fields show more varied data for both $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$, implying different agricultural traditional systems. The combination of these two datasets allowed us to create a model to correctly interpret the stable isotope values obtained from archaeological remains from sites located in dryland areas, namely from Sudan, South Africa, Pakistan and Egypt. This will shed light on water management and land use practices in the past and inform the design of historically-grounded models for sustainable crop management in the future.

3 INFERRING MILLET FARMING IN THE IBERIAN PENINSULA BY COMPARING STABLE ISOTOPES FROM EXPERIMENTAL PLOTS AND THE ARCHAEOLOGICAL RECORD

Abstract author(s): Teira-Brión, Andrés - Stroud, Elizabeth (University of Oxford) - Ordás-López, Bernardo (Misión Biológica de Galicia) - Alonso, Natàlia (Universitat de Lleida) - Montes-Moya, Eva (Instituto de Investigación en Arqueología Ibérica, Universidad de Jaén) - Pérez-Jordà, Guillem (Universitat de València) - Tereso, João (CIBIO-INO/BIOPOLIS; University of Porto) - Charles, Michael - Bogaard, Amy (University of Oxford)

Abstract format: Oral

The current keen interest in millets for sustainable food production in the drylands of Africa and Asia contrasts with the great diversity of environments in which they have been grown since ancient times. The way millets have evolved in a wide variety of agrosystems over time has been conditioned by bioclimatic and social factors that are highly diverse from those in their domestication regions. In the European continent, broomcorn and foxtail millet were usually spring crops that takes advantage of the lower rainfall and higher insolation of the summer season. In recent years, several experiments have focused on learning how carbon and nitrogen isotopes behave in millets from studies conducted in experimental fields, in traditional crops or in greenhouses under controlled growing conditions, gaining new insights for understanding ancient agriculture.

In this study we present the results obtained from the design of experimental plots with different fertilisation treatments (manure, mineral, ash and unmanured) at three different growing calendars – including an annual double rotation with another cereal (rye) – to address the variability of the isotopic composition of carbon, nitrogen, and sulphur in response to trophic shifts driven by human practices and weather and soil conditions. The data obtained is compared with the analysis of archaeobotanical samples from the 13th century BC to the 14th century AD to address similarities and differences with past broomcorn and foxtail millet growing in the Iberian Peninsula.

4 STABLE CARBON AND NITROGEN ISOTOPE ANALYSIS AND FUNCTIONAL WEED ECOLOGY AS POTENTIAL APPROACHES FOR DISTINGUISHING PADDY AND DRY RICE AGROSYSTEMS

Abstract author(s): Wu, Rubi (School of Archaeology, University of Oxford) - Belfield, Eric (Department of Biology, University of Oxford) - Dong, Yu (Institute of Cultural Heritage, Shandong University) - Feng, Shangzong (Agricultural Technology Centre, Linyi Municipal Bureau of Agriculture and Rural Affairs) - Harberd, Nicholas (Department of Biology, University of Oxford) - Hodgson, John (Department of Archaeology, University of Sheffield) - Kikuchi, Yukiko (Paleo Labo Co., Ltd) - Nasu, Hiroo (Center for Fundamental Education, Okayama University of Science) - Yang, Fan (Archaeology Lab and Preservation Research Institute, China National Centre for Archaeology) - Bogaard, Amy (School of Archaeology, University of Oxford)

Abstract format: Oral

Previous work has shown that stable isotope analysis and functional weed ecology of cereal grains are useful in combination for characterizing crop growing conditions in Europe and West Asia. Rice, grown traditionally under a range of agrosystems from deep water to upland, is an important cereal crop in East, South and Southeast Asia from prehistory until today. The aim of the present study was to test whether the stable carbon and nitrogen isotope analysis of rice grains and functional traits of associated arable weeds can provide complementary lines of evidence for differentiating ecosystems of paddy rice and dry rice. Both glasshouse pot experiment and field experiments were conducted to test the potential of stable carbon and nitrogen isotope analysis. Three heritage and four modern accessions were cultivated under various watering conditions in the glasshouse at the Department of Biology (previously Department of Plant Sciences), Oxford. The results show that paddy conditions are associated with lower $\delta^{13}\text{C}$ values of heritage rice grains compared with saturated soil conditions, but with a variable effect on faster growing modern varieties. Waterlogged conditions in general increase the $\delta^{15}\text{N}$ values of rice grains but the effect is not consistent among accessions. Meanwhile, field experiments in Shanghai and Shandong, China similarly show a significant negative effect of paddy versus dry conditions on the $\delta^{13}\text{C}$ values of rice grains. Turning to functional weed ecology, fieldwork in Japan provides species composition and functional traits of rice weeds in experimental paddy fields. Results indicate that paddy plots in Japan are readily distinguished from dryland W Eurasian cereal systems on the basis of functional traits. Overall, this study indicates that $\delta^{13}\text{C}$ values and functional ecology are useful for distinguishing paddy and dry rice, and thus are promising for archaeobotanical application.

5 RECONSTRUCTING THE OPENNESS OF PREHISTORIC WOODLANDS USING STABLE CARBON ISOTOPE VALUES OF HAZELNUTS

Abstract author(s): Styring, Amy (University of Oxford) - Jirdén, Elin (Lund University) - Lagerås, Per (The Archaeologists, National Historical Museums, Lund) - Larsson, Mikael - Sjöström, Arne - Ljung, Karl (Lund University)

Abstract format: Oral

Hazel (*Corylus avellana*) has been abundant in the vegetation of southern Scandinavia since its first occurrence in the early Holocene and has provided food and materials for humans ever since. Pollen analyses show that hazel covered as much as 30% of the land and has been continuously present in the landscape. But how hazel grew and how dense woodlands were is still not fully known.

Here we use stable carbon isotope values of hazelnut shells to infer woodland openness based on the premise of the “canopy effect”. It is well established that plants growing in dense, shaded forests have lower carbon isotope values than plants growing in open areas. By measuring carbon isotope values in hazelnuts collected from bushes growing in different levels of light intensity, we show that the canopy effect is preserved in hazelnuts and that their carbon isotope values can potentially be used to infer woodland openness. We apply the method to hazelnuts recovered from sites dated to between the Mesolithic and Medieval period (c. 8000 BCE to 1300 CE) in southern Sweden. Our results show that the nuts dated to the Mesolithic were harvested from hazels growing in semi-open settings. Nuts from subsequent periods were harvested from progressively more open settings. Given the abundance of hazelnuts recovered from many archaeological contexts, this method can potentially be used to reconstruct changes in forest openness during the Holocene and explore the impact of humans on their environment.

6 BUILDING UP A REFERENCE COLLECTION OF CEREAL C AND N STABLE ISOTOPE DATA FROM THE NW MEDITERRANEAN

Abstract author(s): Antolin, Ferran (Natural Sciences Division, German Archaeological Institute; IPNA/IPAS, University of Basel) - Gerling, Claudia (DUW & DAW, University of Basel) - Martínez-Grau, Héctor (IPNA/IPAS, Universität Basel) - Soteras, Raul (Natural Sciences Division, German Archaeological Institute) - Pratdesaba, Albert (Museu Arqueològic de l'Esquerda) - Jaggi, Madalina (ETH Zurich) - Bernasconi, Stefano (Earth Sciences, ETH Zurich)

Abstract format: Oral

Within the framework of the SNSF-funded AgriChange project (www.agrichange.duw.unibas.ch), several hundreds of grains coming from different archaeological sites dated to the Neolithic period (5900-2300 BC) have been selected for C and N stable isotope analysis with the goal of reconstructing crop management strategies among early farmers in the NW Mediterranean region.

Comparative data exist from the broader Mediterranean context but not from this region. With the purpose of improving this methodological aspect experimentally grown crops from the Archaeological Museum of l'Esquerda (Roda de Ter, Barcelona) were obtained. The museum has had a long-term running experimental project where different crops have been sown, the local climatic conditions have been recorded, as well as the sowing season. These crops were not manured and hence the nitrogen isotope values obtained should give us a baseline for non-manured cereals in the area. Samples of spring- and autumn-sown rye and emmer, autumn-sown einkorn, and spring-sown spelt, both from chaff and grain, were measured at the Department of Earth Sciences of the ETH Zurich.

The results will be discussed considering the reference precipitation data, the sowing season and the type of material analysed (chaff or grain) and compared to published and available experimental analyses performed in other regions.

7 ADAPTATION AND RESILIENCE OF CEREAL CULTIVATION STRATEGIES IN NEOLITHIC SCOTLAND

Abstract author(s): Bishop, Rosie (University of Stavanger) - Gröcke, Darren (Durham University) - Thomas, Antonia - Lee, Daniel (University of the Highlands and Islands) - Church, Mike (Durham University)

Abstract format: Oral

The Neolithic settlement at the Braes of Ha'Breck (c. 3300-2900 cal BC) in Orkney, Scotland, has produced the largest cereal assemblage from Neolithic Britain, providing exceptional evidence for the nature of Neolithic farming. Underlying a series of later floor deposits within a stone-built structure was a thick, dense layer of carbonized grain. The deposit was sealed and spread across the entire floor-levels of the structure, and may represent the remains of a single crop stored within the structure prior to a fire. The scale and density of this deposit was apparent on excavation, with hundreds of thousands of charred cereal grains visible to the naked eye. The assemblage contrasts with other Neolithic archaeobotanical samples from Britain, which mainly contain sparse crop remains. The marginal environmental setting of the site (on a tiny island, approximately 3.2 km from Mainland Orkney) would have placed arable cultivation at the limits of viability, and the site therefore provides key evidence for understanding Neolithic farming adaptations in the North. The archaeobotanical remains, and the carbon and nitrogen stable isotope composition, have been analysed spatially in a grid across the house floor to investigate if variation in crop growing conditions and storage in the house can be identified. This paper will consider this evidence, together with new crop stable isotope evidence from several other major Neolithic cereal assemblages in Scotland.

8 ONE YEAR'S CROP? CHARRED CEREAL GRAIN $\delta^{13}\text{C}$ AND $\delta^{15}\text{N}$ RESULTS FROM THE EARLY NEOLITHIC ASSEMBLAGE AT HOUSE VII.2-3, SLATINA, BULGARIA

Abstract author(s): Blanz, Magdalena (Vienna Institute for Archaeological Science - VIAS, University of Vienna; Human Evolution and Archaeological Sciences - HEAS, University of Vienna) - Marinova, Elena (Baden-Württemberg State Office for Cultural Heritage) - Takarova, Desislava - Nikolov, Vassil (National Institute of Archaeology and Museum, Bulgarian Academy of Sciences) - Ivanova, Maria (Vienna Institute for Archaeological Science - VIAS, University of Vienna; Human Evolution and Archaeological Sciences - HEAS, University of Vienna)

Abstract format: Oral

At the excavation of the Neolithic settlement site of Slatina in Sofia, Bulgaria, multiple grain storages were found in the burnt remains of a 147 m², three-roomed building (House VII.2-3), likely occupied by three related nuclear families. The house was destroyed in one single event of intense conflagration, which led to the preservation of a substantial archaeobotanical assemblage. Multiple accumulations of cereal grains suggest that several individual grain storage containers were present in the different rooms, some filled with a mixture of wheats, and some with barley.

Due to the single conflagration event, the cereal accumulations likely derive from the same year (or very few years), lowering the potential of interannual environmental variability affecting this study.

Samples for isotope ratio analysis were selected from five of the cereal storages: two containing barley and three containing wheats (einkorn, emmer, free threshing wheat, and new type glume wheat; each species analysed separately). Each sample contained 15-20 grains. The samples were pretreated (0.5M HCl), ball milled and analysed for $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$.

The stable isotope ratio results appear to cluster in $\delta^{15}\text{N}$ not by cereal species, but by storage container and room in the building. Since burning temperature and duration affects $\delta^{15}\text{N}$ values in charred cereals, comparisons to present-day charring experiments (from the literature) were made to ascertain whether the observed stable isotope ratio differences between cereal storage containers are due to different burning conditions, or in vivo differences in $\delta^{15}\text{N}$ prior to burning. If the latter, this would indicate wheat mixtures being grown on different fields, fertilised to differing extents, and stored separately, with fields possibly belonging to different households.

9 STABLE ISOTOPES ANALYSIS ON PERENNIAL PLANTS: CHALLENGES AND POSSIBILITIES

Abstract author(s): Joka, Karolina (Adam Mickiewicz University)

Abstract format: Oral

As the first known long-term investments, perennial fruit plants such as olives, figs, dates and grapes acted as a trigger for the development of land ownership rights and had far reaching consequences for the socio-economic developments leading to the emergence of early urban societies. Hence, the study of their domestication and cultivation offers unprecedented heuristic potential for the investigation of the early complex societies, which remains largely unexplored to date.

The paper will investigate an impact of manuring and watering on the efficiency of cultivation of perennial plants at the Early Bronze site at Tel Qedesh, Israel. Preliminary stable carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) isotope data from olives (*Olea europea*) and grapes (*Vitis vinifera*) will be presented. The paper will also address three major methodological issues pertaining to this kind of analysis: (i) the applicability of the method of stable isotope analysis of annually grown plants for the study of perennially grown plants, (ii) developing the research protocol enabling the application of ^{15}N and ^{13}C stable isotopes for studies of perennial crop cultivation practices, and (iii) the usefulness of written accounts (both ancient and modern) pertaining to perennial cultivation from various areas of south-west Asia and the Mediterranean basin for the interpretation of perennial cultivation in the past.

10 NEW INSIGHTS INTO IRON AGE AEGEAN AGRICULTURE THROUGH A COMBINED STABLE ISOTOPE ANALYSIS AND 3D GEOMETRIC MODERN MORPHOMETRICS APPROACH

Abstract author(s): Diffey, Charlotte - Orengo, Hector (Institut Català d'Arqueologia Clàssica - ICAC) - Styring, Amy (University of Oxford) - Livarda, Alexandra (Institut Català d'Arqueologia Clàssica - ICAC)

Abstract format: Oral

The period spanning the end of the Late Bronze Age and the beginning of the Early Iron Age saw significant change throughout the Aegean, with the collapse of palatial societies in the south, the decline of population groups and the proliferation of new socio-political organizations. The causes of these changes have been heavily debated but appear likely to have been instigated by increasingly arid environmental conditions among other factors. These changes have led to suggestions that agriculture underwent a similar transformation, as the large-scale integrated agro-pastoral systems of the LBA were largely abandoned and farmers turned to a more pastoral economy. This view has been thoroughly critiqued, but the nature of agricultural management during this period has been understudied by comparison with other periods, partly due to the relatively few primary archaeobotanical assemblages available.

This paper will contribute to filling this research gap by providing new data from the northern part of the Aegean and in particular from the site of Methone, one of the earliest Greek colonies in northern Greece founded at around 733/2 BCE. Excavations at Methone revealed continuous occupation over a long period that both preceded its foundation as a colony and extends to the beginning of the Roman period. Rigorous archaeobotanical sampling has yielded a large assemblage that adds significant new information for the Iron Age period. This paper presents primary archaeobotanical analysis combined with targeted stable isotope determinations and a newly developed 3D Geometric Modern Morphometrics methodology to infer specific crop management strategies and ultimately a fresh approach to the Iron Age agricultural economy.

SOWING THE SEEDS OF EMPIRE: A STABLE ISOTOPIC INVESTIGATION OF XIONGNU AGRICULTURAL PRACTICE

Abstract author(s): Carolus, Christina - Honeychurch, William (Yale University) - Wright, Joshua (University of Aberdeen) - Amartuvshin, Chunag (National University of Mongolia)

Abstract format: Oral

The Late Iron Age of Mongolia (c. 250 BC-150 AD), also known as the Xiongnu Period, marked the genesis of eastern Eurasia's first pastoral nomadic state and was a particularly transformative time in the history of the eastern Eurasian steppe. Intensive study of the dimensions of sociopolitical, technological, subsistence, and material cultural transformation associated with the emergence of this state has thus been a focal point of Eurasian steppe archaeological research for the past two decades. Recent research posits a complex and diversified steppe political culture whose success may have been based in flexible agropastoral practices. However, a complete picture of Xiongnu foodways and the food production practices underpinning these broad transformations remains elusive. The nature of the arrival, significance, and diversity of agricultural products—namely foreign cereal products—in Xiongnu foodways is especially unclear despite its noted impact. This paper presents an overview of archaeobotanical, stable isotopic, and archaeogenetic evidence for eastern steppe populations' relationships to agricultural practices and products prior to and during the Xiongnu Period. It then reports preliminary results of the first ever formal macrobotanical and stable isotopic analysis ($\delta^{13}\text{C}$ and $\delta^{15}\text{N}$) of a locally produced economic crop assemblage recovered in Mongolia from this period. These data are integrated and compared to previously published data from contemporaneous local human and faunal populations in order to assess the nature and complexity of Xiongnu agricultural practice in northern Mongolian ecoregions. Results are drawn together to temporally and spatially situate Mongolian participation within the broader prehistory of the trans-Eurasian crop exchange for the first time.

A. EXPLORING FLOODPLAIN AGRICULTURE IN PREHISTORY USING SULFUR ISOTOPES

Abstract author(s): Wexler, Sarah - Reade, Hazel (Institute of Archaeology, University College London) - Read, Daniel (UK CEH Wallingford) - Bottrell, Simon (School of Earth and Environment, Leeds University) - Fremondeau, Delphine (Institute of Archaeology, University College London) - Pallett, Denise (UK CEH Wallingford) - Stevens, Rhiannon (Institute of Archaeology, University College London)

Abstract format: Poster

Here we present our ongoing controlled plant growth experiments that are targeted at improving interpretations of ancient plant (and animal) sulfur isotope values. In particular, we are exploring the potential of archaeological sulfur isotopes as a new tool for exploring the hydrological conditions under which agricultural production was taking place. The relationship between naturally occurring irrigation and the development of intentionally manipulated water resources during the development of agriculture is intriguing and fundamental to our understanding of the development of early crop cultivation. Floodplains may have provided an adventitious stepping stone in the gradual shift from hunter-gatherer practises to the development of settlements where crop cultivation and animal management were used. Early crop cultivation on floodplain soils would have benefitted from periodic waterlogging which provides irrigation and brings in nutrients, as well as from rich floodplain grassland which could be used for grazing and foddering.

So far sulfur isotopic composition (^{34}S : ^{32}S) has primarily been used to infer ancient human and animal movement and resource use due to the imprint of local geology and proximity to the coast on soil d^{34}S which is transferred to plants, as well as isotopically heavy marine sulfur in marine resources. However, in a modern context plant sulfur isotope values can be influenced by changing hydrological conditions. In anaerobic environments including saturated floodplain soils, microbially driven dissimilatory sulfate reduction results in a large isotopic offset that may be passed onto plants grown in the saturated soils or grown soon after floodwaters recede. Through our controlled growth experiments, we aim to further our understanding of the impact of waterlogging (both timing and duration) on plant sulfur isotope values. Our results may enable sulfur isotopes to be used to explore water management strategies in the past, particularly in relation to seasonal floodwater agriculture and wetland agriculture.

B. CARBON AND NITROGEN STABLE ISOTOPE ANALYSIS ON CHARRED ARCHAEBOTANICAL REMAINS: INVESTIGATING THE DIET OF THE PAST-POPULATIONS OF SOUTHERN FRANCE

Abstract author(s): Gaveriaux, Fanny (Independent Researcher) - Laurent, Bouby (Institut des Sciences de l'Évolution - ISEM, Université de Montpellier, CNRS, EPHE, IRD, 34000) - Goude, Gwenaëlle (CNRS, Aix Marseille Université, Ministère de la Culture, LAMPEA, MMSH)

Abstract format: Poster

The use of carbon and nitrogen stable isotope analyses on human and animal bones contributed over the last decades to the better comprehension of diet and subsistence strategies of ancient inhabitants of Southern France. Although they represented a part of the alimentation of these past populations, plants were rarely taken into consideration for

the diet reconstructions based on stable isotope analyses. This could have led not only to an underestimation of the importance of the vegetal resources in the human past alimentation but also to misinterpretations of the data. Indeed, animal bones are usually used to infer the local environmental baseline and plants are considered mainly through a broad range of values coming from modern specimens. However, several studies stressed the impact of the local environment and climate, as well as anthropic practices on the stable isotope ratios of a plant, making it essential to include them to this type of study. As a matter of fact, numerous of these archaeological sites provided archaeobotanical seeds and fruits, sometimes in large quantities, beside human and animal remains. This study aims to shed a new light on the previous diet reconstructions by integrating carbon and nitrogen stable isotope analyses done on charred barley, emmer and millet grains as well as acorns originating from archaeological sites situated in southern France and dated from the Neolithic to the Iron Age period. In order to obtain the best representation of the local environment, the archaeobotanical remains are coming from the same archaeological site or as close as possible and are dated from the same period as the human bones. First results obtained for Neolithic populations confirmed that some aspects of the alimentation seemed to have been underestimated or not even considered, such as the consumption of wild resources.

346 **BLAST FROM THE GLASS: PROVENANCE, OCCURRENCE, CORROSION AND PRESERVATION (LATE BRONZE AGE TO PRE-ROMAN TIMES)**

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Oikonomou, Artemios (Science and Technology in Archaeology and Culture Research Center - STARC, The Cyprus Institute; Institute of Nuclear and Particle Physics, NCSR Demokritos; The Department of Conservation of Antiquities and Works of Art, University of West Attica) - Kaparou, Maria (Institute of Nuclear and Particle Physics, NCSR Demokritos) - Smirniou, Melina (University of Lincoln, School of History & Heritage)

Session format: Regular session

Vitreous materials were broadly circulated in the Mediterranean and across Europe throughout late prehistory and history, holding an abundant and ubiquitous presence in burial and settlement contexts. Since the Late Bronze Age onwards, long distance exchange systems evolved, connecting the shores of the Euphrates and Tigris rivers in Mesopotamia and the Nile in Egypt with the Aegean, Europe and the coast of the Baltic and North Seas, establishing a vast network exchanging materials and ideas. At all its ends, as well as at key sites in between, Egyptian and Mesopotamian glass and related materials have been found, inaugurating a dialogue between significant centres of this network.

Archaeological and archaeometric research in recent decades has greatly enhanced our understanding of the production and distribution of vitreous materials across time and space, resulting in a complex, yet fascinating, picture of the socio-economic and cultural aspects underlying vitreous production. Nevertheless, our insight into the technology and provenance of earlier glass artifacts in Europe and geographically related areas, while in expanse, still requires studies aggregating the material culture of the regions involved in this trade and investigating the patterning of vitreous materials in the areas they reached.

Alongside, vitreous materials do suffer a great degree of degradation, with the smaller objects, such as beads and relief plaques, being particularly vulnerable. The degree, extent and nature of this degradation -critically distorting the visual characteristics of the artefacts- affect the way in which the material can be studied and interpreted by archaeologists, conservation scientists and archaeometrists. Thus, the central themes to this session revolve around provenance, occurrence and the role of vitreous materials in the Late Bronze Age towards pre-Roman times in Europe, the Mediterranean, Egypt and the Near East, alongside corrosion and preservation issues.

ABSTRACTS

1 **SCIENCE BEHIND TAXONOMY: DECODING MYCENEAN VITREOUS ARTEFACTS' DEGRADATION**

Abstract author(s): Oikonomou, Artemios (Institute of Nuclear and Particle Physics, NCSR Demokritos; Science and Technology in Archaeology and Culture Research Center - STARC, The Cyprus Institute) - Kaparou, Maria - Karydas, Andreas (Institute of Nuclear and Particle Physics, NCSR Demokritos)

Abstract format: Oral

Vitreous materials suffer a great degree of degradation, with the smaller objects, such as beads and relief plaques, constituting the largest set of artefacts retrieved in earlier contexts, being particularly vulnerable. The degree, extent and nature of this degradation -critically distorting the visual characteristics of the artefacts- affect the way in which the material can be studied and interpreted by researchers. Practically, the final corrosion state of the artefact imposes constraints on its taxonomy, since it has lost the glassy state/glaze and with degradation yielding similar optical effects telling glass apart from faience can prove challenging.

Thus, resolving taxonomy issues is a demanding task not only because of the complex degradation mechanisms which have a direct impact on the visual appearance of the materials and their compositional fingerprint; but also because their physical damage and alterations have led to their frequent misclassification upon retrieval and final storage resulting in further damage, due to mismanagement and, importantly, misleading notions in the archaeological record. For the purpose of this study, a set of vitreous artefacts of different preservation states from Mycenaean contexts in the Aegean have been investigated. A combination of well-established and state-of-the-art scientific methods has been applied in order to analyze, document and identify the specific compositional changes that occur due to degradation mechanisms at different spatial dimensions, within the surface layers. The main aim of this study is to propose firm associations of the analytical data with the observed visual characteristics of the materials and the studied corrosion layers.

The project is being realized within the framework of the 3rd Call of the Hellenic Foundation for Research and Innovation (HRFI) to support Postdoctoral Researchers.

2 FIRST EVIDENCE OF VITREOUS MATERIAL PRODUCTION IN THE MIDDLE - EARLY BRONZE AGE OF SOUTH-CENTRAL SARDINIA (ITALY)

Abstract author(s): Gradoli, Maria Giuseppina (Freelance researcher) - De Giudici, Giovanni Battista (Department of Chemical and Geological Sciences, University of Cagliari)

Abstract format: Oral

For the first time in Sardinia, two almost complete glass crucibles, 19 crucible sherds, glass slag, glass powder and a turquoise vitrified bone were identified in situ at the corridor nuraghe Conca e Sa Cresia (1700-1450 cal B.C.) in the South-Central part of the Island. According to its excavators (Holt and Perra 2021) this area, after collapsing, was sealed by its own debris, preserving its stratigraphy. Indeed, throughout the site life span, glass working debris were in association with their raw materials, such as hydrothermal and fluvial rounded quartz pebbles, quartz pestles and granitic querns, animal bones and rare copper fragments.

In order to study their composition, the samples were analyzed by SEM-EDS, Raman and XRD at the Department of Chemical and Geological Sciences of the University of Cagliari.

Under the petrographic microscope, the tronco-conical crucible shows a fabric different from all the other domestic vessels of the site, rich in macro planar voids, channels and vughs produced by adding grog and vegetal material, possibly to counteract thermal shock during use. Its inner part is lined by a 75 µm whitish layer, which analyzed by SEM-EDS was made of glass (quartz, Na and K alkali, Ca and P and Cu oxides).

Additionally, a sub group of the 19 crucible sherds, lined by the same whitish vitreous material, analyzed by SEM-EDS showed quartz grains not melted completely, indicating semi-finished glass.

The glass slag, analyzed by SEM-EDS, colored dark brown, green and blue has chemical composition similar to the other vitreous remains.

Last but not least, at the bottom of a structure closed by a wall, glass porous materials and powder were found abundantly. Analyzed by XRD and SEM-EDS, the powder is made of quartz as well as the whitish porous material, mirroring the presence of a workshop for glass production.

3 CORE-FORMED GLASS VESSELS IN THE EASTERN MEDITERRANEAN. DEFINING THEIR DISTRIBUTION AND CONSUMPTION DURING THE LATE BRONZE AGE

Abstract author(s): Cosyns, Peter - Bretschneider, Joachim (University Ghent)

Abstract format: Oral

In studies on late Bronze Age glass production and consumption, Egypt and Mesopotamia are recognized as the producers of raw glass and generally considered the sole suppliers of glass consumables throughout the Eastern Mediterranean. The distribution of Egyptian and Mesopotamian glass throughout the Aegean world, Cyprus, Anatolia, and the Syro-Palestinian coastal city-states display the intensive long-distance trade between the Eastern Mediterranean Kingdoms during the late Bronze Age. Advanced research on Cypriot material, however, demonstrates this pivotal island discloses important data not to be overlooked when examining the late Bronze Age glass consumption. Being a highly dynamic hub within the Eastern Mediterranean trade network during the 15th-13th centuries BC, the numerous glass objects discovered on the island makes it worth investigating the status of Cyprus with regard to glass production and tackle the continuous debate on the potential presence of secondary glass workshops in Cyprus and elsewhere in the Eastern Mediterranean. This paper discusses the occurrence and use of core-formed glass vessels from late Bronze Age Cypriot contexts to define preliminary considerations on the idiosyncratic consumption of glass vessels in Cyprus and the presence of other glass producing regions outside Egypt and Mesopotamia.

4 GLASS WORKSHOPS IN MYCENAEAN GREECE: IDENTIFICATION, STRUCTURE AND OPERATION

Abstract author(s): Nikita, Kalliopi (Ephorate of Antiquities of East Attica, Hellenic Ministry of Culture)

Abstract format: Oral

What differentiates the Mycenaean glass industry from the Mesopotamian and Egyptian glass industries is the almost exclusive manufacture of jewellery. Despite the standardisation and mass-production of glass ornaments during the flourish of Mycenaean palaces, i.e. LH IIIA-B (14th-13th centuries BC), there are no recognised remains of workshops for glass making whilst specialised glass-working areas are also difficult to define. The aim of this article is to suggest possible models of reconstruction of Mycenaean glass workshops for primary or secondary glass production.

The extant archaeological evidence of excavated palatial buildings on mainland Greece and on Crete - e.g. Mycenae, Tiryns, Midea, Thebes, Knossos - is presented and assessed, namely architectural remains, technical equipment, the nature of raw and waste materials as well as semi-worked and finished glass objects. In addition, references in the Linear B tablets to materials that can be associated with glass working and possibly making are also included in the discussion. Moreover, earlier published and more recent scientific analyses of glass from Mycenaean palatial and non-palatial sites of the Greek mainland are evaluated and used as a further means of workshop identification.

Suggestions are made for workshops of probable glass working and potential glass making in Mycenaean Greece. Models for the structure and operation of the Mycenaean glass industry are proposed as this is set within the technological context of Mycenaean high-temperature and jewellery industries. Finally, models of interaction of the Mycenaean glass industry with its contemporaneous glass industries in the broader area of the Mediterranean are proposed on the basis of the established palatial trade networks necessary for the procurement and exchange of glass raw materials, raw glass and finished glass artefacts.

5 TYPES AND PROVENANCE OF GLASS FROM CENTRAL AND WESTERN BALKANS IN THE PERIOD OF 11TH C. BCE-6TH C. CE

Abstract author(s): Balvanovic, Roman (Vinča Institute of Nuclear Sciences, University of Belgrade)

Abstract format: Oral

We analyzed a large amount of data on glass reported from 11th century B.C.E. to 6th century C.E. contexts from the Balkans. The analysis showed how the compositional types of glass, their geographic distributions, and their provenance changed with time, indicating changing production technologies, sources of raw materials, and patterns of glass trading over the Mediterranean Sea.

In the period 11th-9th c. BCE, glass was produced using plant-ash and mixed-alkali flux. Two types were recognized, low magnesium-high potassium and high-magnesium. Around two-thirds were of Mesopotamian and one-third of Levantine and Egyptian provenance. The era of natron glass production begun in the 8th century. During 8th-6th c. composition is characterized by low alumina, trace elements indicating Egyptian sands. During 5th-1st c. glass is with high alumina, mostly of Egyptian and rest of the Mesopotamian provenance. In the 1st-2nd c. CE, Roman blue-green and colourless glass dominates, more than two-thirds coming from Levant and the rest from Egypt. In the 3rd-4th c. new types appear, such as Foy 3.2, HIMT, and manganese-decolorized glass. The Egyptian provenance increases to above two-thirds and Levantine decrease to below one-third. In the 5th-6th c., yet new type of Foy 2.1 dominates and the provenance is almost exclusively Egypt. Throughout the period of natron dominance there are occasional occurrences of plant-ash glasses in the archaeological record.

It is noteworthy that throughout this long period of one and a half millennium, the raw glass was almost exclusively imported from the Eastern Mediterranean. This strongly supports the hypothesis that the East was not merely the major source of quality raw materials used for glass production, but also of considerable knowledge, the paramount technological and production center of glass industry of the ancient world. The long-lasting imports also testify that long-range sea commercial routes were functioning throughout this period.

6 BEADS FOR BARBARIANS? GREEK AND SCYTHIAN RELATIONS REFLECTED IN VITREOUS BEADS

Abstract author(s): Yatsuk, Oleh (University of Turin) - Kolesnychenko, Anzhelika (Alma Mater Studiorum University of Bologna) - Zadnikov, Stanislav - Shramko, Iryna (V.N. Karazin Kharkiv National University)

Abstract format: Oral

Greek colonisation of the North Pontic region, that started in 7th century BCE, resulted in a range of complex relations with indigenous inhabitants. The Greeks encountered mighty Scythians and were involved in a large-scale exchange of goods. However, it has long been suspected that such exchange facilitated transfer of skills and technologies in a range of organisational forms: from traveling craftsmen to indigenous industries. Artefacts made of vitreous materials were constantly included in the exchange. Analytical techniques applied in archaeometry have

the potential to shed new light on the scheme and mechanisms of the interaction. 28 glass and faience objects (7-5th centuries BCE) were selected from burials, dwellings and industrial facilities of a 'large Scythian hillfort' of Bilsk (central Ukraine). They were subjected to compositional (SEM-EDS, LA-ICP-MS) and structural (OM, SEM-EDS, μ -Raman, μ -XRD) analysis, rendering the crosscheck of the obtained results possible. This work was carried out by a multidisciplinary team of the V.N. Karazin Kharkiv National University (Ukraine), University of Turin, University of Bari Aldo Moro and University of Bologna (all in Italy). Most glass beads were made of soda-lime-silica glass. Similarities with the other sets of coeval beads known from Central Europe and Mediterranean were noticed. The colouring agents demonstrated a striking variability of technological solutions in order to obtain a vivid and diverse palette of colours and tints. Chemical composition data indicate that the Bilsk inhabitants obtained beads from the main glass-making regions of the time. The comparative analysis revealed the role of Greek colonies in the establishment of this far-reaching trade network.

7 THE WEST FOR LAST - RECENT INVESTIGATIONS OF IRON AGE GLASS COMPOSITIONS IN THE IBERIAN PENINSULA

Abstract author(s): Costa, Mafalda - Lončarić, Valentina - Barrulas, Pedro (HERCULES Laboratory - University of Évora) - Mirão, José (HERCULES Laboratory - University of Évora; Department of Geosciences - University of Évora) - Rodríguez González, Esther (Instituto de Arqueología de Mérida - Consejo Superior de Investigaciones Científicas) - Celestino Pérez, Sebastián - Arruda, Ana Margarida (UNIARQ - Archaeological Center of the University of Lisbon)

Abstract format: Oral

Glass beads and pendants constitute part of the material culture disseminated throughout the Mediterranean region and Iberia by the Phoenician-Punic trade network. In the Iberian Peninsula, these Phoenician-Punic glass adornment objects can be found in a wide range of archaeological sites, including in funerary contexts of indigenous populations, indicating their adoption by the local communities. However, there are still questions regarding the source of raw materials or the raw glass in the case of primary or secondary glass production, respectively.

In the present study we are exploring the complexity of the glass found in 6th-5th century BCE Southern Iberian indigenous sites. Glass beads found in the necropolis of Vinha das Calças 4 (Beja, Portugal) are compared to the glass beads and glass working by-products recovered from the Tartesian site of Casas del Turuñuelo (Badajoz, Spain). A multi-analytical approach comprising handheld X-ray fluorescence (h-XRF), variable pressure scanning electron microscope coupled with energy dispersive X-ray spectrometry (VP-SEM-EDS), micro-X-ray diffraction (μ -XRD) and laser ablation inductively coupled plasma mass spectrometry (LA-ICP-MS), succeeded in bringing forth new information regarding glass production and exchange in Mediterranean and Iberian world during the Iron Age.

Acknowledgements: This work has been financially supported by the PP-nGLASS project (EXPL/HAR-ARQ/0381/2021) and by the UIDB/04449/2020 and UIDP/04449/2020 projects, which were funded by Fundação para a Ciência e a Tecnologia.

8 IT'S (NOT) ALL BLACK AND WHITE: A MULTI-ANALYTICAL STUDY OF IRON AGE "BLACK" GLASS BEADS FROM PORTUGAL

Abstract author(s): Loncaric, Valentina - Barrulas, Pedro (HERCULES Laboratory, University of Évora) - Arruda, Ana Margarida (UNIARQ - Archaeological Center of the University of Lisbon) - Costa, Mafalda (HERCULES Laboratory, University of Évora)

Abstract format: Oral

Glass artefacts from Iron Age contexts in the Mediterranean are taken as evidence of long-distance trade and exchange networks. In Portuguese assemblages, particularly in littoral areas, glass beads are considered a part of the Phoenician-mediated "orientalising" cultural inputs which include novel forms of commodities, technologies, and organisational structures. However, a more careful consideration of archaeological contexts in which these inputs appear shows specific patterns in adoption of exogenous objects by local communities of Southern Portugal. One interesting example is the phenomenon of "black" glass beads with white decorations, which are known primarily from 6th century BC female burials of Southern Portugal.

Here, the results of an in-depth archaeometric approach to the phenomenon of Iron Age "black" glass beads from Vinha das Calças 4 (Beja, Portugal) are presented in the context of known chemical compositions for pre-Roman glass from Portugal and other sites in the Mediterranean. The research methodology focused on non-destructive and minimally invasive analytical techniques by employing handheld X-ray fluorescence (hXRF), variable pressure scanning electron microscopy coupled with energy dispersive X-ray spectrometry (VP-SEM-EDS), laser ablation inductively coupled plasma mass spectrometry (LA-ICP-MS) and micro-X-ray diffraction (μ XRD). It was designed to address the issues of bead manufacture, glass colouring and opacifying technology, and raw material provenance/primary glass workshop location. This work therefore augments the traditional typology-based approach to trans-Medi-

terranean trade in Portugal and has broader implications for understanding the networks of supply and demand during the Iron Age.

Acknowledgements: This work has been financially supported by the PP-nGLASS project (EXPL/HAR-ARQ/0381/2021) and by the UIDB/04449/2020 and UIDP/04449/2020 projects, which were funded by Fundação para a Ciência e a Tecnologia.

9 NETWORKS, KNOW-HOW AND SHOW-OFF: WHEN LA TÈNE SOCIETIES BECAME GLASSMAKERS

Abstract author(s): Rolland, Joëlle (Umr 8215 Trajectoires, CNRS; University Paris 1 Panthéon-Sorbonne; LABEX Dynamite)

Abstract format: Oral

At the transition from the Early to the Late Iron Age, in the 5th century BC, European societies invented a new object of their own: the glass bracelet. This discrete technological innovation is in fact indicative of the development of a unique and typically La Tène glassmaking know-how that, remarkably, was not transferred beyond the borders of European La Tène culture. The development of glassmaking in Europe is also a sign of a major change: glass is no longer imported into Europe only as a finished object, but now circulates as a raw material to be processed. The combination of typological, technological and analytical approaches in the studies of La Tène glass and the development of analytical methods provided important new data for reconstructing the networks for the exchange of raw glass, glassmaking skills and the social significance of ornaments. As part of this research, 1745 glass objects found at 59 sites in France and the Czech Republic were recently analysed using the La- ICP-MS method (laser ablation - inductively coupled plasma - mass spectrometry). The analysis of the composition and its comparison with the typology of the ornaments made it possible to identify changes in the exchange networks between Egypt, the Near East and the La Tène Europe and a diachronic evolution of the compositions used by the La Tène glassmakers. The aim of these communications is to present the results of this study and to discuss the role of La Tène glass ornaments, which were made of an exotic, shiny and sonorous material whose accessibility evolved with changes in wealth in La Tène societies.

10 COMPOSITION AND ORIGIN OF EARLY ROMAN POLYCHROME MOSAIC GLASS FROM THE COLLECTIONS OF THE VICTORIA & ALBERT MUSEUM

Abstract author(s): Richards, Liam - Freestone, Ian (UCL Institute of Archaeology) - Burgio, Lucia (V&A South Kensington)

Abstract format: Oral

With the incorporation of Syria-Palestine in 60-80 BCE and Egypt in 30 BCE into the Roman Empire, the Roman glass industry grew to unprecedented levels. Products of this expanding industry include a group of polychrome mosaic bowls and other open vessels, produced by slumping techniques in the preceding Hellenistic Period. Production of these vessels declined dramatically in the first millennium CE due to the rise in popularity of glass-blowing. This class of objects has been found at archaeological sites across the Mediterranean and Europe, but less is known about where the glass used in their manufacture was produced. This study aims to provide a clearer picture of their provenance, movement and the technologies employed to colour and opacify the glass using compositional and structural analysis. 38 cast mosaic vessel fragments from the Victoria & Albert Museum have been analysed for 58 major, minor, and trace elements using LA-ICP-MS in the Wolfson Archaeological Science Laboratories at the UCL Institute of Archaeology. Non-invasive Raman Spectroscopy was carried out on the objects in the Conservation Science Laboratory at the Victoria & Albert Museum to identify opacifiers. Opacification was generally due to compounds of antimony and metallic copper but in several cases high concentrations of tin are present. Principal component and hierarchical cluster analyses were used to treat the chemical data, and three main compositional groups were identified based on the minor and trace elements commonly associated with the glass-making sand. Two groups comprise glass thought to have originated in Egypt and one in Syria-Palestine. Some objects previously attributed to Egypt on the basis of find location and/or typology appear to have been made from Levantine glass, and comparison with well-provenanced mosaic glass excavated in Egypt suggests that these vessels were instead manufactured in Italy or the Levant.

ARCHAEOLOGICAL IDENTITIES. A METHODOLOGICAL TOOLBOX TO APPROACH IDENTITIES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Poigt, Thibaud (Ausonius - University Bordeaux Montaigne; TRACES - University Toulouse Jean Jaurès) - Adroit, Stéphanie - Parachaud, Kévin (CRIHAM - University of Limoges) - Perdiguero, Pascual (University of Alicante)

Session format: Regular session

Identity is a concept continuously mobilised when dealing with archaeological remains and models. Nevertheless, the identity is characterised by a constellation of definitions. In a general sense, it can be understood as the subjective difference – and the mutual recognition of this difference – by two or several individuals (or groups of individuals). Therefore, the identity is above all characterised by abstract discourse, without objective material manifestations.

In such a framework, the archaeological sciences face a paradox dealing with “identity(ies)” with material proxies they select themselves. The archaeological markers used to talk about the identity are nonetheless numerous: languages, funerary practices, tools of the production and consumption, etc. But what evidence exactly brings these archaeological markers about identity? Are we talking about collective identity (ethnic groups, lineages, communities...) or individual identity (gender, social class, function in the society...). Moreover, are these concepts prevailing in ancient societies or just transpositions of our own identity classification in the past?

In this session, we would like to discuss the identity as an archaeological concept and tool, essential to our studies, but also its limitations. We aim to raise a methodological discussion on how to define and question the material culture and its link with archaeological markers. Namely, why and how specific archaeological data brings to talk about identity from a methodological point of view. In a diachronic approach, we want to interrogate the epistemological process that allows us to deal with identity in archaeology. The papers dealing with methodological and conceptual approaches will be given priority over simple case studies. The idea is to encourage speakers to come up with their own proposals, definitions or interrogations about identity, in order to create a benevolent open debate on doubts and methodological questions.

ABSTRACTS

1 THE METHODOLOGICAL PARADOX TO DEAL WITH IDENTITY IN ARCHAEOLOGY. AN INTRODUCTION

Abstract author(s): Parachaud, Kevin (EA 4270 CRIHAM)

Abstract format: Oral

As an introduction to this session, I would like to quickly present a general definition of the concept of Identity. Then, I would explain the paradoxical relation archaeology maintained with it. I speak to a paradox because, epistemologically speaking, archaeology seems to doesn't have the right tools to approach this part of ancient human societies, and yet it is obvious that we speak a lot about Identity in our discipline. This paradox comes from the nature of Identity, which is an absolutely subjective mutual recognition between a « me » or « us » and an « other.s », whereas archaeology studies ancient societies without direct access to the subjective value and mental representations these men could give to their material world.

This presentation would be a good starting point to then have very interesting presentations and discussions about how we can, as archaeologists, methodologically deal with the concept of Identity regarding our material remains.

2 ROCK ART IMAGES AS SYMBOLS OF IDENTITY

Abstract author(s): Ponomareva, Irina (University of Barcelona)

Abstract format: Oral

Rock art played an active role in ethno-cultural processes and the constructions and negotiations of identities. Looking into various rock art traditions in their historical and cultural contexts can reveal how rock art was engaged in building communities and their symbolic boundaries. Identity is a fluid dynamic phenomenon, and instead of constructing rigid entities it is necessary to look at ethnocultural situations, such as (1) continuity, (2) change, and (3) co-existence of two or more different cultures/ traditions/groups. Interestingly, all three situations occur simultaneously which is explicitly present in rock art. In this paper I will answer the question of why rock art is created, why specific styles and traditions emerge, and why changes in rock art occur through the concept of ethno-cultural identities. Previous researchers treated rock art as a passive object, and specific styles and motifs were considered as markers of bounded ethno-cultural groupings. I suggest that the emergence of rock art styles occurs in a situation of major

cultural change, the reasons and dynamics of which may vary. The important factor is that people had to protect their tradition, culture, and well-being in a situation of threat to their ethno-cultural continuity. By protecting continuity, inevitable change in a rock art tradition occurs. It becomes highly important to mark rocks with relevant symbols of identity, thus expressing the belonging to this place and to the line of succession, and those marks remain there for millennia, continuing to structure identities of those who claim their belonging to this place afterward. Thus, symbols of identity need to be threefold – exhibiting connections with the past, expressing aspects of new identity, and being able to be perceived by both those inside the community and outsiders. Therefore, a rock art tradition/style simultaneously features continuity, change, and similarity to other synchronous traditions/ styles.

3 IDENTITIES IN THE NEOLITHIC SOUTH NORWAY – SITUATIONAL AND SCALABLE?

Abstract author(s): Olsen, Dag Erik (Museum of Cultural History, University of Oslo)

Abstract format: Oral

Neolithic identities have been a subject for a long time within Norwegian archaeology but today there is less focus on identity in Stone Age research. There is however an increased interest in methodological and theoretical approaches that focuses on identifying and describing lithic technologies and how they can be related to distinct groups at local or regional levels. In South Norway, this is exemplified by various technologies used by coastal and inland groups that signify both the development of local traditions and intra-regional contact. In this presentation, the focus will be on how identity can be viewed as situational and is “activated” in encounters with other groups with different social traditions. Eastern and Western Norway will be used as an example as the two regions have always been separated by a mountain range and direct contact would not have been frequent. Meetings are likely to have happened in the mountain areas through the seasonal hunting for reindeer, and are situations where identities might have been signalled through the use and sharing of different technologies.

Participation in different regional networks would also have had an impact on developing different local social traditions, but a tendency has been to equate archaeologically constructed cultures as identities and thus masking the variation we can observe in the material culture. There is reason to approach identity as a scalable phenomenon by building our understanding of archaeological culture complexes starting from the local and up to the supra-regional level. It could be argued that for the most part people were unaware of these large “cultures” and that the dynamics of identity best can be explored through discussing “everyday life” with encounters and cultural exchange at a more local level.

4 THE EVOLUTION OF CELTIC IDENTITY ALL ALONG THE IRON AGE

Abstract author(s): ROURE, Réjane (University Paul Valéry Montpellier 3)

Abstract format: Oral

Approaching the identity of the Iron Age populations is particularly delicate. The name of the Celts appears in several ancient texts that may seem difficult to reconcile at first glance. However, these texts could reflect the identity expressed by the Iron Age peoples at different times in their history. Anthropology shows that populations can express their identity more or less strongly, and thus display specific identity markers in a more or less visible and strong manner, particularly according to interactions with other populations. I have hypothesised that this may explain the differences that exist in the ancient sources concerning the Celts, and also the evolution noticed in some material markers as artefacts (metal objects, ceramics). A change in the distribution of one type of artefact, the appearance of some object or practice, should no longer be systematically linked to a change in population, but could rather be integrated into a reflection on the identity strategy of the populations that choose to wear this attribute, to integrate themselves into this group or the other, to claim their belonging to it, whether it is new or old. Identity is always a behavior and a dynamic thing. After a few theoretical reminders on identity, I will present how the rise of war sanctuaries in Europe during the 3rd century BC could be interpreted as the manifestation of an identity strategy related to the Celts.

5 IDENTITY POLITICS OR ARCHAEOLOGY?: UNIMAGINABLE BINARIES AND THEIR DESTRUCTIVE POTENTIAL TOWARD MATERIAL CULTURE

Abstract author(s): McCabe, Michael (Leiden University)

Abstract format: Oral

Identity is a pressing conversational topic within the modern world, so it should come as no surprise to see that reflect itself in the archaeological world... or should it? Should we be wary of using our modern frame of reference to apply identity on material culture or define it in a way that is reflective of contemporary understandings of self and other? This paper seeks to discuss the use of anachronistic perspectives and terminology surrounding the methodological frameworks of identity within research, reviewing theoretical backings using examples from Etruscology. In doing so, two questions may be raised: Is a post-identity framework possible, and if so, what might it look like?

Discussing new theoretical analyses, such as post-humanist and New Materialist perspectives, in an effort to critically analyse new paradigms against identity-based perceptions is essential if we are to understand emerging views on material culture. My research centres around a new materialist approach toward the archaeological record and, in doing so, conceptualising material culture, not as a passive subject but rather as an actant which plays a part in the more extensive exchange with human actants. I propose a non-anthropocentric approach to material culture as the main propellant to balance out potentially biased identity-based approaches to the material record; this approach will be the main topic of debate within the article.

6 UNDERWATER ARCHAEOLOGICAL IDENTITIES: CONCEPTUALIZATION AND DEFINITION OF PHOENICIAN-PUNIC SHIPWRECKS

Abstract author(s): Jacinto-González, Jesús (University of Almería)

Abstract format: Oral

The conceptualisation and definition of phoenician-punic shipwrecks can lead to a complex epistemological polysemy, which ends up making the cultural and technical barriers of the material reality of the ancient societies we intend to study a very diffuse issue.

Certainly, we have a stable and obvious starting point in the definition of a shipwreck as a closed context made up of the remains of a wrecked ship, or part of its cargo. However, to give it one identity or another depending on what has been found is a difficult question to resolve, where the theoretical and methodological challenge begins.

On the one hand, approaching this conceptualisation strictly from the point of view of naval archaeology forces us to prioritise in the definition process the characterisation of construction techniques and naval typology. In other words, working under the principle of the search for Cato's *punicana coagmenta*.

On the other hand, this cultural ascription can be approached through more versatile approaches, such as the typological study and the chronological dating of the contexts by means of the materials associated with the underwater site and the materials of the wreck's own cargo. This is usually the most common path. And this, without taking into account the possible intrusions of an underwater context, such as an anchorage. And, of course, the question is even more complex when we try to delimit the materials of the cargo and the materials of the crew's equipment.

Therefore, it may be logical to combine the two in an attempt to avoid as many problems as possible. But this would only be a palliative solution. For this reason, we believe that we need to make a joint effort to reflect on the problems of identity and cultural ascription of such unique archaeological finds as phoenician-punic shipwrecks.

7 TECHNO-TYOLOGY: A TOOL FOR UNDERSTANDING BRONZE AGE METALWORKERS' IDENTITIES AND ORGANISATIONS

Abstract author(s): Dumont, Léonard (Ghent University, Department of Archaeology; Université de Bourgogne, UMR 6298 ARTEHIS)

Abstract format: Oral

As direct archaeological traces of Bronze Age metalworkers' activities are very limited compared to the amount of metalwork known for this period, craftsmen remain to a large extent anonymous. Their identities and organisation have been mostly studied indirectly by examining their productions. There is indeed a long-lasting research tradition about Bronze Age metalwork focusing on stylistic features to create typo-chronological classifications, used to identify trends and the productions of different workshops. However, this traditional approach suffers from a major theoretical flaw. It is not clear who, the craftsmen or the users or both, is involved in the decision process leading to the choice of certain shapes or ornaments. On the other hand, production techniques are the result of choices made by the craftsmen alone. As these technological choices reflect craftsmen's habitus and depend on their socio-cultural background, their variations in space enable the identification of different production groups and the monitoring of their evolution in time. To do so, techno-typology seems to be the right tool. This classification system is purely based on the variations observed at different steps of the chaîne opératoire, giving us a proxy to access craftsmen's identities otherwise invisible through the archaeological record. If such classifications are now common in the study of ceramic and lithic productions, it remains scarce in studies dealing with Bronze Age metalwork. In the framework of our dissertation, we were able to build a typo-technological classification of Bronze Age solid-hilted swords based on the results of X-ray imaging techniques. We will present the main results of our research concerning the identification and evolution of production groups involved in the making of these weapons.

8 ENREGISTERMENT AND IDENTITY IN TRANSYLVANIAN BRONZE AGE CERAMICS

Abstract author(s): Arnold, Elizabeth (University of California Los Angeles) - Quinn, Colin (University of Buffalo)

Abstract format: Oral

Material culture plays an integral role in constituting and communicating identity. However, archaeologists continue to grapple with how particular types of material culture assume this role. In this paper, we employ a semiotic approach to develop a framework for how material culture items become encoded to not only reflect social identity, but also help create it. To highlight this approach, we examine a case study from the Wietenberg Culture in Middle Bronze Age Transylvania (2000-1500 BCE). During this period, ceramics became a medium through which Bronze Age Transylvanian individuals displayed and reinforced identities at multiple scales. Employing social network analyses of ceramic motifs, we demonstrate that Wietenberg identity was co-created with ceramic motifs during the Formative Wietenberg (2000-1875 BCE). By the Classical Wietenberg (1875-1500 BCE), ceramic motifs contained significant subregional variation, suggesting ceramics took on additional roles in co-creating smaller-scale social identities, such as households, kin groups, sodalities, and polities. We argue that enregisterment provides an explanatory framework for how a particular category of material culture comes to communicate a particular identity.

9 DO IDENTITIES MAKE POTTERY? PROS AND CONS OF INVESTIGATING IDENTITIES THROUGH POTTERY STYLES

Abstract author(s): Szilágyi, Márton (Eötvös Loránd University, MTA-ELTE „Lendület“ Momentum Innovation Research Group)

Abstract format: Oral

Pottery has always been in the focus of prehistoric archaeology, as it is one of, if not the most abundant find type from that period. This is the reason why pottery has always played a key role in reconstructing past social structures, which have mostly been archaeological cultures. These statements are especially true when talking about Central European archaeology, where there has been an equation between pottery styles and archaeological cultures for a long time. In other words, when archaeologists talked about, for example, the Stroked Pottery Culture, they always meant the group of Neolithic people who made pottery with stroked decoration. Following this logic, the assumption was made that these people shared a common identity which was expressed through the way they made and decorated pottery. As a consequence, we could say pottery style was a foundation for expressing identities in the past.

Was it? Even if there has long been a debate over the meaning and the use of the term “archaeological culture”, the vicious circle of “archaeological culture – pottery style – real social identity” still seems hard to be broken.

The questions arise: was pottery style a distinctive tool for prehistoric people, or is it only an artificial tool made by archaeologists? Can we find cases in which pottery style was a definition of a real past social group, or can we ignore pottery when trying to reconstruct identities? This contribution will focus on the theoretical and methodological issues of reconstructing past social entities through studying pottery styles and will use examples from the Neolithic and Copper Age of Central Europe as illustrations.

10 PAINT ME BY YOUR WAY: APPROACHING IDENTITIES THROUGH IBERIAN PAINTED POTTERY

Abstract author(s): Martínez-Boix, José Luis (Universitat d'Alacant)

Abstract format: Oral

Since the 5th century BC, Iberian culture has featured wheeled painted pottery as one of its characteristic elements. This item has defined the “Iberian identity” from the point of view of archaeological research since its discovery up to the present day.

However, the definition of identities is a complex issue that requires matching two or more groups assumed to be different. This aspect becomes harder to reach when we find ourselves in transition periods, with the end of cultural eras and the beginning of new historical epochs that blur these differences between groups.

That is the case of the end of the Iberian world in the southeast of the Iberian Peninsula, in the region known as Iberian Contestania. In this scenario is where, during the 1st century BC, a new type of painted pottery appeared. This pottery, with a rich array of figures, symbols, and scenes, coincided with the conquest of what was to become the new Roman province of Hispania.

This pottery has been considered an Iberian product since its technique and production process are reminiscent of the craftsmanship skills characteristic of this culture throughout the previous centuries. However, the images depicted in the vessels break with former traditions and offer new messages in a moment of intense changes.

Therefore, in our study of this painted pottery, we are committed to analysing the artistic technique and iconographic aspects to understand the role played by this artistic representation in the assimilation of new identities and social realities in the society that arose with the first Romanisation.

11 SPATIAL AND SOCIAL STUDY OF THE POTTERY FROM CORONA DE QUINTANILLA (LEÓN). A GOLD-MINING SETTLEMENT FROM THE 1ST CENTURY AD

Abstract author(s): Hernández-Tórtolas, Alicia (Spanish National Research Council)

Abstract format: Oral

Para abordar el concepto identitario partimos del modelo propuesto para las formas sociales de la Edad Hierro campesinas, igualitarias, rurales y autárquicas, que cambiarán drásticamente tras el contacto, conquista y dominación romana, sometidas a una economía de mercado, monetaria, tributaria e imperialista. Consideramos que el poder romano produjo la transformación de las formas de organización social indígena en época preprovincial y las primeras formas de desigualdad social. En este trabajo interpretamos el registro material de Corona de Quintanilla para observar estas posibles formas desigualitarias, elitistas o de control de tipo económico, militar o de los espacios en este asentamiento. Vemos una población indígena astur que está explotando la mina de oro para tributar y en unas condiciones de vida bastante precarias. Está claro que todo proceso de dominación implica un proceso de imposición, transformaciones y adaptaciones. Sin embargo, hay una clara dominancia de cerámica y otros materiales de tradición indígena (95%) que conviven con bienes de lujo romanos (vidrio, vajilla fina de mesa, etc.). Esto parece indicar por un lado desigualdades en las formas de estructuración internas del poblado pero también la necesidad de sus habitantes por mantener las tradiciones de forma casi resiliente. Consideramos viene propiciado por la transferencia y permeabilidad del conocimiento que respaldaría el traspaso de ciertos saberes técnicos desde la Edad del Hierro en adelante. Implica la revisión del concepto de “aculturización” y “romanización” entre otros. Metodológicamente, nos hemos centrado en la cerámica de tradición indígena y su estudio desde la materialidad, su distribución espacial, su correlación estratigráfica y su asociación con el resto de conjuntos y ajuares del registro doméstico. Qué papel representan estos materiales en las esferas de producción, economía y sociedad como producto cultural para acercarnos a las formas de vida, consideración de identidad(es) y de pertenencia al grupo con un pasado común heredado.

12 IDENTITY BEHIND CLOSED DOORS

Abstract author(s): Gür, Selin (Universität Bern)

Abstract format: Oral

Houses are social entities and reflect the everyday life, the experiences, the culture, the people's behaviour. People are expected to resonate with what they see, learn and get influenced by from the outside, only to the extent to which they adopt and indigenize it. From this point of view, it is expected that the changes they adopt in their own private spaces can be followed throughout the settlement periods in terms of urban layout, architecture, spatial arrangement, and material culture. In this way, therefore, it is possible to analyze houses' plans and internal arrangements and relations between and within households. The concretization of ideas and thoughts also happened with the adaptation of the developing technology in the materials they used and the influence they gained through social interaction with their surroundings. It is then also expected that these physical structures and finds reflect identity.

Identity may shape and adapt differently within the household and the community in terms of power and status, depending on the social norms and cultural values of the society. Therefore, impacts such as the socio-cultural and political situation of the communities; beliefs and traditions of the people are also to be considered. This study will present the data used for analyzing identity both at domestic and societal level and suggest methods used for evaluation while touching upon the aspects which have an impact on the identity phenomenon such as time, location and environment. It will compare these methods and discuss the difficulties that may be encountered. Finally, it will show the prospective results.

13 FACING THE GORDIAN KNOT OF IDENTITY: INTERSECTIONALITY AND THE RELATIVIZED REPRESENTATION OF IDENTITY IN MORTUARY ARCHAEOLOGY

Abstract author(s): Schlegel, Valery (Freie Universität Berlin)

Abstract format: Oral

To define identity is complex because what is denoted by it changed over the years; it is culturally situated in time and place, it is in need of constant repetition and therefore naturally underlies constant change (small change in short-term, but remarkable in long-term). While research on identity in its beginning focused on ethnic groups and national identities, other aspects such as gender, class and status came to the front later and finally took a turn with the contribution of E. Brumfiel, who advocated for an agent-based approach. In the 21st century, identity is now often seen in a holistic manner, as a combination of a number of social identities that is bigger than their sum.

However, identity should not just be fathomed as a combination but as a nexus of intersecting, reciprocally influencing identity aspects (forming a seemingly inextricable knot). I argue that this intersectionality also needs to be balanced with the knowledge that not all aspects of identity are equally expressed in the archaeological material and that every case study needs to analyze carefully which identity aspects are more or less represented in the data due to the nature

of said data. This contribution aims to discuss the intersectionality of identity aspects and their relativized representation in mortuary archaeology to formulate some guidelines for their examination in such contexts; with a few examples from mostly Assyrian and Scythian burials, it will be analyzed how the identity aspects gender, age and status affected each other to be more or less represented in the archaeological remains of funerals as well as how the conscious selection of grave goods by the kin responsible for the burials influences the interpretation of the identity of the dead today.

14 “SOCIO-PROFESSIONAL IDENTITIES” IN LATE PREHISTORY SOCIETIES. IS THERE REALLY SUCH A THING?

Abstract author(s): Poigt, Thibaud (UMR 5607 Ausonius - University Bordeaux Montaigne; UMR 5608 TRACES - University Toulouse Jean Jaurès)

Abstract format: Oral

The funerary contexts of the Western Bronze and Iron Ages provide quantity of tombs that were labelled based on what we would call today “socio-professional categories” as the “goldsmith tomb” or the “merchant tomb”. These distinctions from other contemporary graves – which lack the appropriate funerary goods – are generally based on the presence of unusual artefacts or specific combinations. Nevertheless, they imply that the identity of the deceased match a certain specialisation in the society in terms of socio-economic activities.

That leads to question the existence of “socio-professional identities” in these ancient societies. Can we really say that, during the Metal Ages, some individuals may have defined their own identity in terms of producing gold objects or trading in goods.? If they did, how can we use the archaeological record to characterize it?

These hypotheses generally rely on a succession of interpretations about artefacts, about funerary mise en scene, and about the idea we have about the studied societies. However, each level of interpretation contains bias, strongly linked to own opinions of the archaeologists that conjured them.

Through several examples from the Western European Bronze and Iron Age, this paper aims to present various specialised activities of the production and the exchange that are called to characterize the socio-professional status of deceased. We will focus on the artefacts at the basis of the hypotheses and question the highlighting of some over others. From this data, we want to debate about the way we handle identities concepts and categories – as part of the archaeological process – that carry within them scientific bias which may say more about archaeologists than about the societies they study.

15 IDENTITY IS IN THE EYE OF THE INTERPRETER: CASE STUDY OF ROMAN PERIOD SLOVENIA

Abstract author(s): Stemberger Flegar, Kaja (PJP d.o.o.)

Abstract format: Oral

The present paper is based on the premise that every interpretation is influenced, consciously or unconsciously, by the personal circumstances of the researcher doing the interpretation. Different elements form the context in which researchers do their work, including but not limited to political, cultural, ethnic, historical, and personal circumstances. Just as the identities that the researchers study, also their own identities driving the interpretation are not singular and monolithic, but rather multifaceted and fluid.

Similar to the age, sex, gender, and social standing of the research subjects, certain aspects of the researchers’ identities are easier to trace, such as the time period and language in which they worked. Both influence entire generations, while personal elements are more limited to one researcher at a time. The proposed paper first and foremost addresses two of the factors shaping interpretations: historical context, where I examine the zeitgeist of the periods in which interpretations of identity happened, and the native language of the researchers. The first usually dictates what areas of identity were at all explored and what was important to the researchers of the time, while language defines our entire perception of the world, and consequently also our interpretations.

As a Roman archaeologist, I focus on identity studies of the population that lived in Roman period Slovenia. The theoretical endeavours dealing with Roman period identities in Slovenia are geographically and temporally narrowly delimited. As such, they provide suitable grounds for testing aspects of identity and their interpretations in terms of topic choices and derived conclusions, and explore how different historical settings and language shaped them.

THE ACHAU CEMETERY - AN ATYPICAL AVAR BURIAL GROUND FROM AUSTRIA

Abstract author(s): Özyurt, Jasmin (Austrian Academy of Sciences- Institute for Medieval Research) - Klostermann, Paul (Natural History Museum Vienna, Anthropology Department) - Strang, Sheridan (Novetus GmbH) - Tobias, Bendeguz (Austrian Academy of Sciences- Institute for Medieval Research) - Jana Pneisl, Jana - Binder, Michaela (Novetus GmbH)

Abstract format: Oral

A substantial amount of funerary evidence from the Early Medieval Period has surfaced in Eastern Austria due to increased development and agricultural activity over the last 200 years. This includes approximately a hundred known burial grounds and several thousand graves from the 7th to the 9th century AD. One could assume that this period and its living conditions are already well understood due to the large number of known human remains and grave goods. However, the excavation of the Achau cemetery suggests otherwise. This partially excavated cemetery dates to the Mid to Late Avar Period (ca. 650 to 800 AD) and is located south of the Danube River in the northern part of the Vienna Basin.

Compared to Avar Period cemeteries in the vicinity, Achau is unique in regard to its find material. In addition to typical burial goods from the Avar Period, finds, some of which are unique for Eastern Austria, were discovered. Approximately half of the excavated inhumations contained high-quality multi-part belt sets. As well as to their material value, belt sets, commonly found in only 10-15% of male inhumations within the Avar Empire, signify prestige and symbolic meaning.

While the discovery of high-quality artefacts suggests high social status individuals at Achau, evidence from skeletal remains indicate that parts of the population was affected by negative living conditions. This is shown by skeletal changes from metabolic stress during childhood and infectious diseases like tuberculosis. Additionally, the high rate of juveniles amongst the excavated burials might indicate a heightened mortality rate.

The impressive material culture and the contrasting osteological evidence make Achau an exciting opportunity to study the diversity of life experiences in the Avar Period.

"KALEIDOSCOPE" OF IDENTITIES: SOME REFLECTIONS FOR AN ARCHAEOLOGICAL APPROACH

Abstract author(s): Pini, Nicolo (Université libre de Bruxelles)

Abstract format: Oral

Dealing with identities is always complicated, especially within a discipline like archaeology, which insists almost exclusively upon using material findings. It is not only the limitations of an archaeological approach, but the nature of identity itself and, more specifically, its diversification and complexity, that represent a problem. To better explain the 'nature of identity,' it is helpful to refer to the idea of a "kaleidoscope of identities" that can describe a single individual. There are multiple identities (cultural, religious, political, ethnic, socio-economic, etc.), sometimes in conflict with one another, sometimes coexisting and galvanised – all at once or just some – according to the context in which the person finds him or herself. Every single identity, included into this broader frame of self-description(s), might have some form of "material" output.

The paper aims to offer some theoretical reflections and possibly some methodological tools to address these different material outputs, bringing a series of examples from the Roman and Late Antique Middle East. Although referring to a variety of material evidence, the built environment will be a privileged object of analysis. More specifically, it is seen as an extremely useful instrument to understand better understand extended family or "tribal" structures and connected identity patterns. In particular, they might be seen as major factors in determining specific forms of spatial organisation at different levels in the settlements (especially in rural contexts) and be also one possible explanation for their recurrence in several areas across the Middle East and over a wide chronological span.

Ultimately, the paper underscores the importance of avoiding rigid and univocal categorisations of personal or communal identities, prioritizing instead the description of the different identities at play in a specific context, and whenever possible, attempting an explanation of why they were preferred to others.

A. INTERCONNECTIVITY OR GLOCALITY? A METHODOLOGICAL PROPOSAL FOR IDENTITY STUDIES IN ROMAN SOCIETIES

Abstract author(s): Díaz Sánchez, Carlos (Universidad Complutense de Madrid)

Abstract format: Poster

More recent studies on cultural processes and identities in ancient Rome have begun to integrate archaeological remains as a fundamental pillar in the proposed hypotheses. However, in many cases, the methodologies used to unravel how these cultural changes take place and the identity of these societies is perceived, despite their success, tend to have a strong regional character, and cannot be used in more complex cases. For this reason, this poster proposes

a methodology that aims to analyse the different cultural processes and to configure the identity of assimilated or conquered societies. This methodology is premised on the analysis of scales (or structures), allowing us to observe the different levels of imposition, acceptance and rejection of provincial societies. For this purpose, the different material remains available and the interconnectivity of this territory with the rest of the Roman World are observed, understanding in a more complete way the integration of the territory within the Roman culture and the construction of identity in the different provinces.

349 REVEALING THE MANY NARRATIVES OF TOBACCO: TOWARDS AN INTERDISCIPLINARY ARCHAEOLOGY OF TOBACCO AND CONSUMPTION

Session theme: 6. Contested Pasts & Presents

Session organisers: Inskip, Sarah (University of Leicester) - Casna, Maia (Leiden University)

Session format: Regular session

Tobacco is one of the most important non-food crop plants in human history. Archaeological research suggests humans have been consuming tobacco for millennia in the Americas where it was used by indigenous peoples in rituals, medicine, trade and recreation. European arrival in the Americas in the 16th century was a watershed moment in tobacco history. Their interest in the medicinal properties of the plant, coupled with recreational use, resulted in a transatlantic tobacco trade, and led to the incorporation of tobacco into everyday life in Europe and beyond. It was also an early impetus for the slave trade and exploitative networks, which has deep ramifications today. Despite significant research by historians, archaeologists have had limited engagement with the topic of tobacco, especially in Europe. Research has revolved around clay tobacco pipes, and focuses on pipes as a dating mechanism, rather than to learn about tobacco history itself. This session aims to expand our knowledge on the varying roles of tobacco in the lives of past peoples and the differing ways that archaeologists can weave a new interdisciplinary tobacco narrative more reflective of its true significance. Topics of interest include, but are not limited to, studies of material culture (clay pipes, snuff boxes, tobacco jars etc), network analysis, archaeology of colonies and production sites, theoretical perspectives on intoxication and consumption, bioarchaeology and residue analysis.

Aim:

- Bring together scholars working on tobacco in any region of the world and at any time.
- Get people to think about tobacco as an agent of historical change.
- Consider the multiplicity of roles and personas of tobacco, beyond recreational use.
- Bring tobacco history to the fore of discussions on early colonialism, imperialism and inequality.
- Encourage understanding of the wider value of clay tobacco pipes for assessing social consumption practices.

ABSTRACTS

1 METABOLOMICS ON OSTEOARCHAEOLOGICAL REMAINS: A MOLECULAR TOOL TO INVESTIGATE TOBACCO CONSUMPTION IN BRITISH POPULATIONS

Abstract author(s): Badillo-Sanchez, Diego - Serrano-Ruber, Maria - Davies-Barrett, Anna (School of Archaeology and Ancient History, University of Leicester) - Jones, Donald (Leicester Cancer Research Centre, RKCSB, University of Leicester; The Leicester Van Geest MultiOmics Facility, University of Leicester) - Inskip, Sarah (School of Archaeology and Ancient History, University of Leicester)

Abstract format: Oral

Tobacco consumption in European societies has been an important topic since its appearance after the 16th century. Tobacco consumption in the osteological record is sometimes traceable in skeletal remains with excellent preservation and completeness when evidence of pipe notches and/or lingual staining can be seen on the dentition. However, such an approach offers an incomplete view of previous consumption, as tobacco was used in ways that will not leave marks on the teeth, and individuals lacking teeth cannot be studied. This creates a need to have another method to evaluate tobacco consumption by past individuals without such limitations or biases.

Our research group has developed a new approach that integrates metabolomics into archaeological science. Metabolomics study small molecules present in an organism and/or their modifications due to a variety of factors. When applied to osteoarchaeological material, it is possible to obtain new molecular information that can be used to understand different conditions of the past.

Tobacco consumption was macroscopically evaluated in 323 individuals from two different British sites (Barton-upon-Humber & London, UK). These were grouped as “Detected” (90), “Undetected” (68), or “Undetermined” (153) based on pipe notches and/or staining. 503 femora micro-samples (including triplicates from 90 individuals) were obtained and subjected to a solid-liquid microextraction, which led to 1006 metabolite extracts used for two sepa-

rated LC-HRMS metabolomic experiments (C18 Reversed-phase and HILIC). 140 less polar/apolar and 250 polar useful metabolites were recovered from which 44 less polar/apolar and 30 polar metabolites were statistically identified as possible biomarkers associated with tobacco consumption in human osteoarchaeological remains. Finally, using the metabolomic data, a mathematical model was created to assign a smoking status to the “Undetermined” individuals. By using a cross-validation of both analytical assays, 119 individuals out of 153 “Undetermined” were placed in the same category, “Detected” or “Undetected”, by both tests.

2 IS EACH CIGARETTE CEMENTING IN OUR TEETH? THE CONSUMPTION OF TOBACCO FROM THE DENTAL CEMENTUM BETWEEN PAST AND PRESENT

Abstract author(s): Perrone, Valentina (Forensic Science Research Group, Department of Applied Sciences, Faculty of Health and Life Sciences, Northumbria University) - Randolph-Quinney, Patrick (Forensic Science Research Group, Department of Applied Sciences, Faculty of Health and Life Sciences, Northumbria University; Department of Human Anatomy and Physiology, Faculty of Health Sciences, University of Johannesburg) - Inskip, Sarah (School of Archaeology and Ancient History, University of Leicester) - Procopio, Noemi (School of Natural Sciences, University of Central Lancashire; Forensic Anthropology Center, Department of Anthropology, Texas State University)

Abstract format: Oral

Dental cementum has been studied mainly to estimate age and season at death in mammalian teeth. Its circannual incremental growth can be used to estimate age within 10 years from real age in adult individuals, which is normally not achievable following traditional anthropological techniques. Three factors make this tissue so useful in biological anthropology: 1) its biorhythm; 2) its low to no remodelling activity; and 3) its continuous growth throughout an individual's life. These features make the cementum a time capsule, enough so that some researchers have tried to use it to detect pathologies or to date life events.

In a recent ongoing study on a modern population, a specific alteration to the cemental pattern of growth was identified in association with smoking habits. This alteration consisted of areas of undefined tissue, where the incremental lines were unobservable. To further investigate this phenomenon and assess its use for understanding past smoking habits, we tested whether the same features were observed in an archaeological population known to use tobacco and to contain individuals that had direct macroscopic evidence for tobacco consumption. The cemetery from Holy Trinity church, Coventry saw burials between 1776-1850 when tobacco was commonly in use by the population.

We assessed teeth from twenty individuals with and without macroscopic evidence for tobacco in the form of dental staining and/or pipe notches and for disruptions to cementum structure as seen in the modern controls. The assessment aimed to understand the smoking habits of this archaeological population in terms of a) the extent of its consumption; b) if tobacco was more commonly consumed by male or female individuals; c) the age at which they started smoking; d) if they stopped in later years or not, finally drawing a picture of the relationship between this population and their consumption of tobacco.

3 DISEASE PREVALENCE AND ITS RELATIONSHIP TO TOBACCO CONSUMPTION IN INDUSTRIAL ENGLAND

Abstract author(s): Davies-Barrett, Anna - Badillo Sanchez, Diego - Serrano Ruber, Maria - Inskip, Sarah (University of Leicester)

Abstract format: Oral

Modern clinical studies of tobacco smoking have demonstrated the extremely detrimental effect of this behaviour on health. Increases in cancers and oral, respiratory, and certain metabolic diseases have all been correlated with tobacco smoking. Smoking in the past is detectable in skeletal human remains by the presence of pipe-facets on the dentition and dental staining. Further, new advances in metabolomics have been successful in identifying the smoking status of past individuals who lack osteoarchaeological evidence. However, little has yet been done to explore the impact of tobacco smoking on the health of past people by comparing smoking-status with disease prevalence rates in human skeletal remains. As part of the UKRI-funded Tobacco, Health & History project, we have identified individuals who smoked using osteoarchaeological and metabolomic methods in two industrial period British populations (St James, Euston and Barton-upon-Humber). This paper compares the prevalence of various diseases in smokers and non-smokers from both sites to investigate the potential impact of tobacco smoking on health in these populations. Furthermore, using an intersectional approach, frequency rates of smoking in different sex, age, and status groups will be identified and the possible cumulative impact of smoking in combination with living environment, occupation, sex, and age in disadvantaged groups discussed.

4 TOBACCO ON THE TRITON – TRACING THE TRANSATLANTIC TRADE, HARBOURS AND CARGO UNDER CAPTAINS FLODBERG’S AND EDLING’S LEAD, 1795-1805

Abstract author(s): Nilsen, Andrine (Rio Göteborg Kultur- och Naturkooperativ)

Abstract format: Oral

Archival records of captain’s instructions, ships journal, bills, cargo records and letters allow us to follow the ship Triton on its journeys between Stockholm/Gothenburg and the Caribbean for a decade, 1795-1805. The ship is under Captain Flodberg’s and Captain Edling’s command for the duration, as part of the Swedish West India Company. The aim of the project is to study the microcosm i.e. the ship Triton, and map harbours, cargo, networks and the people on board, and not the least sailing routes. Although, sugar and traces of slavery are the main topics of the project, tobacco was among the top cargoes listed.

The shipments of tobacco, on what islands it grew, in what harbours it was loaded, what species of tobacco traded, where it was discharged and in what quantities are questions that will be discussed. From an archaeological perspective there is mention of warehouses to store the tobacco in various ports, which gives both the production of tobacco and the storage a spatial property that could be further explored. Another issue is in what ports – “negroe rentals” – were used for the loading and unloading of the tobacco, connecting the produce to the slave trade and exploitative networks of the West Indies and Europe.

5 TRACES OF SMOKEWAYS ON CLAY PIPES AS INDICATIONS OF SOCIOECONOMIC DIFFERENTIATION IN 17TH AND 18TH CENTURY SWEDEN

Abstract author(s): Bergman Carter, Robert (Department of Archaeology and Ancient History, Lund University)

Abstract format: Oral

This paper will present the heuristic concept of smokeways, which is proposed as a means to understand and make salient how clay tobacco pipes and smoking were applied in negotiations of socioeconomic differentiation in the past. Drawing on social practice theory, my ongoing PhD project explores the effects of treating fragments and assemblages of clay tobacco pipes as material remains of consumption practices that, similarly to food and drink, were active in negotiations of socioeconomic status in 17th and 18th century Sweden. By applying a source pluralistic approach to written and pictorial sources, I present evidence that pipe smoking, though almost ubiquitous, was not considered a homogeneous practice, and that both mores surrounding smoking and the pipes themselves were employed to regulate, communicate, and distinguish ideated and correct smokeways from those considered incorrect.

A significant part of my research has been concerned with identifying smokeways specific to different socioeconomic groups and time periods in the documentary record, and subsequently to identifying specific markers that these smokeways may have left on pipe fragments available in the archaeological record. Based on these observations, analyses of clay pipe assemblages from across Sweden show that varying smokeways may indeed explain varying distinct traces in the archaeological record; traces which in turn can be juxtaposed to the specific smokeways of particular socioeconomic groups. I therefore argue that pipe fragments should be afforded the opportunity to act as closely dateable pieces of evidence of the functional roles they played beyond their function as instruments for tobacco smoking, acting as material elements in socioeconomically defined practices of varied smokeways.

6 INTERDISCIPLINARY APPROACHES TO ASSESSING TOBACCO CONSUMPTION: A CASE STUDY OF THREE ENGLISH SITES

Abstract author(s): Inskip, Sarah - Davies Barrett, Anna - Badillo Sanchez, Diego - Serrano Ruber, Maria (University of Leicester)

Abstract format: Oral

Tobacco is one of the most important plants in human history. Its cultivation, commodification, mass production and consumption has had a myriad of effects on the lives of billions of people across the globe. However, scholars of past have barely engaged in the wider ramifications of tobacco use. The history of tobacco and its consumption has largely been dominated through the study of historical sources and documents, while archaeological contributions have largely been limited to studies of clay tobacco pipes, their typologies and dates. While each provide key evidence about the use of this important plant, they only contribute to a partial picture and are biased towards specific users, usually elite males, or tobacco types (pipes). We argue that an interdisciplinary approach that brings together archaeological and historical evidence, and integrates biomolecular methods, offers the greatest potential to reconstruct past tobacco use patterns. We demonstrate this through a case study of three English sites (St James, Euston; Barton upon Humber, Lincolnshire; Holy Trinity, Coventry) where although we find areas of commonality, we also identify clear variation in tobacco consumption between location, gender, ethnicity and lifestyle. From this, we are able to provide a deeper understanding of the variety of reasons that people may have chosen to use tobacco and how

this intersects with various aspects of identity. Critically, this allows us to investigate for the first time how individual and communal choices were important in shaping the tobacco trade. This allows us to link with larger debates about consumerism and the wider impacts of consumer choice in large complex networks.

350 BIO-ARCH METHODOLOGIES TO ASSESS MOBILITY IN THE PAST: THE NEED FOR INTERDISCIPLINARY AND MULTI-PROXY INVESTIGATIONS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Bernardini, Sara (Aix-Marseille Université; Sapienza Università di Roma) - Farese, Martina - Zeppilli, Carlotta (Sapienza Università di Roma) - Micarelli, Ileana (University of Cambridge)

Session format: Regular session

Mobility has always been a constant in past human populations. Several proxies are routinely used to assess short and long-range displacement: e.g. molecular analyses, such as isotopes and aDNA, material culture and osteological studies. The archaeological context is then essential to evaluate the social, economic and cultural drives of human displacements and, therefore, crucial to design research questions and contextualise bio-archaeological results. What is currently needed is an ongoing dialogue between these different fields of research. This dialogue is usually limited to a few disciplines without comprehensively considering all the data available.

This session wants to emphasise the importance of a multidisciplinary approach from the very first steps of the archaeological investigation, not only in the final interpretation of the data. We want to discuss the best practices necessary to perform more comprehensive mobility studies and the limitations that arise when there is no communication between disciplines. Intra-regional mobility reconstructions, in particular, require the involvement of numerous research fields to interpret and contextualise the data. Nonetheless, discussions on long-range displacements will be welcomed, considering their prominent role in mobility studies. We encourage participants to share case studies which would benefit from a cross-disciplinary approach. We will include every proxy used in mobility assessments, such as archaeometric investigation on material culture, biomechanical analyses of long bones, isotopes and aDNA.

The primary focus of this session lies on prehistoric contexts since a lack of written sources makes interdisciplinary approaches essential for reconstructing mobility patterns. Yet, studies on Classical and Late Antiquity cases are welcomed to compare how such interdisciplinary perspectives can be applied to prehistoric and historic contexts.

ABSTRACTS

1 MOBILITY OF LANGUAGES WORLDWIDE (5000 BP-PRESENT)

Abstract author(s): Wichmann, Søren (Kiel University)

Abstract format: Oral

New methods for dating language families or subgroups (Holman et al. 2011) and for inferring their geographical origins (Wichmann and Rama 2021) allow for assessing movements of languages in prehistory. Based on these methods, the present study analyzes more than 2000 diffusion events inferred to have taken place from c. 5000 BP to the present. Rates (=speed) of diffusion can be shown to be higher across the sea and slower at high altitudes. With respect to other kinds of landscape no significant differences in rates can be found. Another observation is that the languages of agriculturalists spread somewhat more rapidly than those of hunter-gatherers. Finally, rates of language diffusion vary across areas and periods, but a shared pattern across most world areas is an increase (peak) in the rates roughly around 4000 BP and 1000 BP. The findings will be compared to insights from archaeology and genetics. These disciplines show environmental conditions on human movements that are generally quite similar to the ones identified in this talk for languages (Fort 2021), suggesting that the spread of languages is largely a matter of demic diffusion, even if languages can and often do spread across populations independently of the movement of people.

2 SHEDDING LIGHT ON THE DARK AGES: RECONSTRUCTING DIETARY HABITS AND MOBILITY PHENOMENA IN MEDIEVAL FLORENCE USING A MULTI-ISOTOPIC APPROACH

Abstract author(s): Giaccari, Matteo (Dipartimento di Scienze della Terra, Università di Roma La Sapienza) - Soncin, Silvia (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances - MAREa - centre, Sapienza Università di Roma) - Pellegrini, Maura (Isotope Mass Spectrometry and High Resolution Elemental Analysis, Thermo Fisher Scientific S.P.A.) - Riga, Alessandro (Dipartimento di Biologia, Università di Firenze) - Di Matteo, Martina (Dipartimento di Scienze Dell'Antichità, Università di Roma La Sapienza) - Lelli, Paolo (Cooperativa Archeologia) - Tafuri, Mary (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances - MAREa - centre, Sapienza Università di Roma)

Abstract format: Oral

Here we aim to reconstruct dietary habits and possible mobility phenomena of individuals recovered from the cloister arcade of San Pier Scheraggio in Florence (11th – 13th century CE) inside the Uffizi complex. To do so, we apply a multi-isotopic approach that combines $\delta^{13}\text{C}$, $\delta^{15}\text{N}$ and $\delta^{34}\text{S}$ used, to our knowledge, for the first time in high/late medieval Italy.

Historical sources suggest that between the Early and Late Middle Ages there was a shift in dietary habits driven by the church. In particular, fish became more important, followed by an increased use of C4 plants and a decreased use of animal products in relation to the social class. The evidence however is limited and mainly based on historical reports and archaeobotanical remains, with a lack of isotopic studies investigating mobility in Tuscany in this period. Hence, there is still the necessity to have direct evidence of the population's food habits and mobility phenomena. This can be obtained thanks to the isotopic analysis of carbon, nitrogen and sulphur in bone collagen.

The overall diet of the population buried at San Pier Scheraggio is in line with that of other Medieval communities from Italy, although with a higher contribution of animal products. We suggest that in Florence there were no dietary differentiations in relation to age or sex. However some differences can be outlined, particularly in the consumption of C4 crops, possibly in relation to the status of the individuals. Although the limited sample size, we could identify at least one individual with a statistically different $\delta^{34}\text{S}$ value, which could be interpreted as non-local.

In general, this study is helping to shed new light on the life of possibly middle/high-status individuals that were given the privilege of being buried in the cloister arcade.

3 THE NECESSITY OF INTERDISCIPLINARY METHODOLOGIES FOR INVESTIGATING THE PAST: A CASE STUDY FROM SOUTHERN FRANCE

Abstract author(s): Holmstrom, Jane (Department of Anthropology, Grinnell College) - Dupras, Tosha (College of Arts and Sciences' Dean's Office, Texas Tech University) - Ardagna, Yann (UMR 7268 Anthropologie bioculturelle Droit Ethique et Santé, AMU-CNRS-EFS, Faculté des Sciences Médicales et Paramédicales de Marseille) - Vidal, Laurent (Institut National de Recherches Archéologiques Préventives, Centre de Recherches Archéologiques)

Abstract format: Oral

The medieval period boasts an extensive written record in many geographical areas, particularly in larger cities. However, in smaller villages or areas that were subject to warfare, written records no longer remain. In southern France, written sources pertaining to the 9th – 13th century Cluniac churches of Saint-Jean de Todon and Saint-Victor-la-Coste are extremely rare.

Without surviving records, analyses of skeletons and material culture are the only ways in which to learn about the people buried in these cemeteries. Further information can be gathered using a combination of additional methodologies. These include isotopic analyses, the use of GIS, and expanded contextual documentation of medieval Christian France. It is through the combination of these methodologies that we can interpret the impact that Christianity had on diet, mobility, status, and diversity within the site. Utilizing GIS to map estimated regions of origin and individual burial location in the cemetery creates new dialogue and generates new questions that otherwise would not have been possible.

Without multidisciplinary biogeochemical analyses, isoscapes would not be available for use by anthropologists interested in mobility studies. It is important to collaborate within the different branches of anthropology as it is to collaborate with other disciplines to gain a more informed understanding of past populations.

4 THE ROAD LESS TRAVELLED: AN INTERDISCIPLINARY, MULTI-PROXY APPROACH TO MOBILITY IN PRE- AND PROTOHISTORIC SCOTLAND

Abstract author(s): Koster, Lucy - Czére, Orsolya (School of Geosciences, University of Aberdeen) - Booth, Thomas - Skoglund, Pontus - Silva, Marina (Ancient Genomics Laboratory, The Francis Crick Institute) - Curtis, Neil (Museums and Special Collections, University of Aberdeen) - Britton, Kate (School of Geosciences, University of Aberdeen) - Girdland Flink, Linus (School of Geosciences, University of Aberdeen; School of Biological and Environmental Sciences, Liverpool John Moores University)

Abstract format: Oral

This paper presents the theoretical background to, and preliminary results of, a PhD project employing aDNA, dietary isotopes, and mobility isotopes to investigate prehistoric and protohistoric populations within the geographic boundaries of modern Scotland. The integration of biomolecular analyses – aDNA (to investigate biological relatedness and genetic ancestry), dietary isotopes ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $\delta^{34}\text{S}$), and mobility isotopes ($\delta^{18}\text{O}$, $87\text{Sr}/86\text{Sr}$, $\delta^{34}\text{S}$) – has been at the core of the study from conception. The key aim is to produce biogeochemical profiles of skeletal individuals for reconstruction and inference of certain aspects of life history, including residence patterns and relatedness amongst burial populations. Interdisciplinary perspectives from osteoarchaeology, excavation records, historical perspectives, and curatorial concerns, among others, have been integrated into project design.

The presentation will specifically focus on how placing the individual, rather than a specific analytical technique, at the core of the project enables more nuanced critical discussions of individual mobility and life history. This includes interrogation of the use of concepts such as ‘local’ in relation to both isotopic and genetic data, and how a more nuanced appraisal of the data can be used to look at intra-regional and fine-scale mobility as well as wider-scale mobility, especially in combination with other forms of archaeological information. Emphasis will also be placed on the importance of considering different data as they relate to different temporal scales, and how ‘conflicting’ or ‘ambiguous’ results can in fact provide greater insight into the life history of an individual. Lochhead Quarry, an early medieval long cist cemetery, will be used as a case study.

5 QUO VADIS, PEREGRINUS? EASTERN GERMANICS IN ANGERS (FRANCE) AT THE END OF ANTIQUITY

Abstract author(s): Souquet, Isabelle (Institut National de Recherches Archéologiques Préventives; University of Bordeaux) - Briceno-Boucey, Lola (University of Bordeaux) - Guillon, Mark (Institut National de Recherches Archéologiques Préventives; University of Bordeaux) - Pruvost, Mélanie (CNRS; University of Bordeaux)

Abstract format: Oral

The excavation of the surroundings of the Saint-Laud station in Angers (France) in 2000 brought to light a late-antique necropolis used between the IInd and the Vth century. Within the buried population, a group of individuals is differentiated by the presence of ornaments and objects deposited in the burial, characteristics of the civilization of Tcherniakov whose origin is about 3000 km away, north of the Black Sea and to the Lower Danube.

Other clues, such as the biological characterization of these individuals and the orientation of their burial, also differentiate them. But at the same time, their burial, within this necropolis itself, highlights their integration into the population.

The question of mobility therefore arises, on the scale of this Eastern Germanic grave goods on the one hand and of these individuals, on the other, between the cradle of origin of this population and their place of burial.

In the context of the “Migration Period” at the end of Antiquity, the presence of this grave good carried by individuals for whom the funerary practice differs from other burials challenged us and led to various interdisciplinary questions on the processes of transfer or migration of populations and/or cultural objects: has there been a migration of individuals with their grave goods or are we in the presence of acculturation? Who are these individuals? Was there interbreeding? What places/roles do they have in this society? What process (identification and role) brought these individuals and/or this material culture to the far west of the Roman Empire?

This communication presents the most recent results of different interdisciplinary research paths (archaeological, anthropological, paleogenomic and historical) used to respond to the problem of mobility through the filter of material culture, individuals and funerary practices.

6 TRADITIONAL AND NOVEL INSIGHTS TO INVESTIGATE HUMAN PROVENANCE IN LUCUS FERONIAE USING STRONTIUM ISOTOPES

Abstract author(s): Farese, Martina (Department of Environmental Biology, Sapienza University of Rome; Mediterranean bioArchaeological Research Advances - MAREa - centre, Sapienza University of Rome) - Bernardini, Sara (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA; Department of Environmental Biology, Sapienza University of Rome) - Zeppilli, Carlotta (Department of Environmental Biology, Sapienza University of Rome) - Micarelli, Ileana (McDonald Institute for Archaeological Research, University of Cambridge) - Fernandes, Ricardo (Max Planck Institute of the Geanthropology; Climate Change and History Research Initiative, Princeton University; Department of Archaeology and Museology, Masaryk University, Faculty of Art) - Tafuri, Mary Anne (Department of Environmental Biology, Sapienza University of Rome; Mediterranean bioArchaeological Research Advances - MAREa - centre, Sapienza University of Rome)

Abstract format: Oral

An interdisciplinary research has been carried out on a subsample of individuals from the Roman cemetery of Lucus Feroniae (Rome, Italy). The site, located 30 km north of Rome, was a rural village during the Roman Empire (I-III cent. CE). The archaeological record suggests it was inhabited by locals, war veterans (from the legions of Caesar and Augustus) and freed slaves. Given the scarcity of available data on members of the working class during this time period, we wanted to reconstruct the origins, mobility patterns and living conditions of the people buried outside the village of Lucus Feroniae. Due to the lack of archaeological evidence from the cemetery to address this issue, we have combined palaeopathological studies and strontium isotope analysis ($87\text{Sr}/86\text{Sr}$). Six individuals (three females and three males) with pathological signs on the skeleton of harsh living conditions - identifying them as probable members of the working class - have been selected for a strontium isotope study on dental enamel. To identify the place of origin of the six individuals a baseline of the geological setting of Lucus Feroniae has been created using: human bones, animal teeth and bones and soil samples from the site; as well as soil values collected from the literature. Since strontium values are connected to the geological signature of the area, several places - close or far away from each other - may present similar isotopic values. To overcome this limit, a Bayesian approach - using the AverageR and LocateR models available through the Pandora and IsoMemo initiatives - has been applied to estimate the probability of an area being the place of origin of these individuals, and explore their life histories.

7 BIOMECHANICAL ANALYSIS OF PHYSICAL ACTIVITY IN A MEROITIC CEMETERY FROM NORTHERN SUDAN

Abstract author(s): Casquero Muñoz, Mar - Ríos Frutos, Luis (Universidad Complutense de Madrid)

Abstract format: Oral

We present the biomechanical study of humerus and tibia of the skeletons recovered from the Nubian Meroitic cemetery of Amir Abdallah (northern Sudan). This necropolis was excavated between 1978 and 1981, and 389 skeletons were recovered from 377 tombs, dated from the third to the first centuries BC from radiocarbon analyses. Our objective was to explore the levels of ambulatory activity and upper limb workload from the analysis of solid cross-sectional images of tibia and humeri. Only adult skeletons were selected for the study, whose osteological sex was estimated through metric analyses of the pelvic bone (DSP2 method), with a total of 52 males and 78 females. Tibiae and humeri were scanned with a surface scan, and solid cross-section images were obtained from the models at the mid-diaphysis. Biomechanical parameters were obtained with the BoneJ software, and statistical analyses were carried out to estimate differences between sexes in the shape index ($I_{\text{max}}/I_{\text{min}}$) of tibia (ambulatory activity), and in the bilateral asymmetry of the second polar moment of area (J) of the humerus (upper limb workload). There were no differences between sexes for the shape index of the tibia (male=2.21, female=2.11, $p=0.157$), from which we infer that there were no differences in ambulatory activity between sexes. In comparative terms, this value is similar to control, urban current populations. Regarding the humerus, no significant differences were observed between sexes for the asymmetry in the standardized polar moment of area (male=10.33, female=11.64, $p=0.703$), from which we infer that there were no differences between sexes in physical tasks involving the development of humeral asymmetry. We discuss the information that these results offer regarding the social structure of the Meroitic society represented by this cemetery.

8 THE ADDED VALUE OF CALCINED PARS PETROSA OSSIS TEMPORALIS AND TEETH TO THE STUDY OF PAST MOBILITY

Abstract author(s): Frère, Anneminne (Multidisciplinary Archaeological Research Institute - MARI, Vrije Universiteit Brussel; Analytical, Environmental & Geo-Chemistry Research Unit - AMGC, Vrije Universiteit Brussel) - Loeffelmann, Tessi (Multidisciplinary Archaeological Research Institute - MARI, Vrije Universiteit Brussel; Analytical, Environmental & Geo-Chemistry Research Unit - AMGC, Vrije Universiteit Brussel; Durham University) - Veselka, Barbara (Multidisciplinary Archaeological Research Institute - MARI, Vrije Universiteit Brussel; Analytical, Environmental & Geo-Chemistry Research Unit - AMGC, Vrije Universiteit Brussel) - Snoeck, Christophe (Multidisciplinary Archaeological Research Institute - MARI, Vrije Universiteit Brussel; Analytical, Environmental & Geo-Chemistry Research Unit - AMGC, Vrije Universiteit Brussel)

Abstract format: Oral

To date, several cremation deposits from archaeological contexts in modern day Belgium have been investigated using a multidisciplinary approach, whereby mobility was examined via strontium isotope analysis of calcined rib, diaphysis and cranial bone fragments. The strontium isotope ratios measured on these different skeletal elements showed a wide variation which, with reference to plant samples from the area, are suggestive of mobility and/or changes in landscape use during the last decade or so of the cremated individuals' lives. With few exceptions, these previous studies did not include the sampling of the pars petrosa (PP) and teeth, although these elements can provide information about childhood residence. The aim of this present study was to explore the potential of sampling early-forming skeletal tissues for strontium isotopes, and to compare the results to previously studied material.

Strontium isotope analyses were performed on the fully calcined PP and teeth from Herstal and Court-Saint-Étienne, two Late Bronze Age – Early Iron Age cremation sites in the region of Belgium. The inner cortex of the otic capsule (PP) was sampled. This part contains isotope ratios reflective of the strontium ingested during infancy and early childhood (up to 2 years of age). Furthermore, the teeth were determined whenever possible, since each tooth type represents a different age span. The differences observed between childhood (PP and dentition) strontium isotope ratios and those of continuously remodeling skeletal tissues (cranium, diaphysis, rib) were highly indicative of changes in diet or in the place of residence during the life of these individuals, allowing us to deepen our understanding of the sites in the context of the period.

This pilot study on cremation deposits from LBA–EIA Belgium demonstrates that including these skeletal tissues reflecting early childhood strontium intake is essential when trying to understand mobility of individuals and populations in the past.

9 EVALUATING MOBILITY IN THE NORTH PONTIC STEPPE IN THE 5TH MILLENNIUM BCE

Abstract author(s): Nikitin, Alexey (Grand Valley State University)

Abstract format: Oral

The Eneolithic period in the North and West Pontic regions is characterized by the formation of continent-wide interactions that involved the farming, salt-producing, and metalsmithing communities of the West Pontic and their nomadic steppe neighbors in the North Pontic. The establishment of the Balkan-Carpathian metallurgic center led to the emergence of trade in metal goods and technology between the producers of metal goods and the consumers of these products in the circum-Pontic area. Mediators of the trade activity were the steppe groups of the North Pontic belonging to the Serednii Stih (Sredny Stog) horizon. Within this horizon, the Suvorove-Novodanylivka (SuNo) archaeological complex is distinguished by its extravagant funeral inventory as well as its extension into the Varna-Karanovo VI-Gumelnița (VKG) territory in the eastern Balkans. Recent stable isotope and ancient DNA analyses revealed heterogeneity in genetic ancestry and subsistence of SuNo groups, likely connected with intra-regional mobility. Newly obtained radiocarbon dates suggest that SuNo disappeared as an archaeological culture shortly after the Black Sea level rise ca. 4200 BCE, coinciding with the demise of VKG groups in the west Pontic. It remains an open question whether SuNo actively contributed to the end of VKG, or if both culture groups fell victim to the same climatic transformations.

10 WHERE YOU GREW UP WRITTEN IN BONES: A RENEWED VISION OF SWISS ALPINE AGRO-PASTORAL SOCIETIES

Abstract author(s): Desideri, Jocelyne - Rosselet-Christ, Déborah (Archaeology of Africa & Anthropology Laboratory - ARCAN, University of Geneva)

Abstract format: Oral

The Swiss Alps are an exceptional territory, as much by its position at the crossroads of various spheres of influence as by the discoveries of major importance for the understanding of ancient periods. Our project concerns the study of neolithic societies across the Swiss Alps using an interdisciplinary approach by combining isotope geochemistry,

dental nonmetrics, aDNA analysis and palaeopathology to understand the evolution of diets, subsistence practices and mobility of these human groups.

While the studies are still in progress, we present here some of the results on mobility through the analysis of dental nonmetrics and isotopes analysis.

The study on dental morphology supports the idea of a certain mobility starting mostly during the Final Neolithic and developing during the Bell Beaker period in this region. A mobility that seems to come from Western Europe according to dental nonmetrics. Samples were additionally analysed for isotope values. The results obtained are consistent with those provided by the dental morphology, supporting the increase of individuals mobility during the late Neolithic in the Alps. In addition, these results reveal interesting elements about the individuals identified as having changed “geological residence” during their lifetime. More than 30% of the Late Neolithic population is outside the local values and this concerns adults and immatures. Nearly 30% of the Bell Beakers are outside the local values, but this is only for adults.

11 NEW PERSPECTIVES ON HUMAN MOBILITY IN LATE/FINAL NEOLITHIC BELGIUM USING STRONTIUM AND OXYGEN ISOTOPIC ANALYSIS

Abstract author(s): van Hattum, IJk (ArcheOs - Research Laboratory for Biological Anthropology, Department of Archaeology, Ghent University) - Costas-Rodriguez, Marta (Centro de Investigación Mariña, Universidade de Vigo, Departamento de Química Analítica y Alimentaria) - Hobin, Kasper (Atomic & Mass Spectrometry research group, Department of Chemistry, Ghent University) - Bodé, Samuel - Robert, Prudence (Isotope Bioscience Laboratory - ISOFYS, Department of Green Chemistry and Technology, University of Ghent) - Toussaint, Michel (Association Wallonne d'Études Mégalithiques, Liège) - Cattelain, Pierre (Cedarc/Musée du Malgré-Tout, Treignes; CReA-Patrimoine, Centre of Archaeological Research and Heritage, Free University of Brussels) - Vandendriessche, Hans - Crombé, Philippe (Department of Archaeology, Ghent University) - De Groote, Isabelle (ArcheOs - Research Laboratory for Biological Anthropology, Department of Archaeology, Ghent University)

Abstract format: Oral

In Belgium, human remains from the Neolithic period were mainly recovered from caves in the Meuse Basin. The funerary caves are characterized by multiple or collective interments and commingled remains. Some funerary caves date to the Middle Neolithic (ca. 4300-3700 cal BC), but most date to the Late and Final Neolithic period (3700 - 2000 cal BC) in Belgium. During the latter period, some of the dead were also interred in megalithic tombs. A cluster of dolmen extends over an elevated area, surrounded by cave burials in the lower river valleys. For a long time, these Late/Final Neolithic dolmen and funerary caves were attributed to the Seine-Oise-Marne (SOM) culture. Although the presence of the SOM culture in this region is no longer believed to be accurate, hypotheses of contact with Northern France and connections between the people that used funerary caves and dolmen remain. Diagnostic archaeological finds from burial contexts are scarce and the commingled state of skeletal remains limits the potential of standard osteological methods. Strontium and oxygen isotopic analysis of dental enamel can provide new perspectives on prehistoric human mobility on an individual level. This presentation reports the $87\text{Sr}/86\text{Sr}$ and $\text{O}-18$ values of 26 individuals from five Late Neolithic archaeological sites: Trou des Blaireaux (n=3), Grotte Ambre (n=4), Grotte de la Faucille (n=12), L'abri-sous-roche d'Hottemme (n=5), and the dolmen of Wéris II (n=2). Additionally, we present $87\text{Sr}/86\text{Sr}$ values of plant and faunal remains which function as local baselines. Based on the isotopic data several 'non-locals' could be identified. We explored what the isotopic data may reveal about places of origin, connections between the Late/Final Neolithic people from different funerary contexts, and contacts outside current Belgium. Lastly, we compared our findings to other isotopic mobility studies of Neolithic populations throughout Europe, to place the study in a wider context.

INTERDISCIPLINARY INVESTIGATIONS OF BURIAL COMMUNITIES OF THE AVAR PERIOD IN THE CARPATHIAN BASIN: MOBILITY, DIET, KINSHIP AND SOCIAL DIFFERENTIATION

Abstract author(s): Knipper, Corina (Curt Engelhorn Center for Archaeometry - CEZA) - Faragó, Norbert (Institute of Archaeological Sciences, Eötvös Loránd University) - Gneccchi- Ruscone, Guido (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Rácz, Zsófia - Samu, Levente (Institute of Archaeological Sciences, Eötvös Loránd University) - Szeniczey, Tamás (Department of Biological Anthropology, Eötvös Loránd University) - Friedrich, Ronny (Curt Engelhorn Center for Archaeometry - CEZA) - Le Roux, Petrus (Department of Geological Sciences, University of Cape Town) - Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University; Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

The Early Middle Ages are an ideal context for interdisciplinary studies on the role and scale of residential movements of people in the past. Historical sources and cemeteries with excellently preserved skeletal remains and elaborated grave goods provide the framework for respective hypotheses and theoretical conceptions. The recent application of aDNA and isotope analyses in combination with archaeological, anthropological and historical investigations provides new data to reflect on migration and mobility. Here, we present a case study from the Avar period (late 6th to early 9th ct. AD) in the Carpathian Basin, which is part of the current interdisciplinary ERC HistoGenes project. aDNA analyses of entire cemeteries uncovered extensive multi-generational pedigrees, a residential system that was based on patrilineality, patrilocality and female exogamy, as well as indication of a community shift between the Early and the Middle Avar period. A subsample of the skeletal remains was tested for the isotope compositions of strontium in tooth enamel and carbon and nitrogen in bone collagen. The genetic identification of the presence or absence of the parents of the sampled individuals at the same sites provides a unique context for the exploration of questions on possible origins of founding individuals (i.e., lineage fathers), exogamous females (i.e., lineage mothers) and unrelated individuals. Strontium isotope data provided sparse indications for people coming from geologically different locations. They mostly suggest local residential continuity as well as regional connections among communities in similar environmental settings. A community shift that is supported by them carrying East Asian genomic ancestry, descending from Mongolian Steppe people and archaeological information is also reflected in $\delta^{13}\text{C}$ values that point to a decrease in millet consumption over time. Moreover, $\delta^{15}\text{N}$ data indicate higher shares of meat and/or dairy products in some male individuals that often accompany elaborated grave goods and reflect social differentiation.

ORIGINS OF THE EARLIEST FARMERS IN CENTRAL CHINA: A LITHIC PERSPECTIVE

Abstract author(s): Li, Weiya (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Departament d'Història i Història de l'Art, Universitat Rovira i Virgili; Department for the History of Science and Scientific Archaeology, University of Science and Technology of China)

Abstract format: Oral

The origins of early agricultural societies have been the subject of major interest for archaeologists over the past decades. China was one of the world's oldest primary centres of independent agricultural development. The most thoroughly studied early agricultural societies in China are located along the Yangtze and Yellow River Valleys, which provide some of the oldest firm evidence for rice (*Oryza sativa*) and millet (*Setaria italica* and *Panicum miliaceum*) farming respectively. Notably, the upper catchment of Huai River, a transitional climatic zone between northern and southern China, also has some of the first significant occurrences of cultivated rice, domesticated animals, and ground stone tools (i.e., stone sickles and stone shovels) that have been linked to agricultural practices at the archaeological site of Jiahu (9000 to 7500 BP), making this population the earliest farmers in Central China. One of the hypotheses is that the Jiahu people probably migrated from southern China along the coastline. This assumption is based on the evidence that sea levels have risen in Southeast China since around 20,000 years ago, thus humans who lived by the coast had to move to higher locations (e.g., Central China). This talk presents the project that explores whether it may be possible to link the Neolithic farmers at the site of Jiahu in Central China and their potential places of origin through their stone toolkits, from the technological, typological, and functional perspectives. Some preliminary results regarding the typology and technology of the chipped stone tools at Jiahu will also be presented.

INSIGHTS INTO THE MOBILITY OF MIDDLE PLEISTOCENE HOMININS

Abstract author(s): Riga, Alessandro (Department of Biology, University of Florence) - Profico, Antonio (Department of Biology, University of Pisa) - Mori, Tommaso (Department of Biology, University of Florence) - Bondioli, Luca (Department of Cultural Heritage, University of Bologna; Servizio di Bioarcheologia, Museo delle Civiltà) - Marchi, Damiano (Department of Biology, University of Pisa; Centre for the Exploration of Deep Human Journey, University of Witwatersrand)

Abstract format: Oral

Mobility can be intended as the study of seasonal movements across a landscape and it is part of the study of settlement systems (Kelley 1983); in this framework, mobility can be residential (all the group moves from a residential base to another) or logistical (individual or small groups move) (Binford 1980). Information on mobility from Middle Pleistocene is limited because fossils are scarce and often fragmented. Indirect evidence may be obtained by collecting data on the paleoenvironment such as : i) spatial distribution of the sites, ii) provenience of raw material, iii) isotopic evidences. Some of these works suggest a low range of residential mobility.

In this contribution, we approach mobility studies focusing on the analysis of human remains from a biomechanical perspective. Functional morphology and paleopathology are crucial to reconstruct the loading history of past individuals. A review of the Middle Pleistocene fossil record reveals a high prevalence of metatarsal stress fractures compared to later periods. Metatarsal stress fractures are linked to high levels of physical activity experienced by the individual. This evidence suggests high logistical mobility, likely for feeding purposes. In modern hunter-gatherers, two main mobility strategies have been recognized (Binford 1980): i) the foragers, who have high residential mobility and low logistical mobility; ii) the collectors, who have low residential mobility and high logistical mobility. Merging the information provided by different lines of evidence, we propose that Middle Pleistocene hominins experienced a mobility pattern typical of modern collectors, with low residential mobility and high logistical mobility.

AGE FOR A SLOW ARCHAEOLOGY, OR HOW TO SURVIVE IN THE NEO-LIBERAL FAST ACADEMIA [AGE]

Session theme: 6. Contested Pasts & Presents

Session organisers: Monton-Subias, Sandra (ICREA; Pompeu Fabra University) - Gaydarska, Bisserka (University of Durham)

Session format: Round table

In 2009, the first official meeting of AGE (Age and Gender in Europe) took place in the shape of a much-needed round table to discuss gender and archaeology in Europe. Fourteen years later, it is time to meet again within this format to discuss a concern that is gaining momentum among both members and non-members of AGE: how to survive in an individualistic and self-accelerated neo-liberal academia that increasingly demands devoting life to work.

This concern is especially pertinent for feminist archaeologists. Feminist archaeology has made other pasts possible through incorporating historiographic silences into its research agenda; through acknowledging dynamics related to the creation, maintenance, and recreation of life; and highlighting social bonds, affective capacity, interdependence, cooperation and care as foregrounding social life. Such discourses about the past have opposed the neo-liberal patriarchal logic that ignores what is fundamental to human life. Is it possible to also oppose this rationale in the professional practice of the present? How can such a drive co-exist with working in institutions and programs of power-knowledge guided by antagonistic inner logics that sustain and recreate neo-liberal patriarchy?

The diagnosis is clear. Departing from it, we seek to discuss different strategies to navigate these structural discrepancies without being engulfed or politically deactivated by a fast academic culture of productivity that: a) rewards instant revenue, production and accumulation at whatever cost, and technology fetishization; b) permits power abuse and patriarchal violence; c) penalizes critical reflective thought that delivers results in the long-term. We seek therefore to discuss how to practice a de-growth slow feminist archaeology that decelerates archaeology (and science). Now that we have made other pasts possible, how can we make other academies feasible?

Several speakers from different countries and academic backgrounds will present their insights as an initial step in a general debate.

THE RIVER BASIN AND ESTUARIES IN THE ANTIQUITY: ENVIRONMENT AND SETTLEMENT

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Lagóstena, Lázaro (University of Cádiz) - López-Medina, María-Juana (University of Almería) - Bivolaru, Alexandra (Ca'Foscari University of Venice) - Aragón-Nuñez, Enrique (University of Almería)

Session format: Regular session

This session focuses on the river basin and estuaries as a geographical unit of reference, already perceived by classical cultures, a space currently revalued as a critical unit for the management of the environment and water resources, especially in contexts of climate change. This session proposal for the Belfast 2023 EAA focuses on two main perspectives, the first of which is of a theoretical and conceptual nature, centred on the analysis of the perception, function, representation and conceptualisation of river basins and estuaries in Greco-Latin thought and its subsequent evolution. The investigation of their potential as a well-defined geographical space with specific territorial and legal problems, defined in classical sources, is a novel proposal in the national and European research panorama. The second perspective, of a practical nature, focuses on case studies representative of these contexts and can show historical problems linked to their occupation by past societies. The aim is to create a forum for discussion of case studies that show interconnected problems, preferably related to the characteristics and conditions of each of these environments – river basins and estuaries – which are always affected by the anthropic actions caused by practices in the field. Thus, issues such as population occupation strategies and their conditioning, economic exploitation, crops, forestation and deforestation processes, adaptation to the environment and resilient attitudes in adverse circumstances, water management, or practices in the face of phenomena such as floods, erosion and alterations to riverbeds, or sedimentation and geomorphological changes, are some of the topics that will be addressed in this session. Special attention will be given to the methodology applied to these archaeological contexts, where priority will be given to the use of novel research techniques, such as non-invasive methods, which have proven to be highly effective in recent years.

ABSTRACTS

1 THE MUNICIPIUM IGNOTUM OF GIBALBIN AND ITS FLUVIAL CONNECTIONS TO THE GUADALQUIVIR AND GUALETE BASINS

Abstract author(s): Lagóstena, Lázaro - Rondán-Sevilla, Isabel María (Universidad de Cádiz)

Abstract format: Oral

The archaeological site of Gibalbín (Jerez de la Frontera, Cádiz, Spain, Roman province of Baetica), originated in protohistoric times and occupied until the Andalusian period, shows characteristics of an urban settlement, although its ancient name is unknown. There are several archaeological elements that confirm its relationship with maritime exports. Its location is strategic, occupying the watershed between the river basins of the Guadalquivir and the Guadalete in its final stretch. Towards the Guadalquivir, to the northwest, the city was connected to the sea through the estuaries of the ancient Lacus Ligustinus, while the connection with the Guadalete River, to the southeast, could have been established through a wetland, today fossilized in the so-called Llanos de Caulina. In this contribution we analyze the role exercised from Gibalbín in the control of the territory and in the maritime-fluvial communications, through the connectivity of the site with the fluvial basins of both rivers.

2 THE OPPIDUM OF MEGABLUM: CONTROLLING THE SALADO DE CONIL BASIN (CADIZ, SPAIN) AND ITS ACCESS TO THE ATLANTIC COAST AND RESOURCES

Abstract author(s): Aragón, Enrique (Universidad de Almería) - Rondán, Isabel - Lagóstena, Lázaro (Universidad de Cádiz)

Abstract format: Oral

The archaeological site of Cerro Patria (Vejer de la Frontera, Cádiz, Roman province of Baetica) has been identified with the settlement of Mergablum mentioned by the itinerary sources (Antonine Itinerary; Anonymous of Ravenna). This oppidum, currently located approximately 7 km from the coast, controls the basin of the Salado de Conil, the mainstream in the area. This waterway would have connected the town to the Atlantic coast and provided access to a strategic area for tuna fishing and catching, as has been the case on this coast up to the present day, as shows the Castilnovo traps are located here, active in modern and contemporary times. The site has not been studied archaeologically to date, although, in a preliminary assessment, its occupation would not have lasted beyond the change of era, when the population was probably moved to what is now the town of Conil de la Frontera. Mergablum seems to have been a critical element in the territorial control and communications associated with the via Heraklea, and the

Salado river basin seems to have undergone significant transformations. In this contribution, we assess the archaeological reality of the site and its function of territorial control and coastal resources through the dominance of the river network and land communications.

3 SETTLEMENT AND ENVIRONMENT IN THE LOWER BASIN OF ANDARAX RIVER AND THE CABO DE GATA-NÍJAR NATURAL PARK (ALMERIA-SPAIN) DURING ANTIQUITY

Abstract author(s): López-Medina, María-Juana - Aragón-Núñez, Enrique - Román-Díaz, María-De-La-Paz - García-Pardo, Manuela - Martínez-Padilla, Catalina (University of Almería) - Lagóstena-Barrios, Lázaro (University of Cádiz) - Morhange, Christophe (Aix-Marseille-University; CEREGE) - Devillers, Benoît (Université Paul-Valéry - Montpellier 3; CNRS)

Abstract format: Oral

Examining an arid area such as the southeast of the Iberian Peninsula over time, river valleys and streams have been a magnet for the settlement of populations throughout history. In this specific case, we are going to focus on the eastern sector of the Bay of Almería (Spain), in the lower courses of the Andarax river and the wadis of the Cabo de Gata-Níjar Natural Park, such as the Amoladeras and Morales wadis, where we have carried out geoarchaeological surveys. The relationship between the settlement of the Roman period and the ancient palaeo-estuaries formed in these low basins will be discussed. In this sense, the territory studied includes relevant roman sites such as the city of Urci (El Chuche, Benahadux) and the port of Portus Magnus (Almería) concerning the palaeo-estuary of the river Andarax, documented by G. Hoffmann, or the officina purpuraria of Torregarcía (Cabo de Gata-Níjar Natural Park, Almería) linked to the Amoladeras stream.

4 POCITO CHICO AT LAGUNA DEL GALLO (SW SPAIN): A SETTLEMENT PATTERN IN AN ENDORHEIC PALEO-LAGOON

Abstract author(s): Catalán González, Francisco Javier - Ruiz Gil, José Antonio (University of Cádiz)

Abstract format: Oral

The case study of an inland water sub-basin (an endorheic lagoon) located between the mouths of the Guadalquivir and Guadalete rivers on the Atlantic side of the Iberian Peninsula is presented. This is a case study centred on the Laguna del Gallo, which was documented at the end of the 1990s using a traditional archaeological methodology, consisting of surface surveys, an archaeological excavation at the Pocito Chico farmhouse and a paleoenvironmental study based on the pollen analysis carried out at the site.

Recently, these investigations have been extended with geophysical surveys and aerial orthophotography by the Geodetection Unit of the University of Cadiz.

Based on this knowledge, the study of the paleo-lagoon is proposed for this work using LiDAR with the objectives of delimiting its outline, defining its basin and the collectors that communicate it with the main rivers and the georeferencing of the human settlements concerning the historical limits, positioning the settlement within a hierarchical historical pattern. All this information is worked with GIS methodology and the comparative analysis of cartography and historical photography, allowing the interaction between society-environment produced in this landscape environment to be specified.

5 SMALL STUARINE SYSTEM OF RIVER IRO BASIN. (BAY OF CÁDIZ, SPAIN). SETTLEMENTS, GEODYNAMICS AND HIDROSYSTEMS DURING ANTIQUITY

Abstract author(s): Ruiz Barroso, Manuel - Villalpando-Moreno, Antonio - Lagóstena, Lázaro (Universidad de Cádiz)

Abstract format: Oral

The aim of the work focuses on the study and delimitation of the basin of a minor fluvial channel associated with the estuary system of the Bay of Cádiz. It is the Iro River, a semi-permanent channel that articulates the maritime-land interconnection of Medina Sidonia and Chiclana de la Frontera, uniting important settlements from the

Orientalizing period to classical antiquity. At this area we can find connect through the river basin a Phoenician location at Cerro del Castillo (Chiclana de la Frontera), a settlement with remains from Bronze Age until Punic times at El Berrueco (Between Chiclana de la Frontera and Medina Sidonia), and the town of Medina Sidonia. The city of Medina Sidonia, roman Asido Caesarina, becomes the main human settlement in the River Iro basins. The historic remains of this city begins at Bronze Age and have continuity throughout the time until today. At ancient times, Iro River connect the ancient city of Asido Caesarina with Bay of Cádiz, but it could be used for navigation just in the river mouth area, far away from where town was placed. Therefore, we try to study a mixed connection, which used maritime and terrestrial transport.

As a novelty, characterization of the hydrological basin and the endorheic complexes attached to it, the relationship with the documented productive activities and communications are incorporated. It's intended to contribute to the knowledge of ancient settlement models related to minor waterways and the interrelation of settlement with historical hydrosystems.

6 MODELLING RIVER NAVIGATION IN THE PAST: GENERAL METHODOLOGY AND CASE STUDIES ON HISPANIC RIVERS

Abstract author(s): Trapero Fernández, Pedro (Cádiz University) - Aragón, Enrique (Almería University) - Carneiro, André (Évora University) - Catalán, Javier - Fernández, Pablo (Cádiz University) - Marques, Joana Margarida (Évora University)

Abstract format: Oral

In the past, rivers were strategic places to access water and the economic uses for it, but also because they were obstacles or communication routes. Except in cases where we know from literary sources the navigability of a river, it is very difficult to study if the river fulfilled the conditions for the transport of people and goods. In this paper, we propose a methodology using Geographic Information Systems to calculate the maximum navigable potential of a river at a given time. The method consists of three phases. First, we study the sources that indicate the navigation of each river or others nearby, whether literary or archaeological. Second, we study the natural factors that have modified this space, such as the sedimentary process, geology and others. Most rivers have extensive current hydrological analyses that facilitate this work. Third, we study the potential maximum water depth under certain conditions, either by tidal influence or sufficient flow of the river itself. To contrast this method, we applied this method to a case studies river. We focus on the Iberian Peninsula due to the differences between the Mediterranean Sea and the Atlantic Ocean in Roman Times. Especially in the roman province of Baetica, with three case studies, Guadalquivir, Guadalete and Barbate rivers. The navigability of the Guadalquivir is well demonstrated by ancient sources and studies and is therefore the basic case study for establishing comparisons. We also use as examples rivers from other Hispanic provinces as the Andarax and Almanzora (Tarraconense) and Tagus and Vouga (Lusitania).

7 SETTLING STRATEGIES OF HUMAN COMMUNITIES IN PANNONIAN HOLOCENE RIVERSCAPE. A MICROZONE CASE STUDY FROM BANAT (ROMANIA)

Abstract author(s): Floca, Cristian (Institute for Banat Studies "Titu Maiorescu" of the Romanian Academy, Timișoara Branch) - Sipos, György (Department of Geoinformatics, Physical and Environmental Geography, University of Szeged) - Gogâltan, Florin (Institute of Archaeology and History of Art of Cluj-Napoca) - Bartyik, Tamás (Department of Geoinformatics, Physical and Environmental Geography, University of Szeged) - Hegyi, Alexandru (Center for Southeast Asian Studies, Kyoto University, Kyoto; West University of Timișoara) - Filyó, Dávid (Department of Geoinformatics, Physical and Environmental Geography, University of Szeged)

Abstract format: Oral

Considering water as a vital resource around which human settlements have gravitated and thrived over time, we have developed a way to explore how the hydrological network from a landscape within the Eastern Pannonian Plain was used by Holocene human societies to their advantage.

Our study's carefully researched micro-zone is situated in the Banat region's lowland (today Romania), covers an area of about 5000 hectares and is naturally delimited by the Pogăniș stream alluvial fan. Here, we have been able to identify seven different generations of this stream, spatially separated, and more than 150 human settlements (from the early Neolithic to the present).

In an attempt to maintain balance between the benefits and disadvantages of living near a river, the communities swing in the choice of establish their settlement between joining an active river, a fossil channel or simply avoiding any watercourses.

Nevertheless, this aspect is quite difficult to understand without establishing an absolute chronology of each fossil river channel. Thus, besides generating a distribution map of historical human settlements, our aim is to recreate a part of the local paleo-hydrography by combining various methods.

The former human settlements were mapped through a systematic field survey of the entire area. The reconstruction of the paleochannel network in order to grasp the micromorphology of the occupied or uninhabited areas was carried out by using high-resolution LiDAR data. Finally, we drilled into the old riverbeds to collect sediment samples in order to perform Optically Stimulated Luminescence (OSL) dating for generating an absolute chronology for each paleochannel.

The correlation of these approaches results enables the reconstruction of the spatial and temporal relationship between the human of the past and the nearby water supply.

8 REMOTE SENSING APPLIED TO ARCHAEOLOGICAL LANDSCAPE ANALYSIS OF LOW GUADIANA MENOR RIVER WITHIN AQUIVERGIA PROJECT

Abstract author(s): Ortiz, Antonio (University of Jaén)

Abstract format: Oral

Interaction of ancient communities with their immediate surroundings are key aspect to understand the evolution of the landscape and how this relation has affected the surrounding landscape in especially sensible ecosystems such us river basins and estuaries. Being aware of the importance of such aspects on the configuration of Landscape and the knowledge that can be extracted about their exploitation, and how they can be extrapolated to present day initiatives, one can ask himself how can we identify the influence of human activities in ancient landscape beyond traditional methodological approach?

What I will show on this presentation are the first results of applying a multiscale and holistic methodology on which different aerial Remote Sensing techniques such us, Satellite Imagery, Lidar data analysis and aerial photography taken by UAV, have been used, analysed and combined between them focused on the identification and extraction of, till now, unseen archaeological information that will complement the already known information about the behaviour, occupation and exploitation of ancient communities. Also, these results will pinpoint key aspects that could serve as a base to focus on future terrestrial teledetection and archaeological field campaigns allowing to reducing time and costs in the study of a big area such as the river basin of low Guadiana Menor, especially focusing in the convergence area with Guadalquivir River within AQUIVERGIA project founded by Spanish Ministry of Science and Innovation.

9 HUNTER-GATHERER-FISHERMEN IN THE SALT MARSHES OF THE CABO DE GATA-NÍJAR MARITIME-TERRESTRIAL NATURAL PARK (ALMERÍA, SPAIN)

Abstract author(s): Román Díaz, María de la Paz - Medianero Soto, Francisco Javier - Calaforra Chordi, Jose María - Sola Gómez, Fernando - Moreno Márquez, Adolfo - López Medina, María Juana - Aragón Núñez, Enrique - García Pardo, Manuela - Berenguel, Manuel (University of Almería)

Abstract format: Oral

This communication is a first approach to the recent archaeological finds documented on the surface, adjacent to the salt flats of the Cabo de Gata Natural Park (Almería), southeast of the Iberian Peninsula.

The outcrop is located at the southeastern end of the Almería-Níjar basin, on sedimentary materials, at the transition between the most distal parts of an alluvial fan and a coastal lagoon. This fan erodes Miocene volcanic reliefs of the Cabo de Gata Volcanic Complex, composed essentially of andesites and dacites.

The archaeological material shows human presence in different periods of prehistoric times. This study focuses on part of this material, which exhibits configurations ascribed to Palaeolithic Mode 2 and 3 technocomplexes, showing carving on allochthonous matrix, the source of which is unknown. They are pieces on compact dolomitic sandstone and volcanic material, with ribs and retouches.

We are aware of the limitations of this proposal as they are records without stratigraphic context, the result of a selective survey within the framework of the AQVA project (UAL-FEDER, Proyectos I+D+i 2014-2020). Its allochthonous character informs of the mobility of the social group over a space that has yet to be elucidated, but which is emerged and passable, with the presence of older Tyrrhenian marine terraces that probably housed an extensive coastal lagoon used as a feeding and breeding area by a large number of birds, which would have made this enclave an especially favourable area for hunting and fishing.

10 TERRITORY AND WATER MANAGEMENT IN THE LOWER COURSE OF THE ANDARAX RIVER (ALMERÍA-SPAIN), DURING LATE ANTIQUITY TO THE MIDDLE AGES

Abstract author(s): García-Pardo, Manuela - Díaz Marcilla, Francisco José - Aragón -Núñez, Enrique - López Medina, María Juana - Román Díaz, María de la Paz (University of Almería)

Abstract format: Oral

Access to water is fundamental for developing territory management in any historical period. Based on this assumption and the environmental conditions of the area in question, this paper proposes to analyse the Lower Andarax's watercourses and the vegetation on their banks. We will also include the location of springs or non-significant natural water courses that do not appear in the current databases but are still continuous support for settlements. These had reduced flows, used to irrigate small land areas and for human consumption. This study aims to draw up a basic but detailed cartography of these enclaves, to confirm their presence or not in the historical documentation and, whenever possible, to verify their use and exploitation in the historical period in question. To this end, we will collect data in the field: through oral sources that older people, knowledgeable about the territory, provide us with testimonies of the existence of these sites, as well as through oral sources. The data obtained from oral sources will be compared with the

results of surface archaeological surveys of the study area. All this is to compare the presence of water and material evidence of its use in the Late Antique and Medieval periods.

11 SPATIAL ANALYSIS OF RESERVOIRS WITH PREHISTORIC SILOS IN THE SOUTHEAST PENINSULAR

Abstract author(s): Moreno Márquez, Adolfo - Román Díaz, María de la Paz - Medianero Soto, Francisco Javier - López Medina, María Juana (Universidad de Almería)

Abstract format: Oral

This communication presents a series of research proposals related to the study of Neolithic populations in the south-east of the peninsula. We will focus on the study and analysis of deposits that present underground storage structures, defined by a series of researchers as “silos”, which we understand as a clear example of the intensification of agriculture for these prehistoric populations. Currently the number of deposits with these characteristics and structures is not very high, compared to other areas in the south of the peninsula, since they do not reach ten, but it is very significant that the majority are concentrated in the Bajo Almanzora basin, one of the most important in the Mediterranean basins. This project intends to follow three lines:

- Analyze the area of concentration of this type of deposits in order to understand their cultural horizon.
- Analyze and value other environments- (river basins and estuary) in other areas through the use of non-invasive research techniques such as Geographic Information Systems (GIS). This analysis would help us to propose and raise other spaces or areas in which its location would be feasible.
- Check the capabilities and shortcomings of this object of study

These proposals can be the germ of future archaeological studies (prospecting and/or archaeological interventions) to propose new sites, while applying new techniques to those already known, enriching the investigation of these past societies.

12 NEW ENVIRONMENTAL DATA FROM THE RIVERBANKS OF THE ANCIENT LACUS LIGUSTINUS (SOUTHERN SPAIN)

Abstract author(s): Sánchez, Daniel Jesús (University of Cádiz) - Castro García, María Del Mar (University of Granada)

Abstract format: Oral

A new archaeological area was recently discovered in Haza de Santa Catalina (Sanlúcar de Barrameda, Spain). An in-depth ploughing has unearthed vestiges of different epochs, including a settlement dating back to prehistoric times and a previously unnoticed Iron Age necropolis of the ancient city of Eborá. The use of complementary techniques in this research contributes to a better understanding of the long-term evolution of the riparian landscape in the southern banks of the lacus Ligustinus (current Guadalquivir marshlands). A total of 15 samples of ash and charcoal were collected for palaeobotanical analysis, considering well-preserved blocks of earth and avoiding intrusive materials. Twelve samples were taken from the burial zone over the alignment of vestiges that were later identified by magnetometry as remains related to tumular structures. The aim of this presentation is to show preliminary results of this ongoing research and to discuss the implications of the environmental evolution at the zone, which points to a changing human impact on the estuarine landscape of the lacus Ligustinus.

A. THE CONFLUENCE OF THE GUADALQUIVIR AND GUADIANA MENOR RIVERS (JAÉN, SPAIN): AN APPROACH TO LANDSCAPE IN ROMAN TIMES

Abstract author(s): Fornell Muñoz, Alejandro - Guerrero, Francisco (Universidad de Jaén)

Abstract format: Poster

The spatial environment where the Guadiana Menor river meets the Guadalquivir constitutes an approximate area of 30,000 ha. of high environmental and landscape value, since it combines the land immediately adjacent to the river valley with others from the foothills of the Sierras de Cazorla and Mágina. In addition to its agricultural, salt and mining resources, it must be added that in ancient times this area was the shortest communication route between the Upper Guadalquivir and the Mediterranean coast. However, despite the potential for ancient anthropic activity that this territory offers, it has not been sufficiently investigated to detect the manifestations of Roman settlement, a matter of historical interest to understand the transformations of the landscape that occurred after the Roman conquest. The union of archaeogeographic analysis with textual, epigraphic and bibliographic sources establishes the starting point of this study, which also reflects on the importance of an archaeological survey that goes beyond the traditional methodology.

CONNECTING A CONTINENT: NEW DATA ON CENTRAL ASIA FROM THE MESOLITHIC TO BRONZE AGE [PAM]

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Dupuy, Paula (Nazarbayev University) - Shnayder, Svetlana (-)

Session format: Regular session

Central Asia situated in the heart of Eurasia – between the Caspian Sea and Xinjiang has served as a major crossroad throughout human history, linking societies from Europe to East Asia. The most intense occupation of this region was initiated during the Early Holocene at which point multiple technologies and social networks foreshadowed long-term and subsequent occupation of this landlocked region. Despite a long history of dedicated research in the region, however, several questions circulate on points such as how to distinguish the Mesolithic and Neolithic periods, when and how productive economies emerged in the Bronze Age or beforehand, and on suitable methodologies for locating early sites in the extreme environments of its high latitudes and mountainous regions. This session aims to facilitate a new dialogue concerned with the identity of social-technological-economic networks across the Mesolithic to Bronze Age while also considering the applicability of terms such as ‘margin,’ ‘center’ and ‘crossroads’ in Central Asian archaeology. Importantly, such considerations in a Central Asian context hold relevance at a European level for exploring the directionality, timing and context of migrations, core economic and material technologies, and belief systems which had lasting impacts on historical developments in both regions. We are particularly keen to see research that presents novel discoveries coming from excavations, new scientific findings from revisits to earlier research, and/or syntheses from big-data or pedestrian survey projects. We welcome papers that touch on material culture assemblages, human-environment reconstructions, and on bioarcheological and/or archaeological remains from macro- or micro-scale perspectives.

ABSTRACTS

1 CULTURAL VARIABILITY OF FINAL-PLEISTOCENE - EARLY HOLOCENE COMPLEXES IN THE CENTRAL ASIAN HIGHLANDS

Abstract author(s): Shnaider, Svetlana (al-Farabi Kazakh National University)

Abstract format: Oral

During the middle of the XX century, A.P. Okladnikov’s proposed to divide the Final Pleistocene-Early Holocene contexts of Central Asia on the basis of the presence of geometric microlithics (Okladnikov, 1966). The complexes with geometric microliths were classified as “mesolithic”, those without geometric microliths as “epipaleolithic”. His hypothesis was later supported by V.A. Ranov [Ranov, 1988], G.F. Korobkova [Korobkova, 1989] and T.G. Filimonova [Filimonova, 2007]. During the last decade, we conducted a two-fold approach based on new fieldwork and a reevaluation of already available collections. Based on techno-typological features and zooarchaeological evidences three cultural groups were identified in Central Asia during this period: Tutkaulian, Alayian, Obishirian. The recent dating of the sites and the study of their spatial distribution also confirmed that they are related to different chorological and geographical frames.

The analysis of Tutkaulian, Alayian and Obishirian complexes provided in frame of RSF project #19-78-10053, the correlations with South Kazakhstan provided in frame of project BR18574057.

2 SITE FORMATION PROCESSES AT TWO ROCK-SHELTER SITES OF THE OBISHIRIAN CULTURE IN AN ARID INTERMONTANE BASIN (KYRGYZSTAN, CENTRAL ASIA)

Abstract author(s): Brancaloni, Greta (Institute of Geological Sciences of the Polish Academy of Sciences) - Shnaider, Svetlana (Al-Farabi Kazakh National University) - Abdykanova, Aida (American University of Central Asia) - Krajcarz, Maciej (Institute of Geological Sciences of the Polish Academy of Sciences)

Abstract format: Oral

In the southern margin of the Fergana Valley, Obishir-1 and Obishir-5 are two archaeological sites of the Pleistocene-Holocene transition bearing archaeological material of the Obishirian culture. The region is situated at a crossroad that links east and north Asia with Europe and the Levant, and it is taken to be a crucial point on the West-East transfer route since Paleolithic times and until the medieval Silk Road. Recent studies on the faunal remains at Obishir-5 shed light onto the Neolithization process in Kyrgyzstan and more ambitiously in Central Asia. In particular, the sites are located in front of two rock-shelters at the toe of largely karstified limestone cliffs in a high-elevated and arid intermontane basin of the southwestern Kyrgyzstan. Geoarchaeological investigations have been carried out to give geologic context to the archaeological and faunal record, as well as for a better understanding of the site forma-

tion processes including post-depositional disturbances. A multi-aspect approach has been designed consisting of sedimentological, micromorphological, and geochemical analyses for the study of the sedimentary material, coupled with chronometric dating and the study of faunal assemblages, as well as artifact spatial distribution analyses. The information retrieved allowed to reconstruct the depositional history, traces of human-related activities, and paleoenvironment reconstructions at both sites. Importantly, the sites are both embedded in cliff-related talus deposits, but they faced slightly differing processes which were recorded throughout the sedimentary sequences. Confronting the Quaternary sequences at the two Obishir sites, the “human factor” emerged to be an important element in the accumulation, erosion and disturbance of the stratigraphic sequences.

The study was supported by the National Science Center of Poland, grant number 2018/29/B/ST10/00906, field-works at the Obishir-1 and Obishir-5 sites were supported by project RSF #19-78-10053.

3 SHEEP PALEOGENOMICS AND THE SPREAD OF DAIRY PASTORALISM ACROSS CENTRAL EURASIA

Abstract author(s): Hermes, Taylor (Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

Dairy pastoralism has long characterized human ecology in the vast grasslands of central Eurasia, but the spread of this subsistence strategy across the steppes remains poorly understood. While Afanasievo communities (3300–2900 BCE) in the Altai Mountains of the Eneolithic purportedly represent the first pastoralists to occupy the Asian interior after migrations from the western steppes, earlier Neolithic dispersals of dairy livestock along alternative pathways to central Eurasia have yet to be fully explored. Later, during the Bronze and Iron Ages, complex movements of people and exchanges of technologies suggest that sprawling interaction networks were shaped by herding mobility. Since sheep were typically the dominant animal for ancient steppe pastoralists, genomic analysis of archaeological sheep is well suited to shed new light on the evolution of dairy pastoralism and attendant cultural dynamics in the steppes. This talk presents results of the ERC-funded project DAIRYCULTURES on the paleogenomics of sheep sampled across central Eurasia dating from 8000 BCE to CE 1000, using a combination of whole-genome deep sequencing and in-solution capture enrichment with a newly developed panel for ~1 million SNPs.

4 RETHINKING INTER-REGIONAL EXCHANGE IN THE BRONZE / IRON AGE TRANSITION: NEW DATA FROM KIMIREK-KUM 1 IN THE ANCIENT ZERAFSHAN DELTA

Abstract author(s): Rouse, Lynne (Eurasia Dept, DAI) - Stark, Sören (NYU, ISAW)

Abstract format: Oral

Roughly in the middle of the 2nd millennium BC, the Final Bronze / Iron Age transition remains a “dark age” in the archaeology of southern Central Asia. There are clear political, economic, and ideological breaks from the previous highs of the Bronze Age, and throughout the region a general downsizing of sites and prestige-oriented trade networks. These changes are often interpreted through the lens of collapse, referencing the peak of regional cultural inter-connectivity under the Oxus / Greater Khorasan Civilization in the late 3rd – early 2nd mill BC. Yet remarkable new data from the recently-discovered site of Kimirek-kum 1 (KK1), deep in the Kyzyl Kum desert of Uzbekistan, tells a different story, in which continuity and adaptation are key elements. Preliminary fieldwork has revealed a thriving copper production and white stone jewelry industry at KK1 at around 1200 BC, centered on the site’s 11-ha enclosure but covering at least an additional 32-ha of the surrounding landscape. Moreover, the small finds from KK1 – including objects and jewelry in precious metal and semi-precious stone – have direct material connections to known archaeological sites as far away as the Urals, northeastern Iran, and Afghanistan. KK1 thus appears to be a significant hub for prestige craft production and inter-regional exchange, specifically flourishing during a period best known for decline and insularity. Our presentation will include the preliminary results of excavation and survey investigations at KK1 as they relate to questions of resources and production chains during a time of significant economic, political, and cultural restructuring; we suggest that KK1 represents a potentially key “missing link” in the archaeology of the region.

5 A UNIQUE AND EARLY NEOLITHIC BURIAL FROM KOKEN (EAST KAZAKHSTAN)

Abstract author(s): Dupuy, Paula (Nazarbayev University) - Tashmanbetova, Zhuldyz (Washington University in St. Louis) - Kiyasbek, Galymzhan (Institute of Archaeology Kazakhstan) - Zhuniskhanov, Aidyn (Nazarbayev University) - Samashev, Zainolla (Institute of Archaeology Kazakhstan)

Abstract format: Oral

The period prior to the emergence of agriculture and pastoralism is one of the most understudied and least deciphered time periods in Eurasian steppe archaeology. A shortage of stratified or well preserved early Holocene campsites means that our knowledge of this period heavily relies on lithic assemblages not always with associated radiometric dates. Contrary to this norm, our excavations at the site of Koken in the semi-arid steppe zone of eastern Kazakhstan

recently uncovered stratified Stone Age deposits underlying a Bronze Age settlement. Within these earlier layers, our team has further discovered a unique and singular human burial dating to the mid-6th millennium BC, in the early Neolithic period. The Koken burial represents the earliest known, and directly dated, human remains within all of Kazakhstan, and hence offers scholars an exclusive opportunity to examine hunter-gatherer dispersals, lifeways, and population composition prior to the appearance of food producing economies in the region. In this paper, we consider the Koken site layout and contents as well as consider its potential utilization during this incipient period of human occupation. Crucially, on a preliminarily basis we further position the early Neolithic burial from Koken within the thin landscape of its regional contemporaries. While research is ongoing, future study of this site and period will be pivotal for understanding early Holocene human adaptations, dispersals, and food systems in the hyper-continental marginal steppe environment, as well as clarify social, cultural, and technological connections among hunter-gatherer populations of the Eurasian steppe.

6 THE DELGERKHAAN UUL SURVEY, MONGOLIA: PRELIMINARY RESULTS

Abstract author(s): Wright, Joshua (University of Aberdeen) - Honeychurch, William (Yale University) - Chunag, Amartuvshin (National University of Mongolia) - Pleuger, Sarah (University of Edinburgh)

Abstract format: Oral

The paper reports on a full coverage intensive pedestrian survey of a water rich region in the Southeast Gobi desert, Mongolia. Regional landscape archaeology here was supported by many excavations providing a robust chronological framework from the mid-holocene through the Bronze Age and beyond. The study focused on a core region, but also expanded into the larger surrounding landscape to provide broad regional context and test the centrality of their study area. In addition to a dense landscape of chipped stone scatters, showing engagement with mostly-vanished hydrology. The survey recorded an extensive and unique monumental landscape of the Eastern Steppe Bronze Age prone burial tradition alongside a longer contemporary habitation record. These demonstrate spatial complexity, monumental scale, asymmetric regional settlement patterns, and adaptation to the changing Gobi environment. The exactitude and rarity of classic late Bronze Age forms in the area elucidate the dynamics of monumental change across the region. Together these results provide a dense and rich dataset of regional archaeology at heart of arid Northeast Asia.

7 VISUALIZING LONG-TERM SOCIAL CHANGE IN PREHISTORIC EURASIA

Abstract author(s): Frachetti, Michael (Washington University in St. Louis)

Abstract format: Oral

Chronological and cultural typologies are the most canonical tools used to structure and communicate archaeological research of Eurasia, and especially its prehistory. Dominant paradigms such as the Neolithic or Bronze Age, and regional cultural assemblages glossed as socio-genetic communities heavily shaped 20th century archaeology, and have found revitalized usage in recent decades, as new methods and regional integrations draw the archaeology of Central Asia into novel scholarly domains which demand general tools to simplify communication and build heuristic analogues across vast arrays of data. This paper explores alternatives to this approach, turning attention away from material-chronological typologies toward the morphological nature of human practices seen as intersectional suites of economic, political, environmental, and social domains. Archaeological data and knowledge—through this lens—can be alternatively combined to visualize newly aggregated constellations of interleaved relationships within realms of economy, political structure, technology, and more. Seen through time, the morphology of these data is visualized as part of a complex matrix of change that ashews common typologies and teleological trajectories, instead promoting a nuanced understanding of the choices, decisions, interactions, and contributions of prehistoric communities to the long-term social ecumene of central Eurasia.

8 CEREAL CULTIVATION IN PASTORAL LANDSCAPES: STABLE ISOTOPE ANALYSIS OF EARLY WHEAT AND BARLEY IN THE BRONZE-AGE INNER ASIAN MOUNTAIN CORRIDOR

Abstract author(s): Ritchey, Melissa (Washington University in St. Louis)

Abstract format: Oral

In the following millennia after domestication in Southwest Asia, wheat and barley spread through the Eurasian landmass. Recent research provides pathways of travel for these grains, but how local communities incorporated these novel grains and cultivation systems into their local subsistence strategies is still unclear. Particularly important to this Prehistoric Food Globalization process, which occurred between the 3rd and 1st millennium BC, is the Inner Asian Mountain Corridor, a region encompassing the foothills, mountain valleys, and mountains of Inner Asia, primarily those of the Dzhungar, Tianshan, and Altai Mountain ranges. The IAMC was home to pastoralist communities, who beginning in the Bronze Age (3rd millennium BC) adopted plant cultivation, as evidenced by macrobotanical remains of grains, chaff, and weeds of cultivated fields. In an ecological region that facilitates pastoralism, how much investment did these communities dedicate to this new, non-mobile subsistence activity? Drawing on stable isotope

analysis of wheat and barley grains from one of the earliest sites in the IAMC, this paper will investigate the labor investments, specifically watering and manuring of agropastoralists at Chap I and II, a multi-phase site located in the eastern Kyrgyzstan (c. 2467-2047 ca. BCE, 1065-825 ca. BCE). Chap I and II, 2,000 m.a.s.l. had an agropastoral economy based on sheep/goat husbandry with crop cultivation. The recovery of the largest assemblage of cultivates in the region, including multiple varieties of barley and wheat, along with potential irrigation works suggest local cultivation of these domesticates. Stable isotope analyses on these grains clarifies the irrigation and manuring activities at Chap and lends to further discussions on grain cultivation across Central Asia in prehistory.

9 CHANGES IN A SMALL COMMUNITY. NEW PERSPECTIVES ON BURIAL CUSTOMS IN LISAKOVSK (KOSTANAY OBLAST, KAZAKHSTAN)

Abstract author(s): Schreiber, Finn (Independent researcher) - Usmanova, Emma (Saryarka Archaeological Institute of Buketov Karaganda University)

Abstract format: Oral

The Late Bronze Age in the Central Eurasian steppes was characterized by a complex network of closely interconnected material cultures, called the Srubno-Andronovo phenomenon. A complex sequence of migratory events is usually reconstructed to explain its emergence. Other scholars have cited acculturation as the driving force behind the phenomenon. Indo-European origin theories and aDNA results have made the picture even more complex. At the same time, the archaeological data base is still very uneven across regions, making comparisons difficult.

One well-studied Late Bronze Age site is Lisakovsk in Kostanay Oblast (Kazakhstan), which consists of seven fully excavated burial grounds and one settlement. In this paper, the diversity and dynamics of burial traditions in Lisakovsk are analyzed using single and multivariate statistical methods on funerary pottery. Significant changes are visible in the field of ceramic typology, which serves as a marker for chronological determination. Burial customs gradually changed due to the abandonment of kurgan burials with wooden chambers and the rise of the cremation burial custom. At the same time, kurgans lost their importance as landmarks, and communal cemeteries spread.

The discussion about the cultures present in Lisakovsk is a long-lasting debate. For the interpretation of the results, we propose a different approach, describing the Upper Tobol area in the Bronze Age as a borderland where local communities were influenced by different burial traditions at different times. This model does not exclude human mobility, but emphasizes the legacy of a local community.

10 MONUMENTAL BURIALS AND EARLY PASTORALISM IN THE GOBI: A CASE STUDY FROM SHIRIIN CHULUU SITE

Abstract author(s): Dashzeveg, Bukhchuluun (Department of Anthropology, Yale University)

Abstract format: Oral

The Gobi Desert and the Eastern steppe of Mongolia witnessed a sudden emergence of burial construction during the Late Bronze Age. During the second half of the second millennium BCE, residents of this vast region began to build burial structures made of stone, in which the deceased were interred in a prone position, and the surface stone feature had shapes in the form of an hourglass or rectangles varying in size. Explanations for what seems to be a sudden rise of these “prone burials” have relied on a range of factors, including the emergence of social hierarchy, migration from the south, and reorganization of the local economy and the establishment of new integrative social institutions, as well as the spread of early shamanism. However, based upon the latest studies, we now understand that the people who built these burial monuments possessed most if not all of the common domestic herd animals (goat, sheep, horse), practiced a developed dairying tradition, and were engaged in networks of interregional exchange based on the tripod ceramic vessels, bronze objects, and semi-precious stone artifacts, all of which are found in burial assemblages.

11 THE THREE-DIMENSIONAL MODELS IN THE MORPHOMETRIC ANALYSIS OF CORES FROM OBISHIR-5 AND KHODJA-GOR SITES (FERGANA VALLEY, KYRGYZSTAN)

Abstract author(s): Markovskii, Grigorii (-) - Alysher kyzy, Saltanat (-) - Charynov, Temerlan (Kyrgyz national university named after Jusup Balasagyn) - Abdykanova, Aida (American University of Central Asia) - Shnaider, Svetlana (-)

Abstract format: Oral

Angle between striking platform and reduction surface – one of the most important morphometric parameter in definition of knapping technique for lithic industries in Late and Final Stone age. While detailed technical and typological description of lithic collections from Obishir-5 and Khodja-Gor sites (South Fergana Valley) it turned out that most cores are small, severely depleted, damaged, with traces of final adjustment and removal. Consequently, measurement by mechanical instrument of the angle between striking platform and reduction surface was not precise. How-

ever, the use of high-quality scalable 3D-models allowed to obtain required angle values, and also to calculate the core's volumes (Obishir-5 – 41 pcs, Khodja-Gor – 21 pcs) and compare the final data.

As a result, the average angle for cores with signs of pressure technique was: Obishir-5 – 87.7°, Khodja-Gor – 86,2°; with signs of percussion: Obishir-5 – 78.3°, Khodja-Gor – 74,9°. In volume artifacts of the first group were 3-4 times smaller and more standardized. The results of the analysis of three-dimensional models confirm our conclusion of the using two types of knapping technologies made by traditional morphological analysis. In the course of this work, was demonstrated the effectiveness of applying the three-dimensional modeling to study and compare archaeological collections.

12 NEW DATA ON EASTERN CASPIAN MESOLITHIC AND NEOLITHIC

Abstract author(s): Alisher Kyzy, Saltanat (independent researcher) - Shnaider, Svetlana (independent researcher)

Abstract format: Oral

Southeastern Caspian was a likely a migration route for early people moving from Near East into Central Asia. Because of its central geographic setting, the area also channeled cultural and technological influences and exchange between adjoining regions in prehistoric time. Mesolithic and Neolithic complexes of Eastern Caspian are represented by a few sheltered sites with stratified deposits (Kaylu, Jebel and Dam-Dam Cheshme-1 and 2). The site was excavated by A.P. Okladnikov (1950's) and G.E. Markov (1960's) and the archaeological materials from the excavation were divided between the several research centers of Russia and Turkmenistan. This research is based on the chipped stones stored in the Institute of archaeology and ethnography SB RAS, from three key archaeological sites – Dam-Dam-Cheshme-1, Dam-Dam-Cheshme-2 and Kaylu obtained by A.P. Okladnikov. Our study reveals key similarities, suggesting that the Dam-Dam-Cheshme-1, Dam-Dam-Cheshme-2 and Kaylu techno-complexes belong to a single Meso-Neolithic culture – which we refer to as the Eastern Caspian – split into a four-stage developmental sequence. We argue that the Eastern Caspian Meso-Neolithic industries, defined by blade/lete industry and an abundance of geometric microliths, with a chronological progression from lunate, scalene triangles to trapeze forms, has its origins in the Southern Caspian Mesolithic emerging.

A. BIOARCHEOLOGICAL INSIGHTS INTO HEALTH AND CULTURAL PRACTICES ON THE ANCIENT TIBETAN PLATEAU IN CENTRAL ASIA

Abstract author(s): Cao, Doudou (Department of Archaeology, University of Cambridge)

Abstract format: Poster

Despite great advances in Central Asian archaeology, little is known about ancient human lives and adaptability in the extreme environments of the Tibetan Plateau in hinterland Asia. To address this issue, this study reports preliminary results from the examination of human remains from the Phiyang-Dungkar group of sites in Ngari Prefecture of west Tibet (altitude 4,030-4,200m asl), to document demographic information and evidence for health, activity and funerary practices during the Early Metal Age (800 BCE – 900 CE).

Human skeletons were examined from 48 burials, yielding at least 69 individuals (25 females, 12 males, 32 undetermined sex). There were 10 non-adults (<16), 15 young adults (16-34, with fused acetabula), 20 middle-aged (35-49) and 10 old (>50) individuals, and 14 age-indeterminate adults. The caries rate at Phiyang-Dungkar (6% of teeth) was much lower than nearby contemporaneous lowland agriculturalists (>10%), while periodontal disease (71% of individuals), tooth wear and antemortem tooth loss (67% of individuals) were prevalent, likely reflecting a less cariogenic and abrasive diet than lowlanders who consumed more cultivated crops (e.g., millet). The low frequency of enamel hypoplasia (1.5% of teeth) and absence of cribra orbitalia and porotic hyperostosis suggest relatively low stress conditions during growth. High individual rates of 'kneeling facets' on the first metatarsal (40%) and 'squatting facets' on the ankle (74%) suggest repetitive postural behavior, while the frequency of individuals with osteoarthritis (45%) and degenerative disc disease (83%) suggests high physical activity levels. Taphonomic changes included sun bleaching and postmortem damage from human/animal activities. The underlying mechanism and/or cultural motivation for these phenomena will be explored in the future to better understand mortuary practices at the site.

Overall, the combined evidence provides unique insights into the demography, health status and potential cultural practices of ancient inhabitants of the vast Tibetan plateau in Central Asia.

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Da Vela, Raffaella (SFB 1070 RessourcenKulturen University of Tübingen) - Heitz, Christian (Leopold-Franzens-Universität Innsbruck) - Klocke-Daffa, Sabine - Frauen, Wulf (SFB 1070 RessourcenKulturen University of Tübingen)

Session format: Regular session

Can archaeological research be ‘objective’? And how much does the background, formation and mentality of the researcher affect their observations? We would like to open a debate on reflexivity and positionality in archaeological practice. Both are well established in Cultural and Social Anthropology as necessary forms of self-reflection during participant observation and fieldwork. These terms indicate an awareness of our own personal backgrounds and their impact on the collection and analysis of data. Self-reflexivity can be a useful, if not essential, epistemological tool for interpreting archaeological data, making scholars aware of their biases, especially regarding topics with distinct political or ideological impacts. Examples include studies on ancient mobility and migrations, as well as on the concepts of ethnicity and identity, and on the definition of alterity. Some concrete references in the history of archaeological research are provided by the discussions on Romanisation, the origin of the Etruscan, prehistoric and late antique migrations, ancient ethnicities in the Balkans, racism in Classical antiquity, and on the use of palaeogenetics.

This session deals with the issue of bias in past and present research on ancient mobility and identities. It invites us to rethink the relationship between archaeologists and the archaeological record as an intersubjective and interpretative process. The session will raise, amongst others, questions such as: in which form can positionality be introduced into archaeological research? Are data collection and methodology subjective, and in what ways? What can archaeology learn from anthropological reflexivity? The session addresses anthropologists and archaeologists alike and welcomes contributions on any aspects, including the analysis of consciousness of unconscious (uses of) positionality in past (archaeological) research, discussions of possible future perspectives that will make research biases more explicit, and the integration of the researcher’s own background in publication processes.

ABSTRACTS

1 ASK THE MAN IN THE MIRROR – A PLEDGE FOR REFLEXIVITY IN THE ANTHROPOLOGY AND ARCHAEOLOGY OF IRAN

Abstract author(s): Frauen, Wulf (SFB 1070 RessourcenKulturen)

Abstract format: Oral

In 1986 an edited volume by James Clifford and George Marcus shook the foundations of anthropology: *Writing Culture*. Previously anthropologists had still, although the façade had shown serious cracks before, believed that foreign cultures can be objectively described in accordance with a positivist ideal of science. Subsequently, it was acknowledged that this seems to be impossible and the best one can hope for is the glimpse at a ‘partial truth’, to say it in the words of Marcus. Consequences of this fundamental epistemological insight have been manifold: experimental forms of writing, sharing the authorship with explored by raising their voices in the account and a well-reflected subjectivity instead of pretended objectivity. Neighbouring disciplines reacted to what was going on in anthropology in different ways. In the case of archaeology, the reaction can be summarized with two words: mostly ignorance. The present contribution strives to raise an awareness that also in archaeology a certain extend of self-awareness is fruitful, if not necessary. I will illustrate this claim by examining a couple of examples from Iran. In the Iranian case, especially the intersection between nationalism and archaeology is striking. In past and present, various authors were embedded deeply in nationalist discourses. Whether they were (and are) aware of this or not remains obscure since it is never addressed in their accounts. An analysis of some of these discourses will show that Iranian archaeology runs risk to write past societies just like the iconic ethnographer on the cover of *Writing Culture*, sitting on the porch of a thatched hut with pen and notepad, writes his culture.

2 GETTING BEYOND VULNERABILITY AND ADAPTATION; MIGRATION AS A RESILIENCE STRATEGY

Abstract author(s): Maziar, Sepideh (Goethe university)

Abstract format: Oral

Migration as a part of human behavior and cultural transformation has taken on once again among archaeologists, anthropologists, and other social sciences. In the social sciences, there are different narratives of migration. In archaeology, however, this theme is conventionally tackled in many cases within an old-fashioned traditional framework. Accordingly, some scholars considered it a mono-factorial approach overlooking the complexity and diversity of other

factors at play. Some others ignore it, not be regarded as anachronistic scholars or trapped in culture-historical or diffusionist paradigms.

In this paper, I argue that part of the problem is that in archaeology, like other disciplines, migration is generally addressed within two primary contexts: 'vulnerability' and 'adaptation'. In this context, migration is often framed in cause-effect models such as push and pull factors. Reviewing different case studies, it seems that we still are trapped in the determinism of migration research and a top-down approach with causative relationships. May adopting approaches from other disciplines curve a new way, rid us of the cubic mindset, and enable us to acknowledge the multi-dimensionality and potential merits of migration. Accordingly, it is argued why migration studies should not be confined to pull and push models and what are their pitfalls and drawbacks. A distinct perspective, namely the resilience approach, is proposed as an alternative and supplementary approach. It is discussed how applying this framework extends our scope regarding human movement. As a case study, by using vulnerability and resilience as analytical tools, the Kura-Araxes's migration, as one of the largest diasporic communities during the 3rd millennium BCE in southwestern Asia, is interrogated. Applying 'resilience theory' in the frame of social resilience and translocality provides a new and different narration of Kura-Araxes migration, its triggers, mechanism, and dynamics, which is the main focus of this paper.

3 RESEARCHER POSITIONALITY IN COMPLEX „SHATTERZONES“: A SELF-REFLEXIVE CASE STUDY FROM THE ADRIATIC REGION

Abstract author(s): Bernardo-Ciddio, Leah (University of Michigan)

Abstract format: Oral

Archaeology looms large in the history of modern relations between states sharing the Adriatic Sea. Archaeology was weaponized to legitimate Italian irredentist and imperialist aims; a fixation on ancient objects underpinned Slovenian nationalist claims to an ancient identity that distinguished them from other South Slavs; Illyrian heritage was and continues to be an important part of Albanian national consciousness.

Some researchers feel a world apart from such examples, especially if fieldwork takes place away from "home". I argue that it is important not only to address openly the legacies of our field and methodology in our areas of study, but also to consider the way internal perspectives and external perceptions shape our work and how we are understood and engaged by colleagues.

In the interest of self-reflexivity, I share questions I have either asked myself or been asked by others about my research - to what extent should I, shifting between outsider and insider, reckon with the difficult history of archaeology, imperialism, war, and nationalism in the Adriatic? How am I perceived, and by whom? What is the impact of my positionality on how my work is presented to and interpreted by others? Do I have a personal and/or scholarly responsibility to acknowledge painful legacies? Are responsibilities shared differently between scholars from different nations around the Adriatic, have they been fulfilled, and is there agreement that they need to be fulfilled? Do today's politics make these questions relevant again or can we ignore politics? Should we? Who is "we" anyway?

In this paper, I argue that it is essential and sometimes even obligatory to think through our positionality, that of our colleagues, and that of our scholarly forebears, and that of living communities. Such an exercise both improves dialogue and can address awkward silences that hamper true collaboration and reconciliation.

4 RIDE ON? CONCEPTS OF MOBILITY IN ARCHAEOLOGICAL RESEARCH OR THE GRACE OF IGNORANCE

Abstract author(s): Heitz, Christian (Institut für Archäologien, University of Innsbruck)

Abstract format: Oral

In archaeological studies, the question of movement was always paramount – where and how did material objects move, and (later) what were the mechanisms and motivations behind this 'mobility'? However, in models like the spread of farming, focus was placed largely on unidirectional, linear and irreversible ("diffusionist") movements, with an inherent teleological attitude placing present social and economic conditions at the top – i.e. the conditions in which modern researchers are situated. It seems questionable whether this position in space, time and society enables us to understand past conditions.

In particular the paper refers to mobile pastoralism, a lifeway that in modern western scholarship (i.e. in societies where it is largely abandoned and almost forgotten) is much more rarely addressed and postulated as a possible model (although attested in ancient sources) than in areas like the steppes of Asia where mobile herding is still practiced on a larger scale. The centralised political structure and territorialized nature of property ownership in most modern agrarian societies is completely different from mobile communities whose "rhizomic and transversal" lifeways from a sedentary viewpoint appear transitory – mobile groups like transhumant herders lie outside the normative framework of (agrarian and sedentary) modern social relations and were often described as causing conflict, chaos and disrupt-

tion. In the light of the continuous marginalization it seems indeed doubtful whether modern scholarship can take a “neutral” approach to this topic. The danger of taking a ‘scholastic view’, as Bourdieu described a distanced, theoretical intellectual perspective shaped by ignorance and the assumption of rational choices for human behavior taken by most researchers – seems great. (How) Can we move on from such a position?

5 THE MYTH OF THE ETRUSCAN COLONIZATION IN THE PO VALLEY. A MISUNDERSTOOD MEMORY?

Abstract author(s): Da Vela, Raffaella (SFB1070 RessourcenKulturen University of Tübingen)

Abstract format: Oral

This paper proposes a review of the narratives around the so-called ‘Etruscan Colonization’ of the Po Valley, considering them as a prime example of the importance of positionality in archaeology. The presence of Etruscan funerary monuments and inscriptions from the 7th to the 5th century BCE in this region has long been considered a confirmation of the colonial presence of the Etruscans. This colonization is also reported in the later Latin literary sources, such as Livy, Polibius, Servius, and Strabo. Archaeological research was particularly receptive to these narratives in those periods where colonial thought matched the general political and ideological atmosphere, such as at the end of the 19th century and in the first half of the 20th century CE. Today, new findings and systematic excavations permit us to reframe our interpretation of the ancient sources and archaeological findings, leading to alternative models. The idea of colonization has thus been replaced by more fluid concepts, such as contact zones, regional identities, and multiculturalism. In this new frame, funerary monuments, inscriptions, and literary sources mentioning colonisation are intended as an ancient means serving to construct the collective cultural memories of local communities. Although these new perspectives seem to be a step forward in comparison to the previous narratives, they are also affected by our modern sensibilities and backgrounds. After comparing the different positions on the question, this paper will discuss the constitutive function of positionality in studying the Etruscan colonization. To what extent is it possible for the contemporary scholar to be objective? Should archaeologists take into account the intention of ancient actors or rather propose global interpretative models? Finally, can the question of the Etruscan colonization teach us anything about the history of culture over the last two centuries?

6 THE EMERGENCE OF GALLIC STUDIES IN ITALY: BETWEEN NATIONALIST AGENDAS AND KUHNIAN REVOLUTIONS

Abstract author(s): Saccoccio, Fabio (University of Nottingham, Department of Classics and Archaeology)

Abstract format: Oral

The late 19th century marked in Europe the birth of many national states as, more or less, we know them today. It was a period characterised by strong nationalist agendas and conflicts. Battles, however, were not only fought on the battlefield; Archaeology was one of the means by which legitimation over newly conquered territories was sought (e.g. the battle between Prussia and Denmark over Schleswig-Holstein and the role played by Jens Jacob Asmussen Worsaae).

The Italian territory was unified by the House of Savoy in 1861. In 1871, the German Empire was established, and Rome became the capital of the Kingdom of Italy (1861-1946). In scientific terms, the 1871 is regarded as a ground-breaking year for a crucial conference held at Bologna, the so-called V.me Session of the Congrès International d’Anthropologie et d’Archéologie Préhistorique (5th International Conference of Prehistoric Anthropology and Archaeology), which was organised with the blessing of the then Prince of Piedmont, his majesty Umberto Count of Savoy. In the literature, it is seen as the event which led to the emergence of Gallic studies in Italy.

This paper shall discuss the political, historical and scientific entanglements linked to this crucial Conference. Particular focus will be given to the reasons why Italian scholars resolutely rejected the idea of a Gallic past in Italy, the moment when a shift in the debate took place and, most importantly, the time-lag occurred for the new paradigm to be accepted and so being labelled as a scientific revolution sensu Kuhn.

7 THE CELTS IN BRITAIN AND IRELAND

Abstract author(s): Collis, John (University of Sheffield)

Abstract format: Oral

In a recent television programme the actor Ardal O’Hanlon explored his Irish ancestry using archaeological and historical data, but was rather surprised to find there were doubts about whether there were Celts in Ireland, or whether they had even ever existed. This contrasted with a much-criticised series on the Celts by Neil Oliver in 2015 in which he presented a very traditional picture of the Celts being slowly squeezed westward by Roman and Germanic expansion, surviving only on the fringes of, or outside, the Roman Empire in Ireland, Wales and Scotland. In this paper I present my own views based on historiographical studies showing that the ancient inhabitants of Britain and Ireland,

though speaking Celtic languages, were never considered to be Celts, and how a new Celtic identity was forged in post-medieval times along the Atlantic coast from Brittany to western Scotland. I reflect on the use of ancient sources from which to seek the 'origins' of modern ethnic groups – my own historical identity as a 'West Saxon' is one which has no meaning in modern Britain!

360 MIGRATION AND MOBILITY IN THE VIKING AGE FROM THE BALTIC TO THE BLACK SEAS: AN INTERDISCIPLINARY APPROACH

Session theme: 6. Contested Pasts & Presents

Session organisers: Shiroukhov, Roman (Centre for Baltic and Scandinavian Archaeology - ZBSA) - McCullough French, Katherine (School of History, Archaeology and Religion, Cardiff University) - Jahn, Christoph (Centre for Baltic and Scandinavian Archaeology - ZBSA) - Kozakaitė, Justina (Faculty of Medicine, Vilnius University) - Baranov, Vyacheslav (Institute of Archaeology of the National Academy of Science of Ukraine)

Session format: Regular session

Eastern Central Europe was a vital zone of interaction during the northern European Viking Age (9th to 11th centuries AD), linking Scandinavia to Byzantium and the Islamic empires. The Scandinavian presence and interactions with the local cultures at this time is a long-discussed and still poorly understood phenomenon. Scandinavian artefacts appear along the Baltic coastlines in numerous burial grounds. The impact extended as far as the Black Sea region.

Increased mobility of people, animals and goods is a defining feature of the Viking Age with evidence drawn from archaeological, anthropological and historical sources. Recent research and discoveries in the Eastern Baltic region and Ukraine provide a more comprehensive picture of population movements that extends far beyond Scandinavian incursions or trade settlements across Europe. Projects like Ostriv (Germany-Ukraine), Ribe (Denmark) and Salme (Estonia) have utilised modern laboratory techniques, including AMS C14 dating to refine regional chronologies, isotopic studies and physical anthropology to reconstruct mobility and diet, and aDNA to detail impacts on the modern European genome. New finds from Poland, the Baltic States, Bulgaria and the Ukraine have made it possible to take a broader look at the "Varangians" phenomenon from an eastern perspective.

This session presents the state of the art of Viking Age mobility research from the perspective of the southern and eastern Baltic Sea region with a reference to the latest research from Scandinavia to the Black Sea. We welcome papers exploring this topic and bringing together the latest results and projects in this thematic field in a broad methodological framework. Our aim is to present a diverse range of data from traditional archaeological, archival studies as well as innovative scientific, anthropological and biomolecular approaches.

ABSTRACTS

1 ADOPT, ADAPT, IMPROVISE? BALTIC IMPORTS AND LOCAL CONTEXTS IN DENMARK

Abstract author(s): Jensen, Bo (Kroppedal Museum)

Abstract format: Oral

Objects travel better than people. People travel better than ideas.

In the last few decades, metal detecting has revealed nine miniature combs in Denmark, and four in England. Five older finds are known in Sweden, one from a grave (Munksön, Uppland), the others stray. These finds highlight the importance of the trading route on River Draugava as an alternative to the bay of Estonia. They also illustrate selective cultural adaptation: combs were copied locally, but reinterpreted as miniature strike-a-lights, a symbol already potent in Scandinavian culture.

Three known individuals from eastern Denmark had filed teeth, normally a Gotland feature. Two are adult men, perhaps Gotland travelers, but the last is a teenage boy. Again, we can see how ideas travelled, and were sometimes adopted locally.

Another intriguing Gotlandic find is the box brooch from Fyrkat, Denmark. Found in the richest grave at the grave site belonging to this round castle, it can be read locally as a reference to the castle's plan.

Thus, we can see both immigrants (Munksö woman, Galgedil man, Snubbekorsgård man) and objects decontextualized and reimagined.

2 BEING (NON-)LOCAL AT VIKING HAITHABU - PREDICTING THE LOCAL ISOTOPIC FINGERPRINT OF ARCHAEOLOGICAL ANIMALS AND HUMANS USING MODERN ENVIRONMENTAL SAMPLES

Abstract author(s): Göhring, Andrea (Christian Albrecht University, Faculty of Engineering, Department of Computer Science, Information Systems and Data Mining; Ludwig Maximilian University, Faculty of Biology, Department of Biology I, Anthropology and Human Genomics) - Hölzl, Stefan (RiesKraterMuseum Nördlingen) - Mayr, Christoph (Friedrich Alexander University Erlangen-Nuremberg, Institute of Geography; Ludwig Maximilian University Munich, Faculty of Geosciences, Department of Earth and Environmental Studies) - Strauss, Harald (University of Münster, Institute of Geology and Palaeontology)

Abstract format: Oral

Stable isotope fingerprints of modern environmental samples (plant, soil, water) are used to establish isotopic baselines which allow to identify non-local animals/humans at a site. In coastal environments, these samples are prone to the so-called sea spray effect resulting in a seemingly marine isotope signal. This effect is also found in animals and humans from coastal regions and was proven to affect archaeological animals and humans from Viking Haithabu, located at the Schlei inlet close to the Baltic Sea. The individuals' isotopic signature can be highly misleading with respect to diet, habitat, or provenance reconstruction. It is, thus, important to predict the local isotope signature while also considering the local sea spray effect.

In this study, we demonstrate that it is possible to reconstruct the locally expected isotope ranges of different isotope systems (e.g., $\delta^{13}\text{C}$ carbonate, $\delta^{34}\text{S}$ collagen, $^{87}\text{Sr}/^{86}\text{Sr}$) in archaeological animals/humans using, e.g., $\delta^{13}\text{C}$ cellulose, $\delta^{34}\text{S}$ total sulfur, and $^{87}\text{Sr}/^{86}\text{Sr}$ data obtained from greenhouse plants. The locally expected sea spray effect can be generated by spraying the greenhouse plants with salty water from the Schlei inlet. In addition, the isotope values of environmental samples collected around Haithabu and close to the Baltic Sea allow to compare the isotope values expected based on the greenhouse experiments with those actually found in the investigated region. The reconstruction procedure is based on isotope fractionation processes between (plant) diet and consumer as well as mixing models.

The resulting isotopic signature of the greenhouse samples as well as of the environmental samples collected next to the Schlei allow to predict the isotopic signature of individuals living around Haithabu which fits and, thus, explains the isotope ranges of archaeological individuals excavated in Haithabu. Furthermore, the data allows the reconstruction of potential catchment area of the settlement. Finally, it is also possible to identify non-local individuals originating from somewhere else.

3 SCANDINAVIANS VS. BALTS? A NEW PERSPECTIVE ON THE VIKING AGE CEMETERY OF WISKIAUTEN AT THE CURONIAN LAGOON

Abstract author(s): Jahn, Christoph (Centre for Baltic and Scandinavian Archaeology Schleswig)

Abstract format: Oral

The cemetery of Wiskiauten is a Viking Age burial ground on the southwestern shore of the Curonian Lagoon, occupied by a Scandinavian population from the 9th-11th centuries AD. Wiskiauten served as an important outpost of Scandinavian expansion from the Baltic to the Black Sea. The burial ground in former East Prussia was excavated by German archaeologists in 20 excavation campaigns between 1865 and 1939, but the results were never published comprehensively. Today, a reworking of the old excavation documentation allows for new insights into previously unknown archaeological finds and features of this necropolis. The extensive excavation documentation offers the possibility to better describe and understand the interaction of the Scandinavian groups with the native Prussians and Balts over a period of about 200 years (850-1050 AD) at this site. For a long time, the German pre-war interpretation of a purely Scandinavian necropolis dominated. However, clearer indications of a simultaneous use of the burial ground by the indigenous population groups are now emerging, resulting in a takeover of the burial site by the native Prussians during the 11th-13th centuries (so called "Aschenplatz"). This presentation discusses the interaction of Scandinavian and Baltic elements at the necropolis of Wiskiauten based on previously unknown finds and features.

4 COMPANIONS IN LIFE AND DEATH: DOGS OF EASTERN BALTIC IN THE VIKING AGE

Abstract author(s): Plankajs, Eduards (Institute of Latvian History, University of Latvia; National History Museum of Latvia, Department of Archaeology)

Abstract format: Oral

In this study author analyses the dog (*Canis familiaris*) co-burial tradition in Livonian culture during the Viking Age. This specific mortuary practice appears amongst the Livonians around the beginning of the 11th century and ceases by the end of the 12th or beginning of the 13th century AD. The archaeozoological material of Eastern Baltic, Ukraine, and Scandinavia was used as context material. The variety of burials confirms that the sex and age of the dogs did not play a significant role. The presence of the dog itself and its symbolic meaning was more important. In addition, the

function(s) that the dog performed during or after the human funeral could also be different from the one that dog performed during its lifetime (hunting, herding dogs, sledge dogs etc.). The deceased (or their relatives) are believed have owned the co-buried dogs due to very similar paleodiet (stable isotope analysis of N and C) of the humans and dogs from the same burials. However, the dogs found in ship burials of Viking and Pre-Viking Age, for example, Salme II Ship burial (Saaremaa island, Estonia) evidenced that dogs could also be taken as companions and prestigious gifts on overseas voyages. The systematic radiocarbon analysis have performed with aim to define the approximate time when Livonians have probably assimilated this mortuary praxis through interaction with Scandinavian brothers-in-arms and / or trade partners, or have influenced by neighbouring Finno-Ugric people (Finns, Osilians, and Estonians) closely tied with Livonians.

5 **“ARMED PEOPLE OF POLACK PRINCES”: BURIAL RITE AND GRAVE GOODS OF 11TH-12TH CENTURIES MALE BURIALS IN UPPER VILIIJA REGION**

Abstract author(s): Plavinski, Mikalai (University of Warsaw)

Abstract format: Oral

During the second half of the 1st millennium AD the region between the Western Dvina and the Neman was actively populated by the Slavs. As a result, by the end of the 1st millennium here a fairly stable borderland was formed between the Slavic Culture of the Smolensk-Polack Long Barrows (Krivichi people) and the Baltic culture of the East Lithuanian Barrows (Lithuanian people). In the last decades of the 10th – first decades of the 11th century, the western border of the settlement of the Krivichi gradually transformed into the western border of the Old Rusian realm, namely, the Principality of Polack. In archaeological materials, this process is recorded by a number of signs, such as the emergence of new hillforts and unfortified settlements that were local administrative centers. Another new phenomenon characteristic of this period is the gradual change in funeral practice and the spread of the rite of inhumation. The first bearers of the new funeral tradition, which is associated with the spread of Christianity on the territory of Old Rus', were precisely the inhabitants of local administrative centers.

At the present stage of research, the most fully studied are the necropolises of the Principality of Polack local administrative centers in the Upper Vilija Region. These cemeteries are characterized by the presence of a significant number of weapons of Old Rusian types in male burials. In some necropolises, almost “total armament” of adult buried men is recorded. The wide distribution of weapons in inhumations of the very end of the the turn of the 10th / 11th – the first half of the 12th century can be considered both as a reflection of the high social status of the inhabitants of local administrative centers, and as a kind of cultural marker characteristic of the new Christian funeral rite.

6 **AN ISOTOPIC INVESTIGATION OF HUMAN AND HORSE MOBILITY IN THE VIKING AGE FROM THE CURONIAN SPIT TO THE DNIPRO UPLANDS**

Abstract author(s): French, Katherine - Madgwick, Richard - Corser, Jessica (Cardiff University) - Shiroukhov, Roman - Meadows, John (Zentrum für Baltische und Skandinavische Archäologie) - Daugnora, Linas (Klaipėda University) - Karczewski, Maciej (University of Białystok) - Baranov, Vyacheslav (National Academy of Sciences of Ukraine)

Abstract format: Oral

Increased cultural exchanges represented by the greater deposition of Scandinavian material culture in the Eastern Baltic region is well attested during the Viking Age (c.850-1050 CE). Biomolecular research is now increasingly identifying the human travelers behind those interactions through isotopic studies and aDNA. This paper presents the results of isotopic analysis of human and horse movement of individuals dated to the Viking Age and buried in modern Lithuania, northeastern Poland, Kaliningrad region (Russia) and Porossya region of Ukraine. Our project sampled individuals deposited from the 2nd to the 13th century CE at 15 cemeteries in the region. Samples included cremated human petrous bone and tooth enamel from humans and sacrificial horse offerings. Results suggest that there was not only an increase in human mobility during the Viking Age, but that there was also an uptick in the importation of ritually deposited horses from Scandinavia and within the Eastern Baltic region. Combining strontium, oxygen, and sulphur isotope analysis, this is the most comprehensive isotopic study to date of mobility in the Eastern Baltic region. The addition of this landmark scientific dataset is providing valuable new insights into the scale and character of connectivity and the role of horses in these networks during the Viking Age.

7 **BURIALS OF SCANDINAVIANS IN SOUTHERN RUS'. IN SEARCH OF ETHNIC INDICATORS**

Abstract author(s): Bibikov, Dmytro (Institute of Archeology of the National Academy of Sciences of Ukraine)

Abstract format: Oral

The quantification and determination of the social role of Scandinavian contingents within individual sites and regions of Eastern Europe are now among the most obvious tasks facing archaeologists in the light of the discussion around

the so-called „Varangian question“. On the territory of Southern Rus' we can consider as undeniable the burials of the Scandinavians the complexes containing: a) remains of ships/boats (“Halychina grave” of Krylos; probably: “Black grave” of Chernihiv; Shestovytsia No. 9; Belogorodka (1976); b) chamber graves in combination with a seated position of the deceased (Kyiv Nos. 110, 125, 30/1999; Shestovytsia Nos. 42, 61/3, 78, 110) or with a stepped platform for the horse (Shestovytsia Nos. 36, 98); c) traces of ritual damage to weapons (Shestovytsia Nos. 58, 93); d) oval (tortoise-like) brooches (Kyiv Nos. 124, 125; Vyshhorod (1985); Shestovytsia Nos. 53, 59, 60, 69, 78, 92); e) separate groups of Scandinavian amulets: iron neckrings with Thor’s hammer pendants (Shestovytsia nos. 104, 138), „Gnezdovo type“ pendants (Peresazh no. 28; Shestovytsia no. 78 (2011), wand amulets (or so called „pins with loops“) (Shestovytsia No. 96), fire sticks-like pendants (Leplyava); f) sets for banquets (“Black grave” of Chernihiv; Shestovytsia Nos. 36, 110, 2/2006) and Hnefatafl board-game (Kyiv Nr. 108; “Black grave” of Chernihiv; Shestovytsia Nos. 24, 33, 98; Sednev (1888). Thus, at the present moment we can speak of 35 burials with authentic Scandinavian features, located at 9 cemeteries, mainly around Kyiv and Chernihiv. But such approach allows us to identify only a minimal, significantly underestimated number of Varangian burials.

8 THE 10TH CENTURY HARBOUR AREAS OF VYPOVZOV AND SHESTOVYTSIA. COMPARATIVE APPROACH

Abstract author(s): Skorokhod, Vyacheslav (Institute of Archaeology National Academy of Sciences of Ukraine)

Abstract format: Oral

The Viking Age in Chernihiv’s Podesenne region is defined by two trade and crafts settlements of the 9th-10th centuries - Vypovzov and Shestovytsia, archaeological complexes located on the Desna River, between Chernihiv and Kyiv. Both sites developed at the end of the ninth century in similar topographical conditions, on elongated capes, and have identical socio-topographical structure. At the extremities of the cape there were hillforts with wooden and earth fortifications, with open settlements behind the ramparts, and the harbour areas at the foot of the terraces. Vypovzov and Shestovytsia harbour areas were studied in late twentieth and twenty-first centuries, which allowed us to obtain results on their form and development. The harbour of Shestovitsa was studied during 1998-2005 and 2019. During the excavations, moorings for landing ships and a significant number of wood splinters were discovered. The presence of clinker-type boats here is evidenced by the iron clinch, large nails, etc. On the lap of the Shestovytsia, ground dwellings, pits, a bone-cutting workshop, and a tar-works were discovered. In 2015, a ditch for pulling out and storing boats was explored in one part of the Shestovytsia. The material culture of the harbour area testifies to the military and trade activities of the inhabitants connected to Scandinavia.

The harbour area of Vypovzov is located on both sides of the cape. During the research from 2012 to 2019, 3 periods of settlement were identified. At the end of the ninth century, berths for mooring ships appeared. Later, at the beginning of the tenth century, ditches for mooring, storage, and repair of boats began to appear. These ditches were equipped with a canopy and were seasonal in nature.

Similar constructions are well known in the Viking Age North-Europe, but on the contrary are unique for the Old Rus’ of the late 9th-10th centuries.

9 FIELD RESEARCH AT THE OSTRIV CEMETERY (UKRAINE) IN 2017-2022

Abstract author(s): Baranov, Viacheslav - Ivakin, Vsevolod (Institute of archaeology of NAS) - Roman, Shiroukhov - Schneeweiss, Jens (Centre for Baltic and Scandinavian Archaeology - ZBSA)

Abstract format: Oral

In October 2017, Ostriv medieval cemetery was discovered on the right bank of the Ros’ river. In total 107 burials were investigated on the area of 2,250 m² in 2017-2022.

The most of burials were placed within ground pits. Most of the identified burials were made in wooden constructions, which are traced by individual boards or nails.

All the burials in the Ostriv cemetery have been laid on their backs, with the majority with extended limbs and head oriented mostly to the southwest, and only a small number to the north, northeast, and southeast. Other limb positions are also single and do not create the series. The vector of the burials and of the river that flows next to the necropolis are the same.

Another characteristic feature of the funerary rite of the Ostriv cemetery was the presence of funerary food and buckets in the burial. The buckets were placed at the feet of the deceased, were found in both male and female burials and can be linked to the process of Christianisation, as well as graves without goods, which are about 20%, and 2 graves with small cross-pendants.

Other burials had numerous funerary goods. The men’s graves contain weapons - axes, heads of pilums or spear, a single-bladed sword, and a sword head, details of a man’s belt, bone containers, grinding stones, and flints. Wire-twisted and zoomorphic bracelets, massive spiral neck-rings, and beads of various types, including gold-glass and kauri shell

beads, were found in female burials. Numerous penannular brooches of various types appear in both male and female burials.

While some artefacts such as weapons, beads and slate spindle whorls may be local products, most of the Ostriv's types of ornaments are obviously of Eastern Baltic origin.

10 DO THE GRAVE GOODS SPEAK? THE INFORMATIONAL POTENTIAL OF INDIVIDUAL BURIALS OF OSTRIV MEDIEVAL CEMETERY (UKRAINE)

Abstract author(s): Diachenko, Dmytro (Institute of Archaeology of the National Academy of Science of Ukraine)

Abstract format: Oral

The preliminary results of the study of the Ostriv cemetery in Porossya proved that at least part of the graves belongs to the group of East Baltic migrants of the 11th century. Ostriv's community was not homogeneous in its ethno-cultural and social composition. This research evaluates the informational potential of individual burial complexes for the possible reconstruction of the structural elements (cultural, ethnic and social) of the population of Ostriv. Two female burials №70–71, investigated in spring 2020, are selected for this analysis. Burials belong to the deceased, connected by close family ties. The recorded funeral rite shows both the common features of the necropolis and individual ones, which may reflect the worldview of the deceased. A similar situation is revealed by the grave goods. Some of the discovered artefacts are already known in the graves of Ostriv, while others surprised researchers. These grave goods take us to different regions of medieval Europe - the Eastern Baltic coast, the upper Niemen basin, the Middle Dnieper area and the early Piast state. Some of these materials have a rather limited area of distribution and a narrow chronology of use. This research actualizes the discussion regarding the relationship between daily and the otherworldly functions of grave goods, which accompany the deceased to the world of the dead. In the author's opinion, with the involvement of interdisciplinary approaches, the grave goods can tell researchers a lot about their origin and the life path of their owner.

11 BALTIC CEMETERY OF 11TH -12TH C. ON THE ROS' RIVER. PALAEOPATHOLOGY OF MIGRATION

Abstract author(s): Kozak, Alexandra (Institute of Archaeology, National Academy of Science of Ukraine)

Abstract format: Oral

More than 100 burials from the Ostriv cemetery, dating mainly to the 11th century, were excavated on the bank of the Ros' River by an expedition of the Institute of Archeology of the National Academy of Sciences of Ukraine. Archaeological and thanatological studies have led to the hypothesis that the territory of Porosia, along the southern borders of Kievan Rus, was settled by people from Northern and North-Eastern Europe, namely the Western and Eastern Baltic States and Scandinavia. Preliminary data from morphological and genetic analyses, as well as stable isotope studies, confirmed the migration hypothesis of the origin of the population buried at this site. It is assumed that the predominance of young and adult males and a small number of children, especially children over 6 years old, are demographic signs of recent migration in the studied population.

Some of the men probably belonged to a military garrison, as evidenced by weapons in the graves and the warriors' osteological complexes on their skeletons. Pathological features of teeth and bones, such as tooth enamel hypoplasia, caries frequency and intensity, calculus characteristics, frequency and location of skeletal injuries, and traces of metabolic and infectious diseases can serve as migration markers. Our results indicated that the individuals studied might have been representatives of different waves of migration. During one of these migration waves, an infection could have been introduced to the territory of Porosia, leading to the death of a part of the population.

12 MATERIAL ANALYSIS OF MEDIEVAL ARTEFACTS FROM EAST BALTIC REGION AND OSTRIV (UKRAINE) USING TRANSMISSION ELECTRON MICROSCOPY AND SCANNING ELECTRON MICROSCOPY

Abstract author(s): Saleem, Khurram (Department of Materials Science and Engineering, CAU) - Shiroukhov, Roman (Centre for Baltic and Scandinavian Archaeology - ZBSA) - Schürmann, Ulrich (Department of Materials Science and Engineering, CAU) - Baranov, Vyacheslav - Ivakin, Vsevolod (Institute of Archaeology of the National Academy of Science of Ukraine - IA NASU) - Schneeweiß, Jens (Centre for Baltic and Scandinavian Archaeology - ZBSA) - Kienle, Lorenz (Department of Materials Science and Engineering, CAU)

Abstract format: Oral

Since 2017, medieval artefacts were excavated at Ostriv cemetery on Ros' river located 80 km South of Kiev (Ukraine). The objects recovered from the cemetery were markedly different from chronologically synchronous antiquities of Kievan Rus' and showed stylistic commonalities with the artefacts from East Baltic regions. The artefacts are hypothesized to have been imported along with the East Baltic migrants from such historical tribes as Prussians, Curonians

and Scalvians. Here, we present a detailed interdisciplinary approach to study these 11-12th century archaeological objects consisting of flat ladder brooches, ring brooches, penannular brooches and neckrings. The analysis is focused towards finding common or separate origins of the artefacts by using a combination of stylistic approach and materials science. For material science approach, material analysis using Transmission Electron Microscopy (TEM) was conducted on the specimens to attain chemical and structural information at nanoscale. Moreover, Scanning Electron Microscopy (SEM) analysis was also performed to identify intrinsic and extrinsic (corrosion by-products etc.) components of the artefacts. The results showed usage of pure copper, brass and bronze in East Baltic artefacts and brass in the Ostriv cemetery artefacts. The theories about the manufacturing process of the artefacts and the craftsmanship are devised in the scope of this work and a strong evidence of common chemical origin of the artefacts is demonstrated. Additionally, the analysis and the used sample preparation by Focused Ion Beam (FIB) Milling is a step in the field of Transmission Electron Microscopy on developing analytical methodology which opens new viewpoints on archaeological artefacts.

13 OSTRIV CEMETERY (POROSSYA, UKRAINE) LABORATORY RESEARCH IN 2018-2023. RESULTS, CHALLENGES AND PERSPECTIVES

Abstract author(s): Shiroukhov, Roman - Schneeweiß, Jens (ZBSA Schleswig) - Baranov, Vyacheslav - Ivakin, Vsevolod (Institute of Archaeology of the National Academy of Science of Ukraine) - Meadows, John (ZBSA Schleswig) - French, Katherine (Cardiff University, School of History, Archaeology and Religion) - Kienle, Lorenz - Saleem, Khurram (Institute for Materials Science, CAU) - Krause-Kyora, Ben (Institute of Clinical Molecular Biology, CAU)

Abstract format: Oral

The main objective of Ostriv's laboratory research was to verify whether its population were migrants or locals. The pilot study confirmed the outward origin of Ostriv's population. Radiocarbon dating of nine graves placed them into the 11th century, synchronizing Ostriv and East Baltic sites with the same artefacts. The carbon and nitrogen isotope signatures of the Ostriv population are comparable to individuals in the Baltic region, along the d_{34S}/d_{32S} signatures are distinctive. aDNA research suggests close genetic proximity between the Ostriv population and Scandinavians, Balts and Fino-Ugrians. Metal analysis shows similar chemical composition of equivalent artefacts from Ostriv and the Baltic region.

The major limitation of the Ostriv pilot project was relatively small number of samples. The conclusions of the laboratory research were based on ten samples in each laboratory area, compared with larger datasets for the Baltic region. However, in the bigger new Ostriv-DFG project, the analytical scope is 3-5 times larger, which will allow robust testing of our hypotheses. Already now, based on new ^{14}C dates and finds data, we can confirm that the chronology of the cemetery reaches the second half of the 12th century. By comparing the data from the stable isotope studies of 2019 and 2022, we can also conclude that, despite its homogeneity, the Ostriv population drew from a variety of places, including the local Porossya people. New strontium isotope studies complement the isotopic picture.

New challenges for Ostriv's laboratory research include unification of sampling – taking all possible samples from the same specimen (tooth or bone); intraskeletal sampling to gather data from different periods of skeletal formation; intensification of strontium isotope research. By the end of the project's first phase in 2025, the comprehensive multiproxy dataset produced by the DFG team will provide powerful insights into the complex, multi-ethnic population buried at Ostriv.

361 WEAVING BIG DATA FOR THE DIGITAL MIDDLE AGES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Vargha, Maria (Charles University Prague) - Eichert, Stefan (Naturhistorisches Museum Wien) - Richards, Nina (Austrian Academy of Sciences) - Parvanov, Petar (Independent researcher)

Session format: Regular session

The proposed session follows a very stimulating meeting at EAA 2022 Budapest on a similar theme. Once again, we aim to bring together researchers from Europe who create digital collections and apply new quantitative modelling based on diverse evidence types, primarily archaeological and bioarchaeological data from archival reports and collections.

The session is interested in case studies enhancing the narrative value of the traditional foundation of our discipline like artifacts, ecofacts, and built features. The digital tools allow fascinating and thought-provoking reconstruction of their original context and the often invisible networks connecting disparate source types. Further, the digital approach intertwines with multiple themes highlighted on this year's event through its sustainability, accessibility, and expanding relevance in the contemporary world.

Adding to that, current research practices, especially prone to recording and analysing big data, will increasingly support and structure the conceptual framework within which archaeology operates. This requires proactive engagement

and matching widespread discussion on the ethical, methodological or even cognitive challenges found in the use of large-scale databases. The position of medieval archaeology in the intersection of available sources and competing narratives about the past can facilitate such a discussion rather successfully. Therefore, the session aims to give a platform to consider the potential and the challenges posed by 'Big Data' in medieval archaeology, review best practices and possible pitfalls, and stimulate a comparative overview by exploring different projects and research directions.

The session welcomes papers focusing on the Middle Ages, within the range of the following topics:

- Digital collection of archaeological sites
- Digital collection and analysis with burial archaeology
- Digital analysis of large-scale archaeological data
- Digital analysis of Medieval processes by archaeological data
- Digital collections and analysis of Medieval material culture.

ABSTRACTS

1 BEYOND THE ITEM (BITEM) - NEW WAYS TO PRESENT OBJECT BIOGRAPHIES AGAINST THE BACKGROUND OF DIGITAL HUMANITIES

Abstract author(s): Eichert, Stefan (Natural History Museum Vienna)

Abstract format: Oral

The bITEM project, funded by the go!digital 3.0 call of the Austrian Academy of Sciences (ÖAW), revolves around museum objects of great significance to cultural heritage and their biographies, which are to be digitized, investigated, and disseminated from a holistic perspective.

Included in the project are, amongst others, various archaeological entities, e.g. the "Venus of Willendorf" as well as the Longobard cemetery of Hauskirchen.

The Longobard cemetery of Hauskirchen - aside from elaborate grave furnishings - is an outstanding case of contemporary grave looting. Of particular importance is tomb 13, in which a woman was buried together with two horses with golden harnesses, which probably pulled a cart during her lifetime. The grave was robbed already a few years after the burial, nevertheless it is considered today as the most important Longobard grave in Austria with a rich research history from its discovery until today.

The submitted paper aims at discussing ways on how to map these objects' biographies in networks defined by classes and properties of the CIDOC CRM including also all relevant events, actors, changes and modifications that form the itinerary of the object from its creation until the present day.

Also the digitisation of the physical attributes utilising 3D Scans, MicroCT Scans and various scientific/material analyses in order to document the physical properties as holistic as possible will be presented.

Aside from the conceptual data mapping and data model also approaches on how to explore and visualise these biographies via open source web technology are an important part of the project and will be discussed.

2 AN INTERDISCIPLINARY APPROACH - ARCHAEOLOGICAL AND ANTHROPOLOGICAL INFORMATION IN OPENATLAS AND THANADOS

Abstract author(s): Richards, Nina (Austrian Centre for Digital Humanities and Cultural Heritage; Natural History Museum Vienna) - Eichert, Stefan (Natural History Museum Vienna)

Abstract format: Oral

OpenAtlas (<https://openatlas.eu/>), developed mainly at the Austrian Center of Digital Humanities and Cultural Heritage of the Austrian Academy of Sciences, is an open-source database software suited to acquire, edit, and manage research data from various fields of humanities. It provides a user interface, which is accessible via any common browser. It allows for easy data entry, while the data is mapped in the background according to CIDOC CRM version 7.1.1 (<https://cidoc-crm.org/>). The flexibility of OpenAtlas makes it particularly well-suited for incorporating previously published archaeological and anthropological data.

However, OpenAtlas is not meant to present this data to researchers and the interested public.

THANADOS - The Anthropological and Archaeological Database of Sepultures (<https://thanados.net/>) - uses OpenAtlas as backend and fills in this gap. The web interface provides and visualizes published information on anthropological and archaeological research on early medieval burial grounds as open data as well as related scientific analyses (e.g. 14C dating, stable isotopes).

The joint presentation of bioanthropological and archaeological data on one platform is of particular interest. Only in this way can connections be grasped beyond the boundaries of the individual scientific disciplines. This allows more

far-reaching conclusions about the life of past communities than would be possible for the individual disciplines on their own.

The proposed paper wants to discuss the implementation of various anthropological analyses in OpenAtlas and THANADOS and thus provides insight into how interdisciplinary data can be handled.

3 GO DIGITAL OR GO HOME: ASSEMBLING BIG DATA FOR COMPARATIVE RESEARCH ON DEVIANT BURIALS

Abstract author(s): Parvanov, Petar (National Archaeological Institute)

Abstract format: Oral

One of the more prominent themes in funerary archaeology over the last decade has been the rethinking of our approach to deviant burials. Very often the standout nature and the rarity of these finds compels researchers to take an in-depth approach to decipher their meaning or even original arrangement. Yet, larger comparative studies demonstrate some recurring patterns in the mortuary deviancy from medieval Europe and point out to multiple related phenomena. The varying levels of interpretation can complement each other and substantiate even more exciting discussion on medieval societies. This presentation, however, is not about this.

The focus will be placed on how the possibilities offered by the digital age can facilitate the expansion of the field based on a recent experience of adding data about the deviant burial practices from medieval Southeastern Europe on the Thanados open source database. Integrating the available information comes with its own set of issues related to legacy data, democratization of knowledge, standardization and so further, all provoking a reflection on its impact on archaeological work as a whole. Moreover, this is a call for cooperation in the study of deviant burials on continental level.

4 EMPOWERING THE VOICELESS - REFLECTING ON WEAVING BIG DATA

Abstract author(s): Vargha, Maria - Fajta, Martin - Václavíková, Dominika (Charles University Prague)

Abstract format: Oral

The present paper introduces the methodological foundations and most important results of a research project funded by the PRIMUS grant scheme titled 'Empowering the Voiceless. The Role of the Rural Population in State Building and Christianisation in East-Central Europe' conducted at Charles University, Prague. The project focuses on the process of Christianisation of East-Central Europe from the point of view of primarily the archaeological heritage of the rural population.

The project explores territoriality and aims to reconstruct the earliest network of rural churches based on historical and archaeological evidence to investigate the development of institutionalised Christianisation in the lowest level of society, and contextualise its network into the contemporary political, economic, religious and physical landscape, creating a comparative analysis with field cemeteries and secular power centres. The paper presents our review at the last year of the project, reflecting on the upsides and pitfalls of weaving large-scale religious and social geospatial databases.

5 URBAN LANDSCAPES - RECONSTRUCTING PAST PROCESSES OF LANDSCAPE TRANSFORMATION THROUGH 3D MODELLING

Abstract author(s): Haase, Kirstine (Aarhus University; Museum Odense)

Abstract format: Oral

Below the modern terrain of cities throughout Europe lies several meters of archaeological stratigraphy built up through centuries. These deposits are irreplaceable archives for studying past lives. Still, there are many things we need to learn and understand about these deposits. Regarding their formation, we often hear that the medieval cities' inhabitants threw waste in the street, the backyards etc., causing the build-up and the terrain to transform. However, this explanation has always seemed too simple and unsatisfactory. Why would people choose to live among their waste? There must have been more – and possibly more complicated processes – at stake. One way of studying the formation processes behind the urban deposits is to reconstruct the landscape and its transformation through 3D modelling. Through a 3D model, the interplay between the natural terrain, the manmade landscape and other structural elements in the city can be visualised, and new insights and understandings of the urban landscape transformation can be gained.

This paper presents a case from a medieval city in Denmark, where voxel-based 3D software is used to process data from the past 150 years of archaeological excavations supplemented by geotechnical borings. Thus, the paper wishes to address the topic of analysing medieval processes by archaeological data, as the organisers have highlighted in the

session abstract. Moreover, the paper will contribute to the session by suggesting best practice when reconstructing and analysing past urban landscapes through digital modelling of a multifaceted and complex dataset.

6 PLANT FOODS IN POST-MEDIEVAL IRELAND: A BIG-DATA, MULTI-DISCIPLINARY APPROACH

Abstract author(s): McClatchie, Meriel (University College Dublin) - Flavin, Susan (Trinity College Dublin) - O Carroll, Ellen (University College Dublin)

Abstract format: Oral

This paper will explore the nature and meaning of foodways in post-medieval Ireland, based upon a major new quantitative analysis of archaeobotanical remains from more than 50 excavations across the island. The sixteenth and seventeenth centuries were a period of increasingly globalised trade when new foods arrived in Ireland, some of which, such as the potato, became dietary staples. Irish food cultures were also influenced by neighbouring Britain, which ruled over Ireland at the time, as well as Europe, but some food choices seem to reflect more local traditions. Hundreds of archaeological excavations have unearthed food-related materials dating to the 16th and 17th centuries, including archaeobotanical and zooarchaeological remains, and artefacts, such as cooking and eating utensils. The paper will focus on the newly collated archaeobotanical dataset from the FoodCult project (www.foodcult.eu), exploring key trends in plant use in the context of wider evidence, including food-related objects, faunal remains, new organic residue and multi-isotope analyses, and new analysis of historical records.

7 DATA, METADATA AND MODELLING FOR QUANTITATIVE AND QUALITATIVE ANALYSES OF MEDIEVAL AND MODERN POTTERY IN CATALONIA. THE GREYWARE INFORMATION SYSTEM

Abstract author(s): Travé Allepuz, Esther (Universitat de Barcelona)

Abstract format: Oral

The GREYWARE project has recently developed a data-modelling structure for pottery analysis including information about medieval and modern pottery, potteries and known potters, traditional practices and raw materials in several intertwined repositories. The aim of this methodological development was to exploit quantitative and qualitative data coming from different sources of information and research approaches within an interoperable framework. Previous experiences of pottery repositories (1) led us to the adoption of the ontological concepts ‚Unit of Topography‘ and ‚Actor‘ as a method to articulate an information system to manage heterogeneous datasets (2).

Going beyond a pottery catalogue including description and graphic documentation, databases included within the GREYWARE information system contain analytical data of medieval and postmedieval pottery as part of the archaeological materials repository. Results of primary data exploitation such as paste groups, typologies, provenance and raw material procurement are introduced as well as second-generation qualitative data, together with non-archaeological information obtained primarily from written sources.

The principles behind this system are built upon the Past Construction Theory (3), considering that any kind of data regardless their nature or support must be integrated in the archaeological analyses of materials for them to be part of a past-constructing science. Our contribution aims at discussing the potential enhancements of the system, further development, and tools for data exploitation.

362 MULTI-PROXY APPROACHES TO PREHISTORIC LANDSCAPES OF THE CENTRAL MEDITERRANEAN

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Gustafson, Julia (University of Cambridge) - Carletti, Elena (University of Rome La Sapienza) - Schmidt, Frijda (University of Cambridge) - Puddu, Dario (University of Sassari)

Session format: Regular session

This session seeks to bring together multidisciplinary perspectives and methods to prehistoric landscapes of the Central Mediterranean, which we define as Italy, Greece, Southern France, Malta, Monaco, and the Balkans. Landscapes cannot be studied from a single viewpoint as there are multiple factors that contribute to the idea of landscape itself. Not only this, but landscapes can be read and interpreted in many ways such as physical, cultural, and social. Ancient

people adapted to their landscape, but they also actively shaped it according to their needs and beliefs. As the interaction between human and landscape is inherently multifaceted, it is necessary to take a holistic approach which allows for the widest range of methodologies and partly relies on multidisciplinary data. Therefore, we encourage contributions from a diverse range of scholars specialising in disciplines such as environmental studies, GIS, mobility studies, social sciences, archaeological sciences, anthropological approaches, theoretical approaches, Geoarchaeology, etc. By examining prehistoric landscapes in this way, we hope to broaden our understanding of the people who lived in and interacted with them.

ABSTRACTS

1 **LANDSCAPE USE IN A RAW MATERIAL PROCUREMENT COMPLEX OF THE CENTRAL BALKANS: HUMAN OCCUPATIONS AND GEOMORPHOLOGICAL PROCESSES AT LOJANIK (SERBIA)**

Abstract author(s): Lesage, Camille - Galfi, Jovan - Barbieri, Alvisè (ICArEHB) - Bogosavljević Petrović, Vera (National Museum in Belgrade)

Abstract format: Oral

The capacity of humans to harvest and modify natural resources has been a crucial skill for their survival since early Prehistory. Raw material procurement sites show evidence of the relationship between humans and their landscape through the ages, and are particularly important to understand prehistoric humans' behaviours. Despite the advantageous position of the Balkans as a corridor of human migrations between western Europe and the Near-East, their archaeological record is not as rich in such Palaeolithic sites as one could expect. In this context, the complex of Lojanik in the Central Balkans is crucial for the comprehension of lithic raw material procurement and landscape use in the region, as it is one of the largest Prehistoric quarrying areas known in Europe, showing numerous lithic raw material outcrops over an area of twelve hectares. Previous studies have shown that these outcrops were exploited during later Prehistory (Neolithic and Chalcolithic), but recently the discovery of Levallois elements indicates that the site was exploited as early as the Middle Palaeolithic. This emphasizes the specificity of Lojanik, since the Levallois reduction sequence is a rare occurrence in the Central Balkans, where most Middle Palaeolithic assemblages are characterized by a more expedient lithic industry. Our project aims to better understand the status of this Levallois components and the earliest occupations of the site, as well as the patterns of the different human occupations through time. Combining airborne LiDAR mapping, geomorphological and archaeological survey, and techno-typological analysis of lithic artifacts, we reconstructed the geomorphological evolution of the landscape and its use by prehistoric societies.

2 **SEARCHING FOR THE SOURCE: RECONSTRUCTING TERRITORIAL MOBILITY IN THE SABINA REGION (CENTRAL ITALY) THROUGH LITHIC RAW MATERIAL SOURCES**

Abstract author(s): Carletti, Elena (Sapienza University of Rome) - Eramo, Giacomo (University of Bari) - Forti, Luca (University of Milan) - Mancini, Alessandro - Conati Barbaro, Cecilia (Sapienza University of Rome)

Abstract format: Oral

Lithics represent one of the most ubiquitous finds throughout Prehistory, hence one of the best tools to investigate human behavior.

Beyond the traditionally adopted technological perspective, multi-scalar approaches can enhance the comprehension of prehistoric societies, with particular emphasis on human-environment interactions. Raw material provenance analyses represent a promising tool to deepen the topic, allowing to detect lithic sources and, consequently, mobility patterns to access natural resources. Human groups were, indeed, deeply aware of the ecosystem they lived in and exploited it according to their needs, adapting to and shaping their landscape.

To answer the question of lithic role in revealing mobility and human routes to natural resources, we applied provenance analysis to the assemblage of Grotta Battifratta (Sabina region, northern Latium, central Italy), a cave site showing a long-term occupation from the upper Pleistocene on. We focused on the Neolithic assemblage. The raw materials examined suggest the exploitation of different sources, whose variability has been analyzed using different methods, with the aim of determining their provenance. The identification of lithic deposits will help defining site-catchment areas and territorial behavior, linking the site to a larger territory in order to 1) trace spatial mobility and 2) reconstruct the ancient landscape.

3 **VISUALIZING UNSEEN LANDSCAPES: REPORT OF THE KHAVANIA ARCHAEOLOGICAL PROJECT, 2022**

Abstract author(s): Fitzsimons, Rodney (Trent University) - Buell, D. - Francis, Jane (Concordia University) - Smith, Robert (Brock University)

Abstract format: Oral

This paper presents the preliminary results of the 2022 season of the Khavania Archaeological Project, the primary objective of which is to document all natural and anthropogenic features at the coastal site of Khavania, East Crete, located on the western shores of the Bay of Mirabello. Interestingly, while exploration of the eastern and southern shores of the bay has produced abundant evidence for cultural development in the region, its western side remains virtually unexplored, particularly for the Bronze Age. Rescue excavations in the vicinity of Aghios Nikolaos have produced a solid understanding of the historical landscape, but the earlier prehistoric remains in the region have continued to elude detection for the most part. It is in this context that the current project was established in 2019, with the overall goal being to study the development of what appears to be a significant Minoan harbour town, especially in terms of its local, East Cretan, and broader, island-wide, socio-political, economic, and ideological relationships. The focus of the 2022 campaign was the study of all portable objects collected during site surveys in 2019 and 2021 in order to: 1) create a refined site history; 2) establish a ceramic profile for the site during various phases of occupation, one which is based on general morphology and fabric composition; 3) provide a ceramic template for future studies in this part of Crete, especially; 4) understand the use of local resources; 5) examine possible activities conducted at the site over time; and 6) develop an understanding of both inter- and extra-island contact and exchange. The focus of this presentation will be the results of this ceramic study.

4 **A MONUMENTAL LANDSCAPE OF MEMORY IN SARDINIA: THE NURAGHI OF THE GIARA DI SIDDI AND ITS SURROUNDS**

Abstract author(s): Gustafson, Julia (University of Cambridge)

Abstract format: Oral

Monuments and more importantly, monumental landscapes, are designed to impress— they have a lasting impact on both their surrounds and the people who encounter and interact with them. As monuments are used/re-used, built/re-built, and encultured/ re-encultured through time, they demonstrate how people attached meaning to difference places and how this meaning shifted and changed as society transformed. They become ‘landscapes of memory’; palimpsests of human-monument interaction. The Sardinian Bronze Age saw the emergence of the Nuragic culture, which is characterised by the construction of impressive megalithic architecture, in the form of the eponymous Nuraghi. Today, Nuraghi are an important symbol of Sardinian national identity, and their continued re-use throughout the classical, medieval and modern periods stands as a record of their important place in the imagination and memory of Sardinians. Using the Giara di Siddi, a small plateau in south-central Sardinia, and its surrounds as a case study, this paper explores human-monument interaction through the *longue durée* and examines how Nuraghe act as mnemonic devices to reinforce social identity and define communities.

5 **OUTSIDE THE VILLAGE: LANDSCAPE MODEL BUILDING FOR SARDINIAN PREHISTORY**

Abstract author(s): Puddu, Dario Antonio (University of Sassari)

Abstract format: Oral

This paper presents the methodology applied to the study of the area between the current centers of Usini, Ossi and Tissi, in northwestern Sardinia, which constitutes a separate sector due to its natural characteristics. From a chronological point of view, the evidence attributable to the Final Neolithic and Eneolithic are taken into consideration. The absence of stratigraphic investigations in this area makes it difficult to trace a more precise chronology and in the same way it is not possible to rely on traditional data from excavations to reconstruct the relationship of the individual communities with the surrounding areas. However, the ground surveys have often highlighted a continuous frequentation in multi-layered deposits in the known sites, testifying to precise and repeated choices in the location of the settlements. Through the settlement strategies modelling, it was possible to experiment with an approach that has as its starting point the reconstruction of the landscape, intended as the primary scenario of human action, even before the single site. The proxy data considered consist of geographical data obtained from the analytical observation of the landscape and made quantifiable thanks to the tools provided by the gis. These can represent both the environmental characteristics of the territory and the interaction dynamics of human groups with each other and with the surrounding landscape. Specifically, the potential of topographic position, soil nature, presence of resources, accessibility of occupied areas, visibility and so on are investigated. At the end of the analysis, it will be possible to define the impact of these assets on the existing settlement strategy and to understand the human perception of the landscape in a utilitarian and functional perspective for its population.

6 MODLAND: NEW INSIGHTS ON CHANGES OF HUMAN-ENVIRONMENT INTERACTIONS IN SOUTH-EAST ITALY DURING THE LATE 3RD AND THE 2ND MILLENNIA BC

Abstract author(s): Lucci, Enrico (University of Bari - DIRIUM)

Abstract format: Oral

The cultural landscape of Southeast Italy results from long-term interactions between human societies and the diverse ecological niches characterising the region. Starting from 4000 years ago, it has been progressively shaped by the increasing impact of human activities. The combining of archaeological, palaeoeconomic and ecological analyses represents the most effective way to understand these human-environment interactions, providing meaningful insights into historical questions and to future sustainability of societies, ecosystems and physical landscape. However, this interdisciplinary approach has never been adopted for Southeast Italy where current understanding of human-environment interaction relies on pollen studies. We lack knowledge regarding the anthropogenic landscape formation processes from a spatial perspective, capable of defining which were the places the prehistoric communities were tied to, what type of economic activities they performed there, and how much such practices physically impacted on those places.

The project ModLand (funded by the Next-Generation-EU) aims at filling this gap, deepening the understanding of human-landscape interaction in Southeast Italy during the 3rd (LCA, Late Copper Age) and 2nd mill. BC (BA, Bronze Age), especially by revealing its diversity over space and time by implementing the MaxEnt modelling technique.

This presentation will outline the project's methodology and first data analysis, with a special focus on two, highly environmentally diversified, sample areas of South-East Italy. The first one encompasses a particular inland/upland territory of the Apennine mountains, which saw the presence of one of the largest waterbodies of the Italian peninsula until the mid-19th century AD (the Fucino Lake); while the second focuses on Northern Apulia, which is characterised by a convergence of diverse ecological niches, ranging from the dynamic ecosystems of the coastal and wet areas to the uplands and rough mountain valleys of the Gargano promontory.

7 DOLMENS IN THE BALEARIC ISLANDS DURING THE EARLY BRONZE AGE (2100-1600 BCE): FIRST RESULTS OF THE RESEARCH

Abstract author(s): Orosa-Queijo, Ángela (Incipit - Institute of Heritage Sciences)

Abstract format: Oral

The megalithic phenomenon is identified in the Balearic Islands during the III millennium BCE. Among the variety of structures, dolmens are the most ancient and the most representative of this period. This is largely due to their presence in the main islands, Menorca, Mallorca and Formentera, with the exception of Eivissa, and to their wide funerary use until around 1600 BCE. Moreover, the construction of the dolmens is one of the first evidences of the anthropogenic modification of the landscape in the archipelago.

However, despite the significance of these monuments as a materialization of the social concept of space by prehistoric communities, their presence and relationship with the surroundings has not been addressed by scientific research. Additionally, the lack of literature and the insufficiency of radiocarbon dating hinders the understanding of the evolution and specific chronology of the phenomenon.

The aim of this research is to analyse the funerary landscape of the Balearic Islands to understand the social characterization of their earliest communities. Thus, we will approach the visual perception of the dolmens and the relationship between monuments through archaeological evidence. To further in their funerary aspect, we will study the human remains with a bioanthropological approach. Bone analysis will allow us to set a more adjusted chronology and to improve our knowledge of the prehistoric inhabitants' lives.

8 NEW ARCHAEOBOTANICAL INSIGHTS FROM TARQUINIA: PLANT EXPLOITATION OF AN ETRUSCAN URBAN CENTRE

Abstract author(s): Schmidt, Frijda (University of Cambridge) - Gaveriaux, Fanny (Department of Earth Sciences, Sapienza University of Rome) - Marzullo, Matilde - Bagnasco Gianni, Giovanna (Università degli Studi di Milano) - Soddart, Simon (University of Cambridge)

Abstract format: Oral

The first millennium BC marks a crucial period for central Italy and one of its main agents was the Etruscan cultural complex, which moved from nucleated settlements to urban centres, and ultimately early state-formations. These processes are regarded as highly interdependent with the reorganisation of subsistence practices, but so far little research has been conducted in understanding how agriculture developed in this framework.

This talk will present new results from an ongoing archaeobotanical examination of the so-called Complesso Monumentale, the ritual centre of former Tarquinia, which has been excavated and sampled for macro-botanical remains in recent decades, and currently represents the largest archaeobotanical assemblage available from the Etruscan core-area. It will explore patterns of plant exploitation during the first half of the millennium, in order to track developments in agricultural strategies of major staple exploitation and environmental adaptation and management. The obtained results will be integrated with archaeological data on the form, function, and cultural role of Tarquinia (Bagnasco and Marzullo), isotopic analysis of cereals from the site (Gaveriaux), and the geopolitical entanglements with the wider territory (Stoddart).

A. MOBILITY STUDIES IN THE SABINA REGION (CENTRAL ITALY): NEW RESULTS FROM POTTERY AND CLAY DEPOSITS ANALYSES OF BATTIFRATTA CAVE (RI)

Abstract author(s): Chiarabba, Emma - Medeghini, Laura - Capriotti, Sara - Marconi, Nadia (Sapienza University of Rome) - Forti, Luca (University of Milan) - Mancini, Alessandro (Sapienza University of Rome) - Conati Barbaro, Cecilia

Abstract format: Poster

Mobility through raw material resources is a central topic of the archaeological panorama. In recent years, multidisciplinary approaches to material culture analysis have allowed us to gain a better understanding of past societies and their interactions with the environment. Multi-scalar approaches on pottery and clay enable to answer many research questions like the raw material provenance, technology of pottery production, exchange networks, and human mobility.

This study focuses on the provenance of the clay used in the Neolithic and Bronze Age pottery production at Battifrattra Cave in the Sabina region (central Italy). The mineralogical composition of the pottery was determined through petrographic analyses in thin sections and, then, compared to the results obtained from clay samples collected from the site's surroundings. Fourier transform infrared spectroscopy (FTIR) was also used to characterize clay samples and Neolithic and Bronze Age pottery. The goal of this work is to go further into this little-known area of central Italy and discuss its prehistoric peopling, exchange routes and mobility. The Sabina region is, indeed, strikingly important due to its role in connecting the middle Adriatic and the middle Tyrrhenian areas.

B. ANTHRACOLOGICAL AND FUEL ANALYSIS OF THE IRON AGE SETTLEMENTS AROUND THE OHRID LAKE (NORTH MACEDONIA)

Abstract author(s): Šmolková, Markéta (Institute of Classical Archaeology, Faculty of Arts, Charles University Prague) - Beneš, Jaromír (Institute of Archaeology, Faculty of Philosophy, University of South Bohemia; Laboratory of Archaeobotany and Palaeoecology, Faculty of Science, University of South Bohemia) - Atanasoska, Nevenka (Institute of Archaeology, Faculty of Philosophy, University of South Bohemia) - Ardjanliev, Pero (Archaeological Museum of Macedonia, Skopje)

Abstract format: Poster

The region around lake Ohrid in the southwestern Balkan represents an environmentally heterogeneous region, where the habitation shifts in the landscape during various periods are clearly observable. The lake area is intensively studied by a Czech-Macedonian research expedition since 2019 focusing on the socio-cultural development at the end of the 2nd millennium BC and the reconstruction of economic and subsistence strategies before the shoreline area of the lake was flooded due to the massive earthquake around 1200 BC. A further part of the research focuses on changes in subsistence strategies in the early and developed Iron Age (1000-550 BC), which are primarily connected to settlement shifts to higher elevations. As part of the research, two hilltop sites have been excavated up to now, Leskovec and Dolno Lakocherej.

Preliminary results of anthracological analysis of charcoal samples from research season 2022 on Dolno Lakocherej are presented here. Together with palynology, osteology, and macroremains analysis, anthracology represents a part of the multi-proxy approach study of the Iron Age landscape reconstruction.

The final outcome should demonstrate presumptive evidence of intensive grazing involvement and describe the forms of fuel management as a part of the economic and subsistence strategies. Together with Leskovec, Dolno Lakocherej represents a settlement form characteristic of the region at the beginning of the 1st millennium BC and reflects the changes in using landscape in comparison with the previous Neolithic and Bronze Age palaffite settlements.

In a broader context, research on the early Iron Age settlement's socioeconomics should allow us to reconstruct the overall society development which resulted in the so-called princely graves horizon at the end of the developed Iron Age, witnessed by the nearby burial site at Trebenishte.

ART AND ARCHAEOLOGY - TOWARDS A FRAMEWORK FOR THE CREATION OF SUSTAINABLE NARRATIVES

Session theme: 3. Heritage Narratives and Representations

Session organisers: Zinn, Katharina (University of Wales Trinity Saint David) - Høst-Madsen, Lene (Skanderborg Museum) - MacGregor, Gavin (Archaeology Scotland)

Session format: Regular session

Can art make archaeology more relevant in these times of change? How can we creatively contribute to local – global conversations and actions through archaeological heritage? How can we understand and communicate the fundamental importance of sustainability, perhaps going beyond the immediate focus of climate and biodiversity crises? How do we tackle changing ethical questions faced in heritage practice and archaeology when attempting to decolonise heritage or to increase diversity in the sector? How can we create communities, weave narratives and tell stories so that we reach out to (new) audiences, foster engagement and create (new/altered) identities?

Thinking in traditional disciplines and practices may not equip archaeologists, heritage and museum professionals or academics to ensure that their sectors stay relevant. New academic turns, such as the focus on the agency of objects, discussions around New Materialism and Post-Humanism, already encouraged innovative thinking. Perhaps, however, it is renewed focus on curiosity and (artistic) creativity which will allow us to develop theoretically grounded and equally successfully applied frameworks towards the development of best practice. This highlights the need to develop complex systems of care spanning archaeology, heritage, art, education and economies through both practice and research in order to stay relevant and have social impact.

The panel invites case studies, and creative responses, which explore how artistic approaches can, will and have deliver(ed) answers to the questions above and further our understanding of the emotive potential of creative/artistic narratives conceived from, or applied to, archaeological heritage. The inter- and trans-disciplinary expertise of the panel organisers will help to weave these examples and approaches together, in discussion with the session presenters, into a potential framework with the aim to publish.

ABSTRACTS

1 WHEN SCIENTIFIC PROFESSIONALISM OF ARCHAEOLOGY MEETS CONTEMPORARY ART

Abstract author(s): Host-Madsen, Lene (Museum Skanderborg) - Rasmussen, Steen (Independent artist) - Lyk-kegård-Maes, Mette (Museum Skanderborg)

Abstract format: Oral

Museum Skanderborg has created the project KUNSTLABORATORIUM – PERRON1 in collaboration with Art Council Skanderborg as part of the dissemination strategy that the museum is working on.

The project works with concepts for the interpretation of archeology through contemporary art; both in temporary exhibitions and in building-integrated art in the building as a whole. One of the initiatives is to involve contemporary art as an active and outgoing citizen-involving participant.

Various artists are invited to try out some of the museum's rooms before an upcoming redevelopment of the museum in order - through art - to explore possibilities and potentials linked to the development of the entire Museum Skanderborg - Perron1

This paper is based on the exhibition "Apocalyptic thoughts - What remains"

Visual artist Steen Rasmussen and museum director Lene Høst-Madsen talk about some of the realizations that artist and museum have achieved through the collaboration. The hope is to create a greater understanding and use of art in archaeological contexts. Based on Lene Høst Madsen's experiences with projects such as Escape and the Art Laboratory and Steen Rasmussen's many years of work in bringing contemporary art to the people through co-creation projects.

The conversation starts from a common recognition that when the scientific professionalism of archaeological museums is set against art's wondering look at the world, you get an expanded perspective on things and a greater understanding is opened up.

We find that the cooperation between art and archeology possesses great potential and would love to share our experiences in this session.

2 DECONSTRUCTING ARCHAEOLOGICAL LANDSCAPES OF THE PEAK DISTRICT

Abstract author(s): Bowyer-Kazadi, Emily (University of Liverpool)

Abstract format: Oral

This paper shall focus on deconstructed landscape photography which uses individual shots within a panel rather than a shot of the entire landscape with different examples being presented from the authors PhD research in the Peak District. This method can be done by anyone with an access to a camera and computer and can highlight many different types and variations of archaeological landscapes and sites in a wide range of contexts, meaning that no two panels will be the same. The panels will be used in several ways including being printed on roller banners so that they are easily transportable and can be used multiple times, therefore being sustainable, in moving exhibitions at various visitor and community centres as well as the author aiming to run guided walks and training on photography and using the software. This method has great scope and potential and must be adaptable to different areas and regions all over the world, linking heritage across borders and it can be sustainably developed whilst considering all the elements discussed above including considering the accessibility of different groups to archaeological landscapes and their needs in relation to identity; wellbeing; equality, diversity, and inclusivity as well as sustainability. This includes (but is not limited) to creating training manuals in different languages (including for those who are audio and visually impaired) and a set of guidelines for all practitioners to follow, training sessions, working with schools, local groups and universities, and finally partnering with local sites and businesses. Deconstructed Landscape Photography is an especially relevant method due to the nature of today's society which is highly linked to sharing images online and can therefore contribute to a potential framework that will enable all people, regardless of their race, gender, religion etc. to engage with archaeological landscapes wherever they are.

3 INNOVATIVE AND PROVOCATIVE APPROACHES TO THE ART AND ARCHAEOLOGY INTERPLAY PHENOMENON: OUTLINE OF A PLANNED PUBLICATION

Abstract author(s): Hadji, Athena (DIKEMES - College Year in Athens) - Jameson, John (ICOMOS ICIP/ICAHM, U.S. National Park Service)

Abstract format: Oral

Archaeological objects can be seen as both expressions of larger cultural traditions and as tied to individual people who have their own idiosyncratic desires, experiences, and understandings, and use art and material culture partly to know and express themselves, and partly to negotiate and confirm their positions in larger social and political fabrics. Materiality is understood as corporeality first and foremost, both of ourselves as inquiring subjects and of our objects of inquiry (Hadji 2015). In our attempts to capture the interplay between archaeology and the arts, we carry forward several relationship assumptions. We believe that the practice of archaeology, as well as archaeologically derived information and objects, can inspire a wide variety of artistic expressions ranging from straightforward computer-generated reconstructions and traditional artists' conceptions to other art forms such as 2- and 3-dimensional art, public sculpture, poetry, music, opera, theatrical performance, and storytelling. Moreover, a reciprocity emerges: art practices of the present can critically inform archaeological interpretation, in more aspects than the practice of art or 'art' in the past. These cognitive connections between archaeology and the arts reflect an inferential approach in defining, explaining, and introducing an object or resource and making it more meaningful to the public. The credibility and relevance of our proposed volume is enhanced by the observation that archaeology and heritage have a long shared history with art. Recent initiatives within and outside academia have probed into the historical interactive relationships between archaeology and the arts. In a planned volume tentatively entitled: "Archaeology and the Arts: Seeing the 'Art' in Artifacts," our goal is to provide insights with a provocative collection of essays that provide unique and innovative approaches to the art and archaeology interplay phenomenon -- the fascinating, dynamic, cognitive reciprocity between tangible and intangible --- in the context of today.

4 ARCHAEOLOGICAL SENSIBILITIES IN POLISH CONTEMPORARY ART: TRACING GENEALOGIES

Abstract author(s): Stobiecka, Monika (Faculty of Liberal Arts, University of Warsaw)

Abstract format: Oral

Recent years have shown a growing interest in art/archaeology exemplified by displays organized in archaeological museums and art galleries, as well as by a wide selection of artworks created by world-famous artists. This interest in archaeology is particularly present in contemporary Polish art. Hubert Czerepok in the video "Nemzeti Tájképek" (2016) presented a future vision of archaeology while visiting a renowned Turkish Neolithic site, Karahan Tepe, with a lunar rover. Diana Lelonek in "New Archaeology for Liban and Płaszów" (2014) presented objets trouvés from an abandoned mine and a former concentration camp in Cracow. She observed the natural processes that took over a variety of objects that she found. In an artistic project "Heavy water" (2017-18), Agnieszka Kalinowska copied African water vessels and decorated them with the "migrant sign" to show analogies between prehistoric migrations and the current migration crisis. Agnieszka Kurant, in the series "Future fossils" (2014-19), created uncanny artifacts from the

future, investigating what will be perceived as our heritage. Angelika Markul has been exploring the archaeological past in order to understand the current climate crisis. This short overview shows the growing popularity of archaeological motifs in contemporary Polish art.

Although traces of a particular archaeological sensibility in Polish contemporary art can be identified in the earlier artworks by Władysław Hasior, Tadeusz Kantor and Mikołaj Smoczyński, archaeology in Polish contemporary art is not used only to refer to important avant-garde artists. Therefore, the presentation will aim to discuss the various genealogies of archaeological sensibility in Polish contemporary art. It will answer questions about why do artists use archaeological motifs? What do they want to address in their art? How do the traditions of Polish art affect the archaeological sensibilities of today?

5 ART + ARCHAEOLOGY + COMMUNITY: A SUSTAINABLE STRATEGY

Abstract author(s): Gheorghiu, Dragos (National University of Arts in Bucharest)

Abstract format: Oral

In the contemporary world archaeology can also be socially engaged as a tool when mixed with art, the material culture of the past becoming a source of inspiration to create a new art and identity for some communities.

The paper presents the results of a 20-year project carried in a rural community in Romania, where the complete loss of the traditional identity during the totalitarian regime, required an approach to create the lost cultural diversity.

Experimental archaeology used as an art tool recovered local ancient technologies, which were used by invited visual artists and villagers as models, creating both contemporary art objects and a folk art in progress, together with an economic change. Land-art and performances, together with digital technologies, also helped archaeology to have a strong educational role.

A large part of the community was involved in the archaeological experiments, the art workshops, and the e-learning courses, contributing with information on the local heritage and producing original objects with ancient technologies. A local workshop of ceramics was created, producing a unique folk art.

This project functioning as a model of integration of archaeology and heritage with art and education initiated the construction of a new heritage and produced in time a social effect on the community. How the ideas of this project to combine art and archaeology were accepted and taken up by other communities of archaeologists, artists and local people in different European locations can be seen at www.timemaps.net.

6 ART/ARCHAEOLOGY: DISARTICULATION AND DISRUPTION

Abstract author(s): Bailey, Doug (San Francisco State University)

Abstract format: Oral

The connections between art and archaeology are rich and well-rooted, both in terms of interpretive and creative work. A recent set of projects, however, has explored the territories that exist beyond the boundaries of both art and archaeology. The goal of these projects and of art/archaeology in a wider sense has been to make creative work and provoke debate. These projects have disarticulated artefacts and other archaeologically recovered materials from their pasts, and then used those newly liberated objects as raw materials in the making of new creative work in order to engage challenges found in the modern world. This presentation will present the art/archaeological work from three of these projects: Ineligible (San Francisco and Santo Tirso); Releasing the Archive (Oslo, Santo Tirso, and Lisbon); and Releasing the Amphora (Syracuse and San Francisco). The aim is to generate discussion and debate about what roles archaeological materials can play in the resolution of contemporary social, economic, environmental, and political challenges.

7 HOW CAN AN EXPANSION OF AN ACADEMIC MUSEUM ENHANCE THE NARRATIVE OF THE PERMANENT COLLECTION OF ATHENS UNIVERSITY HISTORY MUSEUM

Abstract author(s): Papoulias, Evangelos - Zounis, Theoklis - Petros (National and Kapodistrian University of Athens)

Abstract format: Oral

Athens University History Museum (AUHM) was inaugurated in 1987 in the context of the 150th anniversary of the National and Kapodistrian University of Athens (NKUA) Institution since its establishment. AUHM aims at presenting the important history of the oldest university of the country, in the building where the Institution started operating in 1837. Its integration in the cultural center of Athens makes it special on a global level, because very few universities have managed to create a museum which highlights the cultural heritage of the university and one that addresses not only the academic community but also the broader public.

In 1998, with the decision of the Greek Ministry of Culture, NKUA was granted the right to utilize the property at 16 Tholou Street for an expansion of its history museum. The reconstruction and expansion of the building completed in 2019. What was the main aspect of a new narrative of the permanent collection for the new building? Specifically, NKUA's portrait collection includes 347 works of 90 different artists, remarkable examples of modern Greek art narrating the history of NKUA, as well as the important role of those great figures in higher education. All the collection was scattered in many buildings of the university. The NKUA administration decided to present to the new building the NKUA's growth in its historical space-time. The exhibition hall displays oil paintings of figures who composed the university's First Senate in 1837, and significantly marked the course of the university's life, all in one display unit, for the first time. The paper examines the new approaches and perspectives for museologists to create a new storytelling in order to promote and enhance academic heritage to public.

8 CASE STUDIES FOR A CREATIVE ANTHROPOLOGY: BEHAVIORAL ARTIFACTS AND PRIMATOSCOPY-01

Abstract author(s): Potvin, Yanik (Université du Québec à Montréal; Université du Québec à Chicoutimi; <https://hexagram.ca/fr/>)

Abstract format: Oral

The integration of creativity in North American anthropology opens up new and promising avenues of research that align with practice-based research in the arts. By using clay and ceramics as an epistemic object for artistic endeavors within the sub-disciplines of anthropology, I have encountered the intersections between my experiences in archaeology and my art practice. I propose to review two of my projects in creative anthropology: Behavioral Artifacts and Primatoscopy-01. The Behavioral Artifacts project proposes an expansion of the concept of artifact to encompass the traces, images, objects, sounds, or lists of instructions produced by the performativity of working with clay. The interaction of various states of clay and ceramic cultural traditions can shape the body and result in behaviors that challenge the identity of the artist and the legitimacy of material produced in humanities research. The primatoscopy-01 project exemplifies the constructivist approach through the behaviors produced by two species of primates (*Macaca fuscata* and *Theropithecus gelada*) in various phases of manipulation of traditional clay forms. The results of these two research projects will be related and future directions will be discussed. Theoretical articulations around material agency, subjectivity in anthropology, practice-based methodology, art historical contingencies and the practical application of posthumanism will guide the presentation. The Behavioral Artifacts project will be presented in Canada in the spring of 2023 through the publication of a monograph and a transdisciplinary conference (art, literature and archaeology). The Primatoscopy-01 project was presented at the École Nationale Supérieure des Arts Décoratifs de Paris (EnsAD) in the year 2022. As a result of the discussions and interventions, the activities planned for the Primatoscopy-02 project can be better oriented. The experiments will take place between 2023 and 2024 and will allow for enrichment phases in a great ape (*Pan troglodytes*) sanctuary.

9 DIFFICULT HERITAGE, ART, AND ARCHAEOLOGY

Abstract author(s): Bezic, Ana - Tomić, Milica (IZK / Institute for Contemporary Art, Graz University of Technology)

Abstract format: Oral

The archeological concern and engagement with the contemporary past has emerged as a significant field of archaeological endeavour in the past two decades. As representations and memory of the modern conflicts continue to be contested, archaeology has employed various methods and conducted significant work in the attempt to aid in post-conflict reconstruction and reconciliation. Significantly, the domain of art has recently emerged as a critical platform for disrupting the official erasure and silencing of experience and knowledge about the contested past. Can such proactive and complex art, cut across public, political and cultural domains to enabling and producing space where discussion about difficult heritage can take place?

One such space is the focus of our presentation. Four Faces of Omarska, Belgrade based art-collective, has been engaged for the past decade in exploring the strategies of memorial production and the (im)possibility of memorialization from the position of those whose experience and knowledge have been excluded from public memory and public history. This ongoing art project takes Omarska, a former concentration and war prisoner camp during the Yugoslav wars, as a case study and by using the relevant texts, media, photographs, video and audio material, oral accounts, and legal documents this project makes visible the complex set of political, cultural and economical interests that has and continues to shape this location.

The complex history of the site shows at one end a disjunct, marginalised and suppressed knowledge and on the other no political and economic power to build a memorial. How to build a collective of trust and common ground for memorialization? This project, through the material gathered, produced and exhibited has enabled a new kind of praxis, a more democratic and inclusive one with a potential to empower different participants and create new associations.

10 PERFORMATIVE READINGS: OVIL AS A TRANSHISTORICAL PLACE

Abstract author(s): de Carvalho, Helena Paula (Lab2PT - University of Minho) - da Silva, Pedro (CEAACP - University of Coimbra) - Moreira, Inês (Lab2PT - University of Minho) - da Conceição Lopes, Maria (CEAACP - University of Coimbra)

Abstract format: Oral

Mount Ovil site, in Portugal, is a testament to different phantasmagorical realities that cover a broad chronological landscape, from prehistory to contemporary times. This site is characterized by the presence of materialities shared between the ruins of both proto-historical settlement and modern paper factory. Reading these realities is fundamental to understand the relationship between nature and human activities over time, that is, we observe the performativity of the site and how it has evolved over time, including the recycling of materials and their transformations. Shale, for example, is a material that was used in the construction of a proto-historical village, then transported to a paper factory, and today it slowly returns to the river. This archaeological site is also witness to disruptions and a simulation of the place, by the in-situ renaturalization of the ecosystem to look more „proto-historical,“ specifically by the inclusion of autochthonous species that stand out from the surrounding eucalyptus landscape. Our communication proposal is to share this archaeological reading of a site that is transhistorical and that allows us to understand, from this diachronic stratigraphy, how archaeological heritage is shaped by its past, how it influenced its present and may influence the future. We propose this methodology as an important tool of the archaeological imagination for the preservation and understanding of the history of archaeological spaces and its post-materialities, as well as possibilities for new post-nostalgic practices.

11 ART & ARCHAEOLOGY - EXPERIMENTS IN CREATIVE CO-PRODUCTION

Abstract author(s): MacGregor, Gavin (Archaeology Scotland) - McFadyen, Lesley (Birkbeck, University of London)

Abstract format: Oral

Stereotypical modes of production, ranging from lonely garret artist to highly routinised technocratic archaeological field recording teams, distract from the complexity of forms of collaboration and expression which are negotiated through arts, culture and heritage.

How then, facing significant constraints and addressing fundamental challenges, do we mobilise to support greater creativity and begin transcending the realities we encounter in different domains of archaeological practice? How do we enable safe spaces to support experimentation and growth among those who wish to extend their practices? Could a clearer alignment of shared purpose help in rebalancing structural asymmetries? Do some archaeological deposits allow for more experimentation and risk taking? Could different processes of co-design, and other forms of collaboration, allow for the emergence of renewed curiosity and more effective care?

Beginning with a short introductory presentation, an inter-active ‘micro-charrette’ will be facilitated which begins to explore how we could enable creative co-production as a community of practice and seeks to identify opportunities for future shared action.

364 ARCHAEOLOGY OF THE LIMES - ROMAN SETTLEMENTS AND ROMAN MILITARY PRESENCE ON THE MARGINS OF THE EMPIRE

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Komar, Paulina (Uniwersytet Kardynała Stefana Wyszyńskiego w Warszawie) - Karasiewicz-Szcypiorski, Radosław (Polish Centre of Mediterranean Archaeology, University of Warsaw) - Koch, Julia (Justus-Liebig-Universität Gießen) - Czapski, Maciej (University of Warsaw) - Hamburg, Jacek (Krukowski Research Center)

Session format: Regular session

Roman frontiers during the time of the greatest extent of the imperial power were about 5000 kilometres long and stretched from the northern coast of Britain over the Atlantic Ocean, the Black Sea, the Red Sea and through North Africa back to the Atlantic Ocean. They ran through different climatic zones, biological ecosystems and ethnic areas bonding diverse landscapes and cultures and connecting them to the centre of the Empire.

The rchaeology of the limes allows us to understand how the Romans coped with adapting their fortification system to very different environmental conditions and attitudes of the conquered people. Although each military fort had generally the same architectural pattern and the Roman army in general shared the same diet requirements and consumer practices, each military landscape of the Empire demanded new ways of (re-)creating Roman military lifestyle in different circumstances.

We welcome presentations that take multidisciplinary approaches to Roman fortifications and their associated settlements across the Empire to demonstrate, from different perspectives, how remote peripheries functioned within the network of the globalising Roman world.

ABSTRACTS

1 ROMA VERSUS SCYTHIA. WHAT WE KNOW ABOUT THE MOST POORLY UNDERSTOOD AREA OF ROMAN MILITARY STATIONING OUTSIDE THE EMPIRE

Abstract author(s): Kubrak, Oskar (Polish Centre of Mediterranean Archaeology, University of Warsaw)

Abstract format: Oral

Despite the vast territorial extent of Scythia, we can only speak of the presence of Roman troops in this area with regard to the northern Black Sea coast and the interior of modern Romania, focusing on the territory east of the Aluta River, beyond the Limes Transalutanus. We date the influence of the administration of Moesia Inferior and the appearance of Roman troops here to the mid-1st century AD, and their influence ends with the invasion of the Goths around the mid-3rd century.

While the Greek cities that existed in this area have been excavated for more than 150 years, we still know little about Roman military presence despite the fact that soldiers resided here for almost 200 years. The strategic positioning and distribution of Roman outposts, however, indicate the importance of the border areas to the Roman Empire.

During this presentation, I will show the results of a project that has been ongoing for two years, focusing on research of the Roman military presence in Scythia. I will highlight questions arising from, among other things, the lack of publications on the results of research carried out on this area.

2 BRITAIN TO BLACK SEA: RITUAL LANDSCAPES AT ROMAN EMPIRE'S EDGE - EXPLORING STRATEGIES OF RESILIENCE

Abstract author(s): Koch, Julia (Institute of Classics, University of Giessen)

Abstract format: Oral

Throughout the vast Roman Empire military landscapes were clearly dominated by the garrison architecture of legionary and auxiliary forts and fortification systems. Whereas the Roman military lifestyle has been explored both in the forts and in the military vici in the recent past, less attention has been directed towards ritual landscapes surrounding Roman forts. This paper aims to approach the Archaeology of the limes from the rather global perspective focusing on artificially created sacred landscapes newly designed from scratch through the construction, for example, of shrines of Mithras and Meter (Cybele), sanctuaries, and monumental tombs. In this talk I apply the diaspora model to Roman funerary culture and visual expressions of lived religion very closely connected to sepulchral cult in military cemeteries along the northern frontiers of the Roman Empire as far as the southern Pontic coast. Thereby I investigate how military communities dwelling along the frontiers employed specific strategies in order to establish a home away from home both for the dead and the living as a means of building social and cultural resilience. The recently excavated Arnsburg tumulus and its domus aeterna furnished with hunting and bathing equipment otherwise widely distributed in the Middle Danube region thus provides my starting point on the Upper German limes in Giessen County. It enables me to analyse cross-regionally in a few case studies how culturally diverse, uprooted people serving in the Roman army may have strengthened and visually communicated their cultural identity and social cohesion along the edges of the Roman Empire for individual and sustained human well-being. These cultural imprints may further allow us to trace levels of connectivity between ecologically diverse landscapes linking the Roman East and West to demonstrate how people living in remote peripheries engaged with Imperial politics and the globalising Roman World.

3 MITHREUM IN TYRAS (BILHOROD-DNISTROVSKYI)? A NEW LOOK AT A BUILDING WITH AN APSE BEHIND THE WALLS OF A ROMAN CITADEL

Abstract author(s): Karasiewicz-Szczypiorski, Radoslaw (University of Warsaw, Polish Centre of Mediterranean Archaeology) - Saveliev, Oleh (National Academy of Science of Ukraine, Institute of Archaeology) - Misiewicz, Krzysztof (University of Warsaw, Faculty of Archaeology)

Abstract format: Oral

An apsidal building at Tyras (Bilhorod-Dnistrovskiy, Ukraine), discovered by an Ukrainian-Romanian expedition, is known in the literature. This building has never been explored in its entirety, because it is situated partly under the road leading to the nearby Turkish fortress of Akkerman. The predominant view among the scientists who participated in the excavation assume that the apsidal building was an Early Medieval church.

This interpretation of the building's function, however, seems unlikely for a few reasons. First, archaeological layers and artefacts found inside the building date to the period when a Roman garrison was stationed in the neighbouring citadel (2nd century and 1st half of the 3rd century AD). Furthermore, the building is located just outside the walls of the aforementioned citadel. The size and proportions of the building are also not reminiscent of early churches known, for example, from the Chersonesos Taurica.

Geophysical surveys carried out in 2021 in the area of the road have made it possible to reconstruct the plan and dimensions of the building with the apse. This brings us one step closer to clarify the function of this apsidial building as a possible Mithraeum. During the presentation, results of the geophysical survey and analogies for the building with the apse will be offered.

4 A CULT DEPOSIT OF LOCAL POTTERY IN THE APSAROS? CONTACTS BETWEEN THE INHABITANTS OF THE COLCHIS AND THE ROMAN ARMY

Abstract author(s): Lockley, Natalia (Warsaw University, Polish Centre of Mediterranean archaeology)

Abstract format: Oral

Systematic archaeological excavations ongoing at the Apsaros Fort on the eastern Black Sea coast in modern Georgia since 1995 have yielded a large amount of movable artefacts, the most abundant of which are fragments of ceramic vessels. A significant part of this assemblage is related to the period of the fort's operation in the 1st to 3rd centuries AD. In addition to imported pottery (such as amphorae and terra sigillata), the majority are locally produced ceramic vessels (so-called Colchis amphorae, tableware, and kitchenware). During an excavation campaign in 2021, a deposit of local kitchenware was discovered in one room of a hypocaust cellar in its foundation layer. Can we thus speak of a cult deposit and why were vessels of local production used?

In this talk the deposit will be presented first and subsequently connected to broader interaction between the fort crew and the local population. Furthermore, the use of locally produced vessels as foundation offerings provides one starting point for future analysis of ritual practices at the Apsaros Fort.

5 FEEDING THE ROMAN ARMY ON THE MARGINS OF THE EMPIRE

Abstract author(s): Komar, Paulina (Uniwersytet Kardynała Stefana Wyszyńskiego w Warszawie)

Abstract format: Oral

Supplying Roman camps on the limes was not an easy task as it involved a combination of local, regional and interregional products and distribution channels. The aim of this study is to analyse the patterns of supply of Roman military camps on the Upper and Lower German Limes in amphora borne products in order to understand how the empire dealt with organising provisions of wine, olive oil and fish sauces, that means foodstuffs that were not available on local or regional markets.

Proportional share of different amphora types in the total assemblage of transport containers will be analysed for each site and these proportions will be set together with distances from different areas producing wine, olive oil and salted fish derivatives, in order to create potential commercial networks. Distances will be approximated using ORBIS, a Stanford Geospatial Network model of the Roman World. Finally, regression analyses showing the relation between the volume of foodstuffs from different areas and the potential costs of their transport will be used in order to verify which foodstuffs were imported to the Roman camps according the scheme that would resemble market distribution and when other factors, such as state commands/special commercial links etc., were much more important. Such analyses will help us to understand the potential role of *annona militaris* in supplying the Roman camps situated on the margins of the empire.

6 PROVENANCE, PRODUCTION TECHNOLOGY AND 14C DATING OF IRON BALLISTA BOLTS TO ADDRESS THE ROMAN IRON INDUSTRY AT THE GERMANIC LIMES

Abstract author(s): Stepanov, Ivan - Brauns, Michael - Friedrich, Ronny - Knapp, Hannes (Curt-Engelhorn-Zentrum Archäometrie gGmbH) - Langgartner, Anna (Archäologisches Landesmuseum Hessen, Römerkastell Saalburg) - Geschwinde, Michael (Niedersächsisches Landesamt für Denkmalpflege Regionalreferat Braunschweig)

Abstract format: Oral

This study addresses technological and economic aspects of the Roman iron industry both along and beyond the Germanic Limes via a comparative scientific analysis of 18 ballista bolts from the Harzhorn Battlefield (Lower Saxony) and the Saalburg Fort (Hesse) dated to the Imperial period (1st-3rd cent. AD). All projectiles are characterized by a standard shape, a square cross-section of the point and a nail-fastened socket, which allows us to identify them as projectile points of high-precision torsion powered weaponry. The undertaken multidisciplinary approach incorporates investigation of the manufacturing technology via metallography, provenance via osmium isotopy and LA-ICP-MS, archaeobotanical identification of the plant species utilized in the shaft of projectiles, as well as the AMS

dating of steel. The preliminary results suggest that the objects were produced via common blacksmithing techniques from heterogeneously carburized iron. The use of several probably local ore sources can be envisaged, supporting the identification of items as mass-produced goods, the manufacturing of which was not significantly affected by time constraints and spared reliance on long-distance supply networks. This likely contributed to the stability of the Roman military presence at the limes.

7 THE CULT OF SÎN OF HARRAN AND THE ROMAN EASTERN FRONTIER: INDIGENEITY AND LEGITIMACY

Abstract author(s): Dandrow, Edward (University of Central Florida)

Abstract format: Oral

The Roman imperial period saw the “revival” of ancient Syro-Mesopotamian cults, one of which was that of the moon-god Sîn of Harran. Once a state god during the Late Hittite, Neo-Assyrian, and Neo-Babylonian periods, his cult was neglected during the Achaemenid and Hellenistic periods. Yet, during the first through third centuries AD, as inscriptions found at Soğmatar and Hatra reveal, we find the dynasties at Edessa and Hatra invoking Sîn as a source of political and military power and legitimacy. Roman encroachment upon and assimilation of Osrhoene and Hatra forced local cults to adapt to new political realities, and while the character and cult of Sîn did change over time Roman imperial authorities recognized it as an ancient, indigenous, and exotic source of political legitimacy in the region. Thus, emperors campaigning in the east undertook pilgrimages to Harran and gave special privileges to the city. By doing so, they not only aspired to obtain divine favor for their wars but also to integrate themselves into a regional system of religious and political traditions that were believed to originate from an “Assyrian” royal past. Sîn never acquired the popularity and broad appeal among the soldiers that *inter alia* Jupiter Dolichenus and Mithras had, but the mutual support between emperor and the moon-god was seen as essential to Roman power at the eastern frontier. Thus, this paper examines the nature and extent of Roman engagement with the cult of Sîn of Harran and seeks to add to our understanding of the interplay and negotiation between local “indigenous” cults and Roman political and military authority.

8 DAJANIYA IN JORDAN – ROMAN MILITARY CAMP ON LIMES ARABICUS- NEW FINDINGS

Abstract author(s): Misk, Lukasz - Kopij, Kamil - Bodzek, Jarosław (Jagiellonian University in Kraków) - Babucic, Nikola (Hamburg University) - Puniach, Edyta (AGH University of Science and Technology) - Ćwiakła, Paweł (AGH University of Science and Technology)

Abstract format: Oral

Dajaniya is one of the largest Roman forts in Jordan, located 30 km northeast of the legionary fortress in Udruh and 78 km south of the legionary fortress in Lejjun. The archaeological work done so far has not provided a final answer as to when the fortress was built. The material obtained in field surveys and sondage excavations was mainly pottery from the Late Roman and Early Byzantine periods (up to the early 6th century). It also included earlier pottery, however, dating back to the early 2nd century CE. Some scholars suggest it was built in the early or late 2nd century CE, but no architectural evidence had been found to support this claim. The aim of our paper is to present the outcome of testing two hypotheses: the first hypothesis involves the existence of vicus and civilian buildings around the fort; the second, hypothesis concerns the possible existence of a military fort in the second century AD, which has not yet been confirmed. Our paper will present the results of geophysical surveys conducted in late 2022 in the immediate vicinity of the fort. The research was carried out by scholars from the Institute of Archaeology of the Jagiellonian University in collaboration with the University of Hamburg and AGH University of Science and Technology in Krakow.

9 THE HILLS HAVE EYES – RECONSTRUCTING THE ROMAN WATCHTOWERS’ SYSTEM VOLUBILIS NEIGHBOURHOOD

Abstract author(s): Czapski, Maciej (Faculty of Archaeology Warsaw University)

Abstract format: Oral

Roman North Africa aroused a keen interest of the researchers of antiquity due to the numerous remains of both civil and military architecture. The ancient authors testify to the turbulent history of Rome’s relationship with local societies. Despite many years of research and numerous publications, we still have meagre information about the functioning of border fortifications in this part of the Roman Empire. The Tingitana Frontier Project – conducted by a team of Polish and Moroccan archaeologists - is trying to unravel the riddles concerning the southern border of the province of Mauretania Tingitana where the chronology of the founding and extension of the system of defense has not yet been established. The research of our mission since 2018 aims to examine and analyse the defense systems of the border towns of this province of the Roman Empire, taking as case study the city of Volubilis. The surroundings of Volubilis were protected by auxiliary units located in three forts not far from the city. During the season in 2022 the

field works allowed us to confirm the existence of the first-of-its-kind Roman watchtower in Mauretania Tingitana. Preliminary results from that season are giving us interesting insight into the security system of the city of Volubilis. With this contribution I answer some questions about the relations between the observation points and the Roman auxiliary forts existing in this region.

A. ALL'S QUIET ON THE EASTERN FRONTIER: THE PANNONIAN LIMES IN MODERN CROATIA DURING THE LATE ROMAN PERIOD

Abstract author(s): Lukic, Katarina (Faculty of Humanities and Social Sciences, University of Zagreb)

Abstract format: Poster

The Pannonian limes, and particularly its stretch in modern Croatia, was a rural frontier zone where the army was indirectly responsible for establishing a monetised local market that subsequently gravitated towards and depended on urban centres in its vicinity. This talk focuses on the impact of regular coin supply to garrisons stationed at the forts along the 188km long Pannonian limes in modern Croatia and its local monetary economy during the Late Roman period through case studies. Special focus will be set on the cessation of monetary circulation in local satellite markets and thus the adaptation to new economic, administrative, political and social settings. The Roman economy, especially in the rural hinterlands, was probably never fully monetised, and barter was certainly present alongside coinage and used as an acceptable mode of exchange. Moreover, local customs largely dictated local exchange media in Late Antiquity. Thus, coins are not the sole evidence and indicator of the monetary system of an area. Other types of currency, like commodities, credits and loans, impacted monetisation as well. Therefore, apart from the Late Roman numismatic evidence, this paper also examines other everyday finds from military sites and identifies the relations of the limes with the surrounding area to get a clearer picture of the socio-economic context of the Pannonian limes in modern Croatia during the Late Roman period.

B. PORT FACILITY DISCOVERED AT ANCIENT CARSIMUM (HÂRȘOVA, CONSTANȚA COUNTY, ROMANIA)

Abstract author(s): Mototolea, Aurel - Nicolae, Constantin - Sodoleanu, Irina - Potârniche, Tiberiu (Museum of National History and Archaeology Constanta) - Caterinici, Cristina (Faculty of History and Political Sciences, Ovidius University of Constanța) - Stanc, Margareta (Faculty of Biology, Alexandru Ioan Cuza University of Iași)

Abstract format: Poster

Archaeological research started in 2020 in the fortress of Carsium (Hârșova) – point Old Port, led to the identification of a platform that is part of a port arrangement, possibly with the first phase dating back to the Roman period. This platform consists of large, rolled blocks – shows signs of use on the top. At least four phases can be identified in its existence, all marked stratigraphically also, which could correspond to some stages of repair of the already existing elements. Archaeological material without a definite context was also recovered, mainly ceramic fragments and metallic construction material.

Following the research, it can be preliminarily concluded that the port structure is composed of:

- a) massive wall, about 3 m thick, caught between the natural rock on the left, and the Roman-Byzantine phase to the east;
- b) small pier, made of stone of different sizes, shaped on all sides, fastened with mortar. The access behind the wall on the wharf was made through a passage bordered by the natural rock on the left and the wall on the right;
- c) the quay in front of the pier, remains with traces of rolling due to the action of water (pereat quay).
- d) the platform is the first construction dedicated to port activities in the western part of the ancient / medieval port area of Carsium;
- e) the level of treads marked by traces of mortar corresponds either to the repairs of the level of the platform or to its lifting with another seat.

This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-III-P4-PCE-2021-1180, within PNCDI III.

'BEYOND SPOLIA.' A CROSS-CULTURAL COMPARISON OF RE-USED DECORATED STONES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Ljung, Cecilia - Jones, Andrew (Department of Archaeology and Classical Studies, Stockholm University) - Diaz-Guardamino, Marta (Department of Archaeology, Durham University) - Oehrl, Sigmund (University of Stavanger, Museum of Archaeology)

Session format: Session with keynote presentation and discussion

The re-use of building materials, the phenomena broadly characterized as 'spolia', has long been recognized in Roman and Medieval contexts, particularly in the construction of early stone churches. However, the re-use of decorated materials, including sculpture, is also a recognized phenomenon during later prehistory, particularly in the construction of Irish, French, and Iberian passage tombs, and the building of Bronze Age stone cists in Iberia, Britain, Ireland, Sweden and Norway.

In this session we argue that it is no longer tenable to regard the use of 'spolia' in terms of expediency; archaeologists have long argued for the deliberate selection, manipulation, and placement of previously decorated or carved stones. But is there a pattern to the re-use of decorated stones? The aim of this session is to bring together researchers examining decorated and carved stones in the Neolithic and Bronze Age with their colleagues in the late Iron Age, Roman and Medieval periods. Are there similarities in patterns of re-use across these time periods, or do we recognize distinct practices in certain periods? Do we as researchers approach the phenomena of re-use in different or similar ways in terms of theoretical framing and interpretative models? Our aim in bringing together prehistoric, Classical and early Medieval researchers is to examine what each might learn from the other, thereby enriching the debate around the re-use of decorated stones and the use of the past in general.

ABSTRACTS

1 BEYOND SPOLIA: AN INTRODUCTION

Abstract author(s): Jones, Andrew (Stockholm University)

Abstract format: Oral

The re-use of building materials, the phenomena broadly characterized as 'spolia', has long been recognized in Roman and Medieval contexts, particularly in the construction of early stone churches. However, the re-use of decorated materials, including sculpture, is also a recognized phenomenon during later prehistory, particularly in the construction of Irish, French, and Iberian passage tombs, and the building of Bronze Age stone cists in Iberia, Britain, Ireland, Sweden and Norway.

This introduction will reconsider the utility of the term 'spolia' to characterize this phenomenon, and will seek to re-situate the re-use of decorated materials in terms of practices of remembrance, commemoration, evocation and display. I will do so by discussing relevant examples from passage tomb contexts in Neolithic Ireland, Bronze Age stone cists in Britain and Late Iron Age and Medieval decorated standing stones in Britain and Sweden.

This paper forms an introductory framework for the session and its contributors.

2 RECYCLING PASTS. IBERIAN MEGALITHIC CASES

Abstract author(s): Prmitiva, Bueno - Rosa, Barroso - Rodrigo, Balbín (University of Alcalá)

Abstract format: Oral

Stelae and menhirs before to the construction of some megaliths has been considered as one of the issues of the antiquity of these architectures. This hypothesis justified the primacy of the Breton megaliths over other territories of Atlantic Europe.

In the last years our team has documented evidences of pieces recycled in the Iberian megaliths. Stelae and menhirs previous to the construction of the megaliths, remaked in moments of its use, re-meant in procedures of closing, add to information of other elements recycled like mobile decorated pieces, or the bones that appear in secondary burials. To recycle memories, resignify them, and to create new pasts are part of the social systems that that identify megalith building groups.

In this presentation we propose to characterize some case studies and their implications in how megaliths are used transforming from these processes of continuous recycling. In order to achieve this, we will take as an example some Iberian megaliths. The number of sites where we have documented these processes is widespread in Iberian, pointing out that the argument of the antiquity of the Breton megalithic focus, based on this aspect, needs to be rethought.

3 FROM LIGHT TO DARKNESS: THE AFTERLIFE OF ATLANTIC ROCK ART

Abstract author(s): Valdez-Tullett, Joana (Wessex Archaeology)

Abstract format: Oral

The Neolithic tradition of Atlantic Rock Art is known for its circular imagery but also its typical landscape setting. While a defining character, the lack of associated archaeological contexts hinders research and there are still many open questions, namely related to chronology. In the mid-3rd millennium BC this relationship with the landscape seemingly changes. Carved blocks were then often placed within funerary chambers, whether resulting from quarrying of decorated outcrops, or produced specifically for this purpose. This transition from an open-air context to a secluded and dark chamber implies an important change of perception towards the rock art. Although many of these blocks were recovered by antiquarians and their archaeological contexts were not necessarily preserved, their co-presence with other types of material culture, human and animal remains, means that they hold valuable information which is not available for the decorated outcrops in the landscape. This talk will discuss the preliminary results obtained from a contextual archaeological approach to Atlantic Rock Art, which aimed to understand the implications of this use and/or re-use of rock art in funerary monuments, reflect on social transformations that may have resulted in this change of perception and how these affected prehistoric societies.

4 THE REUSE OF STANDING STONES, STELAE AND STATUE-MENHIRS IN BRONZE AGE IBERIA (C. 2200-850 BC): AN OVERVIEW

Abstract author(s): Diaz-Guardamino Uribe, Marta (Durham University)

Abstract format: Oral

Researchers have long recognized the reuse and transformation of rock art, standing stones, stelae and statue-men-hirs in late prehistoric Europe. In the Iberian peninsula, the reuse and transformation of these elements during the Bronze Age is varied but significant. This paper will provide an updated overview of the phenomenon, including an assessment of possible patterns of reuse and their evaluation within broader Iberian and European contexts and the social and historical transformations documented during this period. The presentation will finish with some theoretical and methodological considerations related to the research of this type of archaeological evidence.

5 TWO SPOLIA – ONE PICTURE STONE: SOME EXAMPLES FROM A PH.D. PROJECT ON MIGRATION PERIOD PICTURE STONES FROM GOTLAND

Abstract author(s): Strehlau, Hannah (Center for Baltic and Scandinavian Archaeology- ZBSA)

Abstract format: Oral

The picture stone tradition on the Swedish island of Gotland started during the Migration Period (400-550 CE). With very few exceptions, almost the entire corpus of monuments of this time-period, called group A, were intentionally destroyed, and re-used as spolia in early medieval Gotlandic churches, or in younger graves, respectively. Roman tombstones were treated in a similar way, especially those from the former province of Hispania, which could have served as possible models for the early Gotlandic picture stones.

In this presentation, I will draw from the results of my recently finished Ph.D. thesis. This includes examples of decorated stone monuments that are comparable to the early picture stones as well as a case study from Gotland: The discovery of the correspondence of two well-known picture stone fragments serves as an example to demonstrate the second life of these stone sculptures after their original use. The two fragments, which once belonged to the same stone monument, were re-used as spolia in two different Gotlandic churches. This circumstance allows for a discussion on the intentional destruction, deliberate selection, manipulation, and placement of different parts of this decorated monument.

6 PERCEPTIONS OF THE PAST: PICTURE STONES AS SPOLIA IN MEDIEVAL CHURCHES ON GOTLAND

Abstract author(s): Ljung, Cecilia (Stockholm University)

Abstract format: Oral

Gotlandic picture stones constitute one of the most enigmatic legacies of Iron Age Scandinavia. Richly ornated stone monuments were erected on Gotland for almost a millennium: at least from the Migration period until the early Middle Ages (c. 400-1100 AD). The imagery of the monuments, their shapes and uses changed over time, and by the late 11th century the picture-stone tradition, with its deep roots in pagan society, was transferred into a Christian context. Yet, interaction with this type of carved stone monument did not cease with the end of their production, but continued during the medieval period, and sometimes later, primarily through reuse in stone churches.

Today more than 600 picture stones are known, ranging from small fragments to monuments several meters tall. Around fifty percent of the material has been found in church buildings. However, the reuse of picture stones has attracted little scholarly interest and simplistic models dominate. Either reuse is given a practical explanation, where picture stones are seen as readily available building material, or a symbolic interpretation, either with positive connotations, as a way of reconnecting with the past, or as a negative act of condemnation, showing the superiority of the Christian faith. This paper will explore the reuse of picture stones and its different trajectories in time based on a detailed on-site study of their find contexts in churches. It considers aspects of visibility, accessibility, fragmentation, wear, and spatial relations to architecture and other types of spolia.

7 MONUMENTS, IMAGES AND THE GREAT POTENTIAL OF SMALL FRAGMENTS – RE-USE OF EARLY CHRISTIAN GRAVE MONUMENTS IN THE 12TH-AND 13TH-CENTURIES

Abstract author(s): Nyqvist Thorsson, Anna (Västsvensk arkeologi)

Abstract format: Oral

During the 11th century, lavish grave monuments with rich ornamentation and runic inscriptions were made in the south-central Sweden. Towards the end of the century, these monuments had played their part, instead new types of underground stone coffins to keep the dead body were constructed. By the end of the 12th century, fragments and parts of early Christian monuments were re-used as building materials in stone coffins as well as in early stone churches.

The act of fragmentarization of old monuments has been considered a deliberate strategy by different scholars, either as part of struggles for political power, or as symbolically charged re-use. However, little attention has been given to variations in the practice of re-use in mortuary settings.

This study takes a starting point in theoretical frameworks such as social practice theory and aspects of performance theory. Based on a detailed analysis of diversities within the material, it shows how ornamented parts of older monuments were deliberately and consciously placed with the images either towards the inside of the coffin and the dead body, or towards the outside and the audience of the funeral. The study also identifies regional differences in the re-use of early Christian grave monuments.

In the act of dismantling the grave monuments from the past and re-using of them in new mortuary contexts, the material became actively involved in constructing a new social context around the dead. But above all, it also created a new social context around the living family. This made the fragments of old monuments an active part in social and historical processes of the present.

8 THE STAVANGER PISCINA – CARRIER OF THE LESS SACRED

Abstract author(s): Buer, Margareth (Museum of Archaeology, University of Stavanger)

Abstract format: Oral

The Stavanger piscina is the only remaining example in Norway of a double-arched Gothic 13th century piscina. Over the years much attention has been drawn to the splendid carved head placed on the wall right above, believed to be that of king Magnus Lagabøter (the Lawmaker). However, it is time to lift the piscina from its subordinate position and look at its function and significance. Piscinas are part of a group of architectural elements of medieval churches that served a specific function in relation to the sacraments. From a post-modern, perspective the Stavanger piscina may just be seen as a beautifully carved niche in the choir wall. From a medieval perspective, on the other hand, the piscina was the gateway which transported leftover sanctified water, oil, and wine from liturgic ceremony to consecrated ground. After the Reformation, this physical and mental gateway got gradually closed and the piscina became just that beautiful niche. This paper will try to approach the piscina from the perspective of the medieval sacramentals, the lesser sacraments, those objects and actions which point towards the divine.

9 REPLICATING THE PAST: THE CASE OF THE DOCUMENTED CARVED SYMBOLS IN KULLA IN THE TERRITORY OF REPUBLIC OF KOSOVA

Abstract author(s): Shala, Lekë - Igrishta, Kaltrina - Cousseau, Florian - Besse, Marie (University of Geneva)

Abstract format: Oral

The territory of Kosova - Ancient Dardania which occupies a plateau, surrounded by high mountains, midway between the Mediterranean and the larger Balkan expanse – sits at an intersection, where various roadways converge. Its archaeology begins in early prehistory, stretching across the Metal ages, into and through Roman and Medieval times.

Within the framework of the project* “Memory in Stone”, 579 carved symbols in 107 objects were documented in the territory of Kosova, mainly in Kulla i.e. albanian traditional stone houses, dating from the 16th to the 20th century A.D., which are also found on the territory of Albania, Montenegro and Northern Macedonia. They were considered

as a safe shelter, located in a well-thought-out area in harmony with the surrounding facilities, which guaranteed the control of the landscape and the privacy of its residents. In addition to the living spaces, the protective function explains its character and its high degree of fortification, ensuring security in times of war or blood feud. According to the ethnographical sources and residents of the houses, the symbols have a magical character and they provide help in difficult times of survival, “to protect from the evil eye” and to bring prosperity, they embody the idea of the sacred in nature and the surrounding environment. A number of symbols are reintegrated into everyday use through the copying of motifs or the re-use of decorative stones from antiquity and medieval times. Their symbolism is characterised by a series of figures of a supernatural nature, with an extraordinary variety of figurative depictions, cosmological, anthropomorphic, zoomorphic, floral, geometric, etc. Symbols reflect cultural meanings and furthermore enrich our understanding of past social organisation, people’s thoughts and beliefs, and their relationship with the environment.

* Under the direction of Kaltrina Igrishita and Lekë Shala.

366 MEGALITHS AND GRAPHICAL MARKERS IN LANDSCAPE: NEW TECHNIQUES OF DOCUMENTATION

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Navajo-Samaniego, Esther (University of Alcalá) - Vázquez-Martínez, Alia (University of Santiago de Compostela; University of Alcalá) - Castro Teixeira, Joana (University of Porto)

Session format: Regular session

Megalithism is a long-lasting architectural phenomenon that has characterised Late Prehistory landscapes. The classical view of its expansion was limited to Europe and more specifically to the Atlantic façade. However, megalithic architecture has a much wider distribution, ranging from south-western Europe to Melanesia, the Near East and the Indian subcontinent.

Traditional historiography has studied megaliths from a perspective focused on architectural typology and their archaeological remains. Nowadays, efforts are concentrated on C14 chronologies, DNA and stable isotopes of the human bones located in them. Besides, the introduction of new documentation and data processing techniques has been a novelty in the study of megaliths and graphical markers (as, for example, rock art), giving a prominent role to the landscape in which they are integrated.

This session aims to gather young researchers specialised in Neolithic and Chalcolithic periods, beyond the classical European borders. We welcome papers exploring any aspect of megalithic landscapes, theoretical and practical approaches, documentation and data collection, graphical markers codification and distribution dynamics. The application of new methodologies provides an essential line of research for the study of occupation dynamics, transformation and recognition of the territory in which they are inserted.

ABSTRACTS

1 BI AND TRICOLOR SCHEMATIC PAINTING IN THE LOWER DOURO BASIN (NORTH OF PORTUGAL). COMPARING ROCK ART AND MEGALITHIC ART

Abstract author(s): Teixeira, Joana (CITCEM - Faculdade de Letras da Universidade do Porto) - Sanches, Maria de Jesus (CITCEM-FLUP) - Ramos, Nuno (Morph – Geociências, Lda.) - Almeida, Miguel (Dryas Octopetala, Lda; Morph – Geociências, Lda.)

Abstract format: Oral

Bi or tricolor paintings are rare in open air rock art contexts. Contrarily, it is frequent in dolmens’ chambers or corridors, where red, black, and white pigments are widely combined.

However, in the lower Douro basin (in the river Tua valley area) two rock-shelters display bicolor motifs: Cachão da Rapa (Carrazeda de Ansiães), known since the 18th century, and Ribeira da Pousada 6, in Serra de Passos-Santa Comba (Mirandela). The latter is part of the biggest concentration of prehistoric painting in Portugal - the paintings of Passos-Santa Comba- Garraia mountain.

These two exceptional sites, whose motifs are painted in red/orange and black/blue, remain until now the only occurrences of bicolor motifs across this vast region.

At same time, in the regional context, megalithic painting is dominated by red motifs (Vilarinho da Castanheira, Zedes or Fonte Coberta), while in Madorras Mamoá 1 there is also a black motif superimposed to other engraved ones.

We aim to present the results of the photogrammetric and multispectral records of both sites (Cachão da Rapa and Ribeira da Pousada 6), focusing on the panels’ motifs and general aesthetics in the context of the known regional

prehistoric paintings, followed by a discussion of the sites' possible funerary use, considering their protected locations and morphology.

2 DIALOGUES BETWEEN THE NORTH AND SOUTH OF THE IBERIAN PENINSULA IN OPEN-AIR DECORATIONS ASSOCIATED WITH MEGALITHIC BUILDERS

Abstract author(s): Vázquez-Martínez, Alia (University of Santiago de Compostela, CISPAC; University of Alcalá) - Jiménez-Gisbert, Guillermo - Navajo-Samaniego, Esther (University of Alcalá)

Abstract format: Oral

Traditionally, open-air rock art in Northwest Iberia has been studied in relation to elements of the surrounding terrain, such as lithology or the proximity to roads or watercourses, among others. These investigations have not taken in consideration elements produced by past societies and which are part of the territory, such as megalithic constructions. However, in Southwest Iberia, an integrating perspective between open-air art and megalithic art have been established, finding associations between them through carving techniques and graphic resources.

This communication aims to show the results obtained by studying the characteristics of open-air rock art in relation to natural environment and megalithic art. For this purpose, we will take as a case study two areas far from each other: The International Tagus area (Southwest Iberia) which has already been the subject of this type of work, and Galicia (Northwest Iberia), where there is a lack of research works linking open-air rock art and megaliths.

In both areas, a detailed study of engraved and pictorial motifs is being carried out in field using photogrammetry and geolocation. The combined analysis of different human manifestations in landscape will allow us to make a first approach to the occupation of the territory in both locations, as well as to observe some of the connections based on their symbology.

3 THE BURACO DA PALA ROCK-SHELTER (PASSOS-SANTA COMBA MOUNTAIN, MIRANDELA-PORTUGAL). SCRUTINIZING NEOLITHIC-CHALCOLITHIC SITE FUNCTIONS AND PURPOSES

Abstract author(s): Sanches, Maria - Teixeira, Joana (CITCEM-FLUP) - Ramos, Nuno (Morph – Geociências, Lda.) - Almeida, Miguel (Dryas Octopetala, Lda; Morph)

Abstract format: Oral

The Buraco da Pala shelter is part of a impressive rock escarpment in the «Serra de Passos-Santa Comba», and visually dominates a wide surrounding territory, thanks to its privileged topographic location. This rock-shelter opening is an imposing geological crevice, which appears wide and high at its entrance (about 80m² in area), extending into the interior of the escarpment through a narrow and very long gallery (about 27m long).

It was excavated in the 1980's by one of us (MJS), delivering occupation levels ranging from the ancient Neolithic to the end of the Chalcolithic. Archaeological and archaeobotanical studies have shown that: (i) the rock-shelter was used as a seasonal habitat during the Neolithic, with clear evidence of the practice of cereal and pulse agriculture; (ii) its use in the Chalcolithic was eminently socio-political, i.e. as a place of collective consumption and destruction by fire of agriculture and gathering products.

In accordance with these human occupations, we found in this shelter four panels with schematic paintings, two in the photic, wider area and two others in the extreme end of the narrow gallery.

This paper intends to connect the previous studies with (i) the photogrammetric record of the whole rock-shelter and the multispectral record of the painted panels and (ii) to compare the imagery of its paintings (namely the figures known as "oculados") with other examples from different regional contexts, with emphasis on megalithic and open-air rock art.

This paper is part of a heritage education project in archaeology: ESCARPARTE. So, we will also put to the scrutiny of this session the type of textual and graphic narrative that will be disseminated about the social and ideological Neolithic and Chalcolithic landscape, discussed here.

4 THE MEGALITHIC COMPLEX OF BRÚ NA BÓINNE, IRELAND: LANDSCAPE, CONTEXT AND SPATIAL ORGANIZATION

Abstract author(s): Davis, Stephen (University College Dublin) - Rassmann, Knut - Banffy, Eszter (Romano-Germanic Commission, Frankfurt)

Abstract format: Oral

This paper builds on the results of over a decade of remote sensing and geophysical survey at the Brú na Bóinne World Heritage Site, Ireland. Brú na Bóinne is one of Europe's most significant megalithic landscapes, with over 45 megalithic tombs, including some very large examples, a remarkable density of megalithic art and also a substantial and diverse corpus of post-megalithic earthen and timber monuments. It is increasingly clear that the distribution of these

features within the landscape is not continuous or random, and that there are rules governing at least the preservation of, but most likely also the construction location of a range of monument classes within the area. There are also areas that seem to be almost devoid of obvious archaeological traces – perhaps deliberately so. This paper will present and discuss some of these patterns in the context of the existing dataset, consider the basis for some of this patterning and also consider the role of megaliths within this landscape, including as foci for later activity both in prehistory and in later periods.

5 ANTHROPOMORPHIC ORTHOSTATE-STELAE OF TWO DOLMENS FROM MURÇA (PORTUGAL). ITS CONTEXTUALIZATION IN THE SOCIAL AND IDEOLOGICAL PREHISTORIC LANDSCAPES OF THIS REGION

Abstract author(s): Barbosa, Helena - Sanches, Maria de Jesus (FLUP - Faculty of Arts and Humanities of Oporto University; CITCEM - Transdisciplinary Research Centre «Culture, Space and Memory») - Almeida, Miguel (Dryas / Octopetala) - Aires, Sílvia - Ramos, Nuno (Morph – Geociências, Lda) - Castro Teixeira, Joana (FLUP - Faculty of Arts and Humanities of Oporto University; CITCEM - Transdisciplinary Research Centre «Culture, Space and Memory»)

Abstract format: Oral

This paper discusses the Late Prehistoric landscapes of the Portuguese lower Douro basin through the study of some of its megalithic monuments: tumuli, dolmen, stelae and menhir statues.

Our case studies are two decorated dolmens in the municipality of Murça (Trás-os-Montes): Mamoá 1 of Castelo (excavated) and Mamoá 4 of Alto das Madorras. Based on the photogrammetric record of their engraved orthostates – two of which are completely anthropomorphized –, we aim to search for operating chains and subjective visual and technical options, including the stelae's geological characterization.

Given that regional archaeological research has produced pertinent radiochronometrical, ethno-archaeobotanical and archaeo-environmental documentation of the dolmens and their surrounding regions, along with open-air rock art in the same regional context, the interpretation of the “art” of the chambers and corridors will be equated on a broad relational and explanatory level.

As this paper is part of an heritage education project in archaeology: TSF/Territories without borders, we will also put to the scrutiny of this session the type of textual and graphic narrative to be disseminated about the social and ideological megalithic landscape, discussed here.

6 THE DOLMEN PHENOMENON IN THE SOUTHERN LEVANT DURING THE 4TH MILLENNIUM BC: THE CASE STUDY OF JEBEL AL-MUTAWWAQ, JORDAN

Abstract author(s): Caselli, Alessandra (Perugia University)

Abstract format: Oral

The megalithic phenomenon in the Southern Levant started to be massively attested at the beginning and during the 4th millennium BC, in the Late Chalcolithic and in the Early Bronze Age I. The area is constituted by several sub-regions and the identified megalithic features include standing stones, cairns, dolmens and tower-tombs. Therefore, megaliths were used to build structures linked to the rituality or to the funerary aspect, underlining the importance of the community work to realize such massive structures. For this reason, the analysis of the phenomenon and its evolution is crucial to better understand the ancient communities and their society.

The paper will focus on the dolmen phenomenon in the Southern Levant at the end of the 4th millennium BC. In particular, the case study of Jebel al-Mutawwaq (Jordan) will be presented. Here, a joint Spanish-Italian expedition is investigating the residential area and the megalithic necropolis outside the fenced settlement. The possibility to examine together the funerary aspect, with its rituals and habits, and the daily life inside the residential area allows to reconstruct the socio-economic organization and the cultic expression of the community in the proto-urban period, when features pertaining to urban societies started to be introduced, such as the fortification systems.

Because of the risks that dolmens are facing in the recent years due to the destruction of the archaeological remains to reuse the dolmens slabs, also the documentation of these structures is crucial to preserve them. For this reason, the Spanish-Italian team realized distinct maps of the dolmens in different years to verify the potential destruction of some of them. Furthermore, in the last years, 3D models of some dolmens have been realized with the aim to certify the conditions of the structures through the years.

7 PICKING UP THE PIECES: A MICRO-STRATIGRAPHIC AND TRANS-DISCIPLINARY APPROACH TO THE COLLECTIVE TOMBS OF HORTA DO JOÃO DA MOURA 1

Abstract author(s): Corga, Mónica (Dryas | Octopetala)

Abstract format: Oral

Recent archaeological research on the Southwestern Iberian Peninsula has shown that during the 3rd mill. BC, this region displayed a vast array of mortuary behaviours that show complex social and economic relations in which large enclosures play an aggregating role.

Our research studies the mortuary management of two tholoi tombs from Horta do João da Moura 1, located on the outskirts of the mega ditched enclosure of Porto Torrão (Ferreira do Alentejo, Portugal), an area where several clusters of funerary monuments have been discovered, in addition to the deposition of human bodies or remains inside pits or ditches.

Based on the assumption that death constitutes a critical moment for social cohesion and communal identity, the archaeological data available for each of the categories under analysis (human remains, artefacts, and architectures) are scrutinized through the application of thorough methodological protocols from archaeology, geoarchaeology, and archaeoanthatology. Our micro-spatial and micro-stratigraphic approach allows the discussion of architectures and artefacts, mortuary gestures, synchronic and diachronic tomb management strategies, and site formation processes.

Our results reveal a range of mortuary practices in the same burial site or even inside the same tomb, embedded in prolonged and intricate social processes that encompass discontinuous rhythms, polyphasic depositions, individual or mass displacements of human remains, and scenic displays of relics.

In addition, the archaeological record shows the existence of large scale economic and social interaction networks that are purposefully made visible during funerary performances.

369 MAKING AN IMPACT: DEVELOPING RESEARCH IN APPLIED BIOARCHAEOLOGY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Mckenzie, Catriona (University of Exeter) - Mack, Jennifer (University of Mississippi Medical Center) - Evis, Laura (University of Exeter) - Tilley, Lorna (Independent Researcher)

Session format: Regular session

Bioarchaeological research is uniquely placed to provide insights into the deep past, helping us to explore the lived experiences of people and communities, but it also has an important role in helping us to understand, evaluate and contextualise present-day challenges. Wider engagement with bioarchaeological research provides a means through which we can discuss complex and difficult issues such as slavery, racism, migration, climate change, social inequality, poverty, disability, care, and conflict. In recent years, interdisciplinary collaborations, particularly arts-based collaborations, have been key in addressing some of these difficult topics. This session seeks to explore how we can engage with wider audiences, and how we can move beyond public engagement to affect change through our research. We are seeking papers that provide examples of best practice, and hope to learn through these examples about the challenges and recommendations for developing the field of Applied Bioarchaeology. We are also interested in exploring the role of bioarchaeology in affecting change through advocacy and activism. We hope this session will prompt open discussions from different researchers across the EAA community, and inspire future research endeavours.

ABSTRACTS

1 CONTINUING BONDS: USING (BIO)ARCHAEOLOGY FOR BEREAVEMENT, GRIEF AND WELLBEING

Abstract author(s): Croucher, Karina (University of Bradford) - Booth, Jane (University of Wolverhampton) - Booth, Emmelia (National Lottery Heritage Fund) - Sutton-Butler, Aoife - Bryant, Eleanor - Coe, Mia (University of Bradford) - Dayes, Jennifer (Manchester Metropolitan University) - Giles, Melanie - Green, Laura (University of Manchester) - Walters, Elizabeth (University of Bradford)

Abstract format: Oral

While death is universal, responses to it vary widely, as can experiences of grief and bereavement. However, death and bereavement often remain challenging to discuss, despite the universality and inevitability of the topic. The Continuing Bonds and Dying to Talk projects use funerary archaeology to open up dialogues around death, dying, bereavement and loss, using the past as a distanced place from which to prompt discussion. In several linked projects, this approach has been used with a range of audiences, including health and social care professionals and students; psychologists and counsellors; young people and schools; and members of the public. Overwhelmingly successful, the projects demon-

strate a vibrant way in which the lessons we learn from bioarchaeology can have meaningful impact on experiences today. This paper provides an overview of the projects and results, including insights into our participants and the impact on their lives and experiences. It also reflects more broadly on the wider role that heritage and archaeology play for wellbeing today.

2 BENEATH THE SURFACE: AN ARCHAEOLOGY OF IMPAIRMENT AND DISABILITY IN HISTORICAL ICELAND AND ITS RELEVANCE TO THE FUTURE

Abstract author(s): Walser, Joe (National Museum of Iceland) - Kristjánsdóttir, Steinunn (University of Iceland)

Abstract format: Oral

Disability and quality of life in the past were discussed through case studies of skeletonised individuals from archaeological sites in Iceland. The presentation will discuss how impairment in the past, along with environmental constraints particular to the local climate, geology, environment and cultural history, may have led to social disability across time and regions in Iceland. The presentation discusses medical interventions/treatment and care, paired with historical information for context, considering historical and modern relevance of some of these cases.

Despite the potentially disabling environment across volcanic terrain and against challenging weather, care was evident in numerous cases, and people renegotiated their social roles within a demanding lifestyle based on farming and fishing. Though monasteries cared for those who could travel to them, care was typically the responsibility of individual members/laypersons of small coastal communities - especially prior to the establishment of monasteries, such as at Skriðuklaustur in Eastern Iceland, and likewise after their closure.

The results provide indications about life experience and the possible functional limitations these individuals may have faced. Moving to the present, little has been done to combat the systemic infrastructure problems that people faced in the past: cities are not designed in a way that is easy to adapt to people's needs, and businesses either cannot afford or do not place emphasis on meeting these. As a result, overcoming infrastructure problems often - again - ends up the responsibility of individuals invested in finding ways to make the city, its pathways and landmarks more accessible. In this context, the question becomes: how best can we use historic experience to drive current policy and practice?

3 BIOARCHAEOLOGY OF CARE OUTREACH: HOW LESSONS FROM THE PAST MAY HELP IMPROVE THE PRESENT

Abstract author(s): Saez, Roberto (Uniclaude International Christian University)

Abstract format: Oral

This presentation reports on (i) a series of initiatives aimed at making the results of evolutionary, bioarchaeological and anthropological research into the deep history of care and compassion readily accessible to the general public, and (ii) the creation of a transdisciplinary Spanish-language network of researchers working in this area.

The origins of human caregiving are closely tied to the development of behaviours we consider emblematically human: in particular, our readiness to cooperate for a greater good, and our skills in social organisation. The ability (and willingness) to provide health-related care likely played a crucial role in the success of the species that preceded us. Understanding past experiences of disability, care and compassion challenges popular perceptions of the past as a place of 'nature red in tooth and claw', and can help inform values and behaviours in today's society. Potential outcomes range from deeper appreciation of the universality of these experiences, to inspiration to explore possibilities for a more compassionate society.

Archaeology and palaeoanthropology have seen a surge in popularity in recent years, thanks to digital media and the globalisation of knowledge. Within this realm, bioarchaeological studies revealing evidence of caregiving have garnered significant media attention and public interest, signalling a strong desire to learn more. This, in turn, fuels an eagerness for further studies. My contributions to research and outreach in this field employ different vehicles - a blog (<https://nutcrackerman.com/>), a book (*Evolución Humana: Prehistoria y Origen de la Compasión*) specifically written for a lay audience, public lectures in scientific and social forums, and participation in television and radio interviews and podcasts - and I briefly discuss the impact of these in terms of raised awareness and appetite for further information. I will also describe the development, aims and operation of the recently-established 'care and compassion' research network.

4 INFECTIOUS DISEASE SPILLOVERS: A ONE PALEOPATHOLOGY PERSPECTIVE

Abstract author(s): Buikstra, Jane (Arizona State University) - Uhl, Elizabeth (University of Georgia)

Abstract format: Oral

If we consider the history of human disease in relationship to animal domestication, we find a strong relationship - with dogs and humans, for example, having the greatest number of shared zoonotic diseases. Recent pandemics have

underscored cross-species disease transmission between humans and both domesticated (swine, chickens) and wild animals (bats). By raising sensitivity to such spillovers and the process of disease transmission, past and present, we encourage healthful interactions important in animal conservation efforts and public health measures. We believe that a ONE Paleopathology approach, adopted from the ONE Health model, encourages this broad perspective.

ONE Paleopathology, like its biomedical analogues, combines human medical science/human paleopathology with veterinary science/animal paleopathology. This merger is essential for comprehensive analyses of the interconnected environmental factors and evolution-based susceptibilities that determine health and disease across species and time. Engaging all aspects of health, including animals and their environments, ONE Paleopathology addresses significant worldwide issues, past and present. We initially review the histories of ONE Medicine and ONE Health, as these anchor ONE Paleopathology. We then illustrate how, by using a ONE Paleopathology approach, biomedical advances in imaging and genomics mesh naturally with traditional observations of contexts and morphological

observations of remains. Such methodologically sophisticated developments encourage investigations of disease, past and present, to extend beyond morphological assessments. However, to take full advantage of the remarkable new opportunities, an integrated, problem oriented approach is required. The identification of significant questions should receive primary emphasis, rather than techniques. As illustrated by its application to *Burkholderia* spp, morbilliviruses, and *Mycobacterium* spp, a One Paleopathology approach uses evolutionary contexts to integrate the perspectives provided by multidisciplinary knowledge bases. It thus provides the global and technologically sophisticated viewpoint required to truly understand the complex histories of diseases and can inform both future research and clinical applications.

5 USING BIOARCHAEOLOGICAL DATA TO INFORM DIAGNOSTIC CRITERIA FOR ACQUIRED SYPHILIS IN CLINICAL CARE AND PUBLIC HEALTH THROUGH TRANSLATIONAL SCIENCE

Abstract author(s): Zuckerman, Molly (Mississippi State University) - DeWitte, Sharon (Department of Anthropology, University of South Carolina) - Crespo, Fabian (Department of Anthropology, University of Louisville) - Widrick, Kerri (Department of Anthropology and Middle Eastern Cultures, Mississippi State University) - DeGaglia, Cassandra (Department of Anthropology, Tulane University) - Nichols, Lauren (Department of Anthropology and Middle Eastern Cultures, Mississippi State University) - Umar, Muneebah (Department of Biological Sciences, Mississippi State University) - Wissler, Amanda (Department of Anthropology, University of South Carolina) - Reynolds, Aleisha (Department of Anthropology and Middle Eastern Cultures, Mississippi State University)

Abstract format: Oral

Due to a diverse set of limitations, ranging from difficulties with culturing the causal bacterium (*T. p. pallidum*) to incomplete animal models, less is known about the pathogenesis of acquired syphilis than most equivalently common pathogens. Among the most bioarchaeologically, clinically, and epidemiologically germane of these pertains to syphilis' outcomes: which host characteristics are associated with resolution after early-stage infection, which carries little mortality and morbidity risk, vs. persistence into late-stage infection, which causes significant morbidity and continued transmission (e.g., congenital syphilis)? To circumvent some of these limitations, we assess heterogeneity in frailty to late-stage syphilis relative to evidence of chronic or episodic stress responses over the life course, age, nutritional status, and comorbidity in adult skeletons (N=128) representing individuals with antemortem diagnoses of syphilis in historically documented 19th to early-20th documented US collections. We employ methods—the Skeletal Frailty Index (SFI) and the Combined-Age Charlson Comorbidities Index (CA-CCI)—that will enable empirical translation of our bioarchaeological findings, which are currently preliminary, into public health and medical indices. Through working with experts in translational science, clinical medicine, and epidemiology, these can be used to refine guidelines for screening and diagnosis of syphilis cases with the goal of more accurately identifying patient/ host characteristics likely associated with persistent infection. Rapid increases in syphilis' global incidence, especially congenital syphilis, which are exacerbated by persistent diagnostic difficulties, make these findings critical. This project can therefore fill a crucial gap in understanding of syphilis's disease ecology in ways that can benefit the living.

This research was supported by the National Science Foundation, Award No. 1946203.

6 INDUSTRIALISATION AND THE CHANGING HEALTH OF LONDONERS, A BIG QUESTION AND LARGE DATA SETS

Abstract author(s): Bekvalac, Jelena (Centre for Human Bioarchaeology, Museum of London)

Abstract format: Oral

The period of The Industrial Revolution was a transformative time in history and as a country Britain was seen to take the lead in the profound changes wrought by the processes of industrialisation. As a city, London was at the epicentre of the industrial era and from historical sources the socio-economic effects of such enormous change had marked and often unparalleled consequences upon the lives and health of the populace.

The Impact of Industrialisation on London Health project funded by the Rosemary Green Grant awarded through the City of London Archaeological Trust (CoLAT) was a multidisciplinary archaeology research project to investigate the legacy of industrialisation on London health patterns and notably contextualised with health topics including obesity, cancer, air pollution and ageing all relevant for people today.

Key to the formulation of such a project was retention and access to skeletal collections (notably post medieval), accessible standardised osteological data & digital osteological data (primarily the extensive Museum of London collections) and access to the application of a portable digital radiography kit.

Crucial to the project was the large skeletal data set of 2,241 adult individuals (comprising only of adults possible to have an age & sex estimate) from archaeological excavations of the pre-industrial (medieval) and industrial (post medieval) period from London and Non-metropolitan locations. The large primary sample size was important when dividing in to pre-industrial and industrial cohorts of young, middle and old age males and females for comparative analysis.

Synthesis of the bioarchaeological data sets in conjunction with research of historical documentary sources and modern public health data revealed interesting health trends and patterns from the past to the present. Ultimately highlighting that the impact to health from industrialisation was not a uniform process and the influence it has continues on people's lives and health today.

7 APPLIED APPROACHES TO INDIGENOUS-CENTRIC AND INDIGENOUS-LED BIOARCHAEOLOGY: WITH A FOCUS ON THE STUDY OF VIOLENCE AND SOCIAL INEQUALITY

Abstract author(s): Harrod, Ryan (University of Alaska Anchorage) - Johnson, Norma (Chickaloon Village Traditional Council) - Schenkenberger, Kaelyn Nutuknginoun (University of Alaska Anchorage)

Abstract format: Oral

Bioarchaeological analysis of markers of traumatic injuries, indicators of stress, and the presence of pathological conditions on human skeletal remains, as a means of identifying evidence of violence and social inequality in the past, has exploded over the last few decades. Recent calls for reassessing best practices in bioarchaeology however, argue that researchers should not only establish collaborations with Indigenous communities, but ensure that projects are driven and serve the interests of these stakeholder groups. Our paper will explore how prior research focused on identifying violence and social inequality among Indigenous groups has not adequately included the voices of the descendant communities and how new approaches can provide a more holistic picture of past conflict and disparity. While we are highlighting research on human skeletal remains associated with Indigenous groups in Alaska, we argue that these best practices are relevant considerations for bioarchaeological research in Europe with a focus on Arctic populations, including the Inuit and Saami.

8 THE SOUTHERN CEMETERIES ARCHAEOLOGY PROJECT - BRINGING TO LIGHT THE LIVES OF THE MARGINALISED THROUGH COMMUNITY-LED BIOARCHAEOLOGICAL RESEARCH

Abstract author(s): King, Charlotte - Buckley, Hallie (University of Otago) - Petchey, Peter (Southern Archaeology Ltd.) - Snoddy, Anne Marie (University of Otago)

Abstract format: Oral

Unmarked graves are a common feature of colonial cemeteries in New Zealand. In general these unmarked graves represent those who were marginalised in life (e.g. ethnic minorities, the poor), a lack of permanent marking on their graves ensuring they remain marginalised in death. The Southern Cemeteries Archaeology Project is a community-driven, research-led project that aims to redress this balance.

In this talk we focus on our work with the Chinese community in Otago (New Zealand). Many of this community are descendants of the Chinese goldminers who came to Otago with the colonial goldrushes, and whose burials remain unmarked. For the Chinese community this has serious spiritual implications. Using one individual as an example we will show how multi-disciplinary bioarchaeological techniques have enabled the reconstruction of the life stories of these people. By combining research techniques with community concerns we have been able to give the dead back their voices, allowing the people of the present to learn from their stories.

9 COMMUNITY ARCHAEOLOGY AS ACTIVISM: TWO HISTORIC CASE STUDIES

Abstract author(s): McCrane, Samantha (University of Florida, C.A. Pound Human Identification Laboratory; Metropolitan State University of Denver, Human Identification Laboratory)

Abstract format: Oral

There is currently extensive debate in the field of anthropology regarding the development of best practices for ethically excavating, curating, and/or studying human skeletal remains. One prominent concern is how to overcome public mistrust of bioarchaeologists by historically disenfranchised groups stemming from past violations, such as failure

to obtain consent for excavations and analysis or to repatriate remains readily. Direct community engagement is key in rebuilding trust with these groups, and expanding and maintaining inclusivity in the field. Community archaeology excavations provide a means to do this. In this type of excavation, community members are consulted on how they want skeletal remains handled and actively participate in an oversight role in all stages of the excavation. Giving agency to community members helps to bridge the gap between scientists and the public. This practice is mutually beneficial as it helps to build diversity within the discipline and helps to empower descendant communities, which is incredibly meaningful for all parties involved. Furthermore, engaging in community archaeology is a form of social activism in itself, setting a precedent that we are actively working to mold a more equitable and inclusive society.

In this presentation I review two recent, high-profile community archaeology excavations in different regions of the United States: the Tulsa Race Massacre victim burial site in Tulsa, Oklahoma and the Sisters of Loretto exhumation and relocation in Denver, Colorado. I discuss the strengths and weaknesses of the organizational models employed in each excavation and the benefits to the community and archaeologists. Additionally, I examine how diversity and intersectionality among the excavation team members helped to address ongoing sociopolitical issues and furthered the human rights missions of the respective excavations.

10 **MARCHING FORWARD TOGETHER: TOWARDS THE DIVERSIFICATION AND DECOLONISATION OF BIOARCHAEOLOGY IN CALIFORNIA**

Abstract author(s): Tapia, Ihuixaya (California State University, Monterey Bay) - Arellano, Monica (Muwekma Ohlone Tribe of the San Francisco Bay Area)

Abstract format: Oral

The relationship between the field of archaeology and Native Americans has historically been associated with colonial endeavours. Indigenous erasure has been a prevalent theme in the development of the United States and the field of archaeology has played a significant role in that colonial imperative. This report first highlights archaeology's complicity in the damage that has been caused against Native Americans, with a focus on California Native Americans, and how it has aided in their loss of sovereignty, left them without control of their own identities, and helped construct colonial spaces. It suggests a shift in methodologies so that Native Americans can once again be the rightful owners and stewards of their past via the integration of Indigenous/collaborative archaeology which encourages indigenous interpretation, participation and gives Native American Nations full control of their cultural resources, history, and heritage.

This paper focuses on a skeletal assemblage of 27 ancestral individuals of the Muwekma Ohlone Tribe of the San Francisco Bay Area, from CA-SCL-215- Yákmuy 'Ooyákma-tka, Place of the East Ridge Site. Collaborative archaeology was emphasized throughout the entire project, with the Muwekma Ohlone tribal representatives playing an active and continuous role, from planning and excavation to the analysis of the assemblage. Skeletal analysis was conducted on all individuals prioritizing methodologies that were developed specifically for Native American assemblages, that were developed using Native American assemblages, and/or included Native American individuals as a part of their datasets in order to procure the most accurate results. Cross comparisons with nearby Muwekma Ohlone ancestral heritage sites were included in an effort to elaborate on the comprehension of analysis results. A specific emphasis was given to the subject of diversification and decolonisation of bioarchaeology in the state of California with an underlying goal of tribal revitalization and a push towards a more inclusive collaborative archaeology.

11 **FREE FOR ALL: EXPLORING THE SCOPE FOR A NON-SPECIALIST, USER-FRIENDLY INDEX OF CARE**

Abstract author(s): Tilley, Lorna (Independent Researcher) - Tapia, Ihuixaya (California State University, Monterey Bay) - Caine, Alyson (University of California, Merced) - Canzonieri, Christopher (Basin Research Associates, San Leandro, California)

Abstract format: Oral

Released in 2014, the Index of Care (<http://www.indexofcare.org/>) is a free, cloud-based instrument supporting bioarchaeology of care analysis by providing a framework for (i) interpreting evidence in human remains suggesting experience of disability and receipt of care, and (ii) exploring the implications of this care for insights into past social relations, social organisation and individual identity. In theory available to anyone with internet access, in reality the Index is designed for professional bioarchaeologists, and non-specialists are likely to find it difficult to use. Yet there are many non-archaeologists interested in investigating care-related behaviours in the past, and their active participation in studies may offer new perspectives on what care comprised, the motivations for caregiving, and the wider significance of care provision. This is particularly so when bioarchaeology of care research is undertaken in traditional communities characterised by strong connections between ancestors and their modern descendants. In such cases, not only will stakeholder involvement enrich research outcomes, but may also help to bring about increased control and ownership of the research process by those most immediately impacted by its results.

In response to these observations, a project to ascertain the desirability and feasibility of designing a more user-friendly version of the Index of Care - one aimed at facilitating non-specialist research involvement - is being initiated. In consultation with stakeholder groups we seek to ascertain whether the Index, in principle, is perceived as a potentially useful tool by non-archaeologists; which stakeholders might choose to use the Index, for what purpose(s) and in what context(s); whether a new, more user-friendly version is actually required, or whether changes to the existing Index might suffice; what this user-friendly Index might look like; and whether one version - however friendly - can satisfy the requirements of diverse stakeholder groups. This presentation reports on our progress.

12 CARE, THE GREAT HUMAN TRADITION: A COLLABORATIVE EXPLORATION OF CARE ACROSS TIME AND CULTURE

Abstract author(s): O'Dwyer, Siobhan (University of Birmingham) - Teuten, Maggie (Carer) - McKenzie, Catriona (University of Exeter)

Abstract format: Oral

This presentation provides an overview of an interdisciplinary collaboration which brought together archaeologists, historians, anthropologists, social care researchers, charities, and community arts organisations to co-create a proposal for research exploring cultures of care. Central to the project from the outset, was the active participation of contemporary carers, and organisations that work with carers, to ensure the proposed research was both informed by, and beneficial to, those with lived experience of care. The project culminated in a public consultation which provided an opportunity for a diverse range of carers across the South-West of England to respond to the research ideas. Inspired by this engaged research, Devon artist Leo Jamelli was commissioned to produce a new work, *Invisible Carer*, a large-scale animated light installation that was projected onto the ruins of the St Catherine's almshouse in Exeter. This presentation will consider how collaborative approaches to research might allow archaeological evidence to inform contemporary debates and how the arts can be used to create safe, accessible spaces for the wider community to connect with bioarchaeology.

13 'HOW I FEEL': EXPLORING THE LIVES OF ENSLAVED PEOPLES THROUGH LITERATURE, BIOARCHAEOLOGY AND CREATIVE WRITING

Abstract author(s): McKenzie, Catriona (University of Exeter)

Abstract format: Oral

This presentation offers an account of an interdisciplinary research project *Literary Archaeology: Exploring the Lived Environment of the Slave* which brought together a literary scholar, two archaeological scientists and seven creative writers to explore what it was like to be enslaved. The research examined the relationship between bioarchaeological and literary approaches to slavery, and investigated how the methods and priorities of each discipline might inform each other in understanding what it was like to be enslaved. Inspired by published archaeological evidence about the lives of enslaved individuals, creative writers from the Black British writers group *Our Stories Make Waves* developed new contemporary works that were read and performed in the intimate setting of the Georgian House Museum in Bristol - the former home of sugar merchant and slave owner, John Pinney. This presentation will outline some of the challenges of interdisciplinary working and will explore the legacy of this project.

14 EXPERIMENTAL NARRATIVES: BIOARCHAEOLOGY AND FILMMAKING IN PRACTICE

Abstract author(s): Charles, B (Logan Simpson) - McDaniel, Kym (University of Utah)

Abstract format: Oral

There are many paths to better understanding the human condition. Bioarchaeology interacts with the dead, endeavoring to understand the biocultural impacts of a social life upon the bodies of individuals and populations in the past. This can lead to rigorous and detailed data that is useful to those within the field but few outside of it. Interdisciplinary approaches, including collaboration with artists, broaden our interpretations beyond what can definitively be discerned from data and additionally broaden our reach to diverse audiences. Visual arts, specifically filmmaking in the case for this paper, encourages engagement beyond comprehension of a subject, inviting the audience to internalize and be affected by it. Further, film festivals and public screenings supports the distribution of research to a public who may not have exposure or interest to archaeology within their everyday lives. As a scientific discipline, archaeology often limits investigations to questions that the archaeological record can definitively address. In contrast, experimental filmmaking often balances critical inquiry with open-ended engagement, an invitation for the audience to become curious about knowledge unknown. A collaboration between the bioarchaeologist and experimental filmmaker presents unique challenges. The potential resistance of the scientist to accept the often deeply personal and abstract nature of experimental filmmaking intersects with the learning process of the filmmaker to understand bioarchaeological ethics,

scientific process, and record. Yet, within this collaboration provides a unique opportunity to articulate the social relevance of the past and relate anthropological archaeology to the human condition today.

15 **MADNESS IN MISSISSIPPI: WEAVING NARRATIVES THROUGH BIOARCHAEOLOGY AND ORAL HISTORY AT ASYLUM HILL CEMETERY**

Abstract author(s): Mack, Jennifer (University of Mississippi Medical Center)

Abstract format: Oral

Founded in 1855, the Mississippi State Lunatic Asylum saw 30,000 patients pass through its doors before the institution moved to a new facility in 1935. Vital expansion of the University of Mississippi Medical Center (UMMC), now located on the former asylum property, prompted historical and archaeological investigations of the now-unmarked Asylum Hill Cemetery, which holds the graves of 4,000 – 7,000 individuals who died as patients. Hoping to spur conversations about mental illness treatment and perceptions in modern America, UMMC partnered with the Mississippi Museum of Art to support an artist's installation created by the descendant of one of the asylum patients. Programming presented alongside the show will be provided by members of UMMC's Asylum Hill Research Consortium. As weaving was one of the options offered to asylum patients for occupational therapy, the gallery will include a participatory weaving activity that allows museum visitors to work with different threads representing various psychiatric diagnoses and patient populations. Additionally, display panels will bring together osteobiographies, oral histories, and details from patient records to examine the asylum's successes and failures, and to facilitate discussions of how American society can improve attitudes towards and treatment of mental illness.

16 **LIVES AND EMOTIONS OF SKELETONS: AN INTERDISCIPLINARY APPROACH DIFFERENT BODIED HUMAN REMAINS IN MEDIEVAL ICELAND**

Abstract author(s): Haraldsson, Haraldur (University of Iceland)

Abstract format: Oral

Humans are complex creatures that change and evolve throughout their lives. From an infant to adolescence, from an adult to an elder. A spouse, farmer or priest, our status or roles as individuals within groups changes throughout and within time. Being social animals, humans affect and are affected by other humans. Giving aid, care and security, or setting restrictions, cultural expectations or stigma, are just a few examples of how humans can affect each other. These effects can produce myriad emotional responses and societal attitudes towards certain people, which can be difficult to ascertain from skeletal materials alone.

This paper will examine how the subjects of disability, care and emotions can be discussed academically through interdisciplinary research, with collaboration between fields such as archaeology, history, medieval literature and disability studies. A study will be presented of a different-bodied person, whose remains date to before 1104 AD, and was excavated in Iceland. This case can illustrate how bioarchaeology can serve as a foundation, with concepts such as lived or embodied experiences, for constructing a plausible holistic account of a person's life story by utilizing elements and data from various other academic spheres. This process is complex and must be conducted with rigorous research, understanding and ethical considerations, both for past and modern peoples. However, even though the outcome of the research can produce a mosaic of data, these results can be presented in an easily accessible text that both non- and professionals can understand and relate to. One such method is the fictive osteobiographical narrative, which takes all the gathered data and observations and presents the findings in a story narrative. This method can also be applied to address topics such as emotions within archaeological contexts.

17 **CULTURAL RESOURCE MANAGEMENT AND APPLIED BIOARCHAEOLOGY IN NEW YORK CITY**

Abstract author(s): Lans, Aja (Harvard University)

Abstract format: Oral

The Dutch trading post of New Amsterdam was founded on the southern tip of the island of Manhattan in 1624, on land stolen from the indigenous Lenape. From the outset, colonization transformed local ecosystems and altered the landscape. The colony, later conquered by the British and renamed New York, consistently lacked space to expand, so more land was built along the shorelines of the island by using landfill. Today the city grapples with its literal foundations, as human driven climate change and rising sea levels put many areas at risk while land is priced at a premium. Contending with these issues and attempting to make space for the living inevitably disturbs historic sites and the resting places of the dead across the city. Here, I consider how I use work as an applied bioarchaeologist in the cultural resource management sector to mitigate harm and to account for the needs of both the living and the dead across this complicated landscape. My work has implications for bioarchaeologists conducting applied research in dense urban landscapes, as well as historical archaeologists confronted with issues around repatriation, colonialism, and community engaged practice.

18 FIGHTING FIRE WITH FIRE? BIOARCHAEOLOGY AND TAPHONOMY AS TOOLS TO UNDERSTAND AND MITIGATE THE ONLINE HUMAN REMAINS TRADE

Abstract author(s): Huffer, Damien (University of Queensland) - Graham, Shawn (Carleton University)

Abstract format: Oral

Among the myriad present-day challenges that bioarchaeological research can aid activism and advocacy about, the on and off-line trafficking of human remains of known or unknown provenience and often-fabricated provenance has only recently begun to receive attention by the media, law enforcement or the public. Our collaborative research over the last several years has contributed foundational knowledge about the size and scope of networks across e-commerce and social media platforms, but it is clear that the amount of human remains surfacing and circulating online far outpaces seizures made by law enforcement or the prosecution of offenders. Here, we discuss the reasoning, logistics, ethics, and potential of a mobile application to classify taphonomic indicators of primary or secondary depositional environment of human remains seized from the market, as well as images of human remains for sale online. Since this project is still in the pilot-level development stage, this talk will focus on contextualising the idea and illustrating how and where such a tool could be useful for law enforcement, museum curators that sometimes have human remains offered to them, and First Nations and other descendent communities with a vested interest in stopping the trafficking of their Ancestral remains (or misappropriation of their cultural heritage) before the remains even enter the market.

19 DIGITAL TWINS IN BIOARCHAEOLOGY: APPLICATIONS IN EDUCATION, OUTREACH, PUBLIC ENGAGEMENT, AND CONSERVATION

Abstract author(s): Fry, Megan (University of Florida)

Abstract format: Oral

Digital Twins, broadly speaking, is a digital representation of a real-world object or system that is used for simulations or maintenance. It goes beyond 3D modelling by continuously incorporating information and adjusting the model accordingly. Although primarily applied within the manufacturing and engineering sectors, the framework is easily translated to bioarchaeological contexts. The field of bioarchaeology would greatly benefit from applying Digital Twin theoretical concepts in assessing the needs of descendant communities, and the physical preservation of cemetery sites.

Taking a broad approach to Digital Twins, we use Newnansville African American Cemetery as a case study. It is a segregated cemetery which houses individuals from slavery-era Florida to present day. There is a distinct lack of records for the site, leaving many unanswered questions. Recent survey work has demonstrated a significant portion of the cemetery houses burials which are unmarked, previously unknown to the community. Working with descendant communities and stakeholders, we have created a digital landscape of this historic cemetery, including a 3D model of the site. Drawing on the Digital Twins framework, we have incorporated a means for the community at large to contribute to the project through the online platform by providing their own photographs, stories, or records of the ancestral community in hopes of identifying some of the unmarked graves. By continually gaining feedback/input from the public, we permit stakeholders and the descendant community to steer the direction our heritage work takes. We also discuss the limitations of Digital Twins in bioarchaeology and posit potential means to combat these restraints. Using Digital Twins to incorporate oral histories, historic records and photographs, ethnographic accounts, and cemetery records alongside our digitized cemetery, we can benefit descendant communities as well as researchers. This project shows great potential in the education, outreach, public engagement, and conservation spheres.

370 REFLECTING ON DIGITAL PRACTICE IN HERITAGE NARRATIVES

Session theme: 3. Heritage Narratives and Representations

Session organisers: Kasten, Megan (University of Glasgow) - Pantos, Alexis - Kimball, Justin (Museum of Cultural History, University of Oslo) - Dempsey, Gary (Atlantic Technological University – Galway City)

Session format: Regular session

This session calls on digital imaging specialists to reflect on their own practice, workflows, and methodologies. Colleen Morgan (2022) has argued that digital archaeology is situated in practice-based research, defined by Candy et al. as a “principled approach to research by means of practice in which the research and the practice operate as interdependent and complementary processes leading to new and original forms of knowledge” (2021, p. 2). It is argued here that digital imaging processes exemplify practice-based research. While 3D models, RTI files, and other end-products of digital approaches are acknowledged as important tools to gain new insights into artefacts, monuments, and sites, this is only one dimension of the knowledge gained through these acts of heritage digitization. In an age of increasing automation across all stages of digitization and presentation, it is easy to overlook the decisions made by digital prac-

titioners behind-the-scenes at different stages. While standardised work routines and descriptive documentation (i.e. paradata) can preserve some practical steps, it is hard to argue that they sufficiently communicate the situational, personal, and communal knowledge generated in these key moments.

This session welcomes papers that reflect on the act of digitization, whether capturing, processing, modelling, disseminating, archiving, or collaborating with a range of communities in the production of scientific or artistic outputs.

ABSTRACTS

1 DIGITAL EXCAVATION: AN ARCHAEOLOGIST'S EXPERIENCES WITH DIGITALLY 'EXCAVATING' CT-SCANNED SOIL BLOCKS FROM THE GJELLESTAD SHIP

Abstract author(s): Kimball, Justin (Museum of Cultural History University of Oslo)

Abstract format: Oral

The Gjeljestad ship is the first Viking Age ship to have been excavated in Norway since 1904. After preliminary investigations, it was determined that the ship was in a poor state of preservation—with heavily corroded rivets being one of the most easily recognisable and valuable artefacts still readily discernible. The remnants of the rivets were incredibly delicate, and traditional excavation of these would have resulted in a loss of integrity for the objects, thereby potentially resulting in a loss of information. To mitigate this, each rivet was systematically georeferenced and removed as part of a soil block which would then be scanned with a CT-scanner. As each soil block was georeferenced, we have been able to reconstruct the exact position of each rivet as it was in situ at the site. The volumetric data resulting from the CT-scans is currently being investigated, and the act of working with CT-data can be described as like the act of physical excavation—only digitally.

Thus, this paper endeavours to explore the act of 'digitally' excavating archaeological material. It focuses chiefly on the rivets and how the CT-data can be used to reconstruct the Gjeljestad ship, piece by piece, as it was at the time of the archaeological investigations. A brief examination of the values and drawbacks that this type of CT-scanning has for archaeology will then be given, followed by a discussion about how this methodology might impact how we disseminate archaeological knowledge to both scientific and public spheres.

2 MEASURE ONCE, CUT TWICE - DEVELOPING AN EFFECTIVE PIPELINE FOR 3D DIGITAL DOCUMENTATION IN THE CULTURAL HERITAGE SECTOR

Abstract author(s): Corns, Anthony - Shaw, Robert (The Discovery Programme)

Abstract format: Oral

The phrase “measure twice, cut once” is commonly used in industries including construction and tailoring, and is meant to emphasise the importance of accurately measuring a material before cutting it to prevent wasting it or having to redo the cut.

In contrast, the 3D digital documentation of archaeological objects and structures often flips this statement on its head. Access to sites and artefacts can often be restricted and inadequate resources in the heritage sector can limit the number of sites recorded to a high standard. Therefore, maximising value from such opportunities is vitally important. Applying divergent modelling and visualisation processes to a single data capture event to generate a range of outputs tailored to diverse audiences is our objective.

This paper explores the work practices developed by the Discovery Programme over the last 20 years, digitally documenting many of Ireland's iconic archaeological and historical sites and objects and delivering a range of outputs to a broad audience. Through experience gained across a range of sites and projects a nuanced and holistic understanding of 3D and its applications in cultural heritage has led to the development of a practise-based pipeline which modularises activities. The processes of data capture, modelling, texturing, lighting, rendering and presentation deliverables are discussed, and the critical decisions in each pipeline process explored. It will show how ultimately an appreciation of final data destination and end user requirement informs the how the pipeline is applied.

The paper will use examples from a range of archaeological and historical structures, monuments, and objects to explain the decisions which informed the choice of capture technology, software and output mechanisms to deliver an effective product to a range of users.

3 TRUST THE PROCESS. THE CREATION OF A NEW DOCUMENTATION WORKFLOW FOR PALAEOOLITHIC SITES: INSIGHTS FROM PEÑA CAPÓN (SPAIN)

Abstract author(s): Jiménez-Gisbert, Guillermo - Navajo-Samaniego, Esther (University of Alcalá) - Vázquez-Martínez, Alia (University of Alcalá; University of Santiago de Compostela) - Luque, Luis - Castillo-Jiménez, Samuel - Alcolea-González, Javier - Alcaraz-Castaño, Manuel (University of Alcalá)

Abstract format: Oral

The accurate recording of excavation floors, rock art or field survey areas are essential tasks in archaeological science. The search for new technologies and methods to gain both accuracy and speed in the field workflow has been a focus of recent research. In the MULTIPALEOIBERIA Project we use a Trimble SX-10 device to accurately document the excavation and survey processes and to create georeferenced 3D models of the rock art panels and sites. In this paper we focus on the archaeological documentation of the Peña Capón site (central Spain), a rock shelter hosting a sequence of Upper Palaeolithic human occupations. This site is submerged in a water reservoir for the most part of the year, emerging only during dry years, just for about 50-60 days at the most (usually less), at the end of autumn. In such a short time frame, and considering the large number of lithic and faunal remains found in the archaeological layers, speed is key and every step in the fieldwork must be polished to get the most out of it.

To that end, we aimed at scanning each of the excavation layers as a whole, instead of recording each find individually, as it is commonplace in Palaeolithic sites. What was originally intended to be a simple addition of the laser scanner component to the total station workflow resulted in the creation of a completely new method to optimise the data collection process.

To assess the outcomes and efficiency of this new workflow we conducted an experiment that recreates field conditions and provides quantitative values on the validation of this method. Here we present the results of this experiment and show how our documentation workflow has been improved. The larger the number of remains to be recorded, the larger the time that is saved.

4 LEXICON OF KATYN ARCHAEOLOGY. CHALLENGES OF DIGITIZATION OF ARCHAEOLOGICAL SOURCES AND ARCHIVAL DATA ON THE ARCHAEOLOGY OF WAR CRIME

Abstract author(s): Majorek, Magdalena (University of Lodz; Institute of Archaeology; Laboratory of Dating and Conservation of Artifact) - Ławrynowicz, Olgierd (University of Lodz; Institute of Archaeology) - Zalewska, Anna (University of Lodz; Institute of Archaeology)

Abstract format: Oral

The aim of the research project “Lexicon of Katyn Archaeology (1990-2015)” is to collect, systematise, archive and make public information on to date Polish archaeological research on traces of the Katyn Massacre. A multidisciplinary team interprets the existing knowledge obtained by archaeologists as a result of the research carried out so far at the “Katyn sites”, collects new hitherto unarchived data (archaeological and anthropological) and makes the entire resource available in public spaces. The assumption is that the culmination of the team’s work will be: (1) elaboration of the “Lexicon of Katyn Archaeology” and (2) an open (textual and multimedia) E-repository, which will be available through the Katyn Museum and the University of Łódź, as well as (3) creation of the Project Archive.

In the first year of the project, within the framework of one of the twelve tasks, we have used the wide selection of methods and tools for the documentation, visualisation and archiving of particular groups of source materials (documents, photographs, grave artefacts). The challenge was both the choice of the criteria for the selection of objects and the scanning itself, including 3D scanning of items from the death graves undertaken using archaeological methods. These are objects with different raw material structures, textures, colours, shapes, workmanship and decoration techniques - in various states of preservation. In this presentation, we will discuss the strengths and weaknesses of using particular methods in documenting different types of data and records, and share lessons learned, including methodological and interpretative failures and successes experienced in the course of capturing images of the not-so-distant difficult past.

5 VALUES-LED PARTICIPATORY PRACTICES IN DIGITAL HERITAGE: A COMMUNITY-LED APPROACH TO TECHNOLOGICAL INTERVENTIONS IN THE CONTEXT OF NATURAL DISASTERS

Abstract author(s): Dolcetti, Francesca - Baraldo, Matteo - Di Giuseppantonio Di Franco, Paola (University of Essex)

Abstract format: Oral

While the usefulness of 3D technologies in recovering, reconstructing and replicating the tangible components of lost or damaged heritage is well-established, less explored is their potential in capturing the intangible aspect of sense of place, defined by the values and significance that communities attach to their lost home and cultural heritage. To

address this gap, this paper proposes a values-led participatory design framework that shifts the focus from an outcome-oriented application of 3D technologies to a more ethically-aware human-centred approach to the design of technological interventions, foregrounding community needs, values and sustainability.

The work presented in this paper is part of a UKRI Future Leaders Fellowship titled REPLACE (Rebuilding a Sense of Place), which aims to study the role and impact of 3D technologies (e.g. Augmented Reality, Virtual Reality, 3D printing, Mixed Reality) in supporting communities and heritage resilience after natural disasters. REPLACE proposes an ethnographic, evidence-based and community-centred longitudinal study that focuses on community resilience: a techno-ethnography. The proposed framework of REPLACE is based on an iterative process including ethnography, digital data collection, digital experience, data analysis and processing. Video-ethnographic interviews will inform the development of 3D technological interventions based on how communities conceptualise heritage sense of place during all phases of the Hazard Management Cycle. By understanding how communities engage with and respond to the co-created technological interventions we will be able to transform the way we can use 3D technologies to rebuild heritage and sense of place after natural catastrophes.

This paper discusses the preliminary results of the application of a values-led participatory design framework from the outset of REPLACE, aimed at creating the values and ethical framework underpinning the project's digital practice.

6 GRAVE CLOUDS; DIGITAL WORKFLOWS FOR UNMARKED GRAVE RECOGNITION IN IRISH HISTORIC GRAVEYARDS

Abstract author(s): Tierney, John (Eachtra; Historic Graves Project; Incultum)

Abstract format: Oral

The Historic Graves project, a citizen science digital heritage project, is over ten years old and in that time over 500 rural Irish community groups have surveyed and published digital surveys to the web platform www.historicgaves.com. The basic survey record is created by geolocated survey photographs and a simple survey system, based on archaeological principles is taught to community volunteers.

In the last three years our focus has switched from simple mortuary monument surveys to assessing techniques for unmarked grave identification and recording, aiming for more complete archaeological surveys. Ground modelling from measured drone surveys and LIDAR surveys have been the main tools we've tested.

In this talk we will present our ongoing research focusing particularly on drone SFM (with Dr Paul Naessens) and LIDAR (with Dr Steve Davis) surveys, including handheld LIDAR surveys, for the purpose of understanding 19th and 20th century burial practices.

A twofold typology of graves developed in Ireland based on 19th century legislation with a strong differentiation between earth-cut and walled graves. Earth-cut graves, in particular, have a wider variety of shapes and sizes especially in 'mass'/common burial contexts. Examples relating to the Great Famine burials of 1845-52 (institutional and non-institutional burials) are examined along with later burial practices (Mother and Baby Home burials, District Mental Hospitals and County Homes are considered) in terms of their archaeological identification.

The work was part-funded by a 2021 RIA Research grant and is currently funded by the Horizon 2020 EU Incultum project.

7 OPAQUE METHODS FOR AUTHENTIC RESULTS: MAKING DIGITAL HERITAGE USEFUL FOR INDIGENOUS AUSTRALIA

Abstract author(s): Farrar, Calum (Griffith University)

Abstract format: Oral

When collaborating with Indigenous communities there is an emphasis on ensuring that the relationship is reciprocal. The researcher has access to the knowledge and lands of a community and in return the community receives the raw data and research output of the researcher. But is this as useful to the community as it is the researcher? This paper explores additional means of reciprocity through the creation of digital heritage assets, tools and experiences to fulfill the needs and desires of Indigenous communities in Queensland, Australia. In particular, it focuses on how existing methods of digital archaeological data creation can be leveraged to meet these desires. Furthermore, it discusses how this process can make archaeological methods, data and results more accessible and engaging to communities and the non-academic public more broadly. This is a critical area for archaeologists and heritage specialists to explore in greater detail, to both address existing inequality and prepare for the ever-growing quantity and complexity of digital heritage data.

8 COPYWRONG: AN ARGUMENT AGAINST LEGAL APPROACHES TO OWNERSHIP IN CULTURAL HERITAGE

Abstract author(s): Garrett, Zenobie (University of Limerick) - Wyatt, Kristi (University of Oklahoma)

Abstract format: Oral

The application of ownership in the realm of cultural heritage has become a central, and often contentious point of discussion. Tensions arise from the negotiation of not only multiple contemporary frameworks but also temporally distant frameworks of ownership as well. While prehistoric concepts of ownership can be particularly difficult to define, even modern ideas of ownership can prove irreconcilable with one another. Moreover, although concepts of ownership have been used in cultural heritage debates to validate claims of power and authority, the application of ownership ideas has been rightfully critiqued as a particularly Western method of establishing control.

The increasing ubiquity of 3D scanning in fields concerned with cultural heritage introduces new challenges to the already complicated issue of ownership. Copyright is often used to protect digital object rights because of their presumed creative and artistic nature. Despite the goals of copyright laws to protect creators, there are several issues with the application of these laws that range from the practical to the ethical. This paper will argue that despite the legal authority copyright grants, there are 8 issues that make the pursuit of copyright claims on 3D models problematic and often at odds with archaeology's obligation to recognize issues of power and authority by giving voice back to local communities.

9 PHOTOGRAMMETRY AS SLOW LOOKING IN THE ANALYSIS OF EARLY MEDIEVAL CARVED STONES

Abstract author(s): Kasten, Megan (University of Glasgow)

Abstract format: Oral

It is now well-established that the outputs of 3D recording techniques are useful tools that allow for a better understanding of early medieval carved stones. The resulting 3D models enable researchers to remove the colour/texture to better visualise the geometry of the carved surface, to create new, probable, or impossible lighting positions, and to allow side-by-side comparison of monuments in three dimensions. What is not often discussed is the data capture process, and when it is considered, the discourse is often focused on the automation of workflows and the comparative quickness and efficiency offered by different digital recording methods. However, there are insights to be gained by viewing photogrammetry through the lens of 'Slow Looking'. Visual analysis is a cornerstone of archaeology, but 'Slow Looking' is a specific method described by Shari Tishman as 'strategic...it involves the intentional use of observation strategies to guide and focus the eye'. In photogrammetric Slow Looking, the camera functions as a framing device; as the practitioner works, small areas on the surface of the monument are highlighted for further investigation before, during, and after processing. Blank, hidden, or damaged surfaces are given more attention through this method, as failing to capture these surfaces results in a less coherent 3D output. This paper will reflect on how Slow Looking has informed my practice-based research using photogrammetry and RTI to record and analyse the Govan stones in my PhD research and ogham-inscribed monuments for my current research in the OG(H)AM project. It concludes with a consideration of how Slow Looking generates knowledge for heritage narratives and how this creates opportunities for more focused 3D recording outreach activities.

10 REFLECTIVE IMAGERY AS A TOOL FOR COLLABORATION OF SCIENTIFIC AND ARTISTIC METHODS

Abstract author(s): Lengyel, Dominik (BTU Brandenburg University of Technology Cottbus-Senftenberg) - Toulouse, Catherine (Lengyel Toulouse Architects)

Abstract format: Oral

The moment at which new knowledge is generated in image production is when questions arise that have not arisen before. The questions arise when the image specialist attempts to create a model. Completeness is the crux of the matter. Often there is reluctance against seemingly insufficient data. For this the authors have developed a method with archaeologists and their uncertainty in knowledge that is accordingly called "visualisation of uncertainty", based on two traditional sub-disciplines of architecture: model building and photography. The combination allows the model as abstract as necessary to stay close to the archaeological hypothesis and to represent this abstract geometry as the architectural idea. It is the hypothetical intention that is depicted, not the speculative actual appearance. Both require design as in abstraction it is not enough to pull something away to free something that remains. On the contrary, it is necessary to design visual representations that are both expressive and undefined. In the projection archaeological arguments shall feel like built architecture through photographic composition, lighting and exposure. In each of these steps, the image, a scientific and an artistic result, influences the archaeologists. The visual translation causes immediate reflection and new questions. Since verbal hypotheses are questioned once translated into images, the authors

call this process visual reflection; like hand-drawings that fix formal thoughts and thereby reflects them. Only after an extensive iterative process of joint decisions is a state reached that satisfies both and complements the hypothesis with its visual counterpart. The method will be presented using prominent exhibited and published projects, amongst them the Hildebold Cathedral in Cologne, where contemporary documents overturned its appearance, and the amphitheatre in Dyrrachium, whose appearance resulted from the virtual photographs. In both cases, it was necessities from the point of view of architecture that raised the questions for archaeology.

11 USING CO-DESIGNED RESEARCH-ORIENTED VR TO EXPLORE „POST-EX“ INTERPRETATION AND NARRATIVE MAKING

Abstract author(s): Juckette, Cole (University of Glasgow)

Abstract format: Oral

The use of Virtual Reality in Archaeology has evolved through multiple eras of archaeological methods design, from its early use in “virtual archaeology” through the embodied intentions of “cyber archaeology” (Forte 2016, 277-285; Reilly 133-135, 1991). While it is an established technology, its applications are primarily in the creation of archaeological “products”, finished narrative interpretations that need to be transmitted. What is lacking is an understanding of ways archaeologists themselves might use VR as a digital method to explore their own data and assist or alter how they arrive at interpretations. This paper explores how VR can be constructed to re-orient the technology inward, exploring more reflexive approaches in archaeological image making and narrative construction. In doing so, it asks: How should it look and function?

This paper introduces two case studies in collaboration with projects in Italy, with materials dating from the Iron Age to the 4th century AD and early medieval period. Both have strong potential for incorporating VR into their workflows because of their adoption of digital recording methods. I used participatory design methods to assess the needs of the different teams as collectives. Each activity evaluated aspects of what a research-oriented system for VR might look like. The workshop method encouraged the use of collective imagination and synthesis among users to produce positive outcomes in terms of the team’s overall satisfaction with and assessment of the utility of final designs.

While there is much diversity in the desired functions archaeologists participating in this project expressed, the pilot study presented here revealed patterns of similarity. A few functions constitute the essential design elements for research-oriented VR and must be present to drive its function in a capacity that connects with current archaeological questions and leverages data in 3D to answer them.

12 EMERGENT PROCESS AND RESEARCH PRACTICE IN THE VIRTUAL REALITY GLOBAL LIBRARY PROJECT

Abstract author(s): Dodd, Lynn (University of Southern California) - Zonno, Sabina (University of Southern California; The Huntington Library)

Abstract format: Oral

The Virtual Reality Global Library (VRGL) template is a well-documented, shareable, Unity-based project that is operational as an immersive VR headset experience of 3D, interactive, real time reading of ancient books with parchment page simulation. A goal of the project is to enable galleries, libraries, archives, museums, and other collection holders to meet their dual, and often competing missions, of providing wide access and supporting preservation.

This presentation is a reflexive effort intended to enhance transparency for those who use this project to create virtual reality experiences of ancient manuscripts and a reminder to us of the benefits of doing this work personally. We offer two concrete examples of our digital archaeological work with manuscripts as practice-based research. We take seriously the concerns and potential of this in line Barad’s (2007:93) call for clarity about the constitutive exclusions that are enacted, and questions of accountability and responsibility for the reconfiguring of which we are a part. We discuss interjections of decision making, and hence of subjectivities, into gestural and procedural work of transforming 2D images into 3D parchment simulations. We show examples of de-aging and renewing parchment and its surface designed after playtesting with manuscript curators interested in prompting renewed awareness of the cost of use, of books being read and held as intended. This prompts deeper reflection by us on the nature of damage and the semantic range of that concept in ownership and the curatorial sphere. We discuss this process and engagement with the manuscript that requires a series of decisions, and yet agential cuts (Barad 2007) that are difficult to make transparent except in the aggregate. Still, in undertaking this work, we understand better the socio-material entanglements of use, of parchment naturally ageing and people touching, kissing, crying, and smearing, or reading the manuscript by candlelight.

SEEING IS BELIEVING: AN APPLICATION OF AR ON PALAEOLITHIC ROCK ART

Abstract author(s): Rivero, Olivia - García-Bustos, Miguel (Universidad de Salamanca) - Dólera, Antonio (Cinemedía and Heritage) - Ruiz-López, Juan Francisco (Universidad de Castilla-la-Mancha) - Garate, Diego (Universidad de Cantabria) - Lorente, Juan Carlos (Cinemedía and Heritage) - Eguilleor, Xabier (Universidad de Salamanca)

Abstract format: Oral

The current study of Paleolithic art produces a large amount of graphic information generated on sites with rock and portable art (tracings, photographs, three-dimensional reproductions) providing visibility to this fragile and unknown heritage, whose accessibility to the general public is often difficult or impossible.

In addition, most parts of the Palaeolithic art depictions are on many occasions challenging to observe, due to the very nature of the artistic entities (fine engravings in karst environments with poor lighting), and also due to conservation problems derived from both natural factors such as erosion and geological and biological alteration processes, as well as anthropic factors. These conditions make the Palaeolithic depictions nearly indistinguishable in many places today, except for experts.

This difficulty of accessing and visualising the Palaeolithic artistic heritage, located in fragile environments and on many occasions challenging places such as karst cavities, makes the information and knowledge generated by the investigation of this heritage asset difficult to transfer to society in general, which is frequently unaware of the incalculable value of this heritage. Therefore, our work proposes to generate various mechanisms to transfer the results of research, restitution and documentation of Palaeolithic art to society in general. To do this, an AR application has been created using LiDAR technology, solving the current problems concerning implementing AR technologies in dark spaces. So far this app has been applied to Spanish archaeological sites such as Hornos de la Peña (Cantabria), Domingo García (Segovia) and La Salud (Salamanca). This application will be particularly interesting for those sites that are currently visited with or without a guide, allowing user interactivity and real-time reconstruction, for example, of the visibility of graphic motifs.

374 WEAVING GLOBAL STANDARDS FOR ARCHAEOLOGY: UNIVERSAL GUIDANCE LOOMS

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Hinton, Peter (Chartered Institute for Archaeologists) - Kyle, James (Institute of Archaeologists of Ireland) - Drummer, Clara (ClfA Deutschland)

Session format: Workshop

This proposal relates to creating and applying ethical standards in research and practice.

In a session co-organised by the Chartered Institute for Archaeologists (CIFA) and the Institute of Archaeologists of Ireland (IAI) at the 2022 Budapest meeting, we discussed the potential benefits of universally applicable standards for archaeology, and high-level guidance on how they should be met. We also explored the impossibility of applying detailed guidance globally, recognising the wide variations of law, policy, practice and culture between different jurisdictions. Meeting those challenges, we looked at how country-specific guidance can support and be woven into CIFA's emergent global framework of ethical code, standards and high-level guidance, using an example from Northern Ireland.

This workshop will examine the consultation draft ClfA guidance, and any other specialist or professional guidance which is intended for multinational (not national or regional) use, and which is supplied before the meeting.

We envisage a moderated co-creative writing workshop, not a programme of papers.

375 HOW FAR WOULD YOU GO? THE ROLE OF MOBILITY IN STONE AGE HUNTER-GATHERER-FISHER COMMUNITIES [PAM]

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Mahlstedt, Svea (Lower Saxony Institute for Historical Coastal Research) - Posch, Caroline (Naturhistorisches Museum Wien) - Groß, Daniel (Museum Lolland-Falster) - Onfray, Marylise (UMR 6554 LETG-Brest)

Session format: Regular session

Mobility is seen as key to understand Stone Age lifeways and subsistence of hunter-gatherer-fisher communities. A large variety of different aspects is summarized in the concept of mobility.

Economical decisions are important motives for hunter-gatherer mobility. This has repeatedly been shown, using, for instance, ethnographic analogies (e.g. Groß et al. 2019) or theoretical constructions, as the marginal value theorem

(e.g. Venkataraman et al. 2017). Applied to archaeological sites, a reconstruction of the local environment is quite often available and thus allows us to develop further analysis and theories regarding prehistoric movements in a landscape (e.g. Boethius et al. 2022).

However, other important aspects are harder to trace archaeologically: Where are the borders of mobility (physically and mentally)? When did people stop and turn around? Can we trace the reasons for these limits of mobility, which in turn result in regional behavior? At which point did orientation strategies like piloting and homing (Golledge 2003) as well as traditions, songs, or stories may have played a part in everyday mobility?

In this session, we want to discuss and shed light on as many aspects of mobility in hunter-gatherer-fisher communities as possible. We welcome a wide range of contributions (from ethnographic to archaeological and computational methods), considering not only the different environments in which the foraging communities lived, like open steppe-like environments, forests, mountainous landscapes, and maritime areas but also look at different methods and means of analysis, e.g. origin of raw materials, shape of sites, rhythmicity of settlement, navigation or theoretical attempts. Single case studies are welcomed as well.

ABSTRACTS

1 LET'S RE-EVALUATE. THE EARLY MESOLITHIC IN THE NORTHERN EUROPEAN LOWLANDS

Abstract author(s): Groß, Daniel (Museum Lolland-Falster)

Abstract format: Oral

The expansion of 'the Mesolithic' into the Northern European Lowlands has been subject to several theories in the past. Roughly speaking, we can divide an autochthonous and an allochthonous genesis hypothesis: The development from Late Glacial Ahrensburgian via the Long Blade Industries or the expansion of post-Federmesser groups. Both theories have arguments for and against them and have been argued for from different stand points, e.g. technological, typological, or ecological, and by different researchers.

In this contribution I will briefly re-evaluate existing theories and models for the expansion of the early Mesolithic into the area in the light of a refined data set. Especially in the last decade, many more direct dates on artefacts and sites have been acquired and significantly increased the resolution of the Early Mesolithic chronology in the area. I intend to critically reflect my own findings from previous studies and consider new perspectives in order to develop a better model of how the Mesolithic might have taken foothold in the Northern European Lowlands.

2 WHERE TO GO TO? SPATIAL KNOWLEDGE IN LATE PALAEO-LITHIC NORTHERN GERMANY AND DENMARK

Abstract author(s): Grimm, Sonja - Eriksen, Berit (ZBSA - Centre for Baltic and Scandinavian Archaeology; CRC 1266 Scales of Transformation) - Weber, Mara-Julia (Museum of Archaeology, Schloss Gottorf; CRC 1266 Scales of Transformation) - Krüger, Sascha (National Museum of Denmark)

Abstract format: Oral

During the last glacial maximum (c. 24.5-17.0 kyrs BCE), the Scandinavian ice sheet covered parts of northern Germany. With the retreat of the ice sheets, barren land remained that was formed by its glacial past and still shaped by periglacial processes. Flora and fauna gradually re-occupied and developed this landscape during the Weichselian Lateglacial (c. 12.7-9.7 kyrs BCE) and the beginning of the Holocene (9.7-9.4 kyrs BCE).

Humans who first entered this environment at the beginning of the Weichselian Lateglacial came to a world that had not existed before and that was still changing. They had to explore this landscape and identify favourable areas for settling, hunting, gathering, fishing, and providing with other (e.g. mineral) resources, hence, give directions to their mobility. Probably these foragers used traditional knowledge about environmental interactions to make decisions at the start. Yet, how soon could they establish a traditional ecological knowledge of this unstable landscape? What role did communication among different groups play in establishing this knowledge? While the demographic processes, in particular, the continuity of occupation is still a matter of discussion in Schleswig-Holstein and Denmark, we know of several sites with multiple episodes of occupation. Had these sites favourable topographies that foragers would generally choose in very different ecological circumstances? Or were the circumstances not as different as we had thought in the past? Can we establish some kind of spatial memory that may have lasted across different archaeological taxonomic units and different ecological settings? We approach some of these questions comparatively using a record of Late Palaeolithic sites in Schleswig-Holstein and Denmark and the environmental reconstructions of these areas at different periods of the Weichselian Lateglacial and Early Holocene.

3 **CONSIDERING PIONEERS' MAPPING OF PENINSULAR BRITAIN. TRAVERSING THE EXTREMES OF NORTH-WESTERN LATE GLACIAL EUROPE WITH FRAGMENTS OF HISTORIC KNOWLEDGE**

Abstract author(s): Mills, William (ZBSA, Schleswig)

Abstract format: Oral

The archaeological record of Peninsular Britain clearly indicates multiple occupations by pioneers of this north-western extent of Late Glacial Europe (15500 to 11900 years ago). Now an archipelago, through mapping and modelling of the submerged landscapes of the Channel River and Doggerland it is possible to assess different routes of access to this peninsular during the Late Glacial and Early Holocene. The Late Glacial is of particular interest as there are significant climatic and environmental transitions that take place relatively rapidly, with clear signs of contrasting human adaptations. Some of these archaeological signatures can be interpreted as part of a broader mobility and landscape strategy. There are few analogous environments to the Late Glacial in the world today, with some of the closest examples found in the Canadian arctic, sub-arctic and boreal regions.

Contemporary and historic records of mobility patterns, resources availability and use (for mobility), and landscape strategies conducive to successful travelling through these types of landscape can provide insight into potential past mobility strategies. This talk will focus on the account of Samuel Hearne, and how Matonabee guided him through boreal, sub-arctic and arctic landscapes during the 18th century. It is argued that whilst taking into account a critical assessment of the narrative (the time of writing, the author's perspective, travelling objective, and cultural understanding) that some genuine universal mobility strategies can be recovered from these accounts. A second level of critical assessment is needed to assess how they might be used to help interpret the archaeological record, the pitfalls to avoid, and the perspectives that this landscape-knowledge may shed on the archaeological record.

4 **HUNTING, FORAGING, WALKING, AND RUNNING IN THE MOUNTAINS IN THE MESOLITHIC - A CASE STUDY FROM THE KARWENDEL MOUNTAINS (AUSTRIA)**

Abstract author(s): von Nicolai, Caroline (Römisch-Germanische Kommission des Deutschen Archäologischen Institutes)

Abstract format: Oral

Since 2015, a Mesolithic campsite is excavated in the Karwendel Mountains, at the German-Austrian border at an altitude of 1800 m asl. The hunter-gatherers frequenting this site travelled over large distances, as the use of different raw material sources, as well as typological and technical details of the lithic artefacts show. But how far did they go and how fast could they travel, depending on how the group was composed? The discovery of a child's tooth indicates that not only adults but also children ventured into the mountains. This paper draws on ethnographic and modern examples from persistence hunting and long distance running, as well as on GIS studies to determine the distances that could in theory be covered by foraging communities in this environment. It also studies which paths and landmarks may have been used when travelling from Upper Bavaria (e. g. the Munich gravel plain) to this part of the Eastern Alps.

5 **TAKE A WALK ON THE STEEP SIDE. MESOLITHIC MOBILITY CONCEPTS IN THE NORTHERN AND SOUTHERN ALPS OF AUSTRIA**

Abstract author(s): Posch, Caroline (Naturhistorisches Museum Wien) - Danthine, Brigit (Austrian Archaeological Institute at the Austrian Academy of Science) - Haas, Julia - Lamprecht, Roman (University of Innsbruck)

Abstract format: Oral

Since 18.000 BP, after the diminishing of the inner Alpine ice shields, the Alps became again accessible for animals, plants, and humans alike. These 'new' landscapes offered vast possibilities, e.g. the availability of primary lithic and rock crystal deposits as well as new migrations routes from north to south, east to west, and vice versa. However, mountainous landscapes also demand new concepts of mobility. From now on, it was vital to see one's world not only in its horizontal but also in its vertical dimension. Since several decades, various models for the mobility of alpine hunter-gatherer communities (HG) have been proposed. They include general observations on possible year-round mobility patterns as well as catalogues of specific characteristics where Mesolithic campsites appear most frequently in alpine landscapes.

Often within these models, a position of camps along preferred, 'central' routes through the landscape are proposed. Furthermore, activity zones of one and two hours around the respective HG campsites are put forward, based on ethno-archaeological observations. But are they really feasible when put against the actual archaeological record in vertical spaces such as the Alps? In order to test these models, we propose using GIS-based analyses – least cost path (LCP) and site catchment analysis (SCA) – to calculate hypothetical patterns of movement in two case study regions: The Kleinwalsertal in the Northern Alps as well as the Carnic Crest in the Southern Alps of Austria. In doing

so we want to ask: Are the archaeological sites of HGF groups located along these ideal paths? And if so, can these calculations be of benefit during archaeological survey campaigns?

6 **CHERT PROCUREMENT IN EASTERN IBERIA: TRACING HUNTER-GATHERERS MOBILITY**

Abstract author(s): Ramacciotti, Mirco - García-Puchol, Oretó - Gallelo, Gianni - Diez Castillo, Agustín (Department of Prehistory, Archaeology and Ancient History, University of Valencia) - Cortell-Nicolau, Alfredo (McDonald Institute for Archaeological Research, University of Cambridge) - Juan Cabanilles, Joaquim (Prehistory Research Service, Prehistory Museum of Valencia) - McClure, Sarah B. (Department of Anthropology, University of California)

Abstract format: Oral

The characterisation and identification of siliceous raw materials used in the production of lithic objects is pivotal in order to retrace the mobility of prehistoric populations. In the past few years, a project of geochemical characterisation of the potential chert sources located in different areas of the Valencian Community has been carried out by multielement analysis.

This first study successfully identified the main local and non-local sources of raw materials associated with Cueva de la Cocina (Dos Aguas, Valencia), a key site for understanding the socio-ecological dynamics of the last hunter-gatherer populations in the Western Mediterranean by cross-referencing data from geological samples and from selected artefacts. Furthermore, a study focused on lithic objects from the Late Mesolithic levels revealed the presence of a non-local chert type widely used in the Northern Valencian Community. The obtained results support previous mobility data based on the presence of seafood remains and strengthen the hypothesis of possible connections between the Mesolithic groups from Cueva de la Cocina and Northern region settlements. Our goal consists of discussing spatial mobility patterns focusing on local and microregional data in order to discuss socioecological dynamics of the last hunter-gatherers in the Eastern Iberia.

7 **TIME AND TIME AGAIN - THE REPEATED USE OF STONE AGE SITES AND OUR UNDERSTANDING OF GROUP MOBILITY**

Abstract author(s): Mahlstedt, Svea (Lower Saxony Institute for Historical Coastal Research)

Abstract format: Oral

In areas of relatively poor preservation and unspecific raw material resources as in the sandy uplands of north western Germany and the northern Netherlands, mobility seems not easy to track. Still, site structures and assemblage sizes as well as radiocarbon dates give the impression of repeated use of sites and areas. How can we unravel regularly repeated visits in the timeframe of a few years or decades? Can our interpretation of the site function help to get an impression of the inhabitants' group size and the duration of their stay? How much movement do we expect throughout a foraging year? And how does a long term or repeated use of a site of several hundred years fit into our ideas of group mobility, traditions and change? This paper is going to combine case studies in the mentioned areas with some more general questions on our interpretational background and understanding of hunter-gatherer mobility and regionality.

8 **ASPECTS OF MOBILITY; CASE STUDIES FROM THE MESOLITHIC OF THE RHINE-MEUSE DELTA**

Abstract author(s): Muller, Axel (ADC archeoprojecten)

Abstract format: Oral

In the last 15 years some large stone age sites have been excavated in the Dutch Rhine Meuse delta. The research focus has been quite often on functional interpretation of flint scatters, in terms of classification on the logistic-residential spectrum, e.g. hunting vs base camp. Mobility is only addressed indirectly.

During recent fieldwork we applied different aims to gather data which allows more specific analysis on mobility questions.

In the presentation we focus on three main aspects. Paleo-geographic and vegetation reconstructions can give an opportunity to get a better understanding of the landscape, landscape dynamics and the relation between hunter-gatherers and available resources. Proxy's like raw material units, use wear analysis on flint artifacts and the study of botanical remains, can give detailed insight in activities, seasonality and other aspects of hunter-gatherer society. The relation between activities and landscapes can be analyzed in terms of land use and mobility in or between different zones in a landscape or between different regions and landscapes.

The shift of focus from flint scatters to a combination with these other aspects also gives an opportunity for different methods for future fieldwork (assessment, evaluation and excavations) in development led archaeology. This can give a more balanced research strategy where there is equal attention for all the different aspects of stone age society.

9 PECULIAR RAW MATERIAL AND SITE STRUCTURE AS EVIDENCE FOR MOBILITY OF MESOLITHIC HUNTERS IN SOUTHEASTERN AND EASTERN LITHUANIA

Abstract author(s): Gaižauskas, Lukas (Lithuanian Institute of History)

Abstract format: Oral

In the setting of Southeastern and Eastern Lithuania, most of the find assemblages from Stone Age dryland sites are dominated by artefacts and waste produced from one type of raw material – black or grey Baltic erratic flint, which cannot be reliably linked to particular extraction sources. This combined with the repeated settling of the same areas in the landscape by different hunter-gatherer-fisher groups makes the understanding of aspects such as settlement patterns and mobility during any particular period very difficult. However, one peculiar raw material – erratic flint with reddish or brownish bands, the use of which is mostly constrained to the Mesolithic, can throw some light on these questions.

In this paper it is proposed that by merging the trails of evidence from the use of aforementioned particular raw material and the structure of sites as well as qualitative and quantitative aspects of artefact assemblages it is possible to reconstruct some aspects of mobility characteristic of the Middle to Late Mesolithic hunter-gatherer-fisher groups in Southeastern and Eastern Lithuania. The geographical spread of artefacts from red-banded flint is used to tentatively indicate the movement patterns of the Mesolithic people who used this raw material. In addition, the research into the character of the assemblages and site structure, especially at recently discovered single-period campsites, provides new data points for the pattern of settlement, which is very much intertwined with the question of mobility.

10 MOBILITY AMONG THE PITTED WARE CULTURE ISLAND FORAGERS OF JETTBÖLE, ÅLAND, INVESTIGATED THROUGH SEQUENTIAL STRONTIUM ISOTOPE ANALYSIS

Abstract author(s): Boethius, Adam (Lund University) - Storå, Jan (Stockholm University)

Abstract format: Oral

The middle Neolithic site Jettböle, on the island of Åland in the Baltic Sea, dated to c.5300-2400 cal BP, is one of the northern- and also easternmost Pitted Ware Culture (PWC) sites. A marine-oriented subsistence is evidenced through stable isotope analyses ($\delta^{13}\text{C}$ and $\delta^{15}\text{N}$) and confirmed by zooarchaeological analyses suggesting a human subsistence based on marine resources, i.e. fish, seals and aquatic living birds, with terrestrial animals being largely absent. The site also exhibits a ritualized handling of human remains and a very rich find material, including anthropomorphic clay figurines. While diet and subsistence strategies have been frequently discussed for various PWC culture foragers their mobility patterns are less thoroughly investigated. To increase our knowledge of Middle Neolithic PWC foragers in the Baltic Sea area, and explore questions of human origin/mobility, diet and subsistence patterns among the island foragers, we have analysed the $^{87}\text{Sr}/^{86}\text{Sr}$ ratios in the enamel of selected human, harp seal and dog teeth from the island of Åland. To contextualize the data from Åland, we have also analysed harp seal teeth from two other PWC contexts, Korsnäs, now located on mainland Sweden, and Ajvide, on the island of Gotland. By using high-resolution strontium data, our results show that it is possible to study and interpret the mobility patterns of both animals and humans within the frame of a Scandinavian Neolithic foraging context. This insight provides us with a frame for understanding the coexistence of Scandinavian hunter-fisher-gatherers and farmers/pastoralists.

11 WHAT MOBILITY AMONG MESOLITHIC COMMUNITIES ON THE ATLANTIC COAST? GEOARCHAEOLOGICAL INVESTIGATION OF THE BEG-ER-VIL SITE (QUIBERON, FRANCE)

Abstract author(s): Onfray, Marylise (UMR 6554 LETG-Brest) - Marchand, Grégor (CNRS, Université de Rennes 1, UMR 6566 Creahh)

Abstract format: Oral

Access to food sources is one of the main motivations for hunter-gatherer societies to move. Depending on the season, the nutritional properties of these foods, their diversity and quantity vary greatly, allowing for a wide variety of mobility patterns. Social factors or weather are also essential parameters more difficult to integrate into our archaeological thinking. The shell middens on the south coast of Brittany allow us to understand some of these variables. Excavated since the 1930s they have revealed a variety of domestic structures, including dwelling units and solidly built hearths in Beg-er-Vil, suggesting long-term or repeated occupation. The bioarchaeological and palaeoenvironmental data collected also provide a better understanding of the organisation of this predatory economy.

These archaeological data, collected in a coastal context, have long raised questions about residence times, possible reoccupations of these sites, and thus the degree of mobility of these societies. Geoarchaeological data resulting from the characterisation of the formation processes of the sites can provide details about the temporality and rhythm of occupation, but so far they had never been explored on Breton sites.

When excavations at the Beg-er-Vil site resumed in 2012, the stratigraphy of both the shell midden and the adjacent occupation layers could be followed closely. A spatial sampling strategy for micromorphological analysis inside and outside the midden was developed. The aim of this paper is to present the variability of the identified signals between the sequences in the shell midden and those in the occupation layers, and to compare the geoarchaeological data with archaeological field data. This research is carried out within the framework of the GEOPRAS programme (GEOarchaeology and Prehistory of Atlantic Societies), funded by the Agence Nationale de la Recherche (ANR).

376 **FRAGMENTED METALWORK IN HOARDS AND OTHER DEPOSITS - REGIONAL AND TEMPORAL VARIATIONS IN THE EUROPEAN BRONZE AGE**

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Sörman, Anna (Nantes University - LARA/UMR 6566 CReAAH; Stockholm University - Dept. of Archaeology and Classical Studies) - Bordas, Francis (University Toulouse Jean Jaurès - UMR 5608 TRACES) - Knight, Matthew (National Museums Scotland) - Nordez, Marilou (CReAAH laboratory - UMR 6566; TRACES laboratory- UMR 5608)

Session format: Regular session

Deliberate hoarding and deposition of metalwork was a widespread practice throughout the European Bronze Age. In numerous regions these assemblages did not only contain intact objects but also broken objects, incomplete bits and pieces.

Traditionally, fragments in hoards were assumed to be commodified raw material for recycling or trade. Explanations for this phenomenon have become more diverse and complex over the last decades. Now, interpretations also evoke ideas about making hoards-within-the-hoard, pars pro toto symbolism, ritual damage, fragments as keepsakes or forms of social enchainment, heirlooms and memorabilia etc. Furthermore, the analyses of their role in possible weight economies and their importance as means of transactions have developed. The last decades of studies have also shown that these hypotheses have varying applicability in different times and regions. Despite overarching similarities, there are temporal and regional variations as to how and why bronzes were broken in Bronze Age communities.

The aim of this session is to discuss similarities and differences in the phenomena of fragmented metalwork in hoards. We invite contributions dealing with different times and regions of the European Bronze Age, as well as adjacent periods (Chalcolithic, Early Iron Age) and neighbouring regions featuring this practice. Studies might concern various scales; from the individual deposit, local expressions, regional synthesis or inter-regional comparisons. Relevant issues might be (but are not limited to) the relation between fragmented and complete artefacts, selection of objects for fragmentation, metrology and 'hack bronze', methods for breakage, inter-depositional relations etc. The intention is to contribute to an overview of studies currently working on this theme, and to start the formation of a European research network.

ABSTRACTS

1 **BREAK AND MAKE? FRAGMENTATION AS PROOF FOR EARLY METALURGY IN THE NEOLITHIC FUNNEL BEAKER SOCIETIES**

Abstract author(s): Skorna, Henry (Excellence Cluster ROOTS - University of Kiel)

Abstract format: Oral

The turn from the 5th to the 4th millennium BCE is a period of drastic changes for the societies of the south-western Baltic region. Major innovations like the domestication of animals and the cultivation of grains are slowly changing the subsistence strategy and replacing the more mobile life style of hunter-gatherer groups. At the same time an innovation centre for metallurgy has already formed in South-East Europe with its beginning dating back to roughly 5000 BCE. Products from this early production centres are also reaching Northern Europe and a range of copper objects is deposited by the Funnel Beaker Societies.

Until the very recent finds of a crucible and tuyere from Lønt/Denmark no hard proof for a own production of copper objects in the "North" was known. Using the example of the recently published analyses of the hoard find of Neuenkirchen (NE-Germany) this paper will show that a different kind of evidence for an independent copper industry might have been overlooked so far. The flat axe fragment of the Neuenkirchen hoard shows signs that "hot-shorting" was used as fragmentation technique for the deliberate destruction. This shows the presence of sound metallurgical knowledge already around 3800/3700 BCE. Based on this discovery the corpus of the neolithic copper find in the south-western Baltic region is revisited for signs of the deliberated destruction of objects using this method and to determine if there is more evidence to substantiate the pre-dating of an independent production of metal objects, 1500 years earlier than previously thought.

2 **FRAGMENTED METALWORK IN HOARDS FROM THE ATLANTIC MIDDLE BRONZE AGE 2 IN NORTH-WESTERN FRANCE: DATA FALLACY OR ANCIENT REALITY?**

Abstract author(s): Sörman, Anna (Nantes Université (LARA/UMR 6566 CReAAH); Stockholm University (Dept. of Archaeology and Classical Studies) - Nordez, Marilou (UMR 6566 CReAAH, Rennes; UMR 5608 TRACES, Toulouse) - Mélin, Muriel (Service départemental d'archéologie du Morbihan; UMR 6566 CReAAH)

Abstract format: Oral

In the Atlantic area, the Middle Bronze Age is associated with a drastic increase in the deposition of metalwork. While this practice remained relatively limited in Atlantic Middle Bronze Age 1 (AMBA 1, 1600-1450 BC), it expanded considerably in Middle Bronze Age 2 (AMBA 2, 1450-1300 BC). Another difference between the early and the late phase is the presence of incomplete objects; while fragments are rather common in AMBA1 hoards, they are much scarcer in hoards from AMBA2. This leads to the question: while the inclusion of incomplete objects in hoards is attested both for the AMBA1 and the following Atlantic Late Bronze Age, did this practice also exist in the AMBA2? And if so, to what extent? Moreover, most fragmented objects from AMBA2 belong to hoards recovered before the establishment of modern archaeology. Could the fragments even be the result of a data fallacy where recent fractures appear ancient due to patina or mineralization which has formed after their discovery?

In this paper we explore incomplete objects in Middle Bronze Age hoards as one analytical window to evaluate the existence of AMBA2 fragmentation. The investigation is based on a selection of hoards from north-western France, particularly Bretagne and Pays de la Loire. Based on ocular study of breaks and damages on incomplete objects, we evaluate the timing of the break. Next, we raise questions about methods of breaks and manipulations and selection of pieces for deposition. These observations are then compared to fragmentation in the AMBA1 and to contemporary fragmentation practices in other regions. These results will clarify the presence or absence of fragmentation during AMBA2, and contribute to the ongoing debate about various functions and values of broken bronze.

3 **LARGELY MISSING. THE IMPORTANCE OF ORGANIC COMPONENTS IN FRAGMENTING BRONZE AGE METAL ARTEFACTS**

Abstract author(s): Mörtz, Tobias (University of Hamburg)

Abstract format: Oral

Most Bronze Age weapons and tools had important functional components made of bone, horn, leather or wood. These were often not preserved, on the one hand because of the conservation conditions of the respective find context, and on the other hand because they had been deliberately removed before being deposited. This was mostly done with little care, using considerable force, for example when tearing off handle plates or breaking off shafts. In some cases, the artefacts were also burnt. These acts usually occurred before further fragmentation of the metal parts and already clearly limited the possible uses of the artefacts concerned. The contribution discusses this procedure on the basis of two characteristic hoard phenomena of the Late Bronze Age in western Europe, namely, weapon depositions and sockets blocked with small fragments in mixed depositions. In both cases, very different practices are evident, which can hardly be explained by craft activities related to recycling.

4 **BRIDGING THE RITUAL AND PROFANE - THE LATE BRONZE AGE HOARD FROM HEGRA, NORWAY**

Abstract author(s): Henriksen, Merete (NTNU University museum)

Abstract format: Oral

The Late Bronze Age hoard from Hegra in the valley of Stjørdal, Central Norway, comprises more than 40 complete and fragmented objects of bronze of which socketed axes make up the majority. The objects were probably deposited in one single event c. 700-500 BC. Among the 26 axes in the hoard, six contained small fragments of bronze, mainly the cutting edges of axes, that had been put into their sockets. The one spearhead in the find had been subjected to the same treatment, with a casting jet put into its socket, and two fragments of a bronze lur also contained small fragments of metal. With several of its objects deposited in a fragmented state, the Hegra hoard belongs to a specific group within the larger group of so-called scrap hoards from the latter part of the Bronze Age in Europe, characterized by the occurrence of socketed axes and spearheads filled up with fragmented metalwork. While such hoards have traditionally been seen as bulks of metal meant to be retrieved and recycled, the find context of the Hegra hoard suggests that more complex motives lay behind its deposition. Following the discovery of the hoard in 2017, an excavation revealed the objects to have been deposited in a small wetland. Surrounded by important rock art sites, the site would have been situated in a ritual landscape of special significance in the Bronze Age. The hoard thus contains both functional and ritual elements. Based on studies of the objects themselves and the results of the excavation along with botanical and metallurgical analyses, the paper aims at discussing what could be learned from this hoard regarding the practice of deposition in the Bronze Age.

5 BRONZE AGE SWORDS BROKEN IN PIECES – NEW EVIDENCE FROM CENTRAL GERMANY

Abstract author(s): Maraszek, Regine (Museum of Prehistory Halle)

Abstract format: Oral

In Central Germany we find one of the richest hoarding regions of the European Bronze Age, especially the middle Saale area with mass finds of axes and rings, later sickles presents a unique metal wealth. We can observe here traditions of similar deposition rites lasting more than 1000 years, with an interruption in the middle of the 2nd millennium BC. The fragmentation of some bronzes like sickles show temporal and regional patterns. This could now also apply to swords.

Half of the Bronze Age swords from central Germany were variably damaged or fragmented before coming into the ground. The degree of fragmentation could not be related to the find context so far. New findings from the Altmark region allow new insights. The exploration of an old low moorland area east of Lake Arendsee yielded numerous indications of repeated metal deposits from the Bronze Age to the Iron Age. These include hoards with sword fragments. The destruction gives us an idea of a rarely observed central German hoarding pattern.

6 FRAGMENTATION OF METALWORK DURING THE LATE BRONZE AGE AND EARLY IRON AGE IN THE LOWER DANUBE REGION

Abstract author(s): Matau, Florica (Arheoinvest Center, Institute for Interdisciplinary Research, Department of Exact and Natural Sciences, Alexandru Ioan Cuza University of Iasi)

Abstract format: Oral

The analysis of the fragmentation in this study relies on the bronze hoards identified in the southern part of Romania and the northern part of Bulgaria. It aims to identify and classify the intentionality of the fragmentation practice, the different torsions and blow marks, or the destruction of the artefacts. For assessing the spatial and regional fluctuations registered within the fragmentation pattern a comparison between the two periods will be done. The different wear and tear marks on objects will be examined and the relationship between intensive natural use and intentional fragmentation will be explored. Besides, the relationship between the hoards and the single finds will be investigated.

In the studied area the most fragmented artefact category is represented by the tools, mainly due to their increased frequency. They dominate the weapons, the ornaments, the raw materials, and the moulds. The sickles and socketed are the most widespread artefact category and they register various fragmentation patterns. The weapons category is dominated by spearheads with a wide variety of damage and fragmentation patterns, while the swords included in the hoards are always damaged or fragmented, unlike the single finds that are always intact. Within the ornaments, the bracelets are worth mentioning because they dominate this category and do not appear throughout both periods.

7 FRAGMENTED METALWORK HOARDS AS A SELECTIVE PRACTICE IN LATE BRONZE AGE NORTH-WESTERN EUROPE

Abstract author(s): Knight, Matthew (National Museum of Scotland)

Abstract format: Oral

Hoards of fragmented metalwork are often seen as one of the defining practices of Late Bronze Age communities in Europe. Such hoards have attracted much attention with debates around how and why metalwork was broken and buried. Were hoards abandoned scrap? Or was there a ritual aspect? Although it is true that some regions have a high volume of fragmented metalwork hoards, such as the Boughton-Vénat tradition of south-eastern England and northern France, other regions of north-western Europe, such as the Netherlands and Ireland, are devoid of fragmented hoards. This highlights variability in hoarding traditions that is rarely considered. Instead of focusing solely on 'why' hoards were buried, in this paper I will present an overview of hoarding across north-western Europe and highlight the regionality of this practice that is often overlooked. In particular, I will consider that the fragmentation and deposition of metalwork was a selective practice that varied across different areas at different times and involved deciding what should be broken and where it should be buried.

8 METAL FRAGMENTATION AND METROLOGICAL PRACTICES IN ATLANTIC GAUL DURING THE LATE BRONZE AGE

Abstract author(s): Francis, Bordas - Thibaud, Poigt (Université Toulouse Jean Jaurès)

Abstract format: Oral

The fragmentation of metal is a recurrent practice of the European Late Bronze Age. It is particularly observed through the metal hoards of several cultural horizons. It is generally accepted that such a practice results from technological or economic gestures, sometimes based on the idea that the fragments follow strict metrological patterns in order to facilitate the quantification of the metal.

In order to contribute to this debate, we focused in this paper on the BFa 3 (c. 950-800 BCE) hoards of Atlantic Gaul, which have the advantage of being particularly numerous, covering large areas and consisting of a wide variety of objects. The data studied thus concern nearly 200 hoards for a little more than 10500 artefacts collected.

The aim of this paper is to test the metrological potential of these sample of data – based in particular on statistical approaches – through the analysis of their masses and dimensions. The results of this study and their interpretation will allow to determine what degree of metrological standardisation governs the practice of metal fragmentation in this specific context, from empirical quantification to accurate metrological norms.

From there, we will propose explanations to such applications in the Bronze Age societies, specifically in terms of economic and technological uses.

Even if it is an appealing idea, the use of metrological standards is not a prerequisite to the fragmentation of metal. Even in an exchange context, metal fragments could have been quantified in an empirical manner, by obtaining fragments of recurrent morphology, whose shapes would be sufficiently evocative to allow the appreciation of their exchange value. Through this paper, we want to characterize the degree of normalisation expected by the fragmentation process, through the point of view of the metrological practices, in LBA Atlantic Gaul.

9 **FRAGMENTING BRONZES FOR SHAPING MONEY? QUANTITATIVE ANALYSIS OF BRONZE FRAGMENTATION FROM LATE BRONZE AGE EUROPEAN HOARDS**

Abstract author(s): Lago, Giancarlo (University of Salento)

Abstract format: Oral

The phenomenon of European Bronze Age (BA) depositions (hoarding) is characterized by a significant difference between early stages – when mostly complete objects were buried – and late stages, distinguished by the recurrence of metal fragmentation. Several hypotheses have been stated to explain this phenomenon, the main ones dealing with the possibility that metal objects were broken during ritual activity; metal fragmentation aiming at recycling bronze; weight-based metal fragmentation to use bronze fragments like money. During the last decade, studies on weight systems and weighing instruments drastically changed the state of knowledge on the metrology of the European BA and the Near East. It entails several important consequences on archaeological economic studies. The newly achieved knowledge of weight systems allowed for comparing weight of fragments to weight systems currently used during Late BA (LBA). Based on statistical analyses, recent studies show that fragments and balance weight are compliant, implying that a statistically significant number of metal objects were fragmented to be used like money.

The contribution presented here proposes an overview of the main results of my recently concluded PhD research ‘Metal fragmentation in European Bronze Age hoards’ (Sapienza University of Rome). It involved the creation of a database of ca. 1400 hoards and ca. 31000 objects from BA (2200-800 BC) in Central and South Europe (Italy, Switzerland, Austria, Germany, and Slovenia). The seriation based on the presence/absence and the share of completeness/fragmentation of objects allowed for drawing macro-areas based on the kind of objects circulating and the recurrence of fragmentation through time. Quantitative analyses show that the number and mass of fragments overcome the number and mass of complete objects almost everywhere in Europe during the LBA (1350-800 BC). Updating metrological analyses with the new sample of LBA fragments (ca. 4300) the hypothesis of monetary fragmentation remains still valid.

10 **THE BANALITY OF FRAGMENTS. METAL FRAGMENTATION AND HOARDING BEYOND THE EUROPEAN BRONZE AGE**

Abstract author(s): Ialongo, Nicola (University of Göttingen)

Abstract format: Oral

What are metal fragments for?

Fragmentation and hoarding are undoubtedly among of the most emblematic, and most debated aspects of European Prehistory. They are generally thought to be unique and original phenomena that intimately define the European Bronze Age, in opposition to other historical periods and regions. As a consequence, we tend to think that the fragmentation and hoarding phenomena must have a meaning in themselves, their origins residing in motivations – whether religious, practical or economic – that were unique to Bronze Age Europe and absent elsewhere. But what if they were a response to a set of circumstances that different societies in different periods shared, but coped with in different ways?

Fragmentation and hoarding are not exclusive to the European Bronze Age. In Bronze Age Mesopotamia, for example, fragmentation existed – although mainly limited to silver – as well as hoards, even though they were not nearly as common as they were in Europe. Metal hoarding in Europe, on the other hand, did not end with the Bronze Age, but continued well into the Iron Age, with metal fragments being eventually replaced by coins. On the opposite side of

the timeline, one could hardly make a relevant case for the absence of fragmentation and hoarding for periods prior to the Bronze Age, when metallurgy was not nearly as widespread or did not exist at all.

In this paper, I will approach fragmentation and hoarding as the possible 'epiphenomenon' of more substantial processes, of which fragmentation itself might simply be the most archaeologically-visible outcome. I will address the different forms that metal fragmentation and hoarding assume in different periods and regions, explore differences and similarities, and attempt to assess whether a common denominator exists, that could provide a coherent explanation consistent with the archaeological data.

377 MULTISCALAR APPROACHES TO PAST MOBILITY: FROM INDIVIDUALS TO POPULATIONS, AND FROM OBJECTS TO TECHNOLOGIES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Nikita, Efthimia (The Cyprus Institute) - Degryse, Patrick (KU Leuven)

Session format: Regular session

The circulation of ideas, technologies, material culture and individuals was prominent in the past in different forms and under diverse motivations. The 21st century has seen a strong interest in archaeological mobility studies, leading to the emergence of the so-called 'mobilities' paradigm. To disentangle the complex and dynamic movement of people, ideas, technologies, and objects, contemporary research acknowledges the importance of adopting multi-scalar approaches, encompassing the movement of single individuals and broader groups or entire populations, coupled with the circulation of material culture either as finished objects or as ideas and technologies. This session aims at bringing together scholars to discuss the challenges and potential of blending different methodological and theoretical approaches so that a deeper understanding of past mobility is gained. We are particularly interested in contributions that approach mobility across multiple scales. These scales may be a) spatiotemporal, that is, studies examining mobility at different durations of time and/or at a shorter and longer geographic scale, b) methodological, that is, transdisciplinary studies that provide complementary information on different dimensions of past mobility, or c) thematic, that is, studies that examine mobility simultaneously at the level of past individuals and groups or at the level of ideas/technologies and finished objects.

ABSTRACTS

1 MULTISCALAR APPROACHES TO MOBILITY: AN INTRODUCTION

Abstract author(s): Degryse, Patrick (Earth and Environmental Sciences, KU Leuven; Faculty of Archaeology, Leiden University)

Abstract format: Oral

The circulation of ideas, technologies, material culture and individuals was prominent in the past in different forms and under diverse motivations. Recent archaeological science has seen a strong interest in archaeological mobility studies, in the form of methodological-analytical developments, new theoretical approaches, and in the application of big data. To disentangle the movement of people, ideas, technologies, and objects, multi-scalar approaches are necessary, from the movement of single individuals to entire populations. This should be coupled with the study of the circulation of material culture, either as raw materials, finished objects or as ideas and technologies. Building large databases of baselines for researching origins of populations or the provenance of artefacts are another new aspect of this research. This session discusses the challenges and potentials of blending methodological and theoretical approaches to understand the often complex story of past mobility, with examples from the Greco-Roman world to the Far East.

2 METAMOBILITY: META-ANALYSIS AND AGENT-BASED MODELING OF HUMAN MOBILITY IN THE GRAECO-ROMAN WORLD

Abstract author(s): Nikita, Efthimia (The Cyprus Institute)

Abstract format: Oral

This presentation will focus on the MetaMobility project, the objective of which is to explore the nature and impact of human mobility in the Graeco-Roman world, focusing on the Hellenistic and Roman Eastern Mediterranean. To achieve this objective, MetaMobility integrates published human osteoarchaeological, zooarchaeological, archaeobotanical, economic and social historical data and tests alternative mobility scenarios via agent-based modeling. The bioarchaeological data come primarily from published information in journals and grey literature, but also from original data generated by our team members in Central and Eastern Mediterranean (Greece, Cyprus, Lebanon, Italy), showcasing the importance of maximizing the use of legacy data while also engaging in original data collection. The project

is multiscalar in the different geographic and temporal scales that it covers, but also in the diversity of approaches and analytical methodologies that are combined in order to elucidate different aspects of mobility at different levels of resolution. Preliminary results of the project will be presented, with emphasis on the open access databases our team is developing.

3 A MULTI-SCALAR APPROACH TO MOBILITY IN THE ROMAN WORLD

Abstract author(s): Mardini, Mahmoud (The Cyprus Institute)

Abstract format: Oral

The use of biodistance analysis provides an understanding of gene flow in past societies and has been applied to evaluate mobility and kinship over time and space. In the context of the Roman World, the study of mobility in its various forms (forced, voluntary, permanent, temporary, long-distance, short-distance) has been a focus of research, as it is known to have significantly influenced the character of the Roman society. The use of different proxies, with an emphasis on historical and archaeological evidence, has aided relevant research, but bioarchaeological studies also further our understanding of such phenomena. This paper presents a case study from Roman Phoenicia, whereby the results of biodistance analysis within and between Tyre, Beirut and Byblos are combined with osteobiographic markers of social divisions (e.g. demography, pathology, activity, diet) to explore the expression of different dimensions of kinship (genetic-fictive) and mobility. This multi-scalar approach examines various levels of mobility: individual (intra-site), group (inter-site), and societal (across the Roman Phoenician coast and among different biosocial groups), and offers a deeper understanding of regional and long-distance movement and its implications.

4 A SPATIOTEMPORAL STUDY OF POPULATION CONTINUITY AND DISCONTINUITY IN CENTRAL GREECE DURING CLASSICAL AND HELLENISTIC TIMES THROUGH BIODISTANCE ANALYSIS

Abstract author(s): Karligiotti, Anna (The Cyprus Institute) - Aravantinos, Vasilios (Ephorate of Antiquities of Boeotia, Hellenic Ministry of Culture and Sports) - Nikita, Efthymia (The Cyprus Institute)

Abstract format: Oral

During the Classical and Hellenistic periods mainland Greece was characterized by major historical events that shaped the Graeco-Roman world. The tumultuous history of the area is characterized by a series of great wars, the formation of alliances and city-states, as well as economic and cultural prosperity and decline. Boeotia held an active role to the aforementioned events, while its capital, Thebes, was one of the main powers in the area until its destruction by Alexander the Great in 335 BCE. Macedonian troops inhabited the area until its occupation by the Romans in the 2nd c. BCE. The aforementioned events had a great impact on the people inhabiting the area, causing population dislocations as attested in historical sources. For example, after the destruction of Thebes, the population fled to the adjacent city of Akraiphia as well as in Athens, and some returned after the city was rebuilt by Kassandros 20 years later. As such, the area and period under study present an ideal setting to examine population mobility. The current paper examines biodistances using dental nonmetric and metric data. Intra-cemetery biodistances are used to assess biological kinship patterns and the degree of heterogeneity within Thebes and Akraiphia during Hellenistic and Roman times, while inter-site biodistance analysis aims at elucidating the degree of gene flow between these two Boeotian cities in each of the above periods. Therefore, human mobility is explored at different resolutions (from pairwise individual distances to broader cemetery populations) and at different temporal and spatial scales.

5 WHO ARE YOU, WHERE DO YOU COME FROM AND WHERE DO YOU GO? MOBILITY AND CONNECTIVITY AT THE URNFIELD PERIOD

Abstract author(s): Fritzl, Michaela (Austrian Academy of Sciences)

Abstract format: Oral

The advance of the Urnfield Phenomenon is generally attributed to increased connectivity and mobility. However, various studies have pointed out that the reasons behind this assumption ranging from long term or seasonal migration to residence change upon marriage, moving warrior bands, traveling craftsmen, travel, trade and social visits are hard to grasp. Traditional archaeological techniques have reached their limits in exploring which reasons triggered the spread of cremation burials and the homogenisation in the material culture. Bio-chemical techniques provide the means of assessing individual mobility itself but the outcomes are rarely sufficiently integrated.

The cemetery of Inzersdorf ob der Traisen, Austria serves as a case study to show that mobility and connectivity should best be explored interdisciplinary. A combination of strontium isotope analysis, network analysis, analysis of the topographical features of the surrounding area and its connected sites as well as the archaeological assessment of the burials and its individuals is used to assess to which degree specific kinds of mobility and connectivity can be detected and how they influenced the community of Inzersdorf and its members in their social lives.

Through the careful application of selected techniques, we know more about which people were more mobile than others, why they were more mobile and how they were perceived within the society. Consequently, the impact of mobility on a society becomes clearer. Furthermore, we deepen our understanding in how mobility and connectivity shaped and were shaped by the communities in order to understand the dynamics in cross-cultural communication and finally in cultural shifts.

6 KOREAN CONTRIBUTIONS TO JAPANESE YAYOI AND KOFUN IN THE ARCHAEOLOGICAL RECORD: IMPORTATION, IMMIGRATION, OR INTEGRATION?

Abstract author(s): Fernández, Irene Minerva (International University Isabel I; Complutense University of Madrid)

Abstract format: Oral

During the Jōmon-Yayoi transition, a series of transformations in the populations and material culture appear in Japanese's archaeological record. These transformations, which lead to the beginning of the Yayoi era, are closely related to the introduction to the islands of a series of technological, cultural, and human contributions originated in the continent, and which are closely related to materials and structures excavated in the Korean mumum.

During the Yayoi and Kofun eras, the arrival of continental materials and populations seems to be a booster for socio-economic development, playing a paramount role on the emergence of a proto-state system which will lead to the establishment of the future imperial monarchy.

This work aims to analyze the Korean-influenced archaeological remains during Japanese Protohistory, while determining if their presence within the archipelago is due to the importation of materials and technology and/or to the arrival of immigrant agents, as well as to determine the degree of integration between these immigrant populations and the local human groups.

7 MOVING THE COMMUNITY: HABITATION MOBILITY IN LBA GREECE

Abstract author(s): Hilker, Sarah (University of North Carolina at Chapel Hill)

Abstract format: Oral

The Late Bronze Age mainland Greece saw a variety of sociopolitical changes, with increasing social stratification during the Early Mycenaean period, followed by the development and subsequent collapse of the Mycenaean palatial systems. Such changes, of course, could result in complex forms of human mobility.

In this paper, I examine architectural manifestations of localized habitation mobility that may be tied to wider sociopolitical processes. Many settlements founded or re-founded in late Middle Helladic (MH) or early Late Helladic (LH) Greece continued to be occupied throughout the Mycenaean palatial period, but there are a number of instances where abandonment during the Late Helladic period occurred and appears to have coincided with the establishment of another settlement in close proximity. In other cases, specific areas of a settlement were conspicuously abandoned while habitation persisted elsewhere.

Several examples of habitation mobility off previously flourishing acropoleis appear to have occurred around the transition to LH IIIA, a time of political change related to the development of Mycenaean palaces. It is difficult to pinpoint the precise chronological scale of these settlement shifts; the changes appear to have occurred fairly quickly, but they may not have been instantaneous or wholly contemporaneous with one another, especially as these examples are not confined to any one region or type of settlement.

Ultimately, I suggest that microscalar settlement shifts - localized habitation mobility - in Late Bronze Age Greece may indicate intentional community rebuilding in the face of macroscalar sociopolitical upheaval or change.

8 THE CURRENT STATE OF RESEARCH ON SCYTHIAN-CELTIC RELATIONS. SETTLEMENT HISTORY CHANGES IN NORTHWESTERN ROMANIA

Abstract author(s): Nagy, Norbert (Satu Mare County Museum)

Abstract format: Oral

The Scythians (Szentes-Vekerzug culture) of the 6th-4th centuries BC occupied the entire territory of the Great Hungarian Plain. In the second half of the 4th century, the Celts, bearers of the La Tène culture, appeared in Northwestern Romania. The relationship between Scythians and Celts has been studied by several researchers. One of them was János Némethi, who studied Iron Age cemeteries and settlements. He has published several works on Scythian and Celtic ceramic forms. In recent years, research has been expanded to include landscape archaeology. This has led to increased use of geographic information systems such as ArcGIS and GlobalMapper. At regional level, Carei area is especially important within the Northwestern Romanian territory for the study of the Scythian-Celtic connections. So far, there has not been any extensive study to analyse the environmental situation and the relationship between the Vekerzug and La Tène culture sites in the Carei area. The aim of my study is to synthesise the studies

carried out so far on these sites. I will list the researchers who have worked on this topic and mention the excavations and systematic researches. Systematic research has uncovered new archaeological sites. Most of the settlements are known from field surveys, but there are also large surface excavations. My aim is to map the Scythian and Celtic settlements in the Carei area (Nir Plain, Carei Plain, Crasna Plain). With the help of these maps, I will investigate the situation of the settlements compared to the cemeteries. I will also consider topographical, pedological and hydrological factors. Moreover, when choosing the locations of the settlements, altitude, closeness to water and absence of flooding were important reasons. The study offers a different perspective and new insights into the changing history of Iron Age settlements in the region.

378 THE MUSHROOM SPEAKS: AN ARCHAEOLOGY OF FUNGI ENTANGLEMENTS

Session theme: 3. Heritage Narratives and Representations

Session organisers: Schönicke, Julia (Freie Universität Berlin) - Holtorf, Cornelius (Linnaeus University) - Butler, Beverley (University College London)

Session format: Regular session

The ubiquity of fungi contrasts their underrepresentation in archaeology. It is about time to change that! All contexts we excavate underwent decomposition by fungi. In fact, the soil we are excavating IS the past, transformed by fungi. The story started with a symbiosis of algae and fungi – lichens – creating life on land 400 mya. Fungi challenge our logical thinking, create unimagined communication networks and question whether there is such a thing as an “individual” at all. This opens the stage for new interpretations of past and future lifeways. Yet, most of us meet mushrooms at the dining table and we can assume that this is also true for the past. But where are they in the archaeological record? And in what diverse ways can we grasp them as vibrant and variously curative-deadly heritage entities?

In this session, we aim to explore all kinds of fungi networks that can be investigated through archaeological thinking, critical heritage concepts and related methodologies. Beyond this however we wish to open up our critical perspectives to alternative creative paradigms that may relate further afield to fiction, futurisms, storytelling, legends, performance, artworks and activist interventions. Possible themes may include:

- Evidence in archaeological/ palaeoenvironmental contexts: recipes, textiles, pyrotechnology, iconography, texts, isotopes
- Social spheres: collective collecting, preparing, and eating mushrooms; transfer of knowledge, rituals, transformations of states of being, heritage pharmacology (after Butler)
- Rhizome thinking (after Deleuze/ Guattari) vs. tree thinking: alternative approaches to heritage and history(-making)
- Icons of the Anthropocene: atomic mushrooms; part of future studies as agents for decontamination, sustainable building material; models for neuronal networks
- Multispecies/ companion species networks (after Haraway/ Tsing) like the Wood Wide Web formed by mycorrhizae

We invite creative, provocative and subversive contributions from different fields and research background on any of these themes or completely new thoughts.

ABSTRACTS

1 PEOPLE ARE STRANGE WHEN YOU'RE A MUSHROOM – MULTISPECIES NARRATIVES IN THE RUINS OF THE ANTHROPOCENE

Abstract author(s): Schönicke, Julia (Freie Universität Berlin)

Abstract format: Oral

Hayao Miyazaki's dystopic anime “Nausicaä of the Valley of the Wind” (1984) takes place in a post-apocalyptic future that has been destroyed by nuclear war. Vast areas have since been covered by the Toxic Jungle, inhabited by giant mutant insects and mushrooms that release poisonous spores making it impossible for people to settle. While others want to burn down the forest, Nausicaä explores the lifeways of fungi and discovers that they clean the polluted earth. Only her engagement with the strange saves the world in the end. Fungi are widely associated with (post-)apocalyptic scenarios. This is not surprising as they survived all extinction events on planet Earth. Currently, we are in the middle of the 6th mass extinction driven by anthropogenic influence – the Holocene or Anthropocene extinction. Is there a way out? To overcome the present doomsday and human-centered scenarios, Donna Haraway suggested to give space to a yet unimagined Chthulucene to create more-than-human narratives in a multispecies cosmos. But how can we actually engage with multispecies approaches that also become more important in archaeology? Our current understanding of species is shaped by taxonomy through the anthropogenic lens. But recent microbiological and mycological research fundamentally challenges our perception of “individuals”. Since archaeologists aim to uncover

narratives of past/future lifeways, how can we avoid reconstructing relationships between humans and non-human entities based on our modern view? I argue that engaging with strangeness enables diving into multispecies narratives. For exposing and sensitizing us to strangeness, we need to escape the regulated paths of our capitalist environment. In urban areas, abandoned places provide secret hideouts for forgotten things and species in constant (re-)creation and decay – like Haraway’s “hot compost pile”. I demonstrate that exploring contemporary ruins and their fungal habitats offer ways to entangle with the strange, unexpected, and unknown.

2 THE FUNGAL LIVES OF RUINS: A MUSHROOM ARCHAEOLOGY

Abstract author(s): Venovcevs, Anatolijs (University of Oulu; UiT: The Arctic University of Norway)

Abstract format: Oral

As pointed by Anna Tsing, following Donna Haraway, fungi are a companion species for their abilities to travel, create, co-evolve, and consume alongside their human companions. While providing humans with some of their greatest inventions – cheese, bread, alcohol, penicillin – they have also been a bane for buildings, heritage, and human health. Throughout all this, fungi have shown themselves to be vicarious and opportunistic cohabitants and consumers within anthropogenic spaces – they exist among and will continue to exist after their human roommates. Our present, once past, will become their food. The purpose of this presentation is to explore the more-than-human methods of investigating this metamorphosis by introducing a recently-funded contemporary archaeology postdoctoral research project focused on the fungal ecologies that emerge out of recent ruins. By drawing on ideas from neo-materialism, multispecies approaches, and heritage ecology alongside case studies from northern Norway, Finland, and Canada, the presentation will explore the question of what archaeology and heritage studies would look like if we took seriously the teachings of our fungal cohabitants. What would fungal-friendly heritage practices look like? What anxieties do mushrooms evoke regarding the heritage of recent toxic soil contamination? And ultimately, how do fungal transformations of the recent past make room for more-than-human livability in an increasingly anthropogenic world in the period that many have begun to refer to as the Anthropocene?

3 HERITAGE AS PHARMAKONIC SUBSTANCE - BELLADONNA, MUSHROOMS AND BEYOND

Abstract author(s): Butler, Beverley (University College London, Institute of Archaeology)

Abstract format: Oral

David Lowenthal’s text *The Past is a Foreign Country* is oft cited as the foundational text of heritage studies. The title of which is taken from L.P. Hartley’s *The Go-Between*. What interests me, and what I wish to centre in my paper, is how the latter text has an unexpected moment in it (not featured in Lowenthal’s work) in which the chief protagonist Leo – the ‘go-between’ – adopts the persona of a ‘magician’, and I would argue an occult pharmacologist. In this guise he engages in ritual behaviours, the creation of spells and in interventions that revolve around the procurement of certain pharmakonic substances – notably a belladonna plant – that promise to transform his situation.

From this point of origin, my paper connects Leo’s use of transformative ‘pharmacological substances’ – i.e. as either alternatively or simultaneously ‘poison-cure’ – to entanglements synonymous with ‘heritage questing’ as the search for heightened states of being and to curative-harmful interactions with other overtly pharmakonic substances such as mushrooms. I ground my paper in the intellectual work of Derrida and Stiegler and ultimately contextualise it in the realpolitik of Palestine as a particularly potent ‘heritage pharmacology’.

4 TREASURE MAPS TO THE PAST: FUNGI AS INDICATORS FOR LOST MATERIALS IN THE MICROARCHAEOLOGICAL RECORD

Abstract author(s): Reifarth, Nicole (Cologne Institute of Conservation Sciences, University of Applied Science Cologne) - Pümpin, Christine (Integrative Prehistoric and Archaeological Science, University of Basel) - Drewello, Ursula (Laboratory Drewello & Weißmann GmbH, Scientific Investigations for Art and Monument Conservation) - Drewello, Rainer (Institute for Archaeological Sciences, Monument Sciences and Art History, Otto Friedrich University) - Lochnit, Günter (Biochemical Institute, Justus-Liebig-University Giessen)

Abstract format: Oral

The identification of highly degraded wood, textiles, and other organic materials from archaeological contexts still poses a considerable challenge. Complex processes of decay – in which microbial activity plays a pivotal role – can lead to major structural changes, both at a macroscopic and molecular level. It is thus very often no longer possible to detect organic components by means of direct morphological or molecular comparisons with recent reference materials but only indirectly, by means of characteristic patterns of decay that systematically occur in particular materials. Studies on anthropogenic floor deposits in the Late Bronze Age Royal Tomb of Qatna (Syria) show that one of these patterns can be fungal remains. The heavy alteration of organic materials from the burial inventory asked for different analytical approaches, including micromorphological, physicochemical and biomolecular analyses. The results raise

complex taphonomic questions resulting from the interplay of human activities and post-depositional processes. On the borders between lost materials and fragile microstructures are fungal remains which indicate former wooden constructions, plaited mats, and textiles. These inconspicuous structures of ancient fungi can be likened to treasure maps that indicate components of the burial inventory that have so far been indeterminable.

5 EXCAVATING THE FUTURE? TOWARDS AN ARCHAEOLOGY OF GROWTH AND REGENERATION

Abstract author(s): Holtorf, Cornelius (Linnaeus University)

Abstract format: Oral

The potential for an archaeology of growth and regeneration first arose during an exploratory visit to the Iron Age site of our training excavation. The site of Gamla Skogsby—literally “Old Village in the Woods”—is surrounded by a lush greenery overwhelming the visitor. During the summer, the vegetation is so dense and abundant that it takes considerable effort to filter out ‘the archaeology’, requiring the archaeologist to try and ‘unsee’ what is dominant at the site, i. e. the rich growth of vegetation, to focus instead on slight elevations and patterns of meager stones. At Gamla Skogsby, various actants, capacities and processes are continuously regenerated in a continuing development. This includes natural processes represented by the rich flora, fungi and fauna of the site as well as human growth, skill training and the development of Archaeology itself. Whereas archaeology, traditionally, in the name of recovery, seeks to regain the past for the future, under the sign of regeneration, archaeology engages in processes of natural and cultural growth, now and in the future. In this perspective, nature and culture are united regarding the significance of creative transformation and renewal. The traditional focus in archaeology on the details of periods long past ought to be complemented by asking about the processes we are, and will be, part of as human beings living in the present. —Arguably, the archaeological project at Gamla Skogsby did not so much recover aspects of prehistory some one and a half millennia ago as engage with evidence from different periods from 220 million years ago onwards, including both the three weeks in 2021 during which a group of humans conducted fieldwork, and the future.

380 NEANDERTHALS OF THE NORTH: AGENCY, ECOLOGY AND CLIMATE IN CHALLENGING LANDSCAPES [PAM]

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Di Maida, Gianpiero (CCEHN – Niedersächsisches Landesamt für Denkmalpflege) - Ruebens, Karen (Chaire de Paléoanthropologie, Collège de France) - Wiśniewski, Andrzej (Institute of Archaeology, University of Wrocław) - Weiß, Marcel (Institut für Ur- und Frühgeschichte, Friedrich-Alexander-Universität Erlangen-Nürnberg)

Session format: Regular session

While the first Neanderthal fossils were discovered in western Europe, their archaeological and biological remains have now been found across a broad geographic range, covering most areas of the Eurasian continent, including latitudes up to 53 degrees North. Neanderthals also were around over a relatively large time span, from ca. 400,000 to 40,000 years ago, covering several climatic oscillations. Consequently, it is clear that Neanderthals lived across a plethora of different environmental conditions, as well as radically different and challenging climates, and resilience-testing landscapes.

The scope of this session is to bring together case studies, local and supra-regional overviews, new discoveries and upcoming research projects focused on Neanderthal settlement strategies across the most challenging conditions in Northwest and Central Europe (covering the area from northern France into Poland, and from Britain down to the Alps). The session has a particular focus on the interactions between environment and material culture, including coping mechanisms, adaptive behaviours and innovative strategies. We especially encourage the submission of papers with an interdisciplinary approach, integrating data from lithic, faunal and environmental records, both from new excavations and from existing museum collections.

1 THE POTENTIAL OF ZOOARCHAEOLOGY BY MASS SPECTROMETRY (ZOOMS) TO ENHANCE RECONSTRUCTIONS OF NEANDERTHAL SUBSISTENCE STRATEGIES IN NORTHERN ENVIRONMENTS

Abstract author(s): Ruebens, Karen (College de France) - Smith, Geoff (University of Kent)

Abstract format: Oral

Numerous Neanderthal sites are known from northwest and central Europe (from northern France into Poland, and from Britain down to the Alps), up to latitudes of 51 degrees north. Besides covering a broad temporal range from ca. 400,000 to 40,000 BP, Neanderthals also encountered a range of climatic and environmental conditions. Zooarchaeological studies indicated they adapted their subsistence to both temperate forested settings (including for example fallow deer and straight-tusked elephants), as well as cold open landscapes (as represented by reindeer, mammoth and woolly rhinoceros).

These zooarchaeological identifications can now be enhanced through the application of Zooarchaeology by Mass Spectrometry (ZooMS). Through differences in collagen fingerprints ZooMS is able to taxonomically identify small bone fragments, which lack species-specific morphological features. In this presentation we will explore the potential of this method to enhance reconstructions of late Neanderthal subsistence strategies in northern environments. Firstly, we will discuss the results of our recent ZooMS analysis of 761 bone fragments from the Neanderthal open-site of Salzgitter-Lebenstedt (northwest Germany). Secondly, we will contextualise our results with other ZooMS studies that have been conducted on Northern Neanderthal sites. Finally, we will discuss the broader potential and pitfalls of integrating ZooMS and zooarchaeological data to understand human subsistence adaptations to challenging environmental conditions.

2 THE GATE TO THE NORTHERN LOWLANDS IN THE MIDDLE PLEISTOCENE: NEW RESEARCH AT THE SITE RACIBÓRZ STUZIENNA 2, SW POLAND

Abstract author(s): Wisniewski, Andrzej (Institute of Archaeology, Faculty of Historical and Pedagogical Sciences, University of Wrocław) - Schunk, Lisa (Institute of Archaeology, Faculty of Historical and Pedagogical Sciences, University of Wrocław; TraCER. Laboratory for Traceology and Controlled Experiments. MONREPOS Archaeological Research Centre and Museum for Human Behavioural Evolution, LEIZA) - Weiss, Marcel (Institut für Ur- und Frühgeschichte, Friedrich-Alexander-Universität Erlangen-Nürnberg) - Salamon, Tomasz (Institute of Earth Sciences, University of Silesia in Katowice) - Moska, Piotr (Institute of Physics/Division of Geochronology and Environmental Isotopes, Silesian University of Technology) - Lisa, Lenka (Institute of Geology, Czech Academy of Sciences)

Abstract format: Oral

Exploring the time of occupation as well as the technological traditions of human groups arriving in the European Lowlands during the Middle Pleistocene is a focus of many current discussions. The period of diminishing the Lower Paleolithic industries and the emergence of the Middle Paleolithic between MIS11 and MIS7 is of particular importance. It is assumed that the Lower Paleolithic in this region was represented by human groups using flake industries with a low degree of reproducibility and limited core preparation, while the beginnings of the Middle Paleolithic are linked to the emergence of predetermined technologies in the form of Levallois methods.

The Racibórz-Stuzienna 2 site has played a significant role in these considerations since its discovery in the 1930s. It is located in the Oder River valley at the entrance of the Moravian Gate (SW Poland), which is one of the largest passages connecting the lowland and upland-mountain parts of Central Europe.

The lithic finds were discovered within a sand and gravel pit. The artefacts were initially classified as Lower Palaeolithic, followed by an early Middle Palaeolithic interpretation of the lithics.

In 2022, we started excavations in the eastern part of the former pit (National Science Centre, grant no. 2020/39/B/HS3/02277). Thus, we would like to present new data regarding geological, soil micromorphology and radiometric examination determining the sedimentological environment and its age by OSL dates. Additionally, we present the results of a technological and traceological analysis of lithic finds.

The new artefacts occurred in a large quarry area, at least in two layers of fluvial deposits, representing several stages of human activity. Based on the lithic analyses, it appears that flakes and occasionally blades were manufactured using a unidirectional and centripetal method of core reduction. We also noted the presence of uni- and bifacial tools.

3 NEANDERTHALS LIVED UNDER SEVERE COLD CONDITIONS (GS 19) IN LICHTENBERG, NORTHERN GERMANY

Abstract author(s): Weiß, Marcel (Institut für Ur- und Frühgeschichte, FAU Erlangen-Nürnberg) - Hein, Michael - Urban, Brigitte (Leuphana University Lüneburg, Institute of Ecology) - Lauer, Tobias (University of Tübingen, Department of Geosciences, Terrestrial Sedimentology)

Abstract format: Oral

The resilience of Neanderthals towards changing climatic and environmental conditions, and especially towards severely cold climates in northern regions of central Europe, is still under debate. One way to address this is to investigate multi-layered occupation in different climatic intervals, using independently-compiled paleoenvironmental and chronological data. Unfortunately, most open-air sites on the northern European Plain lack a robust chronostratigraphy beyond the radiocarbon dating range, thereby often hampering direct links between human occupation and climate. Here we present the results of integrative research at the Middle Paleolithic open-air site of Lichtenberg, Northern Germany, comprising archaeology, luminescence dating, sedimentology, as well as palynological analyses. Our findings clearly show Neanderthal presence in a temperate, open-forest environment at the very end of the Brörup Interstadial, MIS 5c/GI 22 (Lichtenberg II). For the previously known Neanderthal occupation Lichtenberg I, we revise the chronology from the former early MIS 3 (57 ± 6 ka) to early MIS 4/GS 19 (71.3 ± 7.3 ka), with dominant cold steppe/tundra vegetation. The early MIS 4 occupation suggests that Neanderthals could adjust well to severely cold environments and implies recurring population in northern Central Europe between MIS 5 and MIS 3. Furthermore, the artefact assemblages differ between the temperate and cold environment occupations regarding size, blank production, typology and tool use. We argue that this change and can partially be explained by different site functions, as well as by the availability of large and high-quality flint raw material during periods of open landscapes, when the primary source of raw materials from nearby glacial sediments was accessible.

4 THE EARLY MIDDLE PALAEOLITHIC PEOPLING IN NORTHERN GERMANY: A REVIEW

Abstract author(s): Di Maida, Gianpiero (Niedersächsisches Landesamt für Denkmalpflege)

Abstract format: Oral

Due to its latitude, the Middle Palaeolithic (MP) peopling of northern Germany has been heavily influenced by the glacial transgressions during the cold phases (Saalian, MIS8 and MIS6, and Weichselian, from MIS5d to MIS4), with what seem to be demographic peaks during the interglacial phases. According to a recently-published summary (2016), more than the half of the German MP sites in the record are to be attributed to the MIS3.

It is therefore a matter of ongoing debate if and how many of the known sites in the region are truly ascribable to the Saalian glacial. The classification of the techno-complexes of the German and European MP, that has traditionally constituted the basis for its chronological systematization, have been plagued by constitutive and interpretative issues that have contributed to an overall picture now from many sides recognized to be distorted and generally unsatisfactory. This aspect has gained a visible predominance in the recent literature, as shown by the spike in the attempts to arranging the known facts and proposing new interpretative models. Despite these attempts though, the overall picture remains very fluid, with environmental aspects gaining more relevance in the way they are thought to have shaped and influenced the composition of the different techno-complexes.

A blatant example of this, is the site of Ochtmissen, attributed to the MIS6, with a proposed age of 150 ka BP (maximum Saalian), based on the typological attribution of the complex (Jungacheuléen) and an interpretation of the glacial/interglacial sequences.

In the frame of the project Climate Change and Early Humans in the North (CCEHN), our team aims for a critical re-evaluation of the MP sites in northern Germany and their chronological attribution within the frame of changing climatic conditions and by establishing comparisons with the neighboring regions.

5 MIDDLE PALAEOLITHIC ARTEFACTS FROM BEACH REPLENISHMENTS IN THE NETHERLANDS AND THEIR IMPLICATIONS FOR THE STUDY OF NORTHERN NEANDERTHALS

Abstract author(s): Niekus, Marcel (Stichting STONE/Foundation for Stone Age Research in the Netherlands; Human Origins Group, Faculty of Archaeology, Leiden University)

Abstract format: Oral

The North Sea harbours a vast archive of prehistoric archaeological, faunal, and other environmental remains and is considered one of the most important areas for the study of the early colonisation and occupation of Northwest Europe and the adaptation of prehistoric hunter-gatherers to changing environmental conditions. Although the scientific potential of the region for the study of Palaeolithic hunter-gatherers is generally acknowledged, targeted archaeological research is still rare due to a.o. reasons the poor accessibility of the submerged Pleistocene landscapes of this European 'heartland'. Most finds from the North Sea are single finds that are poorly contextualised and hence

often considered as being of limited scientific value. This mindset has however changed profoundly during the past decades and the scientific as well as public interest in submerged Stone Age archaeology is on the rise. This is largely the result of regular replenishments for coastal reinforcement and several large-scale infrastructural works that have led to numerous Stone Age finds made by an enthusiastic community of citizen scientists. In addition, increasing offshore economic activities and the application of new technologies have led to seismic and augering data providing well-needed contextual information on these finds. Although Middle Palaeolithic finds are reported from beaches all along the Dutch coast, there are notable differences between replenished collections with respect to numbers, raw material, and techno-typological characteristics. In this contribution I will focus on the lithic assemblages (MIS 5 – MIS 3) of two major infrastructural works: Maasvlakte 2 (Rotterdam) and the Sand Motor off the coast of Ter Heijde, not far from The Hague. Despite all the shortcomings and interpretative limitations of replenished finds, they provide information on the nature of the Late Pleistocene archaeological record of the Southern North Sea basin and hominin behaviour along the northwestern edge of the known Neanderthal distribution.

6 LAND WITHOUT CAVES. A LATE NEANDERTHAL LANDSCAPE RICH IN BIFACIAL TOOLS AT ESBEEK-DIESSEN, SOUTHERN NETHERLANDS

Abstract author(s): Rensink, Eelco - De Kort, Jan-Willem (Cultural Heritage Agency of the Netherlands) - Gisbergen, Piet (local archaeologist) - Huisman, Hans - Os, Bertil (Cultural Heritage Agency of the Netherlands) - De Smedt, Phillippe - Verhegge, Jeroen (Ghent University)

Abstract format: Oral

Since 2006 almost 4000 Middle Palaeolithic stone artefacts, including more than 250 (fragments of) bifacial tools, have been collected from arable fields between the villages of Esbeek and Diessen in the southern Netherlands. The small bifaces and Keilmesser among the surface finds date the sites to the period of the Neanderthals (Late Middle Palaeolithic). Between 2018 and 2022 borehole surveys were carried out and trial trenches were excavated by the Cultural Heritage Agency of the Netherlands to assess 1) the (original) stratigraphical position of the stone artefacts at the present-day surface, and 2) the potential of the area for the presence of in situ occurrences of (concentrations of) Middle Palaeolithic artefacts. Furthermore, the aim of the research is to reconstruct the Neanderthal landscape during the Middle Pleniglacial between about 55.000 and 40.000 years ago. In addition, the question of how to interpretate the large number of surface finds in terms of Neanderthal behavior and adaptation to 'marginal landscapes' and northern environmental conditions (site location, raw material provenance and use, nature of activities performed, settlement strategies, etc.) is addressed.

In our presentation we will focus on the preliminary results of the fieldwork in the spring of 2022. A small trial trench has been excavated in a Middle Palaeolithic artefact concentration consisting of hundreds of surface finds, yielding for the first time stone artefacts in a stratigraphical context below the ploughzone. Alongside discussing these results, we present the outcomes of the geophysical surveys, aimed at contextualizing the artefactual remains, and providing information on the palaeo-landscape and stratigraphy of the site.

A. CLIMATE NICHE DYNAMICS OF NEANDERTHALS IN WESTERN EURASIA

Abstract author(s): Yaworsky, Peter - Hussain, Shumon (Aarhus University) - Nielsen, Trine (Aarhus University; Moesgaard Museum)

Abstract format: Poster

Neanderthals occupied western Eurasia between 350-40kya, roaming a diversity of ever-changing landscapes through multiple cycles of extreme climate change. Based on the distribution of Middle paleolithic sites, the geographic range of Neanderthals generally expanded during warm phases and contracted during cold phases. These rhythmic climate oscillations are identified in the marine isotope stages and offer a framework to understand Neanderthal land use patterns and their response to climate change. A key issue in Neanderthal research is to what extent Neanderthal populations expanded into northern latitudes, particularly those above 55°N, and what conditions facilitated such range expansions. The Eemian Interglacial (MIS 5e. 130-116kya) is often identified as a context of substantial Neanderthal range expansion, with an increasing number of Middle Paleolithic sites reflecting Neanderthal occupation of the North- and East European Plain and the possibility of expansion even further north above 55°N. However, more recent glacial expansion periods, such as the LGM, have erased many, if not all, archaeological evidence of Neanderthal occupation in the northern latitudes. A promising way of quantifying the potential extent of the Neanderthal distributions is by understanding the climatic niche space of Neanderthals using a spatiotemporal species distribution model. Here, using dated Neanderthal sites from across western Eurasia, paleoclimate reconstructions, and a spatiotemporal species distribution model, we test the impact climate changes had on the size and extent of the Neanderthal niche space. Then, using this niche space, we estimate the peak extent of the Neanderthals into northern latitudes.

LINKING DIFFERENTLY: COMPLEX BEHAVIOURAL PATTERNS EVOLVING FROM PREHISTORIC NETWORKS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Jiménez-Puerto, Joaquín R (Departamento de Prehistoria, Arqueología e Hª Antigua) - Diachenko, Aleksandr (Institute of Archaeology, National Academy of Sciences of Ukraine) - García Puchol, Oreto (Departamento de Prehistoria, Arqueología e Hª Antigua)

Session format: Regular session

Non-linear behavioural dynamics evolving from network structures is one of the most prominent research topics explaining patterns in material culture at different spatio-temporal scales. Prehistoric networks were shaped, re-shaped and collapsed through long periods of time across wide geographic areas. Theoretical and methodological approaches to networks and complexity are intensively developed in archaeology and anthropology. 'Metaphoric' applications are being replaced by quantitative approaches. At this point, numerous computational tools developed under this epistemological umbrella,

This session focuses on networks cases of applications and the tools involved in their implementation. It also aims to provide an overview of the state of the art, recent advances, and further directions in studying complex systems and networks in prehistory. We invite contributions from all archaeology-related disciplines dealing with the following questions:

- Case studies on complexity and network analysis in prehistory.
- What are the differences between the features of hunter-gatherer's social networks and those characteristic of Neolithic societies?
- How simulations of the emergent phenomena in a diachronic perspective can contribute to the understanding of transformations associated with landscape and social endeavours?
- Is implementing complexity theory and network analysis into research programs justified in case of simple explanatory alternatives?
- What is the overall impact of complexity theory and network analysis on the development of method and theory in archaeology and anthropology?
- Is this methodology just a short-term hype or has it come to stay?
- What is the impact of chronological resolution on the observed patterns? Do they still contain the potential to perform further applications, being squeezed to the very last drop?
- Epistemological approaches have the potential to provide a theoretical framework to the analytical results obtained, but they still lack of a unified corpus. Could all these approaches be integrated under the umbrella of a unified paradigm for network studies?

ABSTRACTS

1 DISSECTING THE CONFORMIST AND ANTI-CONFORMIST BIASES IN CULTURAL TRANSMISSION

Abstract author(s): Diachenko, Aleksandr (Institute of Archaeology, National Academy of Sciences of Ukraine) - Sobkowiak-Tabaka, Iwona (Faculty of Archaeology, Adam Mickiewicz University in Poznan)

Abstract format: Oral

A spread of cultural traits along the contact networks is affected by frequency-dependent transmission biases. Positive (or conformist) transmission bias refers to the disproportionately high probability of acquiring the more common variant. Negative (or anti-conformist) transmission bias describes the deliberate exclusion of the most common ('fashionable') variants in the copying process. Both the conformist and anti-conformist biases have been intensively considered in mathematical models of cultural transmission and data analysis for almost four decades.

The main focus of this study is the relationship between transmission biases and the level of the analyzed phenomena in the taxonomic structure. A brief review of the research dealing with the frequency-dependent transmission biases is followed by the analysis of the network structure impact on the observed trends in a conformist and anti-conformist transmission of cultural traits. Our 'toy' models and empirical examples aim to contribute to the understanding of prehistoric processes beyond the observed trends.

2 WEAPONS, DATES, AND SOCIAL NETWORK ANALYSIS: REVEALING POTENTIAL INTERACTIONS ACROSS THE MESOLITHIC AND THE EARLY NEOLITHIC IN THE WESTERN MEDITERRANEAN

Abstract author(s): Barrera-Cruz, María (University of Valencia) - Cortell-Nicolau, Alfredo (University of Cambridge) - Jiménez-Puerto, Joaquín - García-Puchol, Oreto (University of Valencia)

Abstract format: Oral

Geometric points are highly frequent in the last phases of the Mesolithic and first Neolithic techno-complexes. Focusing on these assemblages, diversity in geometric shapes (trapezoids, segments, triangles) is visible between regions and over time. Does it happen due to changes in the social network? What kind of social interactions could be addressed by changes in the geometric points assemblage? This work tries to describe and compare Mesolithic and Neolithic interaction patterns from variability in this tool using social network analysis. We wonder whether potential economic and social behavior differences between groups with different subsistence systems (hunter-gatherers versus farmers) might have affected how these groups produced and used this toolkit. To do this, we rely on a paradigmatic classification to create types or groups defined as a unique combination of technical and morphological traits where all the variables and categories are equally important. Once this is done, we will use the frequencies of these groups across different dated layers, where samples will be chronologically grouped. Social network analysis will be carried out in a diachronic axis, following criteria of similarity and considering Mesolithic and Neolithic assemblages. In this way, we hope to contribute to the understanding of (1) the variability in the geometric points toolkit considering different economic and social behaviors from the last hunter-gatherers and early farmers and (2) test whether network analysis can be used in cultural diversity studies under conditions of data scarcity.

3 DOLERITE PROCUREMENT IN MEDITERRANEAN IBERIA AND THE USE OF NEURAL NETWORKS

Abstract author(s): Bernabeu Auban, Joan - Jimenez-Puerto, Joaquin - Gallelo, Gianni - Orozco-Köhler, Teresa (Universitat de Valencia)

Abstract format: Oral

Provenance information results are useful to study settlement patterns, investigate stone tool technologies and enabling the re-enactment of stone transportation networks. These networks can be an indicator of the increasing level of complexity that societies presumably present in the Southeast of the Iberian Peninsula during the Neolithic and Chalcolithic phases. As a first step to reach this goal, a new methodology based on the mineral analysis determination has been developed. Dolerite, raw materials and archaeological lithic materials, from the Mediterranean region of the Iberian Peninsula were analysed by pXRF and chemical elemental data obtained to identify their provenance. Neural networks employing Self Organised Maps (SOM), are suitable to deal with multidimensional representations and map them in a two-dimensional space of neurons, following an unsupervised learning protocol. This statistical method first enabled the evaluation of the elemental markers related to each dolerite outcrop and then the composition of rocks that were associated to lithic artefacts depending of their elemental features. The results showed that in most cases the distribution and dispersion of the chemical profile depend on the outcrops, and suggest that is pivotal to first identify the dolerite raw material elemental markers, being the prior step to create a calibration set to classify archaeological lithic materials following a supervised learning protocol. This calibration set would be used to “train” newer samples datasets in order to classify them correctly in a more accurate way.

4 FOLLOWING COMPLEXITY THROUGH BELL-BEAKER DECORATIVE PATTERNS

Abstract author(s): Jiménez-Puerto, Joaquín R - Escribá Ruiz, Pilar (Departamento de Prehistoria, Arqueología e Historia Antigua de la UVEG) - Molina Balaguer, Lluís (Departamento de Prehistoria, Arqueología e Hª Antigua)

Abstract format: Oral

Many questions about Bell-Beaker period remain unknown in Mediterranean façade of the Iberian Peninsula. Calibration curve uncertainty, together with the low density of well known archaeological contexts contribute to the mystery. Traditionally it has been considered that the so-called “International styles” belong to an early phase, related with a more homogeneous and stable moment; meanwhile the Incised-impressed vessels are included in a later period, probably involved in a fragmented relational situation. However both can be found together in sites with apparently same chronology, making really difficult to make clear chronologic attributions, the social situation of the associated communities or the complexity evolution. In this work we will try to tackle this issue on a dual perspective: carrying out an analysis of the symmetry which can be found in the bell-beaker vessels decorative patterns and linking them through similarity patterns in relational networks, which will be analyzed later with SNA tool.

5 SOCIAL NETWORK ANALYSIS AND GIS TECHNIQUES TO APPROACH SOCIAL COMPLEXITY IN THE CASE OF THE AMAZONIAN GEOGLYPHS

Abstract author(s): Diez Castillo, Agustín (Universitat de València)

Abstract format: Oral

In this communication, we aim to study the so-called Amazonian Geoglyphs using Geographical Information Systems -GIS- techniques and Social Network Analysis -SNA-. These earthen structures were mostly discovered in the present century as a result of Amazonian deforestation. The exact number of these structures is uncertain due to the fact that some have not been physically verified. Nevertheless, we are faced with a phenomenon of hundreds of monumental structures. To date, a clear chronological framework is lacking due to the limited number of available dates. We present a combination of classical GIS techniques (LCP, SCA) and Social Network Analysis to test various hypotheses about the evolution of the geoglyphs. The interconnectedness of these structures is crucial to understanding how the groups residing in the area navigated the anthropogenic landscape through physical paths across various socio-ecological scenarios over several millennia. Social complexity was developed around these earthworks, as evidenced by the intricate network of communities.

382 BREAKING THE BARRIERS. TRACING PALAEOLITHIC HUMAN MOBILITY ACROSS MOUNTAINOUS ENVIRONMENTS [PAM]

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Calvo, Aitor (Seminari d'Estudis i Recerques Prehistòriques - SERP, University of Barcelona - UB; Institute of Archaeology of the University of Barcelona - IAUB; Department of Geography, Prehistory and Archaeology, University of the Basque Country - UPV/EHU) - Deschamps, Marianne (CNRS, TRACES - UMR5608, Maison de la Recherche; UNIARQ, Centro da Arqueologia da Universidade de Lisboa) - Alcaraz-Castaño, Manuel (Area of Prehistory, Department of History and Philosophy, University of Alcalá)

Session format: Regular session

Traditionally, mountains have been considered impassable barriers for past human populations, especially during the most climatically and environmentally severe episodes of the Pleistocene. In addition, the harsh conditions that are inherent to most of these altitude environments, including highland plateaux, led archaeologists to underestimate them as potential occupation zones in many cases. As a consequence, for many years our interests and efforts turned away from these regions in favour of more “optimal” contexts, such as valleys and coastal areas.

However, the development and spread in the last decades of studies on human mobility has changed our view of the Palaeolithic territoriality and mobility patterns. The transit routes resulting from these new approaches have showed that mountain environments were not only viable areas (with at least a rich seasonal exploitable biotope) for Palaeolithic hunter-gatherers, but also more or less frequent transit regions in different situations during the Pleistocene.

The subsequent growing importance of these contexts in Archaeology is reflected in the proliferation of research projects, work groups and publications devoted to the study of how prehistoric humans settled and crossed mountainous landscapes. This session aims to become a new step in this trend, being a scientific forum for the discussion on the role of mountainous environments in relation to the patterns of mobility, territoriality, settlement and subsistence of Palaeolithic human groups. It will encompass works with a main focus on mobility across (or in relation to) mountainous and highland regions throughout the Pleistocene, including from broad material-based studies on mobility to more specific GIS-based analyses, through those grounded in environmental or ethnological data. Finally, this session has a global scope and has no restrictions concerning topography, biotopes or climates.

ABSTRACTS

1 THE MOUNTAIN BARRIER? THE QUESTION OF CULTURAL CONTINUITY ON THE PYRENEAN SLOPES DURING THE MIDDLE PLEISTOCENE

Abstract author(s): Viallet, Cyril (Paléotime; UMR 7194 - Histoire Naturelle de l'Homme Préhistorique) - Fernandes, Paul (Paléotime; UMR 8068 - TEMPS) - Rué, Mathieu (Paléotime; UMR 5140 - ASM) - Tallet, Pascal (Paléotime)

Abstract format: Oral

At the transition between the Middle and Upper Pleistocene, the techno-complexes of south-western France are characterised by the use of Pyrenean quartzites collected in secondary positions in the Garonne alluvium. These raw materials were exploited following S.S.D.A. (algorithmic) and Discoid reduction processes associated with shaping chaînes opératoires geared towards the production of bifaces, unifaces, picks and cleavers.

Intra-site comparisons at local, regional and extra-regional scales show that these assemblages display more affinities with those of the Iberian Peninsula and North Africa, than with neighbouring regions to the north of the Pyrenean chain. Moreover, these lithic assemblages are present from the Lower Pleistocene onwards in North Africa and from the second half of the Middle Pleistocene in the Iberian Peninsula, whereas they are dated to the end of the Middle Pleistocene in southwest France.

The Cassé archaeological site at Cornebarrieu (Haute-Garonne, France), excavated in 2020, provides new data on the lithic chaînes opératoires used for these techno-complexes of the northern Pyrenean piedmont. Combined radiometric and taphonomic data and a detailed analysis of the production sequences clarify the overall techno-cultural context of the site. The aim here is to assess the influence of raw material selection on production and to discuss the importance of this parameter on the perceived affinities between assemblages north and south of the Pyrenean chain. These results have a direct impact on the perception of techno-cultural transfers between France and the Iberian Peninsula, and even with North Africa, during the Middle Pleistocene.

2 LAND AND ROCKS IN THE SOUTHERN PYRENEES. THE ROCA SAN MIGUEL MIDDLE PALAEO-LITHIC SITE

Abstract author(s): Shveygert, Ekaterina - Marco, Sonia - García-Simón, Luis (University of Zaragoza)

Abstract format: Oral

In the Iberian Peninsula, Marine Isotopic Stage 5 (MIS) can be fully considered as a part of the Late Middle Palaeolithic phase. In contrast, little is known concerning MIS 6 industries which are regarded as the moment of disappearance of the Late Acheulean and the co-existing European Ancient Middle Palaeolithic in this area. In this context, Roca San Miguel is a site located on the right bank of the Noguera Ribagorzana river, in the mountainous environment of the Pre-Pyrenees of Huesca (Spain). It has delivered an important archaeostratigraphic sequence related to MIS 6 and 5. As known, MIS 6 represents a glacial stage while MIS 5e is the optimum climatic event of the whole interglacial MIS 5. This should have reflected some abrupt changes concerning environmental data. The adaptative response of human population to these changes still need to be evaluated.

In this paper we propose to analyse an industry sample from two layers dated to MIS 6d and to MIS 5c/d. The strategies of lithic technological organisation, including raw material exploitation patterns, production systems, and blanks management will be analysed in the aim to identify similarities and changes in the territories exploitation between these different occupations phases. For that we have realised a petrographic analysis - including a macroscopic and a microscopic analysis (through petrographic thin section) of a sample from both layers and a technological study of the lithic assemblage to reconstruct the operative chains.

The technological study combined with the raw material analysis will provide us significant data, which will lead us to propose some hypotheses about the adaptation to the pre-Pyrenean environment of two strongly different climatic phases and the mobility patterns of the inhabitants of the Roca San Miguel site during the Middle Palaeolithic.

3 FAR OVER THE MISTY MOUNTAINS. NEANDERTHAL MOBILITY IN THE MASSIF CENTRAL DURING THE EARLY GLACIAL

Abstract author(s): Vaissié, Erwan (Traceolab / Préhistoire et Service de Préhistoire de l'Université de Liège, Université de Liège; PACEA, UMR 5199, Université de Bordeaux) - Faivre, Jean-Philippe (PACEA, UMR 5199, Université de Bordeaux) - Fernandes, Paul (PACEA, UMR 5199, Université de Bordeaux; TEMPS - Technologie et Ethnologie des Mondes Préhistoriques, UMR 8068, Université Paris Nanterre; SARL Paleotime) - Delvigne, Vincent (Traceolab / Préhistoire et Service de Préhistoire de l'Université de Liège, Université de Liège; TEMPS - Technologie et Ethnologie des Mondes Préhistoriques, UMR 8068, Université Paris Nanterre) - Raynal, Jean-Paul (PACEA, UMR 5199, Université de Bordeaux)

Abstract format: Oral

The Massif Central in France has a varied topography made up of mid-mountain plateaus, summits and valleys. For a long time, it was perceived as a restrictive environment that strongly limited human settlement and movements except during phases of clear climatic improvement. However, from a strictly geographical point of view, this area occupies a 'strategic' position between three large archaeological areas rich in numerous sites: to the west the Aquitaine Basin, to the east the Rhône Valley and to the north the southernmost parts of the Paris Basin.

Here we propose to address the dynamics of circulation of Middle Palaeolithic human groups within this area, based on the analysis of lithic industries from the Baume-Vallée site (Haute-Loire). This context provides a stratigraphic sequence in which several units could represent a recurrence of occupations during a time lapse tentatively estimated to MIS 5 and the beginning of MIS 4. It thus makes it possible to question the evolution of Neandertal circulations over time and to discuss the southern Massif Central role within the Middle Palaeolithic palaeogeography during the Early Glacial period.

4 BREAKING BARRIERS IN THE PYRENEES. PALAEO-LITHIC SETTLEMENT AND MOBILITY IN THE WESTERN PYRENEAN MOUNTAIN RANGE

Abstract author(s): Calvo, Aitor (Seminari d'Estudis i Recerques Prehistòriques - SERP, University of Barcelona - UB; Institute of Archaeology of the University of Barcelona - IAUB; Department of Geography, Prehistory and Archaeology, University of the Basque Country - EHU/UPV) - Minet, Théo (CNRS, TRACES – UMR 5608, Maison de la Recherche) - Deschamps, Marianne (CNRS, TRACES – UMR 5608, Maison de la Recherche; UNIAHQ, Centro da Arqueologia da Universidade de Lisboa) - Anderson, Lars (Département d'Anthropologie, Université Paris Nanterre; CNRS, TEMPS – UMR 8068, MSH Mondes, Bâtiment René Ginouvès) - Arrizabalaga, Alvaro (Department of Geography, Prehistory and Archaeology, University of the Basque Country- EHU/UPV)

Abstract format: Oral

As was often assumed to be the case for mountainous and other mid to high altitude areas, for many years the Pyrenees were considered to be an inhospitable milieu for human Palaeolithic populations. As such, altitude has often been considered among the determinant factors for influencing human settlement, shifting regional archaeologists' focus away from mid to high altitude areas. However, growing evidence, via the discovery of new karstic and open-air sites in these contexts, has progressively begun to dismantle this assumption. These new indicators underline that mountainous or mid to high altitude environments were inhabited and/or traversed by human populations during different moments throughout the Palaeolithic. This becomes especially relevant when contrasted with the so-called Txingudi corridor, a coastal corridor that may have facilitated passage between both sides of the western Pyrenees.

This presentation aims to highlight the evidence that points 1) to settlements in mountainous or mid to high altitude environments, and 2) to the traversal of mountain passes in the western Pyrenees. In the former case, sites contain evidence for a degree of functional specialization (such as the acquisition of lithic resources or hunting), and in the latter, just served as places of passage along the aforementioned mountain routes. Lithics are the most relevant evidence for exploring these questions, especially in regards to lithic raw material procurement patterns, as the presence of northern or southern-Pyrenean resources in sites located in the foothills on either side suggests multiple routes connecting both. Moreover, petrographic analyses indicate variable movements in both directions (north-south and vice versa), and even hiatuses in said movements, across different phases of occupation. The exploration of these patterns across several key Middle and Upper Palaeolithic sites will provide an interesting laboratory for examining questions pertaining to mobility and broader scale population dynamics in the region.

5 SUBSISTENCE STRATEGIES IN THE IBERIAN PLATEAU: ZOOARCHAEOLOGY OF LA MALIA ROCK SHELTER

Abstract author(s): Téllez Peñaranda, Edgar (Centro Nacional de Investigación sobre Evolución Humana - CENIEH) - Rodríguez-Hidalgo, Antonio (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Rodríguez-Almagro, Manuel (Centro Nacional de Investigación sobre Evolución Humana - CENIEH) - Pablos, Adrián (Departamento de Prehistoria y Arqueología, Facultad de Geografía e Historia, Universidad de Sevilla; Centro Mixto UCM-ISCIH de Investigación sobre Evolución y Comportamiento Humanos; Centro Nacional de Investigación sobre Evolución Humana - CENIEH) - Sala, Noemi (Centro Nacional de Investigación sobre Evolución Humana - CENIEH; Centro Mixto UCM-ISCIH de Investigación sobre Evolución y Comportamiento Humanos)

Abstract format: Oral

Traditionally, the specialized literature suggests that the interior of the Iberian Peninsula was sparsely populated or even completely unpopulated during the Upper Paleolithic (UP). The orographic characteristics and the altitude of the Castilian Plateau, would have exacerbated the already challenging climatic conditions during the Last Glacial Period.

The Malia rock shelter (Tamajón, Guadalajara, Spain) represents a window into subsistence strategies, the exploitation of animal resources and human adaptation to the ecosystems of the high-altitude plateau. The site has been excavated since 2018, distinguishing 3 UP Lithostratigraphic Units (LU) subdivided in four levels dated between 20-37 ka cal BP. Here, we present the first zooarchaeological study of the site based on the analysis on 1260 faunal remains. *Cervus elaphus* is the best represented species in all the levels of the site, followed by *Equus* sp. in levels LUIII and LUIV_a. *Leporidae* is also abundant in levels LUIV_b and LUV. However, other taxa such as *Bison priscus*, *Caprinae* or birds are less represented in the sequence.

If we look at the bone surface modifications, they indicate an anthropogenic origin of the assemblage. We found a high percentage of cut marks, anthropic breakage and burned bones. Anthropic processing has been documented mainly on red deer and horses in all the sequence, but also in leporids and bison. Carnivore tooth marks were scarcely documented in equids or red deer, but in greater proportion in leporids and birds. To sum up, humans seem to have concentrated their activity on macromammals, while the accumulation of birds and leporids seems to be more of a

carnivore accumulation. These results add a new dimension to the debate about the mobility and occupation of our species during this period.

6 MOUNTAIN VS. COASTAL SITES. SETTLEMENT AND MOBILITY PATTERNS DURING EVOLVED AURIGNACIAN IN THE CENTRAL IBERIAN MEDITERRANEAN BASIN

Abstract author(s): Eixea, Aleix - Martínez-Alfaro, Álvaro - Badal, Ernestina - Bel, Miguel (Universitat de València) - Martínez-Varea, Carmen (Universidad de Salamanca) - Real, Cristina (Universitat de València) - Sanchis, Alfred (Museu de Prehistòria de València, Servei d'Investigació Prehistòrica, Diputació de València) - Villaverde, Valentín (Universitat de València)

Abstract format: Oral

Due to the nature of its relief, the central Iberian Mediterranean basin has an outstanding contrast between the coastal lowlands and the mountainous hinterland. This characteristic fosters the existence of mountain sites and coastal sites in a small geographical area. In this study, we have selected the levels assigned to the Evolved Aurignacian from the altitude sites of Cova de les Malladetes (Barx, Valencia) and Abric de la Ratlla del Bubo (Crevillent, Alicante), as well as Cova Foradada (Oliva, Valencia) and Cova de les Cendres (Teulada-Moraia, Alicante) as examples of coastal sites.

Firstly, we analyse the botanical, faunal and lithic remains in order to assess the existence of divergences and similarities in the landscape, paleoclimatic conditions, resources exploitation and settlement patterns of the sites. Secondly, we use geographic information systems (GIS) to analyse the location of the sites in relation to the natural routes that connect the Mediterranean coast with the interior of the peninsula (East to West), as well as the corridors that link the territory longitudinally (North to South). We suggest possible circulation routes for the hunter-gatherer societies that inhabited the central Iberian Mediterranean region during the Aurignacian and we assess the relation between sites and raw material catchment areas.

In summary, the main objective is to find out how the location and biotopes of the sites influenced the occupation patterns and, finally, the possible circulation routes used by the Early AMH during the Aurignacian.

7 LONG-DISTANCE NETWORKS WITHIN AND BEYOND INLAND IBERIA DURING THE SOLUTREAN. PROCUREMENT STRATEGIES AND TRANSPORT OF CHERTS EXPLOITED AT PEÑA CAPÓN

Abstract author(s): Alcaraz-Castaño, Manuel (Área de Prehistoria, Universidad de Alcalá; MULTIPALEOIBERIA ERC project) - Sánchez de la Torre, Marta (Seminari d'Estudis i Recerques Prehistòriques - SERP, Universitat de Barcelona; Institut d'Arqueologia de la Universitat de Barcelona) - Mangado, Xavier (Seminari d'Estudis i Recerques Prehistòriques - SERP, Universitat de Barcelona; Institut d'Arqueologia de la Universitat de Barcelona) - Castillo-Jiménez, Samuel - Luque, Luis (Área de Prehistoria, Universidad de Alcalá; MULTIPALEOIBERIA ERC project) - Cuartero, Felipe (Centro Nacional de Investigación sobre la Evolución Humana - CENIEH) - Alcolea-González, José-Javier (Área de Prehistoria, Universidad de Alcalá; MULTIPALEOIBERIA ERC project) - Aubry, Thierry (Côa Parque, Fundação para a Salvaguarda e Valorização do Vale do Côa; UNIAHQ - Centro de Arqueologia Universidade de Lisboa, Faculdade de Letras) - Gratuze, Bernard (Institut de Recherche sur les Archéomatériaux - IRAMAT, CNRS & Université d'Orléans - UMR 7065)

Abstract format: Oral

Mobility strategies and social networking among Pleistocene hunter-gatherers, including raw material procurement strategies, are key topics in Palaeolithic archaeology. The Solutrean of southwest Europe (~25000-20000 calibrated years BP) is an outstanding case for studying human mobility and social networks within harsh environmental conditions, given its coincidence with the Last Glacial Maximum. However, little is known about these topics in the inland territories of the Iberian Peninsula, where research efforts have been traditionally sparse. Although it was assumed that humans avoided the Iberian hinterland during the coldest periods of the Last Glacial due to its relatively high altitude, harsh environments and climate variability, recent research has demonstrated that some interior regions were recurrently settled. Thus, investigating mobility patterns and networks connecting these regions with other areas, both within inland Iberian and beyond, is essential for understanding population dynamics and human-environment-climate interactions in southwest Europe during the LGM.

We present results on chert sourcing and mobility patterns of human groups occupying the Peña Capón rock shelter (central Spain) during the Solutrean, including routes potentially tracked for transporting or exchanging rocks. After a first macroscopic observation to define the main features of cherts, we conducted geochemical analyses to quantify their elemental chemical composition by means of Laser Ablation Inductively Coupled Plasma Mass Spectrometry (LA-ICP-MS). This is an entirely non-destructive approach that allowed the preservation of archaeological remains. The statistical treatment of data has allowed connecting different archaeological chert types with a specific geological source. Then, we used GIS tools to establish the least cost routes potentially connecting the archaeological site with the chert sources. Results show that cherts exploited at Peña Capón come from a wide variety of regions, including

areas well beyond inland Iberia. This demonstrates the existence of long-distance contacts during the LGM, regardless of potential mountain and ecological barriers.

8 WHOSE TERRITORIES? WERE THE PYRENEES A BARRIER FOR THE PREHISTORIC OR ARE THEY FOR THE PREHISTORIANS?

Abstract author(s): Aubry, Thierry (Fundação Côa Parque) - Mangado Llach, Javier (Dep. d'Història i Arqueologia / Fac. Geografia i Història) - Almeida, Miguel (Dryas / Octopetala) - Walter, Bertrand - Peyrouse, Jean-Baptiste (SERAP Vallée de la Claise)

Abstract format: Oral

Since Leroi-Gourhan and Binford put Paleolithic within our grasp, understanding the hunter-gatherers' mobility, territories, and resource exploitation strategies became crucial and the Palaeolithic research focus wandered away from classical cave sites into the open territories that Palaeolithic men lived in.

Lithic raw material procurement studies introduced dynamics to our maps, as technology and spatial analysis did to intra-site space. Densified by multidisciplinary field surveys, territories gained life: wide catchment areas were documented not only by lithic raw-materials, but also by other objects (such as marine shells) and even concepts (as the compared analysis of Pleistocene rock-art came to prove).

Because of their complex technology and demanding raw material requirements, Solutrean is particularly adapted for these analyses, offering privileged case-studies across southwestern Europe:

- At the Maîtreaux site (France), allochthonous flints testify relationships within a vast territory surrounding the French Central Massif from southern Aquitaine to Eastern Saône, further corroborated by Solutrean flakes related to the Maîtreaux productions found at Petit-Guinards, in a region where no Solutrean occupation was previously known.
- In the Côa valley, incoming raw materials proceed from an equally wide territory, between the Upper Douro valley and the Atlantic shores.

Recent Iberian results indicate even wider contacts, possibly ranging beyond the Pyrenees, introducing a logistic research problem: palaeolithic catchment areas could be larger than our own research territories, thus limiting our ability to recognize these distant contacts.

9 RAW MATERIAL MOVEMENTS AND SHARING OF TECHNICAL TRADITIONS: NETWORKS BETWEEN RHÔNE AND MASSIF CENTRAL DURING THE UPPER PALEOLITHIC

Abstract author(s): Beauvais, Pierre-Antoine (Université Toulouse2-Jean-Jaurès; UMR 5608 TRACES) - Kherdouche, Arnaud (Université Paul Valéry Montpellier; UMR 5140 ASM) - Fernandes, Paul (SARL Paléotime; UMR 8068 TEMPS) - Monney, Julien (UMR 5204 EDYTEM) - Delvigne, Vincent (CNRS; UMR 8068 TEMPS) - Lafarge, Audrey (Association Archéo-Logis) - Raynal, Jean-Paul (UMR 5199 PACEA; INSAP)

Abstract format: Oral

The Rhône Valley and the Massif Central have traditionally perceived as bio-geographical constraints areas for Upper Paleolithic human groups: the Rhodanian furrow is think as a frontier since distinct technical traditions were defined on both sides of the river, and the Massif Central (especially the Velay) has long been considered a "dead end" for groups supposedly coming from northern areas.

Over the last 15 years, the silicite transfers recognized in archeological sites located in the Rhône Valley (Vivarais) and the heart of the Massif Central (Velay) by means of a petroarchaeological method based on the concept of the evolutionary chain, has made it possible to renew the appreciation of the mobility of prehistoric collectives at the end of the Upper Pleistocene.

Several of these assemblages have been historically attributed to the Magdalenian based on the technological and typological characteristics of their lithic and/or bone industries. If the prehistorians of the time had already noted certain similarities (R. de Bayle des Hermens, J. Combier), our revision of the lithic industries in the perspective of defining the degree of "technical similarity" confirms the existence, if not of a "tradition", at least of a sharing of know-how and behaviors on both sides of the northern Cévennes.

The regional approach adopted in this work allows us to emphasize the articulation of the different types of networks (material and ideal) observed today and linking middle montane sites and the Rhodanian corridor during the Upper Paleolithic.

EXPLORING PALAEO-LITHIC MOBILITY IN THE CENTRAL IBERIAN MOUNTAINS – A CELLULAR AUTOMATA APPROACH

Abstract author(s): Hewitt, Richard (Madrid Complutense University) - Morley, Mike (Flinders University)

Abstract format: Oral

This paper explores the potential of cellular automata to contribute to the study of Palaeolithic mobility in the mountain regions of central Iberia. Conventional cost-surface approaches are conceptually weak for modelling the movement of sentient agents, whose knowledge of their environment is likely to be incomplete, and who may seek only approximate least cost solutions within a local range. The DISPERSCA cellular automata model, programmed in the R environment, is presented. The model is applied to a 48000 km² area of the central Iberian mountain range (the Central System), in present-day Spain. Each simulated pathway began from a randomly selected point on the cell grid, representing a hunter-gather agent or group, around which a 1km cell neighbourhood was defined. The agent then moved to the lowest cost cell of the neighbourhood, as determined by a map of terrain slope, around which a new neighbourhood was defined. The process was repeated for 1000 iterations or until the agent reached the edge of the grid. Both hexagonal neighbourhoods and square “Moore” neighbourhoods were explored. Agents crossed the central mountains on few occasions, usually preferring to explore terrain on either north or south sides, confirming the importance of the range as a barrier to population dispersion. However, agents that did cross the range used well-known crossing points, proving, in principle, the functional utility of the model. Agents frequently roamed in circles or missed nearby obvious least-cost routes, because the local knowledge captured by the cell neighbourhood did not reflect better options beyond it. Such behaviour seemed to reflect the limitations of human perception in mountain terrain in a realistic way. Future developments could include suitability weights layers derived from the locations of known Palaeolithic sites, presumed or verified sources of water, or the movements of game animals.

386 CARVED FEATURES AND CARVED LANDSCAPES. INVESTIGATING THE TECHNICAL AND TOPOGRAPHICAL LINKS BETWEEN QUARRIES AND ROCK-CUT SITES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Sciuto, Claudia (University of Pisa) - Porqueddu, Marie-Elise (École des hautes études hispaniques et ibériques, Casa de Velázquez) - Lamesa, Anaïs (Institut Français d'Études Anatoliennes) - Morlegheem, Daniel (UMR 7324 Citeres-LAT)

Session format: Regular session

In the last ten years, an international exchange has been initiated amongst scholars on the methodological and theoretical challenges in the study of quarries and rock-cut sites. A lively community has been discussing the different approaches used for documenting and interpreting features that are generated in the liminal space between human lives and geologies.

The human activity of excavating geological outcrops results in features that are classified according to two main macro categories:

- rock-cut sites which are linked to the life and death of human beings – including dwellings, shelters, burials, and places of worship.
- quarries are mostly defined as production spaces in which technical solutions are aimed at optimizing the extraction of stone from the bedrock.

Despite the difference in the purpose of hewing, conceptual links exist between features carved in the rock. Similarities can be found in the techniques used for hewing as well as the management of waste and by extension, the same networks of knowledge and know-how transmission. Moreover, dwellings or evidence of places of worship have been found in quarries and blocks extracted from rock-cut sites are often used for construction elsewhere.

Quarries and rock-cut sites can often be found associated with the same outcrops, thus outlining a complex taskscape in which the interaction of human communities and bedrock can result in different carved features.

This session will be dedicated to investigating the connections between quarries and rock-cut sites on different scales. We invite contributors, particularly early careers researchers/scholars, working on different case studies, without chronological or geographical boundaries, to discuss:

- methods for mapping carved landscapes, highlighting the human and geological agencies in shaping a taskscape.
- the more detailed study of tool marks and techniques used for extracting stone blocks and carving specific elements, outlining systems of knowledge transfer in communities through time.

1 CARVING OUT THE SPACE. METHODOLOGICAL CHALLENGES IN BRIDGING THE STUDY OF ROCK-CUTTING TECHNIQUES AND LANDSCAPE ARCHAEOLOGY

Abstract author(s): Morleghem, Daniel (UMR 7324 Citeres-LAT) - Lamesa, Anaïs (Institut Français d'Études Anatoliennes) - Porqueddu, Marie-Élise (École des hautes études hispaniques et ibériques, Casa de Velázquez) - Sciuto, Claudia (University of Pisa)

Abstract format: Oral

Through an overview of the theoretical reflections and technological approaches that have characterised the study of quarries and rock-cut sites, this contribution aims to highlight the challenges in linking different scales of investigation and topographical and topological approaches to the study sites that are carved in the rock.

Two main categories of rock-cut sites will be taken into account: those which are linked to human beings, their life, death and religious practices; those which are related to stone extraction and therefore are associated with production and economy.

We will explore the entangled network of human lives and geologies in the intertwined usages of carved spaces. Although quarries and rock-cut sites are well identified, sometimes both categories intersect each other: rock-cut dwellings or evidence of rock-cut worshipping places have been found in quarries and blocks extracted from rock-cut sites are often used for construction elsewhere.

Similarities can be found in the techniques used for carving and crafting an architecture as in shaping a block, in managing the waste. By extension, we can acknowledge the same networks and transmission of know-how. Quarries and rock-cut sites can be found associated with the same outcrops, thus outlining a complex taskcape in which the interaction of human communities and bedrock can result in different carved features.

2 TRACKING FUNERARY PRODUCTION OVER THE ANALYSIS OF CARVING TOOLS. THE CASE OF MENORCA'S ISLAND (BALEARIC ISLANDS, SPAIN)

Abstract author(s): Carbonell Pastor, Sonia (University of Alicante)

Abstract format: Oral

In Menorca (Balearic Islands, Spain) there is a type of tomb called a complex plant hypogea, which is actually a rock tomb carved in stone. This type of space has been chronologically dated between the 6th and 2nd centuries BCE on the basis of archaeological artefacts recovered from secondary contexts, but given the diversity of caves with similar characteristics and the fact that many were reused and looted, we propose a new study perspective that will allow us to classify them. We consider rock tombs to be the result of human labour, which means that the activities involved in their creation must have been part of the production process that characterises every society, past and present. Menorca has several quarries that have been put into operation in modern times, but where did the stone come from that was used to build the villages and sanctuaries that dot the Menorcan landscape and date back to between the 6th and 2nd centuries BCE? Our proposal is based on the idea that the carving of rock-cut tombs is part of a chaîne opératoire that links the world of the dead and the living, not only through a vital process such as death, but also through the reuse of stone in the construction of living spaces. In this sense, we understand rock-cut tombs not only as funerary sites, but also as quarries that provided stone for settlements. Our proposal attempts to deal with the structural variability of rock-cut tombs by means of a typological classification. In this classification or grouping, the analysis of the carving marks is essential to understand the qualitative changes in the lifestyles of the human groups on Menorca.

3 WEAVING STONE ITINERARIES BETWEEN CAVES, QUARRIES AND BUILDINGS, IN THE AREA OF MUROL AND SAINT NECTAIRE (MASSIF CENTRAL/AUVERGNE, FRANCE)

Abstract author(s): Sciuto, Claudia (University of Pisa) - Allios, Dominique (University of Rennes 2)

Abstract format: Oral

The Puy-de-Dôme (Massif Central/Auvergne, France) is a territory marked by an intense past volcanic activity, a landscape characterised by the colours and textures of different rock types. The aim of this study is to characterise the human-environment interaction in relation to geological outcrops, as expressed in the traces of rock-carved dwellings and stone quarries. The study area is located around the massif of Mont-Dores (including the castle of Murol, the roman church of St. Nectaire and several rock-cut settlements), analysed for a time span going from the early Middle Ages to the modern period.

The coexistence of rock-cut features and quarry traces suggests an overlapping of activities of a different nature at specific outcrops. The porous and friable volcanic rocks favour the carving of articulated rock-cut structures and can well be used in construction to unload masonry weight (i.e. St. Nectaire church's vaults).

Data collected on the traces of carving, still visible in this sector, provide information on the different methods of extraction, to show the integration of rock-cut sites in the local system of stone quarrying. Moreover, the combined study of rock-cut sites, quarries and monuments give us an important chronological reference. While it is sometimes difficult to establish the different phases of occupation of rock-cut sites, we are able to identify chronological markers by looking at the evidence of stone extraction and the usage of materials in specific construction –combined with the analysis of the few pottery sherds.

Through this paper, we aim to demonstrate how the study of the complex relationship between human communities and geologies can be better understood through a holistic approach that takes into account different types of production and interaction.

4 CARVING OUT VALUE: METHODOLOGIES FOR EXTRACTING DATA FROM EPHEMERAL SURFACE QUARRIES

Abstract author(s): Whitaker, Katy (Historic England)

Abstract format: Oral

In the UK, surface quarries are a poorly researched aspect of stone and bulk mineral extraction, highlighted as requiring attention in the current Research Framework for the Archaeology of Mining and Quarrying (Newman 2016). Small pits for a variety of materials and use of 'moorstone' – surface boulders that do not need to be split away from a rock face – were once much more important parts of local community economies. Despite the importance of these resources to landowners and villagers, archaeological records for ephemeral surface quarrying are usually scanty. On the one hand, the sites have often been lost to redevelopment, re-filling with waste disposal or reversion to agriculture; on the other hand, this type of extraction was rarely regulated so there are few if any relevant documentary sources. This paper presents methodologies developed in the study of post-medieval surface extraction sites for sarsen stone, a material available as cobbles and boulders in southern and eastern England that is better known for its use in prehistoric megalithic monuments. Specifically, it will focus on the careful use of traditional measured survey at a quarry site in its landscape setting in the county of Wiltshire, combined with the detailed recording and analysis of tool marks to show that there is value in paying attention to ephemeral stone extraction sites.

5 FINDING THE PERFECT LOCATION. CLOSE-UP SHOT ON ROCK-CUT CHURCH WORKSITES

Abstract author(s): Lamesa, Anaïs (IFEA)

Abstract format: Oral

When it comes to rock-hewn churches, studies have rarely mentioned or even almost systematically overlooked the fundamental question of the choice of location. This first step of implementation, however, is a fundamental gesture of creation. The choice of the location is explained by several phenomena where human or/and natural agencies are entangled.

Building on the idea that a church remains a church, whether it is built or rock-cut, we believe that it is possible to compare built and rock-cut spaces because the nature of the monuments does not affect their function. Using the location choice of rock-cut churches as an example, we propose to carry out the survey and test this hypothesis, and to thus delineate the taskscape of rock-cut worksites.

We will start from the analysis of case studies: churches dating from medieval times, located in Cappadocia and Ethiopia. We will integrate technical archaeology, ethno-archaeology and history to highlight convergences and divergences in this comparative approach. Along this presentation, we will define criteria, useful to understand the choices that led communities, patrons or stonecutters to initiate the process of creating a rock-hewn church and at the end, shed the light of the intertwined of human and natural agencies.

6 TECHNOLOGY AND TRANSFORMATION OF THE ROCKY LANDSCAPE OF ST PEDRO DE ROCAS (GALICIA, SPAIN). QUARRIES, ROADS AND RUPESTRIAN MONASTIC COMPLEX

Abstract author(s): López Quiroga, Jorge (Universidad Autónoma de Madrid) - Figueiras Pimentel, Natalia (Universidad Complutense de Madrid)

Abstract format: Oral

Mount Barbeirón is a large geological formation of granitic rock formations with monumental characteristics in an area of 700 ha. The rupestrian monastery of St Pedro de Rocas is located on the slope of Mount Barbeirón, surrounded by huge and diverse rock formations that housed the first hermitage community. The name of the monastery, as

stated in a document from the year 1007, implies this reference to its geology and morphology: *ecclesia edificata inter alpes rocas nominata*. The research carried out has allowed us to identify a material reality that constantly evolves from Prehistory to the 19th century. The rocky landscape is transformed by human action through a precise technology that adapts to the material reality of the territory. There is a continuous use of natural formations for the creation of domestic and worship areas, already from the Neolithic. Later, with the arrival and settlement of the first communities of hermits the rock is systematically excavated for domestic use (cells, accesses, canals, silos), worship (rupestrian bell tower, chapels) and funerary (cemetery of rock-cut tombs). The technology used for the carving of the rock is adapted depending on the needs and uses that the various communities of inhabitants give to the rocky support as construction raw material. In Mount Barbeirón we have identified numerous communication routes that are distributed optimizing the existing topography. We have been able to locate and identify a complex and structured network of quarries for the extraction of construction material for various purposes: construction of walls for communication routes and living spaces, hermitage and coenobitic cells, as well as for the monastery itself, in its different phases throughout the Middle Ages and Modern Times. In short, a natural landscape in which the rock has been carved, worked and sacred throughout millennia of history.

7 'AN EXTREMELY CURIOUS ROCK, INHABITED BY A CLEAN AND DECENT FAMILY': UNDERSTANDING ROCK-CUT STRUCTURES IN QUARRIED LANDSCAPES

Abstract author(s): Simons, Edmund (Royal Agricultural University)

Abstract format: Oral

The English Midlands has a surprisingly large number of substantial rural rock-cut buildings, ranging from Early Medieval hermitages to 19th century working class housing. Even in many demonstrably early sites there is often a very close relationship between quarrying and rock-cut buildings. Most commonly this is when structures are set within artificial cliff faces created by earlier extraction, but sometimes the relationship is more complicated, and things are not what they seem.

This paper will look at several English Midlands case studies from the Rock-Cut Buildings Project; this project is the first attempt to look at British domestic rock-cut structures as a group, to develop methodologies to record and understand them and their landscapes. The paper will explore how, by analysing negative stratigraphy and by comparing multiple sites, we can understand a little of a neglected, but important monument type. It will look at evidence of eremitic landscapes evolving into and forming the setting of extractive, industrial and touristic places.

The short paper will include tales of rock-cut dwellings saints, dragons, witches, charladies and Hobbits.

The author is director of the Rock-Cut Buildings Project at the Cultural Heritage Institute.

389 ROUNDTABLE SESSION OF THE EAA COMMUNITY ON THE ILLICIT TRADE IN CULTURAL MATERIAL

Session theme: 6. Contested Pasts & Presents

Session organisers: Godfrey, Evelyne (Uffington Heritage Watch) - Beaulieu, Kiara (University of Antwerp) - O'Brien, Leonora (AECOM)

Session format: Round table

Archaeological sites and artefacts are of course central to cultural identity formation. What has been shifting in recent years, for example in the decolonisation movement, is the emphasis on the ethical and universal Human Rights aspects of the creation of national archaeological narratives.

This roundtable session will concentrate discussion on the Principles of Archaeological Research section of the EAA's revised Code and Principles. The topics covered in that section are: ethical practice in expert evaluation of archaeological material; publication of decontextualised archaeological artefacts; Indigenous heritage; restitution and repatriation of contested heritage objects; and the ethical treatment of archaeological human remains.

The area of interest of the EAA Community on the Illicit Trade in Cultural Material also includes Cultural Heritage Management, especially in relation to excavation and collecting of artefacts that are likely to be sold on the Art Market, intentional destruction of archaeological sites, looting in peacetime as well as during armed conflict, the social impact of Heritage Crime, and contrasting interests of economic development and archaeological site conservation.

The Roundtable discussion will focus on the following questions:

'How does archaeological expertise support the antiquities market?'

'To what extent can harm-evaluation principles developed in Human Rights cases be borrowed for the purposes of heritage crime?'

'Ethical treatment of archaeological human remains: How do we respect the dead?'

‘Preservation-by-record, collecting, and trade in cultural material: legal for now, but sustainable in the future?’

‘Which socio-economic interests are associated with archaeological sites, and how do stakeholders suffer due to heritage crime?’

‘Ethics in practice: how do we successfully integrate professional collaboration, construction management planning, and international development-led archaeology?’

‘What does decolonisation look like from an Indigenous perspective?’

390 METHODS AND MODELS FOR THE STUDY OF HUMAN-BIRDS RELATIONSHIPS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Demarchi, Beatrice (University of Turin) - Yeomans, Lisa (University of Copenhagen) - Codlin, Maria (University of Turin) - Best, Julia (Cardiff University)

Session format: Regular session

Birds are intertwined with human lives in three critical ways: avifauna is incorporated into subsistence strategies as an important food resource (meat and eggs); birds have a variety of symbolic meanings due to their connection with the sky and seasonal cycles; their migratory patterns are extremely sensitive to environmental change, thus influencing human-bird coexistence. In human-bird interaction studies, the accurate identification of archaeological remains is fundamental: behaviours, morphologies and ecologies displayed by avifauna are hugely diverse, which makes the category of “birds” almost meaningless for archaeological interpretations.

Recent developments in archaeological science have opened up new avenues for analysis of avian remains, which complement zooarchaeological methods. These include: biomolecular techniques and geometric morphometrics for the taxonomic identification of eggshell and bone; novel methods for obtaining age and environmental information (e.g. through the analysis of stable and/or radioactive isotopes); experimental and taphonomic approaches. However, the data generated by these methods have seldom been fully integrated into comprehensive archaeological and ecological models. We welcome contributions which showcase and critically discuss the contribution of new methods towards revealing nuances in human-avifauna interaction.

ABSTRACTS

1 PROTEOMIC ANALYSIS OF AQUATIC BIRD EGGSHELLS FOR ENVIRONMENTAL RECONSTRUCTION

Abstract author(s): Codlin, Maria (University of Turin) - Yeomans, Lisa (University of Copenhagen) - Demarchi, Beatrice (University of Turin)

Abstract format: Oral

Eggshells from archaeological contexts indicate the presence of breeding bird populations, which can shed light on local environmental conditions or management by humans. Many aquatic birds, for example, migrate and readily alter their behaviours to meet their specific habitat requirements for feeding and nesting. Identifying eggshells from these species can thus inform us on the state of local wetland ecosystems. Yet eggshells are currently underutilized, owing to their lack of recovery from archaeological sites and the difficulty of identifying eggshell to taxonomic groups. Here we present methodological developments for the analysis of eggshell proteins to improve the taxonomic identification of eggshells from archaeological sites. We outline how eggshells can be recovered archaeologically and the important principles for extracting protein from ancient eggshell. We also present new biomarkers for distinguishing among birds in the Anatidae family and demonstrate how this method can be applied to improve environmental reconstructions of local wetland ecosystems in the past.

2 ARTIFICIAL INTELLIGENCE AND ARCHAEOZOOLOGY: THE USE OF NEURAL NETWORKS FOR CLASSIFICATION OF AVIFAUNA ARTIFACTS

Abstract author(s): Paperini, Elisa (Università di Pisa) - Dubbini, Nevio (Miningful Studio srls) - Gattiglia, Gabriele (Università di Pisa)

Abstract format: Oral

Artificial Intelligence (AI) has been increasingly explored in Archaeology in the last ten years. The application of AI techniques, for example, neural networks, represents a valid aid in repetitive or time-consuming activities, such as cataloguing finds; identification of traces of use on osteological, lithic, or ceramic material; evaluation of markers on the ground for the recognition of archaeological sites.

This presentation discusses the development of a convolutional neural network implemented to be applied in the archaeozoological field to catalogue the osteological specimens of avifauna. Zoomorphological studies are of increasing importance, especially regarding understanding environmental changes and how humans and animals relate to each other. For these reasons, the structuring of reference collections as well as the comparison between finds and catalogues, are essential for correctly recognising archaeological faunal remains. The neural network was developed starting from a dataset of 1833 photographs of five different types of bones (carpometacarpus, humerus, coracoid, tibiotarsus, tarsometatarsus) belonging to 25 species of ducks, coming from the reference collections of the Zoological Museum of Copenhagen (Denmark) and the Tring Natural History Museum (England), and reached 86% of accuracy.

The analysed osteological remains represent the parts of the body among those most subject to ecomorphological and morphological changes between classes, i.e. the wings (carpometacarpus, humerus, coracoid) and the lower limbs (tibiotarsus, tarsometatarsus). From an archaeological point of view, the study of Anatidae remains can provide important information regarding the reconstruction of the environment and the seasonality of the deposition: most Anatidae prefer wetlands and migrate twice a year. From their presence, it is also possible to infer specialised hunting patterns.

3 HUMAN-BIRD INTERACTIONS IN THE LEVANT DURING THE LATE PLEISTOCENE TO EARLY HOLOCENE: MULTI-SCALAR ANALYSIS OF AVIFAUNAL REMAINS

Abstract author(s): Yeomans, Lisa - Mazzucato, Camilla (University of Copenhagen)

Abstract format: Oral

This presentation describes analyses of avifauna from Late Pleistocene and Early Holocene sites in the Levant at different scales. Firstly, the avian osteological data from a long sequence of occupation at Shubayqa in Eastern Jordan is presented illustrating changing human-bird-environment interactions over the course of 4000 years. Secondly, this data is compared to published avifaunal assemblages spanning the Upper Palaeolithic to Early Neolithic investigating the range of relationships between birds and humans. Humans hunted birds for subsistence but extensive evidence for the symbolic importance of birds suggests a complex interaction between species. Ubiquity analysis, similarity indices and multivariate analytical methods are employed to explore these interactions. During the Late Pleistocene and Early Holocene of the Levant, increasing exploitation of birds is often framed in the context of resource diminishment with humans resorting to hunting lower return species as populations of larger mammals declined. However, results from Shubayqa as well as the wider region demonstrate that human-bird interactions was complex with habitat alteration, hunting strategies as well as the symbolic importance all influenced how birds and humans interacted.

4 COMMON BIRDS: APPLYING MULTI-METHOD ANALYSES OF CHICKENS TO ENHANCE UNDERSTANDING OF AVIAN-HUMAN RELATIONSHIPS

Abstract author(s): Best, Julia (Cardiff University)

Abstract format: Oral

Chickens are the world's most widespread and abundant domestic animal. They number more than 23 billion and provide much of the world's primary meat and egg resources. They are frequently found on a range of archaeological sites and often feature in zooarchaeological studies. However, until recently there was a tendency for our most common bird to rarely be studied through multi-method analyses or integrated into wider archaeological research questions and interpretations. For example, despite chickens dominating the world today, the timing and circumstances of their spread across the globe, and their transition into a food resource have been poorly understood.

By combining c14 dating, proteomics, isotope analysis and zooarchaeology we have the potential to add nuance to our understanding of these important animals in multiple different contexts. This paper stems from (and acknowledges) a wide range of collaborations and reflects on the challenges, limitations, opportunities, and potential of dating chickens, whilst exploring their shift from a rare, exotic, special bird to a common food source. It presents new evidence for the timing of the spread of chickens across Europe, their use on arrival and well beyond. Using proteomics and medullary bone studies we also explore the creation of repeated egg laying and its impact on the chicken's role in food production. These methods and programmes of analysis allow a multi-scalar insight into avian-human interactions, from the detailed study of individual animals to broad regional models. Combined these approaches investigate the changing dynamics of human-chicken relationships and highlight the value that integrating these more comprehensively can bring to wider archaeological narratives.

5 AN OSTEOBIOGRAPHICAL APPROACH TO ANALYSING FALCONRY BIRDS IN BRITAIN

Abstract author(s): Britton, Hannah - Sykes, Naomi (University of Exeter) - Black, Stuart (University of Reading)

Abstract format: Oral

For over a millennium in Britain hawks and falcons have held a unique relationship with humans through the medium of falconry. Despite a plethora of research surrounding these birds, with references to key historical texts such as the 'Boke of St Albans', most archaeological literature addressing falconry synthesises data from published site reports. While this methodology has illuminated the scope of falconry within Britain, it only provides a cursory insight into the nature of human-raptor relationships, not allowing for in-depth assessment such as sex distribution, pathological assessment or exploration of morphological adaptations. Particularly, this approach does not account for possible species misidentification raising concerns with the validity of any conclusions drawn from the current literature in the field.

This paper presents example case studies which employ an osteobiographical approach to reassess human-raptor relationships utilising novel methodologies, integrating both dietary isotopes and morphometrical analysis such as geometric morphometrics. This research will elucidate the complex human-raptor relationships in Britain and will demonstrate the value of re-visiting individual specimens to uncover individual life-histories.

6 THE LANDSCAPE OF PIGEON TOWERS IN IRAN: HUMAN-BIRD RELATIONSHIPS FOR RESOURCE MANAGEMENT BETWEEN MIDDLE AGES AND MODERN AGE

Abstract author(s): D'Erasmus, Domizia - Giovino, Noemi (Sapienza University of Rome)

Abstract format: Oral

This study focuses on the analysis of clay towers located in the province of Isfahan (Iran) built to contain pigeon guano for the cultivation of melon and watermelon fields (Borj-e Kabotar. Architecture and anthropology of the pigeon towers in the Isfahan province project). According to written sources, the estimated total of these towers amounted to about 700 structures, while the total mapped through field surveys, conducted by the Iranian-Italian project team, is about 100. Currently, the research has focused on the survey of the towers but it is moving towards a broader study on the themes of Landscape Archaeology in order to understand the dynamics of the historical landscape in which the buildings were placed into a long-term perspective of settlement and land management of a rural economy system in which the pigeons themselves play a fundamental role. The first records of these monuments date back to the Middle Ages, but most of those surveyed, and still standing, date back to the Safavid period (16th century). This paper aims to offer a concrete contribution to the study of human-bird relationships on the basis of archaeological evidence as a concrete case study of buildings constructed for the specific purpose of breeding pigeons not only as a food resource in the Iranian landscape in historical times.

7 USING LINEAR AND GEOMETRIC MORPHOMETRICS TO TRACK CHANGES IN HISTORICAL GOOSE HUSBANDRY IN BELGIUM AND NORTHERN FRANCE

Abstract author(s): Gruwier, Ben (Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel; Research Unit: Analytical, Environmental and Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel) - Oueslati, Tarek (HALMA- UMR 8164 - CNRS, Université de Lille) - Snoeck, Christophe (Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel; Research Unit: Analytical, Environmental and Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel)

Abstract format: Oral

At the end of the Middle Ages, a growing urban population in Northwestern Europe fueled the demand for food products, which set in motion a series of innovations in agricultural practice. Zooarchaeology has contributed to our understanding of the timing and nature of this process, by using changes in size and morphology in domestic mammals, as a proxy for the introduction of larger and more productive livestock breeds. However, the role of birds, and in particular geese, in this process, has been largely neglected.

This study demonstrates the use of linear and geometric morphometrics (GMM) to track changes in goose husbandry and breed improvement in (post-)medieval Belgium and Northern France. By combining traditional (i.e. LSI) and novel approaches (GMM) in morphometrics, it is possible to make use of the large zooarchaeological dataset available for the region, while at the same time account for confounding effects, such as the presence of wild geese in archaeological samples. Firstly, our results indicate that wild goose exploitation seems to have had a limited role at most sites and its presence doesn't preclude an analysis of size changes in domestic geese. Secondly, the morphometric dataset suggests that goose stature remained relatively stable during the Medieval and early Modern period. Therefore, the intense selection for larger individuals, with significant skeletal changes, may have been a relatively late phenomenon, starting in the 18th century or later. It can be concluded that geese probably played a minor role in the agricultural

modernisation processes of the late Middle Ages and early Modern period, and that the selection of more productive animals, was largely focused on other species, such as cattle, pig, sheep and perhaps chicken.

8 BIRDS, ZOOARCHAEOLOGY AND ARCHIVE RECORDS

Abstract author(s): Kivikero, Hanna (University of Helsinki/Stockholm University)

Abstract format: Oral

Zooarchaeological analyses have been used to interpret sites for decades. Species, cutmarks, sex, age, and anatomical distribution are some of the aspects of analysis that are often used to understand animals in sites. Whereas zooarchaeological assemblages can give an idea of the animals from their physical residue, other aspects of faunal remains can be found from archive sources. Records, such as accounts, customs records, laws etc. are just some of the sources where animals can occur and represent information of animals from another angle compared to the zooarchaeological assemblages. These records are also informative in parts of animals that are rarely found archaeologically, such as different types of animal fats, intestines or other non-osseous parts. Occasionally, texts can also help to understand the lack of bone material in contexts.

Combining primary data from both zooarchaeological assemblages and archive records have in recent years proven to be a fruitful way of understanding the role animals had to people and societies. The two materials are fragmentary in their own aspects. When combined, it is possible to get a more comprehensive picture of the attitude towards animals and the processes behind the zooarchaeological assemblages. This paper will concentrate on different aspects of combining zooarchaeological assemblages with archival records to gain more knowledge of birds in the Baltic Sea. The focus will be in what kind of information archive records can give of birds and bird related products and how they play into the general knowledge of human-bird interaction together with zooarchaeological remains, as well as problems related to the source material.

A. FEATHERED FOOTPRINTS: UNRAVELLING THE SPATIAL DISTRIBUTION OF EVOLVED AURIGNACIAN BIRD REMAINS FROM ARBREDÀ CAVE

Abstract author(s): Marqueta, Mario (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Departament d'Història i Història de l'Art, Universitat Rovira i Virgili) - Rufí, Isaac (Institut de Recerca Històrica, Universitat de Girona) - Lloveras, Lluís (SERP, Departament d'Història i Arqueologia, Universitat de Barcelona) - Garcia, Lluís (Chercheur associé à l'UMR 5140 CNRS) - Maroto, Julià - Soler, Joaquim - Soler, Narcís (Institut de Recerca Històrica, Universitat de Girona) - Huguet, Rosa (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Departament d'Història i Història de l'Art, Universitat Rovira i Virgili; Unit associated to CSIC, Departamento de Paleobiología, Museo Nacional de Ciencias Naturales)

Abstract format: Poster

During the Upper Palaeolithic period, the western Mediterranean regions recorded an intensification of the small prey hunting by human groups. Arbredà Cave is an exceptional site where this dietary shift can be observed, being influenced by environmental changes. The Evolved Aurignacian level (G), dated 38200 - 35630 cal BP, preserves faunal and lithic remains that provide clear evidence of human activity, highlighting the consumption and contribution of bird and rabbit remains.

Taphonomic analyses on the bird remains revealed that humans were the main accumulating agents at this level. However, a small proportion of the remains have a non-human origin, with raptors and carnivorous mammals taking part in the avifaunal accumulation at this level.

Previous spatial analyses on the Middle (E) and Final (D) Iberian Gravettian levels of the cave suggested, based on the concentration of macrofaunal remains, a spatial organisation by hunter-gatherers in which hearths played a role in the nucleation of space. Furthermore, this distribution revealed how humans organised the space after the ceiling collapse that took place in the cavity after the Evolved Aurignacian.

The aim of this study is to identify, based on the spatial distribution of the zooarchaeological and taphonomic data on bird remains, areas of anthropic bird accumulations by hunter-gatherers during the Evolved Aurignacian. The obtained results reveal a concentration of anthropized bird remains near the west wall of the cave. Furthermore, those contributed by non-human predators follow a more extensive dispersion. These data will contribute to understand how human groups organised the space, as well as to better understand the relationship between the morphology of the cave and the processes of bird accumulation during the Evolved Aurignacian.

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Brughmans, Tom (Centre for Urban Network Evolutions - UrbNet) and Classical Archaeology, Aarhus University) - Coto-Sarmiento, María (Eberhard Karls Universität Tübingen)

Session format: Regular session

Theory and method are thriving like never before in current Roman archaeology. Computational and natural science methods abound in the field, and the theoretical landscape in Roman Studies is rich and diverse (as illustrated by the scope of the new Theoretical Roman Archaeology Journal: <https://traj.openlibhums.org/>). Moreover, the availability of massive amounts of richly documented material culture and the availability of textual sources have enabled Roman Studies to lead in certain areas, including the application of network science, linked open data, simulation, and space syntax. Huge new linked open databases and complex systems theory modelling in particular reveal the prospect of significantly enhancing our understanding of this highly structuring era in European history.

It is crucial that this momentum goes hand-in-hand with a critical attitude towards the necessary overlap between theory and method. On the one hand, theory development needs to consider representability, comparability, testability and assessment of plausibility. On the other hand, computational modelling of phenomena like movement between Roman settlements, the spread of strongly held beliefs like the cult of Mithras, or long-distance trade in Roman economic systems, necessarily rely on diverse and critical theory modelling and debate.

This session will debate the representation, comparison and development through computational approaches of current theory in Roman Studies.

Relevant topics include but are not limited to research in Roman Studies on applications of GIS, simulation including agent-based modelling and mathematical modelling, text mining, machine learning, acoustics modelling, network science, 3D modelling, space syntax and papers discussing the methodological or theoretical potentials and challenges of these approaches. All presenters are required to explicitly specify theories, and demonstrate how theories are formally represented in methodological approaches.

ABSTRACTS

1 SPATIAL INTERACTION MODELS AND CENTRAL PLACE THEORY IN ROMAN RAETIA (AD 1ST - 3RD C.)

Abstract author(s): Vadineanu, Paul - Paliou, Eleftheria (Universität zu Köln)

Abstract format: Oral

The emergence and evolution of central places within ancient settlement networks have long been topics of academic interest. In recent years, the study of such phenomena has greatly benefitted from the development of ever more refined computational tools and methods. In particular, Roman archaeology has seen a plethora of spatial models and quantitative-focused works that attempt to examine settlement interactions at the regional and microregional scales to make better sense of the complexities of Roman urbanism. Despite this, efforts to understand the roles of secondary agglomerations, such as civitates and vici, within provincial and local settlement interaction networks – have so far been tentative.

Using Raetia as a case study during its distinct phases of occupation in the Early and Middle Empire periods, we will explore regional and smaller-scale patterns that bring into focus the hazy intricacies of the Roman provincial system. We will employ spatial interaction models of broad Wilson type, which have been used in the past to simulate the emergence of central places in various cultural and temporal contexts. In particular, we will look into the potential of these models to highlight and explain possible central place functions of secondary agglomerations within a Roman urban context. The theoretical assumptions of the models employed will be discussed as they relate to central place theory, and the results will be interpreted while keeping past assumptions of urban/rural interactions in mind. We anticipate that this endeavour which focuses upon often overlooked secondary agglomerations will be useful in shedding light on the reasons why certain small-scale settlements achieved some measure of centrality while others did not. Lastly, we wish to look at urban affordances as measures of centrality, and especially to explore the role of fora – with their administrative, commercial and religious functions – within evolving settlement systems and centrality patterns.

2 THEORY, TREE-RINGS AND TRYING TO MODEL THE ROMAN WOOD PROVISION

Abstract author(s): Visser, Ronald (Saxion University of Applied Sciences)

Abstract format: Oral

Theory and computational methods are natural friends that allow us to understand wood use and provision in the past in an efficient way. Wood is one of the most important resources, both in the present world as in the past. It is one of the most sustainable and strongest building materials. The use of wood is versatile and it is therefore not surprising that many structures were made of wood or timber in the Roman period. Wood was needed for nearly everything in the Roman world, not only the ships that travelled along the rivers, the carts that moved along the roads, the pegs to secure tents, but also tools and weapons were made (partly) of this material. Various attempts were made to calculate an estimate of the amount of wood needed in the Roman period. For the Lower Rhine region, some studies state that the local landscape could have provided sufficient (fuel) wood and timber to sustain the local population, others debate this conclusion. In addition, there is strong evidence that timber has been transported over hundred(s) of kilometers. This paper will discuss how dendrochronology and computational methods, such as network analyses, GIS and statistics, can help to create a theoretical and archaeological model or framework to understand the Roman wood provision.

3 BETWEEN MOUNTAIN AND SEA: UNDERSTANDING SETTLEMENT PATTERNS AND ECONOMIC DEVELOPMENT IN ROMAN LYCIA THROUGH MOBILITY AND CONNECTIVITY MODELLING

Abstract author(s): McLean, Andrew (University of Edinburgh) - Rice, Candace (Brown University)

Abstract format: Oral

Understanding the ways in which dynamic socio-ecological relationships influenced Roman economic development is a difficult theoretical and methodological undertaking. Relationships between settlement patterns and economy are not straightforward, particularly in the Roman East, where many large urban centres existed prior to, and continued to flourish under, Roman rule. Better approaches to contextualising the complex relationships between landscape and settlement, both old and new and urban and rural, are needed. Recent methodological developments in computational archaeology and spatial analyses in GIS offer promising potential to overcome these theoretical issues.

This paper aims to tackle some of these issues, and to deepen our understanding of wider economic trends under Roman rule by analysing mobility using innovative computational methodologies. It is proposed here that a combined Least Cost Path (LCP) and Circuit Theory (CT) analysis of mobility amongst urban and rural settlements in the mountainous interior and harbours and ports along the coast of Roman Lycia offers valuable insight into patterns of connectivity and economic development the region. LCP provides information on the cost between sites but is restricted to a single optimal route between fixed points. On the other hand, while exact costs between sites are difficult to model in CT, this method allows for a whole region of mobility to be modelled, and it is proposed here, offers a proxy for connectivity between sites, through a more holistic approach acknowledging the complex nature of relationships between a variety of sites. Using a combined approach, we can understand how potential mobility and cost-distance from the coast may have affected settlement patterns and structured wider economic development and relationships.

This paper demonstrates the applicability of a new theoretical approach to modelling mobility for deepening our understanding of the complex processes that shaped the development of settlement and economic life in the Roman Empire.

4 MARKET COMPETITION IN A FRONTIER REGION: EXPLORING ECONOMIC TRENDS IN GERMANIA DURING THE ROMAN EMPIRE THROUGH SIMULATION EXPERIMENTS

Abstract author(s): Coto-Sarmiento, Maria (University of Tübingen; Aarhus University) - Brughmans, Tom (Aarhus University) - Franconi, Tyler (Brown University)

Abstract format: Oral

This study explores economic trends in the Roman market for olive oil and wine in ancient Roman Germany. This region became essential during Roman military campaigns expanding the Empire and protecting its north-western borders. However, the organisation of the supply of foodstuffs to the military stationed along this border via a large-scale infrastructure network is a matter of debate.

We contribute to this debate by exploring competing hypotheses using an Agent-Based Model. Computational models in combination with archaeological data provide a powerful approach to exploring theories about economic mechanisms during the Roman Empire. We will discuss our process of abstracting and representing Roman economic theories in a computational simulation context. In particular, we compare different price-setting mechanisms based on free market principles and state interventionism for the market of two specific products (olive oil and wine) and explore differences between results for military and civilian settlements. Our model's simulated outputs will be compared against the patterning identified in the RAAD database of transport amphorae published for 79 sites in

Germany. We will present an analysis of the patterns of wine and olive oil production from different regional origins, and the results of simulation experiments aimed at enhancing our understanding of how the distribution of products in the region evolved and changed drastically over time.

5 **MODELLING URBAN COMPLEXITY IN HELLENISTIC AND ROMAN ANATOLIA (200 BCE-200 CE)**

Abstract author(s): Beaujean, Bas (Sagalassos Archaeological Research Project) - Daems, Dries (KU Leuven)

Abstract format: Oral

Recently, the combined potential of urban science methods and archaeology to contribute to the study of the long-term drivers of urbanism has been emphasized (Ortman et al. 2020). Beyond individuals and houses, cities are the result of multitudes of social, economic, cultural, political and religious dynamics. To untangle this complex set of driving factors in long-term urban development, we need rigorous approaches that allow us to formalize theories and test hypotheses regarding the origins of the urban centre, its functioning, and its integration in wider urban networks. Simulation techniques like agent-based modelling allow such rigorous testing.

In this paper, we model cities as hubs of energy, resources and information flows, based on a recent model of social complexity formation (Daems 2021). As our starting point, we use a well-defined set of selection pressures: subsistence, cooperation, competition, interaction, distribution, production, governance, and demography. These act as probabilistic, multi-level causal factors for the decision-making processes of social groups that shape the energy, resources and information flows driving urban formation. For example, increased competition between cities might initiate increased settlement nucleation, resulting in denser urban centres and decreasing numbers of rural settlements. This could create a trade-off with sufficient land to sustain the community or the desire to participate in trade networks. By simulating such synergies and feedback loops between multiple selection pressures in a probabilistic framework, we generate scenarios that we can compare to empirical data from the archaeological record, to better understand long-term trajectories of urban development. As urban(-like) communities developed for almost 10,000 years throughout Anatolia, and the Hellenistic and Roman periods in particular represent phases of peak urban development, we focus on Hellenistic and early Roman Imperial times in Anatolia (200 BCE-200 CE).

392 **PEAKS OF DATA - COLLECTING, MANAGING AND ANALYSING ARCHAEOLOGICAL DATA FROM MOUNTAIN LANDSCAPES**

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Basile, Salvatore - Anichini, Francesca (Pisa University) - Carrer, Francesco - Domingo Ribas, Guillem (Newcastle University) - Sciuto, Claudia (Pisa University)

Session format: Discussion session

Mountain archaeology has a long tradition of study; however, in recent years new methodologies and theories for studying these landscapes have emerged, also thanks to the widespread development and use of digital technologies for the management of big datasets.

Numerous scholars have investigated the different facets of these landscapes with multiscale and interdisciplinary approaches, shedding new light on the dynamics of mountain's communities.

The characteristics of mountain landscapes, such as poor visibility in forested areas or deep slopes, have led to the development of different approaches, to collect information even in extreme environments. This results in a variety of data collection methods, depending on landscape features, scale of investigation, chronologies and research objectives. Field surveys may in fact be accompanied by targeted excavations, ethnoarchaeological and ethnographical approaches, and the analysis of paleo-environmental and paleo-climatic data, highlighting the importance of multi-proxy-multidisciplinary databases.

Spatial and computational analysis help to identify patterns in big and diverse datasets and are used to assess representativity and biases in data. Statistical methods and predictive modeling can be used to mitigate these biases and restore realistic images of the human-environment dialectic in the formation of the mountain landscapes.

Finally, data management can contribute to FAIR data sharing, ensuring transparency in scientific practice inside and outside the scientific community, which can aid research work on landscapes where data acquisition is so complex.

This session aims at comparing the different methods of collecting, managing, and analysing archaeological data acquired in mountain landscapes. We seek contributions related to any chronological period on topics including (but not limited to):

- innovative and interdisciplinary case studies of data acquisition, data analysis, and management.
- theoretical and methodological approaches for the mitigation of biases in archaeological data from mountain landscapes.
- novel approaches for the integration of multiproxy-multidisciplinary datasets.

1 FROM THE MOUNTAIN TO THE DATA: DIGITAL DOCUMENTATION IN THE ARCHAEOLOGICAL SURVEYS

Abstract author(s): Voccia, Raffaele - Anichini, Francesca - Basile, Salvatore - Gattiglia, Gabriele - Paperini, Elisa - Sciuto, Claudia (University of Pisa)

Abstract format: Oral

The Versilian side of the Apuan Alps, in the municipalities of Stazzema, Camaiore, and Serravezza (Northern Tuscany, Italy), is rich in undocumented archaeological evidence belonging to historical periods ranging from the Neolithic to the contemporary and present era. Since 2020, the MAPPA Lab of the University of Pisa has conducted archaeological surveys to identify, document and analyse archaeological evidence and investigate the complex mountains' environmental and settlement dynamics. The fieldwalking was conceived as a 'siteless survey' based on Topographical Unit (TU), understood as the minimum recognisable spatial unit into which the territory can be divided and where human and non-human actions were carried out. Artefacts were collected by surface units (i.e. TU), and each unit was analysed separately and independently and interpreted in relation to the other. For this purpose, a digital recording of each TU was achieved during the fieldwork through Geopaparazzi, an open access App, which allows to georeference and archive data using mobile devices. Data is stored as point and line features (tracking) in a .kml file which is then cleaned and converted in a .csv file that can be imported in a GIS environment. We used QGIS to render the TUs spatial consistency vectorising them as a polygonal .shp file based on the tracking that describes the TU limit. Hitherto, 466 TUs were identified and documented. This procedure avoids the time-consuming post-survey digitalisation process and allows us to concentrate on the data interpretation.

2 USING LEGACY DATA TO ASSESS HUMAN-ENVIRONMENT DYNAMICS: A PREDICTIVE MODELLING APPROACH FOR THE MOUNTAIN LANDSCAPE OF ROMAN VERSILIA AND GARFAGNANA

Abstract author(s): Basile, Salvatore (- Campus, Antonio (Pisa University - MAPPA Lab)

Abstract format: Oral

Mountain archaeology has a long research tradition and in recent years the number of studies on this topic has increased considerably, shedding new light on the dynamics of mountain's communities. Renewed efforts aimed at systematically acquiring new data using traditional methodologies or developing new collection methodologies have been more rarely accompanied by a review and digitization of legacy data.

Versilia and Garfagnana districts (Lucca, north-western Tuscany) largely fall between the Apuan Alps and the Apennine ridge. Although these territories have never been systematically investigated, the collection of all available archaeological legacy data indicates a settlement pattern of undoubted interest for the Roman times.

So far, a geo-referenced picture of the archaeological record was missing, and the lack of specific analyses of the settlement-environment interrelationship prevented from identifying and explaining large-scale settlement patterns; this paper will attempt to fill this gap, integrating Point Pattern Analysis and Logistic Regression approaches, and finally create a predictive map, to mitigate biases in data and evaluate settlement dynamics in relation to this specific environment.

Analyses prove the spatial dependence of finds with geomorphological and pedological variables, but also with the distance to major watercourses and solar irradiation. Based on the considered variables, the predictive map confirms that the foothill and gentler slopes facing E-SE areas have suitable characteristics for stable settlement. Moving towards the more inland and higher altitude territories, the non-event areas increase proportionally, especially along the ridges, and the steeper, north-facing areas.

A model that can generate a spatial pattern with predictive implications, cross-validated by the researcher's contextual interpretation, provides greater awareness of the possible extension of the settlement pattern, human-environment dynamics, and past landscape use to direct future research and field validation on lesser-known areas.

3 COMPUTING THE MOUNTAINS' PAST: CHALLENGES OF MOUNTAIN LANDSCAPES AND COMPUTATIONAL METHODS. EXPERIENCES FROM ITALY, UK AND SPAIN

Abstract author(s): Domingo Ribas, Guillem - Carrer, Francesco (Newcastle University) - Álvaro, Karen (Universitat de Barcelona) - Turner, Sam (Newcastle University)

Abstract format: Oral

Mountain landscapes are at the core of many narratives about the human past, but their rugged and frequently forested nature have traditionally hindered the identification and recording of the traces that can be used to understand it. As a result of this, archaeologists have developed and adopted new methodological and theoretical perspectives in order to overcome such limitations and study the past of these landscapes. New digital tools and computational techniques, together with revised field survey strategies and ethnoarchaeological approaches, have significantly helped archaeologists to broaden their perspectives on data collection and management. This has permitted going beyond traditional field surveys, historical cartography and documents, as well as already existing archaeological grey literature and ethnoarchaeological and ethnographic works.

This paper presents three examples of how an interdisciplinary suite of approaches has been key when working in three different areas: the Aspromonte Massif (Calabria, Italy), Devon (UK) and the Upper Arlanza Basin (Burgos, Spain). With a particular focus on the computational methods employed to analyse the data collected, we will illustrate how the research aims in each territory, as well as their characteristics, have determined the strategies of gathering, managing and analysing the data. At the same time, this paper will also revolve around some of the problems and challenges that have emerged when collecting data on these mountain spaces, as well as how computational methods have been employed to address such issues.

4 MODELLING HILLFORT COMMUNITIES IN MOUNTAIN ENVIRONMENTS

Abstract author(s): Fontana, Giacomo (University College London; Royal Netherlands Institute in Rome)

Abstract format: Oral

This paper discusses a transferable approach to studying hillfort communities in mountain environments, using Samnite society (first millennium BCE) as a case study. It integrates a range of spatial and non-spatial computational methods, and combines both qualitative and quantitative data, to address biases and long-standing debates on the non-urban nature of Samnite society and its relation to its specific mountain landscape. LiDAR-based remote sensing is used to create a new, more representative dataset of hillfort sites across 15,300 sq.km of south-central Italy. Spatial and multivariate cluster analyses and a novel labour-cost model of polygonal masonry can then be used to investigate labour costs and site types moving beyond the urban labels that often undermined the study of landscapes perceived as marginal. Finally, point process models highlight site location preferences and clustering taking into account the unique nature of the environment. In combination, such techniques and fresh evidence shed new light on the non-urban character of Samnite society and its resilience under Roman expansion, in which the mountain landscape played a critical role. Entirely written in Python and R and subsequently integrated with Quarto, the overall approach is also replicable and suitable for cross-regional and cross-cultural analysis in other mountainous areas and with different typologies of sites.

395 MERC FORUM: COMPARATIVE ISLAND ARCHAEOLOGIES IN MEDIEVAL EUROPE

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Jervis, Ben (Cardiff University) - Spangen, Marte (UiT The Arctic University of Norway)

Session format: The MERC forum features 3 or 4 invited keynote speakers, forming one of the 2 events on the scientific programme organised centrally by the MERC Committee.

Islands are contradictory spaces. They are places of contact and isolation, simultaneously at the margins reachable only by water or via a bridge or causeway, but also central to the defining processes of the medieval period such as pilgrimage, commerce, warfare, industry, urbanisation and colonisation.

In this year's MERC Forum we invite our speakers and audience to reflect on what islands were for, and what islands did, in the Middle Ages. Our speakers are drawn from across Europe and will be discussing a range of island contexts, from coastal islands to those situated on inland rivers. In particular the session seeks to enable the emergence of a comparative approach to island archaeology, to understand how the social, economic and religious roles of islands intersect and diverge, how distinctive island ecologies shaped experiences of these places and to consider the resonances and distinctions between those living in island environments across medieval Europe.

1 DRUMCLAY CRANNOG POST-EXCAVATION PROJECT

Abstract author(s): O’Neill, John (Irish Archaeological Consultancy)

Abstract format: Oral

Drumclay crannog in County Fermanagh in Northern Ireland was excavated (by Declan Hurl and Dr Nora Birmingham) during construction of the A32 link road in 2012 and 2013. Post-excavation analysis is ongoing by Irish Archaeological Consultancy Ltd, under the guidance of the Historic Environment Division of the Department for Communities, NI.

Located within fen peat on the margin of an inter-drumlin lake, Knockalough, use of the site began just after 800 AD. The fen was entirely unsustainable as a construction surface and as the mass of wood, stone and clay accumulated, it continuously sank below the watertable. The human commitment to remain at Drumclay, despite its obvious flaws, meant that the ground was resurfaced and houses rebuilt every few years: 3m+ of archaeological deposits accumulated in 200 years, a sequence closely dated by alder, oak and ash tree ring chronologies. By 1600, another 2m of archaeologically-rich layers had formed. Use of the site saw periods of intense use, abandonment and changes of use, including one late medieval burial. A range of craft and agricultural activities can be identified amongst the eclectic assemblage of finds and samples, as well as cultural elements such as musical instruments, collected antiquities, gaming boards and pieces, and other aspects of contemporary life that generally are not preserved.

Drumclay produced 1000+ wooden artefacts, gold, copper alloy, iron, amber, glass, leather, textiles, bone, antler and stone tools and are being complemented by detailed studies of faunal, insect and parasite assemblages, plant macro-fossil, wood, pollen and other palaeoenvironmental analyses. The current Drumclay Crannog Post-Excavation Project is in the process of completing an initial monograph describing the archaeology of the site, the architectural forms present, environmental conditions and cultural assemblages. This lecture will provide an overview of the excavated archaeological evidence, specialist analyses and emerging themes.

2 SIMILAR, BUT DIFFERENT: SAAREMAA AND GOTLAND IN THE 13TH CENTURY

Abstract author(s): Mägi, Marika (Foundation Osiliana / Tallinn University)

Abstract format: Oral

Saaremaa (Estonia) and Gotland (Sweden), two biggest islands of the Baltic Sea, are, together with the adjusted islands and islets, of almost the same size. They have frequently been called sister islands, although separated by 120 km. Both are rich in prehistoric evidence. Especially after the 7th century, when sail was taken into use in the Baltic and crossing the open sea became commonplace, material culture in the islands synchronized in certain degree. The contacts were mutual, embraced movement of people, artefacts and ideas.

Both islands had restricted land resources, which caused that the accumulation of power and riches was often based on other sources but the ownership of arable land. Most researchers agree that international trade played a major role in Gotland, that is located in the middle of the sea, at the crossroads of sailing routes. The development of central places resulted in the emergence of a medieval town in Visby that in the 13th century was predominantly German. Centres in the countryside formed a parallel system that clashed with the town in 1288.

Saaremaa is located close to the mainland that was not the most favourable position for the emergence of big trade centres. It was the navy and control over water routes that ensured Saaremaa its prominent power position. Although earlier known because of overseas raids, the 13th century Saaremaa was characterised by wars on the island itself. However, the presence of Germans in Saaremaa was much more limited than in Gotland, and no medieval towns were established. The former centres continued throughout the 13th century, and gradually lost their importance after that.

The speech focuses on the results of the last decades’ excavations in Saaremaa, interpreting them in a broader context, especially in comparison with Gotland.

3 AN ACCESSIBLE COASTAL ISLAND: VENICE’S EARLY MEDIEVAL SPACES BETWEEN CONNECTIVITY AND COERCION

Abstract author(s): Calaon, Diego (Ca’ Foscari University)

Abstract format: Oral

The ontology of Venice has often been connected with its insular nature as a proxy to explain the connectivity and the long-distance commercial and economic relationships that Serenissima developed over the centuries. “Being an island” has been one of the main subjects of study of the vast scholarly production around the early history of Venice, queen of the seas.

Archaeological research and the topography of the early north Adriatic settlements allow us to reconsider the early Venice, detaching it from the importance of the island “idea” and, on the other side, rethinking the role of the availability or non/availability of free and accessible agricultural land in defining the social and economic environments.

Recent analyses have demonstrated the relative non-isolation of Venice in its area. The early Venetian topography should be considered a massive, connected waterscape context, with constant sea/lagoon routes and local circulation of people and goods. The notion of “island” probably had no particular meaning for the early Venetians, moreover in terms of identity. Conversely, the very nature of the wet coastal landscape, with limited availability of free or new land and limited capability to ensure some essential elements (such as fresh drinkable water, food resources other than fish, etc.), have played a central role in controlling labour. The idea of the “island” as a space of coercion, control, and power could be a different ontology that helps us to understand early Venice.

4 SHIFTING CONTEXTUALITIES OF MARITIME SETTLEMENT ON ISLANDS ALONG THE OUTER COAST OF MEDIEVAL NORTHERN NORWAY

Abstract author(s): Wickler, Stephen Kent (Arctic University Museum of Norway, UiT Arctic University of Norway)

Abstract format: Oral

Since initial settlement more than 11,000 years ago, marine resources have been critical for sustaining coastal and island settlement in northern Norway where specialized fishing sites were essential nodes in a complex web of maritime interaction and interdependence. The significance of such sites increased dramatically from the late Viking Age to the high Medieval period (ca. 950-1300 CE) as essential components in expanding maritime trade and exchange networks centered on stockfish production and the commercialization of cod fisheries. Although islands along the outer coast of medieval northern Norway represented central locations for maritime settlement and trade, individual sites in these locations display complex and variable trajectories. In this presentation, I explore two medieval island sites facing the open ocean that reflect very different sequences within an overarching maritime context. The Finnes site on Ingøy along the northwestern margin of Finnmark, was a seasonal marine exploitation base for the indigenous Sámi up until the 13th century when it was replaced by a permanent Norse fishing settlement. The Kvalnes site lies on the exposed outer shore of Moskenes Island in the Lofoten archipelago. Here a thriving early medieval fishing settlement with access to imported items linked to the stockfish trade experienced a dramatic environmental transformation into a marginalized location without access to the sea. By the late medieval period, the settlement was buried under actively accumulating windborne sand deposits. These case studies illustrate the diverse nature of fishing settlements in exposed outer coastal settings and the need for a more explicit thematic focus on island archaeology in Norway.

398 BODY IDEALS AND IDEAL BODIES: MATERIALITIES OF AESTHETICS AND THEIR SOCIAL ROLE IN NON-LITERATE SOCIETIES

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Gramsch, Alexander (Römisch-Germanische Kommission - RGK) - Kerk, Lukas (Universität Münster) - Matić, Uroš - Weiss-Krejci, Estella (Austrian Academy of Sciences)

Session format: Regular session

The ‘archaeology of the body’ explores human remains not only as carriers of information on nutrition, mobility, or biological kinship, but also as a source for research into the role of the body in shaping social relations in ancient societies. Corporeal aesthetics and ideals can be understood as analytical concepts, as they played a decisive role in the shaping, perpetuating, and changing of social identities, and gender norms in particular. Following on from the session “Beautiful bodies: Gender, bodily care and material culture in the past” at the 2017 EAA Annual Meeting, organised by Uroš Matić and Sanja Vučetić, this session focusses on new theoretical and methodological approaches and case studies from non-literate societies (e.g., prehistoric and ethnographic). The aim is to develop a better understanding of how material culture works in creating, maintaining, or transforming bodily aesthetics and ideals. We invite contributions that critically engage with the possibilities of interpreting such culturally relative ideas, drawing on case studies from a wide range of archaeological, ethnographic, or iconographic source material. Papers may consider ‘body-related’ objects, iconography, and ‘body-related’ practices. Objects of personal hygiene (e.g., toiletry sets) or those linked to (self-) representation (e.g., jewellery, clothing, and hairstyles), prosthetics or other objects enabling or facilitating participation in social interactions may be scrutinized as well as statuettes and stelae, depictions on pottery, stone, or other media. ‘Body-related’ practices may include permanent or impermanent modifications, but also the treatment of dead bodies. We are interested in relations between aesthetics and sex, gender, power, hegemony, subversion, as well as intra- and inter-group social relations. The focus should be on contexts, actors, and perceptions, with particular emphasis on how transformations in the presentation or ‘staging’ of the body affect social positions and relations as well as individual or group identities.

1 BODY IDEALS AND IDEAL BODIES: AN INTRODUCTION

Abstract author(s): Gramsch, Alexander (RGK - Romano-Germanic Commission DAI) - Kerk, Lukas (Universität Münster) - Weiss-Krejci, Estella - Matic, Uroš (Austrian Archaeological Institute)

Abstract format: Oral

Understanding the ‘archaeology of the body’ as research into the role of the human body in shaping social relations in ancient societies, we want to introduce this session by presenting ideas on how corporeal aesthetics and ideals can be understood as an analytical concept. Focusing on non-literate societies we will outline approaches for a better understanding of how material culture works in creating, maintaining, or transforming bodily aesthetics and ideals. This includes objects of personal hygiene (e.g., toiletry sets) or those linked to (self-) representation (e.g., jewellery, clothing, and hairstyles), prosthetics or other objects enabling or facilitating participation in social interactions. Moreover, material culture also serves to reconstruct ‘body-related’ practices such as permanent or impermanent modifications, but also the treatment of dead bodies. Also iconographic material such as statuettes and stelae, depictions on pottery, stone, or other media can be a source for analysing body ideals and ideal bodies. We want to point out possible relations between aesthetics and sex, gender, power, hegemony, subversion, as well as intra- and inter-group social relations. And we want to explore how to understand transformations in the presentation or ‘staging’ of the body as related to social positions and relations as well as to individual or group identities.

2 BODY REPRESENTATIONS ON NEOLITHIC STELAE IN NORTHERN ITALY

Abstract author(s): Perifanakis, Jacqueline (Swiss National Museum)

Abstract format: Oral

Neolithic stelae are likely to have been created as ancestral images and depict individuals, whilst embodying the values and traditions of a group, and their collective memory.

Although some traits are intrinsic to particular regions, there are similarities in the manner the human bodies and their attributes are depicted. Specific examples of stelae from Trentino-Alto Adige in Südtirol and Lombardy will be presented in this contribution to show how the people of these neighbouring valleys seemed to have very similar costumes, jewellery and weapons, but had different emphases in the depiction of human bodies.

The sculptures in Trentino are characterized by their three-dimensionality. Male stelae are shown armed to the teeth and wear single-strand necklaces, while women were adorned with prestigious pectoral ornaments and a diadem with pendants. Carved-out breasts leave no doubt about the gender of these stelae. In comparison, the examples in the Valcamonica and Valtellina valleys in Lombardy rarely show a human silhouette. What was important was not the representation of the body itself; instead, the human form is only indicated by the arrangement of motifs and sometimes by an elaborated shoulder. Interestingly, many of these sculptures in Lombardy are multiphase; they have been reworked several times, which means that even depictions of men and women could alternate on the same stone.

The examples from the two above-mentioned regions show that the creators of the stelae used a standard template for composing a body of different elements. The most important part is the upper body, where the differences between men and women are apparent. Real human bodies, as burials in contemporaneous necropolises and the so-called Iceman from the Ötztal Alps, show a comparable composition of and focus on material things. This leads to the assumption, that stelae represent a strongly schematised ideal image of the human being.

3 MALE IDENTITIES IN THE SOUTH-EASTERN EUROPEAN CHALCOLITHIC. IDEAL BODIES IN THE ANTHROPOMORPHIC PLASTIC ART OF THE CUCUTENI-TRIPOLYE CULTURE

Abstract author(s): Turcanu, Senica (“Moldova” National Museum Complex of Iasi Romania)

Abstract format: Oral

The subject of our paper are the modalities in which gender and cultural male identity are expressed. The space we refer to covers the area of the Cucuteni-Tripolye cultural complex of the V-IV millennia BC.

Archaeological discoveries provide little data on male identity and, in general, on the role of men within the social structures of the Cucuteni-Tripolye communities. These societies practised archaeologically “invisible” funerary rituals. Therefore, an analysis of the funeral inventories is not possible. That is why the main source for our presentation are the anthropomorphic statuettes. These allow us to outline male gender identities and cultural identities compared to similar female representations.

Starting from the idea that the anthropomorphized miniature world is the symbolic, idealized representation of the real one, the presentation aims to analyze and systematize the information the anthropomorphic statuettes provide. Our analysis will focus on the particularities of representation from a morphological standpoint (gestures, postures

or especially highlighted anatomical details) and the ornamentation of the body (hairstyles, objects of adornment and clothing accessories, colour symbolism, etc.) characteristic of the masculine plastic representations. This visual language will help us identify how male gender and male cultural identity affect social positions and relations as well as individual or group identities.

Also, the spread of the respective representations in settlements situated far away from each other points to their important, symbolic role within a vast geographical area, proving the community's vision of the ideal male body.

4 BODILY PERFORMANCES AND IDEALS IN THE MINIATURE SEAL IMAGERY OF BRONZE AGE AEGEAN

Abstract author(s): Andreovits, Tatiana (Institut für Klassische Archäologie, Heidelberg)

Abstract format: Oral

The human body is considered an active agent through which humans perceive the world, collect experiences and memories that differ depending on space and time. The embodied involvement with the environment, with other people and with the material culture, constitutes the way in which social identity is formed and expressed. The body entangles with the social and cultural environment through a multisensory process and thus comprises a means for the (re)construction of identities. In the proposed presentation, focus will be given on the representation of the miniature body on Bronze Age Aegean seal images. Seals and sealings with human body representations were common iconographical motifs during the Middle and Late Minoan period. However, the depiction of the human body is not uniform and stable throughout the Bronze Age, but differs depending on the geographical and chronological context, the selected representational forms and engraving techniques, the different materials and tools. Consequently, the human body is depicted abstract or detailed and realistic, sometimes emphasizing on the expression of gender, age and social identities. The human figures are adorned and dressed according to the everyday practices or ceremonial acts performed by the subjects, expressing the multiple and ever-changing bodily aesthetics and ideals. Through the study of the different bodily performances and aesthetics represented on Minoan seal images, the aim is to reconstruct the formation of identities (either individual or communal) performed by the members of Bronze Age Aegean communities. Human bodies and seals are mutually constructed through a proximal and multisensorial entanglement, contributing to the formation of the subject's identity and individuation both in past and present societies.

5 THE MOURNING BODY: DRESS CODES, MUTILATION, AND NUDITY DURING THE FUNERARY PERIOD

Abstract author(s): Weiss-Krejci, Estella (Austrian Archaeological Institute; University of Vienna)

Abstract format: Oral

Unlike the buried dead body, which sometimes leaves archaeological traces of treatment and clothing, at least under favorable conditions, the body treatment and attire of the bereaved during the mourning period is archaeologically elusive. After death, social life is often interrupted for the bereaved, as there is usually a requirement to mourn. What mourners may and may not wear can be governed by conventions that reflect the economic status, kinship ties, and ideology of the bereaved. As ethnographic examples have shown, mourning attire often deviates from, or even completely negates everyday bodily ideals and can range from wearing certain colors and materials of uncomfortable texture to mutilation and nudity. This paper uses selected examples from around the globe to discuss methods that allow us to address the issue of mourning for the prehistoric past. Identifying and analyzing mourning contexts on stone monuments, pottery, and other objects may be one way to understand how the bereaved treated and dressed their own bodies during the time of mourning.

6 SHIFTING BODILY AESTHETICS AND SOCIAL CHANGE IN BRONZE AGE CRETE

Abstract author(s): Simandiraki-Grimshaw, Anna (Museum of London Archaeology - MOLA; Independent Researcher)

Abstract format: Oral

The construct of bodily ideals has been extensively explored in archaeology more generally and for Aegean prehistory more specifically. Relevant studies have and continue to focus on the varied representation of the human body (artefactual bodies), as well as the treatment/manipulation and, more recently, the osteoarchaeology, of extant burials (physical bodies). Shifting bodily aesthetics have been explored for Bronze Age (Minoan) Crete through mostly somewhat distinct methodological categories (e.g. figurines, frescoes, burial practices, grave goods), which have sought to categorise predominantly adornment, gender and status, and especially the formation and interaction of elite groups.

These explorations have been very useful in systematising our knowledge of bodily representations in the wider sense. However, relatively few have attempted to synthesise data towards an understanding of the tropes and reasons for

specific interplay of the human body and/as material culture for aesthetic agendas. More importantly, detectable aesthetic shifts between major Minoan phases, already recognised as indicators of social shifts, have not been problematised enough beyond changes in fashion, customs or the emergence/composition of social elites.

This paper will start by arguing for a combination of available data, proposing ways to break down methodological barriers. It will continue with some case studies which will illuminate two aspects of those shifts: a) hitherto underplayed or undetected correlations between some representational material culture and the osteoarchaeological record; b) some potentially hidden corporeal agendas behind often seemingly straightforward expressions of aesthetics (e.g. clothing, bodily ideals etc.). Ultimately, the paper will propose that, by scrutinising through an embodied approach the 'staging' (and non-'staging') of the body in Minoan Crete during transitional phases, we can understand deeper social changes happening below the fluctuating surface of fashions, conspicuous consumption and burial practices.

7 THE POLITICS OF AESTHETICS: MAKING BODIES IN IRON AND VIKING AGE SCANDINAVIA

Abstract author(s): Aslesen, Elisabeth - Eriksen, Marianne (University of Leicester)

Abstract format: Oral

This paper draws on anthropomorphic imagery in first millennium Scandinavia to explore aesthetic ideals as well as politics of bodies. Bodies — whether of flesh and blood or cast in metal — are always immersed in worlds (sensu Haraway 1997). The body is not a biological fact, a neutral canvas that we 'dress' in culture. Rather, bodies emerge as products of specific histories: our bodies hold entire worlds in how we run, sleep, have sex, interact (Mauss 1973); that is, what we think our bodies could and should do.

Anthropomorphic imagery was executed in wood, stone, gold, silver, and bronze in Iron and Viking Age Scandinavia, however these figurines and depictions are conventionally studied in a visual and representational manner, rather than as material objects with specific histories of making, engagement, display, and deposition. We draw on ongoing work from the ERC project BODY-POLITICS to explore not only what depictions of bodies from Iron and Viking Age Scandinavia 'represented', but how miniature bodies and human bodies co-acted. Figurative imagery expressed and shaped ideas and concepts of human bodies, were used to adorn human bodies, and were handled and manipulated by human bodies. In like manner, these objects acted back onto the human body, imposing certain ways of moving, interacting, and thinking. Ultimately, we argue that these objects did worlding work: they were regulatory ideals communicating specific body ideals while suppressing others.

8 EMERGING FROM ASHES. BODY IDEALS AND IDENTITIES THROUGH THE ETRUSCAN ANTHROPOMORPHIC URNS FROM TOLLE (TUSCANY, ITALY, 7TH-6TH CENT. BCE)

Abstract author(s): Bischeri, Mattia (Dipartimento di Studi Umanistici, Università per Stranieri di Siena) - Alhaique, Francesca (Servizio di Bioarcheologia, Museo delle Civiltà) - Cavazzuti, Claudio (Dipartimento di Storia, Culture e Civiltà, Alma Mater Studiorum – Università di Bologna) - Sperduti, Alessandra (Servizio di Bioarcheologia, Museo delle Civiltà)

Abstract format: Oral

Anthropomorphizing the urn, namely molding the cinerary as a human body, is a relatively common funerary custom of cremation burials in some ancient communities. This practice is likely connected to reintegrating the body after the destructive action of the fire and preserving its materiality in another form. In Italy, especially in the Etruscan territory of Clusium, there is the widespread use of this practice between the 7th and 6th c. BCE as is demonstrated by the impressive necropolis of Tolle, which has yielded 121 intact burial contexts with anthropomorphic urns (the so-called 'canopic urns'). This kind of cinerary container represents a human body, as an ideal portrait of the dead's body, where the gender identity is, in many cases, iconically materialized by the physical traits on the lid and the body of the urn (e.g. hair, beard, breast etc...). In order to test the consistency between the socially ascribed identity and the biological profile of the dead, we conducted an interdisciplinary study integrating the canopic urn features (styles and varieties of the iconography) and archaeological data (funerary rite, grave goods, status indicators, chrono-spatial distribution) with bioarchaeological data from human remains (minimum number of individuals, sex and age-at-death) as well as from ritually associated fauna. Looking at the canopic urns in a diachronic and synchronic view, we assessed also a conservative phenomenon regarding the aesthetic of the urn located within the same burial clusters, through which the social, gender and family identity seems to transfer along three generations at least. The results allowed us to describe complex patterns of funerary behaviours, gendered role differences, and biosocial construction of identities, viewing how a large Etruscan community images itself afterlife through the aesthetic materiality of the urns.

9 BODYSCAPES IN EARLY CERAMIC CHILE (~200 BCE - 1200 CE): AN EXPLORATION OF ANTHROPOMORPHIC VESSELS

Abstract author(s): Campino, Danae - Armstrong, Felipe (Museo Chileno de Arte Precolombino; FONDECYT 11221116; FONDECYT 1200276)

Abstract format: Oral

Around 200 BCE, a number of new technologies emerged simultaneously in a vast region of today's Chile, signalling significant social and cultural transformations of hunter-gatherer populations. These shared features included the adoption of pottery, the first horticultural practices, decreased mobility, greater investment and complexification of funerary rituals, production of special tools for smoking practices, production of stone beads, use of labrets, and the production of anthropomorphic vessels. The emergence of these technologies suggests that the changes impacted the production of material culture. In this paper we will discuss anthropomorphic vessels as a means to characterise this process of transformation through the consideration of the human body as a relevant referent in the production of visual culture. We argue that the aesthetic choices involved in the manufacture of these body-pots, convey local particularities in the construction and conception of human bodies, prioritising certain body parts, as well as different visual effects; developing particular aesthetic choices to materialise different but related human-like vessels.

The groups we deal with for this period lived from the Semiarid region of Chile to the South of the country (26° - 43°Lat. S), developing local traditions related to the very different geographical and weather conditions. Thus, the existence of wider cultural patterns ought to be addressed and discussed. This work seeks to problematize the anthropomorphic ceramic vessels, in order to establish the existence of a new way of conceiving and living bodies, linked to the new technologies evidenced for this period, as well as to discuss the possible existence of a widespread bodyscape proper to this Early Ceramic Period (~200 BCE - 1200 CE). Our work accounts for the existence of a shared tradition in a vast area, opening the possibility of better understanding the processes traditionally understood as an increase in 'social complexity'.

10 BODYSCAPES AND EMPIRE. THE IMPACT OF THE INKA DOMINION ON LOCAL ANTHROPOMORPHIC POTTERY FROM NORTH-CENTRAL CHILE

Abstract author(s): Mansilla, Luis (Magíster en Arqueología, Universidad de Chile; FONDECYT 11221116; FONDECYT 1200276) - Armstrong, Felipe (Museo Chileno de Arte Precolombino; FONDECYT 11221116; FONDECYT 1200276)

Abstract format: Oral

Around 1.470 AD, the Inka Empire annexed what is now North-Central Chile to its dominion. This rapid and intense collision implied radical changes on local production patterns, and an intensification on agricultural, metallurgic and pottery production dynamics. Scholars have shown that this process was not violent based on an understanding of shared complementing Andean traditions that facilitated acculturation as seen on pottery. Despite this being one of the most discussed topics on local archaeology, little is known about the repercussions that this annexation of territories had on the bodies of the local inhabitants of the region, known today as Diaguitas. Along with the economic intensification came distinct ideational elements originating in the Central Andes, meaning the Inka brought a new way to display, to be and to make bodies. The body production on different media (e.g., rock art and pottery) allows an insight into the existence of culturally and contextually specific normative models for the Diaguita prior to and after the Inka arrival. A full examination of body parts complemented with a traditional vessel analysis allowed for the identification of certain trends and significative associations between the presence and absence of singular anthropomorphic elements and distinctive vessel attributes, as well as an intra and inter period comparison showing differences on the body production before and during the Inka regime. Based on this examination, this paper discusses the construction of a new bodyscape (sensu Geller 2009) that shares some principles with the former, but also expressing new ways of displaying bodies in the context of Inka imperialism.

This paper is funded by Research Grants FONDECYT 11221116 and 1200276.

11 BLING FOR THE AGES - GENDERED JEWELRY AND DRESS ADORNMENTS IN PREHISTORIC BURIALS IN CENTRAL EUROPE

Abstract author(s): Pape, Eleonore (Max Planck Institute for Evolutionary Anthropology, Department of Archaeogenetics)

Abstract format: Oral

Jewelry or dress adornments play a fundamental role in the identification of gender in the study of prehistoric burials: their type and function, their finding location within the burial upon excavation, or even the amounts of such objects

per individual often represent a criterion for the identification of archaeological gender. We sometimes even consider the mere occurrence of jewelry in burials a feminine attribute per se.

We know, however, that our perception of gender-norms in burials of illiterate societies of the past can be affected by misconceptions and methodological flaws, especially when we attempt to identify the biological sex and the archaeological gender of individuals: by the fallacy of circular argumentations when bioanthropological and archaeological data are not assessed independently and by the difficulty to assess the reliability of osteological sex estimates. What we do not know, is to what extent. A bioarchaeological approach may offer some solutions to some of the practical issues mentioned: e.g. determine error margins of osteological estimates, verify data that may have been generated by means of circular argumentation and explore the portion of inhumed populations that is not associated with preserved archaeological 'gender'-markers.

Based on selected case studies from published, large inhumation burial sites in Central Europe ranging from the Neolithic to the Middle Ages, I will present how recurrent jewelry and dress components actually are within burial communities of different regions and areas, with a special focus on their association with biologically sexed individuals. I will finally discuss to which extent such attributes can qualify as gender-normative bodily aesthetics, and how much room there is for diversity and individuality.

12 THE MATERIALITY OF ANDEAN BODY MARKING: PERSPECTIVES FROM EUROPEAN AND NORTH AMERICAN MUMMY COLLECTIONS

Abstract author(s): Gerst, Robin (Goethe-Universität Frankfurt am Main) - Deter-Wolf, Aaron (Tennessee Division of Archaeology)

Abstract format: Oral

Tattooing was a widespread cultural practice among Pre-Columbian societies of western South America, reaching back to at least 2500 BCE. Archaeological evidence for these traditions is attested to on the preserved skin of hundreds of mummified individuals found at sites throughout the Pacific coastal deserts of Perú and Chile. Many of these remains made their way into Western museum collections during the 19th and early 20th centuries, and have since remained unexplored by modern archaeological science. This presentation describes research by the authors to catalogue tattooed Andean mummies in European and North American museums. To date our investigations include digital documentation of more than 140 previously-unpublished tattooed mummified specimens. This research, while still ongoing, constitutes one of the largest data sets of preserved, tattooed archaeological remains from any region on Earth, and provides critical new data for assessing body decoration practices in the ancient Andes.

Our findings to date show that this phenomenon had a wide distribution in different archaeological cultures of the Andean coastal deserts, including from well-known sites such as Pachacamac, Ancon, and Chancay. This presentation will include observations on the distribution, orientation, and arrangement of tattoos on the human body.

We will begin by creating an iconographic catalogue that will show the motifs, patterns, and figures used and their use in other archaeological media such as textiles, ceramics, and wooden objects. This comparison facilitates initial conclusions as to the meanings and cultural roots of this phenomenon.

This gives us the first comprehensive insight into an emic conception of the body, corporeality and body modification in the ancient Andes in general, as well as for specific cultures.

13 A PRECIOUS BURDEN: MULTIDISCIPLINARY APPROACH TO BODILY TECHNIQUES OF CHILD CARRYING IN THE NILE VALLEY

Abstract author(s): Carballo Pérez, Jared (Departamento de Geografía e Historia, Universidad de La Laguna) - Hall, Rachael (Laboratory for Human Osteoarchaeology, University of Leiden) - Matić, Uroš (Österreichisches Archäologisches Institut, Österreichische Akademie der Wissenschaften) - Schrader, Sarah (Laboratory for Human Osteoarchaeology, University of Leiden)

Abstract format: Oral

Ancient Egyptian, Nubian and Syro-Palestinian Bronze and Iron Age iconographies indicate that women in these societies used different body techniques to carry children. Whereas Egyptian women used slings to carry a single child, Syro-Palestinian women carried several children in baskets on their backs. Nubian women also used baskets to carry several children, however, with the help of a tumpline attached to the basket and placed over the top of the head. These bodily techniques of child care and carrying do not only allow women to perform certain actions, but also impede them from performing others. Moreover, these different bodily techniques of child carrying can potentially form bodies in different ways, leaving traces on the skeletons. Some bone markers of physical activity could help us approach these embodied loads, such as the tumpline deformations on crania, the vertebral pathology distribution, and asymmetrical musculoskeletal changes in the clavicle. In this paper, we propose a pilot study using the aforementioned iconographies and bone markers of daily life on the skeletal collection of the Nubian cemetery from

Abu Fatima (2500 – 1500 BCE). The contextual study of these „body-related“ practices will allow us to provide complementary visions of how women embodied child care and how the aesthetic perceptions of these close social relationships were like.

14 ARTIFICIALLY DEFORMED SKULLS IN THE LIGHT OF BODY IDEALS: TWO CASES FROM THE GREAT MIGRATION PERIOD (SERBIA)

Abstract author(s): Djukic, Ksenija - Mikasinovic, Veda - Sarkic, Tamara - Djuric, Marija (Center of Bone Biology, Faculty of Medicine, University of Belgrade)

Abstract format: Oral

Artificial cranial deformation (ACD) is defined as a biocultural process that includes the application of an external force on the cranial bone with the aim of modifying the physiological patterns of neurocranial growth. This should be applied in the infant period, given that the cranial bones are soft and easily modified. The reason for the cranial modification is recognised as either specific custom of some ethnic identification and membership, a status symbol within a population or as being linked to certain preconceived ideas of bodily decoration and beauty. Recent studies have additionally explained this custom in the context of complex processes of creating a social identity through cultural contacts and migrations. This biocultural phenomenon appeared independently in different regions of the world, and ACD has been recorded on all continents, in different cultures, and different periods. However, various reasons have been listed as potential motives for ACD, but one is certain, people used their own bodies to send a message to their immediate or wider social environment. The aesthetics achieved in this way were actually unchosen by the person who had a deformed skull, suggesting that this was a physically imposed part of a person's identity, accentuating the role of the body in social relations. In order to gain a clearer picture of the social fabrics of ancient societies, especially in those that were non-literate/illiterate, comprehensive analyses of the biological and social contexts of each case individually would be necessary. Therefore, based on the bioanthropological and burial assemblage analyses, this study looked closely at both the biological and social frameworks of two ACD cases of Great Migration Period from the territory of modern-day Serbia.

399 BEYOND ARCHITECTURE: NEOLITHIC TOMB BUILDERS IN CONTEXT

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Smyth, Jessica (University College Dublin) - Geber, Jonny (University of Edinburgh) - Olet, Lilly (University of Bristol)

Session format: Regular session

The inspiration for this session comes from the ‘Passage Tomb People’ project (IRC Laureate 2018-2023), currently investigating the social drivers of passage tomb construction in the Irish Sea area in the later Neolithic. The connectedness of these tombs (in terms of iconography, building methods, and material culture) has long been recognised, but to date there has been little targeted research on the societies that built them. Erected several centuries after the arrival of farming in each region, these monuments may be responses to economic stress or, equally, the result of surplus and increasing social competition. In this session we welcome fresh approaches to exploring the societies behind the megalithic architecture of Neolithic Europe, in particular contributions that probe the connections between monument construction and wider changes in social, cultural and technological practice. Did similar factors trigger similar architectural responses in different areas? Papers can draw on a range of methodologies or analytical techniques – from osteology to biomolecular archaeology and material culture studies – but must have ‘people’ at their core and be framed in terms of the communities and social networks that supported these extraordinary feats of engineering, logistics and belief.

ABSTRACTS

1 LINKING ANCESTORS WITH MONUMENTS: ENGAGING WITH THE DEAD IN NEOLITHIC IRELAND

Abstract author(s): Geber, Jonny (University of Edinburgh)

Abstract format: Oral

The Neolithic passage tombs of Ireland have been the subject of interest for generations of scholars, but it is only in relatively recent years that the human remains (the people) in these monuments have been considered in more than quantitative terms. Using anthropological interpretative frameworks, how the living approached the dead (and death) in Neolithic Ireland is discussed using the recent and current analyses of the human remains from the impressive passage tomb complex at Carrowkeel (Co. Sligo) and the winter solstice aligned passage tomb at Knockroe (Co.

Kilkenny). The intentional processing of the dead—through disarticulation/dismemberment, fragmentation and cremation—is evident on both these sites but expressed differently. At Carrowkeel, both unburnt (9.7kgs) and cremated bones (5.7kgs) were found, while Knockroe contains almost exclusively (highly fragmented) cremated remains (c. 200kgs). To what extent do the human remains help us understand the complexity of the passage tomb tradition? How does the treatment of the dead reflect the beliefs and worldview of the people in Neolithic Ireland? These questions are likely to remain unanswered. However, a more holistic approach when examining and interpreting human remains from passage tomb contexts can help to elucidate social paradigms from a distant past.

2 I NEED A HERO? EXPLORING DIVERGENCE IN MORTUARY PRACTICE IN MIDDLE NEOLITHIC IRELAND

Abstract author(s): Smyth, Jessica (University College Dublin) - Faillace, Katie - Madgwick, Richard (Cardiff University) - Olet, Lilly (Organic Geochemistry Unit, University of Bristol) - Knowles, Timothy (Bristol Radiocarbon Accelerator Mass Spectrometry Facility, University of Bristol) - Evershed, Richard (Organic Geochemistry Unit, University of Bristol)

Abstract format: Oral

Cremated commingled deposits of human bone are a well-recognised feature of mortuary practice in Neolithic Ireland (c. 4000-2500 BC). They are associated with a range of different megalithic monuments, with some mid-fourth millennium BC (Middle Neolithic) passage tombs found to contain very sizeable quantities of cremated bone (e.g. Geber, this session; O'Sullivan 2005). Around 3600 BC, when the earliest passage tombs begin to be constructed in Ireland, a parallel mortuary tradition occurring outside the main distribution of megalithic tombs is also recorded: large earthen mounds with a stone cist at their centre, containing the remains of one to three inhumations, all male (where biological sex can be recorded). These monuments are called 'Linkardstown-type mounds' after a type site excavated at Linkardstown, Co. Carlow. Previously included in a radiocarbon dating programme targeting single Neolithic burials (Brindley & Lanting 1989/1990), this fascinating corpus of sites is revisited in the light of multi-isotope analysis and new radiocarbon dates, part of the wider 'Passage Tomb People' project.

3 LONG BARROWS IN BOHEMIA. FORM AND PERCEPTION OF FUNERARY STRUCTURES AS ANCESTRAL MONUMENTS OF A LONG TERM TRADITION

Abstract author(s): Kristuf, Petr (University of West Bohemia) - Turek, Jan (Charles University Prague) - Hejcman, Michal (Jan Evangelista Purkyně University in Ústí nad Labem)

Abstract format: Oral

Our recent project focusses on Late Neolithic long barrows as places of ancestral worship and representation of communal and personal identities in the landscape of Central/North Bohemia. The long barrows are commonly interpreted as funerary/religious sites, perhaps erected as part of a system of ancestral cult. They can also be perceived as territorial markers delineating the areas controlled by different farming communities and perceived as landmarks of previous habitation enduring for millennia after their construction.

The long barrows in Bohemia are dating between 4000/3800-3300 BC. Unlike the burials in contemporary megalithic and non-megalithic monuments in Western Europe the long barrows in Bohemia usually contain single burials, particularly emphasizing the familial local ties and more private and intimate relationships towards ancestors.

The results of complex investigations of three Late Neolithic monuments in Central/North Bohemia (Dušníky, Vražkov and Račiněves) will be presented. We are going to discuss the variability of types of long barrows constructions in this region and follow the secondary use of the monuments in later prehistoric periods.

4 MEGALITHIC TOMBS AND BIOARCHAEOLOGICAL RESEARCH IN SWEDEN

Abstract author(s): Ahlstrom, Torbjorn (Department of Archaeology and Ancient History, Lund university)

Abstract format: Oral

Megalithic tombs in southern Sweden are associated with the Funnel-Beaker culture and categorized as dolmens and passage tombs. Megalithic tombs are distributed along the western coast, Scania, Öland and Gotland as well as a notable concentration of tombs in Falbygden, Västergötland. The following talk presents studies on the burial ritual practised. The presence of articulated human skeletal remains was noted already during 19th century but neglected in favour for an ossuary hypothesis as regards the function. Recent excavations have unearthed articulated human skeletal remains and shifted the function towards proper graves. Finds of animal bones also point to regional differences in burial customs. One tell-tale sign of bone materials from megalithic tombs in southern Sweden is the presence of boar phalanxes. Results from bioarchaeological analysis in general, such as paleopathology, will be presented. Here focus will be directed towards the caries rate and diet in general. One intriguing paradox is the recent biomolecular evidence of the plague bacteria, but this in the absence of a catastrophic mortality.

5 NUTRITIONAL STRESS, MARINE RESOURCE CONSUMPTION AND LATE WEANING: NEW INSIGHTS ON NEOLITHIC ORKNEY FROM ISOTOPE RESEARCH

Abstract author(s): Clark, Charlotte - Faillace, Katie - Nederbragt, Alexandra (Cardiff University) - Smyth, Jessica (University College Dublin) - Madgwick, Richard (Cardiff University)

Abstract format: Oral

The Neolithic of Orkney has been subject to a vast amount of research due to its exceptionally rich archaeological record. Previous studies have characterised diet and agriculture as overwhelmingly focussing on terrestrial, domesticated resources. This has been observed using bulk isotope data from bone collagen and zooarchaeological remains. However, this provides only a long term dietary average and improved temporal resolution has the potential to provide a more nuanced narrative. Incremental analysis of stable isotopes of carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) from tooth dentine provides detailed life histories into the childhood and adolescent diet, which would be otherwise obscured in bulk isotope data. This analysis was conducted on fourteen second and first molars for Neolithic passage tombs Isbister and Banks, located on the island of South Ronaldsay, Orkney. Changes in childhood and adolescent diet were observed, including periods of nutritional stress for ten individuals, six of whom were nutritionally stressed between 13 and 16 years old. Evidence for the occasional consumption of marine foods was also found in some individuals. The late cessation of breastfeeding ending at up to four or five years of age was also discovered in two individuals. This evidence suggests that a diet based on farmed foods was difficult to maintain, due to the harsh weather conditions that the Orkney islands experience and provides new detail on the lifeways and foodways on Neolithic Orkney.

6 LIFESTYLE AND SUBSISTENCE AMONGST THE PASSAGE TOMB BUILDERS DEFINED THROUGH ORGANIC RESIDUE ANALYSIS AND COMPOUND-SPECIFIC RADIOCARBON DATING OF POTTERY

Abstract author(s): Olet, Lilly - Casanova, Emmanuelle (Organic Geochemistry Unit, University of Bristol) - Knowles, Timothy - Monaghan, Paul (Bristol Radiocarbon Accelerator Mass Spectrometry Facility, University of Bristol) - Evershed, Richard (Organic Geochemistry Unit, University of Bristol) - Smyth, Jessica (School of Archaeology, University College Dublin)

Abstract format: Oral

As part of the Passage Tomb People project, ca. 500 vessels from three Irish Sea regions of passage tomb construction in the Middle Neolithic – North Wales, Ireland and Orkney – have been investigated for their lipid residues. The sampled pottery includes several styles (Early Neolithic Carinated Bowls, Middle Neolithic Unstan and Impressed Ware, Late Neolithic Grooved Ware) that encompass the time of development of increasingly monumental megalithic architecture, and include the peak and secondary use of the monuments. This approach enabled us to study trends in pottery use regionally and diachronically. Compound-specific radiocarbon dating of lipids entrapped in the potsherds links the pottery assemblages to a specific period of time and is proving valuable to assess how fast artefacts and innovations spread and were exchanged between communities in the study regions. Using both organic residue analysis and radiocarbon dating, we were able to assess whether trends in the use of pottery correspond with changes of lifestyle and subsistence practices of past societies. We considered whether there were localised responses to environmental differences in each of the study regions or whether such changes were a reflection of tight-knit networks of people who shared common ideas regarding form as well as function.

7 MOBILITY AMONG MONUMENT BUILDERS: AN ISOTOPIC INVESTIGATION OF NEOLITHIC COMMUNITIES FROM ORKNEY AND IRELAND

Abstract author(s): Faillace, Katie - Madgwick, Richard - Andersen, Morten - Nederbragt, Sandra (Cardiff University) - Smyth, Jessica (University College Dublin)

Abstract format: Oral

Passage tombs of the Late Neolithic have been subject to extensive research, but the scale of community networks among their builders is enigmatic. This paper investigates mobility, geographic origins, and environmental exploitation strategies of Neolithic communities from the Irish Sea area. Despite similarities in the structure and iconography of Neolithic monumental tombs in this region, the nature of the connections and contact between communities and with the British Isle remains opaque. Enamel from 130 humans and animals from Neolithic Orkney and Ireland was analysed for early life origins using strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) isotope analysis. Early life signatures from human enamel ($n=56$) were also supplemented by oxygen ($\delta^{18}\text{O}$) isotope analysis. While equifinality remains a challenge in isotopic investigations, results demonstrate regional patterns among population movement (or lack thereof). Strontium values from sites within the Orkney Islands suggest inter-island movement between communities, but limited mobility with Hebridean or Scottish mainland communities. A small number of outliers from both eastern Ireland and Orkney exhibit enriched $\delta^{18}\text{O}$ values, and likely represent movement from more westerly or southerly locations (e.g. western Ireland, Wales). As part of the wider 'Passage Tomb People' project, this study uses isotope analysis to show that,

although movement between communities occurred, inter-community mobility was likely restricted to the Irish Sea/ North Atlantic façade region. These findings transform our understanding of Late Neolithic networks and scales of connectivity.

8 MULTI-PROXY APPROACH OF CATTLE SECONDARY PRODUCTS EXPLOITATION IN NEOLITHIC IRELAND: INTRA-TOOTH SEQUENTIAL ISOTOPIC ANALYSIS (C, O, SR) AND ZOOARCHAEOLOGY

Abstract author(s): Pigiere, Fabienne (University College Dublin, School of Archaeology; Department of Geography, Royal Holloway University of London) - Balasse, Marie (UMR 7209 Archéozoologie, archéobotanique: sociétés, pratiques, environnements, CNRS/MNHN) - Snoeck, Christophe (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB; G-Time Laboratory, Université Libre de Bruxelles, ULB; Maritime Cultures Research Institute, Dept. of Art Sciences & Archaeology, Vrije Universiteit Brussel, MARI-LW-VUB) - James, Hannah (Analytical, Environmental & Geo-Chemistry, Dept. of Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB; Maritime Cultures Research Institute, Dept. of Art Sciences & Archaeology, Vrije Universiteit Brussel, MARI-LW-VUB) - Fiorillo, Denis (UMR 7209 Archéozoologie, archéobotanique: sociétés, pratiques, environnements, CNRS/MNHN) - Smyth, Jessica (University College Dublin, School of Archaeology)

Abstract format: Oral

The Kilshane enclosure site (Co. Dublin) has provided the largest surviving Neolithic cattle assemblage in Ireland, offering an exceptional window into animal exploitation in the mid-4th millennium BC. A multi-proxy analysis has been designed to investigate animal management practices and which secondary animal products were exploited. This research presents the results of sequential carbon, oxygen, and strontium isotope analyses of enamel to investigate diet, seasonal herding, birth seasonality, and animal mobility along with an osteological approach of age-at-death, sex, morphology, and pathologies. The data of strontium isotope analysis are used for investigating the geographical range where cattle were raised and moved during their lifetime. The sequential carbon and oxygen isotope analysis of enamel provide evidence of seasonal variation in diet and seasonal calving. This combined multi-proxy study allows to approach animal management within a better defined geographical and seasonal context. The implications of these husbandry practices are discussed in relation to the exploitation of specific secondary animal products, namely milk and animal power.

9 INVESTIGATING MIDDLE NEOLITHIC HERDING PRACTICES: SEX DETERMINATION OF CATTLE REMAINS USING PROTEOMICS

Abstract author(s): Buckley, Michael - Pal Chowdhury, Manasij (University of Manchester) - Pigiere, Fabienne - Smyth, Jessica (University College Dublin)

Abstract format: Oral

Although proteomic techniques have been increasingly used to improve our understanding of the human past, few have focussed on the study of tooth enamel for sexing in archaeofaunal remains despite initial studies over a decade ago looking at human teeth. Here we explore the use of LC-orbitrap-MS/MS for identifying the sex of archaeological domesticated cattle remains from the Neolithic enclosure at Kilshane, Ireland (c. 3600 cal. BC), in addition to modern reference materials. Although several individuals could be confidently identified as male, and some less confidently as female, there were also some inconsistencies with predictions based on morphology, albeit largely on size. Through comparison with osteometric analyses, the ~85% of the proteomic analysis estimates were consistent with identifications on morphological interpretation. Nonetheless, the male/female proportions were relatively consistent between the proteomic approach and morphological approach based on metacarpals previously reported, both providing ~53% of females and 47% of males. Unexpectedly, our results evidence clear differences between modern reference materials and the archaeological materials, likely reflecting preservation biases.

10 MEGALITHIC LANDSCAPES IN CONTEXT: THE ROLE OF LITHOLOGY IN FUNERARY ARCHITECTURES

Abstract author(s): Navajo-Samaniego, Esther - Jiménez-Gisbert, Guillermo (University of Alcalá) - Vázquez-Martínez, Alia (University of Alcalá; University of Santiago de Compostela, CISPAC)

Abstract format: Oral

This communication has a PhD research project as starting point. Its main objective is the study of tomb builders' occupation dynamics in the middle Guadiana River basin between the 5th and 3rd millennium BC, contrasting with other Atlantic areas.

Traditionally, landscape has not been considered in megaliths studies in Southwest Iberia. Archaeological research has mainly been focused on architectural typologies and material culture analysis. Nowadays, the application of new non-invasive techniques, such as LiDAR data and photointerpretation, has allow a significant change. Data obtained

show a richer and more varied archaeological record than expected where landscape plays an important role in these dynamics. Analysis of lithology in relation to megaliths positioning in landscape will allow us to understand how Neolithic societies of Southwest Iberia took advantage of local and foreign resources, both for these architectures' construction and for a long-lasting settlement in landscape. They had a thorough knowledge of the surroundings as well as a "cultural" way of relating to the elements that make it up. For this purpose, we have a detailed inventory of the megalithic structures located in the study area, in addition to lithological information that will be analysed in GIS.

The analysis of megalithic tombs in landscape will allow us to make a first approach to the occupation dynamics of the middle Guadiana River basin in the chronology indicated. Besides, it will allow us the use of geological references that identify the relationship between human groups and nature through the selection of large stones that make up their most emblematic architectures. The agency between nature and culture provides data for broader readings applicable to Atlantic Europe.

11 A NEOLITHIC GEOLOGY? STONES WITH INCLUSIONS IN PASSAGE TOMB ARCHITECTURE

Abstract author(s): Kenny, Patricia (University College Dublin)

Abstract format: Oral

The passage tombs of Atlantic Europe are a lasting memorial to an incredibly accomplished society, with a broad knowledge system encompassing aspects of engineering, astronomy, and stone-working. The stones used to build these monuments have been explored from a range of perspectives. It seems likely that stones were chosen based on criteria such as colour, source, and texture, and some may have had symbolic meaning. This paper investigates the presence of stones with geological inclusions at these sites and asks what these stones can tell us about Neolithic people and their society.

Stones with geological inclusions (SWI) are defined as structural stones with fossils, mineral veins, rock clasts, or other distinct objects embedded in the stone matrix. Anthropological research demonstrates that unusual stones, such as these, often feature in superstitions and folklore and are sometimes attached to origin myths and broader belief systems. This research considered whether the presence of SWI in Neolithic monuments indicates comparable beliefs in Neolithic communities.

This research draws upon fieldwork in Ireland, Britain, and Brittany (France). SWI are present across all regions, and their distribution is often patterned within tombs, suggesting they were deliberately chosen. SWI reference outcrops, mountains, and other geological features at multiple sites. This relationship indicates an intimate knowledge of local geology, in which inclusions played an important role. This paper argues that Neolithic people cultivated a detailed knowledge system of stones, their properties, and geological inclusions in particular. This knowledge system played an important role in their society and is reflected in their artefacts and architecture.

12 THE COTSWOLD SEVERN LONG BARROWS AND THEIR CONNECTION TO THE SUN, MOON AND STARS

Abstract author(s): Armstrong, Pamela (Bournemouth University)

Abstract format: Oral

The Cotswold Severn long barrows are the giants of their time. Built over five thousand years ago, these monumental mortuary houses brought a radical new architecture to southwestern Britain. This research explores the belief systems of the communities who created these sentinels to a lost time. The question at the heart of this project asks whether the Cotswold Severns had a celestial cosmology, one that linked to the sun, moon or stars, embedded in their design. The research process involved choosing barrows that are not only extant but which have either original stonework or a substantial mound still standing. Sixteen such structures were identified. Fieldwork included an assessment of each barrow's orientation towards its local horizon. This involved surveying the axis of each monument and, where they existed, the chambers and horned forecourts as well. Deskwork then involved the application of software to replicate Neolithic skies. The resulting findings indicate that these houses for the dead did connect to the sky. Traditional skyscape archaeology argues that solar and lunar alignments were integral to Neolithic design but this research indicates that where the people of the long barrows are concerned, the stars were given preference.

NO MOVEMENT, NO TRADING, SIMPLY LOCAL: CREATING NARRATIVES AROUND LOCAL RESOURCES IN PREHISTORY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Prieto, Alejandro (Research Group on Prehistory, GIZAPRE. Department of Geography, Prehistory and Archaeology. University of the Basque Country) - de Lombera-Hermida, Arturo (Centro de Investigación Interuniversitario das Paisaxes Atlánticas Culturais - CISPAC) / Universidad de Santiago) - Gehres, Benjamin (CNRS - University of Rennes 1) - Serna, Alejandro (BioArCh - Department of Archaeology - University of York)

Session format: Regular session

Raw materials and resources studies have become a basic source of information to understand Prehistoric humans' mobility and inter-group interactions. In Prehistoric Archaeology, just as nowadays and in historical times, the furthest raw material -representing the longest mobility, interchange or trade route- is often an argument to highlight archaeological sites, regions or periods as the most interesting, the most behaviourally complex, the most advanced or the most meaningful. However, archaeological and ethnographic data show that non-local artefacts are only a small portion of Prehistoric materiality, which is mainly made of quotidian actions using local resources. Therefore, why does the archaeological practice, regardless of the context, tend to stress allochthonous resources? And what are we considering local and what are we considering allochthonous? What are the narratives created after the classification of artefacts or resources as local?

The session "no movement, no trading, simply local: creating narratives about local resources in Prehistory" will discuss these questions from the perspectives given by the various disciplines that can tackle the autochthonous character of the raw materials. Case studies from all around the world working on stone and pottery artefact sourcing, anthracology, faunal studies or isotopic analyses, among other disciplines, are welcome to the session. Multiproxy and theoretical contributions about diverse and complex narratives on the management of local resources in Prehistory are also encouraged.

ABSTRACTS

1 ACQUISITION OF IGNEOUS RAW MATERIALS IN THE UROLA VALLEY: SOURCES OF SUPPLY AROUND THE IRIKAITZ DEPOSIT

Abstract author(s): Dominguez-Ballesteros, Eder (Universidad del País Vasco)

Abstract format: Oral

The Irikaitz archaeological site is located in the north of the Iberian Peninsula, in the Basque Country region. It is an open-air site on the banks of the middle course of the Urola River. Within the framework of the analysis of the capture of resources close to the deposit, we have studied igneous raw materials in the archaeological remains of the Lower and Middle Paleolithic of Irikaitz. Through the study, several tools have been found made of various types of basalt, dacites, and tuffaceous shales, among others. In order to understand how the prehistoric groups that inhabited Irikaitz collected this type of raw materials, we have carried out a geological analysis of the primary and secondary outcrops in the area, detecting several possible sources of supply. The Urola River cuts several geological strata with igneous lithologies that over time have been eroding and accumulating in the form of pebbles, in secondary deposits a few kilometers from the archaeological site. Through Geographic Information Systems (GIS), and based on concepts such as 'accessibility', we have analyzed the environment and the possible routes between the deposit and the sources of supply. These results provide very valuable information on the use of local raw materials, allowing us to understand the management of the territory and its immediate environment, carried out by these Paleolithic groups.

2 ACHEULEAN QUARTZITE PROCUREMENT STRATEGIES AT EL SOTILLO - CIUDAD REAL (SPAIN)

Abstract author(s): Abrunhosa, Ana (IPHES - CERCA - Institut Català de Paleoeologia Humana i Evolució Social; ICArEHB - Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, FCHS - Universidade do Algarve) - Pérez-González, Alfredo (IDEA - Instituto de Evolución en África) - Santonja, Manuel (CENIEH - Centro Nacional de Investigación sobre la Evolución Humana; IDEA - Instituto de Evolución en África) - Méndez-Quintas, Eduardo (GEAAT - Grupo de Estudos de Arqueoloxía, Antigüidade e Territorio, University of Vigo; IDEA - Instituto de Evolución en África) - Panera, Joaquín (Departamento de Prehistoria, Historia Antigua y Arqueología, Universidad Complutense de Madrid; IDEA - Instituto de Evolución en África) - Rubio-Jara, Susana (Departamento de Prehistoria, Historia Antigua y Arqueología, Universidad Complutense de Madrid; CENIEH - Centro Nacional de Investigación sobre la Evolución Humana; IDEA - Instituto de Evolución en África)

Abstract format: Oral

El Sotillo (Malagón, Ciudad Real) is an open-air site in the upper Guadiana basin. It locates in the central-southwestern area of the Iberian Peninsula within the Palaeozoic synclorium of El Robledo-Porzuna-Malagón, a large Variscan structure forming an extended depression in the NW-SE direction.

Sotillo was excavated between 2017-2019 and is the first dated Early and Middle Palaeolithic stratigraphic sequence in a region known for the abundant Palaeolithic superficial findings. Here we present the lithic raw material results from levels 4 and 5, studied under the project CEN154P20, co-financed by the ERDF (European Regional Development Fund) and Junta de Castilla y León. Level 4 contains Acheulean industry (currently under study). The level 5 Acheulean industry was recently published and is the highest concentration of industry recorded in the Iberian Peninsula in fluvial gravel bars, dated by OSL of 303 ± 25 ka and 258 ± 17 ka.

Quartzite represents 99,9% of the exploited raw materials. It is also the most abundant material in the region and seems to be a form of expedient exploitation without many degrees of predetermination or source selection. However, not all quartzites are the same. It is possible to distinguish different grain sizes, degrees of metamorphization, and levels of alteration affected by post-depositional processes and influenced by the spacing between quartz grains and other physical characteristics of the material. Altogether, these aspects influence how the material behaves during knapping and use.

We analyzed the variability of quartzite present in the landscape surrounding El Sotillo and compared it with the proportions present in the archaeological assemblage. In this way, we try to see if it is possible to determine some form of selection and transport of local material. We look to discuss the importance of analyzing local raw materials to understand human interaction with local resources.

3 LOOKING FROM THE OTHER SIDE: WHAT QUARTZITES CAN TELL US ABOUT LOCAL ECONOMIES IN PALAEOLITHIC HUNTER-GATHERER SOCIETIES

Abstract author(s): Prieto, Alejandro (University of the Basque Country) - Álvarez-Alonso, David (The Complutense University of Madrid) - Álvarez-Fernández, Esteban (University of Salamanca) - Arrizabalaga, Alvaro (University of the Basque Country) - Baena-Preysler, Javier (The Autonomous University of Madrid) - Pastoors, Andreas (Friedrich-Alexander University of Erlange-Nuremberg) - Pinto, Ana (Museo Arqueológico Regional de Madrid) - Yusta, Iñaki (University of the Basque Country)

Abstract format: Oral

The mobility of objects and the people behind them constitutes the most outstanding topic addressed by lithic sourcing in Palaeolithic Archaeology. The historiography generally highlights the discovery of the longest contact in a determined period or region, but also a broad historical construct consisting of a continuum evolutionary trend towards the increase of mobility and/or trading routes in human history. This historiographic trend has promoted sourcing research in specific raw materials that have already tested their relevance as long-distance tracers: flints and obsidian. This is especially true if they are rare or even flashy. Notwithstanding, the majority of the raw materials left in a determined archaeological site were not the consequence of long-distance mobility routes, trading or even commercial routes, but the consequence of daily-life actions. Which were these actions? What did they tell us about human behaviour?

In the last ten years of research, we have been analysing quartzite from geoarchaeological perspectives in different chronological scenarios (from Middle to Upper Palaeolithic) and geographies (Cantabrian Region and Central Europe). Contrary to what was expected, a minor portion of quartzites in these sites are unveiling that some were procured from exogenous sources, but more interestingly, we are spotlighting daily-life actions derived from the exploitation of local resources. In this presentation, we will show up different quotidian actions involving quartzites as local resources. They show us a variety of procurement behaviours that range from the quarrying of determined types and varieties in specific outcrops to the selection of raw material in secondary contexts, but also a wide panoply of resource management strategies played by Palaeolithic populations. These behaviours are heterogeneous as we humans are and they unveil that the aforementioned historical continuum is full of deviations and ruptures.

4 FUEL AND ROCKS FROM ABRIC ROMANÍ. A COMPARATIVE ANALYSES OF LOCAL RAW MATERIAL ACQUISITION PATTERNS AMONG NEANDERTHALS

Abstract author(s): Allué, Ethel (Institut de Paleoeologia Humana i Evolució Social; Universitat Rovira i Virgili - URV, Departament d'Història i Història de l'Art) - Gómez de Soler, Bruno (Institut Català de Paleoeologia Humana i Evolució Social - IPHES; Universitat Rovira i Virgili - URV, Departament d'Història i Història de l'Art) - Mas, Bàrbara (Seminari d'Estudis i Recerques Prehistòriques - SERP, Departament d'Història i Arqueologia, Universitat de Barcelona; Institut d'Arqueologia de la Universitat de Barcelona - IAUB, Faculty of Geography and History, University of Barcelona) - Fernández Iriarte, Tomás - Robledo, Andrés (Institut Català de Paleoeologia Humana i Evolució Social - IPHES; Universitat Rovira i Virgili - URV), Departament d'Història i Història de l'Art)

Abstract format: Oral

Fuel and rock acquisition patterns among neandertals are not usually studied together as scientific paths of each discipline often draw separate lines. Fuel procurement practices are influenced by factors such as availability, quality and quantity requirements, environmental conditions, and settlement patterns. Lithic raw materials, considered as the only physical evidence of territorial mobility, are a key element to delimit the exploitation of a territory. Rocks are analyzed for petrography and source areas, aiming to map mobility patterns of acquisition.

The aim of this research is to evaluate firewood and lithic raw materials to identify patterns of acquisition in short- and long-term occupations at Abric Romaní. It is a well-known neandertal site with a 16-layer stratigraphy, dated from ca. 40-110 ka BP. Firewood evidenced based on charcoal analyses has provided data showing recurrent exploitation of *Pinus sylvestris* type (scots pine type). In some layers, presence of other taxa such as *Juniperus* sp., *Prunus* sp., *Rhamnus cathartica/saxatilis* and *Salix* sp. are few represented. Lithic raw materials are dominated by chert (ca. 80% for most layers), sourced from primary outcrops located 16 km to the west. Limestone, quartz, and schists are considered purely local. However, these materials do not represent more than a 20% of the record and are less than 6-10% in most layers.

The general trend is that chert comes from nearby sources, where it is abundant and easy to collect. Fuel, a daily requirement, was collected from the closest area to meet quantity and quality requirements for hearths. The use of local sources suggests a foraging radius of the neandertal communities between 6 to 20 Km. The comparison of both acquisition practices considering distances, requirement, and weight, allows to discuss aspects related to mobility and proximity of the resources to the place of use.

5 LOCAL, BUT NOT SIMPLE. LITHIC RAW MATERIALS IN THE MIDDLE AND UPPER PALEOLITHIC SEQUENCE OF COVA EIRÓS (GALICIA, SPAIN)

Abstract author(s): de Lombera-Hermida, Arturo (Universidade de Santiago de Compostela/CISPAC/GEPN-AAT)

Abstract format: Oral

Cova Eirós is a cave site located in NW Iberia (Galicia, Spain), a region dominated by Paleozoic formations and almost void of flint outcrops. The stratigraphical sequence contains archaeological levels ranging from the Late Middle Paleolithic (Levels 3 and 4) to the Final Magdalenian/Azilian (Level B). The lithic raw materials available in the territory nearby the site are anhedral and euhedral quartz, quartzite, and scant cherts outcrops.

Despite the lithological constraints, the prehistoric groups managed to fulfill the techno-typological standards of the Middle and Upper Paleolithic technocomplexes. Local raw materials are used for the consecution of the most complex and technically demanding lithic production methods (Levallois and laminar reduction). Changes in raw material acquisition, spatial fragmentation of the reduction sequences, and new technical choices and adaptations (technological transfer) are other strategies applied by the Paleolithic groups to help overcome the local raw material constraints. The lithic assemblages analyzed along the Cova Eirós sequence are fully consistent with the technological templates defined in other regions where flint is dominant. The arrival of Cantabrian Upper Paleolithic groups, used to flintknapping and laminar technology, to a new lithological region implied a reorganization of their technological basis. These features of the lithic assemblages show the technical and technological flexibility and variability of the Paleolithic groups and their capacity for adaptation to environmental conditions.

6 A GEOLOGICAL PERSPECTIVE IN LOCAL OCHRE RESOURCES AND PROCUREMENT STRATEGIES DURING PREHISTORY IN NE ITALY

Abstract author(s): Cavallo, Giovanni (University of Applied Sciences and Arts of Southern Switzerland) - Riccardi, Mariapia (University of Pavia) - Zorzin, Roberto (Museum of Natural History of Verona)

Abstract format: Oral

Provenance studies carried out on yellow and red ochre fragments from two Upper Palaeolithic sites in North-Eastern Italy (Fumane cave and Tagliente rockshelter) demonstrated that the raw materials were collected from two

principal geological sources in a distance 8-20 km as a crow flies (Cavallo, 2016). Raw materials were transported to, and processed at the sites. They were fragmented, heated for the conversion into artificial hematite, powdered and used. It is relevant to point out that the procurement strategies varied markedly at Tagliente rockshelter where a major number of samples were analysed. In particular, it was observed that more resistant raw materials (quartz-rich) were selected during the first stages of occupation of the site whilst later carbonate rich ochre were collected (Cavallo et al., 2017). The explanation concerning this change might have been motivated by the necessity to use a weaker material easier to collect and process.

Other potential geological sources were not accessed for several reasons. Eocene carbonate-rich ochre found in palaeokarst caves were difficult to reach and exploit. Ochres associated with Eocene volcanic terrains are clay-based materials and (actually) relatively easily accessible, so it is not clear why these natural resources were not used.

In conclusions, it seems that Prehistoric humans used local available raw materials and selected them according to their specific applications.

Textural, microstructural, and compositional characteristics of Fe-based geomaterials and Upper Palaeolithic ochre in the Lessini Mountains, Northeast Italy: Implications for provenance studies. *Geoarchaeology*, 32, 437-455.

7 BEHIND THE LAUREL LEAVES: LOCAL UPPER SOLUTREAN PRODUCTIONS. SOME INSIGHTS FROM THE NON-FLINT LITHIC COMPONENT OF CUZOUL DE VERS (FRANCE)

Abstract author(s): Villeneuve, Quentin (Univ. Bordeaux, CNRS, Minist. Culture, UMR5199 PACEA) - Renard, Caroline (TRACES - UMR5608, Université de Toulouse Jean-Jaurès, Maison De La Recherche) - Ducasse, Sylvain (Univ. Bordeaux, CNRS, Minist. Culture, UMR5199 PACEAe) - Bracco, Jean-Pierre (Aix Marseille Univ., CNRS, Minist. Culture, LAMPEA)

Abstract format: Oral

What best represents Upper Solutrean technology are its characteristic, over-designed lithic tools, such as laurel leaf points and shouldered points. These implements, most of which were dedicated to hunting activities, depend on “high quality” raw materials (i.e., highly suitable for knapping). Thus, such resources often demonstrate long-distance circulation and spatio-temporal fragmentation of production. Other tools relying on same or similar raw materials and circulation routes are rare (e.g., endscrapers).

The emphasis on these economically invested implements has led to a more limited appreciation of the exploitation of other, low-circulation resources in the constitution of Upper Solutrean lithic toolkit. This is particularly true with regard to “low quality” raw materials (i.e., less suitable for knapping) such as most non-flint rocks (e.g., quartz, basalt, granite). However, these resources play a significant role in daily activities and related toolkits, some of which remain understudied.

We illustrate this question with the archaeological case of le Cuzoul de Vers (Lot, France). The re-evaluation of the non-flint lithic component from Upper Solutrean levels (29-31), using a set of complementary analyses such as macroscopic petrography and technological analysis, provides interesting insights regarding the activities carried out at the site as well as the duration and logistics of the occupations. These results complement the data provided by previous analysis of other archaeological components, notably flint productions and faunal remains, allowing a more complete understanding of the Solutrean occupations of the site. These inferences enhances the current vision of human behaviour during the Upper Solutrean in the northern part of the Aquitaine Basin, organized around a regional and probably seasonal mobility that appears more complex than previously thought.

8 QUARTZ DIVERSITY: IS LONG DISTANCE PROVENANCE A GOOD QUESTION TO ADDRESS?

Abstract author(s): Spinelli Sanchez, Océane (Archeosciences Bordeaux : Matériaux, Temps, Images, Sociétés, UMR 6034, Université Bordeaux Montaigne, CNRS) - Delagnes, Anne (PACEA, De la Préhistoire à l'Actuel : Culture, Environnement, Anthropologie, UMR 5199, CNRS, Université de Bordeaux) - Brenet, Michel (PACEA, De la Préhistoire à l'Actuel : Culture, Environnement, Anthropologie, UMR 5199, CNRS, Université de Bordeaux; Institut National de Recherches Archéologiques Préventives, INRAP) - Travers, Laurine (Géosciences Montpellier, UMR 5243, CNRS, Université de Montpellier) - Chauvet, Alain (Géosciences Montpellier, UMR 5243, CNRS) - Le Bourdonnec, François-Xavier (Archeosciences Bordeaux: Matériaux, Temps, Images, Sociétés, UMR 6034, Université Bordeaux Montaigne, CNRS)

Abstract format: Oral

Quartz is a material commonly used to produce lithic tools during prehistory. Despite this, the study of this material is only slightly invested in comparison with what exists for other rocks. Quartz is a mineral with high variability, both in its geological aspect and in its physical properties (macroscopic aspect, mechanical properties when knapped). The

particularity of this diversity, which is crucial for archaeology, is that it occurs in very small geographical areas. This observation leads us to imagine new patterns of selection and circulation of this raw material. Are the current questions about other lithic materials such as flint or obsidian relevant to the characteristics of quartz? The example of quartz from the Chassezac valley (Ardèche, Lozère and Gard, France) will be used to discuss the characterisation of this rock, from fieldwork to laboratory. A field study carried out by an interdisciplinary team, made it possible to constitute a sampling that was reasoned and representative of the variability. On this basis, knapping experiments were carried out to test the correlation between the type of quartz (generation, geology) and mechanical knapping properties. Macroscopic and thin section observations have enabled their characterisation to be specified. The characterisation of the rock will finally open a discussion on the selection and exploitation for tool making of this raw material by pre-historic human groups. Although often considered as a poor-quality material, the exploitation by archaeology of the constraints and characteristics of this rock can nevertheless allow us to understand their knowledge and management of the geological environment.

9 HUMAN MOBILITY IN THE WESTERN PYRENEES: RAW MATERIAL PROCUREMENT IN NEOLITHIC POTTERY MANUFACTURING

Abstract author(s): Santamaria, Urko (University of the Basque Country) - Gehres, Benjamin (UMR 6566 CReAAH - CNRS - Université de Rennes 1) - Cava, Ana - Barandiaran, Ignacio - Mujika-Alustiza, José Antonio (University of the Basque Country) - Laborda, Rafael (Independent researcher) - Sánchez Carro, Miguel - Bruschi, Viola (Universidad de Cantabria) - Utrilla, Pilar (Universidad de Zaragoza) - Cubas, Miriam (Universidad de Alcalá. Sociedad de Ciencias Aranzadi)

Abstract format: Oral

The mobility of human groups in Prehistory, among other reasons, is closely motivated by the procurement of raw materials to elaborate different artefacts. In this sense, mountainous environments are interesting scenarios to explore the local response and dynamics of raw material procurement and the mobility associated with it. The expansion of the Neolithic in Iberia has been linked to the introduction and consolidation of some technological innovations with a complex process of manufacture like pottery. However, its introduction, manufacturing and use in these environments is far from being well-understood.

In this presentation, we explore the mobility of human groups linked to the introduction of ceramics technology in the Western Pyrenees, focused on the main pottery assemblages recorded in the temporary settlements of this region (Berroberria, Abautz, Aizpea and Zatoya). Pottery, as an ecological and social product, not only keeps a geological history, but also reveals human-environment interactions through the use of different raw materials. Therefore, we explore how raw materials sources are available in the local landscape of western Pyrenees and differentiate local and allochthonous origin of raw materials in temporary settlements. Mineralogical (thin section) and chemical analyses (LA-ICP-MS) offer an integrative and systematic approach to these assemblages, allowing the comparison with geological samples gathered from the surroundings sites.

Being temporary settlements, the pottery is not necessarily manufactured at these sites, and it may come from other settlements where manufacture is taking place. Our research shows a high variability in the procurement of raw materials and technological choices, such as election of temper. In conclusion, our results suggest a high mobility of these human groups interacting with the surrounding landscape.

10 NOTHING ELSE “THAN LOCAL” MATTER? THE CASE OF LBK CERAMICS FROM ALSACE (FRANCE)

Abstract author(s): Gehres, Benjamin (CNRS - UMR 6566 CReAAH)

Abstract format: Oral

Productions made from local materials are often considered to provide little information about the societies in which they are made, or about the craftsmen. However, they can provide a great amount of data on the choices made by potters in the selection of clay, their acquisition strategies: opportunistic or targeted, or on the technical traditions of the clay modification “chaîne opératoire” of the groups studied.

In this paper, we will discuss the contribution of ceramic material analysis and the identification of local raw materials to the understanding of the LBK stylistic groups of Alsace (Eastern France), where the arrival of the LBK culture is dated to around 5355/5240 B.C. Although this culture is known to be very homogeneous and characterised by a strong similarity in domestic architecture, funerary practices, but also in the decorations and forms of pottery, local stylistic variations can be observed, particularly in Alsace, where two stylistic groups have been identified. They are located in Lower and Upper Alsace, separated by a mixed stylistic area located in the region of the city of Colmar. This distinction is particularly observable in their ceramics and decorations, and no stylistic exchange seems to have taken place for more than 500 years. What can be said about the raw materials of the ceramics of these groups? Does the local or non-local character of the production contribute to their characteristics? Have they the same acquisition

strategies? Will they exploit distant materials or adapt to local clays? Will they respond in the same way to geologically similar materials?

These questions are being addressed in the collective research programme “Territorial stylistic division during the LBK in Alsace”, and this paper will present the first results of thin section analyses carried out on ceramic from occupations.

11 **PERSISTENT TECHNOLOGICAL TRADITIONS IN A CHANGING WORLD: LATE NEOLITHIC AND EARLY COPPER AGE CERAMIC PRODUCTION ON THE GREAT HUNGARIAN PLAIN**

Abstract author(s): Gyucha, Attila (Department of Anthropology, University of Georgia) - Riebe, Danielle (University of Georgia) - Kreiter, Attila (Hungarian National Museum)

Abstract format: Oral

In a collaborative effort, the Körös Regional Archaeological Project (KRAP) and the Prehistoric Interactions on the Plain Project (PIPP) in southeastern Hungary worked together to explore how ceramic technology can be used to infer socio-cultural variation and how technological analyses can contribute to the understanding of prehistoric sociopolitical changes. This research focused on the Late Neolithic (5,000-4,500 BCE) and the subsequent Early Copper Age (4,500-4,000 BCE). Previous studies have demonstrated that interactions at multiple scales resulted in a strongly enforced socio-cultural boundary between two major Late Neolithic cultural units (i.e., the Tisza and the Herpály) in the region. By the following Early Copper Age, dramatic socio-cultural changes unfolded, including the abandonment of all Neolithic tell sites on the Great Hungarian Plain, and the socio-cultural boundary dissolved as evidenced by the mass homogeneity in the cultural material representative of the Tiszapolgár cultural unit. While some continuity between the Late Neolithic and the Early Copper Age can be seen visually through specific stylistic techniques on ceramics, variation in ceramic technology is less understood. With our project, ceramic technology was examined through the petrographic analysis of ceramics from six Late Neolithic and Early Copper Age sites and seven assemblages located within a 10-km radius in the Körös Region on the Great Hungarian Plain. This project was uniquely positioned to explore ceramic technological variation, due to a high level of geographic, geological, and chronological control of the selected sites and assemblages. The petrographic analysis resulted in the identification of similar communities of practice between the Herpály and the Tisza and illustrated that ceramic manufacturing practices continued from the Late Neolithic into the Early Copper Age, signalling continuing traditions in a fundamentally changing socio-political context.

12 **ASSESSING A NON-INVASIVE ARCHAEPETROLOGICAL METHODOLOGY IN A LATE PREHISTORY MACROTOOLING WORKSHOP. THE CASE OF THE MINE OF FONT DE FORRADILLA**

Abstract author(s): Emens-Aranas, Cristian (Seminari d'Estudis i Recerques Prehistòriques - SERP-UB, Universitat de Barcelona; Institut d'Arqueologia - IAUB, Universitat de Barcelona) - Alías, Gemma (Departament de Mineralogia, Petrologia i Geologia Aplicada, Universitat de Barcelona; Institut d'Arqueologia - IAUB, Universitat de Barcelona) - Ibáñez-Insa, Jordi (Geociències de Barcelona - GEO3BCN-CSIC) - Mangado Llach, Xavier (Seminari d'Estudis i Recerques Prehistòriques - SERP-UB, Universitat de Barcelona; Institut d'Arqueologia - IAUB, Universitat de Barcelona) - Sánchez de la Torre, Marta (Seminari d'Estudis i Recerques Prehistòriques - SERP-UB, Universitat de Barcelona; Institut d'Arqueologia - IAUB, Universitat de Barcelona)

Abstract format: Oral

A remarkable number of sites described as workshops and dedicated to the manufacture of polished macrotool artifacts has recently been documented in NE Iberia. The works have been focused all along the middle course of the Segre River Basin in the pre-Pyrenees, an area that was largely frequented by past human populations since the Palaeolithic. During our fieldwork seasons, that took place between 2020 and 2022, we identified various sets with representative elements of the bezel/polished tool chaîne opératoire, from which we count preforms, knapping debris and partial polished and picketed tools, most of them associated with human activities during the Late Prehistory. In this communication we present the interdisciplinary study applied to one of these sets, which was recovered at the mine of Font de la Forradella (Alòs de Balaguer, La Noguera, Lleida, Spain). We have applied a non-invasive lithological analysis methodology with the aim of proposing an analytical approach that carefully take in into account the material integrity of the archaeological heritage. Thus, after the application of macroscopic description of the samples, we have performed portable X-ray fluorescence (pXRF) measurements to determine the elemental composition of the collected samples. Then, the archaeological set has been compared to a geological samples' collection to infer past acquisition strategies.

13 WETLANDS AS LOCAL PLANT FIBRE CACHES IN PREHISTORY

Abstract author(s): Loudon, Nysa (University of Glasgow)

Abstract format: Oral

The local ecology of the prehistoric wetlands informs the use, material properties, and aesthetics of what is used to make fabric, cords, and ropes in prehistoric Europe and Britain and Ireland. This paper will explore the first year of PhD research that looks to explore the ecological, material, and aesthetic properties of unusual fibres in prehistoric textiles. With special reference to Britain and Ireland and the Neolithic/Bronze Age pile-dwelling lake settlements in the circum-Alpine region, this paper will set out to discuss the uses of water-side plants such as rushes (*Juncus* sp.) and Cyperaceae, riparian woodland species such as willow (*Salix* sp.), and mosses such as golden hair moss (*Polytrichum commune*) in local craft regimes. Prehistoric communities located near or on wetland environments are making pieces that are inherently tied to their management and conceptualization of their local environment and land. This research aims to investigate often overlooked types of plant-human relationships beyond/in tandem with subsistence. Evidence for these more unusual fibre plants has been difficult to prove until recently. With dedicated research into fibre identification and textile archaeology and improvements in microscopic techniques, the narrative that is emerging is that locally gathered plants played a larger role in prehistoric local craft economies than previously thought. Wetland ecologies, often existing on the edges of 'civilisation,' held many of these fibre plants. Exploration of non-subsistence plant gathering weaves a more nuanced narrative of past peoples' relationship to and how they lived within these wetland landscapes, which have often been seen by modern Western societies as unproductive, foul, and marginal.

14 LOCAL RAW MATERIALS AND POTTERY IN NW IBERIA FROM THE NEOLITHIC TO THE IRON AGE

Abstract author(s): Castro González, M. Guadalupe (EcoPast, University of Santiago de Compostela; Centro de Investigación Interuniversitario de los Paisajes Atlánticos Culturales - CISPAC) - Martínez Cortizas, Antonio M. (EcoPast, University of Santiago de Compostela; CRETUS, University of Santiago de Compostela) - Prieto Martínez, M. Pilar (EcoPast, University of Santiago de Compostela; Centro de Investigación Interuniversitario de los Paisajes Atlánticos Culturales - CISPAC)

Abstract format: Oral

Nowadays, mobility, trade, migrations and cultural interactions are the most popular explanations for technological change in prehistoric pottery. For this reason, a large number of archaeometric studies of archaeological pottery focus on how "foreign" pottery, such as international European types of prehistoric pottery (i.e. Bell Beaker or Corded Ware pottery), were spread out on different cultural areas.

However, we believe that the study of regional styles and local ways of pottery manufacture is equally necessary to understand the entire process of pottery making and how it can change, or not, over time. Therefore, we devised a large scale study of prehistoric pottery from a single region (Galicia, NW Spain). The set is composed by 568 pottery shards of 42 archaeological sites, encompassing from the Early Neolithic to the local Late Iron Age, as well as 103 samples of raw materials (i.e., clays) collected in the vicinity of the sites. X-ray diffraction was applied to determine the mineralogical composition of the samples. Principal components analysis and discriminant analysis were applied to the whole dataset to characterize the mineralogical groups in the pottery assemblage. We intended to determine whether the materials used were of local origin or not, and extract information on the possible reasons for their selection and how prehistoric potters processed the clay. Thus, we aim not only to reconstruct the technological changes/continuities in the selection and processing of raw materials, but also to explore how prehistoric communities interacted with their local landscape and local natural resources.

15 IS LOCAL "BORING?" THEORETICAL AND METHODOLOGICAL CHALLENGES IN ARGUING LOCAL CERAMIC PRODUCTION IN THE ARCHAEOLOGICAL RECORD

Abstract author(s): Golitko, Mark (University of Notre Dame) - Riebe, Danielle (University of Georgia) - Kreiter, Attila (Magyar Nemzeti Múzeum) - Duffy, Paul (Christian-Albrechts-Universität zu Kiel)

Abstract format: Oral

Local" production is both a theoretical construct and a practical definition in archaeological artifact sourcing studies. A long history of Marxist theory in economic archaeology has resulted in local production being seen as the default condition, with trade and exchange as an interesting process and activity that requires explanation. As a result, local production is often viewed as not requiring explanation, or as an uninteresting "null" conclusion. Journals may consequently be less interested in publishing articles that fail to identify trade. Conversely, it is worth asking whether analysts are too eager to identify chemical outliers as indicating longer distance trade, when they could just represent the margins of local composition. Nonetheless, numerous ethnographic accounts globally suggest that pottery trade is a regular occurrence, and that it is a rarity that every community on the landscape produced its own ceramics. Certain

economic, social, and geographic/environmental constraints may however make localized production more likely in some contexts than others. Here, we address these issues using a case study of ceramic compositional analysis at five Bronze Age sites on the Great Hungarian Plain by petrography and LA-ICP-MS. Results suggest that little if any pottery was compositionally “non-local.” However, given the geological homogeneity of the study region, the definition of what constitutes “local” is influenced by the geographic scope over which the provenience postulate applies. It is difficult therefore in this context to distinguish between a scenario in which the occupants of each site produced the ceramics that were used and deposited there, and one in which regular trade occurred across the eastern Pannonian Basin.

16 WHO IS WHO? RE-THINKING EARLY IRON AGE ETHNICITIES THROUGH LOCAL WHEEL-MADE CERAMIC MANUFACTURE IN MEDITERRANEAN IBERIA

Abstract author(s): Cutillas-Victoria, Benjamin (Institute of Nanoscience and Nanotechnology, NCSR Demokritos.; Grupo de Investigación en Arqueología, Universidad de Murcia; Centre of Excellence in Ancient Near Eastern Empires. University of Helsinki)

Abstract format: Oral

The irruption of wheel-made pottery among the Late Bronze Age communities of the Iberian peninsula began with the Phoenician colonisation. The new ceramics were the result of the application of significant technological advances, mainly the wheel and the double-chamber kilns, and were a clear departure from the traditional local hand-made vessels. This dichotomy has tended to be extended to the control of the new forming methods and kiln firing, thought to be the domain of colonial potters and only belatedly transmitted to autochthonous artisans. This situation shows the reduction of colonial encounters to a simple binary opposition between colonisers and colonised, and how multiple narratives are based on the pre-eminence of allochthonous materials.

However, the recent archaeometric analyses in several sites from the Iberian Southeast reveal the local production of wheel-made ceramics between the autochthonous, previously considered Western Phoenician pottery. Using chemical, mineralogical, and petrographic characterisation techniques allow us to discover that these local wheel-made ceramics began from early chronologies, even at the end of the 8th century BC in some inland settlements of the region. This contribution aims to analyze these potteries that we can now clearly identify as local and to discuss the importance of the new influences and the traditional patterns in the evolution of these communities. In a colonial context framework, identifying these local vessels is essential to understand local workshops, consumption patterns, and exchange networks, thus re-evaluating the weight of the Phoenician presence throughout the Early Iron Age societies and the narratives created around the identity development of each community.

17 THE PRODUCTION OF HAND-MADE CERAMICS IN THE VAR REGION : PETROGRAPHY OF THE RAW MATERIALS AND SCALES OF SOURCING

Abstract author(s): Delabre, Margot (Laboratoire ASM - UMR 5140 - UPVM3)

Abstract format: Oral

Hand-made ceramics represent the major part of Gallic ceramic production until the end of the Iron Age. The rare production sites discovered in Provence, as well as the variability of the forms and technical aspects of this pottery, point to a domestic fabric of local character. A few specific productions have been identified and seem to come from a factory, but these are only a minority of the vases found. Suffering from a permanent confrontation with imported Mediterranean ceramics present in most of the sites of southern Gaul since the 6th century B.C., the hand-made ceramics have been little studied. A petrographic analysis of the raw materials used in their manufacture makes it possible to place this production at the center of the problematics linked to the Gallic populations. The heterogeneous and probably local aspect of this production makes it possible to reconsider the pottery traditions, the management of the territory as well as the insertion of these communities in a larger sociological and cultural framework. The domestic, local or regional characterization of these productions is thus redefined according to these criteria. In order to compare data at different spatial, chronological and cultural scales, two oppidums near the coast, a plain habitat, a Gallic pottery production site and the Massaliète foundation of Olbia-de-Provence were chosen as study sites. From these collections, 181 thin sections have been made and make it possible to propose an initial analysis of the raw materials used.

THE ROLE OF LOCAL RESOURCES IN EARLY POTTERY FROM PATAGONIA (ARGENTINA): NEW NARRATIVES FROM ORGANIC RESIDUE ANALYSIS

Abstract author(s): Serna, Alejandro (University of York; Universidad Nacional de la Plata) - Lucquin, Alexandre - Admiraal, Marjolein - Montalvo-Cabrera, Javier (University of York) - Saghessi, Daniela (Universidad Nacional de la Plata) - Colonese, André (Universitat Autònoma de Barcelona) - Mange, Emiliano (Universidad Nacional de la Plata) - Ponce, Paola (University of York) - Romano, Victoria (Universidad Nacional de la Plata) - Craig, Oliver (University of York)

Abstract format: Oral

There has been a growing interest in paleodietary studies in the South American Southern Cone, especially regarding the role of domesticated plants in hunter-gatherer societies. In southern Patagonia (Argentina) recent research has focused on maize production, especially as the region is traditionally perceived to be marginal to its cultivation. Much less attention has been paid to the significance of other plant and animal resources and their role in the dispersal and adoption of pottery technology. As a result, narratives about the past are sometimes biased towards exotic domesticated crops rather than local food items.

Here we explore resource processing by Patagonian hunter-gatherers through organic residue analysis of their pottery. This analysis was carried out on ca. 100 pottery samples from Late Holocene sites across Patagonia using gas chromatography-mass spectrometry (GC-MS) and compound-specific isotope analysis of individual lipids by GC-combustion-isotope ratio-MS (GC-c-IRMS) (C16:0, C18:0). Through well-established molecular and isotopic criteria, we discern the types of commodities -marine, freshwater, ruminant, non-ruminant and plant- that might have been processed using ceramic containers. The results are used to examine whether Late Holocene Patagonian hunter-gatherers developed ceramics for specific purposes, illustrative of specialized subsistence practices in the absence of an agrarian economy.

A. LOCAL OR IMPORTED: EDXRF SPECTROMETRY COMPARISON OF POTTERY AND LOCAL CLAY SAMPLES FROM VELIKA HUMSKA ČUKA (CENTRAL BALKANS)

Abstract author(s): Mladenovic, Ognjen - Bulatović, Aleksandar (Institute of Archaeology, Belgrade) - Gajić-Kvaščev, Maja (Vinča Institute of Nuclear Sciences) - Kapuran, Aleksandar - Filipović, Vojislav (Institute of Archaeology, Belgrade) - Ljuština, Marija (Faculty of Philosophy, University of Belgrade) - Milojević, Petar (Institute of Archaeology, Belgrade) - Milić, Bogdana (Spanish National Research Council, Barcelona)

Abstract format: Poster

The site of Velika Humska Čuka, represents one of the most important multilayered prehistoric settlements in the Balkans, with a continuous inhabitation for almost six millennia. The site is located on one of the main communications hubs of Southeastern Europe, with natural roads spreading towards the north, east, and south. The excavations at the site have been conducted for almost a century, continuously yielding new finds and features from between the Eneolithic and the Late Bronze Age.

Within THE FLOW project, the elemental composition of the 10 uncommon Early Eneolithic vessels for this region and 5 clay samples from the site surroundings was determined by portable EDXRF spectrometry. The technique was chosen since the pots were reconstructed, so the applied analytical method should be non-destructive and non-invasive. The pots analysis was performed in situ, since their large dimensions. The measuring spots were chosen so that existing and available cracks suitable for measurements were analyzed. A milli-beam spot EDXRF spectrometer (in-house developed at the Vinča Institute of Nuclear Sciences, Belgrade, Serbia) was used for the analysis. A 35 kV high voltage, 800 μ A, no filter, and a 120 s measuring time were experimental parameters and kept constant during measurements of pots and clay samples.

The net peak area parameter value for the major, minor, and trace elements was selected for qualitative analysis. The same parameters were subjected to several pattern recognition techniques (HCA, PCA, DA) to explore similarities and differences among pots and raw materials. The elemental composition of the pigments used for the decoration of pots was also done using the same analytical technique and experimental setup. The detected chemical elements: Si, K, Ca, Ti, Mn, Fe, Rb, Sr, Y, and Zr, indicated similar composition between vessels and clay samples, indicating the utilization of local raw clays for production.

BIOLOGICAL PROFILING OF CREMATED INDIVIDUALS: CURRENT METHODOLOGICAL APPROACHES AND LIMITATIONS

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Cortesão Silva, Filipa (Archaeology Institute of Mérida - Spanish National Research Council; Research Centre for Anthropology and Health, University of Coimbra) - Veselka, Barbara (Multidisciplinary Archaeology Research Institute, Department of Art Sciences and Archeology, Vrije Universiteit Brussel; Analytical, Environmental, Geo-chemistry, Department of Chemistry, Vrije Universiteit Brussel) - Loeffelmann, Tessi (Department of Archaeology, Durham University; Multidisciplinary Archaeology Research Institute, Department of Art Sciences and Archeology, Vrije Universiteit Brussel; Analytical, Environmental, Geo-chemistry, Department of Chemistry, Vrije Universiteit Brussel)

Session format: Regular session

In the bioarchaeological study of cremation burials, one of the main objectives is to obtain the biological profile of individuals. Nevertheless, the morphological and structural changes to the bone, resulting from the cremation process, and the often incomplete skeletal representation in the cremation deposit, makes it difficult or even impossible to collect the required data. Particularly in recent years, considerable efforts have been undertaken to develop and further improve specific methodologies for estimating age at death, biological sex, and paleopathologies in burnt individuals.

This session aims to promote the dissemination of the most recent (un)published work in this field, while also seeking to reflect on the possibilities and limitations these methods offer. Papers may concern morphological and/or metric macroscopic methods, as well as histology, computed tomography imaging, cementochronology, and other novel applications. Another welcome contribution is the refinement of the criteria currently used, especially for biological sex attribution, to standardize procedures and increase comparability between various communities.

Since the age at death, sex, and pathologies of the deceased could have influenced their funerary treatment, obtaining a reliable osteobiographical profile is crucial. The reconstruction of both individual and group profiles boosts the understanding of factors influencing the funerary rite of past populations that adopted cremation as their main burial ritual.

ABSTRACTS

1 CREMATIONS AND THE ARCHAEOLOGY OF DEATH: A HOLISTIC APPROACH TO THE OSTEOLOGICAL ANALYSIS OF BURNED HUMAN REMAINS

Abstract author(s): Cerezo-Román, Jessica (University of Oklahoma)

Abstract format: Oral

This paper will discuss a holistic approach to conducting osteological analysis on cremated human remains. Cremation is a multi-stage process involving the body's preparation, burning the body in a pyre, and often removing remains into a secondary burial or secondary cremation deposit. The treatment of the body before, during, and after the fire, as well as the formation processes of the deposit, heavily affect the preservation and scope of the osteological analysis of human remains. Therefore, it is proposed that the osteological analysis start in the archaeological excavation and archaeological context needs to be an integral part of the bioarchaeological analysis of cremated individuals. To illustrate the benefit of this approach, two case studies from different time periods and contexts will be discussed. This will be done by detailed analysis of the archaeological context and posthumous treatment of the body combined with rigorous analysis of the thermal alteration, body preservation, estimation of age-at-death, biological sex, and determining pathologies. This approach facilitates the reconstruction of different stages, variations, and social significance of cremation rituals to the decedent, mourners, and community through time and space, as well as the identity and some aspects of the life course of these cremated individuals.

2 BIOLOGICAL PROFILES OF CREMATED INDIVIDUALS FROM PREHISTORIC GREECE

Abstract author(s): Chatzikonstantinou, Ioannis - Papathanasiou, Vasiliki (Department of History and Archaeology, Aristotle University of Thessaloniki) - Papakonstantinou, Niki (Department of History and Archaeology, Aristotle University of Thessaloniki; Fitch Laboratory, British School at Athens) - Kiorpe, Sotiria - Triantaphyllou, Sevasti (Department of History and Archaeology, Aristotle University of Thessaloniki)

Abstract format: Oral

The study of macroscopic heat-induced changes has advanced considerably in recent years based on the results of experimental, medical, and forensic studies applied to both humans and animals. The comprehension of the thermal alterations on the burnt bones reinforces the archaeological interpretation of the funerary practice of cremation,

allowing insights concerning the burning episode and the actions that precede and follow the combustion process. However, varying biological and cultural parameters, including taphonomic changes, funerary rites, burial context, post-depositional factors, method of excavation, and post-excavation treatment, can lead to progressive destruction of the bone assemblages, affecting the degree of fragmentation. Poor preservation and heat-induced changes deforming the initial size of the bones complicate the application of traditional osteoarchaeological methods for MNI, biological sex, and age estimation. In the last few years, there has been an effort to develop various techniques appropriate for burnt bones by recording the bone assemblages using the zonation system (for MNI calculation) and measuring dimorphic dimensions in cremated populations (for biological sex estimation). In this paper, we will present some preliminary results from the meticulous macroscopic examination of several cremated human bone assemblages from Greece, dating from the Neolithic (7th mill. BCE) to the Early Iron Age (11th-9th c. BCE) implemented in the framework of the research program of TEFRA funded by the Hellenic Foundation of Research and Innovation (H.F.R.I.). The emphasis will be given on the information related to the demographic synthesis and the biological attributes of the people whose bodies were subjected to burning.

3 **MAKING A DENT ON CREMAINS: COIMBRA'S CONTRIBUTION TO THE ANALYSIS OF BURNT HUMAN SKELETAL REMAINS**

Abstract author(s): Gonçalves, David (Direção-Geral do Património Cultural)

Abstract format: Oral

From the bioanthropological point of view, few tasks are as challenging as estimating the biological profile of an individual based solely on burnt skeletal remains. These are usually incomplete and fragmented. To turn things even more complicated, the bones and teeth that actually make it to the bioanthropologist's examination table may have been affected by heat-induced changes which alter their appearance and can therefore jeopardize any inferences. Benefiting from the compilation of experimentally burnt skeletons belonging to the 21st century identified skeletal collection at the University of Coimbra, efforts have been made to better understand how high temperatures affect the estimation of biological profiles. Both metric and morphological methods have been tested to better know their potential and limitations and thus assist experts on the decision process regarding the selection of the most adequate methodological procedures whenever analyses of burnt skeletal remains are required. A summary of the most important conclusions obtained so far from that undertaking is presented.

4 **ASSESSMENT OF THE CHANGES IN THE PARS PETROSA OSSIS TEMPORALIS UNDER THE INFLUENCE OF HIGH TEMPERATURE DURING THE CREMATION PROCESS**

Abstract author(s): Mackiewicz, Klementyna (Department of Archeology, University of West Bohemia in Pilsen)

Abstract format: Oral

Cremation is a very destructive ritual, behind which are deep beliefs in the purifying and releasing power of fire (e.g. in Slavic beliefs, or in Hinduism). However, some of the traditions and technical aspects are still poorly understood, and the nature of the cremains does not facilitate the interpretations.

The main aim of the study was to determine the degree of shrinkage of pars petrosa ossis temporalis under the influence of high temperature during the cremation process. Beside being the densest parts of the human skeletons, the petrous parts of temporal bones show high biomechanical strength even exposed to destructive processes. As a result, they preserve very well in cremation graves. Recognising the dynamics and degree of shrinkage of the different parts of the temporal bone may be useful for the development of new methods for the anthropological analyses, such as biological sex estimations.

In a modern crematorium in Prague (Czech Republic), an experiment was conducted by burning 15 human temporal bones and a pig's head (including soft tissues). Nine measurements were collected from each bone before the burning process. Measurements included the length and the width of the pars petrosa and the measurements of the internal acoustic meatus. Cremation was carried out under controlled conditions in a modern cremation oven. All the bones were burned together to maintain the same experimental conditions. The combustion process took about 40 minutes and the temperature reached 1000°C. Measurements of the individual bones were then repeated, and the significance of the dimensional changes was assessed.

Former studies have shown a size reduction of bone elements of 10-40% depending on bone type. However, those studies were carried out on bones composed of spongy bone. Changes to the dense petrous parts are expected to be smaller.

5 META-SEXING: CURRENT PRACTICES OF SEX-ESTIMATION OF CREMATION DEPOSITS IN ARCHAEOLOGY

Abstract author(s): Hlad, Marta (Vrije Universiteit Brussel; Université Libre de Bruxelles) - Loeffelmann, Tessi (Vrije Universiteit Brussel) - Vercauteren, Martine (Université Libre de Bruxelles) - Veselka, Barbara - Snoeck, Christophe (Vrije Universiteit Brussel)

Abstract format: Oral

Whether performed upon cremated or unburnt human remains, sex estimation is considered a key element of biological profiles within physical anthropology. Osteological data provides us with a basis for further research on palaeodemography, past socio-cultural practices, and palaeopathology. Despite the fundamental nature of sex within archaeological datasets, we rarely question how this data was obtained. While there is widespread confidence among anthropologists in the various methods routinely used for sexing, there is, to our knowledge, no clear consensus on how many traits need to be present for the sexing of cremated remains to be considered reliable. For this, and other reasons, several authors have expressed concern about the accuracy and reliability of sexing in cremation deposits, and some have even shown that multiple experts can produce different results for the same individuals. To identify patterns in sex estimation practices, we examine the available archaeological literature and use basic text-mining tools. The first part of the paper presents a review of methodological papers and observes the applicability of the methods presented therein. An inventory of available tools for sexing cremation deposits is also compiled. The second part of the paper presents a review of case studies of cremation deposits obtained from Web of Science and Google Scholar. The aim is to assess the extent to which researchers use the available tools and how they report the degree of certainty of their estimates. This research aims to provide insights into current practices, as well as reflect on the future of sexing of cremation deposits in the context of this session, and for anthropologists working on cremation deposits in the field.

6 BIOLOGICAL SEX ESTIMATION OF CREMAINS: A FIRST PROPOSAL FOR STANDARDIZING CRITERIA

Abstract author(s): Cortesão Silva, Filipa (Department of Prehistory and Archaeology, University of Seville; Research Centre for Anthropology and Health, University of Coimbra) - Gonçalves, David (Research Centre for Anthropology and Health, University of Coimbra; Archaeosciences Laboratory, Directorate-General for Cultural Heritage; Laboratory of Forensic Anthropology, Center for Functional Ecology, University of Coimbra)

Abstract format: Oral

In the anthropological analysis of cremains, biological sex estimation is a largely debatable issue. Some researchers consider it unreliable because of heat-induced changes affecting burned bone remains, while many others attempt it, nonetheless. The latter, although indicating the methods applied, rarely explain the specific criteria used for sex attribution. Moreover, even when that is the case, a lack of uniformity is noted among scholars since no widespread protocols are available. As a result, this procedure is imbued with doubts and criticism. As a contribution to fill this gap, the present paper aims to discuss and propose a first draft for future guidelines to sex estimate burned skeletal remains.

To this end, and under the light of the still lacking systematic research on the reliability of sex estimation on this kind of material, an assessment of the most appropriate methods is made, linked to an overview of the skeletal parts most frequently found in cremation graves. A first draft concerning the most suitable criteria to take into consideration during sex estimation process will be presented. Special emphasis will be given to the minimum conditions for considering an individual female or male, versus undetermined sex. We hope this work may boost the development of guidelines allowing, in the near future, the optimization and standardization of methodological procedures. This step is essential for the assessment of bioanthropological data achieved in different studies, as well as a more rigorous knowledge of the funerary practice of cremation.

7 HISTOMORPHOMETRIC METHOD ON CREMATED HUMAN BONES FOR AGE-AT-DEATH ESTIMATION

Abstract author(s): Bantavanou, Panagiota (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Pavlidis, Pavlos (Laboratory of Forensic Science, Department of Forensic Medicine and Toxicology, Democritus University of Thrace) - Valakos, Efstratios (Department of Biology, National and Kapodistrian University of Athens) - Siegmund, Frank (Abt. Ur- und Frühgeschichtliche Archäologie, Department of History, University of Münster) - Moraitis, Konstantinos (Department of Forensic Medicine and Toxicology, National and Kapodistrian University of Athens) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

Abstract format: Oral

Age estimation on cremated individuals is a challenging task because high temperatures (>300°C) prevent standard anthropological methods to perform efficiently. Up to date, histomorphological/metric methods can estimate age-at-death of inhumed individuals with standard estimation error of ± 3 -15 years, whereas the application of these methods on cremated individuals exhibit a high estimation error (>10 years). In this study, we present a new histomorphometric age estimation method based on an osteon population density (OPD) regression equation. For this, we used unburned femur samples from modern individuals of known age and sex (n=30) from forensic cases resulting on standard estimation error of ± 3 years. To make it effective for cremated bones we experimentally cremated partially femur cross-sections from the same modern individuals (n=23) at different temperatures (>300°C) using high temperature muffle furnace (CWF). The analysis of the experimentally cremated bones included measurements of the dimensions and occupation area (mm²) of the same microstructures as the unburned bones i.e., secondary osteons and osteon fragments, aiming to estimate the percentage of shrinkage of bone microstructures and calculate the OPD values. For every individual we applied mathematical correction of the OPD value by subtracting the extra density (mm²) of the microstructures resulted from the shrinkage, restoring the initial density number of osteons before cremation. The preliminary results suggest that this modification of the values provides more accurate age estimations for cremated individuals.

Funding: Co-financed by the European Regional Development Fund of the European Union and Greek national funds through the Operational Program Competitiveness, Entrepreneurship and Innovation, under the call Research-Create-Innovate (project code T2EDK-00152)

8 THROUGH THE FIRE: NEW WAYS TO IDENTIFY MATURE ADULT INDIVIDUALS AND VITAMIN D DEFICIENCY IN CREMATED HUMAN REMAINS

Abstract author(s): Veselka, Barbara - Snoeck, Christophe (Vrije Universiteit Brussel)

Abstract format: Oral

Understanding past populations and reconstructing their social roles is an important aim of anthropological and archaeological research. Fundamental variables are age, sex, and pathological anomalies with which life stages and attributed social roles can be reconstructed. The challenging nature of cremation deposits, being fragmented and incomplete, often hinders the assessment of these variables. In particular, age-at-death can be difficult to estimate and often only broad ranges (e.g. 18+ years) can be assigned. This impairs the identification of older adults and precludes the interpretation of the social roles those older adults had in past populations. The investigation of palaeopathological conditions fundamentally increases our understanding of a wide range of sociocultural variables, such as past living conditions, child rearing practices, dietary transitions, gendered division of labour, and social inequality. Yet, identification of these palaeopathological anomalies is almost exclusively reserved for inhumed individuals. This paper presents two novel methods that markedly decrease some of these lacunae. The first one, the Falys-Prangle method, assesses morphological changes to the sternal clavicle end allowing the distinction of ages-at-death over 40 years. The second method is used to diagnose vitamin D deficiency in cremated human remains, which was not possible until now. Recent research demonstrated interglobular dentine, a mineralization defect attributed to vitamin D deficiency, to still be visible in burnt teeth. Applying both methods to cremated human remains will allow the identification of older adults within burial sites, markedly contributing to our understanding of a wider range of life stages and attributed social roles within past populations. Furthermore, identifying vitamin D deficiency in populations that practiced cremation, will tremendously increase our knowledge of daily activities related to sunlight exposure and further aid in reconstructing social roles.

9 LIFE AND DEATH AT ROMAN LEGIONARY FORTRESS IN NOVAE, BULGARIA. COMPILING THE OSTEOBIOGRAPHY BASED ON CREMATED HUMAN REMAINS.

Abstract author(s): Jaskulska, Elzbieta (University of Warsaw)

Abstract format: Oral

“Osteobiography” is a term of considerable history in bioarchaeological research. Since first developed in 1970’ by Frank and Julie Saul, it was defined as creating a life narrative for a single individual based on all information available from the skeleton. However, this approach is relatively rarely employed on human remains exposed to the influence of fire, as in the case of the cremation burial rite. The obstacles can be attributed to two main problems. First is the relatively complicated reconstruction of the biological profile. The second relates to the difficulty in recognising antemortem changes in the fragmentary and taphonomically damaged fragments. These problems together produce a significant impediment to palaeopathological analysis and form a gap in the understanding of health issues in the past. The presentation will explore the unique analysis of two individuals excavated in bustum type graves to the east of the legionary fortress of Novae in Lower Moesia (nowadays Bulgaria), excavated in 2018 and 2019 by a team of archaeologists from the University of Warsaw. The intact condition of the burials and good preservation of remains allowed for recording a series of antemortem lesions, allowing for reconstruction of the diseases and way of life of these persons. The presentation focuses on bringing together the story of two individuals belonging to the Roman settlement. Although a differential diagnosis was not undertaken, the gathered information allows a glimpse into the life and death at Novae legionary fortress in the second to third century CE.

10 STATURE ESTIMATION OF BURNED HUMAN SKELETAL REMAINS - VALIDATION AND LIMITATIONS OF THREE DIFFERENT APPROACHES

Abstract author(s): Wolska, Bogumila (Institute of Archaeology and Ethnology Polish Academy of Sciences) - Vassalo, Ana (Laboratory of Forensic Anthropology, Department of Life Sciences, Centre for Functional Ecology, University of Coimbra; Department of Life Sciences, Research Centre for Anthropology and Health - CIAS, University of Coimbra; Molecular Physical-Chemistry R&D Unit, Department of Chemistry, University of Coimbra) - Marques, Maria (Molecular Physical-Chemistry R&D Unit, Department of Chemistry, University of Coimbra; Department of Life Sciences, University of Coimbra) - Batista de Carvalho, Luís (Molecular Physical-Chemistry R&D Unit, Department of Chemistry, University of Coimbra) - Gonçalves, David (Laboratory of Forensic Anthropology, Department of Life Sciences, Centre for Functional Ecology, University of Coimbra; Department of Life Sciences, Research Centre for Anthropology and Health - CIAS, University of Coimbra; Archaeoscience Laboratory, Directorate General for Cultural Heritage - LARC/ CIBIO/InBIO)

Abstract format: Oral

Heat-induced changes in bone obstruct the application of metric methods used for human stature estimation. Only a few researchers have attempted to overcome these difficulties, but their proposed approaches have not been verified so far. For this reason, we strived to evaluate the reliability of three different methods, namely (i) the Rösing’s method, (ii) a 10% shrinkage correction factor and (iii) chemosteometry. The first two relied on adopting a fixed shrinkage correction factor to stature calculation, while the latter required the FT-IR profile of the bone that predicts its precise shrinkage. Our investigation benefited from 46 skeletons of known sex and age-at-death comprised in the 21st Century Identified Skeletal Collection (University of Coimbra) that were subjected to experimental burns from 700 to 1100°C (attained after 90-188 min). The humeral, radial and femoral head diameters were measured before and after the experiments. Stature estimations were performed through them by application of the three approaches and based on the method proposed by Olivier and Tissier. Absolute mean differences between the estimations obtained on both unburned bones (control) and burned bones were then calculated. The results showed that the chemosteometric approach allowed for potentially more precise stature estimations than Rösing’s method and the 10% shrinkage correction factor. Nevertheless, all approaches were well within the error margin reported by Olivier and Tissier, as was supported by TEM% values smaller than or close to 1%. The advantage of chemosteometry was expected, since it appears to enable a more accurate assessment of heat-induced shrinkage. Additionally, the method can be routinely applied to all bones, regardless of the degree of heat-induced changes. In contrast, the application of the other two approaches is reserved only for calcined bones, although they have the advantage of not requiring further-IR analysis.

A. VIRTUALITY VS REALITY: COMBINING VIRTUAL AND PHYSICAL APPROACH FOR THE ANALYSIS OF MIDDLE-LATE BRONZE AGE URNS FROM NORTHERN ITALY

Abstract author(s): Scalise, Lucia Martina (Department of Archaeology, University of Cambridge) - Morigi, Maria Pia (Department of Physics and Astronomy “Augusto Righi”, University of Bologna; National Institute of Nuclear Physics - INFN - Bologna Division) - Cavazzuti, Claudio (Department of History and Cultures, University of Bologna; Department of Archaeology, Durham University) - Brancaccio, Rosa (Department of Physics and Astronomy “Augusto Righi”, University of Bologna; National Institute of Nuclear Physics - INFN - Bologna Division) - Seracini, Marco (Department of Physics and Astronomy “Augusto Righi”, University of Bologna; National Institute of Nuclear Physics - INFN - Bologna Division) - Bulletti, Clara - Leoni, Cristina (Department of Cultural Heritage, University of Bologna) - Stoddart, Simon (Department of Archaeology, University of Cambridge) - Benazzi, Stefano (Department of Cultural Heritage, University of Bologna) - Pomeroy, Emma (Department of Archaeology, University of Cambridge)

Abstract format: Poster

When cremation is involved, osteologists usually handle highly fragmented and altered remains. This study aims to improve the quality and quantity of information that could be retrieved from the study of cremains by combining two analytical approaches. We performed CT (Computerised Tomography) analysis of ten non-excavated urns from the Middle-Late Bronze Age (15th-12th centuries BCE) necropolis of Vicofertile (Parma, Italy) before inevitably altering the burials with micro-excavation. After the extraction of the remains from four out of ten urns, we reconstructed the individuals' biological profiles, analysed the heat-induced changes to the bones, and compared the preliminary results of the two approaches. We suggest the substantial limit to virtual analyses is technical. Using a 200 kV X-ray beam, we obtained images with sufficient quality for five samples out of ten because of the high density of the clay-rich soil embedding the bones. However, the qualitative and quantitative virtual analysis of the distribution of the remains inside the vessels provided information about the funerary practices. We assessed the potential presence of grave goods and the general taphonomy of the bones and pottery (e.g. fracture morphologies). Non-adult and adult remains were also identified, as well as potential samples for chemical analyses (e.g. teeth and petrous bones for isotopes and proteomic analyses), preventing further fragmentation or dispersion during the excavation. The results of the virtual approach were mostly confirmed by the physical investigation of the first four burials. The exceptions were regarding the bones' taphonomy (e.g. the presence of concretions that were not identified in the scans) and the addition of data about the individuals' sex and age at death. The scans proved to be an essential tool to guide and speed the excavation process and help preserve the completeness of the vessels and potential metal objects and facilitate their restoration.

B. THE CREMATION WEIGHT AND THE BIOLOGICAL PROFILE OF INDIVIDUALS AT THE ROMAN PERIOD CEMETERY OF BRUDNICE, POLAND

Abstract author(s): Dzierlinska, Monika (Faculty of Archaeology, University of Warsaw)

Abstract format: Poster

The examined remains came from the multicultural cemetery dating to the Roman Period, discovered in the Brudnice site 5, Poland. The aim of the research was to reconstruct the biological profile (including the total weight per the cremation deposit) of the individuals as well as analyse the differences in weight between various demographic and cultural groups. This way, repetitive patterns in total weight of the cremation deposits can be observed.

The examined collection contains 126 burials of the Wielbark culture, dating to the Younger and Late Roman Period and 54 burials of the Przeworsk culture, dating to the Early Roman Period. The total weight of cremated remains was documented after 2 mm sieving. For biological profile assessment, standard methods have been applied when available. When the diagnostic elements were missing only distinction between non-adults and adults was possible.

The average weight of the Wielbark culture's single burials of adult individuals was 171.9 g (n=77), while on the male burials it was 732.8 g (n=6) and on the female's only 474.5 g (n=12). For the non-adult burials the average weight was 27.5 g (n=29). The average weight of the Przeworsk culture's adult burials was 771.5 g (n=32). On the male burials it was 1134.8 g (n=5) and on the female's 806 g (n=15). For the non-adult burials the average weight was 65.2 g (n=16). The comparison of the results between Wielbark and Przeworsk culture indicated a significant differences in most demographic groups.

There are no reasons to believe that differential post-depositional preservation alone could account for such disparity. All discussed graves come from one site with small area and short chronology of its use.

The presentation aims to show the results of the research and discuss whether the recorded patterns in the total weight at Brudnice indicate differences in ritual practices.

SKILLS FOR THE FUTURE? [TEACHING AND TRAINING COMMUNITY]

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Geary, Kate (Chartered Institute for Archaeologists) - Karl, Raimund (Universität Wien) - Jones, Cara (Chartered Institute for Archaeologists)

Session format: Round table

The ways by which archaeologists gain the knowledge and skills they need are varied, from traditional academic teaching to vocational training and experiential learning. The priorities for teaching and training will also vary across jurisdictions and different types of institution – some may focus on traditional delivery mechanisms and curricula, others on passing on skills already available or addressing immediate skills gaps. This session will attempt to look into the future to ask what are the skills archaeologists will need five, ten or twenty years from now? How good are our mechanisms for identifying, and addressing, future skills challenges before they become acute? Or are we destined to be, literally, stuck in the past equipping archaeologists with skills that are no longer needed or preparing them for jobs that no longer exist?

During this roundtable, we would like to explore

- How future skills needs are identified and addressed
- How we can improve the way we prepare archaeologists for the careers of the future
- How new concepts, approaches or methodologies can be better integrated into teaching and training
- The mechanisms for better knowledge transfer between different branches of archaeology

We invite participants to contribute their thoughts, challenges and case studies to the discussion. We particularly welcome contributions addressing future skills needs in heritage management, in relation to the impact of climate change and in public archaeology and delivering social value and contributions which consider how we might need to adapt to deliver to more diverse audiences in the future.

URBAN AND UNDERGROUND ARCHAEOLOGY EXPOSED: 15 YEARS CULTURAL HERITAGE EXPERIENCE AND PUBLIC OUTREACH [URBAN ARCHAEOLOGY]

Session theme: 3. Heritage Narratives and Representations

Session organisers: Os, Bertil (Cultural Heritage Agency of the Netherlands) - Wijk, Theo M.A. (Domunder, Utrecht) - Bouwmeester, Jeroen (Cultural Heritage Agency of the Netherlands) - Belford, Paul (Clwyd-Powys Archaeological Trust) - Wiehen, Michael (Stadt Koeln)

Session format: Discussion session

In 2009 the EU funded initiative Portico started research on how to integrate urban developments with underground archaeological visiting centres. In this project the dissemination of knowledge about building, maintaining, exhibiting an underground visitor center and involving the public stood central. Initiatives had been launched at various locations in Europe, for example in Gent, Cologne and Utrecht. But much has also been done outside this project to make underground archaeological remains visible and experienceable in public spaces.

This main session of the EAA Urban Archaeology Community focusses on what has been done in this area over the past 15 years, what it has achieved, but also what, if anything, could have been done better. We would like to focus on two specific themes:

- Building (underground) visiting centres around archaeological remains;
- Integrating archaeology in public space.

We would like to suggest the following topics:

- Evaluation of 15 years' experience of developing exhibited (underground) archaeological sites.
- How to build an (underground) visitor center (best practices)
- Managing and monitoring the exhibited archaeological sites
- How to combine in-situ preservation and exhibiting archaeology: site protection versus site exposition
- Impact of climate change on (underground) exhibitions (groundwater tables/ floods)
- Indoor climate and vulnerable remains (fungi, efflorescence; drying out)
- Outdoor climate and vulnerable remains (rain, sun, frost)
- Training guides and volunteers.
- Public outreach
- Making archaeology attractive (stories, VR, apps, websites)
- Preserving archaeological remains in relation to the great spatial pressure in cities

In this session we will explicitly not focus on one specific period and region and welcome papers from within and outside Europe.

1 THE LONG WAY TO THE JEWISH MUSEUM IN COLOGNE

Abstract author(s): Wiehen, Michael (City of Cologne)

Abstract format: Oral

Work on the construction of the “MiQua-LVR Jewish Museum in the Archaeological Quarter of Cologne” has been underway in the centre of Cologne since 2007.

An area of the Roman governor’s palace, excavated in 1957, will be connected with an area that has been uncovered since 2007 on the adjacent Rathausplatz to form a 6500m² underground accessible museum landscape.

The future museum is located in an outstanding position in terms of urban development. In Roman times, the multi-phase praetorium stood here on the front to the Rhine with public buildings adjoining to the south, such as a thermal bath complex.

From the 11th century, the archbishop settled the Jewish community here, which subsequently developed its own city quarter around the synagogue and mikvah in the centre.

A column-free rising building is currently being erected above these community buildings, which required a special construction technique due to its span of 40m.

As the course runs underground without barriers through the cellars and foundations of these nested construction phases, a variety of questions had to be considered in the planning.

- How are the necessary lines for electricity, power and ventilation integrated into the archaeology?
- How can the closed basement rooms be made accessible?
- How can the Roman and medieval walls, which were not founded deep enough, be secured?
- How can the exposed earth profiles be integrated into the course?
- How does the air conditioning of this underground part of the museum work?

The lecture will present the solutions to these questions.

2 UNDERGROUND ARCHAEOLOGICAL MONUMENTS: CASE STUDIES FROM THE NETHERLANDS

Abstract author(s): Schreurs, José - Van Os, Bertil (Cultural Heritage Agency of The Netherlands)

Abstract format: Oral

The basis for protection of archaeological monuments in the Netherlands is to preserve cultural sites for future generations to learn and to wonder and for future research to understand past cultures. Preserving archaeological remains in situ is one of the main objectives of the Valletta Treaty, which was signed by the Dutch government in 1992. Subsequently, preservation in situ has become one of the pillars of archaeological heritage management in the Netherlands. Another objective of the Treaty is the promotion of heritage education and raising +public awareness for the protection and investigation of archaeological heritage. Until recently, this goal has received too little attention. In addition, the Faro treaty, which is in under consideration by the Dutch government, promotes participation of the public in all cultural heritage aspects.

In the last 15 years several archaeological monuments have been exposed to the public in the Netherlands. Two of them were already accessible for the public but were renovated for larger reach, safety and preservation. Two have been developed as new visitor centers.

The Cultural Heritage Agency was involved as all these sites were listed monuments. For one case, Rijckholt neolithic flint mines, the renovation was subsidized by the agency. The cases were completely different; the initiators varied from municipalities, private parties or church organization and the degree of participation of non-professionals also varied. They all had different goals, had different construction times and planning schedules. However, in all cases the common factor was the preservation and exposition of the archaeological remains and the involvement of volunteers. In this paper we will discuss each case and lessons learned will be shared and discussed.

3 THE LESSONS OF 15 YEARS DOMUNDER

Abstract author(s): Wijk, Theo (Transformation) - Os, Bertil (RCE) - Wynia, Herre (Municipality Utrecht)

Abstract format: Oral

The design and building of an underground visitor center, DOMunder, raised an important question: How to transform a protected archaeological monument into an asset for the community and at the same time ensure long-lasting preservation? Not many parallels exist, as most archaeological sites in urban environments are seen as a burden for development. Sites are generally either excavated or left in situ; in both cases the archaeology remains invisible and inaccessible to the public. In the case of DOMunder, the conservation of the undisturbed clay profiles carrying all

historic events from roman occupation, to early missionary center, and developing Utrecht as the early Medieval religious center of the Low Countries, combined with three phases of Church building, provided even more challenges. In addition, the center is built in excavation pits that were dug in the 1949, by the Dutch prominent archeologist van Giffen. However, carefully sieving and modern metal detection of the material van Giffen excavated, revealed additional more than 100.000 finds among which an early Medieval coin treasure and remnants of bell making. Furthermore more than 200 guides were trained that allowed the more than 50.000 visitors to come in contact with their Roman and Medieval past. All of this would have not happened if strictly the in-situ preservation rule was followed. Instead, the building of the center allowed for very closely monitoring the quality of the site and anticipating the effects on archaeological remains of recent prolonged droughts and excessive rainfall due to climate change.

This presentation will focus on the outcome of 15 years building, monitoring and using the site from perspective of cultural heritage management, the archaeologist, the initiators, site maintenance and the public.

4 KILKENNY ABBEY QUARTER URBAN HERITAGE REDEVELOPMENT PROJECT - A BLUEPRINT FOR ARCHAEOLOGICAL HERITAGE MANAGEMENT AND URBAN PLANNING IN IRELAND?

Abstract author(s): Stevens, Paul (Archaeological Management Solutions - AMS)

Abstract format: Oral

This poster presents a summary overview of an ongoing archaeological, architectural and cultural heritage management, and mitigation, of a large-scale riverside urban redevelopment project, located in the heart of the medieval City of Kilkenny and the grounds of a medieval abbey.

The Kilkenny Abbey Quarter development is centred on the former Smithwick's (Diageo) Brewery complex in Kilkenny City, which includes the upstanding and subsurface remains of several national monuments including St Francis' Abbey, St Francis' Well and Evans' Turret and City Wall, part of the medieval defences. In addition, there are multiple recorded monuments from the late medieval and post-medieval, riverside and industrial heritage of the City.

This poster presents the projects collaborative and multi-disciplinary approach, and showcases the key findings, methodologies, outputs, results, and research agendas arising from the past seven years work. This project is an exemplar for sensitive and sustainable large urban redevelopment projects, where industrial and archaeological heritage can be incorporated, displayed and weaved into new public urban spaces, parks and mixed commercial-residential development.

Present by: Dr Paul Stevens and Dr Richard Clutterbuck

AMS-Archaeological Management Solutions (Kilkenny)

408 QUALITY MEASURES FOR MASS- AND AUTOMATED RECORDING OF ARCHAEOLOGICAL DATA

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Riebschläger, Fabian (Deutsches Archäologisches Institut DAI) - Novák, David (Institute of Archaeology of the Czech Academy of Science) - Roesler, Katja (Römisch-Germanische Kommission - RGK/DAI) - Auth, Frederic (Universität Frankfurt)

Session format: Regular session

High-quality research data forms the basis of scientific research. To guarantee and objectively evaluate the quality of research data, some research projects and institutions are working towards the development of measures and applicable control mechanisms. Quality control is essential and should ideally be carried out at various stages in the data life cycle. Without it, research data cannot be re-used beyond the project's original scope and cannot be FAIR or LOUD.

However, appropriate metrics for ensuring high-quality data and their integration into the research process is still poorly discussed beyond single projects or across institutions. In general, only formal and technical aspects of the data and metadata (e.g. the resolution of images or naming conventions) are integrated directly into the processing pipeline in an automated way. While virtually no metrics for evaluating the content or scientific validity of data currently exist.

This session addresses quality measures of data in archaeology and neighboring disciplines from multiple perspectives, inviting the wider archaeological community to explore key questions such as:

- How can we better understand and measure the data and metadata quality of archaeological data?
- How do we reflect differences in records of scientific data and interpretive or deductive reasoning?
- Which methods ensure and improve data quality?
- How can we implement quality checks in automated data collection workflows?
- How can we optimize archaeological data and metadata for re-use?

We also invite papers that stem from specific case studies or projects that address the above-mentioned questions in a practical manner. For instance, the experience of large scale research projects working with big data, the utilization of rapid inventory of large quantities of data, the use of new methods in the processing pipeline like machine learning and statistics, or the presentation of best practices from established guidelines.

ABSTRACTS

1 QUALITY ASSURANCE AND BIG DATA: DEVELOPING A MACHINE LEARNING MODEL FOR THE IDENTIFICATION OF ARCHAEOLOGICAL LANDSCAPE FEATURES

Abstract author(s): Curran, Susan (The Discovery Programme; Institute of Archaeologists of Ireland) - Corns, Anthony - O'Keeffe, John - Shaw, Robert (The Discovery Programme) - Kokalj, Žiga (ZRC SAZU) - Kocev, Dragi (Bias Variance Labs) - Čož, Nejc (ZRC SAZU) - Dimitrovski, Ivica - Kostovska, Ana (Bias Variance Labs) - Davis, Stephen (University College Dublin)

Abstract format: Oral

Comprising a European-wide interdisciplinary team with experts from archaeology, remote sensing, earth sciences, and machine learning, the TII (Transport Infrastructure Ireland) ALS Machine Learning Research Project aims to develop a user-friendly opensource software tool capable of automatically detecting archaeological features across the Irish landscape. This includes the development of a 'trained' machine learning model that can automatically detect three classes of archaeological earthwork monuments from ALS data.

High quality data were essential throughout all aspects of the project, from monument selection, ALS datasets and derived visualisations, coding, testing, and validation. During the creation of the ALS training data, specific focus and efforts were made in data improvements and standardisation.

The identification of suitable archaeological monument types was a challenge as the quality of this dataset was crucial in providing the best chance of a successful outcome. With c.480 individual monument classifications, careful consideration was given to select those monument types that would have, among other criteria, sufficient topographic expression and a sufficiently large volume of recorded examples.

Once the monument types were identified, more than 10,000 segmentation polygons defining the visible topographic extents of the features were digitised for testing and validation of the machine learning model. However, archaeological remains are not uniform and there can be significant differences in quality within the monument classifications and across morphology and survival. For example, a ringfort can have one or multiple enclosing features, ranging from c.15m to over 80m in diameter. Moreover, in terms of survival, they can vary from excellent preservation with clearly visible features, to almost completely obscured by vegetation, or completely destroyed or removed.

This paper presents the methods and decision-making applied in developing the model; discussing the various challenges and evaluation of key processes used to ensure the best quality data, metadata, and paradata throughout the project.

2 ACCURACY OF 3D POINT CLOUDS GENERATED BY PHOTOGRAMMETRY BY COMPARISON WITH THE LASER SCANNING

Abstract author(s): Zhao, Xinyan - Ogawa, Takuro - Hori, Yoshiki (Kyushu University)

Abstract format: Oral

Several methods for three-dimensional measurement of ancient remains and artifacts such as photogrammetry, optical scanning and laser scanning, are developed, applied and popularized in archaeological sites in recent years. Among these, photogrammetry is often used for the documentation, but its accuracy and precision are not estimated in most cases. When dealing with 3D data, it should be taken into account that, usually, an analyzing of matched points from multiple images is carried out by internal software provided by the manufacturer, then the applied methodology is hidden in a 'black box' whose procedures may hardly be reconstructed. Unlike laser scanner and optical scanner whose accuracy of measurement is guaranteed, photogrammetric processing algorithms can be easily influenced from problems with the image quality (noise, low radiometric quality, time-shifting shadows, etc.), resulting in inaccurate 3D models. Although these automated processes are rapidly and popularly being adopted by archaeological projects, the user should always keep in mind the purpose of the 3D reconstruction and making clear the difference between nice-looking and realistic 3D models and accurate 3D results, and which is important for any given application.

Based on above, this study attempted to use some basic geometric objects in different shapes as research subject. And these models, generated by three pieces of commercial software of photogrammetry under several conditions such as different brightness scenes, outdoor light at different period of the day, and different capturing method, were transferred into points cloud and compared with those accurately generated by laser scanning. Then, the difference between the points cloud by photogrammetry and precis one by laser scanning was found, which also verified the

accuracy of photogrammetry. In addition, by comparing the accuracy of points cloud generated by photogrammetry under various conditions, we also figured out the conditions on getting an ideal model by photogrammetry.

3 IMAGINING ARTEFACTS: ORGANISING DATA FOR ML-BASED ARTEFACT ANALYSIS

Abstract author(s): Blochin, Jegor - Lashmanov, Oleg - Silaeva, Nina - Korolev, Alexandr - Vasiliev, Stanislav (independent)

Abstract format: Oral

The last five years brought an exponential growth of machine learning algorithms in humanities. Archaeologists profited from this general trend and we have seen a series of promising implementations of neural network approaches in different research areas - from landscape archaeology to artefact classification. Our team of researchers is working on developing a neural network based application for artefact analysis. The main function of the application is searching for analogies in archaeological databases from several research institutions. Photographs of artefacts made by researchers, museum staff and restauration specialists are used as source data.

Addressing different databases and diverse field-work traditions makes the question of quality control for the input data vital. In spite of common practices and guidelines for data collecting and storage, sophisticated preprocessing algorithms are required to ensure high quality of data used. In this paper we describe the data preprocessing pipeline, data storage formats and several neural networks in use.

For the data pre-processing we use a late fusion CNN for digital matting approach to retrieve only objects image without background and other noisy objects. In the second step we use image vectorization techniques based on VGG, Resnet and CLIP neural networks and search for similar images on vector similarity metrics. The output is presented as a series of matches found in the connected and preprocessed databases ranged according to their similarities. The application aim is working not only with images of intact artefacts but also with fragmented objects.

The results of recognition and matching are used in the analysis of archaeological collections with a focus on contacts, cultural exchange and knowledge transmission.

4 RECORDING THE RITUAL - A DIGITAL WORKFLOW TO RECORD LARGE QUANTITIES OF POTTERY

Abstract author(s): Auth, Frederic (Goethe-University Frankfurt; Römisch-Germanische Kommission - RGK/DAI)

Abstract format: Oral

In 2016 a sacred area dedicated to the god Iupiter Dolichenus has been excavated in the Roman vicus of NIDA/Frankfurt-Heddernheim (Germany). Within the temenos, over 80 pits have been found, associated with cult practices. These pits mostly contained pottery and animal bones in large quantities, which are currently thought to be connected with ritual feasting and the deposition of remains of those actions.

The main question of this project is, whether it is possible to grasp the rituals which have taken place in the Roman vicus of NIDA and to try to focus in on the people carrying out those actions and rituals.

Especially the large number of ceramic finds have created challenges in properly recording and storing research data. One specific challenge lies in ensuring a high and sustainable data quality, another one is the selection of criteria which are to be recorded in the first place.

This contribution shall explore an early work-in-progress attempt to implement a digital workflow of selecting, recording, drawing, storing and finally processing large quantities of data on Roman pottery, from gathering of visual information through the laser-aided-profiler (LAP), standardising the input and collecting it in a database, to running analyses on the streamlined results. The aim is to provide high-quality, reusable research data-sets through means of rapid mass inventory tools and quality control measures.

5 APPLICATION OF MACHINE LEARNING AND BIG DATA ANALYTICS TECHNIQUES IN ARCHAEOLOGICAL RESEARCH

Abstract author(s): Karamitrou, Alexandra - Sturt, Fraser (University of Southampton, Department of Archaeology)

Abstract format: Oral

Over the last decade numerous satellite and aerial remote sensing instruments are scanning our planet over a wide range of the electromagnetic spectrum, providing unprecedented amount of data that are commonly openly available, causing a revolution in archaeological prospecting.

Due to the abundance of data, common tasks in research that include storage and processing became challenging, while analysis and interpretation are prohibitive solely by human analysts, requiring automated, systematic, and quantitative analysis.

In this work we demonstrate the application of machine-learning methods and big data analytics techniques in three different archaeological projects. On the first we show that a trained eight-layer, fully convolutional network can identify archaeological sites of various characteristics from around the world, using openly available satellite imagery. The second project in a similar manner uses satellite imagery and a trained deep-learning model to indirectly detect shipwrecks on coral reefs, by exploiting a discoloration of the reef that is caused from the iron contamination due to the corrosion of the wreck, a phenomenon known as “black reefs”. The third project utilizes image processing and computer vision algorithms for the detection of islets within thousands of lochs covering the whole region of Scotland. Next, a trained deep-learning model is applied to identify which of those are crannogs.

6 A MACHINE LEARNING APPROACH FOR THE DIMENSIONAL RECONSTRUCTION OF THE LAMINAR ARTEFACTS OF THE MPPNB SITES IN THE SOUTHERN LEVANT

Abstract author(s): Nobile, Eugenio (Institute of Archaeology, Tel Aviv University) - Troiano, Maurizio - University of Rome) - Mangini, Fabio - Mastrogiuseppe, Marco (Department of Information Engineering, Electronics and Telecommunications DIET - University of Rome) - Vardi, Jacob (Israel Antiquities Authority) - Frezza, Fabrizio (Department of Information Engineering, Electronics and Telecommunications DIET - University of Rome) - Conati Barbaro, Cecilia (Faculty of Prehistoric Archaeology, University of Rome “La Sapienza”)

Abstract format: Oral

The lithic industry of the Pre-Pottery B is based on the laminar reduction process that often ends with the production of tools made largely out of blades and secondly on bladelets. However, the artifacts state of conservation doesn't always allow to have a complete dimensional set of data. The presence of broken laminar blanks due to the post-depositional processes is indeed high in many sites. In order to solve such problems, we propose a machine learning analysis as a neural network approach for an automatic reconstruction of missing dimensional data based on a standardised measurements' recording of laminar artefacts's dimensions.

In Machine learning there are indeed two distinct models, one is called a supervised learning model and the other an unsupervised one, the latter is used to discover internal structures in datasets. In our case, we chose the supervised learning model, in which a feed-forward type neural network is trained with an input data vector that corresponds to a pre-established output vector, the algorithms used for learning are the Bayesian regularisation, the Levenberg-Marquardt and the Scaled conjugate gradient back-propagation. Particular attention has been paid to avoid underfitting and overfitting problems.

The neural network analysis has been carried out on Middle PPNB sites from the Southern Levant such as Nahal Yarmouth 38, Motza, Yaftahel, and Nahal Reuel.

7 IMPROVING INTERDISCIPLINARY DATA ACQUISITION METHODOLOGIES BY ALGORITHMICALLY PIECING TOGETHER ARCHAEOLOGICAL 3D PUZZLES

Abstract author(s): Mircea, Cristina (Department of Molecular Biology and Biotechnology, Faculty of Biology and Geology, Babes-Bolyai University; Molecular Biology Center, Interdisciplinary Research Institute on Bio-Nano-Sciences, Babes,-Bolyai University) - Mircea, Ioan (Department of Computer Science, Faculty of Mathematics and Informatics, Babes-Bolyai University) - Kelemen, Beatrice (Department of Molecular Biology and Biotechnology, Faculty of Biology and Geology, Babes-Bolyai University; Molecular Biology Center, Interdisciplinary Research Institute on Bio-Nano-Sciences, Babes,-Bolyai University)

Abstract format: Oral

Following up on previous research concerning the unsupervised clustering of pottery fragments based on texture and 3D curvature, and in the broader context of devising a novel data harvesting methodology to fit the needs of the current interdisciplinary approach to archaeology, we propose an algorithm for recreating a potential vessel from candidate pottery fragments from the same cluster. The issue is problematic to its dimensional and computational requirements (as usually, a significant number of pieces need to combine) and its necessity for novel interdisciplinary measurements to be employed to more clearly define the quality of the 3D reconstruction of the archaeological puzzle.

It follows a progressive puzzle-solving approach: firstly, the matchability between pieces is determined, then the problem becomes an optimization problem in a graph-like environment offering probabilistic candidate solutions to the reconstruction task.

The purpose of the current research transcends showcasing its ability to recommend pottery reconstructions from a cluster of pottery fragments. The focus is on its versatility for any generic form of archaeological puzzle-like problems (e.g. mass-burial skeletal recomposition).

The algorithm only shows its valor when presented as part of a more complex archaeological data harvesting methodology more fitted to the interdisciplinary needs of modern archaeology, especially concerning the field of machine

learning that requires a significant amount of qualitative training data. Therefore, it is just a pretext for opening a wider and broader methodological discussion on harvesting industrial quantities of qualitative scientific data, both manually and automatically, especially for the current machine learning needs of interdisciplinary research that might lead to the creation of novel data acquisition standardized protocols in the foreseeable future.

410 SOCIO-CULTURAL DIMENSIONS OF WATER MANAGEMENT IN CONTEXTS OF WATER SCARCITY

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Marsal, Roser (Universitat de Barcelona) - Salame G., María Fernanda (Uppsala University; Universidad Mayor de San Andrés)

Session format: Regular session

Water management, especially in water-scarce regions around the globe, constitutes a multi-faceted topic of remarkable historical significance, integrating different aspects of life, from the ecological to the socio-cultural parameters. In addition to environmental adaptation, water management involves the alteration of ecosystems, which has created constant links between the past and the present. The reuse, modification, and adaptation of water infrastructures demonstrate their continuing role in the socio-political organisation and cultural practices and their sustainability over time shows the resilience of the communities that managed them.

The socio-cultural implications around water management in water-scarce regions, often underexplored, intangible, or difficult to evidence archaeologically, can be considered among the most significant issues for humans. In contrast to the hydro-technological approach, which focuses on the physical infrastructure of water management, the socio-cultural approach addresses the multiple ways communities ensured the water supply from access to use.

Interpreting the archaeological record of physical structures from a socio-cultural dimension provides insights into essential questions about water management in contexts of scarcity:

1. How did societies ensure hydraulic systems' operation from their construction, maintenance, and use, and what practices did they develop?
2. Which strategies and social structures were defined by the communities to manage water resources and ensure water supply?
3. What kind of social and cultural transformations can be observed among the different communities, and what is their long-term legacy?

This session intends to explore how different approaches, often aided by historical and anthropological research, may complement each other within and between case studies to provide a more nuanced insight into the socio-cultural dimensions of water management in contexts of water scarcity. Papers may focus on reports, regardless of the type of infrastructure studied, theoretical frameworks, and specific methodologies related to this key research topic, from a broad chronological and territorial perspective.

ABSTRACTS

1 WATER STRATEGIES IN THE LATE INTERMEDIATE PERIOD CAQUIAVIRI

Abstract author(s): Salame, María (Uppsala University; Universidad Mayor de San Andrés) - Capriles, José (Pennsylvania State University)

Abstract format: Oral

Understanding the evolving dynamics between pre-columbian societies and their natural environment in the Highlands of Bolivia is a critical question for archaeological, historical, and ecological research. In this paper, we will discuss the economic strategies developed by the pastoral societies who inhabited the region of Caquiaviri in the department of La Paz – Bolivia, during the Late Intermediate Period (1100 – 1450 D.C.). This analysis will address the relationship between settlement location and their access to water management and supply sources based on the information collected during a regional survey conducted between 2014 and 2015*, satellite imagery, and the use of geo-referenced information systems (GIS). Through this analysis, we discuss the existence of a complex system of water reservoirs (cochas) and the use of geomorphological features in the landscape.

*The survey was conducted as part of the project “Reconocimiento del Patrimonio Arqueológico del Municipio de Caquiaviri” from the GIS lab at Universidad Mayor de San Andrés.

2 ANTHROPOGENIC LANDSCAPES AND WATER MANAGEMENT IN THE TIWANAKU VALLEY

Abstract author(s): Calla Maldonado, Sergio Alejandro (Universidad Mayor de San Andres; Instituto de Investigaciones Antropológicas y Arqueológicas) - Salame González, María (Uppsala University; Universidad Mayor de San Andres)

Abstract format: Oral

Lake Titicaca, one of the largest lakes in the world, is located in the Altiplano plateau, an arid environment, at an altitude of 3,812 m above sea level and has been the matrix for the development of several Andean societies in the past. It is the case of Tiwanaku, a complex statal society, known for its Civic-Ceremonial Center, recognized by UNESCO's World Heritage Convention. In this presentation, we will discuss the process of human adaptation and landscape transformation as part of the means of production and the water management strategies employed both on a small and large scale in the valley of Tiwanaku throughout time; from the beginning of the settlement process in the area until the fall of the Tiwanaku state. For this purpose, we will present the results of several regional studies conducted in the area that preserve the cultural memory of local communities and complex sociopolitical structures such as the Tiwanaku state.

3 MAPPING DESERTIFICATION IN SOUTHERN MOROCCO USING GOOGLE EARTH ENGINE

Abstract author(s): Rayne, Louise - Brandolini, Filippo (Newcastle University)

Abstract format: Oral

Earth observation is increasingly being used for recording ancient water management systems and monitoring land degradation. This research aims to assess the desertification rate in the southern Morocco, identifying areas of former, traditional cultivation which supported long-term oases since at least the medieval period. Traditional water technology can be resilient and can be linked with scientific methods (IPCC 2022).

In this paper, an open-source cloud procedure was developed to map desertification in the Ourzazate-Drâa area. We used Google Earth Engine (GEE) to apply this to a large data stack of over 200 Sentinel-2 and Sentinel-1 images and their derived products. The technique tasselled cap was applied to the Sentinel-2 data to divide it into brightest, greenest and wettest components. Sentinel-1 data in VV and VH polarisations was filtered by the same dates. Training data for 5 landcover classes (Desertified, Builtup, Bare, Treecover, Cropland) was produced and a Random Forest algorithm applied to the combined data stack. We compared this data to the location of traditional and ancient water management features digitised using high-resolution imagery. The region was investigated on the ground and the data validated in the field in November 2021 and 2022.

Areas of abandoned traditional fields were correctly identified by the algorithm. They were particularly distinguishable in the tasselled cap image, allowing them to be mapped using unsupervised classification. The Sentinel-1 data allowed areas of sand dunes and natural bare soil to be separated from the desertified fields. A small number of false positives were detected, generally representing areas of disturbed and natural sediment beside streams and roads. When combined with archaeological field data, our algorithm allowed us to detect both areas of fields which were recently desertified, and those which were abandoned prior to the oldest satellite imagery available (1960s-80s).

4 3D MODELLING AND SPATIAL ANALYSIS: A SOCIO-CULTURAL APPROACH TO WATER SUPPLY MANAGEMENT IN A SEMIARID REGION

Abstract author(s): Marsal, Roser (Universitat de Barcelona) - Carpallo, Jesús (Independent researcher)

Abstract format: Oral

The material components of water supply systems that have survived from the past, together with their human agents, are the key items of the operation and long-term feasibility of water management structures.

This paper presents the socio-cultural dimensions of the acquisition, use, and management of water supply systems at the site of Sela on the southern Transjordan plateau based on a photogrammetric model. The 3D model of the site has been designed using aerial photographs provided by the project "Aerial Photographic Archive for Archaeology in the Middle East" (APAAME). Based on this 3D modelling, this work presents a spatial analysis of the hydraulic infrastructures, the remains of urbanism, and a topographic analysis of the site. This modelling has allowed us to locate new hydraulic structures, previously unidentified by survey, and to obtain more detailed direct and indirect relationships between these infrastructures. In addition, the 3D model provided a reference to locate the various elements and correlate their surface with the topographic coordinates recorded by the total station during fieldwork. We have proposed spaces for access, management, and use of the available water resources. The interpretation of these spaces provides a basis for proposing hypotheses about how societies ensured hydraulic systems' operation, from their construction, maintenance, and use; the practices they developed; and community-defined strategies and social structures to ensure water supply and water management. Thus, this study complements research on the hydrological

and hydro-technical dimensions of water management, and water culture in Sela, contributes to its holistic analysis, and compares the outcome with the state-of-art on this subject in the area and worldwide.

5 WATER MANAGEMENT IN MYCENAEAN PERIOD. EVIDENCE FROM A TECHNICAL WORK FOUND IN EAST ATTICA, GREECE

Abstract author(s): Psallida, Maria (Ephorate of Antiquities of East Attica)

Abstract format: Oral

In 2016 and 2017, a technical work of irrigation system of the Mycenaean period was investigated in the site of Peania, East Attica of Greece. It consisted of two parallel retaining walls and built barriers, forming dams across the ravine in order to retain the water of the stream. The agricultural development, the need for water storage in case of drought, as well as the protection of cultivated land from flooding and the debris from the stream flowing down from the foothills of Mount Hymettus required the construction of flood control and land reclamation works. This construction is dated in two different periods of time and it was destroyed possibly in the end of LHIII B2 (1200 BC).

This paper focuses on the presentation of the prehistoric technical work found in the area of East Attica, in comparison with similar constructions revealed in several regions of Greece. These complex hydraulic works are developed in times of prosperity and technological development and therefore the findings from the region of East Attica, Greece indicate the existence of a population which had the knowledge of successful water management for agro-pastoral purposes.

6 WATER MANAGEMENT AMONG SOUTHERN VELEBIT COMMUNITIES

Abstract author(s): Vukovic, Morana (Archaeological Museum Zadar) - Serventi, Zrinka (University of Zadar)

Abstract format: Oral

Water as a crucial and life defining resource is especially problematic in karstic areas. The Velebit Mountain, although being an exceedingly karstic landscape, has been inhabited from the earliest times, which raises the question on ways and methods local inhabitants used to collect and manage water. The geomorphological characteristics of this territory, the permeability of limestone and lack of permanent water sources forced people to adapt and find ways to acquire this crucial resource. How successful the adaptation to such harsh environment was, is clearly attested by the continuity of life from prehistory to modern times, indicating the transference of knowledge.

In this paper we will, therefore, show how water resources were used and managed in the territory of southern Velebit, primarily during Iron Age, which will be based on archaeological finds and ancient literary sources as well as ethnological and more recent remains. We will also consider the impact those processes and activities had on the local societies and how their connections and networks were shaped by the scarcity of such vital resource - from the transhumance and markings in the landscape to distribution of settlements and trade patterns. In the end, although the primary focus will be on the southern Velebit, connections and similarities to other areas of Liburnia, the territory to which Velebit Mountain belonged to, will be considered as well.

A. INCA WATER CHANNEL FLOW ANALYSIS BASED ON 3D MODELS AT THE CHACHABAMBA ARCHAEOLOGICAL SITE (MACHU PICCHU NATIONAL ARCHAEOLOGICAL PARK, PERU)

Abstract author(s): Sieczkowska, Dominika (University of Warsaw, Center for Andean Studies; Silesian University of Technology) - Ćmielewski, Bartłomiej (Wrocław University of Science and Technology) - Bastante, Jose (National Archeological Park of Machupicchu - Dirección Desconcentrada de Cultura de Cusco – Ministry of Culture)

Abstract format: Poster

The Chachabamba archaeological site in the Machu Picchu National Archeological Park contains a unique water complex erected and modified by the Incas. Based on archaeological investigations within the ceremonial sector, it has been established that the function of this water complex was strictly ceremonial. The Incas' absolute necessity to control water flow in an architectural context is often associated with the need to apply water in a spiritual context. Moreover, hydrodynamic studies of the water supply canals have verified the previous, ritual-oriented, findings. Due to the complex characteristics of the site, which is largely overgrown by dense vegetation, we employed a methodology not previously applied in the region. Three-dimensional documentation techniques were used to produce hydrodynamic analyses of the site, which facilitated the preparation of appropriate models that are key to understanding the function of the entire water system. This type of volumetric analysis technique for measuring water flows was first applied in the region and the whole of Andes. In turn, we see great potential in the application of the described method of hydrodynamic analysis in the future. As there are many potential archaeological sites within Machu Picchu Park where this analytical method can be developed, the purpose of the presentation is to share the methodology used and discuss its possibilities and limitations.

WATER MANAGEMENT AND STORAGE SYSTEMS IN ANTIQUITY: ARCHAEOLOGICAL, HISTORICAL, AND ENVIRONMENTAL ANALYSIS OF HYDRAULIC STRUCTURES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Castro García, Maria del Mar (University of Granada) - Acero Pérez, Jesús (Department of Pre-history and Archaeology, University of Seville) - Felício, Catarina (CHAM - Centre for the Humanities, NOVA University of Lisbon) - Gangale Risoleo, Davide (UNICAL - Università della Calabria) - Le Bret, Jean-Baptiste (CNRS, UMR5140 - Archéologie des sociétés Méditerranéennes)

Session format: Regular session

Water is a resource of vital importance for humans, requiring efficient management and planning strategies for its use and control. Therefore, in Antiquity, hydraulic constructions were built to collect water from various sources (groundwater, rainwater or surface water) or to divert its flow. Likewise, although aqueducts, particularly in Roman times, allowed a greater supply in terms of water quality and quantity, it did not eliminate the practice of water catchment, which continued to be employed for a complementary use or with a storage strategy (to accumulate surplus or to avoid water shortages). We are referring to wells, cisterns, reservoirs, water channelling. These archaeological structures survived over time and were frequently reused, making certain dating difficult. In some cases, the typology of these structures is the result of the cultural influences of each community and its adaptation to the natural environment, otherwise a choice influenced by water law.

In this session we emphasize the importance of hydraulic infrastructures in the ancient world, with a particular focus on Europe and the Mediterranean region from Iron Age to Late Antiquity, both as exclusive or complementary means of water supply for human settlements, and also as a method of draining and evacuating water. Papers can present topographic, structural or volumetric analyses of these facilities, as well as their hydrogeological and environmental contextualisation. Contributions addressing methodological aspects focused on the research and archaeological record of these structures are also welcome, including remote sensing techniques for their detection, and GIS analysis. We also accept studies related to the historical background of these hydraulic constructions and their relationship to the cultural evolution of the ancient communities, as well as their role in water planning strategies.

ABSTRACTS

1 WATER SUPPLY IN THE PRE-ROMAN AND ROMAN OPPIDUM OF ZAHARA DE LA SIERRA (SOUTHERN SPAIN)

Abstract author(s): Castro García, Maria del Mar (University of Granada) - Cobos Rodríguez, Luis (Independent Research) - Martin Arroyo Sanchez, Daniel (University of Cádiz) - López Rodríguez, Antonio (Independent Research)

Abstract format: Oral

The water supply in Zahara de la Sierra (southwest of Andalusia, Spain) is attested by archaeological evidence that shows a diachronic evolution of the water management systems (3rd century BC - 18th century AD). Although rain is abundant in the region, the water supply was challenging because of the high altitude of the settlement (600 meters above sea level). Therefore, a thorough water management strategy was required for this oppidum-type settlement. Actually, hydraulic structures are the most significant archaeological vestiges on this site, with a notable presence of Roman cisterns and a conduit showing evidences that point to the same historical framework. The aim of this presentation is to propose hypotheses about the functioning of the hydraulic system from the pre-Roman (Turdetan) and Roman periods. To this end, we have investigated the oppidum and its hydraulic constructions through the technique of photogrammetry, allowing a topographic, volumetric and constructive analysis of them.

2 MONUMENTAL FOUNTAINS WITH STEPS FROM THE LATE IRON AGE IN SOUTHERN GAUL (2ND-1ST CENTURY BC)

Abstract author(s): Agusta-Boularot, Sandrine (University Paul-Valéry Montpellier 3; UMR5140-Archéologie des sociétés méditerranéennes) - Vacassy, Gregory - Vincent, Ghislain (Institut National de recherches archéologiques préventives; UMR5140-Archéologie des sociétés méditerranéennes)

Abstract format: Oral

The site of Glanum presents two remarkable monumental hydraulic installations: the „nymphaeum“ and the „dromos well“, one installed on a resurgence, the other on a water table. These fountains are imposing in terms of their dimensions, their depth and their construction techniques, made of large blocks (heavy masonry) with dry joints typical of the Hellenistic tradition. Their basin was covered. They belong to the period of monumentalisation of the site (2nd century - early 1st century BC). In the absence of parallels in southern Gaul, they were long considered unique. How-

ever, a recent excavation at Castelnau-le-Lez (Hérault) uncovered a 6 m long structure, consisting of a 3 m deep well, which was accessed by steps: this well drained the water that rose from the underlying limestone. Built from local limestone blocks using Gallic construction techniques, this well proves that this type of hydraulic monument – a perennial watering place accessible by a staircase – is of Gallic tradition, putting an end to the debate about the possible Greek origins of the Glanum fountain plan. In the latter case, only the monumental „rhabillage“ appears to be a Greco-Italian contribution. The current study of the so-called „Roman“ fountain at Murviel-lès-Montpellier (Hérault) leads to the same conclusions. This modern building was built on ancient foundations. The last of its three basins (3 x 2.45 m) also appears to be built of large shelly limestone blocks laid with dry joints. This „monumental“ basin is fed by four drains that collect the water that seeps through the faults in the limestone. Its construction is characteristic of the public buildings of the 2nd-1st century BC in Murviel and provides a direct parallel to the fountains of Glanum. These achievements shed new light on Gallic knowledge in the field of hydraulics.

3 THE WELL-BASED WATER SUPPLY SYSTEM OF THE ROMAN TOWN OF IESSO (CATALONIA, SPAIN)

Abstract author(s): Romaní Sala, Núria - Rodrigo Requena, Esther (Serra Hünter Fellow, Autonomous University of Barcelona)

Abstract format: Oral

The presence of abundant groundwater resources in the Guissona plain was one of the main factors that contributed to the foundation of the Roman town of Iesso in this location, at the end of the 2nd c. BCE. After 30 years of archaeological research in the northern district of the Roman town, a total of 5 water wells built between the 1st c. BCE and the 2nd c. CE have been documented. This evidence suggests that the use of the aquifer was a key element not only in the first phases of the town but also after the Tiberian period, when the city was probably supplied by an aqueduct. The aim of this contribution is to provide an overview of the evolution of the water catchment strategies in Iesso over time and the role that the water-wells played in the water supply of the town, especially during its coexistence with an aqueduct. Another issue that we will address with this paper is the specific extraction and water distribution methods related to these water-wells using the archaeological context of the structures and the interesting archaeological remains preserved inside the wells due to anaerobic conditions.

4 WATER MANAGEMENT IN A ROMAN CITY AT THE FOOT OF THE ALPS: AUGUSTA TAURINORUM AND THE WATERWORKS OF THE TOWN

Abstract author(s): Gangale Risoleo, Davide (Università della Calabria) - Ratto, Stefania (Soprintendenza Archeologia, Belle Arti e Paesaggio per la Città metropolitana di Torino)

Abstract format: Oral

From its foundation, between 25 and 15 B.C., the colony of Iulia Augusta Taurinorum was gradually provided with all the essential elements that defined a Roman civitas: gates, walls, sewers, streets, and the forum (the location of which remains hypothetical).

In addition to these basic infrastructures for defining the urban space, the hydraulic works necessary to collect, manage and distribute the territory's water resources were gradually built.

The available data, which are scarce and unevenly distributed throughout the city and its suburbs, have not yet allowed a complete reconstruction of Turin's water supply during the Roman period.

However, it seems possible to assume that, at the beginning of its foundation, the city was supplied with water only through wells and cisterns, and that the aqueduct was built from the late 1st century AD, at the same time as the other urban infrastructures were completed in the 1st century AD.

The aim of this paper is to clarify the current state of knowledge by merging the documentation of the research carried out by the Superintendency over the last few decades, only some of which has been published, and integrating it with the study of historical cartography and comparison with other contexts of the same chronological and geographical frame, in order to draw new interpretative conclusions.

5 WATER AND THE CITY OF VEII: A LINK BETWEEN MYTHOLOGY, RELIGION, ARCHEOLOGY, AND HISTORY

Abstract author(s): Fusco, Ugo (University of Rome „Tor Vergata“)

Abstract format: Oral

In recent years, the state of knowledge of the site has made significant leaps forward thanks to the publications of the British School at Rome and the multiyear 'Progetto Veio', started in 1996 from a convention between La Sapienza, University of Rome and the current Soprintendenza Archeologica, Belle Arti e Paesaggio per l'area metropolitana di

Roma, la provincia di Viterbo e l'Etruria meridionale. From a topographical point of view, the town of Veii stands on a plateau (h 185) and is skirted by two watercourses, both still active today: the Fosso Valchetta, the ancient Cremera, and the Fosso Piordo. The Aqua Traiana (early 2nd century AD) is known to have crossed the territory of Veii (CIL XI 3793), but did not reach the town itself. This paper aims to highlight the close link between water and the site starting from its foundation up to the Roman conquest and beyond. This bond has its roots not only in the historical and archaeological field, of which some reconstructions have recently been proposed, but also has close ties with mythology and religion.

6 WHAT DO WE KNOW ABOUT WATER SUPPLY AT MIROBRIGA (SANTIAGO DO CACÉM, PORTUGAL)? AN OVERVIEW OF THE DOCUMENTED STRUCTURES

Abstract author(s): Felicio, Catarina - Sousa, Filipe (CHAM - Universidade NOVA de Lisboa)

Abstract format: Oral

The first recorded mention of the site is by André de Resende, in 1593, in his *De Antiquitatibus Lusitaniae*. The passage explicitly refers to a bridge; an aqueduct; an enigmatic «squared stone from whence water would have flowed»; and little else.

In roughly 100+ years of on and off research excavations, a roman town emerged: With public buildings, several houses and workshops identified, as well some of the streets that connected them to each other and led to the outskirts. However, if the bridge has been always somewhat visible, said aqueduct was never identified. And what to say of the «squared stone»?

In effect, water supply is a somewhat elusive subject since there aren't traces of a supply network and public fountains or wells are yet to be found.

With some water springs identified in the area, individual buildings seem to have depended on their own means of supply. The two known bath buildings had large reservoirs dedicated to their water supply and some of the houses had private wells, but the means of supply for the remainder of domestic and commercial activities is still largely unknown.

In this communication we address these issues and analyse the known water collection and storage structures how it matches up against the town's documented water needs.

7 WATER STORAGE STRUCTURES IN PRODUCTIVE AND COMMERCIAL SPACES IN POMPEII

Abstract author(s): Sanchez López, Elena H. (Universidad de Granada)

Abstract format: Oral

Water studies, particularly those referring to Roman times, have focused on aqueducts as the main water supply structures, and on baths, public fountains and elite houses, as the main water consuming spaces. But other structures, such as wells and cisterns, were broadly used; and water was necessary in many other urban spaces.

The water supply system to Pompeii is one of the best studied ones in the Roman world, but the research has again focused on the distribution of the water supplied by the aqueduct and on the understanding of the system, especially on the water towers and the supply to the street fountains and the houses. However, there are many other spaces where water was fundamental, for instance many workshops. In this sense, water was essential for pottery production, textile works, basketry or food production, with the particularity that the individualization of these spaces is especially feasible in Pompeii. The aim of this paper is to analyze the presence of cisterns in Pompeian productive and commercial facilities.

8 RAINWATER CATCHMENT SYSTEMS AT POMPEII: DAILY OPERATION

Abstract author(s): Jansen, Gemma (Independent researcher/archaeologist)

Abstract format: Oral

Of old, people in the Roman town of Pompeii (Italy) gathered rainwater in cisterns and used that in their homes. Even after the installation of an aqueduct and the introduction of piped water into their houses, these rainwater catchment systems remained in use. The different parts, found in more than 1200 houses that have been excavated at Pompeii to this date, were aligned with each other to create a good working system: sloping roofs, waterspouts, impluvia, gutters in the garden, cisterns and puteals. In the meantime, these different parts and the technical aspects of these systems have been studied well, see for example Jansen (in press).

The human side of the system, however, has not been that much explored yet. Sure, the complete system was under supervision of the house owner and he was the one who decided to install the system and who subsequently managed its repairs and adaptations. But the daily hauling up of the water from the underground cistern, dragging full buckets through the house and the regular maintenance and cleaning of the different elements of the system was all done by slaves or other members in the household. So the Joshel and Hackworth book on Roman slaves (2014) was the

inspiration for this presentation, in which we will take a look at what actions and actors are involved in the daily use of rainwater in a household. Let us put the Pompeians to work!

- G. Jansen, in press, Rainwater collection strategies at Pompeii, in R. Bonnie and P. Klingborg (eds.) Water in Ancient Mediterranean Households, Routledge.
- S. R. Joshel and L. Hackworth Petersen, 2014, The Material Life of Roman Slaves, Cambridge.

9 THE VILLA UNDER THE LAKES. WATER MANAGEMENT OF NERO'S VILLA IN SUBIACO, ROME

Abstract author(s): Tozzi, Fabiana (Università di Roma Sapienza)

Abstract format: Oral

Subiaco, a town near Rome, is the heir of the villa built there by the emperor Nero before 60 A.D. This inheritance is not just for the territory, but especially for its name: this Roman villa was called Sublaqueum, that means “under the lakes” as actually the villa was. Indeed, it was divided in different buildings, at least five, surrounded by the mountains: this system of buildings and parks overlooked three artificial lakes. Therefore, Sublaqueum evokes the connection among buildings, nature and especially water. However, to be realised, this relationship required a complex system of structures and infrastructures: this speech focuses precisely on the water management strategies used for the construction of the Sublaqueum with different purposes. Firstly, along the Anio River, three dams and some bridges were built to cross the lakes. Certainly, such a demanding construction was not made just to create a wonderful landscape, that was only a collateral result: as it will be clear analysing both the villa and the Subiaco territory, this engineering effort was necessary for the water supply, connected with the different uses of the structures. Secondly, this villa was built in a highly rainy territory, as the name of the local mountains reveals: Simbruini Mountains, that means “under the rain”. Buildings were nestled in the excavated mountains: thus, it was necessary creating a ramified system for the water disposal and reuse. This aspect is particularly evident in the thermal pavilion where a complex and diversified plumbing system was used to collect water and to prevent it from becoming a problem, carrying where it was necessary and managing the surplus. Therefore, the Sublaqueum is an interesting case study for a sustainable water management, where the Roman water technology was used in different ways to make a potential problem a resource.

10 ROMAN DAMS IN HISPANIA. AN URBAN WATER SUPPLY SYSTEM?

Abstract author(s): Acero Pérez, Jesús (Department of Prehistory and Archaeology, University of Seville; UNIARQ - Centre for Archaeology, University of Lisbon)

Abstract format: Oral

In the territories of ancient Roman Hispania (current Iberian Peninsula) there are a large number of dams that have been attributed to this historical period. Some of them, located in the vicinity of important cities, have traditionally been interpreted as caput aquae of the aqueducts that supplied them. However, recent research has questioned the association of these structures with the aqueducts or even their time of construction. This paper aims to contribute to the debate concerning the chronology and function of some of these so-called Roman dams. For this purpose, we will analyse the most significant cases, located in the surroundings of Roman cities of Caesaraugusta (Zaragoza), Toletum (Toledo), Augusta Emerita (Mérida) and Olisipo (Lisbon). This review will indicate that it is not possible to establish a physical link between these dams and the aqueducts they supposedly supplied. These findings show the need to adopt a more cautious approach to the archaeological interpretation of these remains. It also shows the need for a joint analysis that brings together data from other fields, helping to clarify these issues.

11 ANCIENT SPRING TUNNELS OF ISRAEL : CHRONOLOGY, TECHNOLOGY, GEOGRAPHY AND CULTURE

Abstract author(s): Yechezkel, Azriel (Tel Aviv University)

Abstract format: Oral

Spring tunnels are ancient, artificial, cavities, common in the mountainous regions of Israel, designated to extract water from underground perched aquifers to the surface. These spring tunnels vary widely in their length (4~300m), source of initiative, and architectural characteristics, thus reflecting the creativity of mountain settlers as they came to find technological solutions for water scarcity.

In this paper, the analysis of a new, comprehensive data base of Israel's spring tunnels phenomenon, containing geographical-physical-and archeological- historical data, will be presented.

To date, 216 spring tunnels were found in Israel, defining it as the densest region in the Mediterranean. Cross analysis of data enabled to offer a technological typology for this water structure, which correlates to the complexity and cultural aspects of the inhabitants of Israel's mountain regions throughout history. In addition, the study proved that spring tunnels were constructed since the Iron Age (~1000 BCE) (till the 20th c. CE), thus they predate similar water structures facilitated in other regions of ancient world. These two observations suggest Israel is the focal point

of this technology. Nonetheless, in Roman Period, this phenomenon reached its peak numerically, technologically and spatially, pointing probably on Imperial hydraulic knowledge transfer processes.

A GIS based analysis of the phenomenon found correlation, throughout the periods, between the intensity and distribution of settlement in Israel's mountainous regions and the number and geographical distribution of spring tunnels.

12 A WONDER OF ENGINEERING: AQUA VIRGO AND ITS FLOW THROUGH TIME

Abstract author(s): Amadasi, Maria Elisa (Sapienza, Università di Roma)

Abstract format: Oral

Aqua Virgo is the oldest Roman aqueduct still functioning in Rome. On one hand, the mainly underground route has assured the continuous activity of the aqueduct, preserving it from the test of time and destruction. On the other hand, the few traces visible on the surface made it difficult to acquire a precise awareness of the aqueduct and its route towards Rome, and hence to represent it in plan.

To this day the general itinerary of Aqua Virgo is known, but a precise and detailed cartography is still absent.

In the past, the few inspections undertaken inside the underground channel aimed to investigate the general state of conservation and to ensure regular maintenance, while the most recent explorations, conducted between 2020 and 2022, aimed to obtain new data about the aqueduct. Modern technologies and more suitable safety measures have facilitated speleo-archaeological investigations in some parts of the underground channel in a way that has previously been deemed unfeasible.

Direct inspections of the underground tunnel have allowed a better understanding of the architectonic features of the specus, also in relation to the geological context, the water intake system, the route towards the Capital, and the diachronic transformations of the aqueduct in connection with the geographical and socio-cultural context.

Detailed reliefs of parts of the underground aqueduct, along with the resort to non-invasive techniques and GIS analysis, made it possible to acquire a better topographical awareness of the aqueduct and update the cartography in use by ACEA Ato2, the water utility company of Rome.

13 LATE ANTIQUE TRANSFORMATIONS IN WATER PROVISION, MANAGEMENT AND DISTRIBUTION IN THE THERMAL BATH ARCHAEOLOGICAL PARK OF BAIÆ (BACOLI - NAPLES)

Abstract author(s): Di Luca, Gioconda (Università degli Studi di Roma „Tor Vergata“)

Abstract format: Oral

The Thermal Baths Archaeological Park of Baiae (Bacoli - Naples) is a large site sits in a very dramatic location. Lying on the slope of the Sella di Baia hill, huge buildings (with pillars, porches, gardens and many water fountains) facing the Lacus Baianus and overlooking the Bay of Puteoli and Mount Vesuvius far away.

Here, for almost five centuries (end 2nd-1st BC – 4th AD), the Roman aristocrats spent their relaxing holidays in the renowned otium of the pusilla Roma, as Baiae was called. Several large domes were raised including bathing systems and many underground structures and their transformations over time are an interesting guideline to better understand the use and the destiny of the main water supply of Campania: the Serino aqueduct (the famous Aqua Augusta built by the Emperor Augustus for the Royal Navy at Misenum). The modifications suffered by the different sectors of the archaeological area are important not only to surface the building phases, but also to have a clearer idea of what happened to the aqueduct in the years: integrating bibliographic data with theoretical insights, closer research methods and procedures of data analysis, my research obtained new results on the history of the Roman aqueduct in Baiae, above all on its Late Antique period. In fact, they will be able to explain well all the different transformations recorded on drainpipes, water tanks with large layers of limestone, wells and rooms turned into cisterns.

14 HYDRAULIC SYSTEMS IN ROMAN THEATRES: THE TRANSFORMATION OF THE THEATRE IN OSTIA

Abstract author(s): Gottardo, Katerina (Durham University)

Abstract format: Oral

It is well-known that Roman amphitheatres could be used for water displays, such as mimic sea-battles or other performances (Coleman 1993). Less considered, however, is the use of theatre buildings for other water spectacles. Gustavo Traversari (1960) was the first to consider this theme closely, hypothesizing a type of performance called the 'tetimimo'; and, more recently, Anne Berlan-Bajard (2006) has extended his work, establishing that such water displays took place well before Late Antiquity. Nonetheless, they remain disputed in nature, lacking proper definition, and, above all, close relation to the archaeological evidence. Evidence for the supply of water to theatres remains altogether neglected.

In the Italian peninsula it has been counted 67 buildings present evidence of hydraulic systems, in most cases related to the sewerage system. Nevertheless, the presence of basins in the orchestra area or the evidence of the use of the orchestra as a pool in theatres demonstrates that these performances were played. An example of the later use of the orchestra as a pool is the theatre of Ostia, dated in A.D. 4th century. At this time, four radial rooms of the cavea and the axial corridor were converted into tanks to store water that was used for filling the orchestra. This theatre is the only example in the entire peninsula. Through the study of the original excavation reports and fieldwork on site, it has been possible to recreate the plan of the hydraulic systems of the theatre. These systems followed changes and additions due to the enlargement of the theatre itself to support the upcoming necessities. The theatre of Ostia is a crucial study for investigating the changes in this type of building from the Age of Augustus till Late Antiquity, not only in terms of structural and engineering needs but also cultural demands.

A. ABELLINUM AND ITS WATER DISTRIBUTION SYSTEM: NEW EVIDENCES FOR A WIDER COMPREHENSION OF THE HYDRAULIC INFRASTRUCTURES

Abstract author(s): Covolan, Marina (Centre Camille Jullian UMR 7299) - Musmeci, Daniela - Santoriello, Alfonso (DISPAC, Università degli Studi di Salerno)

Abstract format: Poster

Situated on the left bank of the Sabato river, the city of Abellinum (Campania region, southern Italy) represents a tangible testimony to the influence of the Roman civilization in Irpinia. The archaeological evidences (e.g. city walls, Forum, baths, a domus, amphitheatre, tombs) are located mostly on and around the Civita hill, where it is also possible to identify some structures connected to the water distribution system of the city.

Abellinum was, and it is still today, served by the Augustan Serino-Beneventum aqueduct. This infrastructure is part of the big Augustan project concerning also the better-known Aqua Augusta Campaniae.

In Abellinum the hydraulic structures already known are a section of the aqueduct and the big natatio of a domus. Latest investigations, carried out by the DISPAC (University of Salerno) within the project Progetto Abellinum. Piano per la conoscenza, la tutela e la valorizzazione dell'antico centro irpino, made possible to increase the knowledge of the distribution solutions adopted in the city.

The discovery of a piezometric tower and of a fountain's element is something yet unpublished. Both evidences are situated in public areas: the former, realized with bricks, is situated along one of the cardines of the town. Meanwhile, the fountain sculpted element has been found at the crossroads with the major decumanus and a cardo. These findings, linked to the already known infrastructures, allow to make a new and wider reflection on the methods of water distribution within the Roman Abellinum.

420 NEVER LET A GOOD CRISIS GO TO WASTE: COLLAPSE, ADAPTATION AND RESILIENCE IN THE CENTRAL MEDITERRANEAN AROUND THE 1200 BC

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Vinci, Giacomo (University of Siena) - Speciale, Claudia (IPHES Catalan Institute for Human Palaeoecology and Social Evolution) - Sabatini, Serena (University of Gotheborg) - Palmisano, Alessio (University of Torino)

Session format: Session with keynote presentation and discussion

The Central Mediterranean represented a key area within the vast and unprecedented exchange network that defines the Mediterranean in the second part of the 2nd mill BC and that apparently ended around 1200 BC. It was recently argued that the 1200 BC was a turning point for many European societies and that the climatic event recorded in this period (3.2 Ka BP) in various parts of Europe triggered important socio-economic changes. In particular, the decades around this year corresponded to a period of dramatic shifts in the Central/North Mediterranean (e.g. abandonment and reorganization of settlement, new forms of social organization), supposedly influenced by environmental change/stress. For instance, a complex range of ecological, economic and social factors has been evoked for the disappearance of the North Italian Terramare Culture or settlements of the Po Plain. However, many other regions deserve the same attention and the hypothesis of an environmental 'crisis' in this area still needs more robust evidence.

To what extent/ the 3.2 Ka BP event – if so – impact on the Central Mediterranean Late Bronze Age communities? Is it possible to detect adaptive responses (social, economic) to environmental changes at regional or lower level? Is it possible to detect short catastrophic events (e.g. frequent flooding, droughts)? Could have changes been induced or amplified by the widespread anthropogenic modifications on the ecosystems documented from around this period, through unsustainable practices (e.g. replacement of species, extensive agriculture, fire activity?).

In this session we address these questions with a multi-proxy approach (including, but not limited to, geo-archaeological, GIS-based and statistical, paleo-ecological, demographic) in order to compare archaeological evidence, land-

scape and environmental changes occurred around 1200 BC with possible shifts in the settlement forms and patterns or economic strategies. Different scale of analysis (site-based, cluster of sites, regional) are very welcomed.

ABSTRACTS

1 OXHIDE INGOTS IN THE CENTRAL MEDITERRANEAN: INNOVATION, ADAPTATION AND RESILIENCE

Abstract author(s): Sabatini, Serena (University of Gothenburg)

Abstract format: Oral

The so called oxhide ingots from the Late Bronze Age are an intriguing class of objects. They have been found all over the Mediterranean and also in continental Europe. Their number, chronology, distribution patterns and puzzling characteristics have been the subject of several studies and variously interpreted. They provide a glimpse into the extraordinary complexity of the Mediterranean and to a certain extent of the European continental world during the 2nd half of the 2nd millennium BCE. Their long *durée* overcoming the 1200 crisis suggests also that the contrast between transformation and resilience affected the Bronze Age 'international' metal trade, but that different forces maintained longstanding traditions even in times of changes. A critical review of the distribution pattern of the oxhide ingots paired up with critical attention to the chronology of the phenomenon invites reflecting on the role of the Central Mediterranean Bronze Age communities as 'mediators' between old and new times.

2 MEDITERRANEAN MOBILITY AND THE 3200 BP TRANSFORMATIVE LANDSCAPE: THE CASE OF PHAISTOS, CENTRAL CRETE

Abstract author(s): Borgna, Elisabetta (Università di Udine -Dipartimento di Studi Umanistici e del Patrimonio Culturale) - Todaro, Simona (Università di Catania - Dipartimento di Scienze Umanistiche)

Abstract format: Oral

The debate on the 3200 BP crisis in the Mediterranean has been approached from different perspectives and in recent decades has been challenged by several environmental researchers, who have highlighted the severe impact of climate factors on population dynamics and societal collapse. This is especially true in the case of Crete, where an intense, even bitter debate has opposed scholars who link the foundation of settlements on high locations to climate change, and scholars who instead explain the resumption of dispersed settlement and the abandonment of the coast-land and lowland as a response to the threat represented by pirates and invaders.

New data deriving from ancient shoreline and geoarchaeological surveys of inland areas have provided new insights into the landscape of "collapse", in particular concerning those lowland sites which apparently did not experience substantial disruption, such as Phaistos in south-central Crete. In the years around 1200 BP the site, while nowadays being at a distance of 5.6 km from the sea, participated in a new maritime koine involving several Aegean harbours, such as Tiryns in the Argolid, and was specifically connected with Central Mediterranean coastal sites, from the Ionian gulf to Sardinia.

By adopting an integrated multi-proxy approach, we argue that the communities that settled the Phaistos hill in certain periods of its long-term occupation had direct access to the sea. More specifically, in this paper we will argue that around 1200 BC, the Phaistos community took advantage of a series of landscape changes. From this perspective we propose to use south-central Crete as a case for readdressing what might have been the major factors that determined the impressive maritime connectivity linking the Aegean to the central Mediterranean regions.

3 BEHOLD, A SWORD! LATE BRONZE AGE SOCIAL CHANGES SEEN THROUGH THE ANALYSIS AND INTERPRETATION OF A "DAGGER" FROM LUCUS FERONIAE

Abstract author(s): d'Ercole, Vincenzo - Bevilacqua, Adriano (Università degli studi di Chieti-Pescara) - Di Giovanni, Andrea (Università degli studi di Roma)

Abstract format: Oral

During the 2011 campaign in the RBA necropolis of Lucus Feroniae a bronze object found in tomb 8 of the necropolis was interpreted as a ,pugnaletto a codolo' (,small-tanged dagger'). Defining this weapon as a ,dagger' is problematic as we can identify two issues:

- RBA Central Italy seems to be characterised by a prohibition regarding the deposition of weapons in tombs, and they are mostly found as votive offerings and in hoards;
- the blade of our "dagger" has parallel margins and a lenticular cross-section, which is not useful for thrusting, but it aligns with contemporary sword types.

One might construe this ‚small dagger‘ as a miniaturistic sword. The miniaturisation of grave goods suggests the development of a complex hierarchical society that could maintain levels of production necessary for organised exchanges and the management of surpluses. Traces of this complexity could be inferred from the analysis of LBA settlements in the Lazio Region, as well as the EIA necropoleis of Latium Vetus. If our ‚small dagger‘ is a miniaturised sword, then it would be the earliest Italian example of miniaturisation in a funerary context.

A second possible interpretation for this “dagger” is an “experimental” weapon: an attempt to shorten a sword which would indicate a change in warfare from the MBA that would result in the short swords used in the FBA and EIA. This theory is supported by traces of blows found not only on this ‚dagger‘ from Lucus Feroniae, but also on the edges of other Bronze Age ‚daggers‘ ranging from the MBA to the FBA, suggesting a slashing use of these weapons. Contextualizing this interpretation with coeval sword types and the resulting military trends of the period we can see how between RBA and FBA the Italian peninsula went through great societal, cultural and economical changes.

4 GEOARCHAEOLOGY OF THE LARGEST PREHISTORIC MOUND IN EUROPE: MULTIDISCIPLINARY INVESTIGATIONS IN THE HILL OF UDINE (NE ITALY)

Abstract author(s): Vinci, Giacomo - Fontana, Alessandro (Department of Geosciences, University of Padova) - Mocchiutti, Andrea (GeoMok s.r.l) - Muscio, Giuseppe - Visentini, Paola (Museo Friulano di Storia Naturale, Comune di Udine) - Bassetti, Michele (Cora Ricerche Archeologiche srl) - Novellino, Massimo (Department of Geosciences, University of Padova) - Musina, Giorgia - Bonomi, Simonetta (Soprintendenza Archeologia, Belle Arti e Paesaggio del Friuli Venezia Giulia)

Abstract format: Oral

According to legend, the hill dominating the city of Udine (NE Italy) was built by Attila the Hun’s soldiers in the 6th century, but its natural or anthropogenic origin has been debated until now. In the framework of a collaboration between Ministry of Culture, Municipality of Udine and University of Padova, five new stratigraphic cores were drilled in 2020-2022 up to 40 m of depth from the hilltop and some new archaeological excavations were carried out.

Geoarchaeological and other multidisciplinary analyses allow to demonstrate that the hill is an anthropogenic mound erected between 1400–1150 BCE and that, later, folklore has transformed the ancestral memory of its origin into legend. The hill, which measures 30 m in height and over 400,000 m³ in volume, had already these dimensions since the its first construction and, thus, it is the largest prehistoric mound in Europe.

The mound consists of alternations of gravelly and soil lenses which seals occupation layers that are radiocarbon dated. Sediments were quarried in the surroundings of the hill and this excavation led to create a depression extending for almost 100,000 m² that was used as a water basin for supplying the settlement. The implementation of this new systems of water management and supply might be tentatively connected to the severe drought occurred in northern Italy at the end of the Bronze Age, as testified in the Po Plain, where a significant drop in the water table is recorded in the last phase of the Terramare cultural group.

Like a few other fortified settlements located in NE Italy, Udine survived the collapse of the Terramare coeval to that of several Eastern Mediterranean societies in the 12th century BCE. This suggests the resilience of the area to the onset of socio-political and/or climatic stresses.

A. CLIMATE CHANGE AND SOCIAL COLLAPSE IN PREHISTORY: A LOST CAUSE?

Abstract author(s): Molloy, Barry (University College Dublin)

Abstract format: Poster

Prehistory is full of turning points. Viewed in long-term perspective, we don’t take issue with these ups and downs. But when we zoom in to interrogate the nature and timing of disruptive events, particularly when framed as crises or collapse, debate is sure to follow. At a basic level this relates to the issue of cause – for rapid social change, we can feel on a firmer footing speaking of multiple interlocking factors operating at different spatial, temporal and social scales to explain how and why societies change. It is wordy and unspecific, but works. The idea of a single, over-arching cause for rapid and exceptional social changes remains anathema. Yet, we repeatedly encounter arguments that climate change was a driver of major collapses around the world, often from outside our specific discipline. These claims have a sensational click-bait aspect which tend to be roundly rejected. We also see an increase in efforts to bring the archaeological record and paleoclimatology together to investigate how past climate conditions can serve as laboratories or exemplars for challenges we face today. Ultimately, the jury is still out on how we can constructively address climate, causation and social change in the same breath without over-simplifying things to make the diverse and often incompatible data and timelines fit.

The resurgent interest in collapse studies provides critical literary context to human-climate relations. Rather than a failure, collapse is increasingly seen as a forced but creative response or adaptation, and despite potential tragedy in the short-term, it relates to resilient aspects of a society. Aiming to avoid environmental determinism, how can we

constructively speak of the thorny issue of causation when social and climate changes correlate in time and place? This paper explores changes in both datasets in southern Europe ca.1200BC with the above challenges in mind.

423 WRITTEN IN STONE: ARCHAEOLOGICAL APPROACHES TO INSCRIBED STONE MONUMENTS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Forsyth, Katherine (University of Glasgow) - White, Nora (Maynooth University) - Gleeson, Patrick (Queens University Belfast)

Session format: Regular session

From its antiquarian origins, the study of inscriptions was long driven by philologists and historians whose primary goal was the extraction of textual data. In recent decades, more 'archaeological' perspectives have been successfully applied to inscribed monuments, addressing new questions and gaining new understandings of the social and cultural context of epigraphic material. These more holistic and theoretically informed approaches include, for instance, consideration of materiality, embodied engagement, object biography, and landscape context (at various scales). Hitherto, technical aspects of field epigraphy and documentation have to a large extent been dominated by the norms of Classical epigraphy, but these have varying degrees of applicability to other epigraphic traditions across the globe, including those which emerged in the non-urban, relatively small-scale societies on the northern and western periphery of the (former) Roman Empire. This is beginning to change as the new field of historical graphematics (the comparative study of historical writing systems) emerges, and initiatives such as the global EpiDocs community diversify the scope of their guidelines and schema to ensure common global standards for documenting epigraphic material in a broad range of scripts using TEI XML. The session provides an opportunity to look comparatively across different epigraphic traditions to examine what archaeology can contribute to the study of inscribed stone monuments. There will be a particular focus on the non-latin writing systems of Celtic Britain, Ireland, and Scandinavia (the ogham and runic alphabets), especially in the period 4th-11th cent CE. However, we welcome contributions from those applying archaeological perspectives to epigraphic material in other regions and from other periods, including non-monumental and portable inscriptions.

ABSTRACTS

1 DIPINTO INSCRIPTIONS FROM THE ISLAMIC WORLD, 7TH-9TH CENTURIES: AN ARCHAEOLOGICAL APPROACH

Abstract author(s): Nol, Hagit (Goethe University Frankfurt)

Abstract format: Oral

According to the narrative sources, Arabs conquered large portions of North Africa and western Asia during the 7th century CE. Then, based on the documentary evidence, an administrative system emerged following the conquests, with Arabic as its main language. Excavations reveal a possible related phenomenon during the 8th and 9th centuries in that region: the use of various surfaces for writing with ink or pigments. This could be found in a very broad region – between Libya and Pakistan. The surfaces include animal bones, fieldstone, or sherds ('ostraca'), bowls and jars, plastered walls, and marble fragments. The languages employed in these texts are Arabic, Coptic, Greek, Aramaic, Syriac, Pahlavi, and Sogdian. The functions of the inscriptions include spells, contracts, debt lists, and writing exercises, among many other. These finds fall between the cracks: often avoided by archaeologists (because they are 'texts'), by historians (because they are 'archaeology'), and even by epigraphers (because they are not carved). The archaeological approach to dipinto inscriptions will be the focus of this talk. That entails the understanding of the physical context of dipinti, their relation to other finds, and the materiality of both surfaces and ink/pigments. Moreover, through mapping, we can learn about the spatial distribution of all finds as well as their spatial absence from the surroundings. This also allows for focusing on changes over time, correlation between different characteristics, and networks. The main objective of this research is understanding the cultural and/or economic reasons for the phenomenon.

2 TEXT AND OBJECT, DATA AND METADATA: USING DIGITAL METHODS AND TOOLS TOWARDS A MORE HOLISTIC APPROACH TO EARLY IRISH EPIGRAPHY

Abstract author(s): White, Nora (Maynooth University)

Abstract format: Oral

This paper will highlight some of the current work on early Irish epigraphy, particularly with regard to archaeological aspects. In addition to employing digital imaging techniques for recording, visualising and analysing inscribed stones

and other objects, projects such as OGHAM (<https://ogham.glasgow.ac.uk>) and EMILI (<https://emili.celt.dias.ie>) are utilising methods from the field of digital epigraphy, which up to recently has been focused on Classical epigraphy. In particular, the use of EpiDoc encoding (a subset of TEI developed for the publication of digital editions of ancient inscriptions) addresses, not only the transcription and editorial treatment of texts as well as palaeographic analysis, but also the history and materiality of the objects on which the texts appear.

Digitisation and digital documentation of this material has resulted in considerable attention and focus on the materiality and visual representation of the inscriptions. Digital methods can also help us to understand and communicate the relationship between text and support material, monument and archaeological landscape, as well as the functions and broader contexts of the inscribed objects. Working in collaboration with archaeologists, our aim is to work towards more interoperable, open and sustainable datasets and digital resources in order to progress interdisciplinary research on inscribed monuments.

3 EXPANDING TEXT, COMPLICATING RE-USE: CITATIONALITY AND TROPE IN PICTISH STONE MONUMENTS

Abstract author(s): Hansen, Daniel (The University of Chicago)

Abstract format: Oral

Pictish symbol stones from first millennium CE northern Britain have long provoked impressions of enigma. With new evidence strengthening the case that the symbols represent linguistic information, this air of mystery has been channeled into decipherment. Yet “meaning” encompasses more than denotation. If we are to understand late antique epigraphy as embedded in, and consequential for, social life, we need to account for the dialectical relationship between the act of inscription and “macro”-social phenomena like identity, temporality and authority.

I posit that archaeology can contribute to such an understanding by attending to notions of “text” not from classical epigraphy but from the research on the semiotics of interaction. This study focuses especially on citationality: the quality of a text that allows it to represent or reproduce another, while reflexively highlighting the act of representation itself. I propose that a study of late antique inscription with respect to the context of its instantiation can illuminate domains of meaning beyond the denotational value of the inscription, especially in cases where the inscribed stone is re-used from some other social context. Are there dimensions of the new context of inscription that point to the act of re-use? Are there typified socially salient genres of re-use, such as imputed continuity, legitimation, or subversion of the original context?

This study investigates the immediate landscape context of a set of Pictish stones that are known or hypothesized to have been re-used from prehistoric social contexts. I incorporate remotely sensed geospatial data and use spatial statistics to determine whether certain variables co-vary with the probability that a stone is re-used. I assess these patterns to infer genres of re-use, or citational tropes. I draw on historical research in Pictland to inform an understanding of the wider social context of identity and politics possibly invoked in these processes.

4 VARIATIONS IN LANDSCAPE CONTEXTS, A COMPARISON BETWEEN OGHAM AND PICTISH SYMBOL STONES

Abstract author(s): Gonzalez Bojaca, Leidy (University of Aberdeen)

Abstract format: Oral

This paper will briefly present the results of an exercise to mass quantify the landscape context of Ogham inscribed stones in Ireland and Pictish Symbol Stones in Scotland. This exercise was done with the goal of testing common/traditional understandings of both monumental traditions and their relationship with adjacent spatial features, to see how widespread and with what intensity these common associations appear under an all-encompassing, quantitative and comparative view.

This required, beyond an up-to-date database of location and content of the inscribed monuments themselves (circa 400 for each region), the grouping of possibly influential geographical and archaeological features, usually mentioned in the relevant scholarship: waterbodies, burial features (cists, cairns and barrows), approximate political boundaries, among others; and the subsequent use of GIS for all spatial analysis, including distance measuring between both, inscribed monuments and landscape features. Distribution analysis was used to search for possible correlations between monument/inscription content and landscape context. Furthermore, by acquiring consistent measurements across all inscribed monuments for both regions, regarding common associated features, grounds for a comparison were set.

As a result of these explorations it will be argued that while both scripts speak of a common phenomenon of the Early Medieval Period in the regions beyond the Roman Empire’s direct influence, both show stark distinctions between each other and in internal localities per region. These internal variations seen in the monuments and their relationship with their immediate and close landscape context speak of their societies’ use of literacy (and its public display) to manage power and land. Despite showing a similar technique of expression, there is a different approach to the mes-

sage and intention in the monuments, hinting at a different relationship of these societies with the land they occupied and the logics of spatial organisation applied.

5 ANCESTRAL LANDSCAPES: THE LANDSCAPE CONTEXT OF OGHAM MONUMENTS IN FUNERARY LANDSCAPES

Abstract author(s): Gleeson, Patrick (Queen's University Belfast)

Abstract format: Oral

This paper explores the landscape setting and wider context of early ogham stones within the corpus from Ireland. The function and role of ogham stones is multifaceted, but a link with burial and ancestral claims to land is often embodied in later textual sources. This link, however, has not always been apparent in the monumentality and landscape setting of ogham stones. Nevertheless, the character of ogham inscriptions suggests that one important dimension of ogham is their commemorative character. In particular, this paper explores the link between inscriptions, landscape, and monumental strategies, embedded in the setting of ogham monuments within larger funerary landscapes. It critically examines the role of these inscriptions as commemorative markers within ancestral landscapes through a range of case studies, including the early stones of Lugnacappul, Co. Kerry. Exploring the monumentality of ogham, it will explore the wider claims to territory and identity inscribed in ancestral places by the combination of ogham and related monuments.

6 NEW WORK ON ULSTER OGHAM STONES

Abstract author(s): Forsyth, Katherine (University of Glasgow)

Abstract format: Oral

The seven ogham-inscribed pillars from Ulster constitute only a tiny fraction (0.02%) of the total number surviving from Ireland. They have received little scholarly attention and have not been previously studied as a group. Yet they provide important evidence for a pivotal period in the north of Ireland's history, particularly when scrutiny is given to their landscape contexts. Though few in number, this group is heterogeneous and widely distributed, ranging geographically from Topped Mountain, Co. Fermanagh, in the west, to Gartree, Co. Antrim and Drumconwell, Co. Armagh in the east; from Aghascrebagh, Co. Tyrone, in the south to Carncome, Co. Antrim and Dunalis, Co. Londonderry in the north. This dispersion, it is argued, is the key to understanding the social position of the people who erected them, and thus about the role of monumentally inscribed texts in the articulation of political power in 5th/6th century Ireland. Hitherto, the oghams of Ulster have tended to be viewed as peripheral to the main ogham phenomenon further south, but when these monuments are placed in a wider context, which encompasses ogham in adjacent parts of Britain and the Isle of Man, a more accurate picture emerges. The result is fresh insight into the origin and spread of the ogham tradition as a whole.

This paper presents the results of a programme of fieldwork and digital recording conducted in 2022 by the author and colleagues Dr Megan Kasten (Glasgow) and Dr Nora White (Maynooth) as part of the AHRC-IRC-funded OG(H)AM project (www.ogham.glasgow.ac.uk).

426 USES OF MATERIAL CULTURE IN VISUAL REPRESENTATIONS OF 20TH AND 21ST CENTURY CONFLICT HERITAGE

Session theme: 3. Heritage Narratives and Representations

Session organisers: Kim, Geonyoung (University of Cambridge) - Lawes, Tonia (University College London) - Zoh, Minjae (Seoul National University)

Session format: Regular session

Conflicts have been a common part of the global stage throughout the 20th and 21st centuries, leaving a visible impression on our material culture. This has become a field of study in archaeology, especially in public archaeology, with many using the discipline to shed light on the unrecorded stories of war and so expanding our narratives of the past. Material culture, and its significance in producing new narratives and reinforcing existing discourse, are of increasing concern to the archaeological and cultural heritage community. Examples include a concentration camp turned into a memorial, trenches reconstructed in museums, or prisoners' uniforms as a motif of a wartime movie. Of course, material culture is not just limited to what can be excavated. Whether it be museum exhibitions on the Cold War, or how the film industry has depicted events in the Second World War, these visual representations both use and become a part of, the material culture of conflict archaeology and heritage. Discussing the various practices in using and creating material culture in visual representations of conflict heritage can lead to a wider understanding of how narratives on the conflict are being produced or reinforced.

This session invites papers that explore visual representations of the material culture of conflicts from the 20th and 21st centuries, to discuss the role of these materials in sustaining and reproducing discourse on conflict. Themes may include, but are not limited to:

- role of material culture in representations of conflicts (e.g., museums, films, and commodification)
- specific aspects of material culture that complement existing narratives or produce new ones
- impact of the uses of material culture in shaping public perceptions of the conflicts
- methodologies in studying visual representations of the material remain of conflicts
- the extent to which representations themselves become a part of material culture

ABSTRACTS

1 PEEPO! ON THE HOME FRONT: CONFLICT ARTEFACTS AS HOUSEHOLD CLUTTER IN A CLASSIC CHILDREN'S PICTURE BOOK

Abstract author(s): Moshenska, Gabriel (University College London, Institute of archaeology)

Abstract format: Oral

PEEPO! by Janet and Allen Ahlberg is a classic of British children's literature: a picture book with holes cut in the pages, through which the toddler protagonist can peek into the next page, to see what the family is up to. First published in 1981, PEEPO! has entertained generations of readers, some of whom notice the clues - some subtle, some less so - that the story takes place during the Second World War.

In this paper I propose to analyse the use of Second World War British Home Front material culture such as gas masks, ration books, military uniforms, and bomb-sites in PEEPO! as part of a rich material world invoked in the images. Alongside the 'war objects', Janet Ahlberg used a copy of 'The Army and Navy Stores Catalogue, 1939-1940' to populate the fictional home with period-appropriate furnishings and household goods.

My analysis will look at the use of both of these categories of objects alongside domestic space and family-members in the visual storytelling of PEEPO!, and reflect on the importance (or otherwise) of conflict settings in British children's literature.

2 THE DARK SIDE OF RECEPTION AND MISUSES OF CLASSICAL ANTIQUITY WITHIN THE GERMAN ARMY 1933-1945

Abstract author(s): Hansen, Søren (Museum Lolland-Falster)

Abstract format: Oral

The use of Classical antiquity in Nazi propaganda and the German army during WW2 was a significant aspect of Nazi ideology and their attempt to legitimize their rule and increase recruitment. The Nazi regime saw itself as the heir to the Roman Empire, and this idea was reflected in many aspects of the German army, including symbols, and uniforms.

"Cultural appropriation" was used by Hitler and his propaganda ministry to create an image of a superior German race, rooted in Classical antiquity, and to give the German army a sense of historical legitimacy. The Nazi regime selectively picked elements of ancient Roman and Greek cultures while ignoring aspects that did not fit.

Reception Studies provide a useful framework for analyzing how Classical antiquity was used and appropriated by the Nazi regime. Focus is placed on the background and historical context and the reasons why ancient Rome and Nazi Germany recruited from foreign cultures, how the Nazis viewed Classical antiquity, and regarded themselves as a continuation of the Roman Empire.

In addition to the Roman Empire, the Nazi regime also saw the ancient Spartan warriors as a model for the German army. The idea of a militarized society, with strict discipline and a focus on physical strength, was seen as a desirable attribute. This idea was reflected in the training and education of the German soldiers, as well as in the propaganda aimed at the German people.

The use of Classical antiquity in Nazi propaganda and the German army during WW2 was a significant aspect of the Nazi ideology. They had an eclectic use of antiquity from where they chose suitable elements and created a false narrative and myth of the Classical past. This phenomenon seems to be important also in modern conflicts.

3 WAX WARS - RESHAPING THE MATERIAL CULTURE OF WWI IN HUNGARY

Abstract author(s): Kocsis, Andrea (Northeastern University London; University of Cambridge)

Abstract format: Oral

“If the gloves don’t fit” - you must sew new ones. This paper analyses how the Hungarian Centenary WWI exhibition, *A New World Was Born*, mimicked the use of material culture to redefine the historical narrative of WWI. It also examines the impact of using pseudo-material culture on shaping public perceptions of the War.

This curatorial practice helped express the four main narrative pillars of the exhibition. The first theme evokes the image of a pre-WWI Carpathian Basin without territorial claims or ethnic conflicts, where peace was broken only by the outbreak of the War. The second one elaborates on how the Allied powers triggered WWI and considers the Central Powers as victims of the Western aggressors. The third theme relativises WWI by reducing it to a Fraternal War, and the final one blames the tragedy of the conflict on left-wing governments.

These themes are twisting historical objectivity by providing grounding soil for myths beneficial for contemporary political discourses. This paper discusses how these themes are expressed with the help of pseudo-material culture in the exhibition space through installations and storytelling. It also analyses how the exhibited themes nurture the mnemonic conflict between the strengthening Hungarian nationalism and the representation of the European Union in a populist political climate.

Overall, this paper provides a case study which gives a thorough insight into how the museological choice of using commissioned installations at the expense of authentic material culture promoted the stakeholders’ interpretations of the past in a populist setting by rewriting the traditional reference points of history and bringing new memory constellations to life.

4 PUBLIC MEMORY, VISUAL (RE)PRESENTATION AND THE MATERIAL LEGACIES OF THE NIGERIA-BIAFRA WAR (1967-1970)

Abstract author(s): Onyemechalu, Stanley (University of Cambridge)

Abstract format: Oral

Wars, like other forms of violent conflict, cause destructive impacts on the heritage of affected communities. They also leave behind enduring footprints that transform the heritage landscape, including material culture, memorial sites, and monuments. However, because destruction is an obvious impact of wars, many studies in the conflict-heritage and contemporary archaeology literatures have overlooked their (re)generative impacts. That is, little is known (or taught) about how violent conflicts and their legacies also cause the creation/revival of heritage or become heritage themselves. In this paper, I share a part of my PhD research which explores the complex relationship between heritage and the legacies of violent conflicts among the Igbo people in the context of the Nigeria-Biafra war (1967-1970) – one of the largest armed conflicts that marked the early years of Africa’s post-colonial era. Since 1970, successive Nigerian governments have tried to stifle its war history and memorialisation. Ironically, this spurred (or coincided with) increasing people-led efforts to ‘salvage the situation’ through visual representations, resulting in dissonant narratives, distortion of historical events and the weaponization of heritage by parochial interest groups. Combining ethnographic fieldwork, site visits and documentary research, I discuss the material culture generated from the war as visually (re)presented in the government-run National War Museum, Umuahia and the community-run Centre for Memories, Enugu. I investigate how the latter tries to counter the representational problems in the former. I also discuss how this war, 53 years after, continues to be (re)presented/memorialised via movies, literary works, private exhibition centres, digital archives and other artistic interventions. Drawing on contemporary archaeology and conflict-heritage concepts, I explore not only the conflicting socio-political interpretations of these visual representations today but also their role in the teaching of the less-talked about civil war history in Nigeria.

5 RECONSTRUCTION AND MEMORY: THE ROLE OF MATERIAL AND VISUAL CULTURE IN LEBANESE CONFLICT NARRATIVES

Abstract author(s): Krikorian, Danielle (University of Birmingham)

Abstract format: Oral

The Lebanese Civil War (1975-1990) was a fifteen-year long conflict that destroyed Lebanon’s fragile national identity and societal landscape. Instrumental origins of the war were regional volatility, the colonial past, and sectarian divides. Militias fought for power to attain economic and political control of the country (Heinz, 2008). Cultural sites were looted, and archaeological excavations were halted. Beirut was split into West Beirut and East Beirut. The National Museum was on the Green Line (the demarcation line) and became an extremely perilous place in a city filled with violence. The collection was endangered and the museum endured bombs with snipers and militias taking over (Wright, 2016). The collection was saved by archaeologist Maurice Chehab, the director of the Directorate General of Antiquities (DGA), and his wife Olga Chehab (Kadi, 2015). Yet, in the aftermath of the civil war, a collective amne-

sia ensued. The heads of militias who had fought during the war became heads of government and censorship followed (Shaery, 2012). In fear of reigniting the recent horrors, silence was enforced. Amidst this amnesia, reconstruction of Beirut and the National Museum took place. In 1999, the Museum reopened its doors and parts of the collection were reinstated and displayed (McGivern, 2016). In this perspective, how does (and can) the archaeological Museum's material and visual collection and restoration remember the war and fight against collective amnesia? The research argues the importance of material and visual culture as methods of historical preservations of memory. It will explore the archaeological collection and the strategy of its curatorial display in fighting against collective amnesia to restore a sense of national identity. The importance of material heritage and visual culture in conflict narratives against war brutality will be at the centre of the research.

6 MATERIALITIES AND MEMORIES OF THE SPANISH CIVIL WAR: A DIGITAL HUMANITIES-BASED APPROACH TO THE NARRATIVES OF BILBAO'S IRON BELT

Abstract author(s): González Cantera, Tania (Institute for Historical Research - IRH - Universitat de Girona) - Rubio-Campillo, Xavier (Departament de Didàctiques Aplicades - Universitat de Barcelona; Institut d'Arqueologia - Universitat de Barcelona; School of History, Classics & Archaeology - University of Edinburgh)

Abstract format: Oral

Historical narratives linked to war heritage are generated and curated by public institutions, forging an official interpretation which does not necessarily have to coincide with the ones generated by individual or non-official collectives. The archaeological record is a key component of this complex heritage since it acts as a repository, where the same materiality may generate a diversity of memories (hegemonic/counter-hegemonic, resilient/subaltern). The complexity of conflict landscapes requires an approach that takes into account the spatial, archaeological and heritage aspects.

The Spanish Civil War is an excellent example of the complexity of narratives generated by contemporary conflict heritage. In the Basque country, the strong identity of the region has generated a unique and distinct perspective on the Spanish Civil War which has been translated into the memorialising process of the conflict's heritage.

This work confronts the narratives generated by the mythic Iron Belt: a line of Republican fortifications that defended Bilbao from the Francoists in 1937. This WWI imitation structure was designed to create a solid fortification around Bilbao to make the Biscayan capital an impregnable redoubt for Franco's troops. A key propaganda tool since the war, nowadays the Iron Belt has become a myth within the Basque imaginary and one of the main targets of the government's memorial policy.

Specifically, we have analysed 4 sections of the Iron Belt representative of the diverse dynamics of present-day memorialization. Our aim is to discover differences in terms of research, management, and memorialising processes. To explore these questions, we have focused on the geospatial and temporal dynamics. In this context, local entities and associations play a leading role: there are deep differences in the discourse depending on the socio-political, economic and cultural background of each municipality.

7 RIGHT PLACE, RIGHT TIME? QUESTIONABLE RECONSTRUCTIONS OF 20TH CENTURY FORTIFICATIONS IN FINLAND

Abstract author(s): Kauhanen, Riku (University of Turku)

Abstract format: Oral

After WW II several fortified areas in Finland were restored as mementos to past conflicts. Sometimes these sites are restored by professionals in museum field, and sometimes local communities did the work.

This representation studies examples from Finland: A WW I era fortified site and WW II site in Northern Finland which was used by local communist resistance. Local understanding had heavy impact on how these sites were seen, restored, and used to represent history.

In these cases the authenticity of places was not the main goal of restoration works, but they strongly reflected the message of community that wanted them restored. In WW I site the area was restored into a World War Two fortification.

In the second case, even though a member of resistance was the one who took initiative of restoration, the result was deliberately a tourist attraction and a memorial site rather than restoration of the original site. The site was for example visited in 1980s by communist Pioneer movements summer camp; in this case the place and its meaning was explained as mixture of then popular peace movement and local communist history. This local experience and interpretation was then produced to reflect Finnish history as whole, and the place was used as "solid proof" of these interpretations of the past.

Results are a mix of original place and the intentions and experiences of local communities. Cases highlight how the place can be "right" and people strongly associated with actual war time can produce a reconstruction with outcomes

and interpretations, that might make professionals in archaeology, history and museums raise their eyebrows. These reconstructions are still not only mementoes of the time they were supposed to represent: When contextualized, these representations further reflect attitudes towards the past and changes in them: a conflicted history of conflicts.

8 INTERPRETING CONFLICT HERITAGE: SEMIOTIC LANDSCAPES OF LEXICAL AND VISUAL TEXTS AT IMPERIAL JAPANESE CONFLICT HERITAGE SITES

Abstract author(s): Moxham, Oliver (University of Cambridge)

Abstract format: Oral

Are we all reading the same discourse when we visit conflict heritage sites? Do overseas visitors who identify with its history have the same access as domestic visitors? How does this affect interpretation of discourses at conflict heritage sites?

In answering these questions, I argue that difficult elements of conflict discourses can effectively be hidden from stakeholders through selective translation. This paper is based on research conducted at heritage sites in Kyoto, Japan relating to the Asia-Pacific War (1931-45) and the colonization of Asian territories by the Japanese empire, such as the monolingual space of Ryōzen Gokoku Shrine and the multilingual space of Ryōzen Kannon. Based on textual analysis of tourist literature in English and Japanese, as well as ethnographic interviews with English and Japanese language community members, I will present tangible evidence of the impact of the language barrier on interpretation of conflict heritage sites.

I intend to bring together notions of heritage performance (Smith 2020) with the sensitivities of conflict translation (Baker 2018, Giblin 2022) through the perspective of semiotic landscapes (Thurlow & Jaworski 2010). I explore how the historical discourses stakeholders bring with them to conflict heritage sites interact with the discourses made available for them by the site management. This includes lexical texts such as signage, but also visual texts which transcend language. For example, at Ryōzen Gokoku, texts are all in Japanese yet kamikaze statues and maps of occupied territories are internationally recognisable. I assess what meanings monolingual stakeholders draw from site imagery and how accessing textual discourse affects their understanding of the site. In addressing lack of linguistic representation, I draw upon theories of translational justice (De Schutter 2017, Meylaerts 2011) which argue for equal linguistic representation of stakeholders. This can be a means of generating constructive, intercultural dialogue between stakeholders of past conflict.

427 RESHAPING MEDIEVAL DESERTION IN EUROPE: BEYOND THE LATE MEDIEVAL CRISIS PARADIGM

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Quirós Castillo, Juan Antonio (University of the Basque Country; University College London) - Holata, Lukáš (University of South Bohemia)

Session format: Regular session

This session aims to discuss new perspectives on the abandonment of rural settlements and small towns in medieval Europe, which draw on theoretical frameworks concerning the Anthropocene, resilience, connectivity, mobility, social complexity, multiscale analysis, comparisons, human ecology, ecosystems, environmental changes, and landscapes.

In large parts of Europe, the very beginnings of medieval archaeology are associated with the investigation of deserted villages. These sites were considered ‘field laboratories’ for studying domestic social life, as well as the impact of the late medieval crisis. In the last decades, however, this issue has been overlooked in the wake of the expansion of other topics addressed by postclassical archaeologies. The phenomenon of settlement abandonment has thus remained under theorised, with frequent cataclysmic hypotheses and deterministic interpretations being advanced. Most of the existing conclusions do not reflect recent reassessments of rural communities, which increasingly emphasise their active and strategic role.

Finally, a vast number of deserted sites have been discovered due to the boom in development-led archaeology. In parallel, methodological advances, new procedures, and a wide range of geoarchaeological, palaeoenvironmental, and remote sensing data, have opened up new avenues for studying topics such as village origins, social dominance, and environmental and landscape change. Nevertheless, the abandonment processes have not returned to being the major area of study.

The ultimate goal of the session is to produce a collective book that brings together innovative and rigorous papers which revisit the question of settlement desertion in medieval Europe. For this reason, we do not request case studies, surveys, or descriptive reports. Instead, we expect holistic, multi-scale, and interdisciplinary approaches with cutting-edge contextual or scientific analyses, which should reveal the driving forces behind abandonment, shed

light on the interrelationships between various agents and systems, and thus enhance our understanding of medieval landscape dynamics.

ABSTRACTS

1 PATTERNS OF ABANDONMENT IN MEDIEVAL SMALL TOWNS: EVIDENCE FROM LATER MEDIEVAL ENGLAND

Abstract author(s): Morton, Benjamin - Jervis, Ben (Cardiff University)

Abstract format: Oral

During the 14th-15th centuries it is common for archaeologists and historians to identify periods of urban 'decline' or 'decay', suggested by the abandonment of plots or larger areas of urban landscapes. Whilst it is rare for towns to be completely abandoned, the inhabited area, and by extension the population, of many towns fell considerably. This process of abandonment and decline is commonly linked to the impact of the Black Death, resultant economic turmoil and the impacts of climatic fluctuation on agrarian production but needs to be situated more centrally within the wider re-orientation of settlement landscapes, economy and society in the later Middle Ages.

Whilst methods such as town plan analysis have proved useful in understanding the development of the urban landscape (for example identifying evidence of urban planning), our understanding of processes of abandonment and re-development are less advanced. Here, drawing on English evidence, we outline some models of urban abandonment, setting these into their wider context to begin to draw out some of the underlying factors determining how and why townscapes changed in this period. In doing so, we go on to critically examine the concept of abandonment itself, to assess its utility in the analysis of changing landscapes which, whilst not inhabited, continued to find uses as spaces for agriculture, commerce and productive activities. This comparative understanding of urban experiences will take us beyond a general picture of decline, decay and abandonment to understand the complexity and variability of lived experience in this period.

2 MEDIEVAL SETTLEMENT FORMS: EVIDENCE, LANDSCAPE DYNAMICS, AND ABANDONMENT PHENOMENON IN LATIUM REGION (ITALY)

Abstract author(s): Bernardi, Martina (Roma Tre University)

Abstract format: Oral

The 'incastellamento' phenomenon starting between the Early and the Late Middle Ages strongly defined the rural and mountainous landscape of many Mediterranean areas, with the construction of fortified settlements located at the highest point of the mountain reliefs, with the aim to dominate the territory around and enclose peasantry inside walls, both to control and to protect them. The castle-system in many cases ended in a few centuries, and in the Italian context mainly around the 14th-15th century, for historical, social, and geographical reasons related to the context in which the abandonments happen.

But other settlement forms characterized the anthropogenic environment in the age of the incastellamento, as both written and archaeological data indicate, such as open villages, little farms, or scattered houses.

This paper will analyse the medieval landscape of Latium Region and some case studies, with a specific focus on the reasons behind the abandonment phenomenon. In addition, how the landscape changed with the end of castle-system, and which settlement forms survived until the modern era (and why).

3 BEYOND ABANDONMENT: AN INTERDISCIPLINARY STUDY OF MEDIEVAL AGRICULTURE, ENVIRONMENTAL DEGRADATION AND HUMAN ADAPTABILITY IN THE CZECH REPUBLIC

Abstract author(s): Holata, Lukáš (University of South Bohemia)

Abstract format: Oral

Medieval rural communities in Central Europe have long been considered to be victims of environmental instability, leading to the abandonment of settlements. However, these claims are often based on assumptions rather than hard evidence. Our interdisciplinary project challenges this conventional wisdom by combining archaeology, geology, and ecology to provide a comprehensive picture of medieval land use and its impact on the environment.

Using cutting-edge technologies like lidar and geospatial analysis, together with environmental data, a holistic, landscape-scale analysis of four deserted villages in the Czech Republic have been undertaken. By taking advantage of the extensive forests that have preserved the remnants of the medieval landscape, including fields and micro-relief in their hinterlands, we are able to shed light on the long-term ecological effects of medieval agriculture. Preliminary research outcomes demonstrate the considerable impact of medieval land use in terms of erosion hazard. At the same time, however, there is growing evidence of the resilience of medieval rural communities that were able to utilize en-

vironments that we now consider unsuitable. By moving beyond the simplistic view of abandonment, our project provides a new understanding of the interplay between human culture and the environment in the medieval rural milieu.

4 RESILIENCE AND VULNERABILITY IN THE LATE MIDDLE AGES! HOW CAN WE STUDY ADAPTIVE CAPACITIES – AND AVOID ANACHRONISM?

Abstract author(s): Svensson, Eva (Risk- and environmental Studies, ISK-department) - Pettersson, Susanne (Independent) - Johansson, Annie (County Administrative Board, Värmland)

Abstract format: Oral

The late middle ages was a challenging time; plague, climate change, sometimes war, social and power structures under negotiations – and other problems. But changing times also include possibilities, and it is often put forward that those who survived got a better life after the upheavals of the late medieval agrarian crisis. When trying to pinpoint success factors regarding peasants and peasant communities, there is often a focus on skills and adaptive capacities. Such peasant communities are considered resilient, whereas the unsuccessful ones are regarded as vulnerable. The concepts resilience and vulnerability are frequently used in today's sustainability discourses, and we archaeologists are diligently borrowing from those discourses while interpreting our archaeological data. In today's sustainability discourses resilience is characterised by diversity, redundancy, modularity, reserves, social capital, agency, inclusiveness, tight feedbacks and innovation. In line with this, it is common among archaeologists to forward high degree of community equality, diverse, innovative and adaptive economies, elaborated networks and successful resistance to elite actors and power structures as key qualities of resilient peasant communities. Archaeologists are here not only applying concepts and understandings of today on the past, but also politicising the past as being sustainable / resilient in desirable ways. Vulnerability is less studied, or theorised, and often reduced to meaning poverty and impuissance.

In this presentation we will elaborate on the concept of vulnerability in relation to rural settlement desertion, with special focus on unevenness and powerstructures within peasant communities. We will also problematise the concept of resilience as being normative, and show that some characteristics of resilience meant resilience for some peasants and settlements and vulnerability for others.

5 A MULTIDISCIPLINARY AND GEOSPATIAL INVESTIGATION INTO THE PROBLEM OF SETTLEMENT DESERTION IN CENTRAL HUNGARY

Abstract author(s): Ferenczi, Laszlo (Univerzita Karlova) - Rác, Tibor Ákos (Ferenczy Museum Centre)

Abstract format: Oral

Studying a digital database of late medieval settlements covering the total area of medieval Hungary (Engel 2001), we apply topologic and distance based parametric models to address the problem of settlement desertion in connection to both internal and external, as well as long- and short-term factors (i.e. socio-economic changes in the 14th-15th centuries and the impact of the Ottoman conquest in the early 16th century). The results of a quantitative spatial statistical assessment of socio-economic data from textual sources (tax registers) will be presented, in combination with the study of long-term environmental processes based on a comprehensive evaluation of pollen sites (Törőcsik-Sümegi 2019). This will be complemented with the quantitative study of a large inventory of archaeological finds, from field-surveys, excavations and systematic metal detecting surveys conducted on a micro-regional level in County Pest, in the central parts of the country (Füredi-Rác 2021). Focusing on this area and more broadly on the Great Hungarian Plain, where settlement desertion – catalyzed both by climate change (Ferenczi et al 2020) and the Ottoman war – seem to have made a lasting ecological and socio-economic impact, the presentation will underline the necessity of a multi-scale approach to evaluating/interpreting different data types (historical, environmental, archaeological), and advocate for a more nuanced view of the desertion process, in the face of the difficulties implied by weaving together different data, and with regard to the problem of settlement hierarchies, internal migration, settlement relocation (Pinke et al 2016), or the differences between land desertion and settlement desertion (Kiss 2019), as well as between temporary and permanent desertion phenomena.

6 DESERTING VILLAGES AND THE END OF THE “SETTLEMENT PARADIGM” IN THE LIGHT OF NORTHERN IBERIA EXPERIENCE

Abstract author(s): Quirós Castillo, Juan Antonio (University of the Basque Country; University College London)

Abstract format: Oral

In this paper, it is argued that Deserted Medieval Village studies need a deep conceptual, methodological, and theoretical reassessment in order to meet a more comprehensive understanding of rural societies and landscapes. The emergence of rural medieval archaeology in Southern Europe has been based on the study of settlement patterns, hierarchies, morphologies, and desertions. Great Narratives such as Late Medieval crisis, Village formation, or the Incastellamento process have produced, in the last quarter of the 20th century, a “settlement paradigm”, which has been very influential in the study of medieval societies. However, the explosion of rescue archaeology, the implementation of the Archaeological Sciences, and the replacement of the site analysis with a landscape approach have changed rural archaeology in different ways. An unexpected outcome of these developments has been the abandonment of the desertion processes studies, considering them a “natural” dynamic or minor research topic.

Conversely, the study of desertions, considering a new conceptual toolbox, could shed light not only on causality and economic trends but also on core topics such as villages, communities, resilience, and multiple agencies. Taking into consideration some case studies from Northern Iberia, the paper proposes to 1) implement a “relational paradigm” in order to overcome the shortcuts of the “settlement paradigm”, 2) discuss the “crisis” perspectives considering the complexity of the desertion processes, and 3) introduce new avenues for the study of rural landscapes in long diachronic terms.

429 STORIES FOR SALE. THE NARRATIVES OF HERITAGE IN MASS CONSUMPTION

Session theme: 3. Heritage Narratives and Representations

Session organisers: Lin, Shiting - Lyu, Junting (University of Cambridge; Cambridge Heritage Research Centre) - Liu, Si (École supérieure d'art et design Le Havre-Rouen)

Session format: Regular session

The many nuances of stories of heritage in mass consumption, the questions they raise about storytelling and the influences of various forms of mass consumption on heritage narratives sit behind this session proposal. These aspects are obvious, yet rarely discussed. Heritage, the one that is considered to be preserved well, connects more closely to mass consumption in recent years. Our work on the Neolithic culture ‘Yangshao culture’ (China) has made us realise that heritage can be consumed by large amounts of people nowadays through visiting archaeological parks and even buying fast-moving commercial goods tagged with the name of heritage, leading to various narratives spreading in public. The research on narratives of heritage in mass consumption is often underdeveloped but important. For example, the dynamics in the interaction between heritage stories in business and those in museums – do the former correspond with or diverge from the latter? Or are the stories for sale made up? How does commercial storytelling supplement or undermine that in heritage sites? Nor have we paid enough attention to various forms of mass consumption of heritage, especially those heritage narratives (re)presented and consumed in places beyond museums and heritage sites (i.e. shops, VR displays, films and archaeogamings). Scant attention to these aspects means that we may have ignored some major factors that influenced the public’s understanding of the past. It also means that we have neglected the impacts of mass consumption of heritage on political, cultural, and social dimensions. We call for critical discussions on these issues in the mass consumption of heritage. In turn, we also aim to recognise more of the stakeholders (communities, businesses, institutions, etc) who create and consume those heritage narratives.

ABSTRACTS

1 EXIT THROUGH THE GIFTSHOP: A HIERARCHY OF VALUE IN MUSEUM GIFTSHOPS

Abstract author(s): Austin, Summer (University College London)

Abstract format: Oral

The context that museums and heritage sites display their collections form powerful personal connections, dramatic narratives and enhance the objects as visual commodities; this results in visitors departing with a mental picture of what is valuable and thus desirable. Increasingly, museum gift shop displays emulate exhibition displays; they are less kitschy and more refined, further blurring the boundaries between cultural heritage and cultural commodity. While the exhibition itself constitutes a product to be ‘sold’, the exhibits grand finale is the gift shop with a wide range of merchandise on sale, where objects for looking at are replaced by objects for buying. Gift shops server to extend the narrative and extends the experience the audience undergoes within the exhibition. Just as objects displayed within a

museum achieve an elevated level of authenticity and prestige, souvenirs from and inspired by museums also achieve 'museum quality' status; however, not all souvenirs are equal.

Building off Alsop's 1982 theory of a 'hierarchy of value', this paper proposes a 'hierarchy of souvenirs'; where each level appeals to various visitors (socioeconomical, age, etc); serves distinctive functions (educational, fun, prestige, etc) and symbolises different levels of perceived authenticity and value. From logoed items that are relatable, often kitschy, inane, and iconic; through thoughtfully curated boutique souvenirs; progressing to high-end replicas, limited edition, gallery-quality pieces that serve as stand-ins for the real thing. The pinnacle of all souvenirs is the real thing, these souvenirs allow the owner to literally own their own artefact, their very own piece of heritage.

This hierarchy of souvenirs gives us a framework to consider motivations, profiles, and narratives of those who engage with museum gift shops and how storytelling and commodification of cultural heritage from knickknacks into replicas reinforce the materiality of cultural heritage and normalises demand for the genuine artefact.

2 ANCIENT ARCHITECTURE FOR SALE. THE RELATIONSHIP BETWEEN ARCHAEOLOGICAL AUTHENTICITY AND THE FORMATION OF COLLECTOR NARRATIVES IN 19TH-CENTURY GRAND TOUR SOUVENIRS

Abstract author(s): Petreková, Eliška (Masaryk university)

Abstract format: Oral

The phenomenon of mass consumption has gone far beyond the last few years. At the turn of the 18th and 19th centuries, the Grand Tour impacted collector culture, when collectors routinely brought back souvenirs of important sites and monuments from their travels. Market quickly responded to collector demand and offered a plethora of copies of ancient antiquities of varying quality, size, and material to suit the tastes and finances of the collector. A specific group of Grand Tour souvenirs was models of ancient architecture, for which another important factor was also apparent. It was the relationship to the archaeological sites, and therefore the level of their authenticity, which significantly influenced the shape of the story of ancient heritage.

A wide range of such architectural models is represented in the collection of the Austrian Chancellor Metternich's collection at the Czech castle of Kynžvart. His set is unique because it contains a variety of objects, in terms of materials used and different levels of documentary function and archaeological authenticity. Two distinct different perspectives have influenced their final form, the first being purely scientific, pragmatic, and based on the actual condition of the monuments. The second is more idealized, narrative, and based on artistic imagination and contemporary ideas. This study aims to explore the different representations of models of ancient architecture in Chancellor Metternich's collection and, based on this analysis, to interpret the different ways of narrating cultural and historical heritage.

3 FROM BELIEF CEREMONY TO FESTIVAL CELEBRATION: THE HISTORICAL CHANGES OF FISHERMEN'S SACRIFICE TO THE SEA IN RONGCHENG, SHANDONG

Abstract author(s): Zheng, Yan (Shandong Academy of Social Sciences; University of Cambridge) - Zhang, Wei (Shandong Academy of Social Sciences)

Abstract format: Oral

In order to further promote the protection and inheritance of ritual and festival NRMs in China, we undertook the project „Research on the Protection System of Ritual and Festival NRMs“ (2018) commissioned by the Department of NRMs of the Ministry of Culture and Tourism. This paper is a case study and research based on the project's needs. Through literature collection and fieldwork, this paper discovers the inheritance and development mechanism of Rongcheng Yuankuang Fishermen's Sacrifice to the Sea from the personal narratives and life histories of the non-genetic inheritance subjects. It presents the interaction between its inheritance status, economic transformation and tourism strategy. First of all, the rituals of the Yuankuang Fishermen's Sea Festival are passed down and protected by the Yuankuang Village Committee and the Yuankuang Industrial Group, which are united as village enterprises, with the former secretary of the village committee as the representative inheritor and the elites of the village as the leaders. Secondly, with the significant changes in the original production and lifestyle of Yuankuang village, the villagers have changed their production and occupation. The ritual's original faith narrative has gradually faded to inherit it better. Finally, after the upgrading of the Rongcheng Fishermen's Sea Festival to the International Fishermen's Festival, it has been given new content, such as attracting foreign merchants to participate in the fishermen's market trade, holding a grand joint exhibition of intangible cultural heritage and cross-strait dragon culture exchange meetings. As the inheritance and protection unit of national intangible cultural heritage projects, Yuankuang Industrial Group has been involved in the catering and hotel industries in developing and utilising marine resources and products and in the initial attempts of marine cultural tourism.

4 HERITAGE AND HISTORY NARRATIVE IN VIDEO GAME MEDIA: PENTIMENT, A CASE STUDY

Abstract author(s): Caloi, Luca (University of Sassari)

Abstract format: Oral

The mass consumption of heritage and history narrative has increased in the popular culture market, in particular through the video game media. Despite this interest, the accuracy of the reconstruction of the environment has not always proven to be of the highest quality.

The aim of this research is to evaluate this aspect in a specific case study: Pentiment, by Obsidian Entertainment. This game stands out for its graphics inspired by the imagery of medieval miniature manuscripts, its narrative and historical contextualisation.

This analysis is going to examine in detail the principal components of the game: its main themes, its level of reconstruction, its historical reliability, and the presence of didactic components.

The narrative is set in a fictional village of the 16th century Bavaria and follows the action of an illuminator apprentice. Despite the fictional narration, the historical reconstruction of this product is at a very high level.

The relation between the community and their past is an important issue dealt in the game. In the last act of the game the player will have to choose which parts of the local history are more valuable to be recorded for the future generations and which one should be discarded.

To conclude, the didactic aspect is represented by numerous notes that allow anyone to follow the events of the game more precisely and can be real insights into unknown historical elements.

All these elements construct a very immersive narrative that conduct the player through the life in a complex period: the transition between medieval and early modern age. It shows how a little community of that age is trying to understand its identity in a context in which the elements of a previous history are still visible and also traditions of an even older legacy are strong.

5 INTANGIBLE HERITAGE AND HISTORICAL NARRATIVES IN HANFU: THE CASE OF HANFU TOURIST SERVICE IN THE DATANG EVERBRIGHT CITY OF XI'AN

Abstract author(s): Lyu, Junting - Lin, Shiting (University of Cambridge; Cambridge Heritage Research Centre)

Abstract format: Oral

The mass consumption of Hanfu, the traditional clothes of the Chinese Han ethnicity, and the historical narratives behind the clothes have been given increasing attention in recent years in China. Hanfu is no longer a niche interest or an attire for special occasions, but a noteworthy trend among a growing number of young people. Despite the fashionable and entertaining features of Hanfu, its gradually deeper integration with tourism and its implications for symbolising cultural identities are quite intriguing in the current society of China. This research aims to find out how the historical narratives behind Hanfu are created and promoted to the public. In other words, as material representations of intangible heritage, how particular heritage discourses are constructed through the processes of design and promotion of Hanfu. In turn, how do consumers perceive and incorporate particular narratives? By looking into the case of the Hanfu tourist service in the Datang Everbright City of Xi'an, this research hopes to offer more insights into this special popular cultural phenomenon and the dynamics between the local and national identities and heritage behind it.

6 GENSHIN IMPACT AND IMPACT OF GENSHIN: A CASE STUDY OF VIDEO GAMES AS VEHICLES FOR CULTURAL HERITAGE

Abstract author(s): Zhang, Lingran (Ohio State University)

Abstract format: Oral

Few would argue that video games are one of the most popular leisure activities. With enjoyable and educational characteristics, video games can foster enjoyment of many core aspects of life, including those related to cultural heritage access recently. In 2020, a cultural phenomenon swept through the world with the debut of Genshin Impact (GI). This Chinese-made, action role-playing videogame has not only enraptured the imaginations of its 50 million players but has also promoted the recognition of intangible cultural heritage (ICH) internationally.

Utilizing GI as a case study, this article analyzes the utilization and potential exploitation of cultural heritage through its mass consumption by a global audience in the medium of video games. It considers how this game demonstrates an effective method of introducing people to and engaging people with the safeguarding of ICH, specifically the Beijing opera.

GI introduced a new character, Yunjin, in January 2022, who plays the role of an opera practitioner. To familiarize players with this character, GI has designed a storyline for Yunjin, inviting players to embark on an adventure with her.

The entire journey is transformed into the lyrics of a piece of Beijing Opera that Yunjin performs at the end. Players can easily understand the music and relate its content to the plots they have just experienced in the game.

Beijing Opera, like many other ICH practices, faces difficulties in safeguarding due to its decreasing relevance with contemporary society. GI presents this ancient practice in an immersive narrative that is accessible and relatable to modern audiences, stimulating heated discussions about ICH on social media. The article also discusses the responsibilities of game developers when incorporating heritage into video games.

437 CURRENT RESEARCH IN THE AMERICAS [EAA4AM]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Saintenoy, Thibault (Incipit-CSiC; ArchAm, Université des Antilles) - Hattori, Marcia (Incipit-CSiC) - Ziolkowski, Mariusz (University of Warsaw)

Session format: Session with presentation of 6 slides in 6 minutes

Organised by the EAA4Am Community, this session aims to creating a welcoming space for archaeologists participating in the 2023 annual meeting, and interested in introducing and sharing results of ongoing research on the archaeology and heritage of the Americas. Despite the long trajectory of research in the Americas by scholars based in European institutions, few spaces dedicated to Americanist archaeology exist in European archaeological meetings. This session aims to overcome this by sharing information on ongoing projects as well as providing insights about our research practices.

We welcome contributions that present archaeological and heritage research on the Americas from all time periods, and which adopt a variety of theoretical and methodological perspectives, including interdisciplinary and reflexive approaches (alterity, coloniality, gender, resistance, heritage production and conflict, amongst others). The goal of the session is not only networking, but also to generate debates about the possibilities, limitations, and perspectives of practicing Americanist research while based in Europe.

The organising team also contains Carolina Orsini (Museo delle culture di Milano) and Alexander Geurds (University of Oxford).

ABSTRACTS

1 NATIVE AMERICAN CULTURAL HERITAGE IN THE CANYONS OF THE ANCIENTS NATIONAL MONUMENT (COLORADO, USA): DIGITAL DOCUMENTATION, MANAGEMENT, AND PRESERVATION

Abstract author(s): Palonka, Radoslaw (Institute of Archaeology Jagiellonian University; Crow Canyon Archaeological Center)

Abstract format: Oral

The paper is focusing on presenting the newest results of investigations, analysis, and protection of Native American sites located in two distinct areas within the Canyons of the Ancients National Monument, in the heart of the Mesa Verde region, southwestern Colorado (USA). These sites comprise pre-Hispanic Ancestral Pueblo settlements with sandstone architecture and rock art as well as historic Ute (and also possibly Navajo) petroglyphs and Euro-American historical inscriptions. The research includes a combination of traditional archaeological methods with strong emphasis on modern digital techniques such as advanced digital photography, close-range and UAV/drone photogrammetry, 3D laser scanning, and GIS spatial analyses. It led to the documentation of approximately forty Ancestral Pueblo sites and socio-cultural, chronological, and demographic estimates and inter-relationships reconstructions between settlements and the role of defensive architecture in response to the environmental and social changes. The project also recorded previously unknown large rock art sites in the second research area resulting in analysis, digitization, reconstruction, and visualization of the last 2000 years of cultural and settlement changes, migrations, and the interaction between humans and the environment in this area.

The research has been conducted since 2011 by the Sand Canyon-Castle Rock Community Archaeological Project, a research project led by the Department of New World Archaeology, Institute of Archaeology, Jagiellonian University in Kraków (Poland). This is the example of the very few European projects in the field of archaeology conducted in North America. This research include also solid collaboration with Native Americans, mainly from the Hopi Cultural Preservation Office, Hopi tribe, Arizona (as well as other tribes) and several American institutions, including Canyons of the Ancients National Monument/US Bureau of Land Management and Crow Canyon Archaeological Center (both from Colorado) and scholars from various US universities, including the University of Arizona, Tucson or Maryland Institute College of Art.

2 ARCHAEOLOGICAL PROSPECTION IN A NEIGHBORHOOD IN THE CENTER OF TEOTIHUACAN (MEXICO)

Abstract author(s): Pecci, Alessandra (Universitat de Barcelona) - Moragas, Natalia (ERAAUB, IAUB, Universitat de Barcelona) - Barba, Luis - Ortiz, Agustin - Blancas, Jorge (LPA, IIA, UNAM)

Abstract format: Oral

We present here an update of an interdisciplinary project to study a neighborhood in the center of Teotihuacan (Mexico), started in 2017 in co direction between the UNAM (A. Ortiz, L. Barba) and the Universitat de Barcelona (A. Pecci, N. Moragas).

The project is aimed at investigating an area located in the center of Teotihuacan (The City of Gods), Mexico, between the river San Juan, the Sun Pyramid and the Street of the Dead, named by Millon “sectors N2E1 and N2E2”, through the application of geophysical prospection techniques (georadar, electrical and magnetic studies), topography, aerial photography with drone, the study of chemical residues on the surface and the registration of archaeological materials to identify structures and indicators of human activity. The data obtained until now in selected portions of the two sectors, are compared to the map proposed by Millon in 1973 and allow to suggest preliminary hypotheses about the presence of buildings, their distribution and depth and the relationship of this area with the San Juan River.

The project is financed by the Spanish Ministerio de Cultura y Deporte (Ayudas a proyectos arqueológicos en el exterior and the Fundación Palarq, and it is part of the activities of the Laboratorio de Prospección Arqueológica of the UNAM, the Institut d'Arqueologia of the University of Barcelona and the ERAAUB research group (2021 SGR 00696) of the University of Barcelona.

3 POTTERY CONTENTS IN POSTCLASSIC XOCHIMILCO, MEXICO

Abstract author(s): Hernández-Grajales, Meztli (Universitat de Barcelona, ERAAUB, Instituto de Arqueología UB) - Barba, Luis (Laboratorio de Prospección Arqueológica. Instituto de Investigaciones Antropológicas, UNAM) - García-Granero, Juan José (HUMANE-IMF-CSIC) - Mileto, Simona (Universitat de Barcelona, ERAAUB, Instituto de Arqueología UB) - Ortiz-Butrón, Agustín (Laboratorio de Prospección Arqueológica. Instituto de Investigaciones Antropológicas, UNAM) - Mejía-Appel, Gabriela - Castillo Mangas, María Teresa (Dirección de Salvamento Arqueológico, INAH) - Pecci, Alessandra (Universitat de Barcelona, ERAAUB, Instituto de Arqueología UB)

Abstract format: Oral

Food is a basic human need that has become a social, economic, political, and religious activity present in the daily life of all cultures throughout history.

In Mexico, food is, to date, a very strong element of national identity with its prehispanic features as one of the main characteristics; this is one of the reasons why it was named part of UNESCO's World Heritage.

The Spaniard chroniclers recorded a lot of information regarding the food of the Mexica festivals, as well as those dishes consumed by the elites. But what did common people eat in pre-Hispanic times, and which was the use of different pottery shapes?

To meet the objectives of this research, the contents in different archaeological ceramic shapes for food preparation and consumption were analyzed. A multi-proxy approach was applied, and pottery samples were studied with spot tests, gas chromatography coupled with mass spectrometry; and were studied to identify the presence of starch granules. Finally, some of these samples were also analyzed with FT-IR to confirm the presence of lime likely associated with nixtamalization.

The results show evidence of the possible preparation of nixtamalized corn, as well as the presence of residues of mainly vegetable origin. In addition, it is possible to observe that the results obtained for the different ceramic forms do not always confirm the hypotheses about the function that have traditionally been assigned to them, which confirms the importance of integrate different analytical approaches. for a better interpretation of use-function of ceramics and food in the past.

The study is part of the PhD project of M. Hernández financed by CONACYT-FONCA, the Institut d'Arqueologia of the University of Barcelona, the ERAAUB research group (2021 SGR 00696), the Laboratorio de Prospección Arqueológica de la UNAM and the HUMANE- IMF- CSIC research group.

4 NEW RESEARCH INTO THE ANCIENT MAYA OF NORTHWEST BELIZE

Abstract author(s): Neuhoff-Malorzo, Patricia (University of Texas at Austin; SWCA)

Abstract format: Oral

Current research being undertaken to investigate the activities and sites of the ancient Maya of NW Belize has begun to incorporate both new methods and practical field components in order to look at and compare new datasets with existing data in a novel way. This is accomplished by comparing and contrasting a variety of aspects of a selection of

urban and hinterland settlements within this specific area of the Three Rivers Region. Recent efforts are combining magnetometry with existing data to investigate sites across northwest Belize. These efforts have led to new and more complete analysis of creation of space at three locations within the Rio Bravo Conservation and Management Area conducted under the research umbrella of the Programme for Belize Archaeology Project. This research has also led to new theoretical approaches to the analysis of settlements and settlement interactions in this region analyzing the positions and contributions from such sites as La Milpa (the main center for the region) and Tzak Naab.

5 RESEARCH ON THE HIDDEN ARCHITECTURE OF LA BLANCA ACROPOLIS

Abstract author(s): Munoz Cosme, Gaspar (Universitat Politècnica de València) - Vidal Lorenzo, Cristina (Universitat de València)

Abstract format: Oral

Fifteen years of research at the archaeological site of La Blanca, located in the Mopán River Valley (Petén, Guatemala), have offered many insights into its urban structure and the society that occupied it both during its period of splendour and after its abandonment. The implementation of new digital technologies at all stages of archaeological excavation during fieldwork has provided useful advantages when undertaking the exploration of the buildings buried inside the Acropolis by the ancient Maya, especially on its western flank.

The application of this innovative method, together with a meticulous excavation methodology, led to the discovery of an original substructure comprising a building with three vaulted rooms and vestiges of mural paintings, next to another one built on an elevated platform bearing a notable frieze made by small carved pieces fitted together.

The study of the characteristics of these architectural spaces and of the splendid frieze led us to reflect on the cultural links of this area of Petén with other regions of the Maya area, where later similar architectural practices have been documented.

The aim of this paper is to share the results of our methodology and research on Maya archaeology while based in Europe, and to generate a debate on the linkages and influences of architectural techniques witnessed in Petén with those of other regions (especially of Northern Yucatán where we are currently doing research), and to explore the possible vectors of cultural transmission between these regions.

6 THE GEOARCHAEOLOGICAL INVESTIGATIONS IN TAK'ALIK AB'AJ, RETALHULEU, GUATEMALA

Abstract author(s): Gilewski, Michal (Uniwersytet Warszawski) - Schieber de Lavarreda, Christa - Flores, Victor - Espigares, Carlos - Medina, Miguel - Aleman, Aldo (Parque Arqueológico Nacional Tak'alik Ab'aj - PANTA, Ministerio de Cultura y Deportes de Guatemala/Viceministerio y Dirección General del Patrimonio Cultural y Natural-Dirección Técnica IDAEH) - Oglaza, Kajetan - Przychodzeń, Karol - Woronko, Barbara (University of Warsaw)

Abstract format: Oral

The project Investigaciones Geoarqueológicas en Tak'alik Ab'aj (realized in cooperation with the Tak'alik Ab'aj National Archaeological Park and the University of Warsaw) have carried out the geochemical studies of sediments from excavations and auger sondages within the Central Group and North Group. The aim of the study is to reconstruct the form of land use and to reconstruct the function of these areas, as well as to corroborate the existence of residential areas and units, and potential cultivation zones, identified by means of frequency or absence of evidence of garbage pits in previous excavations. For this purpose, an analysis of the content of soil organic matter by the Loss-on-ignition (LOI) method and the geochemical study of soil in different strata were carried out.

The study of the strata carried out in the peripheral areas showed higher and more varied values of loss-on-ignition (LOI) than those in the central area. These data, among other geoarchaeological results, seem to confirm the first hypotheses coming from the traditional excavations.

7 EARLY PLANT DOMESTICATION AND FABRIC TECHNOLOGIES: THE CASE OF SOUTH AMERICA'S COTTON (GOSSYPIMUM BARBADENSE)

Abstract author(s): Alday, Camila (University of Cambridge) - Beresford-jones, David (McDonald Institute for archaeological research, Cambridge)

Abstract format: Oral

G. barbadense, indigenous to South America's tropical lowlands has an unparalleled legacy for the story of modern textile industries and fishing economies worldwide; yet long before being largely cultivated around the world, *G. barbadense* had first become a critical textile material – and likely cultivated 6301–6133 cal. yrs. BP among coastal hunter-gatherers on the Pacific coast. Researchers have long hypothesised about the critical role of cotton in the development of the early subsistence strategies of South America's coastal communities. For instance, Moseley's maritime foundation model (1975) epitomised the idea that cotton and gourds were the basis from which complex technologies were produced (e.g., large-scale fishing nets), and the existing maritime economy was enhanced.

In our research, we conduct a review of archaeological and botanical evidence for cotton domestication in South America. To do so, we compile data from molecular genetics of *Gossypium* (Westengen et al. 2005; Grover et al. 2022; Viot and Wendel 2023), to Stephens and Moseley's seminal works (Stephens 1975, Stephens, and Moseley 1973), Damp and Pearsall's (1994) archaeobotanical analysis and Piperno's model (2011) on plant cultivation and domestication in the Americas.

We critically analyse the compiled evidence to show how cotton cultivation triggered a turning point in the social dynamics of coastal hunter-gatherers by causing a shift from an immediate-return (e.g., wild-gathered plants) to a delayed-return (e.g., sown, watered, and harvested *G. barbadense*) economy. In doing so, we emphasize how relevant cotton cultivation was for the formation of large-scale communities motivating further social cohesion and wider economic links among hunter-gatherer groups on the Pacific coast. Finally, we argue that cotton – as a textile crop, is a unique example to interrogate the link between textile technologies and the concept of 'complexity' among the early coastal communities of South America.

8 MANUFACTURE, USE AND VALUE OF GOLD AMONG THE MUISCA (AD 400-1600): THE CASE OF NUEVA ESPERANZA (COLOMBIA)

Abstract author(s): Benzonelli, Agnese (University of Cambridge) - Rivas Estrada, Sebastián (Corporación universitaria minuto de dios) - Otero Santillan, Joaquín - Calderon Rodriguez, Gabriel Armando (INGETEC) - Campos Quintero, Lina (Museo del Oro) - Crawford, Rosie - Martínón-Torres, Marcos (University of Cambridge)

Abstract format: Oral

Nueva Esperanza (AD 400-1400) is widely recognised as one of the most important Muisca archaeological sites of Colombia, and the most extensively excavated settlement. This site includes more than 3400 burials as well as domestic and ritual contexts, and the extensive material culture recovered comprises pottery, goldwork, lithics, and numerous spindle whorls. This site is therefore a key study focus of the REVERSEACTION project (www.reverseaction.org), which focuses on complex and luxury technologies in stateless societies.

Here we present the analytical study of more than 200 gold objects recovered from the site, using OM, pXRF, LA-ICP-MS and isotopic analysis. Anchored in contextual associations and an extensive set of radiocarbon dates, the results allow an understanding of the provision, manufacture, use and deposition of goldwork. Through a formal evaluation of technical complexity and depositional contexts of the artefacts, we discuss the possible co-existence of technical traditions, collective action, and the social value of gold.

By integrating the goldwork analysis with the information available on the associated individuals (osteoarchoeology and aDNA) and contexts, as well as data from other crafts, we explore diachronic changes in raw materials and technology, craft organisation and social inequality. This work not only enhances our understanding of Nueva Esperanza, but it also provides a solid reference point for research on similar materials in museum collections where contexts are less clear.

9 INTERDISCIPLINARY STUDY OF THE USE OF ANIMALS AT THE SITE OF PACHACAMAC, PERU (10TH-16TH CENTURIES AD)

Abstract author(s): Erauw, Céline (University of Cambridge)

Abstract format: Oral

This paper reports the use of animals at the site of Pachacamac, a major site on the central Peruvian coast (5th-16th centuries AD), according to three themes: their use in the diet, in rituals and offerings to the deceased.

To answer this, a corpus of 30,479 archaeofaunal remains, never studied before, has been analysed. The remains come from 21 buildings and areas excavated during ten excavation campaigns of the Ychsma Project (Université libre de Bruxelles) between 1999 and 2019. This faunal material was approached from three complementary angles: zooarchaeology, which underlies most of the research work, archaeology and the study of complementary sources (ethnohistorical, iconographic and ethnographic).

Zooarchaeological analysis carried out shows a constancy during the successive phases of occupation. Concerning diet, the animals consumed were mainly guinea pigs and domestic camelids. This diet is supplemented by the consumption of various wild taxa. In terms of ritual use, four categories of offerings were distinguished: foundation, abandonment, cult and funerary offerings. Domestic taxa (camelid, dog and guinea pig) dominate the assemblage of archaeofaunal remains found in these contexts. Wild taxa, some of which are not endemic to the central coast, are also used as offerings, but to a lesser extent. If globally, the exploitation, both domestic and ritual, of animals at the Pachacamac site from the 10th to the 16th century presents many similarities with the practices found at other sites, this study leads us to consider that certain aspects give the Pachacamac site a singularity that certainly deserves to be studied further.

10 STABLE ISOTOPE STUDY OF THE DIET AND MOBILITY OF INCA CAPACOCCHA VICTIMS

Abstract author(s): Socha, Dagmara (Center for Andean Studies, University of Warsaw) - Fernandes, Ricardo (Systems Archaeology, Max Planck Institute of Geoanthropology; Computational Archaeology Lab, Max Planck Institute of Geoanthropology; Radiocarbon Lab, Max Planck Institute of Geoanthropology; Compound Specific Isotopic Analyses Lab, Max Planck Institute of Geoanthropology; Faculty of Arts, Masaryk University; Climate Change and History Research Initiative, Princeton University)

Abstract format: Oral

The Capacocha ritual was of great importance in the Inca Empire and involved the sacrifice of children and young women who were selected from the provincial elite based on their beauty and health. These victims were gathered from across the Empire and brought to the capital, Cusco, in order to be sacrificed during important events associated with the royal court, natural disasters (e.g. earthquakes, droughts, volcanoes, and epidemics), and cyclical holidays (e.g. summer and winter solstices).

This paper presents the findings of a stable isotope analysis of the diet and mobility (as indicated by carbon $\delta^{13}\text{C}$ and nitrogen $\delta^{15}\text{N}$ isotope ratios) of teeth and bones from thirteen individuals sacrificed at Ampato, Pichu Picchu, and Misti volcanos. These remains were discovered by a team led by Johan Reinhard and Jose Antonio Chavez in the 1990s. Isotopic analysis of the tooth enamel revealed that the children had mixed origins, while examination of the bone and teeth of the victims from Misti showed that the diet of some of them had changed in the two years prior to their death. This suggests that the children may have been taken from their place of origin to Cusco as hostages or acclimated long before they were sacrificed.

11 MUYU MUYU - THE INCA ORACLE OF SOLIMANA?

Abstract author(s): Klaput, Jan (University of Warsaw) - Presbítero Rodríguez, Gonzalo (Universidad Católica de Santa María en Arequipa) - Ziółkowski, Mariusz (University of Warsaw)

Abstract format: Oral

The presentation will outline the latest results of Polish-Peruvian excavations at the Muyu Muyu site (dep. Arequipa, Peru). The site, located on the slopes of the Solimana volcano, can probably be identified as the Inca ceremonial centre, known from written accounts, associated with worship of Solimana and as the oracle speaking on behalf of the sacred peak. Chronicler Cristóbal de Albornoz mentioned that the sanctuary was rebuilt by the Incas and given a service of a group of mitimaes (settlers displaced from other parts of the Inca empire). This kind of statement suggests the existence of some earlier administrative-ceremonial center in Muyu Muyu, which was probably later adapted by the Incas for their needs.

Following the archaeological prospection carried out at Muyu Muyu in 2017, the Center for Andean Studies of the University of Warsaw, together with the Universidad Católica de Santa María in Arequipa, organised the first season of excavations in 2022. The project involved a series of survey digs, the main objective of which was to document the stratigraphy of the different parts of the site, providing information on its chronology and use. A documentation of the architecture in Muyu Muyu was also carried out, including several unusual structures. Further plans involve, among others, radiocarbon dating of samples collected in various contexts within the site. The project aims to provide answers to questions about the original function of Muyu Muyu, its identification as a major Solimana worship centre, and the presence of pre-Inca activity at the site, indicated by the account of Albornoz.

12 INVESTIGATING SPANISH COLONIAL IMPACT: AN UNDERSTANDING OF TECHNOLOGICAL CHANGE THROUGH CERAMICS FROM SOUTH AND CENTRAL AMERICA (1400-1700 AD)

Abstract author(s): Thompson, Helen (University of Sheffield) - Day, Peter (Institute of Nanoscience and Nanotechnology, NCSR 'Demokritos'; University of Sheffield) - Buxeda i Garrigós, Jaume (University of Barcelona) - Jackson, Caroline (University of Sheffield) - Linero Baroni, Mirta (Patronato Panamá Viejo) - Prieto-Olavarría, Cristina (Centro Científico Tecnológico - CCT - CONICET, Mendoza; Universidad Nacional de Cuyo) - Cocco, Gabriel (Museo Etnográfico y Colonial) - Urbina, Simón (Universidad Austral de Chile) - Chiavazza, Horacio (Universidad Nacional de Cuyo)

Abstract format: Oral

Spanish colonisation of the so-called 'New World' had significant impacts on Indigenous populations, African slaves, and the lives of Spanish settlers. In this project, Spanish colonial impacts will be considered through the study of technological transformations in ceramics and comparative provenance studies across four sites during the 15th-17th centuries. The main sites under investigation are Panamá Viejo (Panama), Mendoza and Santa Fe la Vieja (Argentina), and Valdivia (Chile). There are two key questions under consideration in this paper: 1) Did technological transfer occur between Indigenous and Spanish ceramic traditions and, if so, by what mechanisms? And 2) How were ceramic technologies and patterns of consumption influenced by the process of colonisation, and what can that tell us

about colonial and Indigenous identities in South and Central America? These questions will be addressed through the characterisation and comparison of the production technology of both Indigenous and Spanish ceramic traditions. This characterisation will be approached by examining ceramics from pre and post-Spanish arrival with macroscopic analysis, ceramic petrography, and X-ray fluorescence. The technological insights produced will inform important academic debates on colonialism and understandings of material conditions of contact, control and resistance involving Indigenous groups which have current global relevance.

438 **TIMBER BUILDINGS IN MEDIEVAL AND POST-MEDIEVAL EUROPE**

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Bouwmeester, Jeroen (Cultural Heritage Agency of the Netherlands) - Patrick, Laura (Queen's University Belfast) - Berryman, Duncan (Centre for Community Archaeology, Queen's University Belfast) - Kerr, Sarah (Aarhus University) - Gullbrandsson, Robin (Västergötlands museum)

Session format: Regular session

The general image of medieval buildings is that they were mostly made of stone in urban contexts and of wood on the countryside. This might be based on a nineteenth century romantic vision of rural life in contrast with the urban. The reality was far more complex. Not only could stone be found in farm buildings, equally wood was, despite fire hazards, for a long time a very popular building material in towns. More often a mixture of building materials occurred.

This led to growing demand for wood, in particular from the 12th century when urbanisation increased sharply. Local wood was no longer sufficient to meet the demand and it became necessary to import wood.

So timber construction in the Middle Ages had many dimensions. In this session we would like to explore and discuss these in more detail. Possible themes for discussion include:

- the development of wooden buildings in the Middle Ages;
- the materiality of wood as a building material in context of (for example) status and class;
- the use of wood as building material;
- the exchange of building techniques;
- the trade in wood and the import of wood;
- conserving / maintaining wooden monuments especially in light of increasing pressures from the climate crisis and tourism;
- new methods and techniques in researching wooden buildings.

We welcome contributions with a focus on medieval and post-medieval Europe.

ABSTRACTS

1 **DENDROCHRONOLOGY IN CHURCHES OF VÄSTERGÖTLAND - A VIEW ON TIMBER RESOURCES AND THEIR USE THROUGH TIME**

Abstract author(s): Gullbrandsson, Robin (Västergötland's Museum) - Hansson, Anton (Department of Geology, University of Lund)

Abstract format: Oral

Since the 1980s, several medieval churches in the West Swedish province of Västergötland have been sampled for dendrochronological analysis. In an ongoing cross-disciplinary project at the University of Lund and Västergötland's Museum, almost 400 archived samples from around 30 churches are digitized where data and metadata are made accessible through the database SEAD. The digitized material is used to discuss medieval church building in the province, which timber resources that were at hand and how they were used, focusing on roof structures and belfries. Questions are asked on felling dates, provenances, character of forests, timber qualities, provision and scantling. The project seek to reflect how these things changed over time, from the early 12th century until the Late Middle Ages and the Early Modern Period. The early constructions indicate access to local natural forests with slow-grown straight pines and oaks of large diameter, suitable for cleaving forth high quality rafters, struts, boards and shingles. Early dendrochronological results indicate that oak timber during this time is mostly focused to two areas with suitable oak resources, whereas pine timber seem to be accessible throughout the province. After the intense church building of the 12th century, timbers of high quality seem to have become harder to obtain. This is supported by preliminary dendrochronological results indicating a single area of oak forest supplying the churches in the province. However, a real shortage of construction timber in parts of the province is apparent first in Early Modern time.

2 MEDIEVAL CHURCHES OF WOOD AND STONE - RECONSIDERING CHURCH TOPOGRAPHIES AND BUILDING MATERIALITY STATUS IN NORWAY

Abstract author(s): Rein fjord, Kristian (University of Bergen)

Abstract format: Oral

Wood was the common building material in Norway during the Middle Ages. Both in rural and urban contexts timber buildings dominated built environments. For instance, only 271 of around 1200 churches of the period were built in stone. Even though stone building was introduced as a new technology to the region in the early 12th century, wood building continued throughout the medieval period, in ecclesiastical and secular contexts. Stave churches, wooden halls and timber lofts hold a significant value in Norwegian architectural history and heritage discourses. Being the largest building group of both wood and stone, churches should be starting point of material status enquiries. A scholarly consensus has been that stone churches held a higher status than stave churches and were more prestigious in rural medieval topographies, as stone churches presumably were more expensive to build. Reassessing the evidence of finance (tax protocols and church property income), architecture, and raw material resources (quarries and forestry), the proposed paper argues that the high status of stone in church topographies should be downplayed. It is stated that patrons did not consider finances when choosing raw materials. Other factors, such as raw material resources and socio-political strategies, were of essence when choosing wood or stone in medieval Norway.

3 THE WOODEN TOWN OF LÖDÖSE

Abstract author(s): Lazarides, Anton (Lödöse museum)

Abstract format: Oral

The medieval town of Lödöse in western Sweden was a wooden town. The absence of stone buildings is a rather curious subject, perhaps suitable for another session. This paper will address the topic of the many wooden buildings in Lödöse. The focus will be on the development of building techniques through time as well as creating a better understanding of how the town looked. Were there only small one-storey buildings or could there have been larger wooden structures with several storeys as well?

During the 12th and 13th centuries most buildings were built with post-and-plank technique - with corner posts and horizontal plank infill. The foundation for a building of this technique was usually a few corner stones or just wooden sills. During the end of the 13th century, log construction became more common and was eventually the predominant building technique in Lödöse. From the late medieval times, very few wooden structures have been found due to the poor preservation in the uppermost layers in the archaeological stratigraphy. Instead, we find simple stone sill foundations, usually in rows with just one layer of stone in rectangular shapes.

During the last few years, older excavation plans and documentation have gradually been digitally scanned to easier access the results of these projects. A first attempt to digitally reconstruct parts of the town by georeferencing these plans into GIS has been made. This process has brought light upon the general layout of the town and how it has changed through time.

4 TIMBER BUILDINGS IN EARLY MEDIEVAL TRONDHEIM, NORWAY - TYPES, TECHNIQUES AND DEVELOPMENT AND RESOURCES INVESTED IN THE BUILT ENVIRONMENT

Abstract author(s): Petersen, Anna (Norwegian Institute of Cultural Heritage Research) - Brevik, Per Steinar (Stiklestad National Culture Centre)

Abstract format: Oral

Timber buildings form a substantial part of the built environment in medieval Scandinavia, both in rural and urban contexts. Because of often favorable preservation conditions for organic material in urban contexts, architectural remains are often encountered in the excavated archaeological material from Norway's medieval towns. The past building heritage can be reconstructed using archaeological sources, cultural-historical information and expertise found in traditional timber craftsmanship. Analyses of the volume of timber utilised in buildings in urban contexts, and the types and development of construction techniques used are important factors to be considered in discussions of what an urban economy in medieval Norway consisted of. However, timber as a natural resource is seldom included in studies of urban medieval economy from an archaeological perspective. This presentation uses the secular wooden architecture in early medieval Trondheim (AD 950-1150) as a case to illustrate timber's role as an economic resource, and highlights aspects of the socioeconomic organisation the early urban Trondheim retrieved from remains of the secular wooden architecture regarding access to timber, volumes of timber used, and types of labour and skills employed.

5 THE CONSTRUCTION OF WOODEN HOUSES WITHIN A PLOT IN THE TOWN OF LUND, FROM THE LATE 900S UNTIL THE 1300S

Abstract author(s): Gardelin, Gunilla (Kulturen)

Abstract format: Oral

In the central parts of the medieval town of Lund, the conditions for the preservation of organic material are very good. This means that remains of wooden buildings, both sacral and profane, have been documented during archaeological excavations.

Previous studies of the building culture of Lund were made at a general level, and references are repeatedly made to these generalizations about building culture. The generalizations mostly concern what building techniques were used and when changes to the building culture took place. Why changes took place and how construction work was organized in Lund have only been touched upon on a hypothetical level. This implies that there may be a greater variety of building construction techniques than previously assumed.

The project aims to highlight new knowledge about the medieval wooden buildings of Lund, both in sacral and profane environments. What have building conditions and technology looked like in disparate environments and during different periods?

Of the remains preserved underground, only certain building elements remain. To facilitate the identification of building construction techniques, reconstruction will be used as a method. In the reconstruction process, a decision must be taken on which building technical solutions has been possible. In such a process, interpretations of the found remains can be improved.

This presentation includes a case study dealing with wooden buildings on a plot in Lund, that was archaeologically excavated in 1979-80. The building elements underwent dendrochronological analysis, which makes this particular plot suitable for further studies. The case study will form the basis for a more comprehensive study of the wooden buildings of Lund. In further studies, the hope is also to be able to gain a better understanding of how the wooden building craft was organized during the Middle Ages in Lund.

6 TIMBER-FRAMING IN LATE MEDIEVAL FLEMISH CITIES. AN ARCHAEOLOGICAL AND BUILDING HISTORICAL APPROACH TO URBAN HOUSING

Abstract author(s): Lapeere, Lennert (Ghent University)

Abstract format: Oral

The late medieval Flemish cities were amongst the most populated in western Europe and had a dense urban fabric. Iconographic sources, such as the cityscapes on the Ghent Altarpiece (finished in 1432), show that a substantial part of the townhouses was built using timber-framing techniques. Unlike these iconographic sources, building historical and archaeological data were initially scarce and difficult to interpret. New archaeological research of the last decades combined with building historical analysis made it possible to present a first overview of timber-framed townhouses between ca. 1200 and 1500 in the study area, including present-day French Flanders (Northern France), the provinces of West and East Flanders (Belgium) and Zeeland (Netherlands).

An overview of all used foundation techniques shows a clear shift from earthfast post construction to stone building and timber-framed structures on sill walls or padstones. Building historical analysis of the interior wooden structure of preserved stone townhouses of Bruges and Ghent proves the importance of wood in late medieval structures. The existing wooden house fronts are carefully made and were no cheap alternative of complete stone houses but status symbols on their own.

The analysis of all excavated medieval houses of the medium-sized city of Aalst shows the use of different materials and building techniques in between urban quarters and its evolution through time. These data compared with other excavated sites in Ninove, Ronse, Sluis, Ypres, and Douai gives an evolution of the appearance, building materials, and layout of urban housing but also about plot layout and orientation to the existing urban infrastructure. Some regional differences became apparent in the use of materials and construction techniques.

7 BEHIND THE CURVE: A 13TH CENTURY TIMBER BUILDING IN ASTURIAS, SPAIN

Abstract author(s): Fernández Fernández, Jesús (University of Oviedo) - Moshenska, Gabriel (University College London)

Abstract format: Oral

The study of early medieval timber buildings in Spain has benefitted mainly from the results of rescue archaeology in recent decades and also some academic projects. However, the research of later medieval houses – particularly rural and peasant homes – has lagged behind. In Asturias, as in some other regions, there is virtually no archaeological evidence of early or late medieval rural vernacular architecture. This paper presents the results of an excavation that

recovered the complete floorplan of a timber peasant house dated to the 13th century. The rectangular structure consisted of twenty postholes outlining an area of around 33 square metres, containing trash pits and hearths. We also collected abundant animal bones and other environmental evidence from the site. The house is extremely simple in structure and layout, and the associated artefacts are equally simple and sparse: this is in marked contrast to many contemporary buildings excavated in other parts of Europe. Stone was in widespread use for peasant houses in Italy from the 12th century, and in England and Wales a century later. The findings of our excavation indicate that Asturias was behind the curve in these matters: stone buildings and other evidence (such as the use of coins, and pottery found in market sites) appear gradually from the 14th century onwards. At this point in time we find an intensification in agrarian work, a growing frequency of coin finds, and the presence of non local pottery. Our research on this house and its surroundings offer valuable insights into the variations in the archaeological record of high-medieval peasant houses in Europe.

8 LOG BUILDINGS AND THE CRAFTSMAN'S POINT OF VIEW. WOOD, TECHNIQUES, SKILLS AND TOOLS IN ARCHAEOLOGICAL TIMBER FROM EARLY MEDIEVAL TRONDHEIM.

Abstract author(s): Brevik, Per Steinar - Johansen, Kai (Stiklestad National Culture Centre)

Abstract format: Oral

Archaeological deposits in anaerobic conditions preserves wood and other organic materials for a long period of time. This makes it possible to study both tool marks, decorative elements and construction techniques at a detailed level and is as such an invaluable source to our understanding of for instance log building practice and tool usage. Tool marks and traces of different techniques and processes, as well as the type, volume and quality of timber, adds crucial information of building capacity and the skills of carpentry found in the early urban communities. However, accessing this information from said sources, presupposes a deep knowledge not only of archaeology, but also of historical craftsmanship.

This paper will focus on the early medieval town of Trondheim, Norway. The archeological source material includes various remains of wooden buildings from the early urban settlement from the 11th century. Using this material as the point of departure, the goal is to show how introducing the perspective of historical craftsmanship in addition to traditional archeology, allows us to extract new knowledge from the same sources. At times this knowledge adds to what is already known. Other times it serves as an important correction to what has been deduced from previous archeological investigations. Drawing on examples from the experimental reconstruction of medieval wooden buildings at the museum Stiklestad National Cultural Centre, based on archaeological material, the aim is to give a better understanding of how the craftsman's perspective can provide an important contribution to our understanding of both medieval log buildings and medieval society.

439 SUSTAINING ARCHAEOLOGY: IMAGINING THE FUTURES OF ARCHAEOLOGY

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Wollentz, Gustav (The Nordic Centre of Heritage Learning and Creativity; UNESCO Chair on Heritage Futures) - Ribeiro, Artur (Kiel University)

Session format: Regular session

To create a more sustainable archaeology, we need the capacity to imagine how things can be different. During the last 10 years, there has been a momentum to the critique of the neoliberal structures determining and framing the professional lives of archaeologists in Europe and elsewhere. In these structures, ceaseless growth through fast science is propagated, perhaps at expense of slower and more careful engagements. This critique has highlighted the unsustainability of our practices and the structures we operate in. However, arguably, archaeology has not always had the creative and imaginary capacity to imagine how things can be different and what opportunities there may be now to make positive change. Therefore, we would like to focus our session on possible ways to move forward from the critique towards actions in the present aiming for a more sustainable archaeology.

Our central concern is imagining what sustainable forms of research are possible in the future, how this research could look like and operate, and what actions we can take to move in those directions. Given how our societies are developing historically, we should think about the obstacles and how to overcome them in order to sustain archaeology as a practice.

The session aims to broaden the horizon of what may be possible, rather than determining one desirable outcome. The diversification of possibilities and opportunities is a goal. Furthermore, the ideas presented in the session can be built around ongoing research projects and environments, but it can also be built around ideas that are neither funded nor finalized yet. This is a session where imaginary, creative and novel ideas are valued, but these ideas can very well still be in-the-making.

ABSTRACTS

1 **FORESIGHT IN ARCHAEOLOGY AND HERITAGE - POTENTIAL AREAS WHERE ARCHAEOLOGY CAN CONTRIBUTE TO MORE SUSTAINABLE FUTURES**

Abstract author(s): Wollentz, Gustav (Nordic Centre of Heritage Learning and Creativity; UNESCO Chair on Heritage Futures)

Abstract format: Oral

In 2022 and 2023 ICCROM has been mapping out the future environment for research on heritage, through a literature review of existing Foresight and Forecasting studies. ICCROM has been doing this as part of a European Commission funded project named, ARCHE, Alliance for Research on Cultural Heritage, with the aim of developing a new Strategic Research and Innovation Agenda for heritage in Europe. The study has examined how different fields have been anticipating the future, what these futures look like and the implications and links to heritage. The study provides insight into possible future landscapes for archaeology, in relation to major global trends in society, such as the climate crisis, an ageing population, the digital revolution, and largescale transnational movement. I will look at how these possible future landscapes may inform actions and strategies today for archaeology to be more proactive in shaping a more sustainable future. Focus will be on three identified needs for the future: an economy centered upon wellbeing rather than economic growth, an ethical AI sensitive to human values, and a different, more inclusive, form of heritage in the future, less confined to the narrow of the nation-state.

2 **ARTIFICIAL INTELLIGENCE AND ARTIFICING KNOWLEDGE: EXPLORING THE RELATIONS AMONG DATA, INTERPRETATION AND THE CREATION OF ARCHAEOLOGICAL KNOWLEDGE**

Abstract author(s): Goodchild, Joel - Doonan, Roger (Archaeological Research Services)

Abstract format: Oral

Archaeological practice sits at a crossroads while beset by multiple challenges, perhaps the most pressing of which is how the discipline meaningfully contributes to confronting the impacts of climate change while envisioning more sustainable ways of living. In the face of the increasing pressure on economic and human resources, the prospect of automation through Artificial Intelligence (AI) may appear an attractive means of expediting archaeological investigation, particularly where mandated through legislation. While AI may present an attractive means of increasing productivity, it carries with it the prospect of a world in which AI defines the structures of power and knowledge that provide the conduits for the flow of data, information and the activities of knowledge building. Such approaches are susceptible to being co-opted by established power structures that may, wittingly or unwittingly, seek to reduce archaeology to a quantifiable resource to be identified and mapped, while overlooking the opportunity to create value in building meaningful knowledge and wider societal understanding.

Machine learning algorithms are in the main limited to processing single datasets, producing results by that, in some instances, defy tangible explanation. If interpreting the past is an inherently political process, then there are dangers in ceding the process of knowledge creation to opaque systems that are only partially understood, even by those who utilise them, raising questions about scrutiny and accountability. While the 'fast science' solutions offered by such methodologies have their obvious utility, it is only by retaining a place for recognised human-centred skills that allow integration across multiple datasets and encourage open discussion, that we can hope to elucidate the complex social, societal and environmental relationships that characterise past communities. It is the past lifeways of these communities that may offer an insight into how we express our humanity in a more sustainable manner.

3 **STEERING INTO THE SKID: COUNTERINTUITIVE STRATEGIES IN CONTEMPORARY ARCHAEOLOGY**

Abstract author(s): Ruffino, Jane (Södertörn University)

Abstract format: Oral

"What would an archaeology of data look like if we focused on mapping networks of physical things that carry, store, and manage data? How can we understand the Internet's material forms?" I've been sitting with this question for more than a decade. It started long before I even considered coming back to archaeology after many years in media and the software industry. What is the Internet? Where is it? Where do I start, and then, where do I stop?

COVID-19 hit just as I was starting this project. I made a pivot, looking at the architectures of the undersea fiber optic network, mainly because it was something I could do outdoors. Soon, Russia's war on Ukraine started, accelerating the already changing security practices, and forcing another shift. Then there was the Nord Stream explosion.

In this talk, I'll share some of what I've learned about the data cables under the sea, and about the business structures of critical infrastructure, especially in the Baltic Sea region. But also the challenges of doing work impeded by a pandemic, corporate secrecy and national security, and look for hope and possibility along the slippery and winding path. Rising inflation, ongoing political and economic instability, climate change. It's hard to say what's next, but it would be foolish to think this is the last time this project will be in the blast radius of a crisis.

As I respond to a constantly changing context, my work has become more like a documentary than a "normal" thesis. There's no stable ground. I can't fall back on an inherited archaeological or methodological structure that would make me seem – or feel – like a "credible" archaeologist. So, what if I applied the advice for drivers in a car that's skidding out of control, and just steer into it?

4 A FUND TO EXIST

Abstract author(s): Pintucci, Alessandro - Abbadessa, Anglea (Confederazione Italiana Archeologi)

Abstract format: Oral

The Convention for the protection of the archaeological heritage of 1992 was and is at the center of the international debate: it is common opinion that the Convention has represented a radical change in our discipline, making it one of those related to territorial development and urban planning.

It is equally known that there are a series of negative aspects which are a direct result of the introduction of this legislation (i.e. Wilhems 2014, Kristensen 2015, 2016): among them, above all an excessive bureaucratization of archaeological procedures, with the progressive abandonment of elaboration and synthetic aspect of archaeological studies and the very scarce propensity for the scientific publication of emergency and preventive excavations.

The general consequence was a progressive transformation of archeology into technical knowledge and an ancillary discipline of construction, which it now rarely opposes (in this sense the Anglo-Saxon term development-led archeology is perfectly fitting).

We will start from an analysis of the reasons for these changes, to formulate a proposal that brings research back to the center of interest in archeology, restoring dignity and value to preventive and emergency research and excavations.

Starting from the re-elaboration of known and tested experiences, a proposal will be formulated that is able to combine the principles of Malta (the so-called polluters pay), with market mechanisms, which it is now clear, cannot or cannot include the phase of research, study and publication.

5 NAVIGATING THE LABYRINTH: REIMAGINING ARCHAEOLOGICAL FIELDWORK AT KNOSSOS FOR THE TWENTY-FIRST CENTURY

Abstract author(s): Day, Jo (University College Dublin) - Trainor, Conor (University of Warwick) - Oddo, Emilia (Tulane University)

Abstract format: Oral

This paper reflects on a key aspect of developing a sustainable archaeological practice and discipline: balancing fieldwork, research and caring commitments. The pressures within academic archaeology to win large grants, to direct high-impact projects, and to publish results quickly are well-known. This metrics-driven framework in which many of us operate is further reinforced by funding structures that can disadvantage those who are time- and resource- poor, such as on short-term contracts, in precarious employment, and/or with caring responsibilities. Early career archaeologists are under enormous pressure, and studies have shown women, in particular, face many challenges returning to fieldwork after having children. The Knossos Legacy and Sustainable Archaeology Project (KLaSP), launched in 2022, was developed in response to this neo-liberal norm, taking into account the family circumstances and career stages of the PIs. KLaSP is an international collaborative project of The British School at Athens, Tulane University, University College Dublin and University of Warwick. Its focus is on studying and publishing legacy data from old excavations at the Cretan site of Knossos, a sustainable, non-destructive form of archaeological enquiry, and important for continuing work at a site boasting over a century of fieldwork, on an island with abundant tourism-related development. The three university teams shared teaching and financial resources to foreground pedagogy, as well as to achieve our research goals. Such an agile project that privileges post-excavation studies and caring responsibilities requires a re-imagining of archaeological fieldwork in Greece, a discipline with links to colonialism, a tradition of 'Big Digs' in the nineteenth and early twentieth centuries, and an emphasis on archaeology as digging. We suggest that our methodology will feed into wider calls for a more inclusive understanding of the nature of archaeological fieldwork and its links to tenure, promotion, and disciplinary prestige.

INVESTIGATING INEQUALITY, PRECARIETY AND OTHER MATTERS OF DISCONTENT IN NON-ACADEMIC CAREER PATHS OF ARCHAEOLOGISTS

Abstract author(s): Scheyhing, Nicola (Independent Researcher) - de Raad, Jesper (Municipality of Nijmegen) - D'Aprix, Michael (University College London)

Abstract format: Oral

Archaeology stretches across various specializations, countries, and sectors including traditional academic work but also careers established through the necessity of legal and regulatory structures. These careers include conservation, preservation, fieldwork in commercial and community sectors, non-academic specialists, and staff in the museum and heritage sector.

In 2021, Brami et. al. (2022) launched a survey with the Early Career Archaeologist (ECA) Community of the European Association of Archaeologists (EAA) to understand the career challenges ECAs face. The results highlighted the often precarious and demoralizing circumstances ECAs face in academic careers. The survey and evaluation raised needed awareness but were limited to a single sector. The ECA community represents all ECAs, prompting a second, broader survey to understand inequality, precarity, and other issues facing archaeologists in non-academic areas.

Those career paths are a valuable yet poorly understood part of archaeology as the focus is on more traditional academic careers. New demands of development, regulations and climate change are leading to a rapidly expanding non-academic sector that needs to be understood. The academic survey addressed several areas where knowledge of the discipline was lacking: economic stability, job availability, physical or mental health, well-being, bullying, care responsibilities, and a possible lack of recognition of research value.

These variables need to be better understood in a part of archaeology that differs within regional, and federal states of countries making the field diverse and the number of professionals on those career paths currently unknown.

This paper is on the second survey that will be launched in March 2023; the process that led to the decision, the development of the questionnaire, and preliminary conclusions. The aim is to understand our profession so we can create a more equal, diverse, and sustainable field for a future that promises to be even more challenging.

CAVE CONCERNS: METHODOLOGICAL AND THEORETICAL DEVELOPMENTS IN CAVE ARCHAEOLOGY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Parkinson, Eóin (Queen's University Belfast) - Conati Barbaro, Cecilia - Ochando, Juan (Sapienza University of Rome)

Session format: Regular session

From prehistory to the present, caves have always been central places in the natural landscape that have drawn our attention. For this very reason, caves and their contents are important reservoirs of archaeological and palaeoecological information, and have an almost unique capacity to capture long-term perspectives on human activity and the environment. In some cases they may be visually prominent features of the landscape, while in other cases cave contexts represent secluded, dark and subterranean spaces. This duality lends itself to a broad spectrum of uses and meanings, reflected in a similarly wide variety of archaeological remains and often complex stratigraphic records. In a practical sense, the diversity of taphonomic processes at play, their occupation histories and duration of use present many challenges to archaeologists working in cave environments. The excavation, exploration and analysis of these places thus requires a considered and multidisciplinary approach.

In mind of the broad-spectrum of data, interpretations and methodologies that can be applied in their study, this session aims to draw together active researchers working on the archaeology of cave sites with the view towards discussing and developing a standardised framework of field documentation techniques. We seek contributions discussing innovative and novel approaches to the excavation of caves, ranging from new and emerging methodologies, fieldwork strategies, recording techniques, scientific analyses and post-excavation analyses, to recent theoretical developments. We also seek to bridge the gap between those scholars working on caves from typically practical- or science-led perspectives, with those coming from more with theoretically inclined perspectives. We welcome and encourage a wide variety of contributions from across world archaeology, irrespective of chronological and geographical boundaries.

1 THE DESCENT: GEOGRAPHICAL INFORMATION SYSTEM (GIS) MAPPING AS A METHOD OF OSTEOARCHAEOLOGICAL AND TAPHONOMIC ANALYSIS IN EARLY NEOLITHIC CAVE BURIALS

Abstract author(s): Warburton, Keziah (University of Central Lancashire)

Abstract format: Oral

Caves have long been recognised as an important aspect of Neolithic burial practice and our understanding around such practices has been supported by taphonomic analysis and re-analysis of original excavations. This research aims to assess whether Geographic Information Systems (GIS) can be used as a tool for exploring taphonomy, currently under researched in human cave assemblages. Through our understanding of taphonomic patterns at an element, body and stratigraphic level, site specific inferences of burial practices can be reconstructed and patterns across cave burials assessed.

Two main sites were selected for analysis, Cave Ha 3 (Yorkshire) and Heaning Wood (Ulverston). Bone fragments were assessed for taphonomic modifications and mapped onto templates of bones in QGIS. This has created visual and quantitative data of changes at a body level. Analysis of Cave Ha 3 has highlighted possible burial locations and position of bodies. Spatial archive data was examined and taphonomic modifications were geographically referenced in QGIS. This provided information of its distribution, allowing for analysis of the movement of skeletal elements and possible locations of geological processes within the cave system.

Spatial data for Heaning Wood is less detailed and mapping is currently in progress. Eight of the nine individuals recovered from Heaning Wood have been radiocarbon dated, showing distinct episodes of burial spanning from the Early Mesolithic through to the Early Bronze Age.

Initial results suggest that QGIS can provide excellent visualisation of taphonomic modifications, regardless of whether a site has spatial legacy data. It has allowed analysis of intra and inter-body taphonomic changes. For sites that do have context data, QGIS provides a more traditional use, mapping where these modifications have occurred within the cave. This has implications for understanding original deposition, geological processes and the relationship between the buried bodies and cave.

2 VIRTUAL PALEOANTHROPOLOGY IN KARSTIC ENVIRONMENTS. THE CHALLENGING CASE OF THE NEANDERTHAL SKELETON FROM ALTAMURA (SOUTHERN ITALY)

Abstract author(s): Buzi, Costantino (Catalan Institute of Human Paleoeology and Social Evolution - IPHES-CERCA; Department of History and History of Art, Universitat Rovira i Virgili) - Boggioni, Marco (School of Paleoanthropology, Perugia) - Profico, Antonio (Department of Biology, University of Pisa) - Riga, Alessandro (Department of Biology, University of Florence) - Manzi, Giorgio (Department of Environmental Biology, Sapienza University of Rome)

Abstract format: Oral

Discovered in 1993, the so-called “Altamura Man” (simply “Altamura” from now on) is a nearly complete Neanderthal skeleton dated between 172 ± 15 ka and 130.1 ± 1.9 ka. Within a spectacularly scenic cave setting, the skeleton lies between speleothems and is extensively covered by flowstones and coralloid concretions. The peculiar conditions of deposition and preservation inside the Lamalunga cave – the karstic system in southern Italy where the specimen was found and is still preserved – entail difficulties for its physical removal and ex-situ preservation, which adds up to a decision-making impasse. Yet, the specimen is one of the oldest Neanderthals ever discovered, and possibly the best preserved pre-modern human fossil in the entire paleoanthropological fossil record to date, thus deserving a thorough study of its accessible parts. From 2017 to 2020 we carried out an extensive investigation of the specimen in situ, thanks to a multidisciplinary project funded by the Italian Ministry of University and Research (MiUR, PRIN 2015), that also included an assessment of the condition of the karstic system. For investigating the skeleton, digital acquisition techniques, virtual anthropology methods, and endoscopic technologies, specifically adapted to the difficult microenvironment of the cave, were applied to perform the most detailed assessment possible of Altamura in its present conditions. One of the main outputs from the data collected was the reconstruction of its cranium, obtained by an unprecedented “virtual extraction” of this portion of the skeleton from the cave. The observations done on Altamura in such a peculiar deposition context provided an insight into human evolution and dispersal at the onset of the Late Pleistocene in Europe, and a first glance at the information on the Neanderthal biology this amazing specimen can provide.

3 CAVES IN THE FRANCONIAN JURA, NORTHERN BAVARIA, GERMANY. HOW TO DEAL WITH EXCAVATIONS FROM PAST CENTURIES

Abstract author(s): Burgdorf, Phil (Professur für Ur- und Frühgeschichtliche Archäologie, University of Bamberg)

Abstract format: Oral

The simultaneous appearance of human bones and artefacts lead to an ongoing discussion about the ritual activities that took place at prehistoric cave-sites. Were they used as sacrificial sites or burial places of a community? Non-professionals and archaeologists excavated most of the caves in the Franconian Jura from the 1920s to the 1970s. Due to World War II and other external circumstances, only a selection of bones and artefacts have been preserved. Can cave-sites excavated decades ago still yield new research results?

As part of a research project, eight sites from the Urnfield Culture and the Iron Age are being reinterpreted on the basis of new scientific data. After all these years bone preservation remains excellent. Recently sampled C14-series are based on the minimum number of individuals (MNI) per cave site. Overall 86 samples determine the occupation sequence of five caves for the first time. Intervals between these periods appear too long for regular burial sites. In addition kinship relations are only proven for two individuals at only one site. The caves sampled so far did probably not serve as a burial site for a single family. Therefore, other reasons for visiting the caves must also be considered.

The lack of modern documentation complicates the study of the sites, nevertheless drawings and photos provide information on the distribution of finds. All available information is transferred to a georeferenced floor plan for taphonomic analyses. The distribution of the finds as well as the accessibility of the individual rooms can provide important clues about the ritual acting at cave-sites.

4 WHAT DOES IT MEAN TO LIGHT A FIRE IN A CAVE? A NEW METHOD TO UNDERSTAND HUMAN-CAVE-FIRE INTERACTION

Abstract author(s): Kedar, Yafit - Barkai, Ran (Tel Aviv University)

Abstract format: Oral

The use of fire is abundant phenomena in many archaeological cave sites. An air circulation model, coupled by computer simulations, enables the analysis of influence of fire use on the natural cave environment. Using the suggested method, we can identify hearth locations and characterize activity areas by analyzing warmth and smoke dispersal emitted from hearths in cave sites. The analysis of warmth, and smoke density are affected by various parameters such as: the structure of the cave, the size of the cave mouth, the location of the hearth and wind direction. We will use Lower Paleolithic Lazaret cave, France, as a case study. We will also use the case of Middle Paleolithic Tor Faraj, Jordan, which demonstrates the usage of hearths in a rock shelter. In this case, early humans had to also consider the external wind direction which has a major effect on the smoke dispersal.

In case of deep caves, we analyzed the influence of fire usage such as torches and oil lamps on human survival in this extreme environment because fire usage changes the oxygen, CO and CO₂ density and influences the temperature and humidity in the cave. Using this method, we can shed light on human activities in those caves such as the relevant fire type usage, fire intensity and number of parallel humans occupying the cave space. We will demonstrate the method on several case study from European upper paleolithic cave art.

5 MIND YOUR HEAD: MICROSEISMIC AND MICROACUSTIC MONITORING FOR ARCHAEOLOGICAL EXCAVATION SAFETY AND CULTURAL HERITAGE PRESERVATION

Abstract author(s): Conati Barbaro, Cecilia (Dipartimento di Scienze dell'Antichità, Sapienza Università di Roma) - Fiorucci, Matteo (Università degli Studi di Cassino e del Lazio Meridionale - Dipartimento Ingegneria Civile e Meccanica) - Grechi, Guglielmo - Marmoni, Gian Marco - Martino, Salvatore (Dipartimento di Scienze della Terra - Sapienza Università di Roma; Centro di Ricerca per i Rischi Geologici CERIG)

Abstract format: Oral

The issue of cave or rock shelter safety during archaeological excavation is usually addressed in the plans but rarely systemally managed in a surveying project.

In this work, we demonstrate how engineering geological reconstructions supported by geophysical methods can be used to assess rock stability and design safety measures for caves. Furthermore, the application of microseismic monitoring can guarantee personnel safety during excavation activities, mainly when carried out in fractured rock masses, preserving the integrity of the archaeological heritage. The Battifratte cave case study is considered, an archaeological site carved into the Poggio Moiano Synthema's Middle Pleistocene travertine formation and occupied from the Middle Palaeolithic to the Middle Bronze Age. According to sedimentological and micromorphological data, the formation of the archaeological sequence is linked to karst groundwater circulation. The excavations are being carried out beneath a large rock shelter and at the mouth of a narrow tunnel leading into the cave. The possible presence of

cavities below the ground floor was examined using ambient seismic noise measurements, as well as rock mass characterisation and 3D photogrammetric reconstructions were carried out. Surveys revealed the vault has experienced several rock falls over time, and the ceiling is to date affected by numerous joints and dislodged rock blocks prone to fall.

The use of microseismic and microacoustic geophysical techniques as a monitoring strategy in archaeological sites supports the excavation project design and aims of identifying potential precursor signals of incipient deformation in rock blocks threatening the area under excavation. This topic is critical in archaeological exploration planning to ensure both the safety of researchers and the long-term preservation of archaeological sites.

Cross-fertilization between the Earth Sciences and Cultural Heritage Sciences results in the definition of best practices to be applied in different archaeological contexts.

6 HOW CAN WE USE MAINSTREAM CAVE SURVEY TECHNIQUES IN CAVE ARCHAEOLOGY? THE DRAKOTRYPA CAVE, THASOS ISLAND GREECE

Abstract author(s): Georgiadis, Fotis (EPS - Ephorate of Palaeoanthropology - Speleology, Hellenic Ministry of Culture) - Pennos, Christos (Department of Geography, University of Bergen)

Abstract format: Oral

Topographical documentation is a crucial factor of the archaeological fieldwork research. Especially in caves it often proves to be particularly challenging (difficult access, complex layout of spaces, stratigraphical complications common in cave-sites). The Ephorate of Palaeoanthropology-Speleology carried out excavations in “Drakotrypa” (Dragon-hole) cave on Thassos island, Greece, in 2015-2018. The cave was used since the end of the Neolithic period as a site of temporary residence. Later, from the 7th c. B.C., “Drakotrypa” was a cult cave. In order to study the cave floor morphology we developed a detailed digital terrain model (DTM). To construct the DTM we used the Distox modified Leica Disto rangefinder module (Heeb 2010) that has the ability to record simultaneously the distance, inclination and the bearing of every shot. We anchored our survey on a predefined point at the cave entrance and used it as a geographical reference point. Following, we generated survey stations on the cave floor and made arbitrary shots towards the floor in order to achieve the best spatial coverage of the uneven morphology. The generated points were later exported through Therion cave survey software (Budaj and Mudrak 2008) as a point cloud where every point was registered with real word coordinates and elevation. Finally, we imported the point cloud into a GIS software and used Nearest Neighbour Interpolation to generate the final DTM. The use of the DTM enabled us to acquire a solid 3D topographical documentation of the cave and the excavated strata, allowing us to highlight the most prominent features of the cave floor and to have a detailed overview even at a later time.

7 MOLECULAR INDICATORS FOR DETECTING AND DESCRIBING THE PAST HUMAN PRESENCE IN CAVES. CASE STUDY OF SASPowska ZACHODNIA CAVE, POLAND

Abstract author(s): Gryczewska, Natalia (Faculty of Archaeology, University of Warsaw; Faculty of Biology, Biological and Chemical Research Centre, University of Warsaw) - Chmielewska, Monika (Faculty of Biology, Biological and Chemical Research Centre, University of Warsaw) - Kot, Małgorzata (Faculty of Archaeology, University of Warsaw) - Sulwiński, Marcin - Suska-Malawska, Małgorzata (Faculty of Biology, Biological and Chemical Research Centre, University of Warsaw)

Abstract format: Oral

Recent years brought new unexplored biogeochemical methods giving insight into a past human settlement when applied to cave sites. The Cracow-Częstochowa Upland is a karstic region in southern Poland with an archaeological record of long and variable use of caves but with often fragmentary or enigmatic traces of human occupation. It is a crucial area for testing the potential of these methods in relation to archaeological data.

The research focuses on applying analyses of polycyclic aromatic hydrocarbons (PAHs), sterols and bile acids on sediment samples from selected caves (Ciasna, Saspowska Zachodnia, Bramka, Bisnik, Łokietka, Łabajowa and Shelter in Smoleń III) and testing their potential in detecting human presence.

Ten sediment samples from the Saspowska Zachodnia Cave were extracted, purified, and analysed using GC MS methods to assess the concentrations of biomarkers preserved in cave sediments. We used selected PAHs compounds, carbon (C), nitrogen (N) and phosphorus (P) content in sediments to detect the chemical print of local fire and decomposition processes of organic materials. Analysis of combined selected sterols and bile acids was used to recognize the human and other animals presence.

This approach's preliminary data showed promising results in a case study of Sąspowska Zachodnia Cave. It is one of the few sites in the region with a well-stratified Holocene sequence. Two distinct human occupation periods were identified here, one connected to the Neolithic and the other to Bronze Age, while scarce finds of flints in older parts of the sequence suggest the possibility of human activity in earlier periods. The results of PAHs analysis partially overlap with other data on fire-related activity at the site. Analyses of sterols and bile acid confirmed the presence of anticipated compounds and allowed to identify activity of both carnivorous and herbivorous species in the cave. Additional study of reference material is necessary.

8 BLUEFISH CAVES REVISITED: A GEOARCHAEOLOGICAL AND PALEOENVIRONMENTAL ASSESSMENT OF A POTENTIAL PRE-CLOVIS SITE IN THE YUKON TERRITORY OF NORTHWESTERN CANADA

Abstract author(s): Mandel, Rolfe (University of Kansas; Kansas Geological Survey) - Kisielinski, Caroline (University of Kansas) - Bourgeon, Lauriane (University of Kansas; Kansas Geological Survey) - Norman, Lauren (University of Kansas) - Heffner, Ty (Government of Yukon; Tourism and Culture) - Holcomb, Justin (University of Kansas; Kansas Geological Survey) - O'Rourke, Dennis (University of Kansas)

Abstract format: Oral

Bluefish Caves, a cluster of four small rockshelters in the Yukon Territory of NW Canada, was excavated during the 1970s and 80s under the direction of Jacques Cinq-Mars. Caves I, II, and III yielded faunal remains dating to ca. 30-10 ka contained in loess, plus artifacts. Also, AMS 14C ages determined on cut-marked bones identified during a recent taphonomic analysis of the faunal assemblage suggests that humans occupied the site as early as 24 ka. Hence, Bluefish Caves may be the oldest recorded archaeological site in North America.

Here, we report results of our recent investigations at caves III and IV. In 2019, limited archaeological testing was conducted at Cave III to gain a better understanding of site formation processes. Also, soil/sediment samples were collected for ancient DNA (sedaDNA) analysis to determine the feasibility of isolating and sequencing ancient genetic material of transitional late Pleistocene/early Holocene flora and fauna from subarctic loess. Following initial processing of sedaDNA samples, sequences suggest recovery of sufficient nucleic acids for identification of multiple taxa in those samples, thereby providing a more robust picture of LGM and post-LGM paleoenvironments in the region. Also, we relocated Cave IV, which was not excavated by Jacques Cinq-Mars. The entrance and interior of Cave IV are almost filled with sediments. In July 2022, we tested the area in front of the cave, exposing a ~1-m-thick deposit of loess containing remains of horse, caribou, and other late-Pleistocene fauna. Many of the bones will be 14C dated, and sediment removed from the test units will be fine-screened for micro-debitage. Also, soil/sediment samples were collected for ancient DNA (sedaDNA) analysis, and ongoing micromorphological and sedimentological analyses of the loess will help us gain a better understanding of site formation processes and the spatial integrity of any cultural deposits found in Cave IV.

A. CHALLENGES AND METHODS OF RESCUE EXCAVATION AT LOWER CEROVAČKA CAVE: CASE STUDY OF THE BRONZE AGE STORAGE OF VALUABLE GOODS

Abstract author(s): Kudelic, Andreja (Institute of Archaeology Zagreb) - Tresić Pavičić, Dinko (Kaduzej LTD.) - Marijan, Mia (Heritage 993)

Abstract format: Poster

Rescue archaeological excavations of Lower Cerovačka cave represent a challenging and relatively rare type of intervention in the archaeology of Croatia. This extensive archaeological excavation was conducted in 2019, covering an area of 210 square meters along the route of a new pathway, spanning 10 meters from the entrance, 30 cm in depth, along the axis of the main cave channel. As this section of the cave area has an average width of only 4 m, the excavation covered a significant part of the cave channel. The extent of the excavation, limited time and working conditions in the cave, and difficult access to the cave entrance conditioned the fieldwork strategy. The aim was to identify distinct stratigraphic units and the preserved data of the primary context and to understand the processes of site formation that affect the accumulation of deposits. Due to the elongated surface, the excavation was carried out in 4 meters long segments, according to a preset square grid, and applying dry sieving of the sediment. Considering the small thickness of archaeological deposits, the digital photogrammetry method proved to be fast, effective and precise, representing an appropriate documentation method.

Even though the archaeological features are partly destroyed due to recent electricity installations and past archaeological and geological excavations, the applied excavation method revealed intact deposits throughout the entire excavated area, changing the previous knowledge about the cave use. The strategy of analytical processing of the artefacts had to reconcile the impact of pathway usage affecting vertical and horizontal displacements of a significant amount of Bronze Age movable finds. Therefore, the post-excavation method proved essential for a more detailed

understanding of the use of the cave, including pottery refitting (3.5 tons) and the distribution analysis of other valuable artefacts in relation to the distribution of primary context features (hearths).

443 CLIMATE CHANGE ADAPTATION IN THE PAST AND SOLUTIONS FOR THE FUTURE

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Kerr, Sarah (Aarhus University) - Svensson, Eva (Karlstad University, Sweden) - Dikkaya, Fahri (TED University, Turkey)

Session format: Regular session

Adaptation in archaeological research is considered the capacity for humans to adjust their cultural systems in response to external changes; while the ability and readiness to adapt are considered central qualities of resilience. Adaptation to climate changes has emerged in archaeological discourse, providing a balance to a former propensity for studying climate-induced social collapse. While collapse brought wholesale impacts on all aspects of life, the central narrative in the human past is an ability and willingness to adapt behaviour. Therefore, a constant in the past human-climate relationship is mitigation, adaptation, and resilience. However, resilience and capacity to adapt are highly social phenomena and dependent on a variety of qualities present in a society at risk.

Today, anthropogenic climate change is affecting societies across the world. While impacts have varying degrees of severity, it is clear that more and larger areas will be impacted by climate change and the communities in those areas will have to adapt. Fundamentally, this requires a change in human behaviour: how adaptive are humans to a changing climate and the challenges it brings? How climate conscious were past societies? How do humans instigate change and can we learn from past mitigation? This session will explore adaptation to climate change in the past and discuss the potential, viability, and challenges of translating mitigation scenarios into sustainable solutions for today's problems.

We welcome case studies which show evidence of past cultural adaptation plus examples of how past narratives can be used in today's climate communication and action. We welcome critiques and discussions on how we identify and measure adaptation in archaeological evidence. The session particularly welcomes papers exploring the medieval and post-medieval periods.

ABSTRACTS

1 2027: WAKING THE AKU

Abstract author(s): Gossen, Candace (Ronin Institute)

Abstract format: Oral

Humans have recorded celestial events for as long as we have been able to draw and write. Pictographs, petroglyphs and even standing stones mark moments in time on the landscape to remember changing seasons and repeating cycles. Serendipity makes these cosmic relationships. For this story called Waking the Aku, it is a narrative in the Rapa Nui culture that lives along with the scientific data obtained from coring the crater lake Rano Kao on the island of Rapa Nui. New technology was used to analyze aquatic cellulose from the plants along with fossil pollen that once lived on the floating mat of Rano Kao and remained anaerobic for thousands of years until this expedition crew pulled up 9 meters and 15,000 years of climate history. In the sediments are repeating global cycles of extreme cold and hot events occurring every 637 and 719 years respectively. The one of interest for this paper is the last cold event that began in 1390AD, peaking in 1456AD and ending in 1505AD when the moai were last carved and the trees began to disappear. Simultaneously in the appearance of Akus are also Tapu/Taboo which seek to find resiliency within the changing landscape. Many have used the story of Easter Island as a model of Collapse Theory, but with new evidence and technology, the details have unfolded with a different story about what really happened to the giant palms and diversity of flora and fauna on the island. The greater importance is that these global repeating cycles are in our near future, and 2027 is marked as the beginning of another cold climate event. The question will be: How resilient are we in the Waking of the Aku?

2 OATS, PRAYERS, SETTLEMENT RELOCATIONS, DYKES AND TREES - WHAT CAN WE TODAY LEARN FROM PAST CLIMATE CHANGE MITIGATIONS?

Abstract author(s): Pettersson, Susanne (Independent) - Johansson, Annie (County Administrative Board, Varm-land) - Svensson, Eva (Risk and Environmental Studies, Karlstad University)

Abstract format: Oral

People and societies have faced numerous risks and crises through history. Sometimes these risks and crises have been fatal, but most often people have found ways to mitigate the crises and adapt to new circumstances, for better

or for worse. The Little Ice Age (LIA), and the Late Medieval Agrarian Crisis, are among some of the greater challenges people and societies have faced. In many areas, LIA threatened the agrarian economy, and there were floods, erosion, heavy rain, increasing cold and other challenges. There are numerous examples of different mitigations, that appear rational to present times, such as improved housing and heating, changing agricultural practices such as increased cattlebreeding and alternative crops, dykes to cope with flooding etc. Other mitigations appear less rational to us, such as prayers, religious rituals and popular belief practices. In this paper some common mitigations and adaptations to climate change practiced in response to the threats of LIA will be presented and discussed regarding learning from the past for future sustainable solutions.

3 ORIGIN OF GOLDEN HORDE TOWNS ON THE TERRITORY OF UKRAINE IN FRAMES OF NOMADS' LIVING SPACE OCCUPATION ADAPTIVE STRATEGY

Abstract author(s): Chentsov, Yaroslav (Odesa Mechnikov National University)

Abstract format: Oral

The Mongol Empire, which resulted from the unification of nomadic tribes and in the 13th century captured a huge part of central Eurasia, at the end of this century, was divided into two independent states, one of which was the Golden Horde.

Under this study, the author makes an attempt to trace the transition of a large number of nomadic multi-ethnic tribes of the Golden Horde to a settled way of life, including foundation of their cities.

The most of the tribes, which later had formed the core of the Golden Horde, were originated from the Central Asia. This region is characterized by specific natural and climatic conditions that made it extremely difficult to settle down and did not give the slightest possibility of agriculture, but favourable for breeding large herds of cattle for pasture. In such a way the primary adaptive strategy of living space exploitation inherent for Golden Horde population was formed.

After the capturing a large number of lands and establishing their administrative control over them, the nomads of the Golden Horde, who ended up on the territory of contemporary Ukraine had to adapt to new for them climatic and environmental conditions favourable for long-term and diversified land cultivation. Due to this the nomad tribes have to change their occupation strategy. Archaeologically it could be traced by gradual replacement of previously typical for them archaeological sites, such as burial mounds and scattered sites, by new ones, among which one can detect full-fledged settlements, and eventually cities.

In the result, the nomadic tribes turned out to be highly adaptive to climate and habitat changes and did not leave the occupied territories, but, instead, elaborated the new, more settled, way of life and introduced their culture to these lands, which, in turn, greatly influenced the historical destiny their inhabitants.

4 CONTINUITY OR CHANGE? RESEARCH ON LONGHOUSES AND SOCIAL STRUCTURES IN IRON AGE ROGALAND IN CONNECTION WITH THE 6TH-CENTURY CLIMATE CRISIS

Abstract author(s): Dahl, Hilde (University of Stavanger)

Abstract format: Oral

AD 536 has been suggested as the worst year in history to be alive. Proposed volcanic eruptions in Iceland or in North America caused a volcanic winter that made life difficult: people were starving, populations decreased, and settlements were abandoned. To add to their woes, a further worsening of the climate called the Late Antiquity Little Ice Age prolonged this suffering. These climate changes would have been felt in all of Europe, and especially in the colder, northern regions, such as Rogaland in Norway.

The Iron Age population of Rogaland lived in longhouses, the main residential structure from the Bronze Age to Late Iron Age, a period of 3000 years, and a generally unchanged blueprint of a home. It was a major, multifunctional institution in the Iron Age world, serving as home, as well as the main political, social, and cultural arena. Physical longhouses were connected to social structures in society through structural duality, thus changes in the physical layout of the houses could indicate changes in society and vice versa. By analysing the physical remains of longhouses using time plots, it is possible to explore how the Iron Age society in Rogaland reacted to the climate changes, both in terms of potential changes to their physical surroundings, and in extension also the social structures that upheld their society. Related to modern-day climate problems, this research provides an insight into human resilience and adaptability to a climate crisis, and thus potentially ideas for how we might face our own.

5 ADAPTATION AND RESILIENCE IN LATE MEDIEVAL JUTLAND (DENMARK)

Abstract author(s): Kerr, Sarah (Aarhus University)

Abstract format: Oral

This paper examines the evidence for adaptation in the face of climatic anomalies in late medieval Jutland, central Denmark, and the potential of working with local communities today to use this knowledge for climate action.

It explores the case studies of Nørre Vosborg, a site comprising two late medieval manor houses, describing the architecture and archaeological remains from surveys and excavations. It is argued that Nørre Vosborg 1 was moved approximately 900m inland after it sustained considerable flooding and damage, likely at the end of the medieval to early modern period. In addition, Nørre Vosborg 2 was also moved either pre-emptively or after some damage from the same environmental events. The climatic events which drove these settlement changes appear to have been a series of storm surges in the sixteenth century, including a particularly violent event in c.1593. The combination of archaeological, architectural and environmental data at Nørre Vosborg 1 and 2 allows contemplation of the human response to climate disasters, that is resilience and adaptation, including analysis of the pace of these responses.

The paper turns to set these examples in the wider context of adaptation. How adaptive were medieval communities? Can the ability to adapt be harnessed and used in today's climate change responses? It is acknowledged that despite challenges related to the 'scaling up' from local case studies to a global problem, awareness of human resilience in the recent-past may be an important element of today's climate communication, and thus, climate action.

448 RESIZING AND REDESIGNING THE URBANIZATION POLICY OF THE DANUBE PROVINCES IN THE LATE ROMAN PERIOD (END OF 3RD-7TH C AD)

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Aparaschivei, Danut (Institute of Archaeology in Iași - Romanian Academy) - M'Barek, Brahim (University of Strasbourg) - Topalilov, Ivo (Institute for Balkan Studies and Centre of Thracology) - Bugarski, Ivan (Institute of Archaeology, Belgrade)

Session format: Regular session

The whole evolution of Roman society, as well as its scholarly perception, is altered by the transformations sweeping the Empire during the 3rd century. Regarding the Danube provinces, the most visible such transformation is the heavy revision of the defense system, as extant settlements were reinvented as strategic points, reinforced by a line of new forts, parallel to the border.

In this context, certain questions emerge volens nolens, which have obviously been debated in the literature, but to which new archaeological research can bring some clarifications. For example, we might ask whether we are dealing with a large-scale project, organized at the imperial level, or were there regional, diocesan or provincial solutions? Who were the executors of this project of fortification system redesign? What were the relations between the army and the civilians inside the new built urban structures and the contribution of each in this work of resizing and redesigning the cities? What do we know about the relocation of buildings within the urban topography, perhaps with a discussion about the new buildings adapted to the political, military, economic and spiritual changes of this period? What do we know about the techniques of construction and the materials used for the new edifices of the city? And how much do we know about the relations between the urban center and the rural territories (the hinterland)? Papers are invited which address these questions, and also which extend the timeframe to cover the time when these fortified cities ceased to function.

ABSTRACTS

1 LATE ROMAN PROVINCES ON THE LOWER DANUBE: EMERGENCE OR RE-EMERGENCE?

Abstract author(s): Stoev, Kalin (Institute for Balkan Studies and Centre for Thracology)

Abstract format: Oral

The Later Roman provincial system created several new administrative entities. The problem has been long debated from different points of view, but a fresh discussion on the political, administrative, geo-strategical and reasons behind the new subdivisions from the perspective of the historical background in the region could present a contribution to the Roman administrative practice in general. Were the new provinces an ad hoc response to the changing political circumstances, or a result of a long development? Can we see in their creation old administrative reflexes and traditions? A detailed debate can produce a stable picture covering the literary, epigraphic and archaeological sources. The starting point of the study are the changes in Roman life in the provinces of the Lower Danube from the middle of the

3rd century AD, when the Gothic invasions in these lands contributed to the decline of public life and led to drastic changes in the military and civilian command of the provinces and their accompanying infrastructure.

2 THE LATE ROMAN FORTRESS FROM ARGAMUM IN THE LIGHT OF RECENT ARCHAEOLOGICAL DISCOVERIES

Abstract author(s): Munteanu, Lucian - Honcu, Stefan (Romanian Academy, Iași branch, Institute of Archaeology)

Abstract format: Oral

At this very moment, the history of Argamum is, unfortunately, a mystery. First mentioned as Orgame in the 6th century BC by Hecataios of Miletus, the fortress from the Dolojman Cape continued to exist until the beginning of the 7th century AD.

Some new information was recently revealed, following the archaeological investigations carried out. The town defence wall, as it is visible today, was built in the Tetrarchic or Constantinian age and seems to have suffered repeated destructions. The city gained further importance once it was declared a bishopric by the imperial authority in the second half of the 6th century. At the same time, as a naval port on the Black Sea, Argamum also held a privileged position. The discovery of no less than five basilicae, craft workshops and a vast neighbouring agrarian territory suggests a demographically flourishing background, during the 6th century.

The archaeological research at Argamum - Small Gate Sector uncovered the 4th-7th centuries city wall and gate. The Late Roman enclosure wall seems to have had a narrower perimeter at that stage, compared to the early Roman one. Thus, the results of the investigations carried out in this sector have been mainly intended to obtain more information on the role played by the Small Gate in the economic development of this site. From the outset, it was noted that the Small Gate was a pedestrian one, securing the access from the port to the citadel. The aim of our presentation is to point out the function and role of the Small Gate within the fortress, which, at some moment, provided the link between the citadel and its harbour.

3 AT THE EDGE OF EMPIRE. NOVIODUNUM - FORTRESS ON THE DANUBE LIMES, PROVINCE OF SCYTHIA MINOR

Abstract author(s): Honcu, Stefan (Romanian Academy) - Stănică, Aurel (Gavrilă Simion Eco-Museum Research Institute Tulcea)

Abstract format: Oral

With the annexation of the territory between the Danube and the Black Sea - Dobroudja - to the province of Moesia Inferior during the period of Emperor Vespasian, Noviodunum begins its economic, military and urban evolution, as the main base of the Roman fleet from the Lower Danube - Classis Flavia Moesica - and the headquarters of other military units (detachments of legio V Macedonica and of legio I Italica, legio XI Claudia and of the unit of Milites Primi Constantiniani). Noviodunum is also the terminus point of the military and commercial road that crossed the province coming from Marcianopolis and that met here the limes road.

Throughout the Dominate period, Noviodunum remained an important fleet station and headquarters of the legio I lovia Scythica, who was charged with defending the northern border of the province. The prefect of the Lower Danube fleet, now called Classis Ripae Scythicae, was still based here.

Archaeological investigations in the last ten years have focused on the south-eastern side of the enclosure wall. In this way, three towers were investigated - the Large Tower, The Corner Tower and the Tower A - thus highlighting several constructive phases. According to archaeological finds, numismatic and the literary sources, the city survived until the middle of the seventh century, the latest coins being from the Emperor Heraclius.

The aim of our communication is to present the latest information on the evolution of this important center, in the province of Scythia Minor. Thus, information on the economy and trade relations of the fortress with other cities and provinces of the Empire will be brought into question. At the same time, the strategic role that Noviodunum had in the proper development of political and diplomatic relations with the "Barbarian" populations north of the Danube will be underlined.

4 RESIZING AND REDESIGNING THE FORTIFICATION SYSTEM OF IBIDA (SCYTHIA PROVINCE) IN 6TH C. AD

Abstract author(s): Aparaschivei, Danut (Academia Româna-Branch Iasi, Carol I, 18, CUI 4540917) - Paraschiv, Dorel (Institutul de Cercetări Eco-Muzeale Tulcea)

Abstract format: Oral

The walled town of Ibida underwent a spectacular evolution within the province of Scythia, as early as the first part of the 4th century AD. Being built, most likely, on a Roman habitation nucleus that can be found in the archaeological

discoveries dated in beginning of the 1st century AD, Ibida had a system of fortifications composed of three elements. First of all, it had an enclosure that surrounded the walled town of about 24 ha, then a hilltop citadel measuring about 2.50 ha, as well as a surveillance building located on the highest point in the area.

The archaeological research was able to provide important details about the constructive changes undergone in different stages of evolution, starting with the construction of the enclosure and up to the abandonment of the fortress, in the first decades of the 7th century.

The 6th century is regarded as one of the most significant stages in the urban evolution of Ibida. Emperor Justinian's initiative to restore the fortifications of the existing strongholds and significantly strengthen the border areas caused major changes visible in archaeological outlook.

In at least three research sectors at Ibida we were able to identify significant adaptations and modifications to the enclosure walls, the towers, the access ways on the enclosure and even the edifices erected around these defensive elements. The commencement of archaeological excavations also on the hilltop citadel allowed the extraction of valuable information about the technical capabilities of the engineers of the time, as well as the adaptability to the special topography of the area.

Our paper shall undertake the presentation of the changes to the fortification elements that could be identified following recent archaeological excavations, and we attempt to link the present context with situations reported in the other fortresses in the neighboring areas of Ibida.

5 ZALDAPA. A FORTRESS CITY IN THE HINTERLAND OF THE LOWER DANUBE DURING LATE ANTIQUITY

Abstract author(s): M'Barek, Brahim (EVEHA)

Abstract format: Oral

At the invitation of Bulgarian colleagues, an international team of French and Canadian archaeologists has just completed the field phase of an archaeological study of the site of Zaldapa, a Late Roman city in the Danube hinterland, at the border of the provinces of Moesia and Scythia Minor. One of the subjects of study addressed by the excavation was the fortifications of the city.

Since the first works of the Skorpil brothers at the turn of the 20th century, until the advent of aerial studies via satellite photos, Zaldapa remained on the fringe of archaeological excavation programmes. The project to study the fortifications of Zaldapa was born out of the desire to compare these ancient observations and the information obtained from satellite photos with the elements obtained from traditional archaeological excavations. I was decided to focus on the north-eastern gate of the city. Partially cleared at the end of the 19th and beginning of the 20th centuries, the choice of this sector as the subject of study aimed to verify the degree of validity of the observations of our prestigious predecessors, to complete their data, and to try to pinpoint as accurately as possible the chronological elements surrounding the construction, life and abandonment of the fortifications of the site. A other sector, a secondary postern on the northern rampart, was also subject to archaeological monitoring. It is thus possible to present the preliminary results of these excavation campaigns. These results allow us to understand and discuss the choices made during construction, to propose a chronology of subsequent alterations and adaptations, both on the scale of the site and on the regional scale of the Lower Danube, and to place the overall into the evolution of military architecture practices during late antiquity.

6 DEFENCE AND MILITARISATION OF WATER SUPPLIES: THE FORTIFIED CISTERN OF ZALDAPA DURING THE LATE ANTIQUITY

Abstract author(s): Rodé, Marine (French Culture Ministry; University of Strasbourg) - M'Barek, Brahim (University of Strasbourg)

Abstract format: Oral

Zaldapa (Krushari, Bulgaria) was a late Roman fortified city located in the hinterland of the province of Scythia, not far from its boundary with Moesia Secunda. It was strategically located on a road between the Danube and the Black Sea, which was a key artery for military logistics between the largest city of the Lower Danube, Marcianopolis, and the northern outposts of Noviodunum and Aegyssus. With nearly 25 ha, it was one of the major sites of this region which was particularly exposed at the time to barbarian invasions/migrations. Yet the site rarely appears in the textual sources and therefore remains poorly known. In 1949, the construction of an artificial lake at the edge of the site led to the exploration of the northwestern slope of the promontory and the discovery of at least two basins and a covered cistern, connected to the city by a tunnel. Only then explored on the first 5 meters, it was decided during the summer campaigns of 2021 and 2022 to pursue the subject with the team of the International Archaeological Mission in Zaldapa, in addition to and in parallel with the exploration of the north-eastern gate. The discovery of a postern leads us to new considerations regarding the existence of an access to water outside the fortified walls, its status and

evolution, as well as its relationship with the internal layout of the site. Finally, although the water supply of a fortress is considered an essential and priority requirement by the texts, only few examples of water supply outside the walls are excavated and the few known ones are in the Lower Danube.

7 THE END OF URBANISM? A REASSESSMENT OF THE ARCHAEOLOGICAL EVIDENCE FOR URBAN DESTRUCTION ALONG THE LOWER DANUBE

Abstract author(s): Reed, Fraser (Independent Researcher)

Abstract format: Oral

The prevailing view of urbanisation along the Lower Danube is that the cities of the riparian provinces ceased to function in the late 6th and early 7th centuries. Previous scholarship has demonstrated that successive invasions by the Avars, Slavs, and Bulgars were highly destructive events that had a devastating effect on the urban landscape of Moesia Secunda and Scythia Minor and that many cities in the region were heavily damaged or even totally destroyed during this time. Consequently, it is commonly held that this resulted in the complete breakdown of urban administration along the Lower Danube. There is, however, a tendency to use the instability of the period to fill gaps in the archaeological record or explain ambiguous evidence without adequate consideration of alternative explanations.

This paper re-examines previously published archaeological evidence from select cities in Moesia Secunda to better understand the impact of the invasions of the 6th and 7th centuries on the urban landscape of the Danubian provinces. While some cities in the region were certainly sacked and ceased to function as a direct result of military action, this paper argues that this was not necessarily the case at every site. Specifically, it analyses the archaeological material from Odessus (modern Varna, Bulgaria) and Nicopolis ad Istrum (near Nikyup, Bulgaria) to present a nuanced interpretation of the role military unrest played in the decline of urban centres between the Stara Planina and Lower Danube.

8 THE DEFENSIVE SYSTEMS IN DACIA RIPENSIS BETWEEN THE 4TH AND 6TH CENTURIES

Abstract author(s): Gargano, Ivan (Archaeological Institute Belgrade)

Abstract format: Oral

The proposed presentation will analyze the territory of the ancient province of Dacia Ripensis. It is one of the provinces that marked the northern border of the Roman Empire and it can be said that it is one of the least known. It included a territory between present-day Serbia, Bulgaria and Romania and, from the West, this province marked the beginning of the Lower Danube region.

It is known that, starting from the end of the 3rd century, Dacia Ripensis was subjected to a militarization, and the phenomenon is reflected in the high number of fortifications that have been discovered within its borders. Archaeological investigations have been carried out only for some of them, but despite this it is possible to recognize the topographic distribution of the strongholds and the great variety of plans and adopted forms.

The purpose of the presentation is to analyze on the one hand the textual sources which clearly refer to the construction of fortresses in Dacia Ripensis, such as the epigraphs, the Codex Theodosianus and the De Aedificiis of Procopius of Caesarea. On the other hand this work is intended in order to illustrate the architectural typologies most used in the context of non-urban fortifications: turrets, burgi, quadriburgia, auxilia encampments, and high ground outposts. In this regard it will be analyzed a single site for each of the listed types.

9 SINGIDUNUM AND ITS AREA IN LATE ROMAN AND EARLY BYZANTINE TIMES

Abstract author(s): Bugarski, Ivan (Institute of Archaeology, Belgrade) - Ivanišević, Vujadin (Serbian Academy of Sciences and Arts)

Abstract format: Oral

The important Roman city and the legion's base of Singidunum was located on a dominant site overlooking the confluence of the Sava and the Danube, in the area of the later Belgrade Fortress which has witnessed many changes over the past millennia. The remains of Singidunum are therefore hardly noticeable, which is particularly true of the later phases of the city. Destroyed by the Huns in 441, the city found itself under the Sarmatian and, from 471, Ostrogothic rules, to be reclaimed by the Empire in the early 6th century, when Anastasius settled the Heruli in its area. Although the urban layout is known only roughly, the areas of the cemeteries are better researched, illustrating the shrinking of the urban area and

population changes. Dated from the end of the 4th to the beginning of the 7th century, the Singidunum III cemetery was formed above the northern edge of the former city's core; apart from Late Roman graves it also included those of the foreigners. The other three Migration-Period necropolises, dating from the middle and the second half of the fifth century, were established both in the area of the former fortress and within the settlement. Judging by their dates, the earliest Germanic graves in and around Singidunum belonged to

foederati, those from the second half of the 5th century to the ruling people, while the 6th-century burials were again those of mercenaries. Shedding some light on murky settlement processes, these dates provide us the possibility to examine how the city and this part of limes functioned in the respective periods. In this paper we will also discuss the fortress of Ad Octavum, built eight miles down the stream from Singidunum during Justinian's rule.

10 IT TAKES A VILLAGE TO SUPPORT A FORT: CASE STUDY OF CASTRA AD FLUVIUM FRIGIDUM (MODERN AJDOVIŠČINA, SLOVENIA)

Abstract author(s): Kovacic, Ana (University of Primorska) - Stemberger Flegar, Kaja (PJP d.o.o.) - Urek, Maruša (Maruša Urek s.p.)

Abstract format: Oral

This paper addresses the nature of the settlement surrounding the fort Castra ad Fluvium Frigidum (modern Ajdoviščina, Slovenia). The fort was part of *Claustra Alpium Iuliarum* and was strategically built in the direct vicinity of the section of *Via Gemina* between *Aquileia* and *Colonia Iulia Emona*, and protected by the confluence of the *Hubelj* river and *Lokavšček* creek.

The area is probably best known as the supposed location of the battle of Roman emperor Theodosius the Great and the army of Augustus Eugenius in AD 394, but it was settled much earlier. In the last days of the Republic or the early days of the Roman Imperium, Roman expansionistic strategy turned its focus to the territory of modern Slovenia. After the annexation of the area and the construction of the road in the Augustan period, a coach station was built on the way from *Aquileia* and *Emona*. Next to the station, a settlement gradually developed. Together, they were initially known as *Fluvio Frigido* and later as *Mutatio Castra*, as indicated in several Roman itineraries and other ancient written sources. Sometime between AD 270 and AD 290, the settlement was partially demolished and the fortress *Castra* was built.

We argue that the settlement initially grew around the coach station during the *Pax Romana*. But with changing politics, the gradual decline of towns towards the East, and the contemporary construction of the fort, the settlement shifted to supporting the military garrison that was most likely permanently stationed in the fort.

456 SAME BUT DIFFERENT: IMITATIONS IN THE ARCHAEOLOGICAL RECORD

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Kogalniceanu, Raluca (Vasile Pârvan Institute of Archaeology; Institute of Bioarchaeological and Ethnocultural Research, Chişinău) - Gaydarska, Bisserka (Durham University)

Session format: Regular session

In archaeology, imitations can be discussed from various angles. Most often the discussions are framed either as imitations vs. imports (with impact on discussions about chronology) or as imitations in the context of new materials and technologies. Although these two approaches are extremely interesting, imitations in archaeological record can be a much more versatile topic.

What if neither the materials, nor the technologies involved are new? What about the imitations inside the same cultural and/or chronological framework? What does this type of imitation tell us? Can we always say which is the model and which is the copy? Are imitations copies or fakes of the time? Can miniaturization be considered a type of imitation? Do imitations fulfill a functional or a symbolic role?

In short, we identified so far:

- imitations that preserve the functional role (e.g. marble vs. Spondylus beads and bracelets, deer canine beads vs. their correspondent in other materials, stone/obsidian blades vs. flint ones, etc.) and others that are merely symbolic, such as dummy stone axes in graves (stones imitating the shape of an axe)
- imitations at the same scale, but in different materials (marble vs. Spondylus beads and bracelets, deer canine beads vs. their correspondent in other materials, stone/obsidian blades vs. flint ones)
- imitations at a smaller scale in the same (such as miniature vessels) or in different material (such as miniature houses, stools, etc., figurines); can we look at these last examples as imitations of reality?

Starting with cases from the archaeological record, we would like to expand the discussion beyond the surface, and to look at what can be defined as imitation and why, and also for the reasons and purposes that led to the existence of particular cases of imitations. We invite contributions from all periods and areas across Europe.

1 IMITATING WHAT HAS BEEN LEARNED? THE POSSIBLE REFERENCE MODELS OF PRE-MAGDALENIAN ROCK AND PORTABLE ART

Abstract author(s): García-Bustos, Miguel - Rivero, Olivia (Universidad de Salamanca) - García Bustos, Paula (Universitat de Barcelona)

Abstract format: Oral

Palaeolithic art was a symbolic and communicative resource that certainly played an important role among hunter-gatherer groups. The fact that there was an apprenticeship to carry out this activity highlights the importance of this type of cultural manifestation. The transmission of knowledge and, therefore, imitation results in somewhat standardised samples. Apprenticeship in Palaeolithic art has been approached mainly from the technical point of view of the works of art, especially engraving. However, there are increasingly more different points of view from which it is possible to study it. In this work we have carried out a case study focused on the head of pre-Magdalenian horses (38000-14500 BP) using geometric morphometry. The aim is to try to synthesise the models that artists could imitate in order to carry out their creative activity. The corpus studied comprises tracings of 298 graphic units of rock and portable art from the Iberian Peninsula and France, both engraved and painted. Subsequently, different statistical analyses have been applied, from which a minimum of four types of equine heads have been differentiated. In addition, the variables that most characterise each model were analysed in depth. Finally, another series of statistical analyses (MANOVA and Discriminant Analysis) were used to corroborate the significant difference between the models found. These results show that the proposed methodology is an objective way of demonstrating the imitation of type-models in art that may have been transmitted from generation to generation during the pre-Magdalenian period.

2 MESOLITHIC IMITATIONS OF SLOTTED POINTS FROM THE EASTERN BALTIC - ART, SPECIAL OBJECTS, OR ORDINARY IMPLEMENTS?

Abstract author(s): Jonuks, Tõnno (Estonian Literary Museum) - Chen, Shidong - Kriiska, Aivar (University of Tartu) - Malyutina, Anna (Independent researcher) - Oras, Ester (University of Tartu) - Presslee, Sam (University of York) - Uueni, Andres (Estonian Academy of Arts) - Vahur, Signe (University of Tartu)

Abstract format: Oral

Across the Eastern Baltic countries, Mesolithic imitations of slotted points in bone have been found. The most flawless example has been found from the River Pärnu in SW Estonia and recently dated to 8800-8550 cal BC. This imitates a slotted point, possibly used as an arrow-head, in great detail – the form of the object copies actual slotted points with carefully carved “insets” and the object demonstrates how people themselves in Early Mesolithic saw such implements. The broken tip signals that the point has been used as any other bone point but microscopic red dots on the surface suggest that the point could have been originally tinted with red ochre and thus could have had a special meaning.

This presentation summarises images of slotted points from the Eastern Baltic and addresses several questions about the purposes of such replicas. Why to prepare replicas of slotted points at the high time of slotted technology in this region? Were these ordinary arrowheads or rather some kind of special objects? Does imitation change the essence of an object? Or perhaps, they were all equal to “real” slotted points and its only us, 21st century scholars, who seek a sharp difference between the original and the mimicry?

3 TEETH OF SHELL, FISH OF ANTLER: IMITATION AND SKEUOMORPHISM IN GREEK NEOLITHIC PERSONAL ADORNMENT

Abstract author(s): Ifantidis, Fotis (University of the Aegean)

Abstract format: Oral

Ornaments, per se artifacts meant to be physically intertwined with bodies, assemble a multitude of meanings through their form and material manipulation. Moreover, their heavy use, re-use and alteration is inscribed in many examples both in the Greek Neolithic corpora, as elsewhere.

Although instances of skeuomorphic and imitation practices in jewelry are not always easily discernable (or are biased by our own preconceptions), they do provide valuable insight into the hybrid nature of ornaments as symbolic tools of personal and/or communal manifestations.

In this paper, an attempt is made to discuss the data related to the processes of imitation and skeuomorphism, as witnessed in the Greek Neolithic personal adornment corpora. A review of examples that embody these characteristics will be conducted, with a special focus on the assemblage deriving from the lakeside settlement of Dispilio: shell

bracelets altered into pendants in the form of teeth, stone bracelets carved in the form of shell ones, antler pendants imitating fish, etc.

4 **SAME, BUT DIFFERENT. IMITATIONS FROM A LATE NEOLITHIC CEMETERY IN A LARGER CONTEXT**

Abstract author(s): Kogalniceanu, Raluca (Institute of Archaeology, Bucharest; Institute of Bioarchaeological and Ethnocultural Research, Chisinau)

Abstract format: Oral

During the work on materials from the Late Neolithic Hamangia cemetery at Cernavodă (south-east Romania, on the bank of the Danube), I started noticing “doubles” of various artefacts. First, it was the jewelry (Spondylus and marble bracelets and beads) and the clothing accessories (beads and buttons). Then, it was when some item illustrated something that already existed in the same material or in a different one (a fang or claw made of Spondylus, or something that looked like an axe but was not an axe). Then, it was the pottery: from extremely large vessels to extremely small one, some of the shapes plus associated decoration crossed size boundary from one extreme to the other. In the end, several categories could be identified: imitations that preserve the functional role vs. others that are merely symbolic, imitations at the same scale, but in different materials vs. imitations at a smaller scale in the same or in different material. A series of questions immediately arose: which ones can we really call imitations, and are they specific only to the funerary areas or also to the domestic ones? An attempt will be made to answer these questions and to expand the discussion to the possible reasons and purposes that led to the existence of particular cases.

5 **“CASTING-SEAM IMITATIONS” ON BATTLE AXES IN NORTH-WESTERN CENTRAL EUROPE IN THE FUNNEL BEAKER CULTURE**

Abstract author(s): Schultrich, Sebastian (Institut fuer Ur- und Fruehgeschichte Kiel)

Abstract format: Oral

Many ground stone hammer axes of the Final Neolithic (FN) Corded Ware Culture (CWC) possess a plastic ledge centrally over the entire top side, which scholars often term as casting-seam imitations. A potential role model for the stone axes in general (and thus, the casting seam) is the so-called Eschollbrücken copper axe.

So far, no one has recognised a potential Late Neolithic (LN) origin for potential casting seam imitations. Recent studies on the date of stone and copper battle axes from the Netherlands and north-western Germany add important observations for re-accessing the FN casting seams. We can now trace the cradle for this morphological feature back to the LN Funnel Beaker Culture. Thus, I propose that the FN version is not more than a rudiment of an older tradition.

Often, scholars regard stone axes as imitations of copper originals. However, by evaluating this issue from a long-term perspective, we have to question this notion. Probably, stone and copper are different articulations of the same idea.

6 **THE ROMAN PROVINCIAL COINAGE IN MOESIA INFERIOR PROVINCE BETWEEN THE GREEK TRADITION AND THE IMITATION OF THE ROMAN ICONOGRAPHIC TYPES**

Abstract author(s): Iacob, Mihaela (“Dunarea de Jos” University of Galati; ISACCL Bucharest)

Abstract format: Oral

The monetary activity of the provincial Roman type took place in the province of Moesia Inferior in the period between the reign of Augustus and Gallienus. The 7 Moesian provincial monetary workshops are differentiated by the volume of production, by the period and constant activity of production, but also by the adopted iconographic repertoire.

Some of the workshops of the province, such as Istros, Kallatis, Odessos, Dionysopolis, remain a tribute to the Greek tradition, featuring on the reverse Greek subjects, divinities or iconographic themes - a natural thing in the conditions because these are former Greek colonies; the other three workshops - Tomis (ancient Greek city), Nikopolis pro Istron and Markianopolis - cities founded by Trajan in a Hellenophone environment - are much more likely to adopt themes and subjects typical of Roman imperial coinage such as the representation of the goddess Roma, the emperor or members of the imperial family and, above all, of personified abstractions such as: FORTUNA-TYCHE, CONCORDIA-HOMONOIA, VICTORIA-NIKE, NEMESIS/NEMESIS-AEQVITAS, AEQVITAS, BONVS EVENTVS, LIBERALITAS, VIRTVS, ABVNDANTIA, FELICITAS. Are these subjects an exact transposition (a copy) of the iconographic types from the Roman imperial monetary iconography in the Roman provincial monetary of Moesia Inferior or are they local interpretations of this types? - this is the question that the author tries to answer in the communication (poster) that will be presented at the EAA congress.

458 INTERTWINED TECHNOLOGIES IN PREHISTORIC EUROPE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Bekiaris, Tasos - Dimoula, Anastasia (Aristotle University of Thessaloniki) - Kloukinas, Dimitris (Ministry of Culture and Sports) - Koutsopoulou, Eleni (University of Bern)

Session format: Regular session

The chaîne opératoire concept has offered a powerful methodological tool for the analysis of prehistoric technologies. Similar sequential models and biographical approaches have been employed for exploring technological products and associated practices. These are largely characterised by linearity and they commonly focus on individual material classes. The ways in which different crafts, materials and practices are linked to each other have not attracted the lion's share of attention, even when recent approaches are more holistic in character. This is in stark contrast to the fact that prehistoric technologies were rarely performed in isolation. The very concept of technology provides the framework for dynamic social interactions to unfold. Prehistoric settings (i.e. sites, settlements, landscapes) are perceived as vibrant places, where several objects were produced, consumed and disposed, and various crafts were practiced together, forming networks of technological and social interaction.

The main aim of the session is to move beyond the study of individual material classes and towards their joint and comparative analyses, so as to more efficiently approach the fundamentals and the specifics of prehistoric technical regimes. It is to merge the technological analyses of different materials and practices (e.g. stone tools, pottery, bone implements, earthen structures, agricultural and husbandry practices, technologies of death etc.), and to shed light on the various ways in which taskscapes, technical choices, embodied skills, mental operations and dispositions intertwine.

We welcome contributions that investigate technological interconnections between crafts and across various stages of their production sequences, as well as their consumption, use, discard and deposition. A further objective is to draw attention to the spatiality and temporality of technological practice. The spatial aspect refers both to settlement space and to the wider landscape, while the temporal aspect refers, for instance, to the dominant forms of social time (e.g. the agricultural cycle) and seasonality.

ABSTRACTS

1 FEEDING THE CLAY: WHERE PLANT MANAGEMENT AND CLAY TECHNOLOGIES CONVERGE

Abstract author(s): Papadakou, Trisevgeni (Aristotle University of Thessaloniki; International Hellenic University)

Abstract format: Oral

It has long been noted that the early ceramic vessels in SW Asia and SE Europe, were consistently made with organic temper of vegetal origin. Although there has been much speculation around the source of this temper, it was only recently that analytical work was undertaken to connect pottery making with other domains of the Neolithic reality.

The inconspicuous, and few, organic-tempered of the Early Neolithic of northern Greece provided a fruitful field to examine the botanical composition of the temper, intentionally mixed with the clay, with microscopy techniques and make inferences on the activities this temper was derived from. Even though these vessels are not morphologically different to the non-tempered ones, the difference in their construction is marked: the temper needs to be acquired, processed, and mixed, thus inserting new stages in the pottery construction. After firing, the remains of these materials are permanently incorporated into this new and synthetic artefact, imbuing it with synecdochical significations.

A number of activities were indeed recognized, with various degrees of certainty and overlapping, suggesting a potential conceptual relationship between this clay technology and other domains, most notably food preparation. It is argued that this incorporation of the plant world into pottery concerns primarily the material metaphor both in the performative act of making and in the solid, permanent end-product, that can be viewed as stored memory.

2 TECHNOLOGIES AND TRADITIONS OF POTTERY AND PLASTER PRODUCTION AT NEOLITHIC MAKRI, THRACE, GREECE

Abstract author(s): Barouda, Archontoula - Quinn, Patrick (University College London - UCL) - Efstratiou, Nikos (Aristotle University of Thessaloniki)

Abstract format: Oral

As part of the Marie Skłodowska-Curie Innovative Training Network (PlaCe), this doctoral research project aims to reconstruct the pottery and plaster technologies of Neolithic Makri in Northern Greece, the only systematically excavated prehistoric site in the region of Thrace. Many details of this coastal tell settlement have been preserved, including black-burnished pottery, stone tools, figurines, clay architecture and lime-plastered floors. This offers a

unique opportunity to examine in depth the ceramic and lithic industries of a single site, including aspects of raw material procurement and resource management, pyrotechnology, manufacturing traditions and possible cross-craft interaction. Given its location in an important contact zone between western Anatolia and the Balkans, Makri also holds significant potential to better understand the cultural development of the first Neolithic communities of south-eastern Europe and the economic and socio-political processes involved in the production of their material culture. The on-going project, now in its second year, adopts an interdisciplinary approach that combines macroscopic, microscopic and atomic perspectives and applies these alongside experimental data to reconstruct all stages in the production sequences of ceramics, plaster and earthen construction at Makri. This presentation will introduce the research, present preliminary findings and anticipate the impact of the project.

3 A TEMPORAL APPROACH OF HOUSE CONSTRUCTION IN NEOLITHIC NORTHERN GREECE

Abstract author(s): Kloukinas, Dimitris (Numismatic Museum Athens)

Abstract format: Oral

House construction is a large-scale technological enterprise, which brings together various materials, techniques, environmental stimuli, social bodies, cultural prescriptions and symbolisms. A sequential analysis of relevant technologies is not always adequate to fully grasp the complexities of the process. By paying closer attention to the temporal dimension of house building technologies, it is possible to reveal the multiple material entanglements and social dynamics involved. In addition, it is feasible to reconcile the measurable data of the technological process with the non-reducible, experienced reality of prehistoric inhabitants.

The current paper will attempt to approach the temporal and rhythmic aspects of house construction, with reference to the earthen architecture of Neolithic northern Greece. Examples from the study of fire-hardened superstructural remains from a number of sites will be presented. The main objective is to put forth the ways in which different technologies, practices and taskscapes intertwine. By doing so, the paper will highlight the various difficulties imposed when trying to meaningfully reconstruct the house building process as a whole.

4 AMIDST CLAYS AND STONES: RAW MATERIAL CHOICES AND CROSS-CRAFT INTERACTIONS IN LATE NEOLITHIC AVGI, NW GREECE

Abstract author(s): Papadias, Yannis - Saridaki, Niki - Stergiou, C.L. - Bekiaris, Tasos - Katsikaridis, Nikos (Aristotle University of Thessaloniki) - Kloukinas, Dimitris (Numismatic Museum Athens) - Kalogiropoulou, Evita (University of Crete) - Stratouli, Georgia (Ephorate of Antiquities of Kilkis)

Abstract format: Oral

During the last two decades, research at the Late Neolithic site of Avgi (Kastoria, NW Greece) has developed a multidisciplinary character. Neolithic Avgi is a dispersed settlement, with rich archaeological deposits comprising large assemblages of ground stone artifacts, and pottery, as well as remains of earthen features. This presentation will attempt a combined study of these diverse assemblages, aiming to explore the interconnectedness of technological practices, in terms of raw material acquisition, manufacture processes, and taskscapes. The main analytical tool to be applied will be thin-section petrography.

Regarding the theoretical framework, the cross-craft interaction model (CCI) will be implemented. This has been at the core of archaeological research, for the last two decades, especially for the comparative examination of ceramic, plaster, metal and stone artefacts in the context of Prehistory. In addition, the concept of *chaîne opératoire* will be employed to investigate the individual stages followed in manufacturing the material classes under investigation.

The results of this research will reveal the range of diversity in the exploitation of the geological micro-environments, the recipes, and processes followed in the manufacture of ground stones and clay-based artifacts or structures. It will therefore be possible to highlight the interplay between crafts, as well as the idiosyncratic characteristics of well-established technological traditions, in the Neolithic community of Avgi.

5 OCHRE CHÂÎNES OPÉRATOIRES IN NEOLITHIC GREECE: THE CASE OF KREMASTI-KILADA

Abstract author(s): Stroulia, Anna (University of Southern Indiana) - Robitaille, Jérôme (Laboratory for Traceology and Controlled Experiments - TraCEr, MONREPOS) - Chondrogianni-Metoki, Areti (Kozani Ephorate of Antiquities) - Melfos, Vasilios - Kantiranis, Nikolaos (Aristotle University of Thessaloniki) - Dubreuil, Laure (Trent University) - Silva, Teresa (Democritus University of Thrace) - Saridaki, Niki (Aristotle University of Thessaloniki) - Urem-Kotsou, Dushka (Democritus University of Thrace)

Abstract format: Oral

While ochre had been exploited in the Aegean since the Upper Paleolithic period, its use became more substantial and diverse during the Neolithic. The evidence comes in several forms: decoration on a variety of artifactual types such as pottery; red-stained tools and containers; red-colored wall plasters; ochre powder contained in vessels; a locus of

mining activity; deliberately shaped ochre artifacts; solid pieces of ochre. It is the last category that we discuss in this paper using the assemblage from the site of Kremasti-Kilada as our case study.

Located in the region of Kozani in northern Greece, Kremasti was occupied from c. 5340 to 4800 BC. Extensive salvage excavations uncovered a large number of subsurface features: over 450 pits, 7 ditches arranged in a T-shape, and 23 cremation burials. All features are adjacent to a low tell. The latter has not been excavated, but diagnostic finds from surface survey and limited testing indicate that it is contemporary with the above features. As such, it is assumed to represent the settlement with which these features are associated.

Among the thousands of stone finds uncovered at the site are roughly 80 pieces of ochre, not all of which bear traces of use. This number is not particularly high, yet this is the largest assemblage known from Neolithic Greece. Our paper explores the ochre chaînes opératoires at Kremasti by integrating macroscopic, geochemical, and use wear examination, experimental work, ethnographic observations, contextual analysis, as well as a discussion of the surfaces and objects on which ochre was processed or applied. In addition, we make comparisons with other assemblages in the same region and elsewhere, placing the Kremasti material in its wider Aegean Neolithic context.

6 TECHNOLOGIES BY THE LAKE: RECONSTRUCTING THE MANUFACTURE SEQUENCES OF GROUND STONE CELTS FROM LATE NEOLITHIC DISPILIO, NW GREECE

Abstract author(s): Bekiaris, Tasos (Aristotle University of Thessaloniki) - Stratouli, Georgia (Ephorate of Antiquities of Kilkis) - Kotsakis, Konstantinos (Aristotle University of Thessaloniki)

Abstract format: Oral

Excavations on the Late Neolithic lake site of Dispilio (circa 5600-3500 cal BC), in the region of Kastoria, NW Greece, brought to light an impressive assemblage of nearly 3000 macrolithic artefacts. Among other types, the assemblage includes a large number of finished cutting-edge tools (known as celts), but also hundreds of unmodified raw materials, pre-shaped blanks, roughouts, and other debitage (e.g., remodified tools, flakes). The substantial quantities of the unfinished edge tools and the finished implements imply that Neolithic Dispilio was the locus of systematic production and maintenance of such implements. Neolithic Dispilio, is so far the only neolithic site in Greece that has procured ophiolitic raw materials (serpentinites, peridotites, gabbros), used in celt production, from a primary outcrop, a quarry, instead of secondary sources, such as riverbeds and streams. This choice seems to have affected the manufacturing processes, the applied techniques and led to the development of certain technical skills and dexterities.

The presentation focuses on the analysis of the ophiolitic debitage from Neolithic Dispilio, associated with the production of cutting tools. It seeks to reconstruct the chaîne opératoires of these implements and highlight the technical choices, taken or omitted, during the production sequences by their makers. It will also explore the technical interconnections of celt production with other macrolithic implements, such as abraders, polishing tools, hammers, stone saws and stone drills, that were actively involved in various stages of their production, maintenance, and reshaping. The study is conducted within the context of the ERC Program EXPLO.

7 CAPTURING THE MOMENT: PRACTICES AND CHIPPED STONE TOOLS AT THE NEOLITHIC SITE OF DISPILIO

Abstract author(s): Kita, Angeliki (Aristotle University of Thessaloniki) - Milić, Bogdana (Archaeology of Social Dynamics Research group. Milà i Fontanals Institution. Spanish National Research Council) - Gibaja, Juan (Milà i Fontanals Institution. Spanish National Research Council, InDi Group) - Kotsakis, Kostas (Aristotle University of Thessaloniki)

Abstract format: Oral

Dispilio is a Neolithic lakeside settlement in north-western Greece. According to extensive archaeological research, the site was used since the end of the Middle Neolithic (ca. 5600 BC) until the Late Bronze Age (ca. 1200 BC). Insights to the everyday life of the Neolithic inhabitants was previously obtained primarily from the studies of uncovered built environment and various find categories, of which some are currently being newly analysed.

The EXPLO project (ERC Synergy grant) investigates the interaction between past human ways of life, land use and the wider environment in archaeological sites in lakes on the southern Balkans, and includes Dispilio as one of the key case-studies. In this project framework, the site's collection of around 2000 chipped stone artifacts has been studied so far, focusing on the carefully chosen contexts from the Eastern and Western Sectors. Our first results suggest that there are different patterns in the production and consumption of tools, concerning the forms of local production which outlines a special character regarding knapping techniques, but also largely contrasts other elements in the chipped stone's technology and their potential function.

In this paper we intend to address the relation between the abundance of analyzed artifacts and the Neolithic inhabitants' behaviours, by focusing on social practices and specific moments related to making and use of chipped stones.

In this approach we look at how raw materials, tools and people provide us with intertwined meanings by outlining obtained results from in-depth studies of technological features and additional use-wear analyses, which also reveal how chipped stone tools are interconnected with space, plants, animals, pottery or other materials and synthesise episodes of production or use, in the context of the Neolithic from the second part of the 6th millennium BC onwards.

8 THE TECHNOLOGY OF FIRE IN PREHISTORIC AEGEAN: RETRACING THE CHAÎNE OPERATOIRE OF FIRE-INDUCED MANIPULATION OF HUMAN REMAINS

Abstract author(s): Papakonstantinou, Niki (Department of History and Archaeology, Aristotle University of Thessaloniki; Fitch Laboratory, British School at Athens) - Chatzikonstantinou, Ioannis - Papathanasiou, Vasiliki - Kiorpe, Sotiria - Triantaphyllou, Sevasti (Department of History and Archaeology, Aristotle University of Thessaloniki)

Abstract format: Oral

The use of fire on human remains is one of the most potent techniques for transforming the remains of the deceased and facilitating their fragmentation without destroying them completely. The act of body exposure to fire, either as intentional combustion of the human corpse or in the form of burning fleshed, defleshed or skeletonized remains, involves a complex suite of activities and operational chain of gestures, as well as a wide sequence and range of choices made at all stages of this process. In this sense, the practice of cremation and fire related funerary practices can be viewed in terms of a chaîne opératoire. Geographical and chronological variation in this multi-leveled procedure may reflect different social behaviors and the living communities' ideological and cosmological attitudes to the human body.

In this paper the technology of the use of fire on human bones in prehistoric Aegean will be discussed. We will present some preliminary results from the ongoing research implemented in the framework of the research program of TEFRA funded by the Hellenic Foundation of Research and Innovation (H.F.R.I.). It will be demonstrated that through a multidisciplinary approach on the effect of fire on the human body, combining different methodological tools (published excavation data, macroscopic, microscopic and analytical methods, experimental research) it is possible to gain considerable insight into the technology of fire on human remains, reconstruct the chaîne opératoire of fire-induced manipulation of the body and overview its regional and chronological variation.

9 SHOW ME YOUR METALLURGIST AND I'LL TELL YOU WHO YOU ARE: SECONDARY METALLURGICAL PRODUCTION IN THE EARLY BRONZE AGE AEGEAN

Abstract author(s): Giannakopoulou, Magda (National and Kapodistrian University of Athens; NSRF Demokritos)

Abstract format: Oral

Metallurgical production has played a prominent role in the development of the Early Bronze Age Aegean societies, being connected to economic development and social complexity. This study focusing on the Aegean world, including Crete, Cyclades, Attica and North Aegean Islands and on the production of copper, comes to fill a gap in the Aegean archaeometallurgical studies which have been focused on the primary production.

The Early Bronze Age Aegean sites with evidence of secondary production are Ayia Photia, Poros-Katsambas, Daskalio, Kastri, Ayia Irini, Raphina, Poliochni, Thermi, Ayios Antonios Potou and Skala Sotiros. They are all settlements in strategic locations within the trade routes, close to safe harbours. Secondary production is separated from primary, which is usually conducted in remote areas, close to the ore deposits, away from settlements. Exception to this are Daskalio, Raphina and Ayios Antonios Potou. However, in the first two cases there is a separation between the two parts of the production, with the secondary being the one conducted within the settlement. The enclosure of secondary production in settlements could be the result of the different operational and technological necessities between the two stages. At the same time, though, its location in visible areas, close to the entrance of the sites, could indicate the importance of this part of the production in forming the identity of the craftsman and establishing the settlement as a metallurgical centre.

10 MULTICRAFTING IN HOUSES AT LATE BRONZE AGE AYIA IRINI, KEA (CYCLADES, GREECE)

Abstract author(s): Baxley Craig, Jami (Florida State University) - Abell, Natalie (University of Michigan Ann Arbor)

Abstract format: Oral

In the Late Bronze Age (LBA) southern Aegean (ca. 1600-1400 BCE), there is abundant evidence for specialized craft production based in houses, especially on Crete and in the Cycladic islands. This paper focuses on the site of Ayia Irini on the island of Kea, where most houses preserve evidence for the production of one or more crafts. We examine the distribution patterns of craft tools and production debris across houses at the site over the course of the earlier LBA, in order to evaluate how the labor and knowhow of local craft producers involved in different kinds of crafts may have intersected. We explore how these patterns of production shifted during a time of major socioeconomic and

material culture change in the insular and southern Aegean, often referred to as the era of “Minoanization.” This study contributes to broader discussions concerning communities of practice and their intersection within multicrafting households, where different members may be knowledgeable about materials, tools, and chaînes opératoires associated with several different kinds of crafts.

A. RESILIENCE AND INNOVATION IN CRAFT KNOWLEDGE DURING HORIZONS OF EXCEPTIONAL SOCIETAL CHANGE IN THE BRONZE AGE CARPATHIAN BASIN

Abstract author(s): Brown, Lauren (University College Dublin, School of Archaeology)

Abstract format: Poster

This PhD aims to investigate the resilience of knowledge through a horizon of exceptional social change. This will be done through the comparison of identity, social, political, and economic organization identified in the material evidence of bronze production and settlement remains between the Middle and Late Bronze Ages in the Carpathian Basin. This transition was chosen because of total shift in settlement organization exhibited, the availability of materials, and lack of significant study of the material culture pre- and posttransition. This work utilizes the novel combination of archaeometric, petrographic, and experimental archaeological methods to create a holistic model of technical knowledge and choice in the chaîne opératoire of bronze objects of these two periods. A georeferenced database of all Middle Bronze Age settlements with evidence of bronze production will be created based on Găvan’s 2015 PhD. This data set will be compared a data set of Late Bronze Age settlements with bronze production evidence assembled as part of this work.

Access to the excavation reports and assemblages of the Middle Bronze Age sites of Feudvar, Rabe, and Pecica, and the Late Bronze Age site of Şagu will allow the analysis of technical ceramics and bronze objects to identify the material make up and bronze production process. Changes in settlement structure and layout will provide insight into social change. Through this analysis the evolution, innovation, invention, and loss of technological knowledge and choice will be discussed. This information, combined with settlement information, will be used in the experimental ‘recreation’ of bronze production to identify cognitive, spatial, and sensory aspects not seen through traditional archaeological analysis, but that are essential to understand the intentions of our ancestors. The conclusions of this research may also be used to discuss modern day social shifts and the retention, loss, or transition of social organization.

B. SMOKE ON THE WATER: BURNT MOUNDS AND THEIR CERAMIC EVIDENCE IN BRITAIN

Abstract author(s): Fitzgerald, Nick (University of Bristol)

Abstract format: Poster

Burnt mounds are a common prehistoric feature found in Britain and Ireland. Their function is currently unresolved, and their role within society is also an unknown quantity. This thesis will explore the burnt mound phenomenon and their social and technological role through their physical characteristics and material remains. The primary methods used to explore these questions will be threefold. The first will be the construction of a geospatial database, to explore location, excavation status, morphology, proximity to geographical features and other contemporary or then-historical activity, finds, structures and palaeoenvironmental data such as palynology to elucidate possible patterns and connections between sites. The second will be the use of organic residue analysis to reconstruct specific instances of activities taking place at burnt mounds and associated settlements. Finally, the use of experimental archaeology will help to clarify both the results from residue analysis and to help investigate hypotheses around burnt mound use.

465 LARGE QUANTITIES OF SCIENTIFIC DATA: STEPPING STONES FOR INTERDISCIPLINARY RESEARCH IN ARCHAEOLOGY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Kolar, Jan (Institute of Archaeology, University College London) - Reiter, Samatha (National Museum of Denmark) - Sabatini, Serena (Department of Historical Studies, University of Gothenburg) - Staniuk, Robert (Institute of Archaeology, University College London)

Session format: Regular session

Higher amounts of scientific data about the human past justify the pursuit of more complex models of past processes and events. This is a driver for archaeology to become increasingly interdisciplinary—to analyze, synthesize and harmonize theoretical approaches, methods and data from diverse (sub)disciplines into a cohesive whole. This session invites papers which address the application of large quantities of diverse data for model building (especially diachronic macro-scale) and other interdisciplinary investigations. Research questions to be addressed include:

- What new perspectives can emerge from the integration of large and highly diverse datasets?
- What new models of the past are only explorable by means of interdisciplinarity and large datasets?

- Which case studies exemplify synthesis through interdisciplinary collaboration?

This session invites papers which move beyond the standardization of recording to analyze multiple data types in an interdisciplinary fashion—drawing inspiration and inference from different disciplines (archaeology, archaeogenetics, palaeoecology, archaeometry, environmental archaeology, ecology etc.) to create new knowledge that is greater than the sum of its parts. We would like to invite speakers dealing routinely with large datasets covering large areas and taking a long-term perspective over millennia. We also welcome papers which present new theoretical approaches which unify diverse disciplines into new and cutting-edge modes of model-building, database construction and/or interpretation.

ABSTRACTS

1 DAIRYING, DISEASES AND THE EVOLUTION OF LACTASE PERSISTENCE IN EUROPE

Abstract author(s): Thomas, Mark (University College London, Research Dept Of Genetics, Evolution And Environment)

Abstract format: Oral

In European and many African, Middle Eastern and southern Asian populations, lactase persistence (LP) is the most advantageous monogenic trait to have evolved over the past 10,000 years. Although natural selection on LP and the consumption of prehistoric milk must be linked, considerable uncertainty remains concerning their spatiotemporal configuration and specific interactions. Here we provide detailed distributions of milk exploitation across Europe over the past 9,000 years using around 7,000 pottery fat residues from more than 550 archaeological sites. European milk use was widespread from the Neolithic period onwards but varied spatially and temporally in intensity. Notably, LP selection varying with levels of prehistoric milk exploitation is no better at explaining LP allele frequency trajectories than uniform selection since the Neolithic period. In the UK Biobank cohort of 500,000 contemporary Europeans, LP genotype was only weakly associated with milk consumption and did not show consistent associations with improved fitness or health indicators. This suggests that other reasons for the beneficial effects of LP should be considered for its rapid frequency increase. We propose that lactase non-persistent individuals consumed milk when it became available but, under conditions of famine and/or increased pathogen exposure, this was disadvantageous, driving LP selection in prehistoric Europe. Comparison of model likelihoods indicates that population fluctuations, settlement density and wild animal exploitation—proxies for these drivers—provide better explanations of LP selection than the extent of milk exploitation. These findings offer new perspectives on prehistoric milk exploitation and LP evolution.

2 AN INTERDISCIPLINARY ANALYSIS OF THE DRIVERS AND CONSEQUENCES OF HUMAN MOBILITY CHANGES DURING THE WEST EURASIAN HOLOCENE

Abstract author(s): Canteri, Elisabetta (Section for Molecular Ecology and Evolution, Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen) - Speciale, Claudia (IPHES - Catalan Institute of Human Palaeoecology and Social Evolution; Department of Historical Studies, University of Gothenburg) - Riabogina, Natalia - Bulatovic, Jelena (Department of Historical Studies, University of Gothenburg) - Timpson, Adrian - Thomas, Mark (UCL Genetics Institute, Department of Genetics, Evolution and Environment, University College London) - Shennan, Stephen (UCL Institute of Archaeology, University College London) - Kristiansen, Kristian (Department of Historical Studies, University of Gothenburg) - Woodbridge, Jessie (School of Geography, Earth and Environmental Sciences, University of Plymouth) - Racimo, Fernando (Section for Molecular Ecology and Evolution, Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen)

Abstract format: Oral

Human history is intimately tied to the environment in which it takes place. Humans modify the biomes they occupy, and in turn, biotic and climatic processes determine how humans organise their livelihoods. Thus, a complete view of human history can only be obtained via interdisciplinary research, unifying data across disparate fields, including archaeology, genetics, and ecology. An interdisciplinary approach can thus help us understand how demographic, social, cultural, ecological and evolutionary processes unfolded and influenced each other in space and time. Here, we aimed to take an interdisciplinary approach to the Neolithic and Bronze Age transitions in Western Europe - periods characterised by major movements of peoples across vast regions of Eurasia, and the concurrent spread of various agricultural and husbandry techniques. We combined more than 6000 archaeobotanical and archaeozoological records, as well as over 2600 ancient human genomes, together with human mobility estimates, and paleovegetation reconstructions into a comprehensive database of human prehistorical and historical records (BIAD), covering vast areas across West Eurasia. We used this database to explore the spatiotemporal relationships between human movements and landscape composition, with a specific focus on the effects of the expansion of domestication and cultivation of animals and crops. By co-analyzing these disparate sources of data, we are able to obtain a comprehensive picture

of the drivers and consequences of changes in human mobility, faunal and floral composition on the West Eurasian landscape over the past 10,000 years.

3 FLUVIAL FORCES AND A NETWORK OF TIME

Abstract author(s): Schjerven, Nicoline (University of Gothenburg) - Reiter, Samantha (National Museum of Denmark)

Abstract format: Oral

River systems have long played important roles in human mobility and connectivity, and certainly played a major part in prehistory as well. In addition to being a crucial resource, certain of them were and remain highways for trade, transport, alliances and kinship networks, while others acted as barriers. Though archaeological discussions of connectivity are often limited to monothematic presentations of a single data type through a 'dots-on-maps' approach, increasing advances in both theory and formal network analysis offer new opportunities to refine and test the connectivity paradigm. In this paper, we make a preliminary case study of the river Rhine through a re-presentation of this major European thoroughfare and the Neolithic and Bronze Age sites along its banks. Our new map focuses particularly on the settlements and potential waystations for river travelers. Through estimation of travel times from dynamic interplay and ethnography, we map the Rhine not in relation to artificial projection systems, but rather as closer to the way prehistoric people were likely to have understood it: in relation to the natural and experienced properties of the landscape.

Given the increasing density of isotopic, aDNA and radiocarbon data, we can begin to ask new questions of prehistoric networks, such as river systems like that of the Rhine. We can ask not only about whether there were flows of people, ideas and things, but what those flows looked like and how long they took. By juxtaposing our travel time estimates with mobility data (such as $^{87}/^{86}\text{Sr}$), we have an initial assay into how the ancient Rhine may have been connected and provide a new forward-thinking perspective on space and time in prehistory which contributes to our growing knowledge of human spatial behavior.

4 A SPATIOTEMPORAL CLUSTERING/ANTICLUSTERING ALGORITHM FOR LOCAL TIME-SERIES ANALYSIS OF ARCHAEOLOGICAL AND GENETIC DATA

Abstract author(s): Lee, Victor Yan Kin (Section for Molecular Ecology and Evolution, Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen) - Timpson, Adrian (UCL Genetics Institute, Department of Genetics, Evolution and Environment, University College London) - Kolar, Jan - Staniuk, Robert - Shennan, Stephen (UCL Institute of Archaeology, University College London) - Thomas, Mark (UCL Genetics Institute, Department of Genetics, Evolution and Environment, University College London) - Racimo, Fernando (Section for Molecular Ecology and Evolution, Globe Institute, Faculty of Health and Medical Sciences, University of Copenhagen)

Abstract format: Oral

Human history is characterized by intertwined cultural, ecological and biological processes. To understand these processes, it is often necessary to discretize space and time in order to compare and contrast them across different periods and/or regions of the world. However, aggregation of archaeological and biological data into analytically comparable spatiotemporal groupings is far from straightforward. The general approach in archaeology is to group observations into archaeological cultures based on the similarity of discovery circumstances, such as proximity, material culture and stratigraphy. Depending on the type of discretization used, archaeological cultures could have various definitions which do not lend themselves naturally to a comparative analysis with other types of datasets (e.g. genetic information).

Here, we propose a novel spatiotemporal clustering algorithm designed for local time-series analysis that aims to aggregate data points in an automated manner, driven by the distribution of the data itself. The algorithm is characterized by a combined clustering/anticlustering approach, which searches for an optimal division of space-time based on input requirements by the user. In our specific case, we analyzed time-series data in different geographical regions. In this way, our current implementation works by seeking to minimize within-group variance in spatial locations, and maximize between-group variance (clustering), while - at the same time - maximizing within-group variance in temporal dates (anticlustering). We have applied this algorithm to the newly-created Big Interdisciplinary Archaeological Database (BIAD) with records spanning the European Neolithic, Bronze Age and Iron Age, enabling us to jointly compare and contrast evolutionary and cultural processes in different regions of Western Eurasia. We expect our method to be widely applicable to archaeo-scientists aiming to model different types of ancient datasets in a statistically explicit and reproducible manner, allowing for more rigorous interdisciplinary studies of the past.

5 TOWARDS LONG-TERM PATTERNS OF CULTURAL VARIABILITY – STRUCTURED DATASETS, MORTUARY PRACTICES, AND MOBILITY OF PREHISTORIC POPULATION

Abstract author(s): Staniuk, Robert - Shennan, Stephen (Institute of Archaeology UCL) - Timpson, Adrian - Thomas, Mark (UCL Research Department of Genetics, Evolution and Environment) - Reiter, Samantha (National Museum of Denmark) - Kolář, Jan (Institute of Archaeology UCL)

Abstract format: Oral

Archaeological approaches to studies of variability in mortuary practices have generally focused on discrete contexts associated with specific communities. These approaches tend to amplify cross-cultural differentiation in order to document historically-unique communities in a specific spatio-temporal setting. In this sense, variability is not a characteristic of human culture in flux but an exploration of the possibilities available to a specific group of people.

Attempts at rectifying this problem in the past were often hindered by the decentralized state of mortuary datasets specific to certain periods or regions. The solution in such studies was to examine the replacement of single cultural traits (such as flat graves) with e.g. burial mounds in the 3rd millennium BCE or cremation in the 2nd millennium BCE. Rather than enhancing our understanding of changes in variability, they emphasize the significance of binary, transformative changes.

If we want to understand large-scale changes in prehistory, we first need to be able to conceptualize changes in variability. As such, this paper focusses on three areas:

- (1) presenting the mortuary data stored in the Big Interdisciplinary Archaeological Database (BIAD),
- (2) discussing the first results of analyzing cultural variability in mortuary practices across prehistoric Europe (6000-1000 BCE), and
- (3) correlating the variability of mortuary practices with mobility patterns documented by aDNA studies (Loog et al., 2017).

- Loog, L., Mirazón Lahr, M., Kovacevic, M., Manica, A., Eriksson, A., Thomas, M.G., 2017. Estimating mobility using sparse data: Application to human genetic variation. *Proceedings of the National Academy of Sciences* 114, 12213–12218.

6 ANCIENT ENVIRONMENTAL DNA FROM NEOLITHIC AND BRONZE AGE CONTEXT; PRELIMINARY RESULTS FROM THE COREX COLLABORATION

Abstract author(s): Ruter, Anthony (Globe Institute, Section for GeoGenetics)

Abstract format: Oral

In the last decade, the analysis of ancient DNA recovered from the remains of humans and other mammals has revolutionized archeology. The reconstruction of nuclear and mitochondrial genomes from multiple specimens has allowed the inference of bio-ethnogenesis, drift and selection.

However, most of the DNA sequences from skeletons come from microbes that were either symbiotic or parasitic with the specimen when it was alive or from microbes that invaded post mortem from the surrounding environment, not from the specimen itself. Archaeological features like pits, latrines and accretional floors trap organic refuse, and may contain DNA from a range of organisms sharing the ancient human environment including plants, fungi and animals for which no other traces have survived. Ultimately, tracking changes in pathogens from anthrosols and the microbiomes of ancient skeletons may allow the inference of the infectious disease load through time and space.

The utility of identifying these organisms is obvious to archaeologists but it requires a new approach: ancient environmental or metagenomic DNA (eDNA), focused on the environment's metagenome rather than an individual specimen. Metagenomic analysis involves sequencing all nucleic acids in a sediment sample, which may contain billions of fragments of DNA from mixed populations of microorganisms, plants and animals, and assigning these to their reference genomes to determine which taxa were present and in which proportions.

Researchers at the Globe Institute, Section for GeoGenetics at the University of Copenhagen with collaborators in the COREX project are collecting anthropogenic sediment samples from archeological sites throughout central Europe, ranging from the early Neolithic to the Iron age. We present the preliminary results of an analysis of 80 samples from diverse contexts in 11 separate sites. These will help focus the collection and of additional samples and refine the extraction protocols for specific sediment types.

7 **RADIOCARBON DATES WITHIN THEIR ARCHAEOLOGICAL CONTEXT. HOW TO BETTER RELATE POPULATION DYNAMICS WITH ITS CAUSES AND EFFECTS**

Abstract author(s): Kolar, Jan (UCL Institute of Archaeology) - Timpson, Adrian (UCL Division of Biosciences) - Bulatović, Jelena (Department of Historical Studies, University of Gothenburg) - Speciale, Claudia (IPHES - Catalan Institute of Human Paleoeology and Social Evolution) - Ryabogina, Natalia (Department of Historical Studies, University of Gothenburg) - Staniuk, Robert - Shennan, Stephen (UCL Institute of Archaeology)

Abstract format: Oral

Archaeology currently witnesses a boom in the use of large scientific datasets (often containing tens or hundreds of thousands of records) and interdisciplinary approaches. In fact, novel narratives of the human past at diverse spatial and temporal scales cannot be achieved without such datasets and thinking out of one's disciplinary box. Although radiocarbon dates create one of the most important categories of archaeological data - crucial for dating particular contexts and more recently palaeodemographic analyses, archaeologists often treat them in the existing large databases without contextual information and disconnected from the rest of the archaeological data. This effectively prevents using them in close relationship with other large-scale archaeological datasets, e.g. archaeobotanical or archaeozoological data which are usually collected separately in specific (subdisciplinary) databases at different spatio-temporal scales or databases of material culture.

In this paper, we want to present an interdisciplinary approach taking advantage of large-scale data collection with the common focus on Neolithic and Bronze Age Europe. The existence of common research questions and aims across the involved disciplines enable us to demonstrate that a concurrent data collection driven by shared goals is a crucial prerequisite of every research aiming to be interdisciplinary. As a result, we can, for the first time, directly relate 14C dates and demographic proxies derived from them, with analytical data on many socio-economic aspects of prehistoric societies of Europe. Our approach will be illustrated in two case studies from northern and central Europe where we will relate demographic changes to shifts in subsistence strategies and cultural practices. We will also show how the archaeological data from regions with diverse interdisciplinary data coverage can be used for creation of large-scale and long-term perspectives on the human past.

8 **MULTIPLE IMPUTATIONS AS A MEANS FOR IMPROVING BIG DATA MODELING IN ARCHAEOLOGY AND ANTHROPOLOGY**

Abstract author(s): Ryan-Despraz, Jessica (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Wissler, Amanda (Department of Anthropology, University of South Carolina)

Abstract format: Oral

Modern research benefits greatly from the technology and globalization ubiquitous to the common era. Researchers are able to travel and communicate within a broader network than ever before, and technology has enabled not only larger amounts and more diverse types of data, but also the ability to share data more easily. While these strides have the potential to improve the interpretive accuracy of data analyses, the overwhelming amount and types of data require new discussion on their proper treatment and exploitation. Cutting-edge model building using disparate data types drawn from archaeology, paleoecology, bioarchaeology, and historical demography can generate more robust understandings of life in the past. However, a problem with these types of archaeological and anthropological datasets is the presence of missing data. Multivariate statistics and complex model building cannot be performed when data are missing. While missing data are a commonly encountered phenomena, missing data management remains uncoded and underutilized in many fields of anthropology and archaeology. Failure to recognize the significance of missing data and the biases they create limits the possible analyses and can skew interpretations. This research discusses the issues surrounding missing data in anthropology and archaeology and provides an exploration of techniques in data imputation and their applications in data modeling.

This talk will then present a case study of data imputations with practical applications of applied data modeling on a large dataset containing mixed data types (quantitative and qualitative) derived from archaeological, osteological, and demographic data. The results exhibit the necessity of a more robust treatment of missing data in order to increase data analysis potential as well as to improve interpretations of past populations. As available datasets continue to expand, more complex models and statistical analyses will allow researchers to delve into new perspectives surrounding our shared human history.

9 INTERDISCIPLINARY DATASETS OF DIFERENT KIND - HOW TO INTEGRATE THEM? EXPERIENCE WITH ARCHAEOLOGICAL PROSPECTION AND SETTLEMENT ARCHAEOLOGY

Abstract author(s): Horak, Jan (University of Hradec Králové, Department of Archaeology; Charles University, Department of Archaeology) - Ferenczi, Laszlo - Janovský, Martin (Charles University, Department of Archaeology)

Abstract format: Oral

Analysis of large data sets has potential for future research. However, the nature of interdisciplinary work inevitably raises several key points. Data from different disciplines can have very different characteristics. These differences are of various types and are based primarily on descriptions of different parts of reality: geophysical or geochemical prospection; palynological or macro-remain data; archaeological sites and their hierarchies; geobotanical or pedological data, etc. How these data may or may not they be related? Another aspect is more technical: what is the number of data points in a typical dataset of a particular field? Does it cover a locality or a region? What is the spatial density of data points? Also: some are represented by points, others by polygons or lines. A crucial aspect is integration: do we just want to overlay maps, or to do regression analyses? The last major issue is the mathematical type of the data: what mathematical operations make sense to perform on it? We will present a couple of case studies where we have dealt with such a situation: the integration of geophysical and geochemical data (in a general and site-specific context) and the analysis of a settlement pattern of deserted villages in medieval Hungary. The work was supported by: 1) project INTER-COST (LTC19) subprogram of program INTEREXCELLENCE by the Ministry of Education, Youth and Sports of the Czech Republic, Project: ‘Geochemical insight into non-destructive archaeological research’; project number: LTC19016; 2) project: ‘Monastic manors and the landscape impact of Cistercian estate management: A landscape archaeological and historical ecological study on Plasy Abbey’ financed by the GAČR - Czech Science Foundation, grant No. 21-25061S; 3) networking support by the COST Action SAGA: The Soil Science & Archaeo-Geophysics Alliance - CA17131 (www.saga-cost.eu), supported by COST (European Cooperation in Science and Technology www.cost.eu).

10 CHANGE IS THE ONLY CONSTANT: MODELLING HUNTER-GATHERER ACTIVITY IN THEIR DYNAMIC ENVIRONMENT

Abstract author(s): Hoebe, Pir (University of Groningen)

Abstract format: Oral

Early Holocene sea level rise was a key factor in the changing northwest European environment, ultimately submerging the region of Doggerland beneath the North Sea. This paper takes an interdisciplinary approach to understand the impact of environmental change on human societies, combining models and data from paleoenvironmental studies, paleogeography and archaeology. Understanding change in prehistoric hunter-gatherers’ nomadic and traditional societies requires large, dynamic, and time sensitive spatiotemporal approaches. Here, Early Holocene landscape dynamics are modelled and compared with the spatiotemporal patterning of a large radiocarbon dataset of hunter-gatherer sites (12-7.5 ka calBP).

Mapping the extent and timing of sea level rise’s regional impact depends on reliable digital elevation models (DEMs) of the prehistoric surface and accurate sea level data. Previous models were restricted to combining limited sea level data with bathymetric DEMs, not taking Holocene sediment thickness into account, significantly impacting their accuracy. This is improved upon by combining paleo-DEMs of the top of Pleistocene sediments with relative sea level curves that take regional variability into account. This results in an inundation model that more accurately reflects the timing and extent of transgressions. Combining this with vegetation models results in a dynamic model of significant Early Holocene landscape change.

The impact of dynamic landscape change on human societies is then investigated with a large dataset of over 2000 radiocarbon dated sites. Kernel density estimates (KDE) of meaningful subregions in the landscape show changes in the density of past human activity. This makes it possible to show where and when changes in human activity align with significant transgressions or changes in landscape character. Overall this contributes to a more comprehensive understanding of the relationship between environmental change, landscape dynamics and human societies during the Holocene period.

11 MODELLING MOVEMENT ALONG THE ANCIENT LYBIAN SEA: AN OPEN AND INTERDISCIPLINARY APPROACH

Abstract author(s): Barruezo-Vaquero, Pablo - Laguna-Palma, David (University of Granada)

Abstract format: Oral

This paper is based on the efforts made by the PERAIA Project, which gathers an international team to trace movement and understand the historical connectivity within the regions bordering the Libyan Sea during the transition

from the Late Bronze Age to the Iron Age (ca. 1400-700 BC). The study is thus diachronic in scope and considers different scales of analysis. Its theoretical framework blends notions from Historical Ecology, human ecodynamics, and Landscape Archaeology, as well as approaches from Digital Archaeology. In other words, we aim to model movement whilst accounting for the systemic and historical interaction between humans and non-humans across this vast region.

The complexity of this research has required the application of different digital approaches (e.g., geospatial analysis and archaeological network research) in a methodology that maps archaeological sites by tying together various strands of evidence, from satellite imagery, historical sources, and environmental data. Such a large quantity of multivariate data is managed through a geospatial dataset, the backbone upon which our interdisciplinary knowledge is built. Likewise, the project seeks to attain ethical practices based on Open Science. Hence, digital technologies and the LOUD+FAIR data principles have been at the core of the project in terms of data development and management. This paper seeks to briefly explain—from theory to practice—our approach and workflow to modelling past mobility while enabling open research. We believe such an approach might be of interest to other researchers working in interdisciplinary environments.

12 INTEGRATIVE ARCHAEOLOGICAL AND ARCHAEOGENOMIC DATABASE FOR STUDYING POPULATION HISTORY

Abstract author(s): Sagmanova, Gulnaz - Vyazov, Leonid (University of Ostrava) - Flegontov, Pavel (University of Ostrava; Harvard University) - Isildak, Ulas - Flegontova, Olga (University of Ostrava)

Abstract format: Oral

Archaeogenetics, especially focused on humans and domestic animals, is a rapidly growing field of science. The total amount of sequenced and already published aDNA data exceeds 10000 individuals worldwide. This brings research on the population history to a new level, raising a demand for supporting the archaeogenetic data with a robust archaeological context.

To bridge the gap between aDNA and archaeology, we designed a Web-based and GIS-driven Integrative archaeological and archaeogenetic database, aimed to record, store, and analyze the information derived from archaeological and archaeogenetic research, allowing us to perform multidisciplinary analyses. The database is implemented using the Neo4J graph database management system and provided with interfaces for input/output, information analysis, as well as visualization of cartographic data. Types of stored data include texts, tables, images, and three-dimensional models of objects. The system accumulates all types of data collected as a result of scientific research, including texts, tables, images, three-dimensional models, etc.

Besides archaeological data, our database also contains publicly available genome-wide archaeogenetic data from Allen Ancient DNA resources associated with an archaeological context. The Web-GIS Toolkit allows users to select specific groups of burial sites or archaeological sites and perform simple genetic data analyses: hierarchical genetic distance clustering, PCA (base and user with definition projection on axes), ADMIXTURE, f-statistics, and qpWave / qpAdm. The database also allows users to store links between ancient individuals revealed by identity by descent (IBD), a high-resolution genetic analysis technique.

13 TOWARDS A COMMUNITY STANDARD FOR LEAD ISOTOPE DATA: WHERE WE ARE AND WHERE WE ARE HEADING TO

Abstract author(s): Rose, Thomas (Goethe Universität Frankfurt, Institut für Geowissenschaften; Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum) - Klein, Sabine (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum; Institut für Archäologische Wissenschaften, Ruhr-Universität Bochum; FIERCE, Frankfurt Isotope & Element Research Centre, Goethe Universität Frankfurt) - Westner, Katrin - Hsu, Yiu-Kang (Forschungsbereich Archäometallurgie, Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum)

Abstract format: Oral

Accessibility and interoperability of reference and comparison data is crucial for modern-day archaeometry. While GlobalID is a first step towards a suitable global infrastructure for lead isotope data, the most essential component for the interoperability of such data is still missing: a common way of describing them, i.e. a community standard defining the metadata associated with lead isotope data. Recently, a workshop brought together large parts of the lead isotope community to discuss how such a community standard might be designed. The particular challenge is to deal with the wide variety of materials analysed, to reach an agreement on which metadata are essential and which are optional, and how such a metadata standard could be designed to be compliant with the FAIR criteria.

We will present the lessons learned from the discussions at the workshop, the challenges towards a FAIR-compliant metadata standard, and how we aim to insure interoperability with a wide range of similar data by reusing already existing metadata standards, ontologies, vocabularies, etc. While discussions for lead isotope data might be quite advanced, similar initiatives emerge also for other data types in the archaeological sciences. Our impressions and insights will hopefully facilitate comparable discussions in these initiatives. Moreover, our contribution aims to spark discussions with similar initiatives in other archaeological disciplines, hopefully leading towards an alignment of activities and harnessing synergies rather than working in parallel.

468 GILDING TEXTILES: NEW ARCHAEOLOGICAL EVIDENCE AND SCIENTIFIC DEVELOPMENTS ON THE PRODUCTION OF METAL THREADS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Solazzo, Caroline (Smithsonian Institution) - Scibè, Cristina (University of Seville)

Session format: Regular session

The embellishment of textiles with metals, most particularly gold, can be traced to early cultures, often seen in the ancient practice of adorning the dead in sumptuous garments. Metal threads were interlaced into the weave structure, attached to fabrics using embroidery techniques, or applied to cloth within ornamental bands (galloon, brocaded tablet-woven and tapestry bands, etc.). Another ornamental technique, largely practiced in both Near and Far East, was the use of gold leaf or powder to paint and print fabrics. The trade and exchange of finished textiles, and the sometimes forced relocation of weavers, led to the transfer of technologies and the establishment of highly specialized craftsmanship and workshops.

Extensive scientific works in the 1990s and early 2000s established the basis for the characterization, description and classification of metal threads. These studies, complemented by evidence from archeological finds, have pioneered the research on the production of gold-threaded textiles throughout history, while still leaving some questions regarding raw materials and making processes unanswered.

This session aims at gathering archaeologists, textile historians, and scientists to convene the latest finds and analytical developments on metal decorations, and discuss future research questions. Papers may focus on:

- Recent archaeological discoveries of gold textiles and metal threads
- Techniques of assembling metal threads: solid metal threads including wires and lamellae, and multi-layered complexes with organic substrates, adhesives and top-coat lacquers
- The making of gold and silver printed and painted textiles: gold leaf and powder applications on already woven fabrics, or to coat yarns
- Latest analytical developments for the scientific study of inorganic (metal leaf and powder, pigments, gilding base or preparation layers) and organic (tannins, substrates, adhesives and varnishes) components, using techniques including, but not limited to: optical microscopy, SEM-EDS, FTIR and ATR-FTIR, XRF, PIXE, GC-MS, LC-MS, proteomics, etc.

ABSTRACTS

1 A CROSS-DISCIPLINARY ANALYSIS OF GILDED TEXTILES PRODUCED BETWEEN 800 AND 1200 CE

Abstract author(s): Brown, Tonia (Independent Scholar and Researcher)

Abstract format: Oral

After inventorying more than 2,000 extant printed and gilded textiles dated to antiquity, as well as personally examining more than 200 such pieces to catalogue their physical characteristics (e.g., fiber content, yarn twist and ply, weave structure and density, size of motifs, other embellishments or notable features), the author proffers a cross-disciplinary analysis of the techniques used to print or paint cloths with gold – or substances intended to appear as gold – between the 9th and 12th centuries CE.

This paper presents the author's emerging research, along with an analysis of existing data on gilded textiles crafted primarily in the regions of West Asia and North Africa (e.g., modernly Egypt, Yemen, Iran, and Iraq) and East Asia (e.g., modernly China and Japan), as these two regions are pivotal in the history of gilded textile production. The process(es) of various known and speculated surface gilding techniques will be described, with references to relevant contemporary accounts and insights from period manuscript instructions and/or recipes. Finally, based on contextual clues from research and analysis, this paper explores the possible uses for gilded textiles and what we can surmise about the importance of these textiles in various cultures and at different times.

2 UNTANGLING THE LATE BRONZE AGE GOLD THREADS FROM EBREICHSORF, AUSTRIA

Abstract author(s): Saunderson, Kayleigh (University of Vienna; Natural History Museum Vienna)

Abstract format: Oral

By the Late Bronze Age in Central Europe (c. 1200–800 BCE), more and more textile techniques had been established and reached a peak in the subsequent Hallstatt period. However, one type of textile is specific to around 1100 BCE in this region: gold threads, often in bundles, exhibiting various twists and turns. These were found in burials and hoards, together with other prestigious gold artefacts. The focus of this contribution is one of these bundles that from a hoard in Ebreichsdorf, Lower Austria, excavated in 2020 and has since been carefully documented, cleaned, and analysed. These studies revealed specific structures, which are repeated throughout the bundle, indicating that the threads were part of a woven fabric densely interlaced by these gold threads. This fabric was ultimately tightly folded up and held together with gold wire before being buried. The same interlacing structures are visible in the other comparable gold thread finds, furthermore indicating that they formed patterns, while some structures are due to technological requirements. Additionally, experiments were carried out together with citizen scientists in the framework of workshops at the Natural History Museum Vienna and the University of Vienna, providing further indications of how such gold textiles could have been produced. Thus, we can now further grasp the techniques for producing the earliest known gold textiles and how they looked, likely representing a prestigious fabric reserved for the elite.

3 GOLDEN WEFTS. GOLD YARNS AND ORNAMENTS FROM THE NATIONAL ARCHAEOLOGICAL MUSEUM IN NAPLES. STUDIES AND INVESTIGATIONS

Abstract author(s): Rossignoli, Guia - Gennaioli, Riccardo - Masci, Maria Emilia (Opificio Delle Pietre Dure) - Miele, Floriana (Museo Nazionale Archeologico Di Napoli) - Patera, Anna (Opificio Delle Pietre Dure)

Abstract format: Oral

The National Archaeological Museum in Naples houses an exceptional collection of textiles from the Roman era made of heterogeneous materials such as gold, wool, linen, silk and asbestos. There are approximately one hundred finds, mostly from previous excavations carried out by the Bourbons in the Vesuvian area from 1738 onwards, which already raised curiosity at the time of their discovery.

The aim of this contribution is to present the Museum's core of gold textiles, consisting of around thirty specimens such as ribbons, yarns, skeins, fragments of textiles and laminae and small ornaments. The collection, despite its undoubted interest both in terms of the raw material used and the rarity of the evidence, is still little known to scholars.

In particular, starting from the first results of the collaboration recently established between the MANN and the OPD on a ribbon made of gold thread using the 'sprang' technique, a comprehensive research project is being carried out with the aim of gaining a complete knowledge of the entire group of artefacts. Besides the multispectral diagnostic campaign, investigations were conducted on the metal foil through MO, SEM and microanalysis investigations, which highlighted the absence of an animal or vegetable fibre core inside the very thin yarn, the very high percentage of gold among the elements present in the alloy, and the discovery of a red substance on the surface of the ribbon, which raised many questions. After this first project, focused diagnostic analyses and studies will be carried out regarding the nature of the constituent material, investigating at the same time ancient manufacturing processes. The preparation of a conservation project will begin, including conservation actions and specific indications on the long-term preservation of these rare and precious testimonies in order to make them visible to the public and safe in storage.

4 PREHISTORIC SCANDINAVIAN TEXTILES WITH GOLD THREAD DECORATIONS

Abstract author(s): Mannering, Ulla - Rimstad, Charlotte (National Museum of Denmark) - Vedeler, Marianne (Museum of Cultural History, University of Oslo)

Abstract format: Oral

In Scandinavia the use of metal threads, made of silver and gold lamella wound around a silk core, is a type of textile decoration method that appears quite late in the prehistoric period. It is in the preserved archaeological record possible to follow the development of a textile production tradition in an almost unbroken chain from the Early Bronze Age (ca. 1700 BC) to the end of the Viking Age (ca. AD 1050); a production which is fully based on locally available resources. In the Late Iron Age (ca. AD 700) however, new imported materials like silk and metal threads are integrated into the existing cloth culture. Some of these resources arrive to the North as finished products, such as woven silk textiles, while others rather represent the acquisition of raw materials that could be used in a specific local production, as seen in the narrow and very exclusive tablet-woven bands of silk, silver and gold thread. This presentation will focus on the dating, distribution and use of gold threads in textile production in Scandinavia until the 11th century AD.

5 GOLD AND SILK EMBROIDERED BRAID, 900 CE SCOTLAND

Abstract author(s): Harris, Susanna (University of Glasgow) - Davis, Mary (National Museums Scotland) - Makin, Alexandra (University of Glasgow) - Cartwright, Caroline (The British Museum) - Elliott-Minty, Celia - Opitz, Rachel (University of Glasgow) - Macente, Alice (University of Leeds) - Vanden Bergh, Ina (Royal Institute for Cultural Heritage (KIK-IRPA))

Abstract format: Oral

In 2014 metal detectorists in southwest Scotland discovered a Viking Age hoard of metals and other precious materials, including rare, preserved textiles, and silk braid with unusual gold embroidery. The braid is part of a textile-wrapped bundle containing three gold filigree socketed mounts and a black stone pendant with gold filigree casing. In one section, two strands of silk braid are connected by gold embroidery in a diamond pattern. Some of the silk appears to be threaded through a ring of gold thread. The socketed mounts were connected by the braid, and the same type of braid was used to suspend the pendant, possibly also threading through a ring of gold threads.

There are two types of gold thread. Both are made from gold strips twisted around a silk core, one is doubled. This 'doubled' gold yarn has few parallels and creates a dynamic texture. In this paper we present the preliminary results of the silk braid with gold embroidery, including fibre analysis of the braid using SEM, braid structure and embroidery technique using optical microscopy, composition of the gold using SEM-EDS and CT analysis of position, 3D morphology and formation of the braid and its embroidery. In addition, we will present the dyes preserved in the braids and embroidery threads, which were analysed by HPLC-DAD.

6 THE TECHNIQUES AND MATERIALS OF GOLD TEXTILES IN EAST ASIA

Abstract author(s): Lee, Boyoung (Korea University) - Li, Konstance Chun-tung (The University of Hong Kong)

Abstract format: Oral

Across cultures and throughout history, gold has been used to decorate clothes to manifest affluence, material wealth, and extravagance; as well as to enhance the socio-political function of dress. As a material, gold was favoured for clothing decoration for both practical and prestigious reasons. Firstly, gold as a material is highly malleable; secondly, it is an easily tradable commodity universally accepted – woven into clothes or not. As such, it is highly appreciated as a precious metal that denotes wealth and prestige across East Asia and beyond.

To analyse the development and evolution of the art of gold textiles, the understanding of its production methods and techniques must be illuminated too. More studies have been dedicated to the subject in the last decades, nevertheless, many of them are either published in East Asian languages only or available only in abridged translations, thus not providing the comprehensiveness seen in their originals. Therefore, we aim to integrate current knowledge of the techniques and materials of gold textiles production in East Asia from primary classical literature and modern research. Through this effort, we also hope to establish a comprehensive information database that could inform and supplement current international research. Most importantly, critical and annotated translations of the terminologies are provided in the current study.

7 MAKE IT OR FAKE IT: THE SPREAD OF TEXTILES WOVEN WITH GILDED THREADS IN THE 13TH AND 14TH CENTURIES

Abstract author(s): Shea, Eiren (Grinnell College)

Abstract format: Oral

Textiles woven with metallic threads, and especially gilded threads, were among the most valuable products made for the Mongol courts in the thirteenth and fourteenth centuries. These textiles were tailored into court dress across Asia, fashioned into panels to decorate the tents of Mongol khans, used as diplomatic gifts, and traded as luxury commodities between the Mongol territories, West Asia, and the Mediterranean. Desire for gold-woven textiles caused a spread of weaving technology and production techniques throughout the Mongol Empire and into the Mediterranean. In this paper, I will investigate the implications of the spread of new types of metallic thread production across Eurasia, in particular threads made using a technique I call gilt-membrane filé. This technique, which existed prior to the Mongol period but only became widespread after the Mongol conquests, involved gilding a substrate (usually animal membrane or skin) and wrapping thin strips of this gilded substrate around a textile core (a technique called filé). The core was often silk but could be made of linen or cotton as well. I investigate the ways in which the greater availability of fine textiles woven with gilded threads impacted previously held assumptions about the elite nature of gilded textiles. I will also examine the ways in which perceptions of authenticity impacted the ways in which the textiles woven with gilt-membrane filé were used, and by whom they were used.

8 ALL THAT GLITTERS IS NOT GOLD: THE MORPHOLOGY AND COMPOSITION OF PAPER-BASED METAL THREADS

Abstract author(s): Jerman, Callista (The Textile Museum)

Abstract format: Oral

Metallic embellishments have been added to textiles for thousands of years, in the shape of gilded leather, precious metal wires, spangles, sequins, and beads. The presence of metallic elements, particularly composite materials such as gilded paper and gilded leather, make storing and conserving these objects complicated. They also influence the condition in which these textiles might be found during excavation, especially in damp conditions. In order to further understand the reaction of East Asian paper-based metal threads to water, practical testing was paired with chemical analysis by ATR-FTIR and fluorescence microscopy to determine how 19th Century Chinese threads were made and if that influences their sensitivity to water. While there seems to be a correlation between the appearance of these threads and their composition, that has little impact on their behaviour when exposed to liquid water. Most remained stable on exposure to water vapour alone, suggesting that they may be more resistant to the impacts of humidity than originally thought.

9 GOLD-CLOTH FURNISHING AND ARABIC SOURCES IN THE COURTS OF EARLY MEDIEVAL ISLAM

Abstract author(s): de Lara, Juan (UCL)

Abstract format: Oral

Three documents from Fatimid Egypt, Abbasid Iraq, and Taifa Toledo, dated between the tenth and twelfth centuries and never studied together previously, describe the practice of decorating audience halls with gold-threaded furnishing textiles that were both embroidered and woven using the tapestry technique. These accounts provide important iconographic information. However, their most remarkable contribution to the research on organic metal thread is the specific information they offer on the production centres of each of these textiles. However, when this data is studied against the corpus of surviving material evidence, the results are contradictory, revealing a general preference or higher esteem for Eastern Mediterranean and Iranian fabrics over Andalusian textiles during the tenth and eleventh centuries in court environments. This presentation will discuss the current problems associated to the appearance and the production of organic metal thread in the Muslim world around the tenth century. For this, such discussion will be contextualised within a framework resulting from the analyses of comparative stylistic material in unison with the assessment of the Arabic accounts.

10 MEDIEVAL GOLD THREADS: MULTI-ANALYTICAL STUDY OF ANIMAL-BASED METAL THREADS TO EXPLORE THE SECRETS OF A SKILLFUL CRAFTSMANSHIP

Abstract author(s): Scibè, Cristina (University of Seville) - Solazzo, Caroline - Lam, Thomas (Museum Conservation Institute, Smithsonian Institution) - Török, Zsófia - Dönczö, Boglárka (Institute for Nuclear Research - ATOMKI) - Tosini, Isetta (Opificio delle Pietre Dure) - González López, María José (University of Seville)

Abstract format: Oral

Throughout the middle ages, a certain type of gold thread was widely used to embellish cloths and fabrics. This gold thread was made by gilding/silvering organic materials (leather, parchment, animal membranes or paper) with an adhesive medium (animal glue, egg, bole or the natural membrane exudate) and cutting them into narrow strips. Preferred to the solid strips of almost pure gold, these organic-based strips were characterized by their flexibility and lightweight, and could be used either flat or wound around a fibrous core. From their first appearance in the Far East, followed by the Byzantine Empire, they became very popular in Europe where the main textile workshops developed their own manufacture under the Arabian influence. The gold threads produced there were made by gilding strips of animal skin tissues or membranes and wrapping them around a fibrous core.

In the present work, the results of a multi-analytical approach to investigate materials and techniques of medieval animal-based metal threads are presented. Case studies from medieval Spanish, Italian and Middle Eastern textiles will be discussed.

By combining for the first time Optical Microscopy, Scanning Electron Microscopy/Energy Dispersive X-Ray Spectroscopy (SEM/EDS), Particle Induced X-ray Emission (PIXE) and Proteomics techniques, it has been possible to characterize all the components that made up the complex and multilayered structure of these threads. Therefore, different production technologies have been identified [1]. The complementary information that this approach brings, will contribute to the knowledge of the secrets of this skillful craftsmanship.

[1] Scibè, C., Solazzo, C., Tosini, I., Lam, T., Vicenzi, E., González López, M.J. Gilt leather threads in 11th-15th century textiles. Proceedings of the 11th Interim Meeting of the ICOM-CC Leather and Related Materials Working Group, 2020

11 SPINNING GOLD - PRACTICAL EXPLORATION OF MANUFACTURING METHODS FOR ANIMAL-BASED METAL THREADS

Abstract author(s): Kania, Katrin (pallia – Mittelalter hautnah / EuroWeb) - Niepold, Tracy (Bayerisches Landesamt für Denkmalpflege) - Scibé, Cristina (University of Sevilla)

Abstract format: Oral

Organically or animal-based metal threads were a cheaper and thus more accessible alternative to threads made from solid metal strips wound around a fibre core. However, we only know very little about the manufacture of these threads with their astonishingly fine strips.

Based on the analyses of membrane gilt threads from the Middle Ages, an experimental approach was made to reproduce gilt membrane threads. Different substrates and different adhesives for attaching leaf metal to the substrate were used, with the intention of analysing the resulting metallised membranes for comparison with the originals. In addition, methods for cutting and winding the membrane around a plied linen core was explored.

The trials resulted in a method that seems workable and fits in with microscopic pictures of the originals. At the same time experiences made during the experiment were strongly reinforcing our appreciation of the immense motoric skill and material knowledge of the medieval makers of these threads, as our result was significantly coarser and more irregular than the original pieces.

A. EXPERIMENT IN SPINNING GOLD WITH SILK, WEAVING SAMPLES OF RIBBON AND COMPARE WITH THE FINDS FROM POMPEII AND ALBA POMPEIA

Abstract author(s): Ariis, Lorena (Independent)

Abstract format: Poster

The Roman ribbons made by golden threads, have exerted a great fascination, not only for the characteristics and symbolism, but also for what achieved in the processing of gold threads. They are very thin of variable width under the millimeter, some analyses of Pompeii ribbons have highlighted that golden strips are irregular cut from foils and there are organic traces of silk.

The experiment consisted in spinning thin strips cut by special aluminum foils, this material is like the gold in terms of malleability, hardness, weight. The strips were spun with dyed silk yarn, based on observation from the analyses. This technique has been compared to the technique of cutting strips from gold leaf, used to gilding, and wrapping or spinning it with fiber threads. The next step was weaving ribbon samples with both types of threads, trying to recreate the fragment from Alba Pompeia of the 1st century AD, that is comparable in shape and structure to those of Pompeii collections.

The purpose of the experiment is to verify the similarities between the samples obtained with the morphology of the Roman fragments. An impalpable material such as gold leaf is difficult to wrap around the silk thread and the gold deteriorates easily, while foil is easier to work with, is stable but creates greater thickness irregularities. It can be deduced that both techniques were used in Roman period with different skills related to localized production and available materials.

471 WEAVING BRIDGES BETWEEN FUNERARY AND DOMESTIC ARCHAEOLOGIES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Denis, Solène (CNRS UMR 8068 TEMPS) - Bickle, Penny (University of York) - Souvatzi, Stella (University of Thessaly)

Session format: Regular session

This session asks how do we combine evidence arising from different archaeological contexts, to present more fully rounded social models for archaeological phenomena? Funerary, craft, domestic, industrial, symbolic or religious contexts produce different archaeological datasets, often constrained by the analytical method employed or theoretical framework required for interpretation. Funerary contexts, centered on the human skeleton and accompanying objects, give potential for biomolecular analysis targeted at individual identities and lifeways. Settlement and households, appearing in collective action, reveal specialization, food production, craft activities and environmental exploitation. The contrast between individual and the collection can at times be at odds with each other, while routes to synthesis do not emerge clearly from the evidence itself. For example, in the Neolithic contrasting narratives of equality be-

tween houses and inequality in the grave are in direct conflict. Yet, how to combine this wealth of data is thus rarely considered, usually only occurring at the highest level of analysis, and at quite some distance from the data.

We invite papers from different research traditions, and working across different chronological periods (from the Palaeolithic onwards), to consider how archaeology can produce multi-context perspectives by combining data from funerary and settlement practices.

Specifically, we wish to consider the following areas:

1. Appropriate methods for combining different datasets, whether proposing models or new interpretative frameworks.
2. Case studies from different time periods providing new insights into individual and collective identities, social practices or lifeways.
3. How the same question can be answered in different contexts? For example, mobility, dietary practices, hierarchy and kinship.

By questioning how we integrate datasets drawn from different contexts in different time periods we aim to produce new insights into social organization in the past, but also routes to further analysis.

ABSTRACTS

1 **BURIED WITH THE DEAD. ARCHAEOMETRIC INVESTIGATION OF AN ATYPICAL CHALCOLITHIC ADOBE BUILDING DISCOVERED IN ROMANIA, WITHIN THE SULTANA-MALU ROȘU NECROPOLIS**

Abstract author(s): Manea, Bogdan - Covătaru, Cristina (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB) - Ignat, Theodor - Opreș, Vasile (Bucharest Municipality Museum) - Lazăr, Cătălin (ArchaeoSciences Division, Research Institute of the University of Bucharest - ICUB) - Panaiotu, Cristian - Dimofte, Daniela (Faculty of Geology and Geophysics, University of Bucharest)

Abstract format: Oral

Located in the south-eastern part of Romania, the prehistoric necropolis of Sultana-Malu Roșu was used for an extended period of time during Early and Developed Chalcolithic by the so-called Boian (ca. 5200-4500 BC) and Gumelnița (ca. 4600-3800 BC) communities from the area.

Interestingly, the 2014 excavation season revealed the presence of a foundation ditch in one of the archaeological trenches, which, during the 2015 campaign, turned out to be part of a burnt and collapsed adobe structure, partially identified in another trench placed parallel to the one from the previous year. Following these discoveries, we continued by expanding the digging-area and, for the next six years, we investigated systematically what proved to be the remains of a long building, with atypical large dimensions for this spatial-temporal framework.

The current paper will summarize all aspects related to the applied field methodology and, by default, the entire data set collected in the course of the excavation. The whole post-excavation research endeavour involved the processing of geospatial data (GIS, UAV photogrammetry) and the deployment of archaeometric analysis through multiple techniques (FTIR, XRD, paleomagnetism and radiocarbon dating), to the purpose of identifying as many hidden elements as possible on the birth, life and death of this prehistoric building. All of the acquired information will be presented together with their interpretation.

Ultimately, we believe that by framing the results generated by this study in a broader geographical and chronological perspective, new developments in our understanding of technologies, specificity, decision-making and habitation, will emerge.

2 **ORNAMENTS FOR THE LIVINGS? A STATUS COMPARISON BETWEEN FUNERARY AND DOMESTIC SITES ORNAMENTAL ELEMENTS DURING FINAL NEOLITHIC IN PROVENCE**

Abstract author(s): Viel, Laurine (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA)

Abstract format: Oral

The aim of this paper is to compare the elements of adornment from Final Neolithic burials and domestic settlements in south-eastern France, to understand both the status of these objects and the one of who wear them. Final Neolithic is often presented as the period of increasing social distinction markers. However, the evidence of a marked differentiation of individuals in Provence (south-eastern France) between 3500 and 2200 BC is rare.

The elements of adornment can be markers of social distinction, by the nature of the raw materials, the shapes, and the technical aspects, allowing a distinction between individuals. However, in order to know the status of individuals, it is necessary to wonder about the status of these adornments. How can they be characterised? Do they differ according to the domestic or funerary context?

To answer these questions, I recorded each intrinsic characteristic of the items of adornment (material, dimensions, shape, traces) to define their biography (manufacture, use, deposit) and their status (social value of these objects). This protocol was applied to two burials and one domestic site.

Different results emerged from this study (function of the items of adornment, difference in production demonstrating the presence of several statuses, differentiation of the buried by the adornment...). In this paper, I will focus on the absence of certain items of adornment in the collective burials of the region, which are present in the domestic sites. Is this difference related to a difference in the status of the populations? Or did the populations of the Final Neolithic in Provence sort the ornamental elements before depositing them in the graves with the dead?

3 LIFE CYCLE. LINKS BETWEEN SETTLEMENTS AND BURIAL CAVES DURING THE CHALCOLITHIC IN THE LISBON PENINSULA (PORTUGAL)

Abstract author(s): Delicado, Cátia (UNIARQ- Centro de Arqueologia da Universidade de Lisboa; CIAS - Centro de Investigação em Antropologia e Saúde da Universidade de Coimbra; FCT- Fundação para a Ciência e a Tecnologia) - Texugo, André (CEG- Centro de Estudos Geográficos da Universidade de Lisboa; UNIARQ- Centro de Arqueologia da Universidade de Lisboa; FCT- Fundação para a Ciência e a Tecnologia) - Van Calker, Daniel (UNIARQ- Centro de Arqueologia da Universidade de Lisboa; FCT- Fundação para a Ciência e a Tecnologia) - Rendeiro, Luis (CEG- Centro de Estudos Geográficos da Universidade de Lisboa; UNIARQ- Centro de Arqueologia da Universidade de Lisboa; FCT- Fundação para a Ciência e a Tecnologia) - Sousa, Ana Catarina (UNIARQ- Centro de Arqueologia da Universidade de Lisboa)

Abstract format: Oral

The 3rd millennium BCE, Portuguese Estremadura territory was marked by the existence of numerous hilltop sites, with many confirmed walled structures. This phenomenon is common to the Iberian Peninsula, being Estremadura one of the regions with the highest concentration of these sites, although there is diversity (size, chronology, and architecture).

Estremadura's geological setting, comprising a mosaic of limestone substrates punctuated by volcanic elevations, provides numerous natural caves which have been used as burial spaces since the early Neolithic. This concentration of cave-necropolis is unparalleled in the westernmost part of the current Portuguese territory. Some limestone massifs with a special presence in the landscape, have abundant caves used as burial spaces, such as Montejunto hill, Cesaredas highland, Alcobça valley, or Estremadura Limestone Massif, where domestic contexts are almost non-existent.

There are several walled sites with funeral caves documented within their immediate surroundings, others in which this relation is slightly further apart, but still nearby, and finally, those with no apparent relation. Moreover, the diversity of the diachronic scheme should be highlighted: in some cases, the burial caves are earlier and in other cases, they correspond to the final stages of Chalcolithic. No structured necropolises have been identified near the walled sites in Estremadura, but there are occasional and scarce presences of human remains. This panorama is completely different from the ditched enclosures of the Southern Peninsula.

This paper seeks to analyze the possible correlation between the deployment strategy of walled Chalcolithic settlements and the natural cavities through spatial and chrono-cultural analysis, exploring relationships as places of memories (previous, coeval, or later). An attempt will be made to understand the visual relationship between settlements and cave-necropolis, establishing a direct relationship through the use of GIS and the access routes, assuming the geological bedrock is the main limiting factor.

4 TESTING RESIDENCE THROUGH DWELLINGS' SIZE: ARGARIC SETTLEMENTS AS A CASE STUDY

Abstract author(s): González-Serna Lloná, María del Carmen (Department of Prehistory - University of Granada) - Cintas Peña, Marta (Department of Prehistory - University of Seville) - Murillo Barroso, Mercedes (Department of Prehistory - University of Granada)

Abstract format: Oral

Since the beginning of the archaeological discipline, kinship and residence have been key issues to approach social organization of past communities. In the last years this traditional interest has been renewed by the possibility of addressing it through modern techniques such as aDNA and strontium isotopes analyses, being both type of data obtained directly from human remains recovered in funerary contexts. In some cases, such as in the recent analysis of Argaric Bronze Age society (Iberian southeast) the conclusions obtained have completely transformed previous

hypothesis. Although DNA and strontium isotopes analyses are powerful tools to address residential patterns and, related to it, kinship, cross-cultural studies have demonstrated that approaching residence archaeologically is also possible through the size and distribution of dwellings within a settlement. With the aim of contributing to weave bridges between funerary and domestic archaeologies, in this paper we present the analysis of the size of houses in different Argaric settlements. Thus, in this contribution we test whether the conclusions reached by the genetic studies about the Argaric society being patrilocal are also endorsed by the housing pattern.

5 BETWEEN THE LIVING AND THE DEAD. COMBINING DIFFERENT LEGACY DATASETS IN THE BRONZE AGE SITE OF TORRE CASTELLUCCIA (APULIA, ITALY)

Abstract author(s): Pizzuti, Elisa - Palazzini, Flavia (Sapienza-Università di Roma)

Abstract format: Oral

Torre Castelluccia (18 km southeast of Taranto, Apulia) is one of the few Bronze Age sites in Italy that has yielded remains of both habitations and spatially contiguous burials of different types and chronology. Given its uniqueness, it is an ideal case study to tackle the issue of integrating data from funerary and domestic spheres when reconstructing past societies. However, since archaeological research at this site was mostly conducted in the 1950s and 1960s and information is stored in non-digital formats, data management has proven to be quite challenging. Thus, the first goal of our study was the conversion from a physical to a digital archive; this procedure helped to prevent further data loss and created a space where different datasets could communicate. The new database enabled managing and comparing information on the settlement and funerary areas (e.g. to identify similar pottery functional types used in both contexts) and directly supported their interpretation. One of the outcomes was a more accurate characterization of the activity phases for each considered context, which contributed to further speculations on social and cultural dynamics. In fact, while the fortified settlement is continuously occupied from the South Italian Middle Bronze Age until Greek colonization, the cremation cemetery is in use in the Late Bronze Age and is partly coeval with at least one rock-cut „grotticella“-type tomb (whose skeletons have unfortunately not been fully preserved). This chronological overlap is referable to a complexity of coexisting rites, possibly adopted by different social groups, whose reflection in the settled area can be searched for. In this paper, we will present the results of our research. Based on first-hand experience, we will also discuss the potential of linking funerary and domestic data using a single repository which can be queried and updated at any time.

6 LITTLE BRONZE AGE COMMUNITY. CASE STUDY PŘÁSLAVICE, CZECH REPUBLIC

Abstract author(s): Šabatová, Klára (MUNI - Ústav archeologie a muzeologie) - Cheung, Christina (Chinese University of Hong Kong) - Jarošová, Ivana (Masarykova univerzita) - Snoeck, Christophe (Vrije Universiteit Brussel)

Abstract format: Oral

A little community of Middle and Late Bronze Age lived in Přáslavice, Central Moravia. Defined settlement components represents residential, storage, industrial and refuse functions of a farm settlement and a burial site. The burial component belongs to the Late Bronze Age and falls in Urnfield period in the area. All the methodological parts, the description, statistical analysis and interpretation, had to take into account the different archaeological record in the settlement and burial context and combine them. The development led excavation was realised in the 1990's but new scientific methods enabled the creation of new data sets that allow new discussions over the former conclusions.

The first objective of this paper is to draw a comparison of the formalised ceramic datasets from the graves and settlement contexts. The case study is based on combination of statistical methods (chronology, depositional, and post-depositional history), traditional typology (chronology and cultural affiliation) and GIS methods (spatial relations).

Second, a set of new radiocarbon dates obtained from cremated bones will be confronted with the earlier data from the charcoals and typological schema of the site.

Third, the results of strontium isotope analyses from the cremated burials will be discussed in the context of anthropological and archaeological analysis and subsequent interpretation.

7 THE LATE IRON AGE SETTLEMENT OF SAMREKLO IN THE MIRROR OF ITS SURROUNDINGS

Abstract author(s): Arnhold, Simone (Martin-Luther-University)

Abstract format: Oral

At the multi-phase site of Samreklo, Prov. Kakheti/Georgia, on the north-western edge of the Shiraki Plain, layers of the Late Bronze/Early Iron Age and Late Achaemenid/ Hellenistic periods are currently being investigated. The architecture of the Late Iron Age shows clear differences in construction methods and the pottery represents a wide range of different types, some of which have decorative elements limited to one settlement. In addition, finds were excavated that suggest local workshops. Slightly younger are graves that show very different burial concepts.

Besides Samreklo, other Late Iron Age settlements on the Shiraki Plateau have also been investigated or are known based on surveys. At present, it seems that a diverse settlement pattern existed on the Shiraki Plateau in the Late Iron Age with numerous indications of different crafts as well as a pronounced need for imitation of luxury goods. Their forms appear strikingly familiar, but were transferred in a regional context both in terms of their laying down and in terms of decorative design.

8 WEAVING BRIDGES BETWEEN THE CHURCH CEMETERIES AND RESIDENTIAL AREAS. HOW TO INVESTIGATE THE SOCIAL ORGANISATION OF THE EARLY MIDDLE AGES?

Abstract author(s): Machacek, Jiri - Dresler, Petr - Hofmanova, Zuzana (MUNI - Ústav archeologie a muzeologie) - Sladek, Vladimir (UK Prague, Katedra antropologie a genetiky člověka) - Prichystalova, Renata (MUNI - Ústav archeologie a muzeologie)

Abstract format: Oral

This paper will discuss the integration of datasets from the funerary and settlement context, dating back to the Early Middle Ages. We will focus on interpreting extensive archaeological and bioarchaeological data in terms of social organisation. The case study is Pohansko near Breclav (Czech Republic), an important central place of the Great Moravian polity.

Archaeologists from the Masaryk University have zeroed in on the area of the Northeast Suburb at Pohansko, the site of the discovery of a church, surrounded by a vast cemetery. The most important discovery was made in the rotunda's interior, where five graves were found.

Based on these discoveries, we formulated a hypothesis on the social structure of the community buried there. The most important burial from the whole group was apparently the remains of an older man from grave No. 153, which was found in a prestigious position. We are working with the hypothesis that the man buried in the church was its founder and the graves in the surrounding cemetery were those of his familia, which we take to be a household at the centre of which was the head of the family.

The next step in investigating the North-East Suburb was research carried out outside the cemetery to test the hypothesis proposed above. During testing, we formulated a prognosis derived from our hypothesis that if the man buried in a place of honour inside the church was indeed its owner, he must have had sufficient assets available to ensure the operation of the church. At the same time, he would have owned a splendid residence – *curtis* – matching his social position. In testing the initial hypothesis, we concentrated on the settlement area.

475 EXTRACTING PATTERN AND STRUCTURE FROM A COMPLEX PHENOMENON? TECHNOLOGICAL COHESION, VARIABILITY AND REGIONAL SIGNATURES ACROSS THE EURASIAN INITIAL UPPER PALAEOLITHIC [PAM]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Djakovic, Igor (Leiden University) - Hussain, Shumon (Aarhus University) - Zwyns, Nicolas (UC Davis)

Session format: Regular session

The Initial Upper Palaeolithic (IUP) is emerging as a key to understanding the spread of anatomically modern human populations (AMHs) throughout Eurasia and the pronounced technocultural dynamics marking the period between c. 55 and 35 kya. The IUP macro-phenomenon has been argued to consist of a series of broad technological and typological similarities shared across vast geographic distances, either because of common origin or technological convergence. Yet, IUP assemblages also appear to exhibit striking regional variation and it is presently unclear to what extent this is linked to the flexible nature of the phenomenon itself, for example as an adaptive strategy, or has primarily to do with divergent regional histories. Confirmation of the latter may provide evidence for the importance of inter-hominin relations in the emergence and consolidation of the IUP across Eurasia. Given this situation, it is interesting that there has so far been little explicit attempt towards 'extracting' the regional and temporal structures defining the IUP. Conversely, it remains an important open question which specific technological behaviors 'unite' the IUP (i.e. are ubiquitous) and which behaviors instead circumscribe regional peculiarities. These and related questions gain further immediacy due to the mounting evidence for elevated hominin diversity at the end of the Late Pleistocene.

This session invites researchers with diverse backgrounds to share and discuss present work on the IUP across Eurasia and to interrogate the 'unity' and 'diversity' of the phenomenon. We welcome fieldwork-oriented contributions, assemblage-level and regional analyses, macro-level analyses and theoretically informed reflections as to the nature and structure of the IUP.

1 CHARACTERISING CLIMATIC VARIABILITY DURING THE INITIAL UPPER PALAEOLITHIC: A REVIEW OF EURASIAN CLIMATE RECORDS 50-40 KA BP

Abstract author(s): Paine, Clea (UHI) - Zwyns, Nicolas (University of California Davis)

Abstract format: Oral

The IUP phenomenon extends across a very wide area, today representing a diverse range of climates and ecosystems, including some of the most arid areas on earth. The extent to which this present-day environmental variability existed at the time of IUP occupation has so far been difficult to assess owing to a paucity of long-term, high-resolution climate records, particularly in currently arid areas. This has consequences for our understanding of demography (the geographic extent of any demographic vacuum created by Greenland Stadial (GS)13; the existence of hominin refugia), corridors for and barriers to dispersal (the expansion and contraction of desert margins; possible desert greening during pluvial phases), and technological diversity (where this might be a response to habitat diversity). Through a review of published climate records, this talk presents a first effort at climatic reconstruction for the period between approximately 50 and 40 ka BP, focusing on the regions where IUP sites are attested. In a context of widespread aridity, evidence is presented for locally varied responses to stadials including GS13 (Heinrich Event 5), with possible implications for the habitability of the continental and extreme continental zones of Eurasia both before and during IUP dispersal.

2 THE SUBSISTENCE AND DIET OF INITIAL UPPER PALAEOLITHIC HOMO SAPIENS CA. 45,000 YEARS AGO

Abstract author(s): Smith, Geoffrey (School of Anthropology, University of Kent; Max Planck Institute for Evolutionary Anthropology) - Spasov, Rosen (Archaeology Department, New Bulgarian University) - Martisius, Naomi (Department of Anthropology, University of Tulsa; Max Planck Institute for Evolutionary Anthropology) - Pederzani, Sarah (Instituto Universitario de Bio-Orgánica Antonio González, University of La Laguna; Max Planck Institute for Evolutionary Anthropology) - Fewlass, Helen (Francis Crick Institute; Max Planck Institute for Evolutionary Anthropology) - Ruebens, Karen (Chaire de Paléanthropologie, Collège de France; Max Planck Institute for Evolutionary Anthropology) - McPherron, Shannon (Max Planck Institute for Evolutionary Anthropology) - Sirakov, Nikolay (National Institute of Archaeology with Museum at Bulgarian Academy of Sciences) - Tsanova, Tsenka (Department of Chemistry G. Ciamician, Alma Mater Studiorum, University of Bologna; Max Planck Institute for Evolutionary Anthropology) - Hublin, Jean-Jacques (Chaire de Paléanthropologie, Collège de France; Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

The timing and nature of Homo sapiens expansion into Eurasia remains a crucial and much debated topic. Due to poor bone preservation, past studies have strongly focused on the Initial Upper Palaeolithic (IUP) stone tool record, with only limited reconstructions of the subsistence strategies of these early groups of Homo sapiens possible.

Recent discoveries from Bacho Kiro Cave now provide an exceptionally well-preserved faunal assemblage directly associated with these early Homo sapiens (Smith et al., 2021). In this presentation we will discuss a shift in site use and occupation through time from low, ephemeral occupation in the MP to a significant increase in anthropogenic material within the IUP levels that includes higher densities of lithic tools, butchered animal remains and specialised bone tools and ornaments. These layers are also marked by a significant decrease in carnivore use of the site and seasonality data indicating prolonged occupation by IUP groups. While bone remains are predominantly from large herbivores, a distinct aspect of the IUP occupation is a significant increase human butchery signatures across carnivore remains of all body size classes. This is correlated with exploitation for pendants and potentially for skins and furs.

At a broader scale, this presentation will discuss subsistence behaviour across other IUP sites in Eurasia where the first IUP occupations are characterised by a less intense anthropogenic signature with find densities and human modifications increasing in succeeding IUP layers.

3 PERSONAL ORNAMENTS IN THE IKH TULBERIN GOL (TOLBOR VALLEY, NORTH MONGOLIA): ITS RELEVANCE FOR THE UPPER PALEOLITHIC DEVELOPMENTS IN EURASIA

Abstract author(s): Rigaud, Solange (CNRS-Université de Bordeaux, UMR5199 PACEA) - Rybin, Evgeny P. (-) - Khatsenovich, Arina M. (-) - Gunchinsuren, Byambaa (Institute of Archaeology, Mongolian Academy of Sciences) - Talamo, Sahra (Department of Chemistry “G. Ciamician”, University of Bologna; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology) - Tsedendorj, Tsedendorj - Odsuren, Davaakhuu (Institute of Archaeology, Mongolian Academy of Sciences) - Izuho, Masami (Faculty of Social Sciences and Humanities, Tokyo Metropolitan University) - Hublien, Jean-Jacques (Chaire de Paléanthropologie, Collège de France; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology) - Zwyns, Nicolas (Department of Anthropology, University of California-Davis)

Abstract format: Oral

Personal ornaments are considered as a key element of past material productions that tracks early symbolic behaviors. While beads are attested between 142-60 ky in Sub-Saharan, East and North Africa and the Levant, only four marine species among hundreds available along contemporary shores and estuaries are used as ornament. Although associated human remains have been attributed to anatomically modern humans, they also retain archaic anatomical traits. A clear change is observed after 52 ka with the development and proliferation of disk-shaped beads, particularly with those made from ostrich eggshell in East and South Africa during the LSA. The picture is drastically different in Eurasia where, from 45 ky cal BP onward, the first uncontroversial personal ornaments show substantial variations in shape, color and raw materials. So far, Bacho Kiro (Bulgaria) is the only Initial Upper Paleolithic assemblage for which a clear association between beads and *Homo sapiens* remains is documented. Yet again, the latter have recent Neanderthal ancestors, thereby suggesting that, in Eurasia, variations observed in personal ornaments could reflect cultural processes triggered by successive dispersals of modern populations and their encounters with local hominins. Hence, it raises questions regarding the underlying mechanisms responsible for the formation of such a diverse Upper Paleolithic archaeological record in Eurasia. Recent work in Northern Mongolia offers avenues to document the evolution of personal ornament productions and uses by *Homo sapiens* human groups; from their initial dispersals to their permanent settlement in Central and East Asia. Here, we present recent results obtained on the personal ornaments from the Tolbor Valley (Tolbor-16, -17, -21, -34), and we discuss the cultural meaning of diachronic variations from the Initial to the Middle Upper Paleolithic in Eurasia through large-scale geographic comparisons.

4 THE MIDDLE TO UPPER PALEOLITHIC TRANSITION: INTEGRATING DATA FROM HIGH-RESOLUTION EXCAVATIONS WITH MODELS OF HUMAN DISPERSALS

Abstract author(s): Goder-Goldberger, Mae (Ben-Gurion University of the Negev)

Abstract format: Oral

Debates concerning the appearance and spread of the Initial Upper Paleolithic (IUP) techno-complex are intertwined with discussions regarding the spread of modern humans across Eurasia. As a result, there is an ongoing transformation in the use of the term IUP and its embedded association with the dispersal of modern humans. This outlook overshadows the importance of high-resolution studies of lithic assemblages and their contribution to deciphering triggers of transition.

Turning to the Levantine late Middle Paleolithic (MP) and IUP lithic assemblage variability and their temporal association, it is evident that innovative technological practices first seen in late MP become prominent in the IUP. The introduction and acceptance of innovative technological practices will be presented by comparing assemblages from recently excavated late Middle Paleolithic open-air sites in the north-western Negev, Israel to IUP assemblages from the southern Levant. Assuming that lithic assemblages act as proxies of behavioural flexibility and adaptability, the introduction and acceptance of innovations suggest that something in the social or ecological environment inspired the acceptance of changes. The presented data will then be used to discuss how these studies can contribute to explaining the spread of the IUP across Eurasia.

5 HUMAN MIGRATIONS AND THE INITIAL UPPER PALEOLITHIC - A VIEW FROM THE NEGEV DESERT, ISRAEL

Abstract author(s): Barzilai, Omry (Israel Antiquities Authority)

Abstract format: Oral

The Initial Upper Paleolithic (IUP) in Eurasia is a chrono-cultural phase corresponding with the onset of systematic production of broad-base blades. This phenomenon is often conceived to correlate with the arrival of modern human, but the mechanism of geographical spread is unclear yet.

The IUP was originally defined after the site Boker Tachtit in the Negev Desert where two consecutive superimposed lithic industries were recovered. The lower, named Emiran, is characterized with production of pointed blades from bidirectional cores, whereas in the upper industry the blades were produced from semi-prismatic unidirectional cores. The blades of both industries were produced by hard hammers.

Recent high-resolution dating of Boker Tachtit have shown the Emiran is contemporaneous with Late Middle Paleolithic assemblages dominated by Levallois technology. The identification of parallel lithic industries in a confined geographical area at this specific time span, imply the presence of different cultural groups when modern humans arrived in Eurasia.

Similar technological features between the Emiran and assemblages from the Nile Valley, suggest the early Boker Tachtit inhabitants may have originated from this region. The Emiran developed at Boker Tachtit into the later unidirectional industry, but apparently also expanded northward to central Europe. This expansion possibly reached north-east Asia as suggested by similar technological assemblages.

The later IUP variant behaved in a similar manner. It developed locally into the desert Ahmarian techno-complex but also expanded into the northern Levant and the Balkans. However, recent discovery of the Neronian in western Europe, indicate an earlier expansion into Europe that correspond with the Late Middle Paleolithic in the Levant.

In sum, the Levantine IUP record currently reflect at least two dispersal events.

6 INITIAL UPPER PALAEOOLITHIC ON THE IRANIAN PLATEAU: ESKOULDAR ROCKSHELTER, SOUTHERN ALBORZ MOUNTAINS

Abstract author(s): Ghasidian, Elham (Neanderthal Museum, Mettmann, Germany; Institute for Prehistoric Archaeology, University of Cologne; DiyarMehr Institute for Palaeolithic Research)

Abstract format: Oral

The Late Pleistocene of southwestern Asia witnessed hominin diversification and adaptation to the new environments. The timing and pattern of biological and cultural shifts that occurred in this region during MIS 4–3 are hotly debated in palaeoanthropology. The Iranian Plateau in southwestern Asia lies at the crossroad between Africa, Europe, Central Asia, and the Far East and can, therefore, contribute substantially to the history of hominin migration.

The focus of this research is on the Eskouldar Rockshelter (1903 m above sea level) located in the southern piedmonts of the Alborz Mountains, northern Iranian Plateau. In 2019 and 2021, excavations at this rockshelter revealed novel hominin behavioural and settlement systems, known as Initial Upper Palaeolithic in the Levant, eastern Europe, Siberia and Mongolia. Eskouldar strata was ¹⁴C and OSL dated. The lithic industry comprises of strong use of the Levallois blade technology, associated with typical Upper Palaeolithic tool types including mostly endscrapers, denticulates and notches. Preliminary inter-regional comparisons bear less resemblances of this assemblage to the Middle and Upper Palaeolithic of the Zagros, Iranian Central Plateau and the sites located at the northern slopes of the Alborz namely in the Southern Caspian Sea Corridor. In this chronological window, well developed bladelet industry of the Upper Palaeolithic was already developed in different parts of the Iranian Plateau. In addition, using extensive Levallois technology, like observed in Eskouldar, is not reported at any site on the Plateau so far.

The data from Eskouldar determines, for the first time, a physiogeographic, chronostratigraphic and anthropogenic picture of the Initial Upper Palaeolithic on the Iranian Plateau. It aids in deciphering the Initial Upper Palaeolithic hominins behaviours and unravels the important role of the northern Iranian Plateau in the hominins' expansion route towards Central Asia.

7 INITIAL UPPER PALEOLITHIC IN MORAVIA

Abstract author(s): Škrdla, Petr - Bartík, Jaroslav (Institute of Archaeology of the CAS, Brno) - Demidenko, Yuri (Ferenc Rakoczi II Transcarpathian Hungarian College of Higher Education) - Rychtaříková, Tereza (Institute of Archaeology of the CAS, Brno)

Abstract format: Oral

The time span (ca. 50–35 ky cal. BP) between the Middle and the Upper Paleolithic is a period in prehistory when, in the wider Eurasian context, Anatomically Modern Humans (AMH) replaced the Neanderthals. During this period, lithic technologies in Moravia are generally characterized by evolved Levallois technology in the Bohunician and bifacial reduction in the Szeletian (Škrdla 2017a,b).

While the Szeletian is rooted in local MP technological traditions, the Bohunician has an intrusive character in Moravia and represents a glass in the Initial Upper Paleolithic techno-complex mosaic of sites broadly distributed over Eurasia. The Bohunician technology reconstructed on the basis of the refitted cores from Stránská skála presents a volumetric concept allowing serial production of Levallois points with blades as a secondary knapping product. The Bohunician technology shows a high degree of similarity with the material from layers 1–3 at Boker Tachtit, Israel (Škrdla 2003). In contrast to the technologically pure Bohunician collections from Stránská skála, the collection from the Bohunice

type-site includes bifacial reduction and a recently described industry from Ořechov IV shows two trends – miniaturization of artifacts including Levallois points and the onset of bladelet technology.

8 CORE TYPOLOGY, REDUCTION SEQUENCES, AND VARIATIONS BETWEEN IUP LITHIC ASSEMBLAGES: A CASE STUDY FROM NORTH MONGOLIA

Abstract author(s): Zwyns, Nicolas (University of California-Davis) - Bolorbat, Tsedendorj - Odsuren, Davaakhuu - Gunchinsuren, Byambaa (Institute of Archaeology, Mongolian Academy of Sciences)

Abstract format: Oral

The Initial Upper Paleolithic (IUP) refers to archaeological assemblages that are relevant to the early dispersals of *Homo sapiens* populations in Eurasia. Genetic evidence shows that, as they moved across Europe and Asia, members of our species encountered Neanderthal, Denisovan and maybe other local populations. IUP assemblages are often described as a combination of Middle and Upper Paleolithic typo-technological features, or more broadly, as a technology in transformation. Yet the composition of archaeological assemblages could illustrate contact between different populations/species, but also adaptive behaviors responding to resources availability, or stochastic variations within the realm of specific technologies. At the scale of Eurasia, substantial variations between assemblages are observed and it is not clear whether the IUP should be considered as a relatively unified cultural unit, or as an analytical category lumping together unrelated industries. In this context, to investigate what drives variations within assemblages may contribute in identifying what typo-technological traits are relevant to comparisons on a larger geographical scale. Here, I give a close look at one of the defining aspect of the IUP in a lithic assemblage dated to ca. 45 ka cal BP, at the site of Tolbor-16 (Northern Mongolia). Although variations in core shape and size are often used to recognize distinct reduction sequences, they may also reflect a dynamic process that involves decision-making and stochastic behaviors, raising a general question: what is the influence of dynamic reduction processes on the assemblage composition? To do address this question, I compare reduction methods and core volumes across typo-technological categories. The results suggest that variability in core morphology may illustrate the different steps in a reduction model, but to a certain extent, a coexistence between distinct reduction pathways.

9 IDENTIFYING SHIFTS IN BLANK CUTTING-EDGE EFFICIENCY WITHIN AND BEYOND THE INITIAL UPPER PALEOLITHIC AT TOLBOR, MONGOLIA

Abstract author(s): Johnson, Corey (University of California, Davis) - Bolorbat, Tsedendorj (Institute for History and Archeology, Mongolian Academy of Sciences) - Grote, Mark (University of California, Davis) - Paine, Clea (University of Highlands and Islands) - Odsuren, Davakhuu (Institute for History and Archeology, Mongolian Academy of Sciences) - Khatsenovich, Arina (-) - Rybin, Evgeny (-) - Izuho, Masami (Tokyo Metropolitan University) - Gunchinsuren, Byambaa (Institute for History and Archeology, Mongolian Academy of Sciences) - Zwyns, Nicolas (University of California, Davis)

Abstract format: Oral

The appearance of Initial Upper Paleolithic (IUP) technology in northern East Asia during MIS 3 marks a significant change in the lithic archaeological record of the region. IUP technology is characterized by the production of massive blades from asymmetrical, sub-volumetric cores. The Asian variant also involves the production of small blade/bladelets (for which the function is still unclear), using a singular method described as ‘burin-core’ reduction. Understanding the economic trade-offs within IUP tool kits can help reveal important information regarding how those systems operated, and how they compare to later Upper Paleolithic (UP) technologies that developed thereafter. Here we address the IUP record from Tolbor Valley, Mongolia, by investigating a key techno-economic aspect of the lithic tool kit: blank cutting-edge length. To this end, we analyzed and compared data from four different lithic assemblages dating between MIS3 and MIS2, including IUP and later UP variants. The results of our diachronic analysis of cutting-edge efficiency suggest that in the Tolbor Valley, larger IUP blanks were made relatively more efficiently than smaller ones, and that during the later stages of the UP in the region there was a gradual shift toward the economization of smaller blanks, particularly with the introduction of pressure microblades during the Last Glacial Maximum.

INITIAL UPPER PALEOLITHIC ON THE TIBETAN PLATEAU? NWYA DEVU BLADE ASSEMBLAGE AND ITS PLACE IN THE UPPER PALEOLITHIC OF CHINA

Abstract author(s): Zhang, Peiqi (University of California, Davis) - Zhang, Xiaoling (Institute of Vertebrate Paleontology and Paleoanthropology, Chinese Academy of Sciences) - Li, Linhui - He, Wei (Tibetan Cultural Relics Conservation Institute) - , Dawa (Nagqu Cultural Relics Bureau) - Jin, Yingshuai - Ge, Junyi (Institute of Vertebrate Paleontology and Paleoanthropology, Chinese Academy of Sciences) - Zwyns, Nicolas (University of California, Davis) - Wang, Shejiang - Gao, Xing (Institute of Vertebrate Paleontology and Paleoanthropology, Chinese Academy of Sciences)

Abstract format: Oral

The persistence of 'core and flake' technology in East Asia during most of the Pleistocene raises questions regarding the identification of the Upper Paleolithic in the region. The rare examples of the MIS 3 blade-based lithic assemblages found at Shuidonggou in northwest China and Nwya Devu on the Tibetan Plateau show a technological shift that is consistent with many other regions of Eurasia. The long-lasting phenomenon of core and flake technology indicates that blade technology is likely an exogenous element from Siberia and/or North Mongolia, and possibly represents evidence for modern human dispersal into the region. Being contemporaneous with the Initial Upper Paleolithic and following early Upper Paleolithic assemblages of the eastern Eurasian Steppe, Nwya Devu hence offers an example of technological transmission and/or population movements, expanding toward the high-elevation environments. Here we present an analysis of the macro blade productions at Nwya Devu. Our results show that the assemblage is characterized by a relatively low technological investment in core preparation and maintenance and tool modification. In combination with the proximity of raw material source, it is likely a lithic workshop. The reduction sequence observed generally aligns with the generic Upper Paleolithic blade productions from the Steppe. Yet, it also differs from the typical Initial Upper Paleolithic from Mongolia and Siberia, for example, the lack of asymmetrical reduction methods and external platform edge preparation. It has little evidence of Levallois-like elements described in the assemblages from Shuidonggou locality 1. These differences might be related to Nwya Devu's site function that may not fully reflect technological features of the industry, technological variations across long-distance transmission, or multiple dispersal scenarios into East Asia.

A RADIOCARBON CHRONOLOGY FOR THE LRJ AT RANIS ILSENHÖHLE, GERMANY

Abstract author(s): Fewlass, Helen (Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology; Ancient Genomics Lab, Francis Crick Institute) - Weiss, Marcel (Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology; Institut für Ur- und Frühgeschichte, Friedrich-Alexander-University Erlangen-Nürnberg) - Talamo, Sahra (Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology; Department of Chemistry G. Ciamician, Alma Mater Studiorum, University of Bologna) - Lauer, Tobias (Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology; Terrestrial Sedimentology, Department of Geosciences, University of Tübingen) - Smith, Geoff (Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology; School of Anthropology and Conservation, University of Kent) - Stahlschmidt, Mareike (Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology; Department of Evolutionary Anthropology, University of Vienna) - Pederzani, Sarah (Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology; Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, IUBO-AG, University of La Laguna) - McPherron, Shannon (Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology) - Schüler, Tim (Thuringian State Office for the Preservation of Historical Monuments and Archaeology) - Hublin, Jean-Jacques (Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology; Chaire de Paléolithique, CIRB - UMR 7241 - U1050, Collège de France)

Abstract format: Oral

The Middle-Upper Palaeolithic (MPUP) transition marks a technological turnover in Eurasia between ~50-35 ka cal BP that accompanied the expansion of *Homo sapiens* into the continent and the subsequent disappearance of Neanderthals. Archaeological and genetic discoveries in recent years indicate a complex scenario of at least two incursions of *Homo sapiens* entering Europe prior to 40 ka. Studies of 'transitional' technocomplexes from this time period are crucial to resolving the behavioural dynamics of this population turnover, but many debates remain as to their makers. One such technocomplex, the Lincombian-Ranisian-Jerzmanowician (LRJ), is present in sites across north-west and central Europe from the UK to Poland. The makers of the LRJ are as-yet unresolved and few LRJ sites have a well-refined chronology, although most dates fall between ~44-40 ka. Ranis Ilsenhöhle in Thuringia, Germany is one of the typesites of the LRJ technocomplex and is known for its assemblages coming from excavations in the 1930s. Between 2016-2022 new excavations were undertaken at the site with the aim of refining the stratigraphy and producing a reliable chronology. Here we present an extensive set of radiocarbon dates from newly excavated material at Ranis which securely places the LRJ-associated layers in the interval from ~47-43 ka cal BP. This makes the LRJ at Ranis older than other LRJ sites and contemporary with the Initial Upper Palaeolithic and *Homo sapiens*

at Bacho Kiro Cave in Bulgaria (~46-43 ka cal BP) and the Zlatý kůň individual in Czech Republic (~45 ka). The new chronology provides an important framework for investigations of the artefact and faunal assemblage at the site, and the importance of Ranis in the wider context of the MPUP transition in Eurasia.

12 ARTIFACTS WITHOUT A HOMETOWN. RETHINKING THE LATE MIDDLE PALEOLITHIC AT OSCURUSCIUTO ROCK-SHELTER (SOUTHERN ITALY)

Abstract author(s): Carmignani, Leonardo - Soressi, Marie (University of Leiden, Faculty of Archaeology, Human Origins Group) - Ronchitelli, Anna Maria - Boschini, Francesco (Università degli Studi di Siena, Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente, Unità di Ricerca di Preistoria e Antropologia)

Abstract format: Oral

The end of the Middle Palaeolithic in Europe is marked by the emergence of major cultural shifts that are concurrent to the replacement of local Neanderthal populations by *Homo sapiens* between 50 and 40 thousand years ago (kya). This diversification of cultural trajectories at the end of the Mousterian affects different regions of Europe. The Italian peninsula is a key region because it attests to some of the latest evidence of Neanderthal occupation and the Uluzzian techno-complex related to *Homo sapiens* - which partially anticipated a wider technological replacement process that is later concretized with the onset of the Aurignacian industries.

Factors that have played a role in driving changes in Late Mousterian industries are hotly debated, as is the question of relationships between Europe's so-called transitional industries and the earliest Aurignacian industries.

During the last years, the Uluzzian has catalyzed the attention in discussions about the demise of Neanderthals and the arrival of *Homo sapiens* in Italy, overshadowing the lesser-known technological variability that characterizes the late Middle Paleolithic.

Here, we report the results of the stone tool technology from the latest layers preserved at Riparo l'Oscurusciuto in southern Italy (research directed by the University of Siena, DSFTA). These layers have been previously published as Late Mousterian on the basis of a preliminary techno/typological analysis of a small number of artifacts. Our analysis of the entire assemblage(s) shows the presence of original technological features that cannot be associated with the classical definition of Mousterian. In fact, several techno-typological aspects match with some slightly older lithic assemblages found in south-eastern France, namely, the Neronian techno-complex of Grotte Mandrin and surrounding sites. For the time being, the question of the meaning and origin of these similarities can lend themselves to different interpretations: technological convergences, population movement, or indirect contact.

13 THE EARLY UPPER PALAEOOLITHIC IN THE BASQUE CROSSROADS. THE FIRST STATION, CHATELPERRONIAN?

Abstract author(s): Arrizabalaga, Alvaro (Area de Prehistoria. Universidad del País Vasco - UPV/EHU) - Prieto, Alejandro - Calvo, Aitor - Dominguez-Ballesteros, Eder (Universidad del País Vasco - UPV/EHU) - De-Lombera, Arturo (Universidade de Santiago de Compostela - USC) - Libano, Iñaki (Edestiaurre Elkarte) - Sanchez, Aitor - Iriarte-Chiapusso, Maria (Universidad del País Vasco - UPV-EHU; IKERBASQUE Basque Science Foundation)

Abstract format: Oral

The Basque Crossroad is located on both slopes of the western Pyrenees and constitutes a critical region for understanding the settlement dynamics of the Iberian Peninsula by the *Homo sapiens*. Over the last thirty years, the sequence of the Middle to Upper Palaeolithic transition (45-33 ky cal BP) has been well defined in a succession of Mousterian, Chatelperronian, Proto-Aurignacian, Early Aurignacian and Evolved Aurignacian thanks to the stratigraphies of Gatzarria, Isturitz, Polvorín or Labeko Koba, among others. Due to the absence of human fossils in the stratigraphies, as mentioned earlier, the most relevant information is on the lithic industry and its evolution in terms of Raw Material procurement, Typometry, technological exploitation and classic Morpho-Typology.

Based on the controversial context of the Neanderthal burial at Saint-Césaire (France), the automatic ascription of the Chatelperronian industry to the last Neanderthals has been extended. At the same time, and despite the virtual absence of associated human remains, the Proto-Aurignacian and the whole Aurignacian have been assigned to the first groups of Anatomically Modern Humans. However, the lithic record in our regional environment shows an abrupt cut-off between the most recent Mousterian (50-45 ky cal BP, in sites such as Lezetxiki, Axlor or Arrillor) and the technological modes (in a broad sense) typical of the Chatelperronian. Likewise, the evolution between the Chatelperronian and the Proto-Aurignacian, wherever they stratigraphically overlap (Labeko Koba, Gatzarria or, outside the Basque region, Cueva Morín), shows traits of continuity. In this communication, we will propose a debate and reflection about the bases that should govern our taxonomic assignments and how we hierarchize the information from different fields, such as Evolutionary Anthropology and Material culture.

14

THE VIEW FROM THE WEST: RE-THINKING THE CHÂTELPERRONIAN THROUGH THE LENS OF THE EUROPEAN INITIAL UPPER PALAEOLITHIC

Abstract author(s): Djakovic, Igor - Roussel, Morgan - Soressi, Marie (Leiden University)

Abstract format: Oral

The Initial Upper Palaeolithic (IUP) complex is emerging as a key to understanding the eventual replacement of Neandertals by anatomically modern humans (AMH) across Eurasia. In Europe, IUP-type assemblages are increasingly being considered a proxy for the first AMH occupations in the region. Similarities in bone tools and personal ornaments between the IUP at Bacho Kiro and the Châtelperronian of Grotte du Renne (France) has been proposed as supporting some form of cultural influence by early European AMHs onto late Neandertal populations. Here, we present a point-by-point comparison of Châtelperronian lithic technology with what is known for the European IUP. We highlight that the Châtelperronian reflects a substantially more well-developed 'Upper Palaeolithic' lithic industry in all observable metrics and, in this light, discuss the relevance of this observation to current explanatory models for the onset of the Upper Palaeolithic in France and northern Spain.

We stress that questions concerning the 'origin' of the Châtelperronian and the emergence of the Upper Palaeolithic in this region must be re-framed and re-evaluated in the light of rapidly evolving genetic, paleoanthropological, chronological, taphonomic, and techno-cultural data. To this effect, we make the case that current conceptions surrounding the nature and origin of the Châtelperronian should be reconsidered – and that this is irrespective of the question of the biological author(s) of this industry. Finally, we conclude with a brief discussion on the relevance of geographic patterning in the development and consolidation of Upper Palaeolithic technological behaviours across Europe.

15

ARLANZIAN. A NEW INDUSTRY FROM INLAND IBERIA WITH INITIAL UPPER PALAEOLITHIC FEATURES

Abstract author(s): Sanchez Yustos, Policarpo (Universidad de Valladolid) - Marín-Arroyo, Ana Belén (Universidad de Cantabria) - Arnold, Lee (University of Adelaide) - Luque, Luis (Universidad de Alcalá de Henares) - Kehl, Martin (University of Cologne) - López Saéz, José Antonio (CCHS CSIC) - Carrancho-Alonso, Ángel (Universidad de Burgos) - Demuro, Martina (University of Adelaide) - Sanz-Royo, Alicia (Universidad de Cantabria) - Buckley, Michael (University of Manchester)

Abstract format: Oral

The Arlanzian industry found in interior Iberia calls into question prevailing views on the transition from the Middle Palaeolithic to Upper Palaeolithic in Southwestern Europe and sheds light on the intricacies of this process. This discovery is noteworthy for several reasons: (i) it pioneers the development of Upper Palaeolithic stone tool technologies in Iberia while still incorporating elements of the Middle Palaeolithic; (ii) it lacks a counterpart in Iberia, but has similarities with the Initial Upper Palaeolithic industries in Western Eurasia; (iii) it is located in the Iberian hinterland (Arlanza Valley), being the first and earliest industry with Upper Palaeolithic features found south of the Ebro Basin; (iv) it predates the end of the Mousterian in Iberia, including the bio-geographic region where it is located, suggesting that their makers might have coexisted with geographically close Neanderthal groups. Further research is required to fully understand the origin of the Arlanzian industry.

A MATTER OF TIME. HANDLING CHRONOLOGICAL DATA IN ARCHAEOLOGY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Scholtus, Lizzie (Institut für Ur- und Frühgeschichte, Christian-Albrecht-Universität; UMR-7044 Archimède, Université de Strasbourg) - Dumont, Léonard (Ghent University, Department of Archaeology; Université de Bourgogne, UMR 6298 ARTEHIS) - Nakoinz, Oliver (Institut für Ur- und Frühgeschichte, Christian-Albrecht-Universität; Johanna Mestorf Akademie)

Session format: Regular session

The notion of dating, chronology, phase or period has always been present in archaeology. From the very beginning of the discipline, archaeologists sought to classify their discoveries, but also to relate them to known texts and events for historical periods and then to the ages established by C. J. Thomsen for prehistory (Thomsen 1836). Even now every archaeologist must deal with chronological data.

Many systems were invented in Europe since the typo-chronological method was invented by O. Montelius (1899) and many still co-exist today (Roberts et al. 2013), making archaeologists work difficult when dealing with several cultural regions. Absolute dating can be provided thanks to various scientific methods (14C, dendrochronology, OSL...), but will not be able to replace relative chronologies completely for decades. It can be challenging to make sense of these multiple types of data coming from these different sources developed during the past century.

Although researchers have recently questioned the construction of these chronologies (Lehoërf 2008), or how to refine and improve them with the help of typo-chronology or absolute dating methods (Pare 2008), it seems to us that there is little questioning in the scientific literature about the very use of disparate chronological data or about the interactions between the different tools and methods in archaeological research. Furthermore, with the development of computer technology, archaeological data is becoming more numerous and heterogeneous, but can now also be used on much larger time scales or geographical areas more easily.

We wish to discuss the different forms that chronological data takes and the different techniques for processing and interrogating it. In particular, we aim to gain an overview of different kinds of chronological information, ways of structuring chronological data and formats for storing them as well as of approaches and software to handle heterogeneous chronological systems and information.

ABSTRACTS

1 CONTRIBUTION OF ORNATE BRACELETS TO THE CHRONOLOGICAL SYSTEM OF THE METAL AGES

Abstract author(s): Georges, Vincent (INRAP - National Institute for Preventive Archaeological Research) - Cayrol, Arnaud (Geosciences, Luxembourg)

Abstract format: Oral

Many geometric motifs are recorded on ornate bracelets (website: graphbz.eu ; Georges 2020). Throughout the Metal Ages, complex organizations are in mutation with different patterns emerging. With the knowledge of the absolute chronology, we can study these changes in real time at the scale of Europe. With ornate bracelets, we can see that all countries aren't active at the same time. It exposes some regional typo-chronologies. Our purpose is to show some of those movements from the Bronze and Iron Ages. The underlying idea deals with the distribution of wealth. The pursuit of historic truth requires us to locate the mobility of the spatio-temporal units subject to a particular form of prosperity somewhere on the absolute chronology scale.

- Georges 2020 : Vincent GEORGES, "Un exemple de référentiel graphique de l'âge du Bronze à l'âge du Fer : enjeux et méthodes appliquées à l'Europe", In : Veronica Cicolani (ed.), UISPP PROCEEDINGS SERIES VOLUME 9 – Mobility and Exchange across Borders : Exploring social processes in Europe during the first Millennium BCE, theoretical and methodological approaches UISPP XVIII World Congress 2018 (4-9 Juin 2018, Paris) Sessions XXXIV-4 and 5, Oxford, Archaeopress, 2020, p. 96-116.

2 ROBUST BAYESIAN ALTERNATIVES TO AORISTIC ANALYSIS

Abstract author(s): Crema, Enrico (University of Cambridge)

Abstract format: Oral

The prominence of dates-as-data approaches testifies to how the increasing availability of radiocarbon and other scientifically dated samples can promote new research agendas and bring life to legacy data. Yet, the majority of the archaeological records are still dated by attributing artefacts to periods and phases. From a methodological point of view, examining datasets with these relative chronologies can be challenging due to uneven granularity and uncertainty levels. The most commonly adopted solution to this problem is to employ the so-called Aoristic analysis, a technique initially developed in crime science that was introduced in archaeology nearly two decades ago that has recently seen an increasing number of applications. In its simplest form, aoristic analysis consists of defining a time-span of existence for each artefact and subsequently providing probabilistic weights to each observation based on the length of the time-span and the temporal resolution of interest. These weights are then often aggregated to produce time series representing changes over time in the frequency of particular artefacts. Aoristic analyses have, however, two significant limitations. Firstly, in contrast to its original assumption within crime science, chronological uncertainty in archaeology are not-random. Periods and phases can have substantially uneven durations, and even when aoristic analyses are employed, substantial shifts in patterns will inevitably match with transitions between the underlying relative chronology sequences (a problem known as modifiable reporting unit problem; see Bevan and Crema 2021). Secondly, aoristic-related analyses are non-inferential; they attempt to account for chronological uncertainty but do not consider the impact of sampling error. This paper will highlight the consequences of these limitations and advocate for an alternative approach based on Bayesian measurement error models. The robustness of this solution will be demonstrated via simulated datasets and a case study on the demographic impact of rice farming in prehistoric Japan.

3 HANDLING RELATIVE CHRONOLOGICAL DATA

Abstract author(s): Hillmann, Laurenz (Institute of Pre- and Protohistoric Archaeology, Kiel University) - Nakoinz, Oliver (Johanna Mestorf Academy, Kiel University)

Abstract format: Oral

Although, scientific dating becomes more and more important in archaeology, typological and relative dating is still relevant and will not be replaced in the next time. This leads to the problem of how to include this kind of chronological information in an optimal way in modern archaeological databases. This paper discusses some of the issues of storing relative chronological information in databases and offers a simple and still powerful solution. The solution is based on the experience with several archaeological databases and was developed for the Kiel Fortification Database in recent years.

First, different possible solutions including specific and complex data types are discussed and advantages, as well as drawbacks, are presented. None of these traditional solutions is simple and powerful at the same time. Either it is simple and not capable of storing a sufficient amount of information or it is too complicated to be useful. Besides the information about specific phases, the organization hierarchy of relative phases and the probability of being true of the information has to be considered. Furthermore, the system has to be capable of coping with different chronological systems.

The proposed solution is a text field containing a description using a simple description language for chronological information. This approach is similar to the well-known text format for geographical information for GIS. The text fields with this kind of description can be filed and analysed without specific software, but an R package that is developed along with the database allows for more efficient analysis.

We invite people to join this project and hope for helpful feedback.

4 THE ESSENCE OF TIME. TOWARDS A DEEPER UNDERSTANDING OF THE 14C PROBABILISTIC TIME DETERMINATIONS FROM ALBA IULIA-LUMEA NOUĂ SITE (ROMANIA)

Abstract author(s): Condurateanu, Marian - Gligor, Mihai (1 Decembrie 1918 Alba Iulia University)

Abstract format: Oral

Time is of the Essence in Archaeology since the advent of 14C determinations at the beginning of the second half of the XXth century. The abundant available radiocarbon data that can nowadays be easily modeled in sophisticated on-line environments is accompanying almost all literature being published in the field. What if there is more underneath those ubiquitous gray 14C graphics, what if we could extract more knowledge from the underlying data behind modeled and un-modeled time than we already do? What is their core meaning? What is the essence of probabilistic time?

Alba Iulia-Lumea Nouă, situated in the center of Romania, is a well-known Eneolithic site where a number of primary and secondary burials and mass graves containing a total of more than a hundred individuals of all ages and both sexes have been excavated between 2003 and 2019. The deceased, all belonging to the Early Eneolithic Foeni cultural group (4600-4400BC), were typically found in commingled human remains archaeological contexts, many of the skulls displaying evidence of perimortem trauma.

35 14C data from the human remains were used to build a time model and propose a new archaeological narrative of the site based on a novel methodology that relies on the determination of the absolute maximum probability year and exploits the intrinsic mathematical properties of the numeric data that lies beneath the well known calibration curves provided by OxCal.

5 IN SEARCH OF TIME LOST - CULTURAL TRAJECTORY IN THE COPPER AGE ON THE GREAT HUNGARIAN PLAIN

Abstract author(s): Ridge, William (University of Illinois at Chicago) - Gyucha, Attila (University of Georgia)

Abstract format: Oral

Archaeology traces past cultural change, commonly identifying discontinuities in material culture and treating them as chronological markers. This simple pattern recognition leads to the creation of distinctive cultures and well-defined periods that come to characterize regions. The cultures are joined together like pieces in a puzzle, regularly reconsidered and rearranged, particularly since the introduction of absolute chronological methods.

The basic story of this paper is simple and familiar to many. Recent radiocarbon dating studies have reshaped the chronology and refuted the traditional notion of temporally distinct cultural units on the Great Hungarian Plain during the first half of the Copper Age. While the Tiszapolgár and Bodrogkeresztúr cultures were previously believed to have occurred sequentially during 4500-4000 BC and 4000-3700 BC, recent studies have demonstrated remarkable synchronicity between the two units and placed them both between 4500-4000 BC (i.e., Early Copper Age). This

has not only complicated the relationship between the Tiszapolgár and Bodrogkeresztúr cultures but has also revealed a significant cultural break in many parts of the Great Hungarian Plain sometime during 4000-3600 BC.

In this paper, we take a multiscalar perspective to reconstruct the chronological and cultural trajectory of the Copper Age using data from sites in the Körös Basin of the Great Hungarian Plain collected systematically over the past two decades. First, we will outline the underlying dynamics that resulted in diverse cultural pathways between 4500 and 4000 BC. Then, we will examine how the existing evidence can be interpreted in light of the archeological gap in the first centuries of the 4th millennium BC.

6 SHORELINE DATING FENNOSCANDIAN STONE AGE SITES AND THE R-PACKAGE SHOREDATE

Abstract author(s): Roalkvam, Isak (University of Oslo)

Abstract format: Oral

Isostatic rebound resulting from the retreat of the Fennoscandian Ice Sheet has led to a process of continuous and rapid relative sea-level fall in large areas of Fennoscandia throughout prehistory. When this is combined with the observation that most coastal Stone Age sites in the region appear to have been located on or close to contemporary shoreline when they were in use, this can be drawn on to assign an approximate date to the sites, based on their elevation above the present sea-level. Since the early 1900s this method, also known as shoreline dating, has been widely applied. A new, probabilistic method for shoreline dating sites on the Norwegian Skagerrak coast has recently been published in Roalkvam (2023) and the accompanying R-package shoredate has been released (<https://cran.r-project.org/package=shoredate>).

This contribution will present how shoreline dating was operationalised in the paper, the assumptions underlying its application, and how these dates can be achieved and handled with shoredate. While shoreline dating is a well-known technique in Fennoscandian archaeology, it is useful to present the concept to a wider audience, as a host of questions pertaining to the method still remain to be explored. This concern issues relating to its applicability and reliability, future avenues along which to test, extend and improve it, as well as how the dates achieved with shoreline dating can be combined with other kinds of temporal data.

- Roalkvam, I. 2023 A simulation-based assessment of the relation between Stone Age sites and relative sea-level change along the Norwegian Skagerrak coast. *Quaternary Science Reviews* 299:107880.

7 NOT ALWAYS AS IT SEEMS: DIFFERENCES IN CHRONOLOGICAL DATA FROM AN IRISH CRANNOG

Abstract author(s): Barrett, Marie-Therese - Brown, David (Queen's University Belfast)

Abstract format: Oral

Various methods of dating are used to establish the chronology of a site. Any chronology is however constrained by the availability of datable material. Some sites are limited to artefact typologies whereas for others absolute dating can be achieved. While all chronological data is valuable it is not all equal making inter-site comparisons problematic.

Here we show how the chronological narrative of Drumclay crannog changes based on the different forms of dating. This waterlogged site was located in the north of the Ireland and has a chronology spanning the 9th to 17th century AD. The site was originally dated by artefact typologies and radiocarbon dating. A dated sequence was also obtained by dendrochronology of long-lived oaks. Tree-ring analysis of short-lived timbers used in the construction of the site, has provided an annual chronology of construction and occupation. This absolute chronology was achieved by combining different forms of chronological data including tree-ring analysis, radiocarbon dating, wiggle-match modelling and the identification of the 774/775 AD 14C spike.

The results of this multifaceted approach to chronology, has revealed the pace at which the site developed on a year by year basis. This provides an opportunity to test different types of chronological data against an absolute timeline. We will also consider the issues that arise when comparing inter-site chronologies composed of different types of chronological data.

8 EXPLORING DIFFERENT LEVELS OF TEMPORAL CHALLENGES IN IMPLEMENTING AN INFORMATION SOLUTION FOR AN INTERDISCIPLINARY RESEARCH ENVIRONMENT

Abstract author(s): Strohm, Steffen (Department of Computer Science, Kiel University - CAU) - Buening, Hartwig (Institute of Pre- and Protohistoric Archaeology, Kiel University - CAU) - Renz, Matthias (Department of Computer Science, Kiel University - CAU)

Abstract format: Oral

Digital research data management has accelerated in moving forward following the notion of Open Data and FAIR principles. Both of these concepts enable faster sharing of data as well as results, easier collaborations on the same

informational sources and opening more efficient ways for scientific work. Project or domain specific repositories for collecting research data have become popular tools in achieving these goals. The Collaborative Research Center (CRC) 1266 “Scales of Transformation” at Kiel University brings together experts from Archaeology, Archaeobotany, Computer Science, Ecology, Geography, Geology, Geophysics and more domains to identify and analyse transformational patterns in human-environmental interactions from 15000 BCE to 1 BCE. One special focus is the interdisciplinary usage of science data. For this purpose, a research data management solution was set up including a standardized meta data catalogue, adequate processes, roles and policies for the usage, retrieval and storage on basis of standardized data formats to assure best benefit for scientific work and fulfilling the FAIR principles. The presentation will show our two-step solution approach to set up an information system for these goals. First step was a science-focused data repository that meets the FAIR requirements. The second step is an integrational framework which enables researchers to select, merge, explore and analyze data sets from this repository. This raises challenges in identifying overlaps in space and time between data sets. While spatial information usually comes in a hand full of global or local coordinate notations, the temporal dimension is a tougher task. While a larger variety of chronologies needs to be translated when absolute dating is provided, there is also the challenge of relative dating which might only have one distinct or fuzzy reference point in any chronology based on absolute dating. We want to share our perspectives on these challenges and discuss our solution approach.

9 INTEROPERABLE DATA AND CHRONOLOGIES: SHARING ARCHAEOLOGICAL INFORMATION

Abstract author(s): Scholtus, Lizzie (XSCAPE Project on “Material Minds” - ERC 2020 Synergy Grant 951631; UMR-7044 Archimède, Université de Strasbourg; Institut für Ur- und Frühgeschichte, Christian-Albrecht-Universität) - Bernard, Loup (UMR-7044 Archimède, Université de Strasbourg)

Abstract format: Oral

The ArkeoGIS platform, and its open equivalent ArkeOpen, allows researchers to share their geo-referenced data and makes it interoperable by relying on a defined, precise and closed (though evolving) thesaurus. It applies the FAIR principles of open science by using open standards and norms, web semantics and Link Open Data to enable interoperability with other platforms and data accessibility.

The data shared on these platforms is by nature heterogeneous. It comes from different discovery contexts, different regions of the world, different chronological periods and sometimes even different research disciplines. While the establishment of a common descriptive thesaurus, although not obvious, does not pose specific insurmountable problems, the establishment of an interoperable chronological system, adapted to different levels of interpretation and which can be used by all users, has raised more questions.

The proposed solution consists of setting up a multi-chronological platform in which the user can select (to consult or share) the chronology closest to his or her study area and period. The switch from one chronology to another applies to all imported data and is also applied when querying by chronological phases. The elaborate system, based on absolute dating (whether precise, by range or even indeterminate), makes it possible to align heterogeneous data on different relative chronological models, thus enabling their sharing and interoperability.

477 WITHIN THE COST FOR PEOPLE AND EARTH: CLIMATE CHANGE AND ARCHAEOBOTANICAL HERITAGE

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Berihuete-Azorin, Marian (IPHES-CERCA) - Martín Seijo, María (Departamento de Ciencias Históricas, Universidad de Cantabria) - Kerfant, Céline (Universitat Pompeu i Fabra) - Piezonka, Henny (Anthropologische Archäologie Institut für Ur- und Frühgeschichte Christian-Albrechts-Universität zu Kiel)

Session format: Regular session

Climate change, with its expression in the current mounting climate crisis, is threatening life on Earth as we know it. It is already affecting millions of people, their environments, and livelihoods, with extreme weather events: drought and heat in some places; torrential rains and flooding in others. Beyond these devastating consequences for humanity and the planet, climate change as a hazard to archaeological heritage is a topic of concern among archaeologists and related professionals.

This especially impacts the delicate bioarchaeological remains at archaeological sites across different ecological zones. Droughts affect the valuable record kept by waterlogged materials, whilst the accelerating thawing of permafrost results in the loss of invaluable archaeological and archaeobiological remains. The endangered materials include organic plant debris that constitute invaluable and irreplaceable archives for past plant use, management, and roles in diverse – and often sustainable – economies.

As specialists in archaeobotanical heritage, we must prepare to fight this situation BY identifying and initiating courses of action. Firstly, we need to develop a plan to protect the information deposited IN these archaeological archives:

Where do we have to intervene most urgently, how much time do we have until it is too late? Secondly, a better understanding of how past communities dealt with climate change may strengthen our own resilience and ability to cope with it. In this respect, reference to Traditional Ecological Knowledge of today's Indigenous and descendant communities in different ecozones (e.g., nurturing of the local biodiversity) is an essential pillar. Finally, this archaeobotanical and climate change binomial also has a logistical dimension: How are we going to face the increase in conservation costs?

Archaeologists and other scholars wishing to contribute on any of these topics are welcome to submit their proposals for oral and poster communications.

ABSTRACTS

1 **ARCHAEOBOTANY IN AN ERA OF CHANGE AND CHALLENGE: FRUITS OF THE PAST, SEEDS FOR THE FUTURE**

Abstract author(s): Berihuete-Azorin, Marian (Department of Prehistory, Autonomous University of Barcelona - UAB; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Kerfant, Cèline (Department of Humanities, Universitat Pompeu Fabra) - Robledo, Andrés (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Burguet, Aitor (Department of Archaeological Sciences, Faculty of Archaeology, Leiden University; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Revelles, Jordi - Garay, Blanca (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Rodríguez-Antón, David (Department of Prehistory, Autonomous University of Barcelona - UAB; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Fernández Iriarte, Tomás - Expósito, Isabel - Speciale, Claudia (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art)

Abstract format: Oral

Current dramatic climate events are affecting the integrity of archaeological heritage. Archaeobotanical record, already fragile by nature, is especially sensitive to these processes and to the broader changes in temperature and precipitation that are rapidly generalizing. One of the consequences is the irreparable loss of precious information about past economies and human-environment interactions. However, beyond that, this information has the potential to inform us on questions relevant for the present and the future.

In the first place, this information may help us understand how past communities have coped with climate changes in the past and which resilience mechanisms they developed regarding plant use and management. In the second place, this can serve as a basis to rethink our economic system and implement new circuits and networks to face current challenges and mitigate their consequences (e.g., re-adopt forgotten crops, implement circular economy models).

In this work, we intend to offer a thoughtful insight into the potential of the main proxies of Archaeobotany to shed light into the above-mentioned questions, which knowledge we will lose by losing the chance to study them and what people are already doing to preserve this information. At the same time, we call for action to milder the effects and fight against climate change and, finally, we want to draw archaeologists' attention into the importance of sampling and recovery to protect archaeobotanical heritage.

2 **THE IMPORTANCE OF COLLECTING PHYTOLITH SAMPLES IN BOTH CHINESE AND AUSTRALIAN ARCHAEOLOGICAL PLACES**

Abstract author(s): Bestel, Sheahan (Independent Researcher)

Abstract format: Oral

Archaeological heritage is under threat worldwide due to factors ranging from climate change to urbanisation. It is vital that we preserve archaeological objects and places before they are gone for good. Archaeobotanical remains such as phytoliths may preserve evidence of foods gathered in archaeological sites or processed around campfires, or may represent the local environment. Phytoliths can provide possible evidence of grain or crop preparation and processing including of rice in southern China, and of *Setaria* or *Panicum* millets or other gathered or wild foods in semi-arid Australia. Sediment samples from which phytoliths may be extracted are not always collected and, if collected, may not always be processed: the valuable information that may be gained from microscopic paleoenvironmental information is sometimes overlooked. Phytolith remains in particular can be quite susceptible to changing climatic or environmental conditions such as rising lake water levels. I will discuss how climate change and urbanisation can impact preservation and recovery of phytoliths in both Australia and China in semi-arid and waterlogged sites.

3 SEEDS LOST AND FOUND – AND LOST AGAIN?

Abstract author(s): Lempiäinen-Avcı, Mia - Koivisto, Satu (University of Turku)

Abstract format: Oral

People have changed the environment, utilised vegetation and influenced biodiversity throughout the history. Due to human activity, plant and animal species around the world are steadily disappearing. It has been predicted, that if we do not manage to flatten the curve of biodiversity loss, there will be e.g. widespread hunger.

The rapid collapse of ecosystems has been recognised as a significant crisis for archaeological heritage. Therefore, the (pre)historic botanical information is also in danger to get lost. However, archaeobotanical research is among the fundamental tools to study interactions between humans and nature. Anthropogenic soils form paleo-archives, which provide excellent long-term data for biodiversity research. Therefore, surviving archaeological plant finds and the data they contain should be studied systematically from the excavations before we lose that material. This botanical information is vital to safeguarding our current natural resources and to addressing present and future ecological challenges, for example in food production.

The aim of this talk is to present the archaeobotanical results from a Neolithic wetland site (6000-2000 cal BC) in Humpilla, Finland, where contemporary drainage works have threatened the preservation of unique archaeological finds and well-preserved paleo-archives. Also, this presentation discusses the solutions that archaeobotanical finds can give to future demands of resilient plant-based food production.

4 JUA HERBARIUM ETHNOARCHAEOLOGICAL COLLECTION AS A KEY COMPONENT FOR SOUTH-CENTRAL ANDES BIOCULTURAL HERITAGE CONSERVATION AND SAFEGUARDING

Abstract author(s): Musaubach, Maria (National University of Jujuy; Institute of Andean Ecoregions - CONICET-UNJu) - Sato, Héctor (Cátedra de Botánica General – Herbario - JUA, Facultad de Ciencias Agrarias - UNJu)

Abstract format: Oral

This paper analyzes the key role of biocultural collections for archaeobotanical research and their potential usefulness in generating actions to reduce the effects of the climate crisis and related issues. JUA Herbaria („Jujuy-Agronomía“) is situated at the Agrarian Science Faculty (UNJu) since 1981. It is registered in the Index Herbariorum and belongs to the Argentinian National Network of Biological Collections. Recently, it has started an Ethnoarchaeological Collection which has initiated as a small local collection with the purpose of safeguarding the biocultural heritage, systematizing and disseminating the traditional knowledge associated with Andean Crops and their foodways. Specimens of Andean Crops are collected through ethnobotanical and ethnoarchaeological approaches. The knowledge and culinary practices related to the collected specimens are also studied. So far the collection is composed of several genera of Andean Crops, either in their natural state or as culinary preparations elaborated from them. In dialogue with the people who are the bearers of this heritage, we generate actions that enhance the valorization, safeguarding and visibility of the elements of the Culinary Cultural Heritage of the Quebrada de Humahuaca, including nutritional aspects of the culinary products of the Quebrada, as well as symbolic, ideological and socioeconomic aspects. By systematizing the collection and the reference material, we achieved greater precision in the archaeobotanical identification of archaeological remains of preparations based on Andean plants, and the foodways. In addition to the usefulness of this comparative material for archaeobotanical work, its description, recording and publication in repositories allow us to catalog and add value to this community heritage.

5 MONITORING THE IMPACT OF WATER-TABLE FLUCTUATION ON THE WATERLOGGED LAYERS OF LA DRAGA (BANYOLES, SPAIN)

Abstract author(s): Piqué, Raquel (Universitat Autònoma de Barcelona) - Andreaki, Vasiliki (Archaeology of Social Dynamics group, Institució Milà i Fontanals, CSIC; Departament de Prehistòria, Universitat Autònoma de Barcelona) - García, Irene - Palomo, Antoni (Departament de Prehistòria, Universitat Autònoma de Barcelona) - Rabago, Daniel (Universidad de Cantabria; Archaeology of Social Dynamics group, Institució Milà i Fontanals, CSIC) - Terradas, Xavier (Archaeology of Social Dynamics group, Institució Milà i Fontanals, CSIC)

Abstract format: Oral

This research takes part of the European project „Woodpdlake. Archaeological Wooden Pile-Dwelling in Mediterranean European lakes: strategies for their exploitation, monitoring and conservation“ (JPICH Conservation and Protection Call), whose main objective is to evaluate the impact of climate change on the preservation of lacustrine sites in the Mediterranean area, paying special attention to the agents and processes of degradation of organic materials. In the frame of the project several actions have been carried out for monitoring the water table fluctuation on the shore of Lake Banyoles and its effect on the waterlogged layers of the Early Neolithic of La Draga (Banyoles, Spain). La Draga site has provided an outstanding sample of organic remains dated 5300-4900 cal BC, however the conservation of organic materials is determined by the proximity of the archaeological layers to the lake and the fluctuation

of the water table. Understanding how this fluctuation affect at the different areas of the site is crucial for determine the future excavation programme as well as for developing strategies of on-site conservation. In this paper we present the first result of the data gathered trough the probes placed at the site to monitor the water-table fluctuation and thus determine the risk of degradation of the layers with organic material.

6 CAN ARCHAEOBOTANY AND ARCHAEOLOGY GROUND A PROJECT TO PROMOTE CIRCULAR ECONOMY AND BIODIVERSITY? THE INTERTWINED PROPOSAL

Abstract author(s): Martin Seijo, Maria (Universidad de Cantabria) - Berihuete Azorín, Marian (Universitat Autònoma de Barcelona)

Abstract format: Oral

Traditional forms of ecological knowledge and craft practice should be at the centre of the current debates about biodiversity preservation and circular economy. INTERTWINED is focused on direct and indirect archaeological evidence of basket- and cordage-making using plant-based materials from Western Mediterranean and dated between Iron Age (IA) and Early Roman Empire (ERE). By focusing on these craftworks, we will try to deepen our understanding on the intertwined relationship among people, plants, and crafts. This multi- and interdisciplinary project integrates archaeological, ethnographical, and ethnobotanical evidence with the experimentation developed by artisans. It seeks to promote research, development and innovation applied to the conservation and sustainability of the important archaeological, historical, cultural and social heritage of the Iberian Peninsula, with the specific focus on crafts and raw plant materials. This investigation will contribute to the social and economic development of the territories under study, mostly rural areas affected by ageing and depopulation, by combining archaeological and ethnobotanical research, experimentation and artisanal work. The objectives are aligned with the transition to a circular economy, it will foster activities aiming at (1) increasing the durability, reparability, upgradability or reusability of products, in particular in designing and manufacturing activities; and (2) raising of the recyclability of products. In alignment with the European Cultural Heritage Green Paper (ICOMOS 2021) by incorporating social and cultural aspects to the circular economy actions additional benefit of enlisting Europe's robust, human-centred culture and heritage sectors as co-creators of a cleaner and more sustainable Europe. Most of the plant-crafts also require a careful management of crops, woodlands or scrubland areas, and the application of silvicultural practices well documented ethnographically and archaeologically. The efficiency in the use of resources and raw materials could be improved by recovering ancient silvicultural practices and plant cultures that could eventually increase biodiversity.

480 METALS AND METALWORKING I - ARCHAOMETALLURGICAL NARRATIVES OF THE COPPER AND BRONZE AGES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Wärmländer, Sebastian (Stockholm University) - Saage, Ragnar (Tartu University) - Kurisoo, Tuuli (Tallinn University) - Wrobel Nørgaard, Heide (Moesgård Museum) - Kmošek, Matěj (Institute of Archaeology of the Czech Academy of Sciences)

Session format: Regular session

Archaeometallurgy is a multidisciplinary field where researchers from different fields, and different traditions, come together to answer questions related to ancient metals and metalworking. Most research in this field is based on metallurgical analysis, but studies involving experimental archaeology or isotope characterization for material provenance are also common. For this session we welcome full-length papers on archaeometallurgy of the Copper and Bronze Ages. In line with the overall theme of the 2023 EAA meeting, i.e. "Weaving Narratives", our aim is to focus on how metals, metalworking, and related technologies have contributed to the narratives of the Copper Age and the Bronze Age. "Narratives" should here be interpreted in a broad sense, both as the stories that we create about the past, and as the stories that past societies have created themselves. As there are many ancient stories and myths involving metals and the transformation and creation of metals, we especially invite researchers that involve literary and ethnological sources in their research. As many analytical tools have become an inseparable part of modern research, we welcome papers focusing on new methods and interesting materials. Contributions from all geographic regions are welcome, and we encourage students and young researchers to present their research projects.

1 NETWORKS AND WORKSHOPS IN BRONZE AGE SOUTHERN SCANDINAVIA: METALLURGICAL VIEWS OF FOREIGN AND LOCAL AT EUROPE'S NORTHERN FRINGE

Abstract author(s): Noergaard, Heide (Moesgaard Museum, Department of Archaeology)

Abstract format: Oral

Isotope-related research has changed our view of the Bronze Age. Lead isotopic investigation of metal artifacts revealed that Southern Scandinavia was not exploiting its copper sources; instead, it was importing metal via large-scale exchange networks from the establishment of the Bronze Age 2000 BC onwards. Though, our knowledge concerning the extent and directions of the trade is restricted from the moment that craftspeople intentionally mix, reuse and recycle the needed metal. Although in work, the necessary methods that can ignore the factor of human impact are not yet available, and time-traveling still is just a wish. But perhaps we just have asked the wrong questions? Maybe, the origin of the raw material alone won't allow us to understand the networks and relations behind metalwork. We know only little about the organisation of these contact networks and can only assume the importance of ambassadors in creating these contacts. It could be much more important to understand whether contact networks are established at a regional or national level. And whether the supply of raw materials is organised centrally or individually.

This presentation aims to present the results of several projects that applied a mixed-method approach to lead isotope data to understand workshop-specific networks in the Scandinavian Bronze Age. The question in focus is not provenance-oriented and will not shed light on the networks' starting point and extent. The focus of this presentation is the question of what is foreign and what is local from a regional and national perspective.

2 EMERGING PATTERNS IN LATE BRONZE AGE COPPER SUPPLY & ALLOY PRODUCTION IN CENTRAL BALKAN HOARDS

Abstract author(s): Mittermair, Nicole - Gavranović, Mario (Austrian Archaeological Institute) - Mehofer, Mathias (Vienna Institute for Archaeological Science; Human Evolution and Archaeological Sciences, University Vienna)

Abstract format: Oral

Late Bronze Age Balkan metallurgy within the general archaeometallurgical discipline still draws comparably little research attention. In scope of this presentation, we discuss Late Bronze Age (ca. 1400 to 900 BC) copper-based artefacts from hoards situated in the Central Balkans (Serbia) in light of new data. The paper aims to contribute significantly to the existing knowledge of Late Bronze Age metal circulation and alloying practices within this region by exploring metal compositions of finished products through analysis of minor and trace elemental contents and lead isotope ratios (ED-XRF, MC-ICP-MS).

The generated project results attest to the south-eastern Alpine area as predominant source of consumed copper. Such an intensively operated copper-supply network reaching this far west was not anticipated, especially since the cross-cultural trading lasted over centuries in spite of nearer resources available. Moreover, the raw material seems to have been used for artefact types with regional as well as supra-regional distribution.

The hoard context also allows to observe hoarding practices in detail by looking beyond archaeological and typological information. Investigations on site-specific metal composition of artefacts, shed light on distinct Bronze Age manufacturing processes, more specifically alloying. Thus, allowing conclusions to be drawn on production backgrounds of hoarded objects and enabling a better understanding of prevailing prehistoric crafting habits.

3 TRACES OF LOCAL COPPER METALLURGY IN THE COPPER AGE OF THE CARPATHIAN BASIN - INTERPRETING THE TRANSMISSION OF METALLURGICAL TECHNOLOGY

Abstract author(s): Siklósi, Zsuzsanna (Eötvös Loránd University, Institute of Archaeological Sciences, MTA-ELTE Lendület „Momentum“ Innovation Research Group) - Virág, Zsuzsanna (Budapest History Museum) - Villa, Igor (Institute of Geology, University of Bern; Centro Universitario Datazioni e Archeometria, Università di Milano Bicocca) - Nisi, Stefano (Laboratori Nazionali del Gran Sasso, Istituto Nazionale di Fisica Nucleare, L'Aquila) - Mozgai, Viktória - Bajnóczi, Bernadett (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences, Eötvös Loránd Research Network - ELKH) - Kraus, Dávid - Szilas, Gábor (Budapest History Museum)

Abstract format: Oral

The Early and Middle Copper Age of the Carpathian Basin (4500-3700 cal BCE) is the heyday of copper metallurgy. During the first half of the period, a wide variety of copper artefacts with high raw material requirements were unearthed as grave goods or as part of a hoard. They are primarily concentrated in areas of the Great Hungarian Plain and the Transdanubia, far from potential sources of raw materials. In present-day Hungary, the first definite finds of

local metallurgy, smelting crucibles and slag remains are known from the Middle Copper Age Hunyadihalom, and Furchenstich contexts. The question arises: how did the communities living here gain access to this technological knowledge? Where did the raw material they processed come from? Are there antecedents of this technology in the previous era? How can we reconstruct the flow of information and the process of knowledge transfer? We will try to find answers to these questions by combining lead isotope and chemical compositional analyses with radiocarbon dating based on new archaeological finds.

The project is financed from the NRD Fund (NKFI-FK-124260 'The spread of the products and technology of metallurgy in the Carpathian Basin between 5000 and 3000 BC' PI: Zsuzsanna Siklósi).

4 METALLURGICAL PRACTICES IN THE AEGEAN DURING THE EARLY BRONZE AGE: THE CASE OF THE UNDERWATER HOARD OF RHODOPE PREFECTURE

Abstract author(s): Nikolopoulou, Athina (National and Kapodistrian University of Athens; NCSR „Demokritos“) - Filippaki, Eleni (NCSR)

Abstract format: Oral

A significant number of archaeological finds were discovered in 2008 by the Ephorate of Underwater Antiquities in the sea area of Rhodope Prefecture in northern Greece. A total of 116 metallic tools, 23 ingots, and two ceramic bases dating to the Early Bronze Age are contained within this assemblage, which is considered to be an important discovery for the Aegean region.

An archaeological study of the finds was conducted by the Ephorate of Underwater Antiquities. In the meantime, the Palaeoenvironment and Ancient Metal Studies Laboratory of NCSR “Demokritos” has initiated an archaeometric investigation of the hoard. Preliminary analyses were conducted on 64 objects using the non-destructive XRF method in order to determine their constituent elements. Based on the analyses, copper was used along with arsenic in various amounts, as well as zinc, antimony, and lead in minor quantities. As a second step, 41 samples were collected from 32 finds (19 tools and 12 ingots). The samples were examined under an Optical Microscope, and their chemical compositions were determined using a Scanning Electron Microscope (SEM-EDS). As a next step, the samples were etched with a ferric chloride solution, recommended for ancient copper alloys, to examine the microstructure of the tools and understand how they were manufactured. Additionally, a microhardness test was also conducted on the samples in order to determine their durability and functionality.

The purpose of this presentation is to provide a brief overview of the preliminary results of the archaeometric analyses and observations made on the samples collected. This study will draw conclusions regarding the production processes and raw materials used in northern Greece during the Early Bronze Age.

5 METAL RECIPES TRADITIONS AMONG COASTAL COMMUNITIES OF NORTHWEST IBERIA: ALLOY TRENDS DURING LATE BRONZE AGE AND EARLY IRON AGE

Abstract author(s): Gómez Faro, María - Sureda, Pau - Armada, Xosé-Lois (Incipit-CSIC)

Abstract format: Oral

Palstave hoarding is a widespread social practice among indigenous communities of north-western Iberian Peninsula during the Late Bronze Age. In this presentation we have studied the most significant palstave assemblages found in the coastal region of northwest Iberia.

X-Ray Fluorescence analyses have revealed interesting trends in the alloy selection used in the manufacturing of these artefacts. On the one hand, copper-tin alloys are usually chosen for the manufacture of the archaic type, single-looped palstaves, like the ones present in the Mougás hoard. On the other hand, there are two types of double-looped palstaves where the most regular chosen recipes are made with copper, tin and high amounts of lead. In contrast to what was expected, while Samieira and Noalla hoards follows this pattern, Estea hoard have revealed a variety of different alloys. The heterogeneous alloys compositions present in Estea Palstaves set are: copper-tin, copper-lead, copper-tin-lead alloys and a copper palstave.

Northwest peninsula, where some researchers place the Cassitérides classical sources, is one of the regions linked to the Tin Route used during Phoenician period. Could be this change in the metalwork local recipes pattern related with the arrival of new Mediterranean contacts to northwest Iberia?

6 USE OF ARCHAEOMETRY IN TRACING PYROTECHNOLOGICAL ADVANCEMENT OF HARAPPANS IN GHAGGAR REGION, INDIA

Abstract author(s): Singh, Garima (Deccan College PGRI - Deemed to be University) - Manjul, Sanjay (Archaeological Survey of India) - Parmar, Narendra (Central University of Harayana)

Abstract format: Oral

The development of pyrotechnology in protohistoric (Chalcolithic) India has led to a paradigm shift in scientific analysis. A century of Harappan research in the Indian subcontinent culminated in the discovery of two small Harappan settlements in Northern India: Binjor 4 MSR and Tigrana. Archaeometric analysis has greatly aided in tracing the origins of the raw materials used in the site's craft production. Numerous crucibles and slag have been discovered on the site of Binjor, along with kilns and furnaces, indicating the mass production of terracotta and metal objects.

The paper discusses the findings of a chemical analysis of vitrified crucible and copper slag reported from the Harappan site of Binjor 4 MSR and Tigrana. Utilizing Scanning Electron Microscopy Energy Dispersive Spectroscopy (SEM-EDS) and Raman Spectroscopy for compositional analysis and structure measurement of slag collected from the furnaces and Kilns, two distinct types of slag were considered belonging to Bronze Age (Chalcolithic). It deals with non-ferrous metallurgy depending upon the smelting slags and crucible slag collected from these two Harappan sites in northern India.

This analysis's collected data has been considered for cross-cultural analysis of contemporary sites in the region. The paper will discuss the analysis in greater detail in order to trace the hinterland and international trade links among these small rural Harappan settlements.

7 IDENTIFYING SILVER-COATED SURFACES ON EARLY BRONZE AGE AXES FROM BOHEMIA

Abstract author(s): Schimerová, Eva (University of Hradec Králové) - Havlíková, Markéta (Masaryk university Brno) - Msallamová, Šárka (University of Chemistry and Technology Prague) - Bláhová, Zuzana (University of Hradec Králové)

Abstract format: Oral

Our multi-method analysis was focused on two Early Bronze Age hoards of axes from Eastern Bohemia, Czech Republic. Both hoards were analyzed by electron and reflected-light microscopy to determine their elemental composition, surface topography and metalwork wear analysis. All measurements were taken from the surface, as only non-destructive research was allowed. We took advantage of minor defects caused by post-depositional processes to measure the elemental composition. The results showed different types of copper alloy. Metalwork wear analysis showed that the majority of axes were actively used for various purposes. The most interesting finding was residues of silver and in one case gold on the surface of the axes. These were interpreted as secondary coating, which was unfortunately preserved in a very fragmental state. Although some silver artefacts from the same period have been uncovered in Bavaria, none are known so far from Bohemia. Obtained results provide information about the composition, use and manufacture of the axes without the necessity of disturbing the core, in cases it is not an option. The research was possible thanks to the artefacts not being conserved. One of the results of our research is pressure to re-evaluate the necessity and scale of conservation of artefacts from copper and copper alloys.

8 EARLY AND MIDDLE BRONZE AGE GOLDEN SPIRAL RINGS FROM POLISH LANDS

Abstract author(s): Rataj, Karolina (University of Warsaw - Faculty of Archaeology)

Abstract format: Oral

Spiral rings made from gold are category of materials found in inventories, in various cultures, throughout practically all of Europe, since the Neolithic period. Being the so-called prestigious items, they served as determinants of high social status of the people who owned them. They were used as ear, finger or lock rings – as hair fastener, or headband applications.

On the Polish lands in the Early and Middle Bronze Age they appeared relatively rarely. Currently, no more than several dozen golden rings have been discovered at funerary sites, in hoards or as loose finds, located in various regions of the Polish lands, belonging to different cultures, with varying degree of metallurgy development. They represent various types and forms, were formed both from golden wire and tape and have differently shaped ends. Despite this rarity of occurrence, not all of these artefacts have been analysed in great detail.

The research focuses on the issue of Early and Middle Bronze Age golden spiral rings from Polish lands, their production, use and manner of wearing. During them, non-invasive analysis have been conducted on selected artefacts, including XRF and SEM-EDS and analysis under traceological microscope. The use of such methods makes it possible to find answers to crucial questions such as: What is the elemental composition of artefacts? – qualitative and quantitative analysis of elements contained in the tested metals; What was the technique of production of the mentioned rings and was it the same for artefacts from different sites? – observation of technological and production

differences of the tested items; Are there traces of use on the artefacts? – whether in the grave were placed worn spiral rings or not.

482 MEGAPROJECTS AND HISTORIC ENVIRONMENTS: A SUSTAINABLE ROAD MAP TO MEGA LEGACY?

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Plunkett, Emily (High Speed Two - HS2; MCIfA Chartered Institute for Archaeologists - ClfA; Transport Infrastructure Ireland) - Aitchison, Kenneth (Landward Research; Federation of Archaeological Managers and Employers - FAME; University of Liverpool) - O'Flaherty, Enda (Rubicon heritage; Red River Archaeology) - Wink, Karin (Arcadis Netherlands) - Schweitzer, Holger (Jacobs, Suedlink)

Session format: Regular session

Megaprojects are transformational temporary engineering projects, characterized by large investment, vast complexity, and long-lasting impact on the economy, environment, and society.

This session, organised by: Landward Research, TII, Arcadis Netherlands, HS2, Rubicon Heritage, Jacobs, and Red River Archaeology, will examine the interconnectivity between infrastructure projects and finite heritage resource.

Examples of megaprojects include: the TII programme, Suedlink, Canal Seine Nord Europe, Heathrow T5, HS2, Dike reinforcement Afsluitdijk, LUAS Dublin, and ViA15 Highway Netherlands.

However, projects which leave mega-legacy don't have to be mega in size. Smaller agile investigations can also yield mega-impact.

Such projects provide the opportunity to continually improve on:

- Innovation
- Sustainability and green procurement
- Cross disciplinary cooperation
- Practice and management
- Holistic approaches to heritage (landscape, monuments, geography)
- Learning lessons and seeking opportunities for improvement

These opportunities should allow for long-term sustainable transformation of our industry and heritage management by building skills, capacity, and inter-institutional communication while also conserving heritage infrastructure and landscapes.

Many megaprojects will be publicly funded and as such pressure is always present to ensure value and sustainable outcomes for the people who are both funding and benefiting from the project. Long term change can be challenging to affect even through the largest projects and often there is a need to recognise the benefits derived will be realised in the future. These pressures drive innovation and the adaptation of new approaches to manage the challenges and scale of these projects.

Bearing this in mind:

- How do we deliver our works to maximise our impact?
- How can we understand the challenges and opportunities of megaprojects?

This session invites papers which examine the practice and management of delivering sustainable heritage works or which offer case studies about:

- Approaches before or during investigation programmes
- Lessons learnt
- Challenges and how these were overcome
- Threats and opportunities of sustainable heritage

ABSTRACTS

1 A LINE TO LEITH: THE ARCHAEOLOGY OF TRAMS TO NEWHAVEN

Abstract author(s): Lawson, John (City of Edinburgh Council; ALGAO:UK)

Abstract format: Oral

This paper explores the archaeology of the Trams to Newhaven project, managed by the City of Edinburgh Council Archaeology Service and undertaken by GUARD Archaeology between 2019 & 2023. This City of Edinburgh Council project is the culmination of the Edinburgh Trams programme (instigated in 2003) which has seen the construction of a new light rail line linking Edinburgh's airport in the west, through the city centre, to its port of Leith in the north.

The project has proven to be one of the largest and most controversial infrastructure projects ever undertaken in Scotland, which has been constantly and literally in the public eye, given its urban location. However, the programme has uncovered nationally important archaeological remains none more so than during the current project which has provided new evidence for the port's Napoleonic defences, the 19th century cable tram system and most significantly the excavation of a section of South Leith Parish Church's medieval kirkyard undertaken whilst dealing with the challenges presented by the COVID-19 pandemic.

2 ARCHIVING HIGH SPEED 2: LESSONS IN PRESERVING AND DISSEMINATING DATA FROM A MEGAPROJECT

Abstract author(s): Zoldoske, Teagan - Green, Katie (University of York; Archaeology Data Service)

Abstract format: Oral

Over the past three years the Archaeology Data Service (ADS) has been undertaking the long-term preservation and dissemination of the digital data from the archaeological investigations undertaken as part of the UK's High Speed 2 (HS2) railway infrastructure development project. It is estimated that the HS2 project will deposit 15 TB of data in total; this is by far the largest single project dataset ever deposited with the ADS. The vast scale of the dataset and the complex nature in which the data was collected by multiple different archaeological sub-contractors brings with it both challenges and great opportunities.

This paper will look at the challenges that ADS has faced preserving, disseminating and aggregating such a large and disparate dataset. Highlighting the lessons ADS has learnt as a result of the challenges faced, and reporting on how these lessons are being integrated into the next stages of the HS2 project. This paper will finish by looking forward to how the legacy of HS2 and the lessons learnt will reach beyond the HS2 project to benefit future projects of any scale.

3 SUEDLINK-HESSE: ARCHAEOLOGICAL WORK WITHIN A MEGAPROJECT OF GERMANY'S "ENERGIEWENDE"

Abstract author(s): Schneider, Jan - Misterek, Daniel (SPAU GmbH)

Abstract format: Oral

SuedLink, as a key infrastructure project of the German "Energiewende", involves the construction of the longest underground power cable of the world with a length of more than 700 km across five federal states from northern to southern Germany, crossing five federal states. This technically demanding project is also to be considered a mega-project from an archaeological point of view. SPAU GmbH has been commissioned by TransnetBW GmbH since 2020 to carry out preparatory archaeological work in the approximately 60 km long section through the federal state of Hesse.

In the course of this work, the evaluation of remote sensing and archive data, the planning and execution of non-invasive surveys, the archaeological monitoring of the subsoil investigations and the planning of invasive surveys have been carried out in several stages so far. The work was always carried out with the involvement of the client, the heritage management and the engineers in order to profitably incorporate the results into the technical design of the cable trenches.

The presentation by the two project managers Jan Schneider and Daniel Misterek will provide an overview of the work carried out, the methods used and the cooperation between the various parties involved. It will also address the opportunities and challenges of commercial archaeology in the working environment of such a mega-project.

4 WORKING AT THE SHARP END - DELIVERING ARCHAEOLOGY FOR THE HS2 (CENTRAL) ENABLING WORKS

Abstract author(s): Collard, Mark (Red River Archaeology; Infar JV)

Abstract format: Oral

Infra JV (Rubicon Heritage (Red River Archaeology) and Network Archaeology) worked as an archaeological contractor on the HS2 Enabling Works Contract Archaeological Framework for Phase 1 Central, the largest single archaeological delivery project in the UK to date.

Working for Fusion JV on behalf of HS2 Ltd from 2018 to 2022 Infra JV successfully delivered 20 individual mitigation works packages across 35 separate sites, to a value of £20 million delivering more than 1100 evaluation trial trenches, 24 ha of mitigation excavation, 2500 test pits, and more than 75 post-excavation reports. All works were delivered to HS2 Technical Standards including the Historic Environment Research Design Strategy (HERDS), working closely with the clients' archaeological and engineering teams. We developed a strong systematised, experienced management and organisational structure to specifically deliver HS2 related works to the required high quality.

The project required new ways of working, to different scales of operation for the archaeological contractors involved, with new responsibilities and requirements. Flexibility, mobility and innovation for organisational cultures and structure proved essential. Uninterrupted delivery of most of the main works through the Covid 19 pandemic brought additional challenges to traditional ways of working.

The project could only be delivered through collaboration, breaking down traditional barriers between actors and stakeholders in the archaeological process, and working across the client/contractor/sub-contractor commercial relationships to ensure that the key aim was met - the best quality archaeological work, delivered to time and budget. Trust and respect across the whole team were vital to that and a 'Right first time' culture was fundamental.

We will examine what had to change to make this happen, staff development and growth, the lessons learnt (good and the less good), how the whole was greater than the sum of its parts and show the exceptional quality of the archaeological results obtained.

5 TII ARCHAEOLOGY AND HERITAGE: REFLECTING ON TWENTY YEARS OF IMPACT AND LESSONS FOR FUTURE ARCHAEOLOGICAL PROJECTS

Abstract author(s): Swan, Ronan (TII)

Abstract format: Oral

In the context of Transport Infrastructure Ireland's (TII) experience on national road and public transport projects, TII has developed a nuanced and purposeful approach to the management of archaeology and heritage, which recognises the legislative and regulatory context, the need to manage risk, and the fundamental importance of building public trust.

This presentation will briefly outline TII's approach to archaeology and heritage, with a particular focus on ensuring that heritage works are delivered to a high standard throughout the lifespan of a project and that the results are accessible to different audiences ranging from the local community to international researchers.

It will then concentrate on some of the impacts from TII's programme of works in terms of:

- providing a sustainable model and template for the management of archaeology and heritage, through the development of standards, guidelines, and contracts,
- improving our understanding and knowledge of particular periods and particular site types,
- creating structured approaches to the dissemination of these results, and,
- enabling significant research, either through TII's own research initiatives, collaborative projects, or making data available to major research projects.

Collectively, these impacts provide a model for realising a Mega Legacy.

6 CULTURAL HERITAGE MANAGEMENT AND BIG INFRASTRUCTURE PROJECTS - EXPERIENCES FROM SOUTHWEST NORWAY

Abstract author(s): Sundet, Nils Ole (Agder county council) - Meling, Trond (Museum of Archaeology, University of Stavanger) - Aasbøe, Malin Kristin (Rogaland County Council) - Stokke, Jo-Simon (The Museum of Cultural History, University of Oslo) - Vivås, Arild (Stavanger Maritime Museum) - Nymoen, Pål (The Norwegian Maritime Museum)

Abstract format: Oral

To improve the road standard and to reduce traveling time between Stavanger and Kristiansand in the southwestern part of Norway, the construction of a new highway is under planning. The development of part of the road have been selected as a project arena to test how archaeological investigations and the protection of cultural heritage interests could be done more efficient, more predictable, and in an early stage of the planning process. A close collaboration within the culture heritage administrations, which includes four museums, two county councils and the Directorate for Cultural Heritage, and between these administrations and the public road developer, have been essential to fulfill the objectives of the project. The project began in 2019 and so far, there have been four seasons of fieldwork, mainly surveys.

The project area is ca. 125 km long and nearly 400 m wide. It is located to the interior of the counties of Rogaland and Agder, within a landscape characterized by forests, valleys, and heaths. Previously, only a handful archaeological investigations had been carried out in this area, and few archaeological sites were recorded. Hence, our knowledge of the prehistoric settlement was scarce before the project started.

In this paper, we will present the expectations and the strategies of the project, how we have collaborated to achieve the goals of the project, and our experiences of doing cultural heritage management within the project.

7 TII CULTURAL HERITAGE IMPACT ASSESSMENT GUIDELINES AND STANDARDS

Abstract author(s): Coldrick, Bryn (Archaeological Management Solutions; Transport Infrastructure Ireland)

Abstract format: Oral

Transport Infrastructure Ireland (TII) is in the process of implementing new Cultural Heritage Impact Assessment (CHIA) guidance and standards to replace the 2005 National Roads Authority (NRA) guidelines for the assessment of archaeological heritage and architectural heritage impacts of National Road Schemes. Archaeological Management Solutions (AMS) has been working with TII on this important initiative, which has involved extensive consultation both internally within TII and with a wide range of external stakeholders.

The new, more detailed guidance and standards for the assessment of the impacts on Cultural Heritage address archaeological heritage, built heritage and intangible heritage. They set out the expected requirements for undertaking CHIA and the production and delivery of Cultural Heritage outputs for inclusion with Constraints Reports, Option Selection Reports, Environmental Impact Assessment Reports and/or Environmental Reports for TII Projects.

In this presentation, AMS will provide an overview of the new guidance and standards and their key requirements. This presentation is an important opportunity for Cultural Heritage Professionals to find out how TII has undertaken this major review of their Cultural Heritage guidelines, and become familiar with their new requirements.

8 A HOLISTIC APPROACH TO CULTURAL HERITAGE ON THE LOWER THAMES CROSSING

Abstract author(s): Bishop, Lara - Lucey, Donal (Arcadis) - Dickinson, Ed (Jacobs)

Abstract format: Oral

The Lower Thames Crossing (LTC) is a National Highways project to improve the strategic road network with a new crossing of the River Thames east of London. In 2022 the project submitted its Development Consent Order application to the Planning Inspectorate.

The LTC has adopted a holistic approach in many aspects of the project. We'll discuss this in relation to three examples:

- Dedicated environmental coordinators have oversight of several related environmental topics, this aided in avoiding 'siloed' working particularly between the cultural heritage, biodiversity and landscape and visual teams. This enabled us to ensure that any potential conflicts in mitigation between topics were picked up as early as possible and lent weight to our design review, which aided in producing collaborative working with the engineering and design teams on the project.
- To inform the environmental impact assessment for cultural heritage an extensive programme of archaeological evaluation was undertaken in 2019 – 2021. The results of this enabled an understanding of the archaeological baseline on a landscape scale. This enhanced understanding fed back into the iterative design process.
- The lasting benefit and social value of the project – working with heritage stakeholders outside their planning role, charities and voluntary groups to identify where the project can add value to other heritage initiatives and contribute to social value. This has led to financial support for over 20 heritage projects.

9 BUILD IT AND THEY WILL COME? SKILLS, CAPACITY AND LONG TERM SUSTAINABLE TRANSFORMATION

Abstract author(s): Geary, Kate (Chartered Institute for Archaeologists)

Abstract format: Oral

It is 2015. The UK archaeology sector is starting to show signs of recovery following the crash of 2008, although it has lost a lot of its workforce. The Westminster government is 'spending its way out of recession' by investing in a programme of infrastructure development. We are worried that there won't be enough archaeologists to undertake the programmes of work that will be required. But we have also identified a unique opportunity to work together as a sector to tackle strategically long-term problems in skills and employment.

So what did we do about it? Eight years later, and with many of those programmes of work still ongoing, have we effected a strategic transformation in the arena of skills and capacity? Did we miss the opportunity or is it still a work in progress? This paper will reflect on the progress we've made and take a critical look at the challenges involved in delivering change. It will consider the barriers the sector has faced and what needs to happen to ensure that mega projects deliver mega impact and legacy.

10

MEGA EIA AND HS2: THE APPLICATION OF HOLISTIC APPROACHES FOR A SKILLS LEGACY

Abstract author(s): Plunkett, Emily (HS2)

Abstract format: Oral

As heritage professionals we all know that a holistic approach to the assessment of the historic environment using its three pillars (archaeology, built heritage, and historic landscapes) is critical to project success and robust assessment.

But do we apply this thinking to our teams or ourselves?

During the drafting of the Phase 2b (Crewe to Manchester) Environmental Statement we integrated a high functioning team dynamic into assessment via the progressive assurance approach (developed by ARUP as part of the HS2 project). This was part of the larger 'one team' collaboration.

For the historic environment team this saw the adoption of a holistic approach team focused approach to assessment which integrated:

- Data analysis using a database;
- Consultation and collaboration with stakeholders;
- Integrating risk/archaeological potential considerations into our assessment; and
- Assuring assessments for all three pillars of the historic environment through inter-organisational collaboration.

The outcomes of this approach were:

- Rapid skills development;
- Rapid team formation;
- Increased knowledge sharing; and
- Tangible skills gain.

This paper will discuss and examine the Progressive Assurance approach which led to the rapid development of a high functioning team with direct effect on the quality of the historic environment assessment.

11

ARE WE REALISING THE GEOSPATIAL VALUE OF DATA FROM PRIMARY FIELDWORK?

Abstract author(s): McKeague, Peter (Historic Environment Scotland)

Abstract format: Oral

Project archives are a fundamental legacy of archaeological fieldwork from individual research to large scale multi-disciplinary infrastructure projects. Data is expensive to collect, unique in character, and for destructive processes, an irreplaceable record of those investigations. Issues of archive deposition and long term preservation aside, how reusable are digital data created by multiple practitioners, working across the spectrum of archaeological fieldwork?

By their nature archives classify and compartmentalise depositions ensuring easy retrieval with researchers working across discrete collections but archival practices hinder effective reuse within the wider geospatial environment. In Britain online reporting through OASIS has introduced some curatorial data standards to project archaeology. Users of the system are also encouraged to share the spatial extents of projects to update inventory systems. However, more sophisticated use of born digital data maybe compromised by non-deposition of data, preservation in the wrong format and the lack of agreed, published data standards and vocabularies.

The need for standardised approaches is pressing. The United Kingdom government established The Geospatial Commission in 2018 to accelerate the delivery of economic, social and environmental benefits derived from geospatial data, products and services across the private and public sector. A key infrastructure project is the National Underground Asset Register designed to collate and share underground infrastructure data from utilities. Buried archaeology is an important but neglected aspect of that environment.

With the volume and sophistication of fieldwork undertaken each year existing curatorial and archival approaches to data are ill-prepared to contribute meaningfully to the wider geospatial environment. This presentation calls for the development of consistent and transparent data standards across the spectrum of fieldwork techniques – and collaboration on megaprojects is an important step in that process – in conjunction with data curators to realise that potential in the context of a rapidly evolving geospatial infrastructure.

12

DEVELOPMENT AND REJUVENATION: FACILITATING THE HISTORIC ENVIRONMENT AND REJUVENATING HISTORIC INFRASTRUCTURE AT SCALE FOR A LIVING LANDSCAPE

Abstract author(s): O'Flaherty, Enda (Rubicon Heritage)

Abstract format: Oral

The all island Strategic Rail Review commissioned by the Department of Transport (Republic of Ireland) and The Department of Infrastructure (Northern Ireland) will set forth proposals for the rejuvenation and reinstatement of railways across the island of Ireland over the coming decades. This ambitious all- island endeavour will present new and unique challenges in the area of Cultural Heritage Management.

Accommodating largescale sustainable infrastructure projects presents both threats to, and mitigation opportunities in the area of Cultural Heritage Management, as much of the required infrastructure must be intertwined with existing infrastructure that is of historical, architectural, and cultural heritage significance. This circumstance is exceptional and presents challenges to how we can manage the non-renewable cultural resources of our urban and rural environments, integrate rail with the living city and countryside, and still facilitate the journey to sustainable living.

Policies and practices in relation to the protection of the cultural heritage must be implemented while accommodating policies and practices that strive toward a sustainable future. This circumstance represents potential conflict between directives which facilitate the preservation of cultural heritage, and those directives which strive toward a greener future.

What have we learned to date about this delicate interface? What threats and opportunities does railway construction and rejuvenation pose to the historic environment, both urban and rural? What happens when environmental protection policy and cultural protection policy clash?

The answers to these questions may be probed and sometimes answered through previous experience e.g. the re-instatement and rehabilitation of past mega-projects such as canal infrastructure (Waterways Ireland), the rejuvenation of former railway lines as greenways (Mallow-Dungarvan), the excavation and rejuvenation of former docklands (Broadstone harbour), and the integration of new railway with historic streetscapes (Luas Dublin). From this starting point, what have we learned that can improve our work in the future?

13 **COMMUNICATING ARCHAEOLOGY IN SUEDLINK - CONVEYING THE NECESSITIES AND HIGHLIGHTING THE BENEFITS OF MANAGING CULTURAL HERITAGE**

Abstract author(s): Schweitzer, Holger (Jacobs/ SuedLink)

Abstract format: Oral

Renewable energy: as much as possible as fast as possible, is the currently political demand of the day in Europe. Accordingly, Germany's targets for the transition from fossil to renewable energies, too, are ambitious and increasingly accelerated as a result of the current geopolitical and economic situation. With a length of more than 700 km Suedlink is currently the largest project of the German national energy transformation plan with electricity envisaged to flow through the underground cables by 2028.

Accelerating planning and consent procedures also means exploring new avenues for managing and protecting cultural heritage in compliance with multiple federal laws. To meet this challenge, the SuedLink Archaeology team are forging new ways to ensure compliance and improve methods so that overall project targets are met (or even improved on).

A key role in this regard is continuous, transparent and target group-orientated communication. Designing out impacts, agreeing archaeological mitigation measures, or negotiating their integration into the construction process requires a well-established and clear dialogue with engineers, senior project management, construction agents and a whole host of other key stakeholders. Establishing a mutual understanding of practical, technical, or legal requirements is vital for the creation of an environment of constructive cooperation for the project's delivery.

Furthermore, a holistic public outreach strategy is key to a successful mega-project delivery. This involves e.g. informing landowners on planned archaeological fieldwork well in advance of the fieldwork, or disseminating information to the public on archaeological findings. Fundamentally underlying to all project communication is a recognition of all cultural heritage, including archaeology, as a shared social valued and valuable public resource, and understanding that good practice not only meets the demands of good conservation management. It can simultaneously contribute to an accelerated project delivery with critical socio-political goals.

14 **REDISCOVERING THE IDENTITY OF A LANDSCAPE - EXPERIENCES FROM LARGE SCALE EXCAVATIONS IN NORTH ZEALAND, DENMARK**

Abstract author(s): Aarsleff, Esben (Museum Nordsjælland)

Abstract format: Oral

In recent years The Museum of North Zealand has carried out large scale excavations prior the construction of a new superregional hospital and derived infrastructural, housing and industrial projects in a mosaic landscape dotted with smaller wetlands around the former inlet called Salpetermosen.

The excavations were initiated in 2012 and are still ongoing as the area is being developed over a long period of time. The combined area (hospital and other projects) of investigation so far covers 3 km², which by Danish standards, is a relatively large area. The finds comprise of sacrificial and profane use of wetlands, as well as settlements and villages from larger parts of the period between 4000 BC and 1560 AD.

Most of the constructors show a fundamental understanding of the time needed to make the excavations. Generally, they also want to benefit from the results in their branding, which is a tendency that began somewhat twenty years

ago in North Zealand. The same goes for the local community, who take great interest in the many results, and they all consider the archaeology as a part of their shared past.

The archaeological results provide an identity for the landscape, which we need to communicate to the public, the developers and the municipality, if we want the identity to be part of the new townscape. Our effort is usually focused on the wellknown ways of branding archaeological results: Exhibitions, tours of the sites, open excavations, lectures, newspaper articles and so on. But we still haven't found the right way of integrating the past identity in the present townscape. Perhaps we need to focus our energy on other solutions?

15 RE-EXCAVATING THE ARCHAEOLOGY OF LONDON 2012

Abstract author(s): Gardner, Jonathan (Edinburgh College of Art, University of Edinburgh)

Abstract format: Oral

This paper reviews the varied roles that archaeology played in the London 2012 Olympic and Paralympic Games.

Even before London's successful bid in 2005, the Games' main site in Stratford was branded a 'wasteland' and a 'scar' across the city; this despite being home to hundreds of people, providing employment for ca. 5000 workers in 284 businesses, and hosting allotments and leisure facilities (Davies et al. 2017, p. 1). Following the site's compulsory purchase for construction in 2007, archaeologists (including myself) moved in to document parts of the 200ha area before its complete clearance. While this archaeological investigation was comprehensive for some areas and time periods, in this paper, I suggest that opportunities were missed for far greater engagement with the recent past and the contemporary inhabitants and users of the site. This program of development-led archaeology – carefully controlled by major environmental consultancies – arguably failed to challenge the simplistic wasteland narrative in favour of providing positive news stories for the mega project's organisers.

Presenting the result of a major investigation of the relationships between mega events and heritage (Gardner 2022), I suggest that re-excavating such projects' engagement with archaeology is essential if we are to create richer and more heterogeneous understandings of the past, and to ensure the complexities of more recent history are not ignored in favour of older, 'safer', depoliticised stories.

16 HERITAGE MANAGEMENT AND THE RENOVATION OF THE AFSLUITDIJK, THE NETHERLANDS

Abstract author(s): Timmermans, Luc - Mol, Koos (Arcadis)

Abstract format: Oral

In this paper we want to share how the contractor was motivated to integrate heritage in designing and renovating the Afsluitdijk. We want to address the factors we consider to be pivotal in this process, from the exploration phase until project execution.

In the 1930's, the existing discharge sluices on both sides of the Afsluitdijk were fortified with separate concrete bunkers and shelters. Both fortified positions were constructed around the sluices and made use of the existing dams, which was both strategic militarily and cost efficient. After a five-day battle in the Second World War, the positions remained their military importance in the beginning of the Cold War. The result is a relatively young but rich and layered cultural landscape with both archaeology and listed monuments.

The renovation of the Afsluitdijk in the Netherlands started in 2019 and encompassed not only the elevation of the existing dam, but also constructing a new set of sluices and pumps, next to the existing ones. The project for the renovation of the dam was issued by the Directorate-General for Public Works and Water Management of the Netherlands (Rijkswaterstaat) and has been tendered as a DBFM (Design, Build, Finance and Maintain) project. The challenge was to both preserve this site of national heritage and renovate the water works to make it future proof.

Prior to the tendering of the works, the government specified the room for adaptations and changes of the dam in legislation and in the tender conditions. It defined both restrictions and possibilities, for physical interventions. In that way the future contractor would have the freedom to come up with its own design solutions, but within a predefined framework. The contractor took this as an imperative to integrally incorporate heritage into the design process.

SAVE IT BEFORE YOU LOSE IT

Abstract author(s): Toja, Sara - Silva, Elisângela (Arcadis - MG)

Abstract format: Oral

Brazil is known worldwide for its mining deposits mainly for the capture of iron, gold and its derivatives. For the execution of this type of work, mining dams are built, as a barrier, where the tailings are deposited, such construction constitutes the category of megaprojects of large companies that are established in Brazilian territory.

Our work since the beginning of these megaprojects is of major importance because we participate in the entire life cycle of the enterprise, with its challenges and opportunities, enabling the anticipation of problems. Projects of this dimension allow the use of digital solutions that facilitate the safeguarding of important data about cultural heritage, like “Fulcrum” and “Memory Places” developed by the digital team of Arcadis Brazil.

In 2020, five years after the dam burst in the city of Mariana, the law which establishes the National Dam Safety Policy (PNSB), was updated, in which cultural heritage is brought as part of the PAE (Emergency Action Plan) which must contain measures to rescue and safeguard cultural heritage.

In the specific case of the state of Minas Gerais, the legislation of the State Institute of Historical and Artistic Heritage (IEPHA) defines the procedures and studies that must be conducted to safeguard cultural heritage under the PAE, activated when a mining dam alerts to a level drive. Among the stages, there is the diagnosis of the material cultural heritage that should include, this document should also contain the identification of archaeological structures and other elements of preservation interest.

It is of major importance to carry out the diagnosis and cadastral survey of both material and immaterial assets to record the cultural heritage that is on the imminence being lost.

REVISITING ARCHAEOLOGY AND THE EUROPEAN FAR-RIGHT

Session theme: 6. Contested Pasts & Presents

Session organisers: Niklasson, Elisabeth (University of Aberdeen) - Hølleland, Herdis (Independent)

Session format: Session with presentations of 6 slides in 6 minutes

In the EAA session ‘Archaeology and the European Far-right’, held in Maastricht in 2017, we asked participants to tell us about the rise of far-right political movements in the countries where they live and work. We wanted to know about far-right heritage policies as well as attitudes and responses among archaeologists and heritage officials. Could we soon be facing a situation where civil servants had to choose between political compliance and ideals of inclusive and decolonized practices?

In this session we seek to revisit and extend this discussion. There are two important reasons for this. The first is to evaluate continuity and change. Six years down the line, the far-right momentum seems to have fizzled in some places, like with the criminalization of Golden Dawn in Greece and the declining influence of UKIP in the UK. Elsewhere, like in France, Italy, and Sweden, it has persisted, accompanied by political proposals to establish national canons, to celebrate fascist symbols, and to increase protection and funding for archaeology and historical monuments. How, if at all, have archaeologists and heritage officials adapted to this? Six years later, we also find a new research trend in archaeology and heritage studies that examines the uses of the past in contemporary far-right politics and the reception of their narratives in the public space. What can we learn from this new research direction as a whole? And what is the next step, after educating the field and sector about these explicit archaeopolitical connections?

We invite contributions that, in 6 slides and 6 minutes, update, reflect, exemplify, theorize, and explain current intersections between archaeology/heritage and reactionary, radical, and populist right-wing movements in Europe and beyond.

ABSTRACTS

FAR-RIGHT IDENTITY POLITICS IN POPULAR PERFORMANCES OF THE PAGAN PAST

Abstract author(s): Reichenbach, Karin (Leibniz-Institute for the History and Culture of Eastern Europe)

Abstract format: Oral

Popular interest in pre-Christian societies like early medieval Vikings and Slavs has grown in central and eastern Europe like never before and is often linked to a strong ethnic resp. national identification. Staged in performances of historical reenactment, Neopagan rituals and thriving Pagan metal and folk music genres, imaginations of the Pagan past seem to fascinate a growing public audience. At a closer look, however, the intersections of these fields of performative history engagement reveal a closeness to far-right ethno-nationalist or even racist ideological programs and networks.

Based on case studies from Poland, I will trace the trajectory of the Pagan revival from open and radical political activism after 1990 to a change towards more subtle but publicly effective cultural work since the late 2000s. I will ask for their role, influence and success in the popularization of history which seems based on epistemic approaches towards knowing, experiencing and conveying the past that differ in certain respects from established scholarship. Addressing the challenges, but also the responsibility this poses for Public Archaeology and History Education, the more general question is raised whether and how radical political appropriations of history should be recognised, absorbed, and confronted.

2 “CREATING A NEW ITALIAN IMAGINARY”: HISTORICAL AND ARCHAEOLOGICAL ELEMENTS IN NATIONALIST AND IDENTITARIAN PROPAGANDA IN ITALY

Abstract author(s): Visonà, Mara (University of Salento)

Abstract format: Oral

The use of historical and archaeological elements within nationalist and identitarian propaganda in Italy is not new. During the twenty years between Mussolini's rise to government and the beginning of WW2, the Fascist government worked to create the basis of an Italian 'mythology' based on the image of a mythical and stereotyped ancient Rome (Torelli, 2010). This resulted in the extensive use of Roman symbology within the political debate, and in massive funding of archaeological excavations in Rome.

With the recent strengthening of nationalist and identitarian propaganda throughout Europe (Dalton & Berning, 2022), Italian nationalist and identitarian movements, especially on the right-wing, are using history and archaeology themes within political propaganda (eg: Fratelli d'Italia, Lega Nord and CasaPound). The means and purposes of propaganda have changed today, but the objective remains the same: to seek legitimacy in the past for the policies of the present (Niklasson, 2023).

At present, this interest has not directly affected the policies within the research institutes. Still, the effort to create a popular imagery linked to the values of the historicity of Italian identity and its culture is clear. Through web radio programmes, blogs, films and historical re-enactments, Italian right-wing parties and movements approach history, sometimes extolling the heroism of the Italian against foreign invaders, sometimes the roots of Christian culture and the familialist model of society.

The aim of this proposal is to present the historical-archaeological contents and themes employed in right-wing propaganda, as well as the means used to create “a new Italian imaginary” (Fratelli d'Italia, political programme 2022).

3 ON THE MAINSTREAMING OF 'HERITAGE POPULISM' IN SWEDEN

Abstract author(s): Niklasson, Elisabeth (University of Aberdeen)

Abstract format: Oral

It is often said that the extreme is going mainstream and that long established political parties have taken advantage of populist far-right tactics to appeal to their voters, opting for a 'politics of whatever works'. This contribution examines if this is the case when it comes to the far right's uses of heritage in Sweden. Rather than focusing on the far right, however, it examines if elements of their 'political imaginary' appear on the platforms and in the rhetoric of other parties. Here, political imaginary means symbols and keywords that are organised into a system of meaning, functioning as shorthand's for ideological messaging and to legitimise collective social existence. When Christian democrats want to reinstate traditional family values, or when left-wing politicians try to naturalize ideas of a classless society, do they draw inspiration from or mirror far-right rhetoric? Do the traditional right use heritage to reaffirm or recode ideas of the national past? What historical symbols, periods, or sites do they activate? Based on a survey of other parties, I argue that there is a slight mainstreaming of the far-right political imaginary, but that the 'heritage populism' of many established parties predate the rise of the far right in Sweden.

4 THE SCYTHIAN „EMPIRE“ AND MODERN IMPERIALISM

Abstract author(s): Shelekhan, Oleksandr (Institute of Archaeology, National Academy of Sciences of Ukraine)

Abstract format: Oral

This contribution examines the appropriation of Scythian culture in modern Russian imperialism. Rather than focusing on marginalized groups, it deals with state propaganda. After decades of research in the Black Sea region, scholars agreed that certain archaeological groups could be associated with certain tribes. The Scythian-, as well as the Sauromatian and Sarmatian cultures were outlined within specific chronological and geographical frames, while distant Asian communities remained nameless (labeled after the eponymous monument).

The situation changed after 2014. Instead of the long and tedious descriptor 'cultures of the Scythian period,' the bright term 'Scythians' became widespread among Russian scholars studying Asian steppe peoples. And instead of the variety of diverse cultures, the illusive 'Scythian empire' entered academic and public discourse. A strong contrib-

uting factor was the exhibition ‘Scythians: Warriors of Ancient Siberia’ (2017-2018), held in the British Museum in collaboration with the State Hermitage. Though many of the displaced artefacts in the exhibit came from the territory of modern-day Ukraine, the curators avoided any mention of their origin, stressing the common Eurasian cultural landscape and the assumed Asian origin of the Scythians. One could argue that the narrative simply represents a different point of view on history, but the real intentions were revealed by the initiators. Hermitage director said: “The first period of the Scythian war has come to an end” with the occupation of Crimea, and today “Our recent exhibitions abroad are just a powerful cultural offensive. If you want, a kind of ,special operation.’ So in searching the imaginary common historical roots of Ukraine and Russia, the Russian imperialistic propaganda digs way deeper than 1945 or even 998. A simple rebranding exercise tied the cultural marker “Scythian“ to the Russian territory, and the stolen heritage from a former imperial outskirt was used as “jewels in the crown”.

5 TOO FAR, OR NOR FAR ENOUGH? CURRENT RESEARCH ON THE USES OF THE PAST IN FAR-RIGHT POLITICS

Abstract author(s): Hølleland, Herdis (Independent) - Niklasson, Elisabeth (University of Aberdeen)

Abstract format: Oral

Research on far-right heritage politics and on the public reception of far-right symbolism and narratives can be found in many fields of study. In archaeology, research has looked at everything from far-right cultural policies to the appropriation of archaeological results and sites. In anthropology, the focus has mainly been on political symbolism and the uses of historical monuments in the formation of social networks and group identity. In classical studies and history, discussions have centred around the role and reception of the particular periods of past and the uses of tropes and narratives of those from different regional contexts. Far-right uses of the past have also been noted in social and political science research, especially when speaking of religious heritage and the (re)formation of nation states. Looking at this widespread interest, it seems like we should have come quite far in understanding the motivations and character of far-right groups’ mobilization of heritage and its various effects. Yet, we argue, that because the research to date has mostly happened inside disciplinary silos and limited frames of inquiry, we have not come far enough.

This contribution examines and synthesises research done in these fields. What are the dominant themes in the literature? Is research from different fields complementary, parallel, or overlapping? What can we learn about the far-right’s political activation of the past if we consider the research across disciplines?

6 ETHICS, EMOTION AND THE FAR-RIGHT: REFLECTIONS ON THE ROLE OF HERITAGE AND ARCHAEOLOGY

Abstract author(s): Farrell-Banks, David (University of Cambridge)

Abstract format: Oral

In recent years, we have seen significant focus given to the interaction between the past and the ideologies and propaganda of the far right. This paper uses a focus on the emotional impacts of our interactions with the past to reflect on the political role of archaeology and heritage practice in the UK today.

The way with which we communicate our understandings of the past have become frequent targets of attack in the UK. Through a mainstreaming of reactionary ideologies, archaeology and heritage can become focal points of political division. Often, those who work within these fields can be caught on the frontline of discussions that are far removed from their motivations for doing the work they do.

Against this foundation, this short paper will reflect on the ethical implications of the politics of archaeology and heritage practice. Drawing on examples of progressive practice in the UK, the paper will argue for the continued necessity of communication of the past that champions diversity and inclusivity, while also recognising that this work must come with a practice of care for those working in the sector.

7 THE ENEMY WITHIN? NATIONALIST TOTALITARIAN THINKING WITHIN ARCHAEOLOGY

Abstract author(s): Karl, Raimund (Universität Wien)

Abstract format: Oral

During the Third Reich, the majority of germanophone archaeologists were active supporters of the Nazi regime. While sometimes presented as a ,devil’s bargain’ - massively increased financial support for archaeology, which was considered an ,ideological discipline’ by the Nazi regime after all, enabled more research and made for great career opportunities - there are sound reasons to believe that most germanophone archaeologists were ,deutschnational’, racist, and autocratic totalitarians well before the Nazis took over and thus found a natural home in the party. Thus, they did not so much have to be enticed than becoming Hitler’s archaeological executioners quite willingly (Goldhagen 1996).

Archaeology, at a first glance, appears to be a rather 'leftist liberal' discipline these days; and there is – quite rightly – considerable concern about archaeology being 'abused' by far-right political movements for their own (nefarious) purposes; especially as popular support for far-right parties has (more or less) steadily been increasing in Europe for decades. Thus, the session abstract asks whether we could “soon be facing a situation where civil servants had to choose between political compliance and ideals of inclusive and decolonized practices?”. Indeed, much like in that quote, the far-right seems to always be presented as an external threat to archaeology in the current discourse; despite our less than glorious disciplinary past even in Austria and Germany.

This paper will take a radically different perspective. It will examine to what extent nationalist totalitarian thinking still exists in archaeology; whether it is still prevalent; and whether it might even be inherent to some of our most fundamental disciplinary assumptions and principles. Our biggest enemy and the greatest threat to inclusive and decolonised ideals may well be the one within.

484 GLOCALIZATION OF IDENTITIES IN THE ROMAN WORLD

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Mech, Anna (University of Warsaw) - Perinić, Ljubica (Croatian Academy of Sciences and Arts)

Session format: Discussion session

According to sociologist Roland Robertson, the term 'glocalization' was coined by Japanese economists to explain Japanese global marketing strategies. The term introduced by Robertson was widely accepted and used in sociology, and in recent years is finding its use in archaeology. If we accepted that what is 'local' is organically shaped by the 'global', then what of the opposite? In this session we would like to explore the glocalization in different spheres of life in the Roman world, understanding this notion as 'the refraction of a global phenomenon through local entities', defined as such by sociologist Victor R. Roudometof. The Roman Empire took control over a territory located on three continents, thus multiple cultural interactions, influences, and transitions were unavoidable. Glocalization can concern different aspects of religion, art, and material culture. We will study how identities were manifested in various ways within the globalising Roman world, especially in the provinces, and what this could have meant to the whole Roman Empire. We welcome papers dealing with different types of evidence, from different chronologies, and different areas of the Roman Empire, but dealing with the phenomenon of glocalization or its theoretical framework.

ABSTRACTS

1 ETRUSCAN, ROMAN, MEDITERRANEAN... GLOCAL AND PERSONAL? SOCIORELIGIOUS AND MEDICAL APPROACH TO THE ANATOMICAL VOTIVES IN THE NATIONAL MUSEUM IN WARSAW

Abstract author(s): Dziurdzik, Tomasz (National Museum in Warsaw) - Grzegorska, Aleksandra (University of Warsaw)

Abstract format: Oral

Among the artefacts in the Collection of Ancient Art in the National Museum in Warsaw, there is a number of "Etruscan" anatomical votives and other, mostly "Roman" objects with representations of body parts or their imprints. The complicated provenance of this rather eclectic group (including objects transferred to the Museum after the second world war from different collections, as well as private donations) means that their origins can be reconstructed only approximately. Paradoxically, this lack of detailed information on their archaeological contexts facilitates a new angle of their analysis. It helps us drop wide, ethnopolitical labels such as "Etruscan" or "Roman" from the conversation on what were quintessentially glocal religious practices within the globalizing Mediterranean in the Hellenistic/Republican and Early Imperial periods. Those depictions of body parts were individual appropriations of a shared visual language that were employed in different ways within local religious contexts. They shaped the lived religious experiences through their materiality, including, as Graham (2020) put it, "the tripartite affectivity of these offerings as objects manipulated in the moment of ritual, as material things, and as bodily proxies". Due to the fact that their physical manufacture and creation of additional meaning happened in interactions between artisans, the dedicants, and any groups associated with sacred spaces in which the votives were deposited, each of them was at the same time a materialisation of collective medical, anatomical, and religious knowledge. It will be demonstrated that the body part votives expressed religious identities that were at the same time local and global, individualised and shared, and could be used to convey various messages through the use of a common media. Thus they were at one level a globally understandable phenomenon, but on the other an expression of local and individual identities.

2 EPIHETS IN ROMAN DALMATIA

Abstract author(s): Perinic, Ljubica (Croatian Academy of Sciences and Arts, Division of Archaeology)

Abstract format: Oral

Currently, Croatian Science Foundation is funding the research project titled 'Among Gods and Men, The Cults and the Population of Roman Dalmatia According to the Votive Inscriptions' and the main goal of the research project is a thorough review and/or revision of the votive inscriptions and figural representations of the deities and their systematization, which will result in extensive insight into social aspects of religious beliefs, traditions, practices, and their combined impact on the evolution of cultural identities. In Roman religion, an epithet is a descriptive term or title attached to a deity's name. Epithets can be identifying or characterizing a deity and they serve to identify the deity and distinguish them from other gods and goddesses. They often reflect the deity's attributes, powers, or sphere of influence. For example, the Roman goddess Juno was known as Juno Moneta, which translates to „Juno the Warned,“ reflecting her role as a goddess of prophecy and warning. Epithets can be divided in six categories, and the most numerous are those describing the function of a deity or its particular manifestation. The intention and goal of this paper is to collect the epithets that appear on the votive inscriptions of the Roman province of Dalmatia in order to determine which and what elements of glocalization can be observed and applied to the mentioned spectrum, and whether the changes are vertical (chronological) or horizontal (territorial), or both.

3 GLOCALITY OF RELIGION IN ROMAN LIBURNIA

Abstract author(s): Mech, Anna (University of Warsaw)

Abstract format: Oral

Roman Liburnia was the northern part of Roman Dalmatia, situated between the modern rivers Raša and Krka. In pre-Roman times this region was inhabited by Liburnians mentioned in literary sources as nautical people. The region quickly developed contacts with Greeks and Romans, who were somewhat puzzled by elements of their culture. Ancient authors, especially Pseudo-Scylax in his "Periplus", underlined the position of women in Liburnian society, writing that those people were ruled by women. Nevertheless, it is more probable that it was a sort of exaggeration of some customs which were different from what was known in the Greco-Roman culture.

Liburnia was also quite exceptional in Roman times. The society quickly accepted Roman customs, both religious and cultural, but simultaneously they adapted them to their own traditions (visible in archaeological and epigraphic material), a perfect example of glocalization. The second one draws particular attention in terms of studying religion in the Roman Empire through votive and funeral inscriptions. In Roman Liburnia an exceptionally high number of these inscriptions were set up by women or for them. Among them there are some referring to local traditions: there is a name of the local goddess, a local name on them or even the original, local shape of the monument. This paper will aim to analyse the relation of those "local" elements with "global" trends.

4 MERCURY "GLOCALIZED"? DISCREPANCIES OF A CULT

Abstract author(s): Szigli, Kinga (Ludwig-Maximilians-Universität München)

Abstract format: Oral

Pre-Roman and Roman religion show a complex correlation: significant sociocultural changes and vivid interaction between cults & religious practices on local and global level. The development of new hybrid religions clearly indicates the mutual impact of the Roman and local religions on each other. While local cults and religion seem to dominate in certain provinces (e.g. Gaul, Germania, Britannia), other territories, such as Illyrian and African regions show a rather Romanized or "globalized" picture, with scattered relics of local cults. Moreover, within the same province there are territorial differences between the intensity of local and global sociocultural interactions, also according to various categories of archaeological material.

Whilst literary testimonies merely provide general information on local cults and essence (vis) of deities, epigraphy shows a more coherent picture (giving names & identity). However, this is the case only in the Western and North-western provinces, whereas inscriptions in other regions hardly show any sign of indigenous cult under the "Roman" surface. Similarly, statuettes of gods seem to present pre-Roman iconography only in certain territories.

Is this discrepancy a matter of different speed in the process of glocalization in different territories, part of a translation process (interpretatio or translatio)? Which consequences could this interaction have on society and religion? How does religion fit into this process? Can we define and differentiate local communities & identities in the provinces according to the different pace of glocalization?

Current work attempts to answer such questions in a multidimensional context from the perspective of religion, sociology with the help of a case study about Mercury's cult in Pannonia, where statuettes are put in contrast to votive inscriptions and ancient texts, as well as to some significant epigraphic sources and statues from provinces with a different intensity of glocalisation, such as Gaul, Germania and Britannia.

THE IMPRINT OF WEANING: NEW METHODS TO APPROACH EARLY LIFE NUTRITIONAL CONDITIONS

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Stefanovic, Sofija (Laboratory of Bioarchaeology, Department of Archaeology, Faculty of Philosophy – University of Belgrade)

Session format: Regular session

Infant feeding practices influence short and long-term health outcomes and survival at later stages of life. Central to early life development lies breastfeeding and weaning which have profound consequences on demography, health status and disease for mothers and children. As biological mechanisms, they monitor infant health and are firmly rooted in human physiology. As culturized activities, are influenced by cultural, ethnic, and societal values, ideas and beliefs.

Understanding the choices behind the upbringing of children in ancient societies is of paramount importance in bioarchaeological research. The innovations that have emerged in bioarchaeological methods have provided the unprecedented opportunity to reconstruct early life nutritional conditions of the past. These findings have evoked ideas of life history theory and the developmental origins of health.

The objective of this session is to enhance our understanding of weaning behavior in past societies from osteological, paleopathological, bio-archaeological, demographic, and genetic perspectives. We intend to explore multi-tissue and multi-disciplinary approaches (stable isotopes, histology, aDNA) new applications/tools and machine learning implementations to reconstruct ancient weaning practices. With this premise in mind, we welcome papers that represent the whole breadth of research areas and uncover the blueprint of infant feeding practices in past societies in the light of the constantly evolving methods from analytical and computational techniques.

ABSTRACTS

1 INFANT FEEDING IN THE NORTHERN MESOLITHIC – A CASE STUDY FROM YUZHNIY OLENIY OSTROV

Abstract author(s): Eckelmann, Rebekka - Batanina, Olga (University of Helsinki)

Abstract format: Oral

This study presents the first results of investigations into early childhood diet and weaning strategies at the Mesolithic site of Yuzhniy Oleniy Ostrov/Russia.

Nutrition during infancy and childhood is one of the key determinants for health status in later life and as such has been subject of intensive research in the life sciences, ethnography as well as archaeological research. In Europe the archaeological research has, however, primarily been focused on agricultural communities. Since variations in weaning behaviour, being a product of both biological need and (often distinct) cultural practice, have been linked to wider differences in childrearing and to a lesser degree subsistence system, this is a gap in our understanding of prehistoric Hunter-Gatherer-Fisher (HGF) lifeways that only recently has started to diminish.

As such we have conducted high-resolution sequential analyses of Carbon and Nitrogen stable isotopes on the dentine of 23 individuals from Yuzhniy Oleniy Ostrov – the largest Mesolithic burial site in the European North. By combining this analysis with other bioarchaeological methods, we examined dietary life histories and patterns of infant nutrition. The investigations revealed a high variance in early life dietary intake between individuals, including differences in the duration of the weaning process and the composition of supplementary weaning foods.

These results conform with the high diversity of burial practices visible at Yuzhniy Oleniy Ostrov, which have previously been interpreted as an indicator for the potential presence of subgroups within the burial community. Simultaneously, this data set constitutes an important step forwards to improve our understanding of HGF lifeways and childrearing in prehistoric Northern Europe.

2 DIACHRONIC CHANGES IN WEANING PATTERNS DURING PREHISTORY AT LOS CANES CAVE: NEW DATA FROM ISOTOPE ANALYSIS ON DENTINE SEQUENCES

Abstract author(s): Higuero Pliego, Antonio (Instituto Internacional de Investigaciones Prehistóricas de Cantabria - IIIPC; Universidad de Cantabria-Gobierno de Cantabria-Grupo Santander) - Salazar-García, Domingo Carlos (Departamento de Prehistoria, Arqueología e Historia Antigua, Universidad de Valencia) - Schulting, Rick (School of Archaeology, University of Oxford) - Arias Cabal, Pablo (Instituto Internacional de Investigaciones Prehistóricas de Cantabria - IIIPC; Universidad de Cantabria-Gobierno de Cantabria-Grupo Santander)

Abstract format: Oral

Los Canes cave is a key site in northern Spain (Asturias) to understand the daily life and the funerary practices during the Mesolithic due to the burials and good preservation of the individuals found within the cave, which allows the study of diet at both the individual and group level. New radiocarbon dates on several isolated teeth also showed the presence of human remains from the Bronze Age, previously unexpected. Previous bone collagen stable carbon and nitrogen isotope studies indicated a terrestrial C3 diet for Mesolithic adults. We now present the dentine sequence analysis of a series of four Mesolithic and eight Bronze Age teeth to also study the evolution of childhood diet of twelve individuals from these prehistoric periods.

Our results suggest for the Mesolithic individuals a weaning period that could last until three or four years of age, time during which the maternal milk might have provided an additional nutritional source for the last hunter-gatherer groups of the Iberian Peninsula. No evidence for periodic use of marine foods could be detected, despite the coast being only ca. 10 km from the site. During the Bronze Age weaning period appears to have been more variable. While some individuals experience an extended weaning duration similar to that of the Mesolithic, others were weaned as early as the first year of life. This latter data must be interpreted in the archaeological context of a productive society where a social hierarchization process was taking place. Also, we observed the introduction of new C4 crops during the Bronze Age in the Cantabrian region, which had likely an impact on the population. The combination of these “new” cereals with the already known C3 crops provided grain during all the year, resulting in different dietary strategies for children during their first years of life.

3 DIETARY ASPECTS OF RURAL CHILDREN IN THE LITHUANIA PROPRIA (16TH-17TH CENTURIES)

Abstract author(s): Brindzaitė, Ruta - Jankauskas, Rimantas (Vilnius University)

Abstract format: Oral

As diet and disease can set the irreversible individual pathway for the whole life course, a thorough examination of mature and immature individuals from a bioarchaeological context can cover daily life aspects that have remained unrecorded in historical documents. Childhood life experiences in the Grand Duchy of Lithuania are still scarcely studied. Here we aim to present childhood diet and disease prevalence among the Vievininkai sample, and discuss infant feeding practices and weaning in relation to the presence of pathological conditions among non-adults. The rural community in Vievininkai was a village located around 30 km west of Vilnius. The Vievininkai burial ground was used by inhabitants of the village and the surrounding area during the 16th-17th centuries. Standard procedures of sex and age estimation, as well as osteometric and pathological analyses, were supplemented by stable isotope (carbon and nitrogen) analyses of incremental dentine. Out of a total of 88 individuals, 28 were estimated as younger than 18 years of age at the time of death. The results revealed the presence of scurvy, rickets, and non-specific stress indicators among the non-adults. In addition, stable isotopes indicated the dominance of a terrestrial, C3 plant-based diet for both adults and non-adults. Moreover, it appears that breastfeeding did not last long (until the first year of life), whereas weaning ceased at around three years of age (n=9). This is the first study using incremental dentine analysis to reconstruct childhood diet in early modern material from the territory of the Lithuania propria, thus encouraging scholars not only to reconsider previous interpretations and possible new scenarios, but also pointing out the variety of diets, the complexity, and the need for such analyses in the future.

4 RESOLUTION: COMPARING ISOTOPIC WEANING PROFILES IN PERMANENT AND PRIMARY TEETH

Abstract author(s): Beaumont, Julia (University of Bradford) - DeWitte, Sharon (University of Colorado) - Redfern, Rebecca (Museum of London) - Montgomery, Janet (Durham University)

Abstract format: Oral

The aim of this study is to investigate whether analytical methods using incremental dentine collagen carbon and nitrogen isotope ratio profiles of primary molar and M1 from the same individual show the same patterns: or does temporal blurring in M1 affect the quality of the potential interpretations of breastfeeding and weaning?

Primary molar teeth develop from the last trimester of pregnancy with the crown completed at about 9 months of age; permanent M1 crowns contain tissue from around birth to 3.5 years \pm 6 months. Beaumont Method 2 (2013) in

a primary molar gives isotopic profiles containing an in-utero value for the first ½ mm and an average of approximately 3 months per 1mm sample, while M1 yields approximately 7-9 months per sample. Using 1mm sections from primary teeth is therefore better for investigating the breastfeeding/weaning period but these will not be available from the adults in a population. In order to improve the temporal resolution of the M1 data, a new method of micromilling using the method described in the paper by Curtis et al. (2022) has been employed.

The paired primary molar and M1 datasets from 18 modern individuals from the Tooth Fairy Project (with known breastfeeding histories) and 9 individuals from the Black Death period site of Thornton Abbey from the project “Diet, Migration and Health in the Context of Medieval Mortality Crises” are presented as a guide to help researchers decide how best to interpret incremental dentine collagen data from M1 teeth in future.

5 DIFFERENT INFANT FEEDING PRACTICES AND “WEANING STRESS” IN EARLY MEDIEVAL BAVARIA

Abstract author(s): Velte, Maren (State Collection for Anthropology, Munich - SAM) - Czermak, Andrea (State Collection for Anthropology, Munich - SAM; School of Archaeology, University of Oxford) - Grigat, Andrea - Seyr, Elsa - McGlynn, George (State Collection for Anthropology, Munich - SAM) - Lösch, Sandra (Institute of Forensic Medicine - IRM, University of Bern) - Harbeck, Michaela (State Collection for Anthropology, Munich - SAM)

Abstract format: Oral

The sensitive period in early childhood coincides with the introduction of complementary foods and the weaning process. This can result in so called “weaning stress”. Physiological stress during the weaning process is affected by the age at the introducing of complementary foods, contaminated or quantitative insufficient food and the duration and frequency of continued breastfeeding. The period of greatest risk occurs after breastfeeding has ceased completely: nutritional and antimicrobial support of breast milk discontinues but exposure to pathogens and dietary needs increase while the children’s immune system is not yet fully developed. But also cultural, socio-economic and environmental factors can influence whether a child experiences stress during or after weaning.

We investigate infant feeding practices and potentially associated stress in 38 individuals buried in Bavaria during the transition from Late Antiquity to the Early Middle Ages (ca. 350–450 AD: n=4; 500 AD: n=23, n=13 of non-local origin; 7th century AD: n=11). Isotope profiles of serial dentine samples from 1st molars are compared to the formation of linear enamel hypoplasia (LEH) in the anterior dentition. Additionally, a new model to assign chronological ages of dentine samples and a customized scheme to estimate the approximate age at the cessation of weaning are presented.

The highly variable $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$ values within isotope profiles represent different diets of breastfeeding females, complementary foods and post-weaning diets, as well as individual weaning patterns. Cessation of weaning occurred mainly between age two and three. Longer weaning periods are often observed in women of non-local origin, likely displaying weaning practices of other communities.

A change of post-weaning diet in the 7th century coincides with increasing LEH. These stress markers most frequently occur during the end of weaning and the post-weaning phase which supports the assumption that children are at increased risk during this time.

6 BREASTMILK CONSUMPTION AND PHYSIOLOGICAL STRESS: A MULTIPROXY INVESTIGATION OF WEANING USING STABLE ISOTOPES, LINEAR ENAMEL HYPOPLASIA AND BAYESIAN MODELING

Abstract author(s): Souleles, Angelos - Ganiatsou, Elissavet - Bantavanou, Panagiota - Georgiadou, Angeliki - Papa-georgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

Abstract format: Oral

Carbon and nitrogen stable isotope ratios in dentinal collagen provide a useful means to study ancient individual diets sub-annually, best epitomized by the opportunity to reconstruct their breastfeeding and weaning durations. Bayesian isotopic mixing models can further improve our understanding of past diets by estimating the relative contribution of different food sources. Research into increasing the precision in weaning durations has taken place, however, limited focus has been given to the quantification of breastmilk during weaning in relation to health outcomes, since this condition increases the risk of developing diseases during infancy. In this study, we estimate the relative amount of breastmilk during weaning and examine whether its restricted consumption correlates with the manifestation of physiological stress in ancient individuals.

The weaning processes of 65 individuals from the site of Thessaloniki dated to the Roman period (168 BC-324 AD) were reconstructed through the measurement of nitrogen and carbon isotopes on incremental collagen of their first permanent molars. Breastmilk and supplementary foods were estimated using the Bayesian mixing model MixSIAR.

The timing and duration of Linear enamel hypoplasia (LEH), an abnormal deposition on tooth enamel caused mainly by malnutrition and infections, were used to reconstruct physiological stress episodes through histological analysis of permanent canines or incisors sampled from the same individuals.

Our results demonstrate that infants consuming less than 50% of breastmilk during weaning (n=25/65) showed multiple LEH defects whereas those who consumed more than 50% did not. We found that LEH occurs close to the age at completion of weaning or afterwards. This line of evidence shows that breastmilk deprived individuals show frequent and severe morbid events during infancy and indicates the association between weaning and LEH. With our assay, we hope to provide a starting point for more sophisticated approaches on early life nutrition in the past.

7 PREHISTORIC WEANING EQUIPMENT: METHODOLOGICAL CONSIDERATIONS

Abstract author(s): Stefanovic, Sofija (Department of Archaeology, Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade) - Petrović, Bojan (Faculty of Medicine Novi Sad, University of Novi Sad) - Jovanović, Nikola (Faculty of Medicine Novi Sad, University of Novi Sad) - Porčić, Marko (Department of Archaeology, Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade)

Abstract format: Oral

During the last decade, isotope analyzes have provided important novel evidence about breastfeeding and weaning in the past. Despite these significant advances in understanding of weaning practices, archaeological artifacts remain poorly studied when it comes to children's feeding practices. Although we can assume that prehistoric people produced objects that were used for weaning, such types of objects have been rarely detected so far. One of the possibilities for such objects to be confirmed is to reveal traces of deciduous teeth marks on them, since it is known that children very intensively bite objects that we feed them with. In order to develop the method for the detection of teeth marks on bone objects, in our previous study, we compared experimentally produced deciduous bite marks on animal bones with marks on the Early Neolithic bone spoons, and we had shown that spoons were used for feeding. In additional study, presented here, we experimentally produced bite marks by deciduous teeth on pottery. Elastic modulus and hardness were examined using nanoindentation, and samples of 483 bite marks were analysed using SEM with 20–50x magnification, DSLR camera, and profilometer, in order to detect bite marks dimensions. Comparison of experimentally obtained data on pottery, with marks on different types of prehistoric ceramic vessels, give us opportunity to detect prehistoric ceramic „weaning equipment“ and to provide methodological guidance for similar studies which may discover artefacts used for weaning. Further development of methods and approaches to detect artifacts that could have been used for weaning is very important, as the data on the presence, types and quality of production of „weaning equipment“ could provide a lot of information about the communal organization of weaning, attitudes towards children's feeding as well as about its changes over time.

8 A WEAN-WEAN SITUATION: DIACHRONIC PATTERNS OF INFANT AND ADULT DIET IN ANCIENT THESSALONIKI THROUGH THE ANALYSIS OF INCREMENTAL DENTINE

Abstract author(s): Ganiatsou, Elissavet - Souleles, Angelos - Choupa, Maria Nefeli - Bantavanou, Panagiota - Georgiadou, Angeliki (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Protosalti, Tania - Tzevreni, Stavroula - Konstantinidou, Krino - Vasileiadou, Stella (Ephorate of Antiquities of Thessaloniki City, Ministry of Culture and Sports) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

Abstract format: Oral

Technological advances have enabled the analysis of weaning durations on individuals of different sex, age, and archaeological background by measuring the carbon (^{13}C) and nitrogen (^{15}N) isotopic ratios in bone and dentine collagen. The aim of this study is to combine stable isotope analysis and Bayesian modelling to show probabilistic variations between infants', children', and adults' diets over time.

We analyzed individuals dated to the Roman period (168 BC-324 AD) from Thessaloniki, the capital of the Provincia Macedonia that played a leading role in economic, administrative, and cultural transformations in southeastern Europe.

Infant and childhood diets of 65 individuals were reconstructed through the measurement of nitrogen and carbon isotopes on serial dentine collagen samples from their first permanent molars. Additional 160 individuals were analyzed to reconstruct adult diets measuring the $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ ratios on bone collagen from femora. The relative contribution of food sources was estimated with the Bayesian mixing model MixSIAR and weaning duration was reconstructed with the application WEAN.

We found that 57 individuals breastfeed up the age of two or older with different proportions of breastmilk during weaning. 32/57 individuals consumed equal parts of breastmilk and supplementary foods (breastmilk: 55%, fish: 16%, animal protein: 15%, C4 plants:10%, C3 plants: 4%). 25/57 individuals consumed less breastmilk than other foods (breastmilk between 26%-48%, fish: 20%, animal protein: 20%, C4 plants:14%, C3 plants: 4%). Eight individuals

were never breastfed or were weaned shortly after birth (fish: 46%, animal protein: 37%, C4 plants:8%, C3 plants: 9%). Childhood diets differ from adult diets in the consumption of C4 plants, which are used only as infant food. This study sheds light on the infant and adult feeding choices in the southern Roman Empire that reflect impalpable aspects of early life and nutrition.

487 FORTIFICATIONS AND DEFENSIVE BEHAVIOUR IN SOCIO-HISTORICAL AND CONTEMPORARY CONTEXTS: BEYOND SOCIO-POLITICAL COMPLEXITY AND EUROCENTRISM

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Schreiber, Tanja (Institute of Pre- and Protohistoric Archaeology, Kiel University) - Garcia-Piquer, Albert (Department of Prehistory, Autonomous University of Barcelona) - Messal, Sebastian (Lower Saxony State Service for Cultural Heritage) - Podėnas, Vytenis (Lithuanian Institute of History, Department of Archaeology) - Andersen, Anna-Theres (ROOTS of Conflict, Kiel University)

Session format: Regular session

Material remains referred to as fortifications, hillforts, or enclosures have traditionally been associated with stratification, centralisation, and/or the rise of elites competing over power and prestige. In this context, fortified sites represent costly signaling and material manifestations of violent conflicts between people. The emergence of fortifications in small-scale societies has particularly been discussed in connection with resource abundance and the need to protect surpluses, leading to the emergence of territorial ownership and institutionalised social inequality.

However, archaeological and anthropological research, especially outside of Europe, draws a different picture: communities that construct fortifications instead draw upon this de-escalation strategy to defy centralisation and successfully prevent violent conflicts. These principles of autonomy and coordination manifest materially in different forms, including the construction of fortifications, which can be found in societies of various political structures and subsistence strategies. Enclosed sites thus embody particular socio-historical events, negotiations, as well as peaceful and violent interactions between people.

This observation raises the question of how defensive behaviour is connected to social hierarchy in non-western societies, including those in the past. Do socio-political complexity and monumental investments in community defence go hand in hand? Or can the construction of defences be coordinated at various levels of socio-political organisation? Can they actually represent conciliation rather than conflict?

Approaches from disciplines other than archaeology, including written sources, can help to shed light on human social organisation and coordinated defensive action. Of special interest is the potential interdependence of socio-political organisation, landscape modification, and the construction of place in past and living societies. Papers exploring the roles and functions of defensive architecture beyond archaeological sources are especially welcome. The session aims to capture a cross-geographical comparative historic approach to discussing the social implications of fortification construction on a global scale.

ABSTRACTS

1 DON'T EVEN THINK ABOUT IT. EARLY FORTIFICATIONS AS A NEGOTIATION STRATEGY IN THE EASTERN BALTIC

Abstract author(s): Podėnas, Vytenis (Lithuanian Institute of History)

Abstract format: Oral

The development of early fortifications in European prehistory has been understood as both the necessary action for security as well as the establishment of centers for accumulating stock, trade goods, and hosting specialized knowledge. Naturally, a wider variety of artifacts found in these sites compared to unenclosed ones encouraged discussions around the emerging economic power in certain localities. However, the potential actors that caused the perilled environment are hardly identifiable and overlooked. In this paper, I propose to discuss the defensive systems as embedded actions of communities to negotiate the manner of future contacts with extra-local groups of people. This approach allows analyzing communities not only as passive reactors to a potential threat but also as actively engaging in intraregional social and economic development. Late Bronze Age fortified settlements in the Eastern Baltic region were created in varied environments and were not exclusive to highlands or riverine lowlands, but both. This indicates a shared potential for intraregional trade routes in larger river basins and their bordering areas, where land routes between these basins could have been established. Current data support the hypothesis of local communities as active agents in developing regional economic networks and not passive reactors to external threats. This means that for

de-escalation a condition of the unfavorable subject of aggression was unavoidable and necessary before any other contact development could have happened.

2 WALLED PASTORALIST SITES IN WESTERN CHINA: SUBTLETIES OF EMERGING SOCIAL COMPLEXITY

Abstract author(s): Betts, Alison (University of Sydney)

Abstract format: Oral

The highly unusual appearance of walled hilltops in the Bortala Valley in western Xinjiang may be associated with early signs of social inequality among Late Bronze Age transhumant pastoralists. The hilltop sites contain very small clusters of residential structures and overlook one of the richest areas of seasonal pasture in the Bortala Valley in the western Tian Shan. The walls do not fully encircle the residential structures but protect the most vulnerable points of access to the hilltops, and in particular protect against direct access from the pastures. It is suggested that they were lookout posts, with a small garrison of herders prepared to defend the area in the event of attack by rival pastoralist groups. This early sign of direct competition and potential conflict, together with group control over prime resources, is significant in terms of regional patterns of increased social complexity in the Eurasian (eastern Andronovo) Late Bronze Age.

3 CONSTRUCTING FORTIFICATIONS - DECONSTRUCTING COMPLEXITY: HUNTER-GATHERER ENCLOSURES IN SIBERIA THROUGH A POSTHUMANIST LENS

Abstract author(s): Schreiber, Tanja - Piezonka, Henny (Institut fuer Ur- und Fruehgeschichte Kiel)

Abstract format: Oral

Archaeologists have become increasingly critical of the social evolutionary thinking of the 19th century. However, in academic practice many archaeological studies continue to be shaped by evolutionist views on social complexity. This is especially evident in research into the emergence of fortifications attributed to “complex” hunter-gatherers, usually relying on explanations rooted in evolutionary ecology. Such approaches postulate a linear path to social complexity, with environmental changes as the impetus for social change, leading to the construction of defensive sites as manifestations of political power and economic imbalance. Consequently, complexity in hunter-gatherer lifeways is largely explained by the emergence of some form of inequality.

In this paper we seek to demonstrate the benefits of utilizing posthumanist conceptual frameworks in fortification and hunter-gatherer research. By framing social complexity through fluidity and entanglement, we have tested potential relationships between fortification construction and social inequality, using West Siberian hunter-gatherer settlements as a case study. We applied the Gini index to house size distributions of c. 300 fortified and unfortified settlements from the end of the 7th millennium BC to the 17th century AD. Our results reveal a correlation between (i) phases of increased fortification construction and higher levels of inequality and (ii) architectural changes towards homogeneity and a simultaneous decline in inequality, with oscillations between these two modes through time. The social organisation of the Siberian hunter-gatherer communities revealed complex socio-material interdependencies: people were agents with the capacity to act collectively by repeatedly counter-acting emerging inequality through the transformation of architectural space in a way that helped foster community solidarity.

Our paper provides new insights to counteract entrenched evolutionist notions of social complexity in fortification research as we demonstrate the formation of a socio-material network of people, things, and practices coalescing in the formation of hunter-gatherer enclosures in Siberia.

4 GARDENS OR THE BUSH: A COMPARISON OF MĀORI FORTIFICATIONS BETWEEN HORTICULTURAL LANDSCAPES WITH THE NEW ZEALAND HINTERLAND

Abstract author(s): Allen, Mark (Cal Poly Pomona)

Abstract format: Oral

New Zealand featured the development of widespread fortifications to protect people and resources. The vast majority of these are located close to the ocean in areas which were conducive to producing the sweet potato due to lower incidences of frost and longer growing seasons and had ready access to kaimoana (seafood). The Māori economy, however, was largely dependent on gathered plant resources such as the bracken fern root, hunted birds, and fresh-water resources such as eels and mussels. Though less common, fortifications were constructed in inland regions far from appropriate horticultural zones and the ocean. Comparison of these types has thus far been given only cursory attention by archaeologists. This paper examines these through analysis of fortifications in the Heretaunga (Hawke's Bay) region of the east coast of the North Island in the whenua (land) of the iwi (tribe) Ngāti Kahungunu. It utilizes archaeological and environmental data woven together through Māori history and whakapapa (genealogy).

5 INDIGENOUS FORTIFICATIONS ON THE SOUTHERN GREAT PLAINS OF NORTH AMERICA: THE DEVELOPMENT OF WICHITA PALISADES, 1450-1800 C.E.

Abstract author(s): Perkins, Stephen (Oklahoma State University) - Drass, Richard (Oklahoma Archeological Survey) - Vehik, Susan (Department of Anthropology, University of Oklahoma)

Abstract format: Oral

Occupying numerous villages on the southern Great Plains, Native North Americans, known today as the Wichita, figured prominently in the region's political economy during the European Colonial Era. From the 16th to early 19th centuries, ancestral Wichita groups avoided Spanish colonial domination while developing trade relations with French *coureurs de bois* from Louisiana. A number of European reports over these centuries document circular palisades within Wichita villages serving as a refuge from potential native or European attacks. In a well documented incident on Oklahoma's Red River in 1759 C.E., Wichita defenders and Comanche allies decisively repelled a Spanish military expedition sent from southern Texas. In testimony after the battle, Spanish officers described their surprise in finding the Wichita barricaded within a large palisade and condemned the Wichita's French allies for designing it. Modern historians using Spanish colonial documents also attribute historic Wichita fortifications to French design.

For the past twenty years, we have used geophysical analyses, archaeological testing, and excavations at four ancestral Wichita village sites in Oklahoma to gather evidence concerning palisades and their social context. Earlier investigations and our findings demonstrate their indigenous origin. Palisades were constructed 300 years earlier (approximately 1450 C.E.) than historians suggest. They grew in size and complexity over time. Later examples (1700 to 1800 C.E.) indicate greater labor expenditures in digging circular ditches external to the palisades; the construction of semi-subterranean shelters within them; and an increase in their overall circumference. We hypothesize these changes reflect Wichita coalescence into larger villages caused by the intensification of conflict in the southern Plains by 1700. The arrival of horses led to greater mobility in intertribal raiding and increased competition for southern Plains resources like the American bison as tribes sought greater access to European commodities.

6 FORTIFYING THE SOCIAL AND THE BARRIERS TO CONFLICT AMONG THE NATIVE PEOPLES OF LA FLORIDA

Abstract author(s): Thompson, Victor (University of Georgia)

Abstract format: Oral

What are the social barriers to conflict among sedentary people who pursue hunting and gathering economies? Are these barriers manifested in formal institutions that subvert opportunities for conflicts to escalate? If present, to what extent and scale do such institutions operate? Are there tipping points where they cease to function? Do these institutions dramatically differ from those groups who practice agriculture? In this presentation, I consider these various questions by exploring the histories of the various Native American groups that inhabited 16th century La Florida. I compare and contrast both inland agriculturalists, coastal fisher-gatherer-hunters, and groups that pursue a mixed economy of hunting, gathering, and farming to explore both the metaphorical social fortifications these groups created, as well as materialized fortifications, such as palisade walls, related to conflict among these groups. This analysis highlights the differences and similarities in various institutions related to fortification among people following divergent economies in the region.

7 FORTIFYING DEFENSES, DELINEATING COMMUNITIES: INVESTIGATING THE SOCIOPOLITICAL ASPECTS OF COAST SALISH FORTIFICATIONS

Abstract author(s): Angelbeck, Bill (Douglas College) - Grier, Colin (Washington State University)

Abstract format: Oral

For over 1600 years, Coast Salish peoples have employed a range of strategies to construct defensive fortifications at various scales, from small household protections to full palisades shielding a village community. An analysis of these structures provides insight into their forms of sociopolitical organization and labour mobilization. The largest defensive structures that indicate the cooperation of multiple households within a community, which is uncommon for a culture in when the autonomy of local groups generally predominated. Further, such complexity is generally seen as uncharacteristic of fisher-hunter-gatherer societies and others lacking intensive agricultural practices, yet these have been evident in the Salish Sea for at least one to two millennia. Combining ethnographic and oral historical knowledge with archaeological evidence, this research explores the dynamics of Coast Salish sociopolitical organization and labour mobilization in constructing large defensive fortifications in largely decentralized fashion. In so doing, we aim to demonstrate how these fortifications reveal the delineations of community as manifested materially.

8 COAST SALISH FORTIFICATIONS AND THE CONSTRUCTION OF COMMUNITY IN THE POST-CONTACT PERIOD OF THE NORTHWEST COAST OF NORTH AMERICA

Abstract author(s): Grier, Colin (Washington State University) - Angelbeck, Bill (Douglas College)

Abstract format: Oral

With the arrival of settler (European-derived) populations in the 19th century, Coast Salish peoples adopted defensive fortifications similar in style to that used by Colonial powers, including stockades, bastions, and block houses. This adoption has been seen as the borrowing of new techniques to improve Indigenous defensiveness, particularly to meet the threat of armed gunboats and other Colonial military tactics. It is important to recognize, however, that Coast Salish peoples were familiar with and had employed not dissimilar defensive infrastructure for several millennia. With this recognition, several lines of inquiry as to Coast Salish defensive practices and their relationship to community structure emerge. The particular organization of Coast Salish communities has been debated, but their communities have been seen as relatively fluid entities structured along lines other than a common village identity or collective action. The question explored in this paper is whether the kinds of defensive infrastructures employed in the early post-contact period (from roughly the early 1800s) both required and materialized new forms of community organization that were structured more by defensive considerations than prior to contact. Given the dramatic demographic changes and social upheaval of the 1800s, we consider how the shifting nature of defense relates to the re-organization of communities to face qualitatively different external and existential threats than prior to contact.

9 A SEAFARING PERSPECTIVE: EXPLORING THE INTERPLAY BETWEEN BOATS, WATERSCAPE AND DEFENSIVE STRATEGIES ON THE NORTHWEST COAST OF NORTH AMERICA

Abstract author(s): Garcia-Piquer, Albert (Universitat Autònoma de Barcelona; Washington State University)

Abstract format: Oral

Archaeological research of the past decades provides abundant evidence for the indigenous development of labor-intensive fortifications as well as for the use of defensive sites, forts or refuge rocks, throughout the Northwest Coast of North America. The organization of defences and their materialization in defensive features in the landscape have been fully analyzed (e.g. Angelbeck 2016), as well as the quantitative relationships between site location, fortifications and the defensive qualities of the landscape (Martindale and Supernant 2009). Adding to previous studies, this work will address hunter-gatherer fortifications or defensive sites from a water-based, seafaring perspective. Indeed, at least during the early contact period, boats -particularly large war canoes- were the cornerstone of a regular form of interaction between indigenous communities that consisted of surprise attacks and rapid retreats. Therefore, the shoreface of sites can be thought as the frontline of defensive organization. As it has been pointed out, particularly on the North coast, exposition to local winds and even the presence of swirling tidal currents provided additional protection from attacking enemies (Moss and Erlandson 1992). In that sense, the work will explore the way in which water-based defensive qualities (coastal outline, currents, winds, eddies...) were integrated into the broader defensive organization of settlement. The spatial differences in the accessibility or defensibility of local waterscapes within and between regions of the Northwest Coast will be evaluated with quantitative and GIS-based methods, with particular attention to differences between coastal and riverine systems. Finally, the research will discuss the ways in which the development of advanced transport technology -its social implementation- helped to stimulate new levels of socio-political complexity, perhaps intensifying both violent and non-violent interactions between indigenous communities.

10 SO BIG, IT GOT LOST. THE REDISCOVERING OF SAXO'S PUBLIC FORTIFICATION

Abstract author(s): Lauritsen, Leif (Museum Lolland-Falster)

Abstract format: Oral

In early autumn 2016, Museum Lolland-Falster carried out a small excavation on a location called "Trygge Castle", a hourglass-shaped ridge with steep slopes on 3 sides. According to the academic view of the site, nothing of the medieval castle, located somewhere on this ridge, should have survived the decades of plowing.

But folklore, priests and the medieval historian Saxo told about a place in the surroundings where all of the people of the rather big island of Falster could seek refuge when attacked and a local village is named after the Danish name for a public fortification a "virket". A fortification was in the start of the 20th century located as up to three, up to 1,5km long and half circle shaped moat and rampart running through the forest of Hannenov bog and forests. Around 1,5 km from the mentioned ridge. Shortly after the discovery of these ramparts in the forest were proclaimed to be The public fortification told about by Saxo.

Local folklore and the local inhabitants in the surroundings kept claiming that the place for the common stronghold was on or near Trygge Castle, but around 1930 these claims faded away. The excavations of 2016, 2020 and 2021 at the Trygge site now points to the site for the Virket at the location of the Folklore.

A MEDIEVAL FORTRESS IN THE LIGHT OF WRITTEN SOURCES AND ARCHAEOLOGICAL DATA - THE CASTLE OF CSÓKAKŐ (HUNGARY)

Abstract author(s): Kovács, Bianka (Institute of Archaeology, Research Centre for the Humanities, Budapest) - Hatházi, Gábor (Ministry of Culture and Innovation, Budapest) - Kovács, Gyöngyi (Institute of Archaeology, Research Centre for the Humanities, Budapest)

Abstract format: Oral

Many of the written sources of the medieval Kingdom of Hungary were destroyed as a result of the Ottoman-Hungarian wars in the 16th and 17th centuries and later the Second World War. Because of these events, there are relatively few medieval fortress of which we have significant written sources from the period. The castle of Csókakő provides a good counter-example in this respect. Csókakő is located about 25 km from Székesfehérvár, the crowning city of medieval Hungary. The castle was built in the second half of the 13th century on the edge of the Vértes Mountains. It was owned by royalty and important lords during the Middle Ages, and came under Ottoman rule in 1543-1544, which was essentially continuous until 1687. The building's destruction began after the first decades of the 18th century.

Between 1996 and 2017, considerable archaeological researches and monument restoration works were carried out on the castle grounds. So the area of the fortress is almost completely known archaeologically, providing a good basis for comparison with written sources.

There are several direct and indirect written sources about the castle and its estates from the 15th-17th centuries. These sources and the archaeological data complemented, confirmed or refuted each other during the research. There are also descriptions of the castle from the 18th-19th century, which provide a basis for the interpretation of some architectural details and early modern artefacts. In our presentation we will present lessons learned from the use of this data, which may also be useful for researching similar strongholds in the wider area.

RARE AND PRECIOUS. RECENT ADVANCES ON THE ANALYSIS OF ARCHAEOLOGICAL WOOD [PAM, ARCHWILD]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Leder, Dirk (Niedersächsisches Landesamt für Denkmalpflege) - López-Bultó, Oriol (Department of Prehistory, Universitat Autònoma de Barcelona) - Vidal-Matutano, Paloma (Department of Prehistory and Natural Sciences, University of Basel) - Piqué Huerta, Raquel (Department of Prehistory, Universitat Autònoma de Barcelona) - Milks, Annemieke (Department of Prehistory, University of Reading)

Session format: Regular session

Archaeological knowledge of past technologies is generally founded on durable materials such as stone, pottery or metal. However, most material culture in the past consisted of perishable organic materials that are now all but absent from the archaeological record. The rare preservation of organics affects our understanding of ancient lifeways where wood was an essential raw material used for fuel, timber, tools and crafts. Woodworking was an essential craft activity in the past involving deep knowledge of plant availability, the mechanical properties of species, and the development of specialized tools for managing, obtaining and transforming wood. For this reason, the study of wooden artefacts and woodworking tools provide valuable information on traditional technological and ecological knowledge.

Despite the difficulty in identifying and recording woodworking activities in the past, tool marks on wood remains are the most direct evidence and they are known from contexts as early as the early Pleistocene. This session aims to bring together specialists on the analysis of archaeological wood through archaeobotany, experimental archaeology, tool-mark analysis, use-wear analysis, dendrology or ethnoarchaeology. Contributions from any geographical and chronological context are welcome. We particularly invite submissions highlighting new methodological approaches, analytical tools, and protocols to identify, record, and analyse wood technologies.

ABSTRACTS

1 THE COMPLEXITY OF MANUFACTURE AND DESIGN OF MIDDLE PLEISTOCENE WOODEN TOOLS

Abstract author(s): Milks, Annemieke (University of Reading, Department of Archaeology) - Leder, Dirk (Lower Saxony State Office for Cultural Heritage) - Koddenberg, Tim (Georg-August-University Göttingen) - Lehmann, Jens - Terberger, Thomas (Lower Saxony State Office for Cultural Heritage)

Abstract format: Oral

One-piece wooden implements are known from a small number of African, Asian and European Middle Pleistocene archaeological sites. Objects are interpreted on the basis of morphometrics, use-wear analysis, ethnography, and ex-

periments as digging sticks, planks, hunting spears and throwing sticks. They are characterised as ‘simple’ because they are one-piece tools made of a material characterised as easily sourced and worked. Some researchers, notably Miriam Haidle, show the multi-step process to craft ‘simple’ wooden spears, such as those from the MIS 9 site of Schöningen. However in absence of detailed analyses, it was impossible to appreciate the depth of manufacturing processes and design. Here we share a case study of a double-pointed stick from Schöningen, analysed within a framework using nomenclature developed specifically for the analysis wood tools. We share details showing a focused acquisition of raw material, and a multi-step manufacturing process to craft an aerodynamically and ergonomically designed tool.

On the basis of lithics and dating, Schöningen is typically referenced as Lower Palaeolithic. We argue that the wood-working by Middle Pleistocene hominins at Schöningen and elsewhere foreshadows future Middle Palaeolithic technological and material innovations. For example, the selection of and potential orientation of the tool to take advantage of harder wood anticipates later innovations involving use of harder weapon tip materials including stone and bone. Evidence of seasoning and possible application of fire treatment also foreshadows subsequent innovations such as treatment of lithics in the African Middle Stone Age, and other transformative technologies like adhesives during the Eurasian Middle Palaeolithic. Treatment of the raw material, a preconceived design and selection and orientation of the blank, and a multi-step manufacturing process implies a complexity that cannot be understood without this in-depth analysis. The nature of complexity of manufacture and design in turn implies significant skill and a complex learning process.

2 METHODOLOGICAL ADVANCES IN THE ANALYSIS OF THE SCHÖNINGEN WOODEN HUNTING WEAPONS

Abstract author(s): Leder, Dirk (Lower Saxony State Office for Cultural Heritage) - Milks, Annemieke (University of Reading) - Koddenberg, Tim (Georg-August-University Göttingen) - Lehmann, Jens (Lower Saxony State Office for Cultural Heritage) - Terberger, Thomas (Lower Saxony State Office for Cultural Heritage; Georg-August-University Göttingen)

Abstract format: Oral

Wood as a raw material is a widely available resource, that is relatively easy to work and shape, quite resilient, and thus has been used by humans since prehistory. Its importance in daily activities of prehistoric people has thus been acknowledged by archaeologists for a long time. Unlike lithics, pottery, or metal artefacts, artefacts made from wood rarely survive in the archaeological record and thus omit pivotal evidence connected to a major component of past human material culture and daily life. The Middle Pleistocene site of Schöningen has provided a wealth of not only lithics, worked bone, and processed faunal remains, but first and foremost wooden artefacts with an outstanding preservation. During rescue excavations in an open cast lignite mine between 1994 and 1998, Schöningen 13 II-4 – the so-called spear horizon – has delivered ten spears, one throwing stick, and another pointed and partially charred artefact called Bratspieß or skewer. While these items have been published in a number of papers over the years what has been missing is a thorough evaluation of the complete wood assemblage and an in-depth study of traces connected to crafting, use, re-use, and taphonomy on a piece by piece basis. As part of a research project funded by the German Research Foundation (DFG), we performed such studies following recently developed standards for the analysis of wooden artefacts in accordance with chaîne opératoire principles. This approach provides new insights into past human craftsmanship, raw material selection, tool use, re-use, and taphonomy. We will present our applied methodology exemplified based on well-documented wooden hunting weapons from Schöningen 13 II-4. Our results provide an advanced understanding of past human behaviour and planning depth while expanding our knowledge of woodworking workflows in Palaeolithic hunter-gatherers.

3 WOODEN INDUSTRY AT THE MIDDLE PALAEOOLITHIC SITE OF ARANBALTZA. NEW INSIGHTS ON NEANDERTAL WOODWORKING IN THE IBERIAN PENINSULA

Abstract author(s): Lopez-Bulto, Oriol (Universitat Autònoma de Barcelona) - Rios-Garaizar, Joseba (Bizkaiko Arkeologi Museoa) - Piqué, Raquel (Universitat Autònoma de Barcelona) - García Boullosa, Laura (Bizkaiko Arkeologi Museoa)

Abstract format: Oral

The production and use of wooden tools in the European Lower- Middle Palaeolithic has been indirectly attested through use-wear analyses, but direct evidence is much more scarce, most likely due to preservational biases, and only a few sites have yielded preserved wooden tools. Aranbaltza III is part of this select group of a few archaeological sites due to the identification of a short yew digging stick, the oldest wooden tool in the Iberian Peninsula. In this work, we will complete the overview of the wooden industry at Aranbaltza III by presenting the archaeobotanical, technological and functional analysis of other fourteen carbonised and organic wooden archaeological materials from US4-US6 excavated at the test pit made in 2015.

Aranbaltza III is an archaeological site which includes several archaeological horizons dated between ca. 137 and 50 ka, attesting to the long-term presence of Neandertal communities in the North of Iberia. Therefore, the materials presented in this work will be a unique insight into Neandertal woodworking in the Iberian Peninsula and an extremely valuable complement to the scarce information on European Palaeolithic archaeological wood. The analysis of the materials will show tool marks, morphological features of the wooden elements, and a broad strategy of taxonomical selection.

4 VINTAGE WINE LOOKING FOR A NEW BOTTLE? - TOOLMARK ANALYSIS THEN AND NOW

Abstract author(s): Sands, Rob (UCD School of Archaeology)

Abstract format: Oral

Nearly 33 years ago, as part of PhD research at Edinburgh University, I began the process of working out how to record and analyse toolmarks found underwater on an Iron Age lake dwelling site in Scotland. In fact my interest in these marks had begun 2 years earlier, when, as an undergraduate, I had been diving on the site to gain excavation experience. In the process I was introduced to the topic that was to become the basis for my undergraduate thesis and subsequently my PhD. After completion of the PhD in 1994, I wrote a small book summarising the findings of this research, published in 1997. Since that time I left and then returned to archaeology. Remarkably, at least to me, over the intervening years the book has continued to be cited. However, it is a work that was written three decades ago and the techniques available to us have moved on in ways that were simply unimaginable in the early 1990s. These new approaches and technologies are now being used in excellent and imaginative ways by new generations of researchers. This short presentation will summarise and reflect on my original work, the questions it posed and the potential it sought to examine. In doing so the paper will explore how things have changed, how the exploration of toolmarks is being realised today, and some of the questions that remain.

5 EXPLORING DRINKING PRACTICES IN NORSE GREENLAND: INTERDISCIPLINARY ANALYSIS OF A UNIQUE TYPE OF STAVE-BUILT VESSELS

Abstract author(s): Pinta, Élie (School of Human Evolution and Social Change, Arizona State University; Museum of Archaeology, University of Stavanger)

Abstract format: Oral

Wood was an essential material for people living in most parts of Scandinavia. Recent archaeological data obtained from Viking Age and Medieval sites across the North Atlantic islands (c. 9th-15th century) show that there too, Norse settlers continued to rely heavily on this material despite more limited access to wooden resources.

In Greenland, wooden stave-built vessel components represent some of the most common finds in Norse contexts. Recent studies indicate that most staves were used to manufacture small, open-topped vessels that could be used for a wide range of domestic activities but are most likely linked to the preparation and consumption of food and drinks. Among a sample of over 700 wooden 'small finds' from Norse Greenlandic farmsteads, a handful of staves – mostly made of juniper wood (*Juniperus* sp.) – were identified as pieces of refined cups frequently displaying intricate decoration. These may well have been used to consume specific beverages – alcoholic or not – and/or on certain occasions.

In this presentation, I use ecological, technological, and ethnological data, along with literary sources, to explore drinking practices at the edge of the Norse world. Which types of beverages were consumed and by whom? Are these vessels a material representation of cultural connections and trends shared across the Norse diaspora? Can we identify local adaptations in the form of vessel types, or the manufacturing processes involved in their making? Do the consumed products vary due to environmental factors? I will explore these questions in the context of past and present drinking practices from across northern Europe.

6 THE WOODEN SOUL OF THE FORTRESSES IN THE IBERIAN PENINSULA MIDDLE AGES

Abstract author(s): Celma Martínez, Mireia (ARHIS, Universidad de Murcia) - Eiroa Rodríguez, Jorge A. (Universidad de Murcia) - Martín-Civantos, José María (Universidad de Granada) - Rouco-Collazo, Jorge (INCIPIT-CSIC) - Baño López, Ana (Freelance archaeologist) - Baños Serrano, José (Ayuntamiento de Alhama de Murcia) - Bellón Aguilera, Jesús (Freelance archaeologist)

Abstract format: Oral

Medieval fortifications evidence the use of plants as auxiliary elements in much of its constructions. In archaeological and reintegration interventions, the presence of remains of needles, beams, and other fiber elements in the already deteriorated walls is usually detected, which have lost their lining and exposed the interior to the weather.

Both discovery and recovery are extremely limited, making it a rare and precious material where interventions have been mostly carried out in the circumstantial recovery of these elements to obtain radiocarbon dating and thus con-

trast the results with the whole material locally. In others, their remains have been extracted and deposited, as the result of conservation and restoration work, pending consultation by researchers. From the written sources, it should be noted an increasing presence of the fluvial and long-distance Mediterranean timber trade. The DendroMED research line, ARHIS Research Group (www.um.es/arhis), arises from the need to deepen forestry for the use of woody plants and fibres in monumental constructions in the peninsular territory and, specifically, in the southeast (current territory of extreme aridity) to observe the existence of territorial and chrono-cultural differences to approximate the capacities of forest management according to the changing medieval geopolitics, considering the paleoecological environment.

The results of the detection and analysis of more than 47 fortresses dating from the 11th to 15th centuries have been collected, with up to 21 taxa used for the construction, where differentiated patterns of wood use have been identified. Along with the written resources and the identified taxa, more archaeometry and GIS analyses are in development.

7 THE USE OF WOOD AND CHARCOAL IN THE CONSTRUCTION OF THE ROYAL BURIAL MOUND GOMILA IN JALŽABET (CROATIA)

Abstract author(s): Kovacevic, Sasa (Institute of archaeology, Zagreb)

Abstract format: Oral

One of the most significant prehistoric landscapes in continental Croatia lies south of the Drava River in the Jalžabet and Martijanec micro-region, southeast of Varaždin, in the Plitvica - Bednja Rivers basin (Northwest Croatia). This Early Iron Age landscape consists of the remains of extensive settlements, necropolises, and some of the largest burial mounds in Central Europe. The recent rescue archaeological excavation of Gomila in Jalžabet brought to light an extraordinary amount of data from closed archaeological contexts, while the most important finds from burial mound 2 (excavated in 1989) are already well known. In these monumental tombs made of wood and stone with a square floor plan and ceremonial access corridors - dromoi, we recognize the last resting places of the Hallstatt aristocracy. The burial mound Gomila in Jalžabet is one of the largest prehistoric monuments of its kind ever researched in central Europe and we assume that it belongs to the last in a series of rulers of the Eastern Hallstatt Culture (mid-6th century BC). Among the wide spectrum of finds, a special place belongs to the complex construction of a monumental burial chamber. Large quantities of charcoal were thrown on the outside of the wooden-stone burial chamber. The reason behind this practice is still not clear.

8 KNOWLEDGE, SKILLS AND RESOURCES: WOOD CRAFT AS AN INDICATOR OF DIVISION OF LABOUR AND SPECIALISATION IN ANCIENT TIMES

Abstract author(s): Boenke, Nicole (Ruhr-Universität Bochum)

Abstract format: Oral

Wooden materials in archaeology are often not considered to be precious, if they do not represent exceptional evidence of elaborate craftsmanship. At best, the fact that wooden artefacts are often only rarely preserved makes them appear desirable. In cases when favourable preservation circumstances allow the numerous transmissions to the cultural heritage, thousands of wood-fragments beside entire wooden artefacts easily appear as a logistic problem for archaeological excavators and institutions because of their demands on the storing facilities. In those cases, wood seems to be more irritating than valuable.

The announced paper will deal with different approaches in manifesting the "value" of wood at archaeological sites as well as the value for the ancient societies themselves. In this respect, the value of wood is not only measured by the degree of its availability or in the uniqueness of the processing techniques or surface treatments. Rather, the degree of utilisation and the care of craftsmanship are important factors of the rating, even if the artefact itself seems to be of minor interest. The perception of daily practice in this case represents a value in its own right.

The considerations presented base on comparative case studies of tools, other artefacts and waste wood from ancient salt exploitation sites from Europe and Western Asia with their special needs for archaeological conservation. The paper will illustrate how the documented skills and knowledge of the ancient craftsmanship do contribute to the discussion of sociocultural conditions if we are thinking in dimensions of how to trace specialization or the division and organisation of working processes.

9 WOOD IN THE BRONZE AGE EURASIAN STEPPE CULTURES: IDENTIFICATION, VARIATIONS OF 87SR/86SR ISOTOPES AND RECONSTRUCTION OF ANCIENT LANDSCAPES

Abstract author(s): Shishlina, Natalia (EAA)

Abstract format: Oral

In the south of the East European Plain wood was used by different population groups as construction material. Xylo-tomic analysis of wood samples helped to determine taxonomic affiliation of wood fragments. The estimated variations in the strontium isotopic ratios of wood samples are helpful in understanding whether wood was local or nonlocal. Most analyzed items were made of wood that came from the tree species which naturally lived and reproduced in the areas where the sites are located. Direct radiocarbon dating of the wood samples from the analyzed assemblages confirms that in 3000 calBC maple, ash, oleaster, willow, elm and aspen grew in the south of the East European Plain.

Thus, forest resources were actively exploited by the populations. Another important result of the study is the conclusion that the wood used to make the parts of the wagon found in a Catacomb grave at Ulan IV was local. It means that, most likely, the wagon was made in the Sal-Manych steppes. The pollen spectra of the buried soil also confirm the results of the analysis performed to estimate variations in the strontium isotopic composition of the examined wood fragments. These data show that by the early 21st century the steppe landscapes were completely changed through human economic activity.

10 ASSESSMENT OF MANUFACTURE AND USE OF PREHISTORIC WOODEN ARTIFACTS BY BIOMOLECULAR ARCHAEOLOGY

Abstract author(s): Bertin, Ingrid (Departament de Prehistòria, Universitat Autònoma de Barcelona; CEPAM, UMR 7264, Université Côte d'Azur) - Colonese, André - McGrath, Krista (ICTA, Departament de Prehistòria, Universitat Autònoma de Barcelona) - Piqué, Raquel (Departament de Prehistòria, Universitat Autònoma de Barcelona) - Théry-Parisot, Isabelle (CNRS, CEPAM, UMR 7264, Université Côte d'Azur)

Abstract format: Oral

Wooden artefacts are exceptionally preserved in Mesolithic and Neolithic contexts of the Iberian Peninsula. La Draga (Banyoles, Spain), dated 5300–4900 cal BC, is one of the few Early Neolithic sites particularly rich in plant-based objects and with a high diversity of wooden objects: bowls, spoons, combs, sickles, handles, needles, worked wooden sticks, arrows and armaments... Previous studies on these objects focused 1) on the assessment of functionality by reconstructing their original shape and looking for use-wear traces, 2) on plant resource management through taxa identification and in correlation with other archaeobotanical proxies, and 3) on material technology by studying anatomical features and tool marks. However, little has been done to explore the organic residues present on many items, which can attest the exploitation of certain resources and on the manufacture of complex and composite artifacts, including plant fibers, adhesives, resins or waterproofing substances in addition to wood. These superficial residues can also shed new light on the direct use of these objects, and provide valuable insights into the substances stored, sealed, processed, and treated within them. This research aims to present the preliminary results of biomolecular analyses applied to these plant artefacts, and to highlight the interest of this method to identify technological knowledge related to the production and use of these objects. Macro and microscopic observations coupled with chemical analyses allow the identification of the material used in the composite artefacts. The identification of protein makes it possible to determine the nature of the residues and to know whether they come from animal or plant resources, and in some cases to specify the type of product and its origin. The work involved in the entire artefact's production could be highlighted, and different specific uses identified.

491 ATLANTIC CONNECTIONS IN THE FIRST MILLENNIUM AD: CERAMICS, TRADE AND ANYTHING ELSE?

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Doyle, Ian (The Heritage Council of Ireland) - Duggan, Maria (School of History, Classics and Archaeology, Newcastle University,; British School at Athens)

Session format: Regular session

This session takes a starting point from a growing understanding of the complexity of trade and exchange along Europe's western Atlantic fringe in late antiquity and the early medieval period. A better understanding of ceramic exchange from the fifth to the seventh/eighth centuries AD has developed in recent years through the increased networking of researchers and better data. Coherent terminology across the Mediterranean and Atlantic zones has helped improve knowledge of the distribution and chronology of late Roman fine wares and amphorae. While there has been a longstanding recognition of imported coarse wares in western Britain and Ireland (the so called 'E ware'

pottery type) there is now a growing body of knowledge of these same ceramic types in their area of production in western France.

While imported ceramics of early medieval date have been long studied in western Britain and Ireland they are generally seen as a phenomenon peculiar to the fifth-seventh centuries. This session seeks to place these imports against a broader, long-term background of exchange along Europe's Atlantic littoral in the first millennium AD. How does this 'post-Roman'/early medieval dynamic connect with systems of commodity exchange active in the Atlantic region in the first half of the first millennium and what is the evidence for this? What can development-led and research excavations and artefact analysis conducted over the past twenty years tell us about enduring networks of trade or redistribution, or patterns of consumption, in the Atlantic zone? Do the ceramics that we see in western Britain and Ireland represent demand for liquid cargoes and dining vessels, or were other items also in circulation? What were the dynamics in western France, Portugal and Atlantic regions of Spain that led to the circulation of Mediterranean and Atlantic pottery and other exotic goods in the Irish Sea area?

ABSTRACTS

1 ANYTHING ELSE? AN IRISH ENTREPÔT AND THE ROMAN WORLD

Abstract author(s): Baker, Christine (Independent)

Abstract format: Oral

Drumanagh promontory fort is a nationally important Iron Age archaeological site and is of international significance in terms of Ireland's relationship with the Roman world. The site which consists of a headland of c.46 acres defended by a series of earthworks has long been acknowledged as of being of great significance in the context of Roman trade along the east coast of Ireland. Three seasons of community-based research excavation have been undertaken to date, and the results, from structure types, evidence for textile and craftwork, to the recovery of at least four different types of pottery, glass vessels fragments and personal adornment from the Roman Britain and beyond, are adding immeasurably to our knowledge of this Iron Age site and its place in the world. This paper will detail the imported finds which date to the 1st-3rd century AD and attempt to place them in the context of trade and redistribution.

2 TINTAGEL, CORNWALL, UK, IN LATE ANTIQUITY: RECENT RESEARCH EXCAVATIONS TCARP2016-2017

Abstract author(s): Nowakowski, Jacky (Freelance archaeologist) - Scutt, Win (English Heritage) - Duggan, Maria (University of Newcastle) - Bayliss, Alex - Campbell, Gill - Baker, Polydora - Paynter, Sarah (Historic England) - Tyson, Rachel (Freelance glass specialist)

Abstract format: Oral

The spectacular coastal citadel of Tintagel, north Cornwall, UK, occupies a special place in late Antique Britain and early medieval research. Excavations in the 1930s and 1990s have revealed exceptional archaeology with artefactual evidence for connectivity with maritime networks along the Atlantic sea-board and places in the Mediterranean basin. Such connectivity has framed narratives about the distinctive character and identities of elite communities in early medieval South West Britain. The site continues to yield new data and major results from recent excavations by Cornwall Archaeological Unit for English Heritage Trust in 2016-2017 will be presented (TCARP – Tintagel Castle Archaeological Re-search Project). Intact buried middens, early buildings, exceptional faunal and plant data alongside late Roman imported pottery, glass, and critically, a major scientific dating programme, have all provided the opportunity to enhance interpretation about an exceptional place, and the servicing and functioning of an elite settlement dating to the late 5th and 6th centuries AD.

3 POTTERY IMPORTS TO THE ATLANTIC SEABOARD IN THE 1ST MILLENNIUM AD – THE VIEW FROM TINTAGEL

Abstract author(s): Duggan, Maria (Newcastle University) - Kiriati, Evangelia - Müller, Noémi (Fitch Laboratory, British School at Athens)

Abstract format: Oral

This talk will use the coastal headland site at Tintagel, Cornwall, UK, to consider shifting maritime networks in the Atlantic Seaboard region during the 1st Millennium AD. The phenomenon of Byzantine/ 'post-Roman' Mediterranean and Continental imports to sites in the coastal landscapes of western Britain and Ireland will be reviewed against earlier patterns of exchange, extraction, and consumption. The talk will focus on results of a British Academy project held at Newcastle University in collaboration with the British School at Athens, to catalogue the entire historic collection of 5th/6th century imports from Tintagel, and will highlight scientific analysis conducted at the Fitch Laboratory, which has revealed new types of pottery (transport amphorae) for Britain. Emerging patterns of demand and consumption

will be considered, as well as understandings of the function of imported commodities, such as wine and slipped tablewares, within regional power dynamics. Finally, the Tintagel assemblage will be reviewed against Atlantic exchange patterns developing from the later 6th century, typified by the transport of E ware coarseware and glass.

4 RECENT WORK ON IMPORTED CERAMICS IN 5TH- 7TH CENTURY IRELAND

Abstract author(s): Doyle, Ian (The Heritage Council of Ireland)

Abstract format: Oral

There has been a longstanding recognition of imported coarse wares in western Britain and Ireland (e.g., the Mediterranean fine wares and amphorae and the 'E ware' pottery type) and there is now a growing body of knowledge of these same ceramic types in their area of production in western France and in places like Vigo in northwest Spain.

In Ireland the increased pace of archaeological excavations has led to an improved understanding of these imported pottery types. This paper will set out recent analysis from the high status trivallate ringfort enclosure at Garranes, Co Cork, from a series of excavations at the mouth of the river Boyne, in eastern Ireland and point out zones of contact and activity associated with early medieval power centres.

The Garranes inter-disciplinary project (2011-18) revisited the excavation results from 1937 and allowed a reassessment of the chronology of the pottery assemblage at what is probably a royal settlement complex. Increased planning-led archaeological excavation in the area south of Drogheda, south of the river Boyne has created opportunities to see early medieval settlement and funerary landscapes. In this location significant quantities of imported ceramics were mediated through coastal contact points to be redistributed further inland with the river Boyne acting as a means to access the interior of the then kingdom of Brega.

5 UNITING THE STUDY OF E WARE: NEW UNDERSTANDINGS AND A NEW CHARACTERISATION OF AN ATLANTIC SEABOARD CERAMIC PRODUCT

Abstract author(s): Fernández Fernández, Adolfo (Universidade de Vigo) - Cau Ontiveros, Miguel (ERAAUB) - Fantuzzi, Leandro (Universitat de Barcelona) - Guitton, David (INRAP) Marache, Valérie (Bordeaux Council) - Le Bomin, Joachim (Institut français d'archéologie orientale) - Duggan, Maria (Newcastle University) - Doyle, Ian (Heritage Council) - Campbell, Ewan (University of Glasgow)

Abstract format: Oral

This paper will establish a 'state of knowledge' for E ware pottery, and consider new understandings of its composition, production, typology and distribution. This ware was originally categorised through its discovery at sites in western Britain and Ireland of c. 6th-8th century date, but its precise origin and function have been widely discussed in by different scholars.

This talk will summarise knowledge of this ware as an Insular import, before introducing new information on discoveries in its (now recognised) source region of South West France, as well as finds from North West Spain, signifying export routes heading southward through long-lasting Atlantic networks. This talk will also introduce a new project, with analysis conducted at the University of Barcelona, which represents a unified, international effort to characterise by a combination of various methods (XRD, XRF, OM...), examples of this pottery from all countries within its zone of distribution along the Atlantic Seaboard.

A. BLACK-BURNISHED 1 AND MEDITERRANEAN IMPORTS: THE FRENCH ATLANTIC SEABOARD, ANOTHER MEDITERRANEAN DOOR TO BRITANNIA DURING THE FOURTH CENTURY AD

Abstract author(s): Guitton, David (INRAP - National Institute for Preventive Archaeological Research; Université de Poitiers) - Sireix, Christophe (Bordeaux Métropole)

Abstract format: Poster

Discoveries in recent years of a few examples of Black-Burnished 1 pottery on the French Atlantic coast, more precisely in Bordeaux and its surroundings, can be seen to attest another trade route linking Britain and Ireland and Mediterranean during the second half of the 3rd and 4th centuries AD. If the main route remains the fully maritime course skirting the Iberian Peninsula, another axis is possible: firstly by sea to Bordeaux, then by river to Narbonne, and then across the Gallic Isthmus. The non-negligible import of Mediterranean ceramics (North African red-slipped ware; African, Oriental and Palestinian amphorae...) to Bordeaux and Saintes in the 4th century affirms the vitality of existing links with the south, and highlights the role played by the traditional riverine route of the Gallic Isthmus – and furthermore positions this part of the French Atlantic coast as an immediate and privileged contact zone between British and southern merchants.

B. SOCIO-ECONOMIC IMPACTS OF THE EXPOSURE TO ROMAN CERAMICS IN THE INLAND IRON AGE COMMUNITIES: A QUANTITATIVE APPROACH

Abstract author(s): Rodríguez Nóvoa, Alba - Brughmans, Tom (Aarhus University) - Fernández Fernández, Adolfo (Universidade de Vigo)

Abstract format: Poster

How did the first ever exposure to Roman imported material culture at inland sites affect local material culture practices? What does this reveal about the speed and nature of cross-cultural influence between Roman and Iron Age communities? And about the specific dynamics of integration within the Roman Empire of inland sites? Our ability to address these key questions about the exposure of Iron Age communities to the Roman world is hampered by a research bias in classical archaeology towards the study of ceramics contexts from coastal sites. In this poster we present the first replicable quantified contextualised ceramics data analysis to address these questions, through a study of more than 150,000 sherds from inland sites in the northwestern Iberian Peninsula. We conclude that century-long gradual changes in local common wares and amphorae from Iron Age traditions to Roman-inspired forms reflect changing food consumption and production and consumption behaviours. This transition is also reflected in an increasing presence of imported Roman goods. Our results suggest very gradual but increasing integration with the Roman world and ceramic data patterns correlate with known events from textual sources: Caesar's campaign, the Augustan Cantabrian wars, and the Flavian reforms.

495 LANDSCAPE ARCHAEOLOGY AND ORAL TRADITION

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Vieira, Alexandra (CITCEM.FLUP; Instituto Politécnico de Bragança) - Kyriakidis, Evangelos (The Heritage Management Organization)

Session format: Regular session

To study landscapes in their multitemporality, to make their biographies, we must be aware of two types of phenomena. Firstly, we emphasize the “visible elements”, materialized by archaeological evidence. Secondly, we must consider “the invisible elements”, the immaterial or symbolic dimension of the landscape, which we can try to understand through the analysis of the oral tradition as the manifestation of the social memory of a local community. The landscape is shaped by the intertwining of temporal and spatial relationships.

The practices that perpetuate social memory are inscribed in the landscape and inscribe the landscape itself in the memory of the local communities, since it can be preserved through the continuity of all kinds of practices, either with the same content and/or form, or, through the creation of legends and/or superstitions. To study the way archaeological remains have been integrated into popular beliefs we must be aware that the traditional tools of Archaeology are not enough. So, in order to understand the “time depth” of the landscape and try to make its “biography”, it is essential to analyse their oral tradition, as well as the place names, the historical documentation, the legends, superstitions, practices and beliefs.

Several questions related to these themes can be made, namely: under what circumstances were these archaeological sites discovered? What legends are associated with them? What memories of these sites have been preserved by local communities? How were the vestiges of previous occupations integrated or not? How were materials and structures reused? Is the place name related to the archaeological remains? In short, how can archaeologists study the immaterial dimension of landscapes of the “past” and how are the material traces of these landscapes perceived in current landscapes?

ABSTRACTS

1 THE ROLE OF LOCAL BELIEFS IN SHAPING A SITE: EXAMPLE OF BABIN GRAD IN CROATIA

Abstract author(s): Igljic, Sara (University of Zadar) - Vrkić, Šime (Independent Researcher) - Kulenović, Igor (University of Zadar)

Abstract format: Oral

Landscape archaeology has seen a rise in popularity during the last few decades in Croatia. In the karst regions of the country, the material traces of the past are highly visible in the landscape. As such, the immateriality of landscapes defined in beliefs, oral tradition, and practices is often omitted. The case study of an archaeological site Babin grad is presented in the light of a new perspective that focuses on the local knowledge surrounding the site. It is a fortified position on the river Krupa, near Obrovac in Croatia, with several different accounts of the origins of the name of the site. In older archaeological records there is little to no mention of Babin grad, but its importance and existence are defined through the local oral traditions and the place the site occupies in various stories of the area. This paper will

present a valuable source of research: relationships and perspectives of local communities toward archaeological sites and how it can help us understand the shaping of the landscape in all its temporalities.

2 THE DOUBLE ROLE OF ORAL SOURCES: FROM OBJECT TO SUBJECT OF THE RESEARCH PROCESS IN BOSCO FONTANA SITE (LIGURIAN APENNINES)

Abstract author(s): Piu, Caterina - Stagno, Anna Maria (LASA - Università degli Studi di Genova)

Abstract format: Oral

This presentation offers a methodological reflection about the role of oral sources within archaeological research through the case study of Bosco Fontana site (Val d'Aveto, Rezzoaglio, GE) which has been owned by members of the Fontana family since the mid-15th century and now by their heirs united in the "Family Communion of Bosco Fontana". This study focuses on the archaeological analyses of the traces of past forms of environmental resources management and the transformations that affected them over the centuries, especially in relation to the rights of access and use of environmental resources that has sometimes generated jurisdictional conflicts.

The interest of the research stems precisely from the role that these people play: this study, in fact, originated thanks to the local community's urging to analyse and reconstruct its own history not only to make it usable to a wider public but, above all, to reaffirm and legitimize its rights of use of the resources that constitute a shared heritage, whose value is emphasized by the research operations.

The community represents an important source because it preserves the collective memory of the history of the area, and, at the same time, becomes an active part of the research process by helping to construct its paths and aims. This strong bottom-up drive allows researchers to create a space for dialogue to establish collaborative relationships with the local community and think deeply about the very concept of community and how different social configurations are defined and redefined around resources use. This duality constitutes the focus of the presentation, which aims to reflect on the research perspectives and challenges that the involvement of living actors (who then become oral sources) poses to archaeological research.

3 HOLY MOUNTAINS IN A SACRED LANDSCAPE IN MULTIFOCUS EVIDENCE - A CASE STUDY OF PODLASIE (POLAND)

Abstract author(s): Wawrzoniuk, Joanna (Institute of Archaeology, Cardinal Stefan Wyszyński University in Warsaw)

Abstract format: Oral

In the magical-mythical perception of the world by the „pagan“ Slavs nature was hiding numerous mysteries and inexplicable power that had to be worshiped. An important element of the magical landscape was a mountain, which made a strong numinotic impression. Sacred mountains can be a good example of the materiality of religious beliefs. There is only one condition. They should be considered sacred. Where there are no written sources, archaeological ones are weak, one can use folklore data and oral evidence. In the case of the Slavs, oral traditions are an excellent supplement to the knowledge of spiritual culture. The memory of „holy“ places is preserved, among others, in different legends about so-called castles, Swedish or bald mountains, gods, and demons living on their tops. In Podlasie (Poland) there are a lot of mounds of different sizes and heights. Some of them have their own names: Góra Zamkowa (Castle Mountain) or Babia Góra (Old Woman's Mountain). Numerous legends are associated with them, which were fortunately recorded by researchers. According to several archaeological research, they were used as ritual places in the Iron Age, Middle Ages, and even later. The Podlasie region is also interesting because of the numerous influences of Slavs and Balts, and in later periods also of other communities living there. In my paper, I would like to indicate how analyzing oral traditions and other sources can interpret the sacred landscape, especially the holy mountains, in this region.

4 THE MOORISH TRADITION IN THE PORTUGUESE ARCHAEOLOGY

Abstract author(s): Vieira, Alexandra (CITCEM.FLUP; Instituto Politécnico de Bragança)

Abstract format: Oral

With this work, I seek to understand the perception and presence of the Moors in the Portuguese landscape, from the study of archaeological sites, toponyms, legends and folk beliefs, supported by historical documentation and a wide range of publications that record and analyze Portuguese oral tradition. I chose, therefore, to establish a set of relationships between the archaeological remains, oral tradition and folklore, and demonstrate ways of interpreting or explaining these pre-existing materialities that are part of our tradition.

In particular, I will try to understand the relationship between archaeological remains, and the concepts of the enchanted female Moors and the historical Moors, that punctuate the Portuguese landscape. The landscape reflects the past through a material legacy (archaeological remains) which, although they retain their structure, are part of another temporal and social context, in any case, different. In this way, the reference to a more remote past, framed

in a certain logic of thought (the “wonderful”, the “enchantment”, the “other”, the Moor or the “Moira”) allows us to understand these physical and constructed features of the landscape. Human landscapes are not immutable, and the analysis of toponyms as well as oral tradition, namely legends, allows the understanding of aspects inherited from the past. This allows us to perceive the dynamics of the landscape from an immaterial legacy built through a constant dialectic of memory and forgetting.

5 LEGENDS, PEOPLE, AND THE LANDSCAPE ARCHAEOLOGY OF BORDERSCAPES IN IRELAND

Abstract author(s): Fitzpatrick, Elizabeth (Independent)

Abstract format: Oral

In *Memory, myth and long-term landscape inhabitation* (2013), Chadwick and Gibson suggested that in complex societies with professional bards, ‘fragments of past knowledge in collective memories and oral traditions’ may have persisted longer than the 200-year lifespan attributed by some archaeologists to stable oral tradition within landscapes.

In response, this paper presents an approach to generating dialogues between topography, archaeology, and legend and localized place lore, which has led to the identification of specialized borderscapes that memorialized dynastic histories of Gaelic chiefs in medieval Ireland.

A diagnostic feature of such borderscapes are hills of outcropping rock, designated by the place name *formaoil* (‘bare-topped’) and associated with prehistoric funerary and ritual monuments, and hillforts. They are the settings of battles and raids between the 7th and 16th centuries CE in written histories. In medieval tales, they are the domain of the Irish legendary warrior-hunter and border-hero, Fionn, who is a recurrent figure in recorded oral tradition of rural communities into the twentieth century.

Settlements of medieval poets who served chiefs were situated beside these notable hills, suggesting that they may have been curators of the monuments of *formaoil* and the borderscapes they demarcated.

In view of the involvement of poets with the biographies of bare-topped hills, which extended to poetically relating them to battles lost and won by chiefs and their ancestors, the fragments of modern local lore that associate the heroic deeds of Fionn with prehistoric monuments and topographical features, need reconsideration as connotations of past knowledge about cultural practices in borderscapes. Furthermore, the findings urge that monuments, to which this lore is attached, should not be reductively interpreted as mnemonics but as representations of long-term relationships between borderlands and people in past societies.

6 NATURAL SACRED SITES IN ESTONIA - WITNESS OF OLD BELIEFS IN PRESENT TIME LANDSCAPES AND COLLECTIVE MEMORY

Abstract author(s): Kama, Pikne (National Heritage Board of Estonia)

Abstract format: Oral

There are hundreds of natural sites in Estonia that are or have been considered to be sacred, for example sites where communication with spirits, rituals, offerings or healing activities have taken place. Most commonly, these are sacred trees, groves, stones and springs, sites without manmade structures. Sacred sites combine nature, physical space and intangible culture expressed in form of folklore, place-names, memories etc. – and sometimes also archaeological record.

Although these sites have long been protected as archaeological sites, there may be sacred sites without any archaeological finds as there are many ritual activities which do not leave behind long-lasting traces. The lack of archaeological record could also be the question of the state of research in terms of scale and methods. The limitation of archaeological knowledge makes the dating of these sites difficult. Yet, it can be stated that sacred sites similar to the ones we know today have been recorded in the early written sources about Estonia from the 13th century reflecting pre-Christian beliefs where nature was considered spirited.

Natural sacred sites are not only a source of information about the past, but also an important part of contemporary landscape that needs recognition, systematic study, and protection. Therefore, National Heritage Board of Estonia is leading a project to inventory sacred natural sites in Estonia. The inventory grants us new insight and overview about sacred natural sites and also points out how limited our understanding about human-landscape is, especially when dealing only with archaeological record without oral tradition.

ENHANCING ORAL TRADITION IN FIJI FOR THE STUDY OF ARCHAEOLOGICAL REMAINS. THE CASE OF THE HILLFORTS IN THE NADROGA-NAVOSA PROVINCE

Abstract author(s): Lancini, Loredana (CReAAH - UMR 6566 Le Mans Université) - Duval, Hervé (Société Jersiaise; CReAAH - UMR 6566) - Nunn, Patrick (University of the Sunshine Coast) - Compatangelo-Soussignan, Rita (CReAAH - UMR 6566 Le Mans Université)

Abstract format: Oral

The Fiji Islands represent a stimulating case study for cross-cultural research combining archaeology and the oral tradition. In fact, they present favourable conditions for exploring the oral tradition, since Fijian society retains many contexts where the oral transmission of knowledge is still practiced. The local oral tradition comprises diverse and varied stories bearing valuable contents for the community, well worth being recorded. There are also stories, legends and beliefs linked to old sites inhabited in the past and considered sacred for their symbolic role. Their memory is preserved through ritual practices and is kept vivid in the minds of the local population by performing traditional narratives.

In June 2022 the authors conducted fieldwork in Fiji, in the province of Nadroga-Navosa (Viti Levu, Fiji) as part of the project 'Environmental Changes and Heritage in the Fijian Islands'. The project aimed to study hillforts as well as the oral traditions of the local populations, by means of both archaeological fieldwork and oral surveys. The collected data from the sites of Tabuqutu, Kavukavu, Old Tau, Nakaro, Vasilaulau, and Koromani show that landscape and archaeological remains are well-integrated in local memories and beliefs. Local people are indeed well informed of the type of archaeological remains that could be found on site. Moreover, we were able to collect stories of origins and foundations, still vivid in the memory of the villages, and to understand that place names are directly related to historical and topographical elements. Finally, the symbolic role of the hillforts as the home of ancestors is well rooted in traditional beliefs. This paper aims to present the results of the oral enquiries held in Fiji and to provide insights on the enhancement of local tradition for the comprehension of archaeology in a society where oral tradition is the main tool of social memory.

496 COORDINATION, DISSEMINATION, AND COMMUNICATION - MANAGEMENT TASKS IN THE ARCHAEOLOGICAL WORK ENVIRONMENT

Session theme: 3. Heritage Narratives and Representations

Session organisers: Seidl da Fonseca, Helena (Kuratorium Pfahlbauten - National Management Austria of the UNESCO-World Heritage) - Grömer, Karina (Head of Department of Prehistory - Natural History Museum Vienna) - Črešnar, Matija (Department of Archaeology at the University of Ljubljana) - Alpino, Nadine (DokuPlus - Büro für Dokumentation in Archäologie und Denkmalpflege)

Session format: Regular session

Like many other disciplines in science and humanities, archaeology has much to offer to the broad public and hence finds itself traditionally confronted with the public's wish for information in a variety of settings. In this session, the organizers want to present and discuss different management structures, new and innovative dissemination projects and communication strategies for archaeological heritage sites and research, may it be based at universities, academies, museums and other research institutions.

In general, the session organizers see within the last decade a professionalization in common administrative tasks in the field of archaeology. Special knowledge of project management appears to be expected that still is rarely taught at universities. Also, the archaeologists in charge are seldom professionally trained in the development of educational programs or strategic communication plans. What are the most important components for a holistic archaeological education nowadays? What exactly is needed to insure professionalism in the management part of our work? How can archaeologists already working in research, museums and other institutions achieve this knowledge?

With these and other questions, this session picks up a thread that started at the EAA 2019 Conference in Bern, Switzerland, in a round table session regarding professional communication of archaeological research. One outcome of that session was the need to raise more awareness of the importance and benefits of professional communication within the archaeological community, but also to form a strategy for education.

The session organizers want to take a broader perspective on the topic at the EAA 2023 and feel the need to present and discuss good practice examples, or examples of failures to learn from, in different management structures, dissemination projects, and communication strategies as well as ideas and examples for an integration of these topics in archaeological education and further trainings.

1 SCIENCE COMMUNICATION MANAGEMENT IN COMMERCIAL ARCHAEOLOGY IN AUSTRIA**Abstract author(s):** Hangartner, Jasmin - Binder, Michaela (Novetus GmbH)**Abstract format:** Oral

In many countries such as Austria commercial archaeology represents over 90% of all archaeological field work taking place. These sites worked on by commercial archaeologists are therefore the most common touchpoints for local communities with archaeological fieldwork and the wish to know more about this heritage being excavated is very present. This wish often stands in opposition to the interest of the constructors/owners of the site whose interest is dominated by keeping the spending for the archaeology low and finish their construction projects in time. The possibilities and methods for science communication in this challenging environment of opposing stakeholders as well as the skills needed to succeed with these projects will be the topic of this presentation. The talk will demonstrate how to manage archaeological education projects with different stakeholders in a professional work environment and will be illustrated by the presentation of case studies, such as a garden project dedicated to communicating the story of a close by medieval site and developed in cooperation between a windmill construction company, the municipality, and a local association dedicated to rendering the town more livable.

2 SCIENCE COMMUNICATION AND SOCIAL MEDIA IN PORTUGUESE ARCHAEOLOGY: A BRIEF ANALYSIS TO OPEN THE DEBATE**Abstract author(s):** Cura, Sara (School of Communication and Media Studies)**Abstract format:** Oral

Researchers, as well as scientific institutions, always took action to disseminate their findings and engage the public with their science. How they did it and how they do it now has changed over time while the practice of science communication evolved to become not only of recognized significance but also an essential component of scientific research processes, as well as part of the acknowledged social responsibility of science and scientists. In the last decade, there is a visible and increasing activity of both scientists and scientific institutions to reach out to audiences in a more interactive way using social media such as Facebook, YouTube and Twitter or others.

Portuguese archaeology is no exception and there is a myriad of scientific archaeology institutions, organizations and archaeologists on an individual basis sharing content on social media. However, it remains to be studied how and what is communicated (the focus of this presentation) and the purpose of such communication (a further highly relevant study to be done).

In a first overview of science communication on social media in Portuguese archaeology and to open the debate we present an analysis of the social media use of two major research centres dedicated to archaeology and one preventive and rescue archaeology company. Questions focus on what and how these institutions communicate in their social media and the related engagement (likes, shares and comments) with their audiences.

3 WALK THE LINE: FIRST EXPERIENCES WITH MULTIPLE CITIZEN SCIENCE TARGET GROUPS IN THE TRANSDISCIPLINARY LBK RESEARCH PROJECT "UNITED BY CRISIS?"**Abstract author(s):** Längauer, Julia - Hascher, Cornelia (University for Continuing Education Krems, Center for Museum Collections Management) - Pieler, Franz (State Collections of Lower Austria) - Teschler-Nicola, Maria (Natural History Museum of Vienna; University of Vienna) - Maurer, Jakob (University for Continuing Education Krems, Center for Museum Collections Management)**Abstract format:** Oral

The transdisciplinary research project "United by Crisis?" (2022-2025) aims to investigate a cluster of Early Neolithic sites surrounding the LBK settlement of Asparn/Schletz (Lower Austria), which is famous for human skeletal remains with perimortal defects indicating a violent event approx. 7.000 years ago. Within our research project, joint work with Citizen Scientists is a core feature, additionally motivated by extra resources granted for a "Citizen Science Add-On" by the funding body (GFF NÖ).

The Citizen Science activities within the project include collecting and processing of soil samples for isotope analysis by local schoolchildren and extensive Line Walking-surveys and processing finds by lay experts and other volunteers. As part of our cooperation with Citizen Scientists, we also organize lectures and joint interpretation workshops.

Within this contribution, we want to give a first overview 1) of how the special attention on "Citizen Science" influenced the development, structure and evaluation of the project application and 2) on our experiences with the implementation of the Citizen Science aspects in the project so far. This includes a discussion of the different target groups of Citizen Scientists interacting with the project as well as an introduction to the projects methods, goals, dis-

semination channels and communication strategy. We will also point out problems encountered during our joint work with CS and perceived benefits. Furthermore, we want to outline possible broader impacts that we think cooperation with CS – such as ours – might have on future research projects, archaeology, STEM and the public.

4 WE CAN DO IT – WITH A LITTLE HELP FROM OUR FRIENDS. COMMUNITY MANAGEMENT IN THE CONTEXT OF ARCHAEOLOGICAL HERITAGE

Abstract author(s): Dworsky, Cyril - Poppenwimmer, Fiona - Seidl da Fonseca, Helena (Kuratorium Pfahlbauten) - Fath, Barbara (International & Swiss Coordination Group UNESCO Palafittes)

Abstract format: Oral

When it comes to protection and research of archaeological sites heritage managers have a lot of balls to juggle. They have to keep track of historic sites and artefacts, communicate with heritage agencies, local authorities and landowners, present results, ensure the integrity of their research within the scientific community and create easily accessible knowledge for the public. At the same time, archaeological projects often face a lack of a wider support. This is particularly challenging where there are heritage protection issues that conflict with the interests of other groups of people. That's where community management can help, or be seen as a necessity.

In this paper the speakers present their community management structures and why it is important to consciously evaluate and work on those structures. By the example of the concepts that were developed for the management of the Prehistoric Pile Dwellings around the Alps UNESCO World Heritage Sites in Austria, we show how they were implemented, and the successes and failures that were faced during this process. The speakers will also talk about aspects of inclusion and exclusion of individuals and groups in archaeology – e.g. the sport diving community – and how other partners in this particular World Heritage site deal with this issue.

In our opinion, by working with a community of local historians, educators and other stakeholders or individuals, archaeologists can create a valuable tool to ensure that historic sites and artefacts are much more likely to be appreciated and respected, and consequently better preserved as they are for future generations.

5 SHAPING NEW NARRATIVES THROUGH COMMUNITY-LED ARCHAEOLOGY IN THE BASQUE COUNTRY

Abstract author(s): Egia, Mikel (Aranzadi Science Society, Department of Archaeology) - Mendizabal-Sandonís, Oihane (University of the Basque Country - UPV/EHU, Classic Studies Department; Aranzadi Science Society, Department of Archaeology) - Aiestaran, Mattin (University of the Basque Country - UPV/EHU, Department of Geography, Prehistory and Archeology, Investigation Group of Prehistory IT-1223-19; Aranzadi Science Society, Department of Archaeology) - Narbarte, Josu (University of the Basque Country - UPV/EHU. Research Group on Heritage and Cultural Landscapes; Aranzadi Science Society, Department of Archaeology) - Ruiz-González, Daniel (Aranzadi Science Society, Department of Archaeology) - Conde-Egia, Eider (Aranzadi Science Society, Communication Department) - Agirre-Mauleon, Juantxo (Aranzadi Science Society, Department of Archaeology)

Abstract format: Oral

Over the past 75 years, Aranzadi Science Society has carried out archaeological interventions in the Basque Country based on a philosophy of *auzolan* or collective work. These dynamics can be framed in the theoretical-methodological current referred to as 'social' or 'public' archaeology. In this presentation, we delve into the impact of community-led archaeological projects in shaping the identity and belonging of the Basque society through its heritage. Within this work frame, knowledge is constructed collectively, within the limits imposed by the scientific method, but integrating and valuing the perceptions of those who have a daily relationship with cultural heritage. Thus, heritage is conceptualised as a means to materialise people's collective identity and practices, and this also expands to dissemination and communication activities to give value to local heritage. During our presentation, we will share successful dissemination and communication strategies of different archaeological sites (namely the Hand of Irulegi and Amaier Castle, among others) that have contributed to new understandings of local and regional heritage, as well as how these communities are an active asset from the beginning of the archaeological intervention until its dissemination. We will also show how archaeological sites may turn into cultural resources and contribute to shared memories and creative narratives.

6 SCIENCE COMMUNICATION AND OUTREACH IN AN INDUSTRIAL RESEARCH PROJECT COMPARED TO PROJECTS IN THE ARCHAEOLOGICAL SECTOR

Abstract author(s): Loew, Carmen (RHI Magnesita)

Abstract format: Oral

Having worked in science communication for around 20 years, ReSoURCE is the first project that I communicate outside of the archaeological field. “Refractory Sorting Using Revolutionizing Classification Equipment” is a Horizon Europe project, grant agreement # 101058310, that is coordinated by the global giant for heat resistant B2B products RHI Magnesita. The project aims to reduce Europe’s carbon footprint significantly by developing a sorting unit for the most complex recycling of used refractory products, so that the use of raw material with its intense carbon emissions can be minimized. In the focus of ReSoURCE’s research are therefore mineralogy, artificial intelligence, laser technology, hyperspectral imaging and waste management, to name just a few of the disciplines involved. In the presentation I would like to give an overview of the similarities and differences in terms of science communication, outreach and professional project management between a research initiative in an industrial, business-driven environment and in the archaeological field, which is so often characterized by the rather non-profit nature of the humanities.

7 ENTHUSIASTIC CROSS-SECTORAL COOPERATION IN HIGHER EDUCATION, FOCUSING ON HERITAGE INTERPRETATION

Abstract author(s): Wollak, Katalin (Independent heritage expert) - Kovács, Máté (Budapest University of Technology and Economics) - Anders, Alexandra (Institute of Archaeological Sciences, Eötvös Loránd University Budapest) - Vukoszávlyev, Zorán (Budapest University of Technology and Economics)

Abstract format: Oral

Preparing students for collaborations beyond joint research with their peers in an environment focused primarily on investment-led excavation has been one of the great challenges of archaeological education in recent decades. Acknowledgement and promotion of archaeological research, and the interpretation and reception of the results and the sites themselves by the local community, can only be successful in the long term if researchers present archaeological findings in a way that takes into account and draws on the preferences and priorities of other disciplines as well. Emphasizing a project approach in archaeological heritage management can contribute to this endeavour.

This paper presents some of the positive initiatives in the context of both independent and joint training programmes in various institutions of higher education (such as the archaeology programmes of Eötvös Loránd University and the programmes of the Budapest University of Technology and Economics for architects and heritage engineers), which in many cases receive support from national and international projects.

The management of built heritage, which includes various activities of research, design, restoration and management, requires a comprehensive approach that combines knowledge from different disciplines. The promotion of this holistic approach is of key importance during the training of heritage professionals. Interdisciplinary consortia formed by international projects involving institutions and experts from different disciplines, which generate knowledge transfer between these persons and their fields of study, provide an ideal basis for developing educational and dissemination programmes. The paper discusses the experience gained from educational programmes, based on the themes of an international project, which was used in the education of Hungarian and international undergraduate students of architecture whose training focused on interdisciplinary research in a historical environment, as well as in the post-graduate education of engineers specialised in monument protection.

8 WORLD HERITAGE “PREHISTORIC PILE DWELLINGS AROUND THE ALPS” - MEDIATION VERSUS MARKETING

Abstract author(s): Haggmann, Sabine (Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart) - Fath, Barbara (International Coordination Group Palafittes)

Abstract format: Oral

In addition to protection, the mediation of world heritage is of great importance. With the “Prehistoric pile dwellings around the Alps”, UNESCO has an idiosyncratic Monument category placed under the protection of the world community: the World Heritage sites cannot be seen above ground, they cannot be touched and many of the 111 nominated sites cannot be visited.

For the mediation of this World Heritage new paths must be taken. The seemingly easiest way to present the hidden heritage is via the finds – which are not part of the World Heritage – in numerous museums. Reconstructions complement the museum presentation, as well as educational programs of the exhibitions. However, the exhibition of finds conveys neither the idea of world heritage nor the methods with which the excellently preserved organic

materials can be made to speak: How are the results evaluated in an interdisciplinary manner? What do these results mean for the present?

Tourism is listed by the UNESCO as one of the dangers to the World Heritage sites. However, tourism could also be seen as an opportunity, insofar as it raises public awareness of the cross-border significance of the world heritage, its beauty and the economic income for the conservation and care.

Tourism organisations and monument authorities could provide a monument-compatible and promote sustainable tourism in the sense of mediation.

9 HOW TO DEVELOP THE EUROPEAN ARCHEOLOGY DAYS (EADS)

Abstract author(s): Ratier, Pascal (INRAP - National Institute for Preventive Archaeological Research)

Abstract format: Oral

In 2022, the EADs had their fourth edition with great success. More than 30 European countries participated in the event on the third weekend of June. Despite the health crisis, the EADs have continued to grow, attracting more public support, new countries and new organisers with each edition. How can the EADs develop by making an event a place where the public can meet the entire archaeological chain of operations? The event can only find its audience through the intersection of national communication, driven by a national and public player, and communication developed by the local organisers to their usual networks. Another of the fundamental missions at national level is to mobilise all the archaeological actors in the country, „from the excavation to the museum“, so that the public can have access to the diversity of the entire archaeological process. It is therefore essential that the national authorities managing archaeology in each European country be able to coordinate the event on their territory, in order to integrate it into their overall policy of sharing the archaeological heritage. The creation of a network of coordinated organisers at national level in each country is therefore an essential challenge for future editions.

498 IN AND OUT OF CONTEXT: WEAVING THE ITINERARIES OF OBJECTS IN MUSEUMS, COLLECTIONS, AND STOREROOMS

Session theme: 3. Heritage Narratives and Representations

Session organisers: Kathariou, Kleopatra (University of Ioannina - Department of History and Archaeology) - Marini, Christina (Australian Archaeological Institute at Athens) - Colonna, Cécile (L'Institut national d'histoire de l'art - INHA) - Sarti, Susanna (Direzione Regionale Musei della Toscana - Ministero della Cultura)

Session format: Regular session

Objects, in the course of their production and their cycles of use, develop layered histories and form intricate entanglements with both people and things. Object biography has long been a well-established analytical tool for addressing these webs of human-object interactions. In recent decades, updated conceptualisations on materiality, shaped by new materialist and post-humanist thinking, have re-formulated the biographical discourse, placing emphasis on matters of agency, movement, and relationality. Object itineraries have thus emerged as a fresh take on the biographical approach, embracing these theoretical advances and adopting a revised ontological point of view.

This session looks at untangling the itineraries of objects as they transform into subjects of archaeological or art-historical research. We seek to explore how objects, in their literal and figurative movement across time and space, become re-defined, re-interpreted, and re-evaluated, as they enter and leave contexts of circulation, use, and study. The aim is to weave together the narratives of objects, which – whether displayed in museum exhibitions and institutional collections or put away in depots and storerooms – continue to acquire complex relational connections, that are neither linear nor unidirectional.

We welcome discussions on case studies from antiquity to today that employ relevant methodological perspectives, inter-disciplinary approaches, and novel ways of incorporating object itineraries in public, heritage, and educational environments. We are particularly interested in papers that examine how the study of collections and assemblages can be enriched by and benefit from nuanced analysis of object itineraries.

1 THE SECRET OF THE TREASURY OF ATREUS

Abstract author(s): Paschalidis, Konstantinos (National Archaeological Museum, Athens)

Abstract format: Oral

The National Archaeological Museum of Athens keeps over 300 fragments of the stone relief decoration of the Treasury of Atreus in Mycenae. Among them, a fragment of the monument's epistyle stands out, decorated with Mycenaean floral motifs in relief and bearing strange inscribed graffiti from the 18th century AD.

Sir William Gell first identified the epistyle in 1805, reporting that he saw it in a ruined church near the village of Mycenae. Gell did not comment on the engravings, which appear to have been first noticed by the Greek archaeologist Panagiotis Stamatakis in January 1878. Stamatakis retrieved the stone fragment from the church of Saint George and brought it to Athens, along with the findings of his excavation in the Treasury of Atreus.

The epistyle seems to have been collected by a priest in 1758, upon his arrival in the local parish. The word παπαγ could be an abbreviation of his name. The inscription of the rest of the names on the petals of the left rosette and the subsequent engraving of a cross on the name *αναστας* recalls the custom of inscribing the names of the children of a family on icons, in the order of birth and noting the year of death afterwards.

The collection of the inscribed fragment by the priest of Mycenae in the mid-18th century, as well as some spolia of the ornate decoration of the monument, found embedded in the houses of Christians in the area, indicates a kind of appropriation of the ancient artefacts by the Greek Orthodox residents of Harvati (the pre-revolutionary name of Mycenae), who felt the need to preserve them and possibly saw in them the imprint of their origin and identity, 70 years before the Greek War of Independence.

2 SPINNING THE WHORL FOR ATHENA: OBJECT BIOGRAPHIES (RE)DISCOVERED IN STOREROOMS AND THE CULT OF ATHENA ON THE ATHENIAN ACROPOLIS

Abstract author(s): Gavalas, Georgios (Ephorate of Antiquities of the Cyclades, Hellenic Ministry of Culture and Sports)

Abstract format: Oral

A large number of objects, i.e. textile manufacture tools, mainly spindle whorls and loom weights, have been recently found, dating to various periods, but mainly to the Archaic and early Classical ones. Most of them were stored in the medieval tower, known as "Belvedere"; on the Acropolis of Athens; a few more were boxed in old wooden coffin boxes in the National Archaeological Museum storerooms, along with a large number of pottery fragments. These were unknown and no reference to them was implied either in the museum registers or in the extensive bibliography about the Athenian Acropolis.

The material on the Acropolis was stored in hard-to-reach areas, bearing no longer any details about their exact find spot; they were only identified as finds from the old Big excavation on the Acropolis. As for the wooden boxes in the National Archaeological Museum, these were marked as "AKP.", "Akrop." or "from the Akropolis" in possibly two different periods: either a century ago, around 1910, or in the period right after the outbreak of World War II, around 1941.

A recent new study of these humble tools of weaving, clearly overlooked by earlier research allows further discussions on their function on the Acropolis. Their fascinating biographies shed new light on their find spots and their relation to other finds, such as the hand-made terracotta figurines. Moreover, new interpretive issues concerning the activities related to weaving at the main place of the goddess Athena cult on the Sacred Rock during the Archaic and early Classical periods in Athens and Attica may be stressed.

3 FILLING IN THE BLANK PAGES OF AN OBJECT'S BIOGRAPHY: AN OUT-OF-CONTEXT STONE AXE IN THE ARCHAEOLOGICAL MUSEUM OF THESSALONIKI

Abstract author(s): Tsangaraki, Evangelia - Papadopoulou, Stella (Archaeological Museum of Thessaloniki)

Abstract format: Oral

The collections of the archaeological museums in Greece include predominately artefacts that result from systematic or rescue excavations. To a lesser extent, they consist of objects that come from donations of private collections, repatriations, confiscations, voluntary handing-in, etc.; in these cases, the objects that enter the museums are mainly poorly documented and, thus, the museums' curators usually fail to transform them into subjects of archaeological research. As a result, most of these artefacts remain "silent" in the storerooms and hardly ever see the light of a systematic documentation, study or exhibition.

In 2000 a great number of partly preserved antiquities were handed over to the Archaeological Museum of Thessaloniki (AMTh) by an unusual collector: a civil engineer who, while supervising the infrastructure of the rail network, collected ancient artefacts from various places in Macedonia, Northern Greece. Among them there was a shaft-hole axe made by a greenish stone. As a stray surface find, and not a product of systematic excavation, its “biography” remains largely foggy. Despite its common character –such stone tools are usual archaeological exhibits and collection items in museums– this artefact triggered our interest mainly due to its almost perfect state of preservation and its exceptionally skilled craftsmanship. Appearing “too good to be true”, doubts have also arisen as to its authenticity.

In this paper, we will try to unveil the “cultural biography” of this out-of-context stone axe, applying an inter-disciplinary approach (interviews, geological and chemical analysis, survey, bibliographic research, etc.). Our ultimate goal is to discuss its authenticity, to reconstruct aspects of its production, circulation, use and deposition, and to untangle its journey across time and space, from the very moment of its manufacture till its accidental discovery in the 20th century and, finally, its entry to the AMTh’s collection.

4 A MISSED BIOGRAPHY: THE CASE STUDY OF A FEMALE STATUE IN THE NEW MUSEUM OF VERGINA

Abstract author(s): Kyriakou, Athanasia (Aristotle University of Thessaloniki)

Abstract format: Oral

Archaeological objects are entangled in a fascinating network of people, things, emotions and landscape settings. The research aims at unveiling their life episodes, document them in scientific output and communicate them to the wider public. This procedure brings together in a circular movement the objects under analysis, the inquiring minds and the receivers/stakeholders.

This paper seeks to cast light as case study on a prominent find from the archaeological site of Aigai, the first capital of the Macedonian Kingdom. It is the statue of a peplophoros, found in a sanctuary close to the palace and the theatre with epigraphic evidence related to Eukleia, goddess of good repute, and Eurydice, mother of king Philip II. The sculpture was dedicated in the mid-4th c. BC, but four centuries later, following large scale destruction in the sanctuary, it was ritually deposited in a pit. It was brought to light 33 years ago in the framework of the Aristotle University of Thessaloniki Excavation at Vergina project.

The peplophoros is housed for the first time in a museum in the village of Vergina in Northern Greece. It stands still in the central optical axis of an atrium with other sculptures of shiny white marble. Its rich cultural biography is distinctly absent. A short phrase in a general text attributes to it only one identity, its relation to the royals. Its incorporation in the public sphere of the city, the impact on the viewers, the connection to the rest of the sculptures, the manpower and ideology behind its transportation and structured deposition, to name a few aspects of its life history, are not even implied.

It is the obligation of scholars to investigate such discrepancies and point towards alternative suggestions.

5 RETRIEVING IDENTITY FROM FRAGMENTS: THE BIOGRAPHY OF A BRONZE SITULA FRAGMENT FROM OLYNTHUS

Abstract author(s): Touloumtzidou, Annareta - Tsangaraki, Evangelia (Archaeological Museum of Thessaloniki)

Abstract format: Oral

The collections of the Archaeological Museum of Thessaloniki (AMTh) apart from antiquities that come from scientifically conducted excavations, comprise also objects that come from donations of private collections. One of the most significant and sizeable such collection, formed by Georgios Papailiakis (1884-1944), was donated gradually to the AMTh by his heirs.

Among the antiquities of this donated collection is a small, cast made, bronze, relief-decorated fragment, of unknown provenance. We have strong reasons to believe that this small fragment, now in the AMTh, was originally an integral part of a 4th c. BC bronze bell situla with a unique relief decoration, said to have been found at Olynthus, a larger part of which belongs to the collections of the Harvard Art Museums/Arthur M. Sackler Museum.

In this paper we shall try first to argue in favour of this assumption and document that they are both parts of the same bronze vessel. Then we shall try to untangle the itinerary of the original bronze situla and reconstruct its biography, tracing the possible roles that an antiquities dealer, an archaeologist and an antiquities collector of the early 20th century may have played in its fragmentation and its final recipients.

6 THE „BURNT VASES“ AND THE LONG-TERM FORTUNE OF PRESTIGIOUS VASES

Abstract author(s): Colonna, Cécile (INHA)

Abstract format: Oral

During certain periods of antiquity, in Greek or Etruscan cities, the funerals of some elite members were the occasion for a funeral pyre where the most beautiful figured vases, among other valuable goods, were placed beside the dead. The remaining fragments were then buried in the grave. Some of these were discovered there in the 19th century; the appearance of these broken and fragmentary vases was even more intriguing because their orange-red clay had taken on a characteristic grey color on the pyre. They were given an important documentary value as testimonies of funerary rites of which little was then known. In a manner typical of the time, this archaeological value was quickly transferred to an art market which, in the first half of the 19th century, still only concerned a small number of scholarly amateurs. A new category of “burnt vases” appeared in the sale catalogues, and their rarity determined their price. Specimens of these vases then entered the greatest collections. However, this added value was in contradiction with the prevailing practice of the time, which valued quality vases, whole and in good condition, deemed worthy of display in private and public collections. And soon these burnt vases were, in most of the cases, removed from the public eye again and kept in the storerooms.

In this talk, several case studies will be discussed in order to highlight the articulation of the different artistic, religious, archaeological and aesthetic values attached to prestigious vases and to understand the alternating registers of visibility/invisibility at work over a very long period, both in antiquity and in the modern period.

7 THE TRAVEL ADVENTURES OF VASES: FROM ATTICA TO ETRURIA AND FROM THERE ALL-AROUND EUROPE

Abstract author(s): Kathariou, Kleopatra (University of Ioannina)

Abstract format: Oral

Subject-matter of the current paper are vases made in a significant attic pottery workshop, namely that of the Euphiletos Painter. He was one of the most prolific painters of Panathenaic amphorae, active in the last third of the 6th century BC. There are also reported neck-amphorae of standard type and a few amphorae of type A and B painted by his hand, as well as hydriae, oinochoai, column-kraters and two votive plaques from the Athenian Acropolis.

Since Beazley's times the number of vases attributed to his hand has increased, and many more additions have been made possible. Interestingly, there is a considerable number of vases painted by his hand with known provenance.

In respect to the mechanisms of diffusion the traders that carried vases by the Euphiletos Painters followed, it comes out that the most dense and easy to follow commercial network of the particular pottery workshop was to the Western markets. As expected, Etruscan communities dominate, as these were the primary recipients of attic figured pottery exported at this time. It comes as no surprise that the major market for vases painted by the Euphiletos Painter was Vulci.

By taking Beazley's catalogues as a starting point and going backwards, it is possible to follow the travel adventures of a considerable number of vases by his from the very moment they were unearthed in the first half of the 19th century and their first appearance in a private collection all the way to their journey's end in one of the greatest museum collections, where they are kept nowadays.

Some of the most prominent persons who will be included in our discussion will be Prince of Canino Lucien Bonaparte, Eduard Gerhard (the first secretary of the Istituto di Corrispondenza Archeologica in Rome) and King Willem I of the Netherlands.

8 THE DISPERSED VASES FROM THE BONAPARTE EXCAVATIONS AT VULCI: FROM ARCHIVAL RESEARCH TO THE ANALYSIS OF ARCHAEOLOGICAL CONTEXTS

Abstract author(s): Mazet, Christian (Istituto Nazionale di Studi Etruschi ed Italici)

Abstract format: Oral

The sepulchres of the Etruscan city of Vulci have been known since the end of the 18th century, but were exploited mainly in the first half of the 19th century. A french couple made a profound contribution to the history of the site: Alexandrine and Lucien Bonaparte, owners of the land of Canino on the eastern bank of the Fiora river, intensively excavated the necropolises from 1828 to 1855. They also developed a proper commercial operation that dispersed thousands of archaeological objects, mainly Greek and Etruscan vases, on the antiquities market in Rome, Paris and throughout Europe.

My ongoing research aims to outline the contours of a global study of the archaeological assemblages from these excavations through the combination of information provided by various archival sources and the direct knowledge of artifacts preserved in worldwide museums and collections. In many instances, the reconstruction of their ancient and

modern itineraries (their “social biography”) allows to reconstruct their lost contexts of use and deposition, in dialogue with the most current archaeological issues: here the question of the presence of Greek vases in Etruscan tombs.

This contribution will focus on a few cases that demonstrate the effectiveness but also the impasses of the method, as research on the history of collections of antiquities is intrinsically intertwined with the accuracy of the data provided by the archaeological record.

9 THE DEPOSITION OF ATHENIAN FESTIVAL WARE

Abstract author(s): Smith, Amy (University of Reading) - Volioti, Katerina (University of Roehampton)

Abstract format: Oral

In this paper we expose the methodological problem of selective curation, with a case study of black-figure ceramics produced in Athens from c. 525-400 BCE, and offer a curatorial solution that resonates with contemporary environmental concerns. We interpret these mass-produced and hastily decorated ceramics as ‘festival ware’, that is, small containers produced for Athenian festivals, thus historical records of Athens’ politico-religious culture both within and beyond its borders. Field archaeologists are well aware of late Attic black-figured pots that mass in tombs, sanctuary and residential clearance pits, and other archaeological contexts throughout the Mediterranean, from East to West, but particularly in Athens, where they are also found in workshop deposits. Curators are also aware of such vessels, mostly unprovenanced and often fragmentary, that mass in museum storerooms. Yet, from the outset, museum curators have largely overlooked them for display purposes. When they are displayed, moreover, they are overshadowed by larger pots and rarely showed en masse, as they were in antiquity. Their ambiguous iconography separates them from standardized narratives about myth, history and art. Their fragmentary state and small size, however, encourages their use in educational programmes, including environmental studies.

We chart object itineraries of complete and fragmentary festival ware, drawing parallels between ancient practices of deposition and the stacking of pots and fragments in museum storage. We suggest museum practitioners might employ theoretical advances in post humanism to chart the journeys of Athenian festival ware, placing ceramic objects in the ground to return them to nature. The ground (soil, dirt, dust) resonates with archaeological fieldwork and modern challenges, such as refuse management. Nature is not an ideal(ised) open space but rather a deposit that—like museum storerooms—preserves used and broken artefacts for future study. This inherent natural quality pertains to both ancient and modern audiences.

10 ENRICHING THE ANTIQUARIAN COLLECTIONS OF THE YORKSHIRE MUSEUM: AN ETRUSCAN CINERARY CHEST AS CASE STUDY

Abstract author(s): Carroll, Maureen (University of York)

Abstract format: Oral

The paper reports on a project that is focused on the original archaeological context, significance, and acquisition history of a stone sculpture of a reclining woman from Etruscan Italy in the antiquarian collections of the Yorkshire Museum. The object was recorded in the list of donations to the Yorkshire Philosophical Society in 1883 simply as a purchase made in Italy, without its specific provenance being noted. It has been displayed (erroneously) in the Museum’s Roman York gallery for some time. A research grant from the University of York has enabled both an investigation of comparative material in museums in Tuscany and a petrographic determination of the stone source, allowing us to put this carved lid of a cremation chest back into its primary context in a family tomb of the third century B.C. in Chiusi. Archival research suggests that the object was purchased by a local York architect on a Grand Tour of Italy between 1829-1831. The knowledge gained in this exploration of object narratives sheds light on the background of antiquarian acquisitions in Britain and on the route the Etruscan lady might have taken to her destination in York, benefiting the Museum’s understanding of its holdings and improving the visitor experience through a new and engaging display. Furthermore, the restoration of the sculpture, the analysis of pigments on the sculpture, and 3-D scanning provide exciting new material for digital access.

11 PEOPLE AND MONUMENTS, INTERSECTING LIVES: TWO SARCOPHAGI OF THE ARCHAEOLOGICAL MUSEUM OF THESSALONIKI DURING A CENTURY OF URBAN LIFE

Abstract author(s): Galiniki, Styliana (Archaeological Museum of Thessaloniki)

Abstract format: Oral

Two Attic sarcophagi of Roman times, discovered in 1929 in western Thessaloniki, entered the city’s daily life, upsetting its inhabitants until they were moved for safekeeping and display in the multi-level Foucauldian heterotopia that was then the Archaeological Museum, formerly a place of worship of Islam by the city’s crypto-Jewish community. Over the years, the sarcophagi were used to protect small objects buried during World War II, were re-exhibited in the post-war period, and in 1983 were moved to the city’s new Archaeological Museum and of course were included in

several archaeological studies. After the museum's exhibition renewal in the first decade of the 21st century, they took a prominent place in the museum's outdoor areas. In this way, decades after their discovery, the sarcophagi returned to the urban rhythm, either as scenic elements for the various cultural activities of the museum or as ephemeral stages for the performances of youth groups such as skaters or hip-hop dancers. In addition, these same monuments were projected as performers of the city itself in a theatrical event at the museum, and during the covid-19 virus pandemic as a source of creative inspiration for the museum's online visitors through a digital activity.

Through aspects of the lives of these ancient objects, the relational character of antiquities is explored, as well as their potential to produce and be produced as a Lefebvrian space, constituting social constructions that are redefined by their various uses.

12 GREEK CITY, OTTOMAN EXCAVATION, TURKISH MUSEUM: OBJECT BIOGRAPHY OF A GRAVE ASSEMBLAGE FROM NOTION

Abstract author(s): DiFabio, Christina (Independent Scholar)

Abstract format: Oral

This paper will present the biography of objects from a grave assemblage excavated from the ancient Greek city of Notion, now in modern western Türkiye. The tomb of multiple burials was published in 1912 by Theodore Macridy of the Imperial Ottoman Museum in Istanbul, but with few details. A portion of the assemblage was kept by the Imperial Ottoman Museum and is still in the collection of the now Istanbul Archaeological Museum, but the human cremated remains are lost. I closely studied the objects that were kept, which included gold jewelry, bronze cosmetic equipment, and terracotta figurines. I will present the grave assemblage for the first time, as whole as possible, since its original publication in 1912, and I will analyze the objects' biographies from three points in time: their original deposition in the tomb, their excavation during the Ottoman empire, and their current display and storage in Istanbul. As part of the team that produced new, systematic survey research at Notion, I contextualize the objects as from an elite burial of people who lived during Notion's peak occupation in the Hellenistic to Early Roman periods (3rd century BCE to early 1st century CE). For the tomb's excavation, I show how politics and archaeological practices of the time contributed to what information about the objects is known and what is lost. Lastly, I consider the museum contexts of the objects in present times at the Istanbul Archaeological Museum. I especially focus on two pairs of gold earrings, which are displayed in the galleries as examples of Hellenistic jewelry but are decontextualized from the original tomb. Overall, I demonstrate how studying legacy data in museums can enrich our understanding of not only the objects' biographies, but also of the histories of the places where the objects have been.

13 FROM ANCIENT STONES TO MODERN STREETS: THE PATHS OF PLASTER IMMIGRANTS

Abstract author(s): Anderson, Emily (Johns Hopkins University)

Abstract format: Oral

This paper examines the unique biographies and biographical entanglements that emerge when we approach replicas of ancient objects as distinct sociocultural entities in their own right. Circa 1878, Baltimore, Maryland, a city positioned between the USA North and South, was reeling after the conclusion of the Civil War. Immigration from Europe was bringing massive influxes of people to the port city, which was experiencing booming industrialization. As the city's elite enjoyed the fantastic wealth of the Gilded Age, workers coped with oppressive and discriminatory conditions. In this context, the president of the hugely important Baltimore & Ohio Railroad paid for a collection of plaster casts of classical sculpture to be produced in the museums of Europe; the collection would become the centerpiece of the Art Gallery of the newly established Peabody Institute in Baltimore, founded by George Peabody, the wealthiest American of his time. Over the next two years, the plaster bodies took form in the hands of castmakers from Britain to Italy, Germany to France. From the moment of their formation upon the surfaces of ancient sculptures, these bodies embarked on remarkable modern lives that departed significantly from their stone parents. Through extensive archival research, the plaster casts' journeys can be traced as they boarded ships alongside hundreds of living immigrants in European ports to engage on lengthy Atlantic crossings. Once in Baltimore, close consideration of archival material concerning the casts and their living community reveals the complex parallels and interactions that the plaster bodies had with fellow city residents, beyond the famed names of wealthy funders and founders. We instead consider networks of workers—including other immigrants, the daughter of a railroad laborer's family, and a formerly enslaved person—who shared paths and places with these complex, modern "ancient bodies".

14 ARCHAEOLOGICAL OBJECTS AND POLITICS: THE SITE MUSEUM OF THE ROMAN TOWN OF COSA

Abstract author(s): Sarti, Susanna (Direzione Regionale Musei Toscana)

Abstract format: Oral

Cosa (Ansedonia), a small site in southwestern Tuscany, was a Latin colony founded in 273 BC and was inhabited, albeit intermittently, from Late Antiquity to the Middle Ages.

After the end of the World War II, the American Academy in Rome, which had no excavation tradition in Italy, was allowed to undertake archaeological excavations at Cosa. Thus, in 1948 an American team under the direction of Frank E. Brown (1908-88) began digging, with the permission of the Ministry of Public Instruction of the Republic of Italy and of the owners, Marchese and Marchesa San Felice di Monteforte.

For many years Cosa has been the flagship of American archaeology in Italy and soon the Americans together with the Italian Soprintendenza were faced with the problem of how to preserve such an archaeological site after excavations and rescue operations, and how to contribute to the creation of a dialogue with the territory around. In the 1980s, the Italian State and the American Academy signed an agreement to build a museum to host the numerous and precious archaeological finds. The architect of the project was Roberto Einaudi, the grandson of the former President of Italy, Luigi Einaudi.

Essential to the question of such a site museum was how much information should be made available for display, and how much reconstruction could be carried out. Different countries and different approaches to the past were brought together in Cosa with the aim of presenting the story of a Roman town through the objects discovered on the site.

15 AN EXHIBITION TRIGGERED BY A DIARY. BUILDING A KALEIDOSCOPIC SCENOGRAPHY OF REIFIED MEMORIES

Abstract author(s): Chourmouziadi, Anastasia - Ifantidis, Fotis - Nikolopoulou, Konstantina - Karkazi, Elli - Tourtas, Alexandros - Galani, Eleni (University of the Aegean)

Abstract format: Oral

Material relics of the past are typically considered the backbone of exhibitions about the past. Regardless of any academic discussion regarding their polysemy, fragmentary nature, or numerous interpretations, the aura of authentic objects and their „undeniable“ physical testimony continue to be the focal point of visitors' experiences. Having all that in mind, when we designed an exhibition about the Asia Minor Catastrophe, one of our primary objectives was to discover an alternate method for incorporating material objects into an integrated exhibition narrative. Instead of designing an exhibition around objects and assigning all other media a supporting, interpretative, or explanatory role, we treated material objects as elements of a non-hierarchical narrative toolkit; although the exhibition's narrative included a small collection of heirlooms, they had the same narrative significance as that of sound, video, still image, text, and spatial installations. Even though the first thing that visitors see is an authentic diary kept by a refugee from Asia Minor, the exhibition's plot plays with the materiality and affective power of this iconic object. Similarly, all other objects, carrying rich and diverse biographies, are introduced into a kaleidoscopic scenography, where, with the use of light and sound, they oscillate between being isolated museum entities and ambiguous personal reified memories. Monitoring visitors' behaviour we tried to understand whether we succeeded in both exploiting material objects' power and fighting their fetishist domination. The exhibition was designed and implemented by the Laboratory of Museology of the University of the Aegean, being part of a wider project co-financed by Greece and the EU programme, Digital Transformation of the North Aegean in Culture and Tourism“ [e-Aegean CulTour].

16 IMAGINED BIOGRAPHIES: A COMMUNITY ETHNOGRAPHIC COLLECTION FROM THE VLACH VILLAGE OF SAMARINA IN NORTHERN GREECE

Abstract author(s): Marini, Christina (Australian Archaeological Institute at Athens) - Theodoroudi, Eleftheria (Basketball Museum YMCA Thessaloniki)

Abstract format: Oral

Objects, in the course of their movement across time and space acquire complex itineraries and get entangled with human lives and social processes. They are enmeshed in relational connections that are themselves in a constant state of becoming, and as such the narratives associated with them are products of the particular social, historical or political contexts within which they are (re)constructed.

In this paper we address how factual evidence and inaccuracy are not mutually exclusive when untangling these narratives, especially from the perspective of the collective imaginary. This is particularly the case of objects and assemblages that function as mediators of an imagined sense of identification.

To provide an insight to these matters, we take a look at a small ethnographic collection in the village of Samarina. Samarina is home to one of the most robust Vlach communities of Northern Greece, with centuries old tradition of pastoral transhumance, and an identity treading the fine line between minority politics and the national cultural narrative. The community collection, albeit never systematically documented, has become a point of reference for local conceptualisations of the historical past and its relevance to the present. The itineraries of the objects are at best blurred but mostly creatively enhanced, yet they are no less real in the imaginary of the community.

Where does historic fact end, where do re-invented narratives begin, and how can object biographical approaches embrace and make sense of this ambiguity?

17 **IN-BETWEEN THE SHOVEL AND THE SHELF: CONTEXTUALISING THE CATEGORISATION OF INDUS VALLEY SEALS FROM ARTEFACTS TO ART**

Abstract author(s): Chandra, Swati - Patil, Koumudi (Indian Institute of Technology Kanpur)

Abstract format: Oral

By situating the Indus Valley (IVC) Seals and Sealings in their post-excavation, contemporary environment, this paper examines the trajectory of the IVC seals from an archeological find into the coveted category of art.

Archaeological as well as art historical studies of IVC Seals and Sealings are limited to their lives and their significance in the pre-excavation context of ancient times alone. These studies evade the discussion of how archaeological artefacts change their categories through post-excavation socio-cultural interactions that refurbish meanings and interpretations. This study, in particular, traces the interpretative trajectories and object itineraries formed by the literal and figurative movement of seals visible in colonial exhibitions (1920–1947), the Indian national movement, post-independent India in its formative years of partition, as well as pre- and post-liberalisation, through their records in national and international exhibitions and museums. The itineraries of the seals collected from the National Museum of India, the Calcutta Museum, Site Museums, archaeological records, and textbooks reveal their current membership in the category of art at the intersection of several discourses, including colonialism, nationalism, and the evolving archaeological and art historical scholarship of the twentieth century. Furthermore, the findings suggest that the value of IVC seals was also shaped by preexisting itineraries of discrete archaeological artefacts that had already attained the status of art, such as those from Mesopotamia.

Post-excavation narratives contextualise archaeological artefacts in museums and exhibitions by giving a voice to subaltern and mainstream processes of meaning-making and value acquisition. Such narratives not only decolonise the process of categorisation, but also offer agency to the artefacts.

18 **STONE OF SCONE, STONE OF DESTINY: MOVEMENT, MYTHOPOESIS AND CONTESTATION OR ITINERARIES AS CULTURAL BIOGRAPHY**

Abstract author(s): Hall, Mark (Perth Museum; University of Stirling)

Abstract format: Oral

This contribution will explore the itinerary to movement approach to cultural biography through the case study of the Stone of Scone, also known as the Stone of Destiny. Prosaic of appearance, this sandstone block is politically and culturally integral to total inauguration in Scotland and coronation in England and Britain and has been pivotal in fostering concepts of national identity. This paper will consider both the Stone's mythic and actual journeys, its fragmentation and reproduction and how it illuminates the human trait of attributing agency to material culture. Its mythic travels include identifications Jacob's Pillar and journeying - with Scota daughter of pharaoh - to Scotland via Spain and Ireland. Its actual journeys include from Scone to Westminster (as a trophy of war), its enshrinement in a throne and travelling from Westminster to Edinburgh as an entanglement of 20th century independence politics in the UK. It will embark on further stops on its itinerary in 2023 - to Westminster for the coronation of Charles III and from Westminster to Perth for display in the new Perth Museum.

19 **ACTS OF ART(E)FACTS: THE ÖVERHOGDAL CASE. THE CIRCULATION OF KNOWLEDGE - MUSEUMS COLLECTIONS IN FLUX**

Abstract author(s): Lind, Kerstin (The Society for Textile Archeologi & Culture Studies; Linköping University) - Larsson, Annika - Pallin, Karolina (The Society for Textile Archeologi & Culture Studies; Uppsala University)

Abstract format: Oral

This presentation deals with the biographical movement of four textile objects from northern Sweden, which during history, have been circulating in and out of different contexts. All four weaves depict figural scenery motifs and dates between AD 900 and 1100. Based on the finding place they are called the Överhogdal tapestries, but are exhibited

in Jamtli museum in nearby Östersund. By referring to these tapestries, our aim is to show how collective as well as individual knowledge is being created, shaped and reshaped in time and space, also within different social contexts.

Historical objects and museum collections have always constituted sources for research, but also for new creative ideas in arts and crafts. The Överhogdal tapestries are a magnificent example of how ancient figural contents and expressions have developed through archaeological, historical, and art science perspectives, has been developed. In parallel, the artistic and artisanal expressions have been investigated and transformed into new products and works. The objects also form an important basis for teaching. Different forces, which hardly can be understood as either linear in time or unidirectional, have maintained, blocked, initiated or guided a more circulating movement in the development of knowledge.

The Överhogdal figural hangings consist of four separate weaves with individual motifs, which once and again have been torn out of context to become part of new complex networks of objects, people and institutions. Still, these textiles and their motifs are brought in and out of different disciplinary and trans-disciplinary contexts. We aim in the lecture to present one example that recently was carried out as a case study among teacher students in craft education, at a Swedish University.

This lecture is part of a comprehensive international research project entitled “Acts of Art(e)Facts”. Additional partial studies within the project are presented in session #601 #696, respectively.

20 PRIVATE COLLECTIONS OF ANTIQUITIES IN GREECE: FOR EVERY OBJECT, THERE IS A STORY TO TELL

Abstract author(s): LEKKA, ANNA (Greek Ministry of Culture)

Abstract format: Oral

Private collections of ancient artifacts have a longstanding tradition in Europe. For hundreds of years, the possession of antiquities has been a symbol of power, strength, wealth, education, and national identity. From the 17th to the 19th century romantic travelers returned to Europe bringing back exotic souvenirs from their travels in the Ottoman Middle East. Many Greek antiquities have “traveled” to Europe for the enrichment of collections such as the Caryatid of Eleusis, whose story is very interesting. In Greece, the first private collections have been created during the 19th century. Many of them have constituted the basis for the establishment of public museums, following the donations of some well-known collectors of the period. Greek private collections are also interesting for the way they were assembled. The formation of these collections reveals affecting stories about people and their course around the Mediterranean and gives us a chance to see antiquities from a different perspective.

21 THE MUSEUM OF LIES - THE LAYERED LIVES OF OBJECTS OUT OF CONTEXT?

Abstract author(s): Zinn, Katharina (University of Wales Trinity Saint David)

Abstract format: Oral

The Museum of Lies as subproject to the Cyfarthfa Castle Museum Project collects fictional stories inspired by Egyptological artefacts. It aims to appraise unprovenanced objects by using alternative, creative and artistic narratives (word, image, art, dance) in addition to and beyond scholarly description allowing the literal and cultural (re-)discovery of artifacts completely devoid of their archaeological provenance. In connecting the objects with (new) contexts, they are brought back to life and out of the storerooms by being connected with audiences at the intersection of tangible and intangible heritage.

Artists, poets, craftsmen, dancers and pupils (A-level art, level 9 English) are creating said narratives which are revealed together with the objects and their academic descriptions in annual pop-up exhibitions. Fitting with the cyclical (re-)use of objects in ancient Egypt, this traces their trail through time and space from the moment of first production and consequent usage in Egypt over being picked up by travellers, being misplaced and rediscovered in Wales. At every stage a layer of new context and interpretation was added, revealing their identity giving multidimensionality.

Creative narratives function as simultaneous cultural representations highlighting the EXTRAordinary within such neglected objects. The inherent emotional power and imagination allows to capture a potential which otherwise cannot be detected. This helps to communicate them to the wider public and research community alike, creating several identities and complex relational connections: locally at Merthyr Tydfil in rural Wales, students of UWTSU involved in primary research, local school children using the objects in their curriculum, the community around Lampeter, researchers (Egyptologists, anthropologists, heritage professionals) and more. The focus on different audiences captures the temporality of social agency and changing identities.

This framework challenges the troubled relationship museums can have with truth, authenticity and “the real thing” and contribute to the discourse around museums are not neutral.

OBJECT BIOGRAPHIES AND DIARY FILM: A CREATIVE EXPERIMENT EXPLORING THE SPACE BETWEEN ARCHAEOLOGY AND MOVING IMAGE STRATEGIES

Abstract author(s): Kapsali, Konstanza (LUCA School of Arts)

Abstract format: Oral

Seven objects, dating between the 3d – 4th century AD and the 2010s, become the springboard for a quasi – diaristic story, navigating through a young woman’s childhood and early adulthood memories, but also exploring stories inherited to her by two generations of men in her family. The stories cover a time from, approximately 1952, through the 70s, and until 2021.

In this first-person cinematic attempt, the story is unravelled in an episodic fashion. Each object unlocks a series of free subconscious associations, related to past events in the artist’s life, family memories and historical facts, blurring the line between the seemingly insignificant manifestations of the everyday and that which becomes history.

By questioning the symbolic value attributed to objects of archaeological interest, this work seeks to entertain the idea of self-excavation, as a proposal for the dissemination of scientific ideas on materiality and culture, to the wider public. How familiar are we allowed to be with a museum exhibit?

Synergies between art and archaeology are a long-standing tradition. In the case presenting here, the authorial presence and voice- over narration, which often reflect on conceptions of history and archaeology, in a personal, informal manner, attempts to supplement any pretence of objectivity, with absurdity , nostalgia and humour, to produce a critically self- conscious work of art.

Finally, the associative editing of images and sounds, refers to the fleeting nature of memory, avoiding a linear biographical approach to it, to distance the artefacts from their fixed chronological narrative and from their original contexts, and refamiliarize them to the public, next to other, contemporary artefacts, similarly decontextualised, and other stories of mobility.

NEW INSIGHTS INTO AGRICULTURAL PRACTICES AND THEIR ENVIRONMENTAL CONDITIONS. THE CONTRIBUTION OF ARCHAEOOMETRY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Ben Makhad, Sammy (Muséum national d’Histoire naturelle, Paris) - Gavériaux, Fanny (Independent researcher)

Session format: Regular session

Past-agriculture is widely studied, not only because it can represent an inspiration for our current agriculture, but also because it is a precious source of information about past societies. This session focuses more precisely on plant production, which was, for a long time, understudied due to a lack of evidence. Yet, the domestication, production, exploitation and diffusion of plants and crops were at the basis of numerous socio-economic transformations on different scales. Most of the information known about former crop production is based on literary sources (when available), traditional archaeobotanical or artefact studies. Nonetheless, they still give an incomplete picture of the farmers’ techniques and their environmental setting. The complex entanglement existing between these different aspects remains also challenging to assess.

The last two decades have seen the development of new methodological approaches to archaeological soils and/or archaeobotanical remains to address these issues. For instance, new protocols, including biogeochemical analyses on different proxies, weed ecology or soil micromorphology can help assess various farming techniques (such as tillage, manuring, irrigation, marling) or environmental conditions (such as water status, soil types).

In this session, we want to bring together scholars from different backgrounds to discuss innovative methods for the reconstruction of field environment, ecology, land use, and farming practices, across time and space. Multidisciplinary research dealing with relationships between livestock, draught animals, and crop production, as well as studies offering experimental protocols developed in modern field experiments which could be applied to the archaeological record, are also welcome.

1 THE FERTILIZATION OF FIELDS IN GAUL (500 BCE - 500 CE), APPROACHED BY THE BIOGEOCHEMISTRY OF CEREAL REMAINS

Abstract author(s): Ben Makhad, Sammy - Fiorillo, Denis (Muséum national d'Histoire naturelle, Paris) - Malrain, François (Institut National de Recherches en Archéologie Préventive) - Aguilera, Mònica (Department of Crop and Forest Sciences, Universitat de Lleida) - Matteredne, Véronique - Balasse, Marie (Muséum national d'Histoire naturelle, Paris)

Abstract format: Oral

The dynamic demography and economy of Gallic societies in the Second Iron Age and the Roman period is based on the efficiency of the agricultural system. One of the parameters that increased the potential of crops, and which was studied in a recently defended thesis, was the management of soil fertility. Archaeologists have often dealt with this issue from disparate sources (Latin agronomists, stall and latrine studies, off-site furniture, weed ecology), but which often only attest to the capacity to produce manure. Recent methodological developments in biogeochemistry applied to archaeobotany have made it possible to renew our knowledge of a territory that has been little studied.

These isotope analyses ($\delta^{15}\text{N}$), applied to cereal remains from 68 archaeological sites, have shown that the use of manure was widespread throughout the northern half of France throughout the Second Iron Age and the Roman period. In some areas, it was shown that farmers used less fertiliser, probably due to geological constraints limiting agriculture. A second contribution of this study was to highlight the specific treatment of certain cereal species, in particular bare wheat, which benefited from fertilisation in a greater number of cases.

2 AGRICULTURAL PRACTICES AND ARCHAEO-BIOLOGICAL DATA IN MIDDLE AGES CONTEXTS: A CASE STUDY FROM THE NORTH WEST OF THE IBERIAN PENINSULA

Abstract author(s): Garcia, Victor - Fernández, Jesus (University of Oviedo) - Martin, María (Universidad de Cantabria) - Moshenka, Gabriel (University College London)

Abstract format: Oral

Environmental archaeological studies are commonly incorporated into archaeological projects and reports: however, this practice is not consistent throughout Europe. For example, archaeological data on medieval agricultural practices in the north of the Iberian Peninsula remain scarce. In this area relatively few excavations have systematically sampled and studied botanical and zoological remains, and even fewer have integrated these findings together with other environmental and geographical factors to interpret medieval agricultural landscapes. In this paper we present the bioarchaeological findings of excavations carried out between 2015 and 2022 in and around the medieval village of San Romano, in Asturias, Spain. The site dates to between the thirteenth and fourteenth centuries. We will examine the organic remains using quantitative and qualitative methods, together with environmental and geographical data, to ascertain the past agricultural processes. The materials from San Romano provide data on livestock management: a greater representation of suids (*Sus* sp.) compared to other farm animals, a near-total absence of game animals, and groups such as equids or canids. Within the archaeobotanical data we highlight, within the cultivated or collected groups, both dressed wheat and nut shells such as hazelnut (*Corilus avellana*) and walnut (*Juglans Regia*). Charcoal analysis demonstrates a diversified and complex woody resources exploitation combining firewood obtained from mixed oak forests with temperate plants, as well as riverine and scrubland species. Firewood was obtained in the valley but also in the highest elevations of the surrounding mountain areas. This environmental information is fundamental for a correct interpretation of the peasant settlements of the high and late medieval period.

3 PAST AND PRESENT WEED VEGETATION AT LJUBLJANSKO BARJE AREA, SLOVENIA: PRELIMINARY RESULTS

Abstract author(s): Skrt Kristan, Taja (Institute of Archaeology ZRC SAZU) - Tolar, Tjaša (Institute of Archaeology ZRC SAZU) - Küzmič, Filip (Jovan Hadži Institute of Biology ZRC SAZU)

Abstract format: Oral

Ljubljansko barje area in Slovenia is well known Late Neolithic to Early Bronze Age archaeological wetland site, where more than 40 pile-dwelling settlements have been discovered. Besides the remains of cultivated and intentionally gathered plants, seeds/fruits of other plant taxa from the surrounding area can also be recovered. Weeds are important, but usually get less attention. The variety of weed species that occur in fields depends, among other factors, on the crop and field management. The presence or absence of certain species can also give us, beside the information about environmental conditions and agricultural practices (such as tillage, manuring, sowing and harvesting time and methods, etc.) the information about intensification of agriculture. We aim to apply a multi-faceted approach to

study past and present weed vegetation of the Ljubljansko barje, including (i) soil seed bank analysis, (ii) recording standing weed vegetation, (iii) utilizing an existing vegetation plot database, and (iv) compiling archaeological records of herb species from the 4th mill. BC Slovenian pile-dwellings. We will compare results from botanical studies (i-ii) performed at modern organic cereal and flax fields with the currently available historical and archaeobotanical records (iii-iv). First results show that certain taxa are detected in both recent and archaeological sediment samples, such as species from genera *Chenopodium*, *Rumex*, *Trifolium*, and *Stellaria*, while others are totally absent or present only with individual specimens. With further research we will try to elucidate species' roles as either weed, ruderal, unintentionally introduced or even cultivated species in the present and past.

4 SOIL SEED BANK AND ARCHAEOBOTANY: STUDYING THE PAST LANDSCAPE AND HUMAN ACTIVITIES DISTURBANCE THROUGH THE SEEDS

Abstract author(s): Stella, Matilde - Grasso, Anna - Fiorentino, Girolamo (Laboratory of Archaeobotany and Palaeoecology, University of Salento)

Abstract format: Oral

Seeds surviving at the most superficial layer of the soil form the soil seed bank. The soil seed bank is a precious tool for biodiversity conservation, plant identification and crop renovation. Thus, the study of soil seeds bank process distribution provides important information about weed control, crop seasonality, farming strategies and soil-forming processes.

Studying the modern soil distribution processes of seed helps to understand which seed characteristics influence the movement, the penetration and the deposition of seeds in the soil. Previous studies have shown that seeds penetrate the ground very slowly and demonstrated that seeds are conditioned by their shape and the relationship between surface and their volume.

In this work, we survey the soil seed bank of a modern wheat field in South-East Sicily (Italy), through phytosociological, ecological, biometric and morphological analysis. Specifically, we focus on vegetation and anthropogenic disturbance activities to analyse past agriculture systems and human–environment interactions.

5 WHAT'S IN A SHAPE? 3D SHAPE ANALYSIS OF PHYTOLITHS AS A TOOL TO REFINE BOTANICAL ATTRIBUTION OF CEREAL PHYTOLITHS

Abstract author(s): Hermans, Rosalie (Department of Chemistry, Research Unit: Analytical, Environmental and Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB; Department of Art Sciences and Archaeology, Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel, MARI) - Chevalier, Alexandre (Royal Belgian Institute of Natural Sciences, Quaternary Environments and Humans) - Strömberg, Caroline (Department of Biology, Burke Museum of Natural History & Culture, University of Washington) - Nys, Karin (Department of Art Sciences and Archaeology, Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel, MARI) - Snoeck, Christophe (Department of Chemistry, Research Unit: Analytical, Environmental and Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB; Department of Art Sciences and Archaeology, Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel, MARI) - Devos, Yannick - Vrydaghs, Luc (Department of Art Sciences and Archaeology, Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel, MARI)

Abstract format: Oral

Phytoliths, opaline silica bodies in plants, are used to identify the remains of wild and domesticated plant species in archaeological contexts. In combination with geoarchaeology, phytolith analysis enables to shed light on local crop cultivation. The grass family (Poaceae), including cereals, is known to produce high amounts of phytoliths often taxonomically diagnostic, making phytoliths an excellent proxy to study cereal cultivation. Particular phytolith morphotypes, called ELONGATE DENTATE and ELONGATE DENDRITIC, are produced in the inflorescence bracts of many cereal species.

The current work builds on the research of Gallaher et al. (2020) by investigating ELONGATE DENTATE and ELONGATE DENDRITIC phytoliths from modern cereal species within the Triticeae and Aveneae and some wild grasses using confocal microscopy. The latter enables the production of 3D phytolith models, followed by 3D shape analysis (3D geometric morphometrics). With this 3D analysis, we hope to get a more in-depth understanding of these morphotypes, and consequently refine botanical attribution of wheat, rye, spelt, and barley phytoliths in archaeological contexts to better understand food production.

PASTURES ON THE EDGE: MARGINAL LANDSCAPES AND ALTERNATIVE SOCIAL FORMS

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Houghton, Mark (Aarhus University) - Costello, Eugene (University College Cork; Stockholm University) - Løvschal, Mette (Aarhus University; Moesgaard Museum)

Session format: Regular session

Many of our most evocative landscapes – heathlands, bogs, forests, high mountains – have been productive and lived environments throughout human history. Nevertheless, they sit in strange relation to much archaeological work, liable to come into focus as the site of exceptional finds, bodies frozen in pack ice or preserved in bog for instance. While these spectacular finds might grab our attention, they do not break the overriding sense that these were ‘marginal’ landscapes, visited for special purposes on unusual occasions. Given their marginality to modern, productivity-focused worlds, it is easy to forget the centrality such landscapes held to past communities and the particular forms of social organisation and tenure which they called into being, notably commons and shared grazing rights. Understanding land as held-in-common is, for example, a complex and actively heterarchical, even anarchic, way of managing resources. Yet, these landscapes are still underestimated as sources of insight on economic and social life, as if we assume their marginality today must reflect some unchanging essence of the landscape itself.

In this session, we want to re-people and re-animate these ‘marginal’ areas. How can we understand the effect of these landscapes on their inhabitants, and the inventive and productive relationships that people forge with one another in order to use and live in these places? We seek papers that explore social organisation in marginal and pastoral landscapes around Europe, in both the recent and distant past. We particularly welcome papers that discuss entanglements of people, plants, animals and topography, so as to get a fuller understanding of the factors influencing social organisation and landholding. How did ‘marginal’ landscapes afford opportunities for particular social forms, and what factors led to the disruption, reconfiguration or persistence of these regimes over time?

ABSTRACTS

1 COUNTING SHEEP: NEW INSIGHTS INTO HERBIVORE DYNAMICS IN ATLANTIC HEATHLANDS

Abstract author(s): Davies, Althea (University of St Andrews)

Abstract format: Oral

Across Europe, heaths and moors have become a focus for restoration and rewilding which raises challenging questions about how well we actually understand the role of grazers and pastoralism in generating and maintaining internationally significant Atlantic heathlands. Herbivores are part of archaeological narratives in UK upland landscapes from the Mesolithic onwards, but we currently have a limited understanding of how animal abundance has changed over time since soils are too acidic for bone preservation and shepherding systems leave a limited archaeological footprint. Spores from dung fungi are increasingly used in palaeoecology as a proxy for large herbivores. However, promising statements about the value of dung fungi as quantitative indicators of herbivore biomass have until recently not been tested in heathlands. This study outlines recent methodological advances using fungal spores, pollen and biomarkers to explore changing pastoral regimes during the “Agricultural Improvements” of the last 200 years. The findings emphasise strikingly different narratives of social and ecological change, in a period people were displaced in favour of sheep. Applying this multiproxy approach to other heathland landscapes has the potential to bring into sharper focus just how central these hinterlands were as engines for socio-economic change.

2 PREHISTORIC LANDSCAPE OF LUENEBURG HEATH

Abstract author(s): Menne, Julia (Lower Saxony State Office for Cultural Heritage; Gerda Henkel Stiftung) - Behling, Hermann - Krug, Johanna - Fabian, Estella (University of Göttingen, Department of Palynology and Climate Dynamics)

Abstract format: Oral

The Lueneburg Heath is one of the best known heath areas in northern Germany. It is a cultural landscape that man has cultivated for thousands of years. Agricultural land alternates with woodland, which was intensively managed by pastoral farming. Due to the sandy soils, it was a barren and sparsely populated land for a long time. The transformation continued in modern times, which led to a complex shaping of the landscape.

This contribution considers the archaeological site ‘Oldendorfer Totenstatt’ and the surrounding areas in the heathland. On this necropolis, graves were built in a very confined space from the Neolithic to the pre-Roman Iron Age. The area has been continuously used as ritual place and was steadily expanded by burials. The continuity of this kind and intensity is unique in northern Germany.

During the Neolithic, the site was part of a network of trade and mobility, whose finds bear witness to far-reaching contacts. The project investigates the connection between the construction of Neolithic monumental architecture up to the use of the site to the present-day and the changes in the landscape caused by man.

Today, the vegetation on the site is heathland with adjacent pine-rich mixed forest and alder swamp forest. Recent palynological analyses show how manifold the landscape has been formed. A change in cultivation is recognisable over the entire period of use, which made it possible to reconstruct the landscape around the site.

3 **HISTORY OR ARCHAEOLOGY? RECONSTRUCTING UPLAND COMMONING AND HERDING IN NORTH-WEST EUROPE, C.1300-1800**

Abstract author(s): Costello, Eugene (University College Cork; Stockholm University)

Abstract format: Oral

For the late medieval and post-medieval periods, a lot of research has been undertaken by historians on the social organisation and work patterns of rural communities. Most of this research has focused on lowland areas where cereal growing was dominant, and the majority also underestimates the landscape itself as a factor in the development of different social practices. There is also arguably a bias towards the study of elites. Nevertheless, it is a very significant body of work for archaeologists of the recent past to reckon with and one which we still have to come to terms with.

In this paper I focus on the gaps and overlaps between social history and landscape archaeology. To do this I look at so-called 'marginal' rural communities in western Ireland, Highland Scotland and north-central Sweden, from roughly 1300 to 1800 AD. These were communities that depended on distinctive forms of social organisation, particularly the common holding of upland pastures and the gendered herding of livestock. However, there is uncertainty about the specifics of these practices because of the nature of the evidence and the methodological gap between historians and archaeologists. This neglect is a shame as we know from other contexts that there can be a lot of complexity in both common property regimes and rural work practices. Using different sources and examples, I discuss when gendered herding may have emerged in mountain and forest areas of north-west Europe and consider different potential forms of negotiation within these commons over time.

4 **'ONCE OUR HILLSIDES WERE RINGING': RE-POPULATING THE UPLAND LANDSCAPES OF GLENCOE IN THE SCOTTISH HIGHLANDS IN THE EARLY MODERN PERIOD**

Abstract author(s): Stewart, Edward (University of Glasgow)

Abstract format: Oral

Popular narratives towards the Scottish Highland landscape often position the uplands as an enduring wilderness or wasteland prime for rewilding. The assumption of the marginality of the upland shieling landscape, as an empty, liminal and unproductive space, and the assumed centrality of the valleys and straths as areas of permanent settlement and cultivation ignores the social complexity and diversity of practices occurring within these landscapes. Recent research into Gleann Leac-na-Muidhe, Glencoe, in the post-medieval has attempted to explore one such landscape in relation to its complex seasonalities and the busyness produced by networks of practices throughout the year. This is with the aim of producing narratives which repopulate these supposedly empty landscapes and challenge notions of 'marginality' and 'centrality'.

Alongside considering the productivity of these often assumed to be unproductive and marginal landscapes this paper will also explore the various ways communities and local elites set out to control and manage their upland resources, through various forms of occupation of 'marginal' land. As part of this the expression of control by local and regional elites over these uplands will be interrogated to consider the social complexities of the upland communities created through these relationships, based on recent investigations of a shieling cluster and chiefly summer settlement in Glencoe.

From this point the trajectories of this landscape over the course of the early modern period will be considered charting the impacts of periods of unrest, improvement and clearance which rendered many such landscapes into so-called 'emptied lands'. The new forms of social organisations and land management which evolved from this transition to hill sheep farms and sporting estates will be explored to recognise the shifting busyness of the uplands through this period which continues to shape how these landscapes are used and understood today.

5 ANCESTRAL COMMONS: EXPLORING THE CENTRALITY OF 'MARGINAL' HEATHLANDS TO THE NORDIC BRONZE AGE WORLD

Abstract author(s): Løvschal, Mette - Houghton, Mark (Aarhus University)

Abstract format: Oral

The heathlands of northern Europe are easily overlooked in archaeological narratives of prehistory. This is a product of their marginality in recent centuries and the language of progress and industrialization that accompanied their conversion to agricultural land in the nineteenth century. It is surprising, then, to learn that inland heaths were deliberately expanded and carefully managed for millennia across northern Europe. This fact suggests radically different understandings of heathland, their affordances and centrality to the structures of life. In this paper, we focus on a large area of prehistoric anthropogenic heathland in western Denmark and investigate how reframing it as central to prehistoric life encourages new understandings of cosmology, social organization and landscape governance to emerge. We suggest that the expansion and management of this landscape form was rooted in a form of ancestral commons, in which life and death were entangled in the renewal of landscape and the burial of the dead. These ancestral commons formed a backbone for further developments across southern Scandinavia, becoming instrumental to Bronze Age travel and social organization, enabling different social groups to coalesce and reconfigure in a manner which was vital to the functioning of the Nordic Bronze Age world.

6 PASTORAL WEALTH IN MARGINAL LANDSCAPES

Abstract author(s): Sand-Eriksen, Anette (University of Oslo; Museum of Cultural History) - Løvschal, Mette (Aarhus University; Moesgaard Museum)

Abstract format: Oral

The concept of marginality gives immediate association to peripheral or isolated landscapes. And indeed, physical marginality has often been connected to social and economic marginality. However, with this paper we approach marginal landscapes more openly, exploring how marginal landscapes in late 3rd-2nd millennium BC southeast Norway were spatially, economically, and socially integrated through practises of pastoralism.

Consider the mountains and wide-stretching woodlands of southeast Norway – plentiful of marginal, wet and dry grazing landscapes with highly seasonally dependent resources. Rich archaeological evidence, such as pit fall traps and lithic debitage, reveal how people traversed and exploited such landscapes for hunting, fishing, and trapping throughout prehistory. Curiously, however, we know very little about how pastoral communities in the region operated in and governed these marginal areas, not least in relation to so-called 'core' areas. This is particularly striking since recent settlement archaeological research suggests that this region was oriented towards pastoralism in contrast to cereal-based agriculture. If this is indeed the case, it suggests that we need to approach the archaeological material substantially different.

In this paper, we take a deeper look into an often-overlooked category of sites, what we call off-sites, aiming to identify seasonal gatherings and pastoral activities in upland and inland areas in southeast Norway. By investigating factors of physical and biological character at these locations, e.g., water points, movement corridors, and distinct landmarks, we aim to bring forth new knowledge of this highly overlooked way of living in and with marginal landscapes.

7 ECONOMIC AND SOCIAL DYNAMICS OF CENTRAL CRETAN MOUNTAINOUS BORDERLANDS IN THE FIRST MILLENNIUM BC

Abstract author(s): Drillat, Quentin (Ghent University)

Abstract format: Oral

In the modern Heraklion prefecture, central Crete, Greece, multiple city-states emerged and evolved during the first millennium BC within an area bounded by mountains: the Psiloritis to the West, the Lasithi to the East, and the Asterousia to the South. This highly compartmentalized landscape, split between multiple city-states, was, as a result, composed of many borderlands, areas at the frame of each independent territory. This paper aims to study these borderlands with a special focus on economic and social practices in relation to geo-environmental constraints. Since these marginal areas provided city-states with specific ecosystems interesting for specific activities such as pastoralism, their control and access were crucial for the economic sovereignty of polities. This paper will apply spatial analyses and modeling technics to define and characterize border zones, their access and their use. First, Least-Cost Site Catchment analysis enables to model city-states' border lines. Around them, border zones will be characterized based on terrain analysis and paleoenvironmental data, to estimate their agricultural and economic potential. These marginal landscapes will then be re-humanized by analyzing the accessibility of these zones from city centers with cost-based analyses. Finally, settlement patterns will be explored as a proxy of the social organization in borderlands. Combined with historical documents that describe borders and mention shared grazing rights among some city-states, this study

will emphasize the importance of borderlands that were not only marginal areas but also zones of economic activities and places of both social opposition and cooperation.

8 CHANGES IN THE MEANINGS OF 'PASTURELAND' AND 'PASTORAL COMMUNITIES' IN HUNGARY SINCE THE 19TH CENTURY

Abstract author(s): Varga, Anna (Environmental Humanities Research Group, Department of European Ethnology - Cultural Anthropology, University of Pécs)

Abstract format: Oral

Pastoralism is one of the millennia-old subsistence activities and tradition that is widespread worldwide and has a strong influence on the way of life of the people who practise it. It is therefore important to identify not only the practices that remain constant, but also the changes that can help us to understand the different narratives and to uncover the marginal details.

My questions: how have pasturelands and pastoral communities changed from the pre-enclosure period of the early 19th century to the present day, and what role did the enclosures of the second half of the 19th century play in this process? To achieve this, I investigated case studies in Hungary using ethnohistorical and environmental-historical methods.

The most important goal of shepherds is to raise healthy, reproductive livestock. In order to avoid negative effects caused by short or long-term environmental changes, it is best for them to have access to as many different types of habitats as possible. One of the reasons for the pastureland crisis that followed the introduction of enclosure was the significant reduction in the extent of pastureland and the reduced number of grazed habitat types. Nevertheless, the view that pastureland is not made up of only one habitat type is still present in the thinking and practice of contemporary pastoralists. The phrases 'the pastor is dying with the pasture' and 'the pot of the herder is already broken' were expressed by a herder in the mid-20th century, which illustrate the trends towards the transformation of pastoral communities. After the enclosure, professional shepherds became more widespread, while today, the electric fence is increasingly taking over the role of guarding livestock. But the direct link between the herders and the livestock and the need for close relationship with nature in nature-based farming can be seen as eternal.

9 SILK ROAD SYNOECISM AND STATE-FORMATION ON THE EDGE OF THE KAZAKH STEPPE

Abstract author(s): Goffriller, Martin (Xi'an Jiaotong Liverpool University)

Abstract format: Oral

The Dzhetyasar Culture of Kazakhstan, located within the Syr Darya delta near the eastern littoral of the former Aral Sea, presents significant potential for a range of hypotheses on the emergence of settlement practices among pastoralist groups. As one of the great unknowns of Central Asian archaeology, located on the edge of the steppes and the settled world, the people of the Dzhetyasar Culture and their many dozen complex settlements, have so far eluded any form of ethnonymic attribution. The same had to be said of the culture's historical extent, which was very loosely located between the 3rd and 1st centuries BCE until approximately the 6th-8th centuries CE.

Recent results from an extensive core-sampling campaign and a consequently updated chronology of the culture, offer a clearer view of the early stages of development of a number of representative sites, as well as a better understanding of processes whereby smaller segmentary settlements coalesced into larger, proto-urban centers. Additionally, questions regarding the formation of an early Dzhetyasar state can now be more clearly related to the precise historical context within which it operated, while also presenting a clearer picture for the reasons of the abandonment of the cultures' settlements and its eventual overall disappearance.

502 CORING IS NOT BORING! DRILLINGS IN COMBINATION WITH OTHER NON OR MINIMAL-INVASIVE METHODS FOR INVESTIGATING ARCHAEOLOGICAL MONUMENTS [COMFORT]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Ibsen, Timo (Centre for Baltic and Scandinavian Archaeology - ZBSA) - Črešnar, Matija (Department of Archaeology, Faculty of Arts, University of Ljubljana - UL FA DA; Centre for Interdisciplinary Research in Archaeology - CIRA)

Session format: Regular session

This session is dedicated to multi-method approaches in archaeological investigations, that involve the use of drilling. Especially monuments like fortifications with their often enormous rampart-and-ditch systems, terraces, slopes and thick occupation layers full of archaeological and biological relicts, but also burial mounds or settlement tells, offer the

perfect playground for hand augering and mechanical coring. Quick and cheap, drillings serve as an endoscope into the past of such monuments. Drillings in modern times have become an omnipresent, but not en-vogue tool on excavations to verify geophysical results, to distinguish occupation phases, and to answer palaeo-environmental questions. Yet systematic coring strategies are lacking standards.

The often multi-layered cores may contain soil material and hence information about the entire life span of the monuments. They are used for dating hillforts and other monuments by radiocarbon analysis or micromorphological studies of the soil and the relicts it contains, which provide information about the age and function of the site and its parts. Combined with (p)XRF measurements or pollen and phytolith analysis they add information about the environment and the human impact; susceptibility measurements and other geophysical methods help to understand the geomagnetic images or ERT and GPR data. Hence there is a bouquet of methods, which can be applied to drilling cores themselves to make them speak about the history of the site.

We invite archaeologists, soil scientists, geologists, and those from related disciplines to present their method and strategy of drillings used for investigating fortifications, burial mounds or settlement tells with massive earthen elements. Reports about technical challenges, problems, limitations or successful new ideas are welcome, as are presentations on best practice examples of different methods combined with drillings and especially the results we can gain from systematic interdisciplinary coring strategies.

ABSTRACTS

1 CORING EXPERIENCES FROM BALKAN PREHISTORY

Abstract author(s): Penezic, Kristina (Biosense institute, University of Novi Sad)

Abstract format: Oral

For over a decade, coring and augering at numerous prehistoric (Mesolithic to Bronze Age) sites in the central Balkan area have provided insightful information on site size, formation processes, paleo-topography, and small- or large-scale prehistoric earthworks. Samples taken from off-site cores have been used for landscape reconstruction, while samples originating from sites have provided valuable information on environmental proxies (e.g. by analysing biomarkers originating both from archaeological layers and different soils and sediments). Neolithic tell-site Vinča - Belo Brdo has been one of the numerous playgrounds for the application and development of coring techniques. In this presentation, a short history of development of augering methodology will be presented, from first baby steps over a decade ago, to full-scale field campaigns focused on specific research questions. Several other examples from Neolithic, Eneolithic, Bronze Age or multi-layered sites will be presented, focusing on a wide application of hand augering and quick, cheap, and reliable results that were obtained by applying this method.

2 A KEYHOLE TO THE NEOLITHIC: A COMPARISON OF CORING STRATEGIES AT TWO SITES IN THE CARPATHIAN BASIN

Abstract author(s): Kühl, Till - Wilkes, Fynn - Skorna, Henry (Christian-Albrechts-Universität zu Kiel; Cluster of Excellence ROOTS)

Abstract format: Oral

The Carpathian Basin is a hot spot for settlement activities since prehistoric times and offers a wide range of possible method application for archaeological, geophysical and geomorphological survey in different regions. Coring has been used in the contexts presented, in combination with geomagnetic measurements and field walking, to get an impression about settlement layouts, feature preservation, dating and the layering of the features appearing in the geomagnetic survey.

In Slovakia a large rondel from the late neolithic was discovered via a geomagnetic survey near the village of Podhájska in 2022. A combined coring and excavation campaign took place there in summer of 2022. Here, corings were used specifically to investigate several settlement pits, that were scattered across the terrain. The purpose was to gather datable material and to investigate the pit layouts and stratigraphical sequences.

The exploration of the site in Serbia, near the village of Opovo, was different. Geomagnetic investigations and field walkings revealed a late neolithic settlement, that had been partially known already by earlier surveys and even excavations in the 1980s. However, a geomagnetic survey in spring 2022 showed, that the settlement was much larger than anticipated by the former researchers. The settlement appeared to be far-reaching, with a ditch system and several burned houses. Based on this results, the aim of the coring activities at Opovo, was to extend and reevaluate the knowledge of the site by verifying the stratigraphy of multiple features and dating parts of the settlement.

We aim to show that even though a relatively similar combination of survey methods was applied, the research focus strategies differed massively. Whereas coring in Slovakia was used as an explorative method for the gathering of new

information, it was used as a precise sondage tool in Serbia for very specific contexts, in an already researched environment.

3 CORING HALLSTATT

Abstract author(s): Reschreiter, Hans - Kowarik, Kerstin (Natural History Museum Vienna)

Abstract format: Oral

Salt has been produced in Hallstatt for 7000 years. This long history of production has given rise to a specialized landscape in which all aspects of life were attuned to salt. This was one of the decisive reasons for the designation as a UNESCO World Heritage Site.

One of the aims of the research carried out by the NHM Vienna and its cooperation partners is to record the prehistoric and imperial mines in their spatial and temporal dimensions, to characterise the impact of mining activity on the surrounding landscape and to reconstruct the human-environment relationship over millennia. Moreover, prehistoric mining activity was interrupted several times by huge landslides. An understanding of these events is necessary to reconstruct the development of this industrial landscape.

An essential tool for achieving these goals is the sampling - coring - of various archives. Coring is used to reconstruct the impact of mining activity on the ecosystem, to record the size of the mining chambers and the dynamics of the landslide events that repeatedly interrupted mining.

In addition to sampling environmental archives, exploratory drilling in the mine is currently the focus of research. This goes beyond anything previously known in archaeological research. With professional mining equipment, core drillings of dozens of metres in length are carried out in a fan shape to record the size, direction and also the filling of the excavation chambers. In order to explore the landslide masses in the Salzberg valley, it was necessary to drill a core borehole more than 40 metres deep. The environmental history of Hallstatt, on the other hand, can be reconstructed by means of sediment cores from lake deposits and from bogs, some of which are over 50 metres deep.

4 HOW TO APPROACH THE IRON AGE URBAN SPACE - A MINIMAL-INTRUSIVE SURVEY OF OPPIDUM ZÁVIST, CENTRAL BOHEMIA (CZ)

Abstract author(s): Bursak, Daniel (Institute of Archaeology of the CAS, Prague) - Kothieringer, Katja (Informationsverarbeitung in der Geoarchäologie, Otto-Friedrich-Universität Bamberg) - Sonnemann, Till (Bonn Center for Digital Humanities, University of Bonn) - Danielisová, Alžběta - Křivánek, Roman - Kyselý, René - Daněček, David - Kertés, Samuel (Institute of Archaeology of the CAS, Prague)

Abstract format: Oral

Oppidum Závist is one of the longest-settled hilltop sites in Bohemia and a unique example of urban space in Iron Age Central Europe. Despite intensive archaeological investigations from the 1960s to the 1990s, most of the settlement area remained unexplored, as research focused largely on the most prominent structures. Our research questions focus on the use of space through time, population density dynamics, and economic activities. We address the challenges associated with a site of intensive prehistorical occupation studied through a comprehensive surveying methodology: geochemical analysis and radiocarbon dating of charcoal collected from soil coring, complemented by geophysical surveys and spatial analysis of artefacts obtained from metal detector surveys.

Previously conducted large-scale magnetic surveys revealed settlement activity, particularly in the bailey at the foot of the slope, just outside the fifth of six defensive walls, showing pits and linear structures. GPR added a structural analysis and depth component to the magnetic data. A massive support structure appears to prop up the second extensive man-made platform called Balda to the west of the acropolis. The main task of geochemical research is to differentiate the surveyed locations by their function. The geochemical footprint of many pre-Iron Age periods is however distorted by the extensive changes in inhabited space during the 1st millennium BC. Soil investigations and new dating revealed sediment sequences that reflect different phases of use in the Early Medieval period and the Early La Tène period. The latter also contains older charcoal, evidencing fire activities in the Late Bronze Age. Whether the medieval overprint is related to agricultural activities on these terrace-like slopes remains to be seen in further studies by micromorphology, biomarker and XRF analysis. Results from the metal detector survey indicate an important change in the character of settlement during the Iron Age.

5 MULTI-METHOD INVESTIGATIONS (INCLUDING CORING) OF EARLY IRON AGE SITES BETWEEN THE ALPS AND THE DANUBE

Abstract author(s): Crešnar, Matija - Mušič, Branko (University of Ljubljana, Faculty of Arts, Center for Interdisciplinary Research in Archaeology) - Czajlik, Zoltán (Institute of Archaeological Sciences, Faculty of Humanities, Eötvös Loránd University) - Horn, Barbara (University of Ljubljana, Faculty of Arts, Center for Interdisciplinary Research in Archaeology) - Nagy, Balázs (Department of Physical Geography, Faculty of Sciences, Eötvös Loránd University) - Rupnik, László (Institute of Archaeological Sciences, Faculty of Humanities, Eötvös Loránd University)

Abstract format: Oral

The colourful pallet of research methods integrated into the investigations of Early Iron Age sites and landscapes on the fringes of the south-eastern Alps has, in recent years, witnessed a tremendous upswing. It has become a melting pot for diverse disciplines, which partly met their limits in the complex conditions of prehistoric settlements and their landscapes. Our primary goal was not to accumulate vast amounts of data, nor to understand one feature or one site, but to develop a 'methodological toolbox' which could be, due to its systematic nature, applied (almost) anywhere in similar environmental and archaeological circumstances.

Our first research step was aimed at understanding the geological and archaeological settings of the area with the help of remote sensing data (ALS, aerial photography). The most prominent areas were further selected for multi-method geophysical surveys. Minimally invasive ground-truthing (including coring and shovel pits) of the identified natural or anthropogenic features located in crucial positions at the sites was conducted to determine the most suitable areas for intensive geophysical surveys, geochemical mapping, and further invasive investigations.

Our approach, when locating sites for coring, is to follow the preliminary assessment of all available data. In this sense, it is a sampling strategy that is always adapted to our knowledge of the archaeological characteristics of the site, recently at Poštela in Slovenia and Süttő in Hungary (Hungarian-Slovenian bilateral project; NRDIO-SNN134635/ARRS-N6-0168). This is also reflected in the further analyses of acquired materials, which are again adapted to their type, archaeological content, etc. Moreover, we also adapt the on-site and laboratory procedures for further analyses of the drilled material.

We cannot completely replace (small-scale) excavations with shallow coring, but we can certainly reliably explain various anomalies documented with non-invasive methods, understand the results better, and transfer the approach and techniques to other similar sites.

6 RECONSTRUCTING THE PREHISTORIC LANDSCAPE IN AND AROUND THE VIKING AGE FORTRESS NONNEBAKKEN, DENMARK THROUGH A BOREHOLE SURVEY

Abstract author(s): Runge, Mads (Odense City Museums) - Jessen, Catherine - Henriksen, Peter Steen (National Museum of Denmark)

Abstract format: Oral

The Viking Age fortress, Nonnebakken, lies beneath Odense in central Denmark and has, since the beginning of the 19th century, been gradually obscured by, and integrated into, the modern city. A series of targeted research excavations have shown that much of the fortress is preserved beneath the city but this, and the fortress' status as a protected historical monument, has meant that any archaeological excavations can only offer glimpses into the past.

A borehole survey and other non-destructive investigations have been carried out over recent years in order to gain a greater overview of the fortress and its cultural-historical and landscape context. Here we present a landscape reconstruction based on borehole data that aims to place the fortress within its Viking Age landscape and which would be otherwise difficult to determine beneath a large city. The borehole data additionally provides significant new knowledge about the fortress' construction and preservation.

The landscape reconstruction data collates all available data from previous excavations, geotechnical drilling, non-destructive surveys, historical maps, etc. together with a targeted new borehole survey. The new survey aimed to fill any data gaps by coring in private gardens, roadsides, riverside areas etc. and gave borehole data from 40 new positions in and around the fortress. The landscape reconstruction was achieved by modeling the collated data and reveals the Viking Age terrain of the site selected for the fortress and its immediate environment.

The landscape context of the Viking Age fortress has since been combined with new analyzes of the potential navigability to the fortress along with models of the preservation and extent of the nearby city's cultural layers in the Viking Age and the Middle Ages.

7 **BORGRING: REVEALING HIDDEN LANDSCAPES AND TACKLING NAVIGATIONAL MYTHS AT A VIKING AGE FORTRESS**

Abstract author(s): Jessen, Catherine - Henriksen, Peter (National Museum of Denmark) - Ulriksen, Jens (Museum of Southeast Denmark)

Abstract format: Oral

A fifth Viking Age ring fortress in Denmark was only confirmed in 2016. This relatively late recognition of Borgring was due to it being more or less invisible in the present-day landscape. Questions of how the fortress was positioned in the original Viking Age landscape, and how post-Viking age landscape changes concealed the fortress so effectively, were addressed by a large-scale borehole survey supplemented by detailed sedimentary and stratigraphic data from archaeological profiles. The borehole and profile data were used to model the changing shape and nature of the landscape. The reconstruction revealed the geomorphology, wetlands, deep channels and streams which were otherwise unidentifiable and aided the archaeological interpretations. This approach shows how data-based reconstructions are important in the understanding archaeological sites and that sometimes, not everything is quite as it seems.

Another important question asked of the investigations at Borgring was whether the location of the fortress close to the Køge stream meant that it was possible to navigate ships upstream from the coast. The modern Køge stream is narrow and undulating in a relatively large valley which is mostly wetlands and frequently flooded. The sediments and stratigraphy from a series of borehole transects across the valley and downstream were documented to ascertain whether this was also the case 1000 years ago. The borehole records together with ¹⁴C dates showed where and when the valley was infilled with peat and lake sediments. A further detailed investigation of a trench immediately in front of the fortress which showed the position of the stream in the valley during the Viking age. The investigation showed that during the Viking period the stream had much the same size and course as that of the modern day and that navigation with vessels any larger than dinghies would not be possible.

8 **INSIDE A FORTIFICATION RAMPART: GEOARCHAEOLOGICAL ANALYSIS OF THE CONSTRUCTION MATERIAL OF THE SEMI-CIRCULAR RAMPART AROUND THE FORMER VIKING SETTLEMENT HEDEBY**

Abstract author(s): Khamnueva-Wendt, Svetlana (Institute for Ecosystem Research, Kiel University) - Kurgaeva, Anastasiia (Cluster of Excellence ROOTS, Kiel University) - Bork, Hans-Rudolf (Institute for Ecosystem Research, Kiel University)

Abstract format: Oral

Investigation of archaeological monuments through coring is a challenging task regarding the understanding of the composition, stratigraphy, and inner structure of monuments. We propose a method of statistical classification and identification of construction materials of earthworks sampled by coring technique, which was applied for the semi-circular rampart in the Viking settlement Hedeby.

The physicochemical properties of 139 samples from two cores through the top of the rampart and from one core through the buried ditch at the outer footslope were determined: weight percentages of gravel, artefacts, bones and charcoal, loss on ignition, magnetic susceptibility, grain size distribution, and element concentrations. After statistical pre-treatment of data (normalization, correlation, standardization), principal component analysis and cluster analysis were applied to distinguish and group the materials according to their physicochemical properties. The resulting clusters were used as a basis for material classification. Some clusters were mildly transformed according to the morphological properties of material.

As a result, 20 groups of materials were distinguished. We could conclude that the rampart consists of material originating from soil horizons, cultural deposits, Pleistocene materials, and mixtures of these materials. These materials were used in different proportions along the investigated transect. It was also revealed that the volume of material excavated from the ditches was not sufficient for the rampart. Due to a large portion of soil horizons in the rampart, it could be concluded that topsoil horizons must have been extracted from large areas around the rampart.

The presented method for statistical classification of material facilitated and objectified the identification of the genesis and possible sources of the materials. Application of this method on additional transects, best combined with geophysical surveys, would help reconstructing the large-scale anthropogenic landscape transformation in Hedeby.

9 'SPEED-DATING' HILLFORTS BY DRILLINGS - CASE STUDIES FROM THE KALININGRAD REGION OF RUSSIA

Abstract author(s): Ibsen, Timo (Zentrum für Baltische und Skandinavische Archäologie)

Abstract format: Oral

Hillfort research highly depends on chronological information. Without, all statements and theories about cultural affiliation, functional interdependencies or their role in the cultural landscape and society remain pure hypothesis. Findings and especially the most present category of pottery from excavations on plateaus, ramparts or ditches, on the contrary, are often difficult to date.

Since 2014 in the frame of the project “Continuity of research and research of continuity” (funded by the Academy of Science and Literature Mainz, Germany), several hillforts in the Kaliningrad Region of Russia were investigated to receive chronological information. Especially the rampart-and-ditch systems contain data about the whole live span of the monuments. In order to avoid costly and expensive excavations, a motor driven vibra core hammer with metal probes of 60 mm diameter and 1m length is used for conducting series of drillings on ramparts and ditches of hillforts, in combination with a larger series of 14C-dating.

This methodological approach, internally called “speed-dating”, allows for the creation of schematic profile sections and their dating by extracting datable organic material even from greater depths and hence from the initial phases of rampart construction.

Since the first successful investigations in Apuolė (Lithuania) in 2014 the method has been further developed and applied to 13 so far not or only roughly dated hillforts in the Kaliningrad Region of Russia between 2014 and 2018 as the main working area in the project. The results show, that also in the Kaliningrad region hillforts emerge already at the end of the Bronze age and form a stable factor of the cultural landscape between the pre-Roman Iron Age and the 13th centuries AD until the arrival of the Teutonic Order.

The paper describes the method of using drillings for dating and discusses the results against the archaeological background of the Baltic Region.

10 HARD CORING, GEOPHYSICS AND EXCAVATIONS: STRATEGY TO ANALYSE KUKULIŠKIAI HILLTOP SETTLEMENT

Abstract author(s): Pranckenaite, Elena - Urbonaitė-Ubė, Miglė (Klaipėda University)

Abstract format: Oral

Kukuliškiai hilltop settlement (Klaipėda district) is the only single layered (883–403 cal BC) Late Bronze Age settlement in the Lithuanian maritime landscape, located closest to the Baltic Sea. Systematic investigation is being conducted since 2017: 130 boreholes were drilled, around 3,5 hectares scanned with GPR and 68 sq. meters excavated. The main goal of investigations is to determine paleo-environment, inner settlement's structure, possible fortifications, economic technologies and diet. The investigation strategy was based on combination of non-invasive methods (GPR and drilling) with testing pits and excavation plots due to very complex and challenging landscape of this settlement. This strategy enabled to reconstruct primary landscape, main traits of community's subsistence economy. It is important to collect data for macrobotanical, zooarchaeological, palinological material, samples for AMS C14 dating, inorganic and organic phosphorus and geomorphological analyses. The presentation is focused on benefits of this complex investigations, limitations and challenges encountered during 4 years' experience in research of this Late Bronze Age site.

11 THE HILLFORTS OF KERNAVĖ: MORE BOREHOLES - MORE KNOWLEDGE

Abstract author(s): Velius, Gintautas (Vilnius University) - Vengalis, Rokas - Pilkauskas, Mindaugas (Lithuanian Institute of History)

Abstract format: Oral

In recent years, Vilnius University and the Kernavė State Cultural Reserve have been carrying out the project “Functional Development of Hillforts - from the Fortified Settlement to the Residence of the Duke”. The main object of this research is a complex of 4 hillforts located in the UNESCO-protected Kernavė archaeological site. The aim of the project is to identify and precisely chronologise the functional development of the Eastern Lithuanian hillforts and the activities carried out on them during the Iron Age and the Middle Ages (5th century BC - 14th century AD). At the same time, an attempt was made to reveal the dynamics and chronology of the transformation of the natural, uninhabited landscape of the Kernavė hillforts into a cultural landscape. The main research strategy was to obtain as much data as possible using none or minimal invasive research methods such as geophysics and drillings.

Three geophysical methods were used: magnetometry, GPR and ERT. These surveys were followed by coring and archaeological excavations. Over 300 boreholes were drilled and sampled for 14C dating. The excavations were carried

out on the basis of the geophysical surveys and the drilling information. The interdisciplinary research data were synthesised to determine the evolution of the hillforts' residential and defensive functions. The new 14C dates obtained have significantly extended their chronology.

The aim of this report is to highlight the importance of coring in such multi-method investigations. The advantages and disadvantages of this method will be revealed and discussed.

12

INTERDISCIPLINARY HILLFORT STUDIES AT THE DAUGAVA RIVER: MERGING AND DECODING ARCHAEOLOGICAL, ENVIRONMENTAL AND LINGUISTIC DATA (INHILLDAUGAR)

Abstract author(s): Schneeweiss, Jens (Centre for Baltic and Scandinavian Archaeology; Cluster of Excellence ROOTS; Kiel University) - Ibsen, Timo (Centre for Baltic and Scandinavian Archaeology) - Kittel, Piotr (University of Lodz, Faculty of Geographical Sciences) - Sikora, Jerzy (University of Lodz, Institute of Archaeology) - Visocka, Vanda (University of Latvia) - Whitefield, Hans (Centre for Baltic and Scandinavian Archaeology)

Abstract format: Oral

In Eastern Europe rivers represent the main gateways for trading flows between Scandinavia and south-eastern continental Europe. The Daugava River is one of the most important traffic arteries in the Baltic region. On the 350 km long Latvian river section, about 30 hillforts give evidence of the high significance of this waterway. Roughly half of them have not been investigated at all. The INHILLDAUGAR project takes this archaeological river landscape into macro scale research focus as a whole system, by combining palaeoenvironmental, archaeological and linguistic studies. The application of non- and minimal invasive field techniques like geomagnetic surveys, drillings and test pits, 14C- and dendrochronological datings are crucial for obtaining valid and evaluable data from a large number of fortifications in a short period of time for understanding the system as a whole in its chronological development. Drill catenae with the ram core auger through the rampart structures allow an approximation of their structure and stratigraphy. Geological and geomorphological investigations for palaeoenvironmental studies are carried out with the hand auger in the vicinity of the most important sites. Detailed drilling can uncover geoarchives and potential bioarchives that can be used for studies on the palaeoenvironment and human-environment relationships. The achieved data is transferred to a GIS. Crucial for validating the dating is a sufficient number of radiocarbon dates, on average about 20 per hillfort. The outcome of the project will be a GIS-based open access atlas, including standardized topographic maps of the archaeological monuments and their immediate surroundings, thematic maps related to the core questions of the project and digital modelling of the Daugava waterway in prehistory. In the talk will be presented the results of the first project year 2022.

Acknowledgement:

- Beethoven-CLASSIC4 joint project funded by DFG (465100096) and NCN (2020/39/G/HS3/01542).

INTEGRATING GROUND-PENETRATING RADAR, MAGNETOMETRY, AND TARGETED CORING IN THE STUDY OF IRISH MEDIEVAL SETTLEMENTS AND SETTLEMENT PATTERNING

Abstract author(s): Bair, Andrew (Harvard University)

Abstract format: Oral

Across global contexts, buried settlements are rich archaeological resources, recording the daily lives and repeated practices of ordinary people and diachronically archiving changes and continuities. In their complexity and frequently large size, settlements present a host of challenges for the researcher, who is often limited by time, money, and labor. This paper presents a methodology designed to address challenges inherent in settlement archaeology, by firstly combining datasets of ground-penetrating radar and magnetometry to create large-scale three-dimensional maps of subsurface archaeological features, and secondly coring targeted buried features to better inform geophysical interpretations and to collect paleoethnobotanical, soil, and radiocarbon samples. In doing so, a buried archaeological landscape can be "pseudo-excavated", where features are identified, mapped, and sampled without a single shovel being raised, leaving most of the archaeology intact and preserved. The case study is a medieval cultural landscape in Western Ireland at Ballintober, Co. Roscommon, centered on a newly discovered deserted medieval village but incorporating its wider context, notably a series of smaller dispersed earthwork settlements that dot the surrounding area. The project hopes to reconstruct the history of each site, but also to create a chronology of settlement patterning in the region through the entire medieval period.

WHAT'S HIDDEN IN A CORE? ON THE USE OF MAPS, GPR AND DRILLING IN EARLY MODERN FORTIFICATIONS

Abstract author(s): Pettersson, Claes (Sydsvensk Arkeologi AB)

Abstract format: Oral

In the aftermath of the Kalmar War (1611-1613) it was obvious that the vulnerable north-eastern border of the Danish realm had to be strengthened. Swedish troops had laid waste to twenty-six parishes and the town of Vå in the province of Scania. The solution was to give up two medieval cities in favour of a new fortified town built in the Dutch fashion, surrounded by vast wetlands. So, Kristianstad received its privileges in 1614 while Åhus and Vå lost theirs.

The whole region was mobilized to provide the labour force and logistics needed. The new site was perfect from a strategic point of view, but highly unsuitable otherwise. Large volumes of soil, branches and timber was brought in to create ground fit to build upon. And then fortifications, a church, a royal residence, an armoury, and hundreds of ordinary town houses were built. After the Roskilde Peace Treaty in 1658 Kristianstad became a Swedish garrison town. The fortifications were modernized and enlarged in the following century but declared redundant in 1847 and demolished shortly thereafter. Today very little remains to be seen above ground of the once mighty walls and bastions.

During the last decade the remains of the fortifications has been subject to archaeological investigations. Using a combination of rectified, highly detailed 17th and 18th century military maps and drawings, GPR surveys and extensive drilling has given us new knowledge on exact location and state of preservation together with samples for paleo-botanical analysis. Thus, it has been possible to achieve invaluable information with non-invasive methods before the traditional excavations begin.

Here we would like to present the sources and methods used so far together with the gains and pitfalls encountered in the process. It may prove useful for others when dealing with town fortifications from the Early Modern period.

LIVING AMONG THE RUINS. RE-SETTLEMENT AND IDENTITY FORMATION IN DEVASTATED LANDSCAPES AND ABANDONED CITIES

Session theme: 6. Contested Pasts & Presents

Session organisers: Meier, Thomas (Kaete Hamburger Center for Apocalyptic and Post-Apocalyptic Studies, Heidelberg University; Institute for Pre- and Protohistory and Near Eastern Studies, Heidelberg University) - Moragas, Natalia (ERAAUB-IAUB-University of Barcelona) - Lekakis, Stelios (McCord Centre - School of History, Classics and Archaeology, Newcastle University) - Torras Freixa, Maria (Boston University; Gerda Henkel Fellowship) - Peci, Alessandra (ERAAUB-IAUB-University of Barcelona)

Session format: Regular session

The importance of rootedness in an individually charged built and/or natural landscape is highlighted in the (post-) modern world as being a key ingredient to mental and bodily well-being and positive identity-formation. What happens, however, if this intimate connection between identity and landscape is broken?

This session will focus on the re-occupation, re-settlement and transformation of abandoned, sometimes 'lost' cities and landscapes in the immediate as well as in the long-term aftermath of devastation and de-urbanisation. These abandoned, devastated or ruined places and spaces are often alive in the memories of their inhabitants and are part of cultural memory that implies negotiating identities, constructing mythical topographies, creating new perceptions and instrumentalizing power relations.

We are interested in both temporalities of re-use and re-settlement: What happens in the immediate aftermath, the weeks and months to follow catastrophe and devastation as well as resettlement a long time after abandonment and oblivion of towns and landscapes? We are especially interested in (re-)settlement, de-urbanization and (re-)shaping of rural and urban landscapes after a – mostly human-caused – apocalyptic experience. How did settlement patterns, daily life management such as critical infrastructures and, cultural perception of the abandoned place change? How was it re-used by different settlers and time periods? How did such dystopian experiences impact people's identity and connection with their environments, not the least in terms of resilience and social change? How were abandoned landscapes and lost cities perceived, how were they integrated in the cultural memory and mental landscapes and how did they recode and instrumentalize these urban and rural landscapes?

A wide variety of cultural and historical contexts is highly appreciated. Presentations that point their relevance for global challenges induced by climate change, global inequality, or war are also welcomed.

This session is affiliated with the research project "Living in the ruins of the city of Teotihuacan (Mexico)", funded by the Gerda-Henkel-Foundation and the DFG-AHRC research project "Devastation, dislocation and (re-)settlement. Breaking/replacing the people-place connection in landscape".

1 LIVING AMONG THE RUINS - INTRODUCTION

Abstract author(s): Meier, Thomas (Kaete Hamburger Center for Apocalyptic and Post-Apocalyptic Studies, Heidelberg University; Institute for Pre- and Protohistory and Near Eastern Studies, Heidelberg University) - Moragas, Natalia (ERAAUB-IAUB-University of Barcelona)

Abstract format: Oral

The importance of rootedness in an individually charged social and spatial environment is highlighted in the (post-) modern and globalised world as being a key ingredient to mental and bodily well-being and positive identity-formation. While the impact of heritage destruction on individual and group identities receives more and more academic attention there is still little research into the impact of human-caused, deliberate landscape devastation, processes of de-urbanization and the emergence of abandoned urban areas – and even less research on the re-shaping and re-settlement of landscapes and identities in the immediate aftermath such apocalyptic experiences or on the re-occupation and transformation of built environments. These abandoned or devastated places and spaces are often alive in the memories of the inhabitants and imply negotiating identities, re-constructing mythical topographies as well as functionalities, creating new perceptions and instrumentalizing power relations. How do you survive and how do you live in such abandoned places? How do the inhabitants interact with the destructed environment? How are the elements of a lost past perceived by non-indigenous groups?

2 AFTER THE CITY OF TEOTIHUACAN :A FORGOTTEN ARCHAEOLOGY

Abstract author(s): Moragas, Natalia (ERAAUB-IAUB-University of Barcelona) - Torras Freixa, Maria (Gerda Henkel Fellowship) - Pecci, Alessandra (ERAAUB-IUAB -University of Barcelona)

Abstract format: Oral

Much of the archaeological research carried out in Teotihuacan refers to the classical period when urban development reaches its maximum.

Undoubtedly, the monumentality of the structures and the astonishing quality in the construction of monumental architecture have been key elements for Teotihuacan society but also for the interest of Mesoamerican archaeology. The collapse of Teotihuacan has received some attention but always related to the earlier Classic period. The Academy seems to forget that the population lives in the valley from the past to this day and different cultures and interactions will take place over more than a thousand years. Consequently, the research about the society after collapse is fully accomplished falls considerably. The Project :” Living in the ruins of Teotihuacan “ focuses how the population of Teotihuacan lives in the valley when the organized urban landscape has disappeared and the regional leadership of Teotihuacan seems forgotten. Our project aims to understand the role of the population of the Teotihuacan valley in a very altered landscape and a forgotten (or not) city.

3 THE ACROPOLIS OF LA BLANCA. A MEMORY SPACE AFTER ITS ABANDONMENT DURING THE DECLINE OF THE MAYA CLASSIC CIVILIZATION

Abstract author(s): Vidal Lorenzo, Cristina (Universitat de València) - Muñoz Cosme, Gaspar (Universitat Politècnica de València) - Aliperta, Andrea (Universitat de València)

Abstract format: Oral

The decline of the Classic Maya civilization between the eighth and tenth centuries A.D. led to the abandonment of its splendid cities, most of them built in jungle environments. From then onwards, nature began to invade their colourful buildings and sculptural monuments until they were partially buried by the thick tropical vegetation. Despite becoming uninhabitable as cities, later generations imbued them with new meaning and many of them became memory spaces where ancestors were venerated.

An example of this is the Acropolis of La Blanca, an exceptional Late Classic architectural complex in the Mopán River Valley (Petén, Guatemala). Its principal palace, known as the Orient Palace, has the widest vault in the entire Maya area. This building has been the focus of an exhaustive archaeological and architectural investigation by the La Blanca Project, using new digital technologies for the study and documentation of the Maya cultural heritage. Thanks to this and to the meticulous analysis and interpretation of the archaeological remains found inside, it has been possible to reconstruct the gradual deterioration of the building until it became an archaeological ruin and the place chosen for some of the most significant burials of this period in La Blanca.

Focusing on the Acropolis of La Blanca as a case study, the paper discusses the reuse of abandoned structures in Maya cities and examines how these ruined buildings were perceived and integrated into the cultural memory of the new occupants of the Postclassic period.

4 UNDERSTANDING THE END: DEVELOPING A THEORETICAL FRAME FOR DEVASTATION IN THE LANDSCAPE

Abstract author(s): Fairclough, Graham - Lekakis, Stelios (Newcastle University)

Abstract format: Oral

Violent, abrupt and deliberate human-made events that break the connection between landscape and social identity and cause loss of human lives, settlement/farming land destruction and population dislocation are - regretfully - frequent in the historical archive, from the Siege of Melos (Greece, 416 BC) to the Srebrenica massacre (Bosnia - Herzegovina, 1995) and from the Irish Potato Famine (1845-1852) to the Hutu-Tutsi strife (Rwanda & Burundi, post 1959). Starting with one example - the military 'burning' of the Rhenish Palatinate by French armies in 1688-89 - but expanding outwards to other periods and places, the AHRC-DFG project "Devastation, dislocation and (re-) settlement: Breaking/replacing the people-place connection in landscape" will create an initial theoretical conceptualisation associating 'landscape', 'devastation' and 'response'. The theoretical framework will be used to categorise specific cases drawn from the disciplines of history, anthropology and archaeology in an attempt to develop building blocks for an archaeology of destruction, disruption and re-habitation.

5 A REBUILT LANDSCAPE: THE PALATINATE COUNTRYSIDE AFTER ITS DEVASTATION DURING THE NINE YEARS WAR (1688-1697)

Abstract author(s): Vuletic, Nikola (Ruprecht-Karls-Universität Heidelberg; Christian-Albrechts-Universität zu Kiel)

Abstract format: Oral

For a long time the scale of the devastation of the Electoral Palatinate, carried out as a defensive strategy by the armies of the French King Louis XIV between 1689 and 1693 during the Nine Years War, was seen by historians as so enormous that it rivalled the damage done by the Thirty Years War, 1618-48. The devastation left many traces in the cities and their surrounding landscapes, some of them glaringly obvious, like the ruins of castles, some hidden in plain view, like the existence of woods where agriculture was once practiced and baroque cityscapes that don't have anything in common anymore with the medieval structures that had preceded them. However, because most of the archaeological and historical research on the devastation of the Palatinate as well as the contemporary news coverage was focused on the cities, the surrounding countryside with its villages was often presumed to have been destroyed just as completely. The actual extent of the countryside's devastation was never thoroughly researched and there is compelling evidence that some, if not many, villages labelled as destroyed by historians and contemporary writers actually survived relatively unscathed. This presentation attempts to take a closer look at how the devastation wrought during the Nine Years War affected the Palatine countryside in a way that is still visible or recognizable today. Did the devastation and the subsequent reconstruction and resettlement efforts completely change the villagescapes as they changed the cityscapes, or did they fail to do so, and why? And are there noticeable material differences between villages that survived and those that were razed to the ground and rebuilt? Answering these questions will hopefully not only contribute Palatine historiography, but also shed light on how early modern warfare affected cities and their surrounding countrysides respectively.

6 HOME IN A FOREIGN LANDSCAPE: AN ANALYSIS OF RE-SETTLEMENT STRATEGIES OF PALATINE IMMIGRANTS THROUGH THE LENS OF CRITICAL HISTORICAL CARTOGRAPHY

Abstract author(s): van Duijvenvoorde, Julia (Universität Heidelberg; Vrije Universiteit Amsterdam)

Abstract format: Oral

After months of journeying down the Rhine and waiting in makeshift camps around London, thousands of 'Poor Palatines' were finally re-settled on the estates of Protestant landowners amongst the rolling hills of Ireland, County Limerick in the years 1709 and 1710. Upon arrival, a wet, boggy and rocky landscape unfolded before their eyes, only vaguely reminiscent of the famously lush viticultural lands they reluctantly left behind in the midst of war-induced devastation and poverty. Considering the countless topographic, linguistic, social and cultural differences that the Palatines encountered in Ireland, the following question comes to mind: what are some of the strategies that they employed to make sense, reappropriate and ultimately make a home of this foreign Irish landscape? With this paper, I hope to contribute to the broader theme of re-settlement and homemaking in the landscape in two main ways. First, I introduce a more holistic and interdisciplinary approach to the concept of 'home' that allows to link and reflect on different constitutive aspects of the matter that are normally confined to specific academic disciplines. Second, I show that critical map analysis can contribute to a better understanding of historical processes of re-settlement in the landscape, challenging the widespread assumption that maps are a 'dangerous type of evidence'. In order to do so, I cross-compare historical maps from the Ordnance Survey Ireland depicting first- and second-generation Palatine

settlements around County Limerick, paying particular attention to elements such as place names as well as settlement patterns, use and situatedness.

7 MEMORIAL FRAGMENTS. RUIN INTERACTIONS, SPATIAL CONCEPTS AND NARRATIVES AT THE NEOLITHIC SETTLEMENT OF GÖBEKLI TEPE

Abstract author(s): Kinzel, Moritz (German Archaeological Institute Istanbul) - Schönicke, Julia (Freie Universität Berlin)

Abstract format: Oral

The Neolithic settlement of Göbekli Tepe (SE-Turkey, ca. 9500–8000 calBCE) is situated on a terraced limestone plateau and well-known for its special buildings with up to 5.5 m high monolithic T-shaped pillars. With increasing size of the settlement, the buildings accumulated on the steep slopes of the plateau. Inevitably, while the load of the structures became too heavy, severe landslides occurred that increased during strong winter rainfalls.

The Neolithic people reacted to the challenging periodical destruction of their built environment and put great effort in repairing and maintaining the structures which became an integral part of their daily practices. We demonstrate that ruins within the settlement served as sources for extracting building material such as secondary used wall stones, grinding stones, soil mixed with artefacts, and pillar fragments. The latter, even if broken to small pieces, were often placed in prominent positions as spolia. Re-using building materials can be addressed as incidental routines whereas others might have been intentional ritual practices. More than half of the building material in the latest phase of occupation consists of reused objects. Post-abandonment interactions, in turn, are detectable in room fills and their geochemical composition. Ruins, therefore, were still an integral part of the settlement, not only for extracting building material but temporal shelter, meeting places or secret hide-outs and affected people's actions.

Despite all efforts, it became impossible at a certain point to keep the settlement going due to its challenging topography. The memory of the site has been carried on in narratives, reflected in settlements with comparable buildings, T-shaped pillars and similar iconography continuing to exist in the vicinity of Göbekli Tepe. Today, 10000 years later, Göbekli Tepe is re-occupied by politicians, archaeologists and tourists who appropriate the site in their own way – scientifically, politically, and pop-culturally.

8 HOLDING ON TO URBAN LIFE? ENDURING URBANISM IN LATER MEDIEVAL ENGLAND

Abstract author(s): Jervis, Ben - Morton, Benjamin (School of History, Archaeology & Religion, Cardiff University)

Abstract format: Oral

The apparent 'decay' and 'decline' of towns in the 14th century is commonly linked to the devastation of the Black Death, resultant economic turmoil, and the impacts of climatic fluctuation on agriculture. Yet, the concepts of 'decay' and 'decline' are relative. Whilst some urban areas were abandoned or saw a decline in the intensity of occupation, life persisted. Here, we argue that in enduring through crises, urban households and communities re-negotiate what it is to be urban, a process which perhaps resonates with the contemporary re-orientation of urban economies and patterns of labour following Covid lockdowns and subsequent economic challenges. As such, we do not see the towns of this period to be any less 'urban' than their predecessors, but for their urbanity to surface in different ways. Drawing on case studies from medieval England (derived from the ongoing UKRI funded project ENDURE: Urban Life in a Time of Crisis: Enduring Urbanism in Later Medieval England) we explore persistence and change in urban lifeways through reconstructing the experiences of urban households. We ask how households adapted to new urban realities, how they capitalised on the potential of disruption or suffered from its consequences and how elements of their lives endured. By focussing on endurance at the household scale, we propose that it is possible to explore these processes from the 'bottom-up', to understand how the experiences of those marginalised in narratives of seigniorial foundation and civic institutions, led to the emergence of situated forms of urban becoming. Our aim is to move away from a focus on the apparent desolation of townscapes to engage with lived experience, to understand the diversity of urban realities – in short to question what an apparent process of 'de-urbanisation' can tell us about what it was to be urban in the later Middle Ages.

9 WHICH ONE IS THE GHOST TOWN? REFLECTING ON THE RUINS OF REPAIR IN EARTHQUAKE ITALY

Abstract author(s): Di Giuseppantonio Di Franco, Paola (University of Essex)

Abstract format: Oral

The lexicon of repair suggests that when a place is ruptured due to 'natural catastrophes', repair should be conceived as a form of darning, "a stitched response to holes/breaks/wounds/ that develop in knitted fabrics". The darning process requires careful understanding of how the rupture ought to be repaired, as well as a close examination of how to start repairing from the threads that remain. Darning after a catastrophe occurs when the reconstruction project considers

the identity of the community affected by the disaster. Otherwise, the risk is that the rebuilt town will produce a new rupture, within communities, and between communities and places.

This paper will clarify this point by presenting the results of a study conducted in Senerchia, a town in Irpinia (Campania, southern Italy) hit by the 1980 earthquake.

This research involved interviews with community members and clarifies how the architectural layout of an urban context embodies social dynamics. The new Senerchia was rebuilt near the remains of the old village, known by many as one of the Italian ghost towns. The reconstruction ripped apart the town, which became three times longer than it used to be, but socially dismembered and “empty”. This study underscores the profound social value of repair, a process that must embed past experiences, present needs, and heritage values, before propelling a community into the future. It is part of a larger project, titled REPLACE (Rebuilding a Sense of Place) and funded by a UKRI Future Leaders Fellowship, which explores the sociocultural role of 3D technologies in increasing community resilience after natural catastrophes.

10 **LIVING AMONGST THE ,RUINS': RURAL TRANSFORMATION AND THE LOST IDENTITY OF SANTA ON THE HIGHLANDS OF THE EASTERN BLACK SEA**

Abstract author(s): Abay, Pelin (Independent researcher) - Serin, Ufuk (Middle East Technical University, Dept. of Architecture)

Abstract format: Oral

The rural settlement of Santa is one of the most outstanding examples of Pontic rural heritage sites in the Eastern Black Sea (Turkey). The site includes seven neighborhoods scattered on the highlands within the modern Province of Gümüşhane. Following the Population Exchange between Turkey and Greece with the Lausanne Treaty in 1923, Santa, along with numerous other rural settlements, has undergone a significant transformation affecting both its built environment and socio-cultural structure. Along with the rural depopulation occurring in the aftermath of this compulsory exchange of peoples, the majority of buildings, once occupied by an Orthodox Greek community, was abandoned and gradually became ruins. Although the site was resettled by a limited number of Turkish inhabitants, it is mainly used as a seasonal highland settlement (yayla) in summer time. As a result of the current appearance of the physical environment, the site was named 'Santa Ruins' (Santa Harabeleri) and irrelevantly designated as a '3rd degree archaeological site' in 1999. Since then, the seasonal inhabitants are literally living amongst the 'ruins'.

The present contribution explores processes of rural depopulation and abandonment, transformation and re-settlement at Santa in the aftermath of the Population Exchange. How did such processes affect the built environment and local identity? How are these landscapes of change integrated into the cultural memory of the emigrant Rums and, equally, how are they perceived and used by the new settlers? This paper also argues that this rural settlement, incorrectly referred to as the 'Santa Ruins', needs to be re-identified, in light of its past and present attributes, as a 'continuing cultural landscape': a settlement where traditional methods of life are merged with modern demands and where evolution continues due to the existence of a local community, although seasonal.

11 **MAKING AND UNMAKING THE PAST. URBANIZATION PROCESSES, LIMINALITY, BELONGING AND SOBA ARCHAEOLOGICAL SITE (SUDAN)**

Abstract author(s): Drzewiecki, Mariusz (Polish Centre of Mediterranean Archaeology, University of Warsaw) - Kurcz, Maciej (Institute of Culture Studies, University of Silesia)

Abstract format: Oral

For the Sudanese, the term Soba has essentially two meanings today. The first refers to the former capital of the medieval Nubian Kingdom of Alwa (5/6-15/16 century CE). Its ruins constitute one of the largest archaeological sites in Sudan covering approximately 275 ha ('Past Soba'). The second describes the suburban zone of the Khartoum agglomeration ('Modern Soba'). 'Past Soba' and 'Modern Soba' are two intertwined space-time continuums, whose relations are multi-layered. Especially since the 1990s, when the ruins started to be radically reduced by modern settlement.

This paper will explore how communities re-settling the former metropolis conceptualise the past of this place in order to organise their daily life, establish linkage to the place in the search for roots in their new place of residence and respond to shifting political, economic and environmental factors. The research is part of the project entitled 'Soba – the Heart of Alwa' initiated in 2019.

LOST AND FOUND ABELLINUM. THE RESHAPE OF AN HISTORICAL LANDSCAPE AND THE CONSTRUCTION OF A CULTURAL MEMORY

Abstract author(s): Musmeci, Daniela - Santoriello, Alfonso - Radaelli, Lorenzo - De Girolamo, Laura (University of Salerno)

Abstract format: Oral

Abellinum, the modern city of Atripalda (Campania, Italy), represented one of the most important urban centres of Roman Hirpinia. Located on the Civita plateau and already frequented in the Samnite age, the city became a Sullan colony and prospered during the imperial period.

From the 5th century A.D. a gradual abandonment started: phenomena, of short and long term, equally devastating for communities (the aftermath of the eruption of 472-505 A.D. and wars; the depopulation of the city, etc.) led to the displacement of the population to the area of the current city of Avellino. This event caused the deconstruction of the ancient urban plan and a progressive landscape transformation, from urban to rural.

The modern city of Atripalda settled again on the banks of the Sabato river, around the plateau, de-urbanised and used for agricultural and mining activities; it developed mainly in the modern and contemporary age. The Civita represented a productive and social hub for the community, a meeting place and also a refuge during WWII. The mining activities effected the buried city destroying archaeological layers and reshaping landscape forms.

Local communities have shown adaptability, resettling and re-functionalising urban space, even after the last catastrophic event, the Irpinia earthquake in 1980: reconstruction has also led to new archaeological discoveries and started a season of research on the ancient centre.

The project led by the University of Salerno focuses on it: the aim is to recover knowledge of the ancient city in order to reconstruct a cultural ecosystem for the benefit of the community. The recovery of the Civita thus is a way to reclaim the past in order to revive it daily within a green space, for public enjoyment, where collective memory lives, identity is created, and the urban and rural landscape is recoded.

DEVASTATION INVERTED? CYCLICAL LANDSCAPE RUINATION AND RE-APPROPRIATION IN THE VELUWE AREA, THE NETHERLANDS

Abstract author(s): Egberts, Linde (National Agency for Cultural Heritage of the Netherlands; Vrije Universiteit Amsterdam)

Abstract format: Oral

This paper focuses on the “appropriation” of a ruined landscape in the Netherlands: the Veluwe. Even though it may not seem evident now, the sandy landscape of the Veluwe Plateau in the Netherlands used to be a relatively densely populated area, where, in the Middle Ages, farming and iron production brought local wealth to the communities. The intensification of these practices however also led to the depletion of the ecosystem: forests were cut for charcoal production and heathlands were overgrazed by cattle. Drifting sands expanded and forced communities to abandon their settlements, which in some cases disappeared under the sand dunes completely. Kootwijkerzand is one example, that has completely been submerged by what is now the largest sand drift area in Western-Europe. Landscape elements in neighbouring settlements testify from the measures inhabitants took to defend themselves against submersion by sand.

In the twentieth century it was exactly the vastness of the uninhabited sands, heathlands and forests that was monumentalized for their natural heritage values. Its devastatedness became the core attraction for newcomers, who did not settle here, but turned it into a prime tourist destination, dotting the area with campsites, vacation enclaves and second homes.

This paper approaches the case study from a landscape biography perspective, based on literature study, archival research and landscape observations. It aims to understand how the cultural perception of the Veluwe landscape changed over the past century; from abandonment to heritagisation. The historical understanding of the inversion of landscape settlement, use and place attachment gains new relevance the light of climate risks, that once again threaten this fragile landscape.

FOR AN ARCHAEOLOGY OF HOUSEHOLDS: NARRATIVES, LANDSCAPES, MATERIALITY, INEQUALITIES, GENDER, RACE, ETHNICITY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Santos, Joel (University of Leicester) - Pacheco, Susana (CFE-HTC Nova University of Lisbon)

Session format: Regular session

A household is not just a space, nor a family, nor a house and not even just a domestic place, and, nonetheless relationships exist among all of these spaces, people, and things that might be included in what a household is. Households among other things are sites of conflict and struggle, emphasizing class, ethnicity, race or gender. Wilk and Rathje said that “archaeologists do not dig up households. They dig up dwellings and domestic artefacts but not social units” (1982), thus it is up to archaeologists to reconstruct the different social dimensions of those units. Households, as a multidimensional relational system of networks delimited by space, can be deconstructed into narratives and discourses, landscapes – be they mental or physical – and materiality. Its thread also has the potential for an intersectional analysis, weaving together inequalities, class, gender, race, ethnicity and sexuality.

We welcome papers approaching places with the traditional view of households such as conventional families’ domestic places, but also from corporate households such as brothels, prisons, asylums, hotels, refugee camps, hospitals, monasteries, barracks, from Prehistory until five minutes ago. Archaeology as a discipline that is grounded in the present also has the potential to become a politically engaged science, and, thus, papers that envision households as sources of contemporary debates will be strongly appreciated, together with papers engaging with the concept and potential household definition.

ABSTRACTS

1 RETHINKING HOUSES AND HOUSEHOLDS: CAPOTE AND THE SOCIETY OF THE CELTIC BETURIA

Abstract author(s): Berrocal-Rangel, Luis (Departamento de Prehistoria y Arqueología) - Ruano, Lucia (Universidad Complutense de Madrid) - Paniego, Pablo (Instituto de Arqueología de Mérida - CSIC) - Sánchez de Oro, Pablo (Universidad Autónoma de Madrid)

Abstract format: Oral

The domestic space is designed not only for functional reasons for the human group, but also for social and cultural reasons. The aim of this contribution is to discuss the Late Iron Age domestic architecture of the Southwest of the Iberian Peninsula, taking as a starting point one of the most important archaeological sites of the period: Castrejón de Capote, Badajoz (5th BC – 1st AD). Between 1985 and 1996, archaeologists partially excavated this site, unearthing more than thirty houses that have hardly been investigated or published. After studying grey literature and old excavation reports, we present the results of our constructional, typological and spatial analyses of these structures, that have allowed us to propose spatial narratives and organisational models for the different phases of occupation of the site. Comparing the results with the data we have from other nearby settlements – Villasviejas del Tamuja, El Raso and La Coraja, for the prehistoric period, and Los Castillejos, Nertóbriga, Fornacis and Mesas de Castelinho, for the early Roman phase –, we seek to better comprehend the social dynamics surrounding houses and household of the Celtic Beturia. With this study of the Iron Age dwellings, our aim is to provide social content to the spaces we analyse, reviewing the archaeological record to discover the nature of the human groups that designed, built, inhabited, reformed and abandoned the domestic structures.

2 SCHOOL DAYS: HOSTEL LIFE AT BOTSHABELO MISSION STATION, MPUMALANGA, SOUTH AFRICA, IN THE FIRST HALF OF THE TWENTIETH CENTURY

Abstract author(s): Swanepoel, Natalie (University of South Africa)

Abstract format: Oral

Botshabelo Mission Station was established in the second half of the nineteenth century by the Berlin Mission Society in what is today Mpumalanga, South Africa. Educational offerings for converts who lived on the station, as well as those within the larger mission network, soon became an important component of life on the station. This culminated in the early twentieth century with the building of a new seminary and the development of a training institute that was eventually taken over by the apartheid government in the 1950s. The legacy of mission education has long been contested in South African history – they were one of the few places where Africans could access a formal education and thus produced many alumni who went on to become political, social and artistic leaders. At the same time, mission schooling also served the interests of the colonial and white minority governments. The institutional households of the

Botshabelo hostels were contexts in which German Lutheranism shaped an emerging African Christianity within the broader context of a newly formed Union of South Africa. This presentation will explore the experience of pupils at the school. The excavation of a large midden at the site in 2015 revealed it to be the discard site for material from the hostel kitchens and living quarters associated with the institute. The archaeology (both excavation and site survey), in concert with documentary accounts and the pictorial record, reveals insights into student diet, hygiene practices, educational programmes, gendered identity and other aspects of their daily life, not evident in or easily gleaned from the documentary record alone.

3 BETWEEN FAMILY HEROES AND SUPERSTITION: HOUSEHOLD CULTS IN ANCIENT ITALY

Abstract author(s): Piccioni, Aura (KU Eichstätt-Ingolstadt)

Abstract format: Oral

As several ancient sources remind us, household cults held a peculiar status among ancient expressions of religio and were occasionally regarded with suspicion—for example, as ‘superstitious’, as Plato himself notes in his discussion of the ideal State. However, the archaeological reality of pre-Roman Italy is significantly more complex than textual sources can convey, not least in the consideration that the distinction between ‘public’ and ‘private’ cults has been rendered obsolete by recent research (R. Parker, *Public and Private*, in R. Raja, J. Rüpke (eds.), *A Companion to the Archaeology of Religion in the Ancient World*, Oxford 2015, pp. 71-80; A. Piccioni, *Culti domestici in Italia meridionale ed Etruria*, Regensburg 2020, with bibliography).

For instance, research in recent years has allowed us to individuate hero cults within aristocratic homes of Southern Italy’s indigenous population during the Archaic period, as exemplified by the case study of Monte Sannace (Monte Sannace. *Gli scavi dell’acropoli* (1978-1983), Galatina 1989; etc.). Alongside these monumental, ‘official’ expressions of household cults built around the figure of an ancestor, there are, of course, ‘humbler’ modes of worship, connected to rites of passage and to the mundus muliebris, as indicated by evidence from other settlements. It is precisely rites of this nature that likely furnished the basis for Plato’s characterization of household cults as superstitious. A *tabella defixionis* (4th–1st c. BC) from the Oscan settlement of Roccagloriosa, likely written by a woman, is exemplary in this sense.

However, the evidence from the central and southern parts of the Italian peninsula is particularly rich and varied. Therefore, the present paper aims to offer a survey of the situation in ancient Etruscan, Latin, Greek, and indigenous Southern Italy through the presentation of selected case studies.

4 MAKING A HOUSEHOLD IN EARLY MODERN TOWN OF TURKU, FINLAND –ARCHAEOLOGY AND CONTEMPORARY SOURCES OF WOMEN’S ACTIVITY AND OWNED BELONGINGS

Abstract author(s): Niemelä, Tia (Univeristy of Helsinki) - Uotila, Kari (Muuritutkimus Oy; Univeristy of Helsinki; Univeristy of Turku) - Helamaa, Maija (Muuritutkimus Oy)

Abstract format: Oral

In historical periods contemporary sources could be used together with archaeological data. In order to research the people from the past in a micro level, contemporary sources can give a lot of personal information about plots, buildings and personal belongings such as clothing, high value metal objects e.g.; gold, silver and copper objects, and other things used in everyday life. In Finland the volume of contemporary sources is growing almost exponentially when it comes to the Early Modern period those being still rare at the Medieval times. This gives a possibility to combine the data from archaeologically excavated sites and historical contemporary sources about household and living. The largest urban archaeology excavation in Finland so far was Turku Market Square excavations from 2018 to 2022. The area included almost 30 different town plots dating from 1650 to the year of the Great Fire of Turku 1827, when the area was destroyed by the fire. In the Early Modern period Finland only widows could be in charge of business, but it was not unusual for women to own a plot. This paper is going to present a couple of town plots from Turku Market Square owned by women. It is going to discuss possibilities to trace women’s activity on the plots and making a diverse general view about the objects used in everyday life in early modern town by women. In Finland the probate inventories, which includes the exact list of dead persons owned property, are rarely used together with archaeology. What information archaeology and contemporary sources can give about women’s activity? What kind of objects did women of Turku Market Square owned in early modern period? Is archaeological evidence about socioeconomic status of a household showing similar standard of living than the contemporary sources?

5 SPACE, THE FINAL FRONTIER – RECONSTRUCTING THE LATE COPPER AGE HOUSEHOLDS IN THE CARPATHIAN BASIN

Abstract author(s): Rajna, András (Hungarian National Museum; Ferenczy Museum Center) - Fábíán, Szilvia (Hungarian National Museum) - Marton, Tibor (Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Network) - Csippán, Péter (Institute of Archaeological Sciences, Eötvös Loránd University) - Priskin, Anna (Déri Museum) - Daróczi-Szabó, Márta (Budapest History Museum) - Czifra, Szabolcs - Klinga, Flóra (Hungarian National Museum)

Abstract format: Oral

Reconstructing the Late Copper Age household units is quite problematic in the Carpathian Basin. The house, which is supposed to be the center of the household leaves no – or almost no – trace, that can be identified during the excavations. Thus we have to start investigating other factors: we have to decipher the size and role of the household from the finds, recognizable settlement features, and activity zones. This investigation is based on the analytical examination of the excavated settlement materials from the Late Copper Age Baden complex. Examining large-scale sites, which cover different regions and different landscape units in the Carpathian Basin, our research team not only tries to identify the household units but also tries to map their local and regional relationship system, using archaeological and natural science methods to compare the results in microregional and regional level.

To create a narrative, we must try to delineate the household units and the activities which could be carried out within the household and outside in the community arena. Through this, we can take attempt to reconstruct the social connections between them and, their relationship with each other, and with the settlement as a whole. We can estimate the differences and inequalities among the households, and settlements, within the socio-economic environment in the Late Copper Age.

6 AT HOME IN ROSCOMMON: AN ARCHAEOLOGY OF THE RURAL HOUSEHOLD IN THE WEST OF IRELAND C.1700-1980

Abstract author(s): Campbell, Eve (Archaeological Management Solutions)

Abstract format: Oral

During recent works on the N5 Road Project in County Roscommon, in the west of Ireland, archaeologists from Archaeological Management Solutions excavated and surveyed over twenty small rural houses ranging in date from the eighteenth to the twentieth centuries. While all broadly conforming to established vernacular forms and representing the houses of the tenant class on the large estates characteristic of rural Ireland into the early twentieth century, the buildings and their assemblages varied considerably. The significant corpus of data generated during the scheme provides insights into the diversity of rural households in the period between c.1700 and c.1980, elucidating social relationships both within the household and between the household and the wider world. This paper will examine what the rich material record can tell us about the changing nature of the rural household across this period. It will discuss the household both in the context of internal dynamics (gender, age, class) and external dynamics (tenant-landlord relationships, the Great Famine (1845-52), Ireland's role in the British empire, and Independence).

7 EXCAVATIONS OF DOMESTIC SPACE AT SEGESTA, SICILY: RESULTS OF THE 2022 AND 2023 SEASONS OF THE ARIZONA SICILY PROJECT

Abstract author(s): Schon, Robert - Blake, Emma (University of Arizona) - Ducati, Fabrizio (Università degli Studi di Palermo) - Wigodner, Alena (Princeton University)

Abstract format: Oral

This paper presents the results of the 2022 and 2023 seasons of the Arizona Sicily Project's excavations in the residential quarter of the ancient city of Segesta, Sicily. Segesta was founded by a local indigenous group, known as the Elymians, in the Archaic period (c. 6th century BCE) and flourished for several centuries before the city's decline during the Roman Imperial period. It was then reoccupied in medieval times. Our work focuses on a domestic structure, west of the Agora, on the northwestern slopes of Monte Barbaro. In 2022, we opened a 5m x 5m trench adjacent to the area briefly excavated in 1978. Those earlier excavations revealed a portion of an archaic period floor level inside a modest rectilinear dwelling. Our project seeks to expand on previous work to study households at Segesta using contemporary analytical methods. Near the surface, we exposed the corner of a stone masonry structure that likely dates to the medieval period. The walls that meet at this corner are aligned with walls in the 1978 trench and we interpret them to be from the same building. Ceramics and other household artifacts from the fill of this structure provide a chronological range of 6th C BCE to the early Middle Ages with a gap between the 7th and 10th centuries CE. The artifacts we have recovered thus far include local and imported pottery, figurines, jewelry, loomweights, and animal bones. Collectively, this assemblage of domestic material culture reveals a picture of quotidian affairs and pri-

vate life at Segesta that contrasts with the activity at its public monuments, such as the Doric temple and Hellenistic theater.

8 CAPTAINS, LANDLADIES AND MERCHANTS RESIDING IN THE SAILORTOWN - THE HARBOUR DISTRICT MASTHUGGET, GOTHENBURG REVISITED IN 1816

Abstract author(s): Carlstein, Caj - Brown, Oliver - Nilsen, Andrine (Rio Göteborg Natur- och kulturkooperativ)

Abstract format: Oral

Suburban areas dependent on sea- and landbased maritime industries are referred to as maritime societies or sailortowns. We have limited knowledge about the physical and social geography of port towns because traditional narratives often diminish their contribution to the overall town economy through depictions of sailortowns as poor, dangerous and immoral places and its population as problematic. This viewpoint misses out the extraordinary vitality and importance of the ports in the early nineteenth century. In this presentation we will challenge these narratives, through a bottom-up study, analysing a combination of a large-scale archaeological investigation of the harbour district, historical maps and archival studies.

We will discuss the household from the perspective of a maritime community focusing on the harbour plots that held both tenement houses for workers and officials, as well as formal gardens and town houses of the upper bourgeoisie. These dwellings and urban backyards had to compete for space with marine related activities on the piers i.e., the loading and discharging of cargo from the ships, warehouses, wet storage for timber, tobacco factories and so on. The fact that the piers were inhabited to such an extent was a surprise for us, and so was the mix of people living there – landladies with flats to rent, captains and skippers, custom officials, apprentices and maids sometimes 37 persons in one building, not to mention a large section of Scottish immigrant merchants. The pre-industrial maritime society thus display social diversity and entrepreneurship in contrast to dark depictions of the late 19th century.

9 HOUSEHOLDS AS PROXIES: REASSESSING SOCIAL DYNAMICS IN THE NW IBERIAN IRON AGE (9TH-1ST CENTURIES BC)

Abstract author(s): Álvarez, Samuel (Universidade de Santiago de Compostela; INCIPIT - CSIC)

Abstract format: Oral

This paper proposes an approach to the social dynamics of northwestern Iberian Iron Age, focused on the study of the domestic sphere. Tackling an analysis of different characteristics of the domestic units (living space, internal structuring, morphology and construction techniques, archaeological context, settlement layout, etc.) a *longue durée* of study of the Iron Age societies is proposed. The main objective is to present a methodology to study social dynamics at different scales and thus build a multi-scale historical and archaeological narrative about the development of heterogeneous processes in Iron Age Societies.

Thus, this work explores the changes and continuities in the domestic field as a means to understand social organization, considering that the way that houses were inhabited and structured reflects part of the societal ethos. It also aims to provide a more “temporal perspective” in a field of study usually focused on space. Our intention is to suggest a narrative that allows to “flow” social narratives, avoiding static or prefixed interpretations and thereby turning dwellings and households into representative proxies of social change.

10 WHAT MAKES A HOUSE - MATERIAL CONNECTIONS IN FUNNEL BEAKER CULTURE HOUSES

Abstract author(s): Bockmeyer, Sarah (Kiel University)

Abstract format: Oral

The first houses in north-west Germany, i.e. Lower-Saxony, were built by the Funnel Beaker Culture West groups (3500 – 2800 BC). They are composite buildings connecting many different materials in one place. Trees were felled, inserted into the ground anew and connected with wattle and daub walls, therefore, clay tempered with straw or even animal dung was used. The roofs – potentially pitched ones – were thatched with straw or similar. There are three different building types, grubhuts, houses with only one room, and the majority of house floorplans in the area have up to four rooms.

Furthermore, from 3300 BC onwards, one room of multi-roomed buildings seems to have been reserved for ancestral “energies” as a single earthen burial could be observed and in one case, the pit of an erected boulder was found despite further earthen burials and megalithic tombs being in the near vicinity of all observed intra-house burials.

It is argued that building these houses connected the people with the land, bringing together different materials that they dealt with on a day to day basis but which then formed shelter and community. Furthermore, the houses with ancestor rooms will be closely inspected and potential explanations are given for the inclusion of dead people in the building of a house.

AN ARCHAEOLOGICAL VISION OF FECES AND URINE MANAGEMENT IN EARLY MODERN PORTUGUESE URBAN HOUSEHOLDS

Abstract author(s): Casimiro, Tania (FCSH-UNL) - Santos, Joel (University of Leicester)

Abstract format: Oral

In the period from the end of the Muslim occupation to the 19th century there were no “toilets” or private spaces where to evacuate one’s bowels and bladder in Portuguese households. While living in the country it was particularly easy to attend to your needs anywhere, how did people handle while living in urban centers, where moral stated that one could not simply evacuate in front of everyone? The solution were chamber pots or wood barrels where one could urinate and defecate in, located either in corners or in the sleeping room. Archaeological excavations have found a huge amount of this evidence and considering the number of pots found everyone had access to one. The purpose of this paper is to discuss the way people defecated and urinated in early modern urban households and how the study of archaeological evidence can promote the debate about a spatial analysis of where these actions could take place withing Portuguese urban houses; to analyze the materiality of defecation and urination and discuss how can these artefacts reflect different genders, identities and social inequalities; and to discuss how did households got rid of these excrements and all the economical and social process of that management.

HUMAN STORIES AND HISTORIES IN THE ERA OF INTEGRATED SCIENCE

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Thompson, Jess - Robb, John (University of Cambridge) - Tafuri, Mary Anne - Soncin, Silvia (Sapienza University of Rome)

Session format: Regular session

Archaeologists can study ancient people in more detail than ever before. Bioarchaeological methods have rapidly developed in four key directions: (i) skeletal investigations of new ways of studying health and activity; (ii) Biomolecular approaches, including genetic ancestry, kinship and disease, isotopic studies which increasingly address incremental analyses of life trajectories, and emerging proteomic and metabolomic analyses; (iii) taphonomic studies providing new insights into ritual and post-mortem trajectories, and (iv) grounding these in their specific archaeological context. For studying social life, the real breakthrough comes not from a single technique, but from the nuanced pictures that emerge when multiple techniques are combined. On an individual level, these result in increasingly multidimensional biographies. On the group level, this may give us a chance to see how people of different kinds related or experienced different life risks and social opportunities. This session explores the detailed human histories that we can create through multidisciplinary bioarchaeological approaches: stories of gender differentiation, kinship dynamics, differential activity, health and nutrition, and social values associated with different kinds of people.

Multidisciplinary bioarchaeology clearly provides exciting opportunities, but the field is still emerging. This session focuses both upon the gains of integrated multidisciplinary bioarchaeology, and reviews the landscape and challenges of the field so far. We are interested in hearing from projects – both small- and large-scale – across all regions and periods which have integrated multiple analytical approaches to reveal nuances in past social formation and identities. Asides from past human histories, papers might reflect on current practice, for example: how do we coordinate work across specialists with different frames of reference? How is such research funded and organised, and what filters does this impose? What are the practical and ethical considerations, and how can we maximise information from multiple source methods rather than from a single approach?

ABSTRACTS

DOING MULTIDISCIPLINARY BIOARCHAEOLOGY: BASIC IDEAS, GOOD PRACTICE AND CARDINAL SINS

Abstract author(s): Robb, John (University of Cambridge)

Abstract format: Oral

New methods and approaches require new tools and ways of doing research. Multidisciplinary bioarchaeology isn’t simply a matter of adding a few more columns into our databases and running the same old correlations; it requires us to think in different ways. This paper discusses the concepts, methods and processes needed for multidisciplinary bioarchaeology. Conceptually, ways for layering and combining data range along a spectrum from statistical to biographical, with a potentially productive, poorly explored zone of collective biography in between. Methodologically, every kind of data comes with its own assumptions and limitations, and a key part of multidisciplinary research is translation and establishing acceptable equivalencies and approximations needed to align them (for instance, aligning isotopic readings with “diet”, or genetic relationships with social relationships). Good practice here involves negotiation, poor

practice is more like a “smash and grab robbery”. In terms of social process, multidisciplinary bioarchaeology generates different dynamics than single disciplinary work, involving boundary objects, research brokers. It may inherently be “slow science”. It also can generate new problems, for instance unequal power relations between subfields, and multidisciplinary work can only be done in large, well-funded or centralised projects. Here too we need to develop new good practices.

2 FURTHERING A MULTI-DISCIPLINARY BIOARCHAEOLOGY: THE SYNTHESIS OF BIOARCHAEOLOGY AND ARCHAEOETHANATOLOGY

Abstract author(s): Knusel, Christopher (Université de Bordeaux)

Abstract format: Oral

Archaeoethanatology, bioarchaeology and funerary archaeology trace their origins to the last decades of the 20th century but followed parallel developmental trajectories that have tended to separate rather than unify these sub-disciplines. Despite clearly shared interests and although the first two were constructed to bridge the divide between archaeology and biological anthropology, they have tended to travel different routes, fragmenting studies along disciplinary lines and also national, linguistic and organisational ones. In order to provide synthesis with newer scientific analyses, especially biomolecular ones, a better working relationship is required. Such a relationship would provide a platform for organising joint working and permit better, more holistic, and more soundly theoretically grounded research questions that render interpretations more complete and compelling.

Archaeoethanatology and bioarchaeology offer ways to develop greater insight into funerary ritual, and both encompass funerary archaeology, with its emphasis on the grave and its constituents, as well as the study of human remains. Both also advocate for the active participation of biological anthropologists trained in archaeological methods in the excavation of human remains. Key to this approach is the adoption of standard anatomical terminology for recording the disposition of skeletal remains and the creation of a research design that involves planning for the application of archaeological scientific analyses that helps to ensure the integrity of samples. An archaeoethanatomical approach can then be implemented in the field that can be summarised in three steps: (1) field observations and recording, (2) reconstruction of the disposition of the remains at the time of their final deposition and how the accompanying funerary assemblage was placed through taphonomic analysis, and (3) interpretations of mortuary behaviours and social information more generally. This presentation outlines the advantages of this approach through the example of a challenging mortuary context from the Neolithic site of Çatalhöyük (Turkey).

3 DIFFERENCE, BEFORE AND AFTER THE GRAVE, IN NEOLITHIC SOUTHERN ITALY

Abstract author(s): Thompson, Jess (University of Cambridge) - Soncin, Silvia - Panella, Sofia (Sapienza Università di Roma) - Booth, Thomas (Francis Crick Institute) - Tafuri, Mary Anne (Sapienza Università di Roma) - Robb, John (University of Cambridge)

Abstract format: Oral

Diversity and flexibility in Neolithic approaches to food gathering and growing, marking the landscape, composing kin, and disposing of the dead, have long been observed. It has even been proposed that Neolithic lives were founded on a “politics of difference”, in contrast to the increasingly culturally restricted and codified expressions of social differentiation from the Copper Age onwards. Small-scale tribal communities in Neolithic Europe were probably oriented around a fluctuating system of collective action; while certain individuals may have occasionally gained esteem or prestige, the evidence from lifeways and burials is remarkably quiet on this front.

We track the dynamics of Neolithic lives and deaths in southern Italy by combining bioarchaeological analysis, bulk and incremental isotopic data on lifetime movements and diet, with funerary and histotaphonomic data on post-mortem treatment. People living on the Apulian Tavoliere during the early to middle Neolithic experienced frequent, short-term shifts in dietary composition as well as mobility. At the same time, funerary traditions were remarkably local and yet varied even within a single site. Incorporating published isotopic and burial data reveals only further heterogeneity, suggesting flexible approaches to subsistence based on the local climate and environment, and slow but consistent change in funerary practices. In the 6th-5th millennium BC in southern Italy, lives—before and after the grave—resisted rigid pathways.

4 DIGGING FOR NUANCE AND OPPORTUNITY IN THE ADNA MINES

Abstract author(s): Booth, Thomas (Francis Crick Institute)

Abstract format: Oral

Large-scale archaeogenetic studies of human populations in varied regions of the world have provided coarse narratives of population movement and genetic change. More recently there has been a move towards more regional and site-specific studies, particularly those which explore close biological relationships in at funerary sites. However,

larger-scale studies still contain many underreported but important regional and site-specific results which, when considered in their regional or site-specific archaeological context or alongside additional biomolecular data, serve to nuance or sometimes even contradict broader interpretations. These case studies often throw up new questions which could be effectively addressed through further targeted analyses, particularly other biomolecular methods. Here I will discuss a few such case studies from archaeogenetic studies of prehistoric Britain including questions about the origins of the Early Mesolithic Cheddar Man and the complexities of interactions between migrants, local communities, and their descendants in the Neolithic and Bronze Age. Future integrative research could be instigated through careful appraisal of archaeogenetic papers and associated supplementary materials to identify cases where detailed contextualisation and further analyses would be disproportionately beneficial to our understanding of sites, individuals, and communities.

5 NEW PERSPECTIVES FOR WOMEN'S STUDIES IN PAST POPULATIONS: SOME KEY ISSUES PRESENTED IN THE WOMENSO FAR ANR PROJECT

Abstract author(s): Goude, Gwenaëlle (CNRS) - Leduc, Guillaume (CNRS UMR 7330 CEREGE) - Rottier, Stéphane (Univ. Bordeaux UMR 5199 PACEA) - Power, Robert (University College of Dublin) - Salazar-Garcia, Domingo (University of Valencia) - Lambert, Aurore (EVEHA International) - Le Roy, Mélie (University of Bournemouth) - Gandelin, Muriel (INRAP Méditerranée) - Couvrat, Maëlle (CNRS UMR 7269 LAMPEA - Consortium, ANR WomenSOFar, <https://womensofar.hypotheses.org/category/equipe>)

Abstract format: Oral

The WomenSOFar ANR project (Individual life histories and WOMEN Status at the Onset of FARming: Bioarchaeological perspectives in the French and Mediterranean Prehistoric context) proposes to discuss the place of women in first farmers' communities by using a multidisciplinary approach. It aims at deciphering how individuals move, eat, care for and work and combines previous and new dataset on bioanthropology, biogeochemistry, bioarchaeology and archaeology. The project focuses on specific questions as: 1- Does maternal/allomaternal investment and food transfers differ according to their own experience and local subsistence economy? 2- Does parental/alloparental investment lead to female vs. male social distinction as early as childhood? Does a timing/pattern exist to get the role of "female" or "male" into these communities? 3- Why do women migrate differently from men and how does it influences their diet and its diversity? 4- Are women involved in specific activities affecting their health and morphology? Does this exist in connection with their place of origin? Does it have an impact on their diet/the emergence of their childhood socialization? The project investigates human remains and their cultural contexts from several sites located in different natural environments in France and North Africa, mainly dated to the 5th millennium BCE. Skeletal and dental records, cross-sectional geometry of long bones, multi-element isotope ratios, funerary records, dental calculus micro-remains and microbiome and kinship data will be compared. Examples of previous researches using this multidisciplinary approach illustrates the risk/gain of such study; among other things, data allowed to identify female individuals with specific life history and mobility pattern and male individuals with possible "disadvantaged" status. WomenSOFar expects to provide a new vision of the diversity and mutability of women status in Prehistoric times at the onset of major societal disruptions.

6 THE AYIOS VASILEIOS NORTH CEMETERY PROJECT: BIOARCHAEOLOGY IN THE 21ST CENTURY

Abstract author(s): Voutsaki, Sofia (Groningen Institute of Archaeology) - Moutafi, Ioanna (The M.H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens) - Vika, Efrossini (Ephorate of Athens, Greek Ministry of Culture)

Abstract format: Oral

In this paper, we would like to present the questions, methods and first results of the Ayios Vasileios North Cemetery project, the excavation and study of an early Mycenaean (1700-1450 BC) cemetery in Laconia, southern Greece. We will do so by focusing on the osteobiographies of two individuals, a man and a woman buried in close embrace, which have been reconstructed by combining contextual and bioarchaeological methods of analysis. The emphasis, however, will be not so much on the material itself, but on the way our approach has been shaped by the developments in bioarchaeological research in the last two decades: the constant refinement and proliferation of analytical techniques, the increasing specialization and fragmentation of the field, but also the attempts at integration of scientific methods and theoretical reflection. Our paper also has to address the different funding structures and publication cultures between the humanities and the sciences as well as the growing divide between research and rescue excavations or between well-endowed institutions in north-western Europe or North America and Mediterranean countries. Our approach and theoretical reflection also need to be placed within changes in the society around us, especially the growing polarization and the renewed significance of identity politics.

Our main argument is that our research and results are shaped by the constraints of the institutional frameworks we operate in, but also that our experiences, if shared and reflected upon, can bring about changes in these institutions and academic cultures.

7 INVESTIGATING SOCIAL HERITAGE THROUGH MULTI-DISCIPLINARY BIOARCHAEOLOGY AT ANCIENT AKSUM (50-400)

Abstract author(s): Basanti, Dil (Northwestern University)

Abstract format: Oral

This paper employs multi-disciplinary bioarchaeology to better contextualize the stelae monuments of ancient Aksum (50-400 AD) with local priorities of social heritage. Aksum, in northern Ethiopia, was the capital of an ancient polity that spread across the northern Horn of Africa and became a major power in the Indian Ocean trade. The most notable remains of the ancient capital are its towering funerary stelae and monumental tomb complexes. Today, the stelae are important cultural emblems of Ethiopian heritage. The 2018-2020 Aksum Bones Project analyzed previously excavated human remains from two stelae tombs. Isotopic signatures of ~20 bone samples suggest tomb burials represent intimate groups with similar diets that may vary by tomb. Micro-CT histological imaging revealed heavy bacterial bioerosion throughout all samples, suggesting relatively immediate burial after death. Cutmark distribution suggested remains were disinterred and cleaned soon after death. Contextualization with excavation records allows for the identification of ancient reentry tunnels for the retrieval of Aksumite bones, as well as providing a thicker description to the sequence of post-mortem steps. These data come together to reveal a history of Aksumites orienting their mortuary rituals around intimate group identities and continued access to dead members. Notably, these experiences also seem to underpin the growing symbolism of houses and ritualized doorways on Aksumite mortuary architecture – abstracting personal experience into formal symbolism. Intangible and social heritages are especially valued in northern Ethiopia, and multi-disciplinary bioarchaeology helps link the stelae to a tradition of social practice that better resonates with local and region-wide priorities. In the process, it also helps shift public portraits of death as “grim” or exotic to celebrations of community-belonging and social performance that feel more familiar to many in Aksum today.

8 THE STAGGERED TURRIFORM OF SON FERRER (MALLORCA, SPAIN), A CASE STUDY OF A MULTIDISCIPLINARY RESEARCH IN BIOARCHAEOLOGY

Abstract author(s): Salvador, Paloma (Universitat de les Illes Balears, Àrea de Prehistòria; Universitat Autònoma de Barcelona, Unitat de Antropologia Biològica) - García, Jaume - Calvo, Manuel (Universitat de les Illes Balears, Àrea de Prehistòria) - Santos, Cristina (Universitat Autònoma de Barcelona, Unitat de Antropologia Biològica)

Abstract format: Oral

The Staggered Turriform of Son Ferrer is an archaeological site located in western Mallorca (Spain) that worked as a necropolis during the Late Iron Age, also known as Postalaïotic period, (650/550-123 BC). This site has been studied for more than twenty years. During this period several kinds of analyses have been performed, namely, pottery studies, paleobotanic and faunal remains analysis, radiocarbon dating, among others, in order to become acquainted with these past societies. The information provided by all these analyses helped us to deepen our understanding of Postalaïotic society customs regarding funerary practices, how they managed their resources or related with other peoples. However, questions such as: Who was buried there? Were they related? Where these individuals come from? were issues that needed to be addressed with the analysis of the individuals themselves. Hence, a new project that includes both a morphological and metric analysis and ancient DNA analysis of the human remains have been developed in order to shed light on those questions.

We intend to present the current results of each part of this project in which archaeology and biology work together to broaden our understanding of Son Ferrer human group and Postalaïotic period. Thus, we will address issues such as their geographic origins and matrilineal kinship; the demographic profile of this group and also, as the 79% of the individuals are non-adult, we will be able to discuss the results regarding age and sex assessment, among others. Furthermore, we intend to discuss the challenges of integrating biological information in the archaeological research.

9 VIOLENCE (?) IN THE HALLSTATT PERIOD: BIOARCHAEOLOGY OF HUMAN SKULLS FROM TWO SITES OF THE URNFIELD CULTURE IN POLAND

Abstract author(s): Biernacka, Katarzyna- Konczewski, Paweł (Wrocław University of Environmental and Life Sciences) - Pokutta, Dalia (ARL University of Stockholm; Instytut Archeologii Uniwersytet Rzeszowski) - Martewicz, Katarzyna (Independent researcher) - Kwiatkowska, Barbara - Szczurowski, Jacek - Karykowska, Aleksandra (Wrocław University of Environmental and Life Sciences) - Soliński, Daniel (Regional Specialist Hospital, Research and Development Center, Wrocław)

Abstract format: Oral

One of the phenomena of life and death of communities living in Central Europe during the Late Bronze Age-Early Iron Age is the human remains discovered on settlements in contexts indicating their non-grave character. They are characterized by the abandonment of cremation, which was common at the time, and the defragmentation of bodies perimortem. These finds are explained as evidence of conflicts or religious rituals, sometimes taking the form of anthropophagy. Those interpretations have also been proposed for human skulls found in Lusatian culture sites (a Central European variant of urnfield cultures) located in Wiązów and Siechnice, in southwestern Poland. To verify this hypothesis, the skulls were given in-depth studies: tafonomics and archaeological context, osteology, CT scan and isotope analysis. For the skull from Wiązów, digital facial reconstruction was also done.

The results indicate that the skull discovered in Wiązów belonged to a adolescence female (juvenis), and the skull fragment from Siechnice seemed to belong to a child (age class infans II). Radiocarbon analysis shows that these people died in the B-C Hallstatt period. The woman found in Wiązów (or her body) was decapitated. A skull fragment of a child from Siechnice has cut marks, and deposition in a trash pit with post-consumer animal remains would suggest anthropophagy. A depression resulting from a healed trauma was also noted on the frontal bone of this individual. Strontium isotope analysis of the Wiązów woman's skull suggests her local origin. The drastic treatment of the two bodies indicates the connection between their deaths and the violence against them. However, given the lack of unequivocal evidence of violence and considering culturally and chronologically similar findings from Central Europe, one may ask whether the remains found in Wiązów and Siechnice (in particular) may be evidence of endocannibalism rituals?

10 BIOARCHAEOLOGY OF THE DUTTLENHEIM NECROPOLIS (800-510 BC, EIA, FRANCE): FROM THE INDIVIDUAL STORY TO THE FUNCTIONING OF THE GROUP

Abstract author(s): Fischer, Claire-Elise (University of York) - Seguin, Guillaume (EVEHA) - Reich, David (Harvard University) - Armit, Ian (University of York)

Abstract format: Oral

The Hallstatt necropolis of Duttlenheim, recently exhaustively excavated, has yielded an exceptional funerary assemblage associated with two pits from the end of the Bronze Age: one circular, and the other elongated of the langgraben type, which is much rarer and is likely to have had a cult function. The archaeological material is dominated by local ornaments and pottery, and only one female wore a pair of bracelets not previously documented in the region.

The excavation revealed 52 individuals: 44 adults and eight juveniles. Osteological analysis indicated an over-representation of females. From an anthropometric point of view, one group of females are very homogeneous and could constitute a family group. Most of the individuals were buried supine, four female individuals were buried prone, one of whom had developed tuberculosis (also known as Pott's disease).

As part of the COMMIOS Project, we conducted aDNA analysis on all individuals where sampling was possible (n=40). The results showed excellent preservation of aDNA, with 87% of the samples yielding meaningful data. Interestingly, the genetic results contrast with the osteological data in demonstrating a more balanced sex ratio, and include one robust, and osteologically sexed as female, individual with an XY genetic profile. The data also revealed 3 families, composed of 2 to 6 individuals. The data places the Duttlenheim community within the local context, allows the discussion of genetic diversity of the group and significantly increases the number of analysed EIA individuals in the region. Finally, the analysis of the pathogens allows us to document, for the first time, the presence of tuberculosis in Alsace during the Iron Age.

11 VARIATION ABOUND: A MULTIDISCIPLINARY LIFE-COURSE APPROACH TO LEPROSY IN MEDIEVAL ENGLAND

Abstract author(s): Blom, Alette (Department of Archaeology, University of Cambridge; School of Archaeology and Ancient History, University of Leicester) - Inskip, Sarah (School of Archaeology and Ancient History, University of Leicester)

Abstract format: Oral

Leprosy/Hansen's Disease has been affecting humankind for millennia, and has been described and studied for centuries due to its characteristic and debilitating lesions. Most recently, modern medical research has shown that early life circumstances, socioeconomic status, diet and overall health can influence infection risk, and this can subsequently influence the risk of comorbidities and alter social status in many cultures. Meanwhile, historic approaches have shown that attitudes toward the disease have changed throughout history, influencing the medical, social and legal treatment of those considered to have the disease. While leprosy has become increasingly popular in (bio)archaeology in recent decades and a large amount of case studies have been published, few have considered individual life history approaches incorporating the conditions raised by historian and medical professionals in order to create socially contextualised life-course reconstructions to better understand leprosy, and its impact on people and societies, in our past.

This paper discusses the results of a multidisciplinary approach to reconstruct the variable narratives of people with leprosy in medieval England, and builds on the analysis of 383 skeletons from varying sites. The life course reconstruction of 52 individuals is complemented by burial data, early and late life carbon and nitrogen isotope values, ancient pathogen DNA and osteobiographical data. This approach has allowed a better understanding of the impact of early life circumstances on leprosy infection risk, the social and biological consequences of leprosy infection, and how physical and social (dis)ability and treatment has created varying life outcomes of those affected by the disease.

12 STAYING HEALTHY - AN ANALYSIS OF DIETARY DISEASES AND SOCIAL STATUS IN THE MIDDLE AGE TOWN OF TRONDHEIM AD 1000-1600

Abstract author(s): Christophersen, Axel (Norwegian University of Sciences and Technology, Departement of Archaeology and Cultural History, University Museum)

Abstract format: Oral

The presentation takes as a point of departure one of the session's 4 described trajectories of development within bioarchaeology, namely how skeletal investigations can study health and activity, and how this can illuminate how people experienced different life risks and social opportunities. The Norwegian Research Council founded project "Medieval Urban health: From private to public responsibility AD 1000-1600" studies i.the food access to the medieval town of Trondheim, based on pollen and macrofossil analysis, and the possible link to climate change, based on palaeoclimatological data (year-ring data) from archaeological contexts. The result from this study has been used to study damages from insufficient nutrition on skeletons from two medieval cemeteries, one located in an elite environment including a monastery, the other in a craft quarter in the outskirts of the town. The results from this study gave interesting results concerning how different quality (and quantity) of food intake during the early ages influence the general health status in different neighborhoods in the town. This raises concerns regarding the quality of the diet for individuals and groups within the urban population: To what extent was health dependent on social and economic inequality, and was anything done to prevent an all too unequal distribution of a vulnerable and at times unpredictable supply situation of food to the town? The question is of great interest to the overall health historical problem about how and when the town's authorities took initiative to improve public health condition. The study is based on a wide range of interdisciplinary data and methods and have a potential to throw light over the emergence of early biopolitical considering in the medieval town of Trondheim, Norway.

13 MAKING CONNECTIONS IN MEDIEVAL BRITAIN AND IRELAND: USING SENSITIVE HAPLOTYPE APPROACHES TO REVEAL DISTANT GENEALOGICAL TIES AND NON-LOCALS WITHIN CEMETERIES

Abstract author(s): McCann, Maeve - Cassidy, Lara (Trinity College Dublin)

Abstract format: Oral

The concepts of ancestry and kinship are major anchors of human identity and the principle organising factors of many past societies. Crucially, perceptions of shared ancestry may or may not align with true genealogical history. Thus, ancient genomes have the power to provide deeper understanding of the diverse manifestations of gender, kinship and social organisation in the past. However, the most popular methods employed by the field make use of allele-sharing statistics to identify genetic relatives and individuals of non-local ancestry. These approaches lack resolution to identify distant relatives (>5th degree) or non-local individuals from closely related populations.

Here, we demonstrate the power of haplotype-based analysis to reveal fine-scale genetic histories of ancient communities and individuals. Specifically, we implement a multi-step imputation and phasing pipeline to maximise the information potential of ancient genomic datasets and apply IBD-segment-sharing and chromosome-painting techniques to these. We present several case studies from Late Iron Age and Medieval Britain and Ireland, a period of increasing mobility and urbanisation across Europe, as well as reduced genetic differentiation.

We identify individuals within cemeteries whose ancestry derives from different regions of the islands and combine this with burial information and isotopic data, to reveal the life histories of migrants and their descendants. This includes women who travelled long distances within their lifetimes, such as an older individual buried at Ranelagh, Co. Roscommon c. 1000 AD, who likely came from an urban center in the north of England. We also explore kinship networks within cemeteries, including the Kirk of St. Nicholas in Aberdeen. This also provides an additional avenue to identifying ancestral outliers, based on the presence or absence of distant relatives. Through the implementation of these sensitive approaches we are able to reconstruct the biographies of individuals and families that otherwise would have been lost to history.

14 **BREAKING UP A MONOLITH. EXPLORING THE DIVERSE LIFE EXPERIENCES OF THE „DISENFRANCHISED“ IN THE EARLY MODERN CITY OF BASEL (SWITZERLAND)**

Abstract author(s): Rindlisbacher, Laura (Integrative Prehistory and Archeological Science, University of Basel; Archäologische Bodenforschung Basel-Stadt) - Flatscher, Elias (Kunsthistorisches Institut, Universität Zürich; Archäologische Bodenforschung Basel-Stadt) - Gerling, Claudia - Pichler, Sandra (Integrative Prehistory and Archeological Science, University of Basel)

Abstract format: Oral

Archaeologists investigating historical periods are simultaneously gifted and cursed by the amount and variety of written records, both enriching and complicating analysis. Especially when entering the so-called Modern era, one is confronted with narratives that directly impact our own society and thus result in a multitude of biases which we need to address in our research. The bioarchaeological analysis of human remains offers a way to highlight individual and societal life experiences also of those segments of societies who often find no mention in the written records.

The excavation of an Early Modern skeletal sample discovered underneath the “Stadtcasino” concert hall in Basel (Switzerland) offered the opportunity to study a segment of the urban population who were to some degree excluded from socio-political participation. During this period, the majority of Basel’s population lived in precarious economic conditions, covering a spectrum from low income work and occasional begging to deepest poverty. The intersectionality influencing the social status - and related social participation - of the members of Basel’s middle and lower classes affected the health status of the persons concerned in many ways. This also applies to their ability to survive crises e.g., the recurring plague and typhus events of the 16th and 17th centuries.

By combining historical information on social factors with a multidisciplinary bioarchaeological life-course approach various aspects like diet, trauma patterns and childhood stress can be analysed. With this broad lens we can attempt to identify diverse groups of women and men who seem to have grown up with differential access to food and/or communal support during their life course. These diverse life histories enable a more nuanced interpretation of groups, which have - until now - often been addressed as quite monolithic (e.g., “lower” vs. “upper” classes) despite the broad spectrum of experiences they actually encompass.

A. **A PEEK INTO THE LIFE AND DEATH OF HISTORICAL INDIVIDUALS WITH UNKNOWN CULTURAL BACKGROUND FROM ROMANIAN ARCHAEOLOGICAL CONTEXT**

Abstract author(s): Rusu, Ioana (Molecular Biology Centre, Interdisciplinary Research Institute on Bio-Nano-Sciences, Babeş-Bolyai University) - Popescu, Octavian (Institute of Biology Bucharest of Romanian Academy) - Bodolică, Vitalie (Museum of National History and Archaeology) - Dobrinescu, Cătălin (Museum of National History and Archaeology) - Kelemen, Beatrice (Department of Molecular Biology and Biotechnology, Faculty of Biology and Geology, Babeş-Bolyai University)

Abstract format: Poster

Human skeletal elements unearthed from archaeological contexts remain a promising resource to reveal or revise various aspects of life, death, and relationships among ancient individuals and populations. Continuous technological improvements in the analysis of ancient biomolecules have paved the way to a refined understanding of our past. However, new facets of the story continue to emerge as more and more unique osteological collections are being analyzed.

This study aims to reconstruct the biological profile of a past population discovered in a large multi-phase archaeological site in southeastern Romania by integrating archaeological, anthropological, isotopic and genetic data to gain a more meaningful picture.

Even though the funerary complexes were initially dated to the medieval period according to archaeological attributes, the results of radiocarbon dating place the necropolis in the pre-modern era and suggests it has been used only for few generations. A significant proportion of non-adults were identified in the screened assemblage indicating a high mortality rate in early childhood, a fact that might be related to their exposure to systematic infections. Preliminary results indicate that some of the analyzed individuals might have suffered from malarial infection, but despite a multidisciplinary approach to address this issue no indisputable evidence could be produced.

More insights regarding kinship, migration patterns, paleo-epidemiology, and regional shifts will be brought to light when integrating genetic data.

Acknowledgment. This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-III-P1-1.1-PD-2021-0634, within PNCDI III.

B. ECHOES OF URBANITY. OSTEOBIOGRAPHIC NARRATIVES AND THE LIFE COURSE IN THE ANCIENT CITY OF THESSALONIKI

Abstract author(s): Aidonis, Asterios - Ganiatsou, Elissavet - Souleles, Angelos - Korelidou, Maria - Bantavanou, Panagiota (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace) - Protopsalti, Sultana - Tzevreni, Stavroula - Vasileiadou, Stela - Konstantinidou, Krino (Ephorate of Antiquities of Thessaloniki City, Ministry of Culture and Sports) - Papageorgopoulou, Christina (Laboratory of Physical Anthropology, Department of History and Ethnology, Democritus University of Thrace)

Abstract format: Poster

The reconstruction of individual lives by multidisciplinary approaches has become an active topic in the field of bioarchaeology. Our study integrates a toolbox of bioarchaeological methodologies to investigate urban life in ancient Thessaloniki. The city was founded in 315 BC and due to its strategic position turned into a significant economic-political hub and a multicultural metropolis, continuously retaining its urbanity. We analyzed human remains excavated during the construction of the city's metropolitan subway, spanning from Hellenistic (323 BC) to post-Byzantine period (15th c AD). We highlight the city's history through the reconstruction of individual biographies and population secular trends. Using osteological, isotopic, aDNA, and archaeological data, we build osteobiographies representing the Hellenistic, Roman, and Byzantine chrono-cultural periods. To reconstruct the secular trends of the population, we study the population structure, diet, and living conditions of inhabitants. Population differences among chrono-cultural groups were investigated through the morphological variation of the temporal bone with the use of geometric morphometrics. A multi-tissue isotopic approach was employed to reconstruct the infant and adult diets of 240 individuals. The living conditions of the population were assessed through skeletal indices of stress including stature, body mass, linear enamel hypoplasia, and trauma. Our study aims to investigate how the changing urban environment impacts the living conditions of the population and point out the significance of ancient humans as central agents in archaeological narratives.

Funding: This research has been co-financed by the European Regional Development Fund of the European Union and Greek national funds under the call RESEARCH – CREATE – INNOVATE (project acronym: ECHOES T2EΔK-00152), and by Greece and the European Social Fund through the Operational Programme: Human Resources Development, Education and Lifelong Learning, Act: “Enhancing Human Resources Research Potential by undertaking a Doctoral Research, subaction 2”, implemented by the State Scholarships Foundation (IKY) (MIS 5113934).

507 MODERN QUARRIES AND ARCHEOLOGY: PROTECTION ISSUES, REGULATIONS, METHODOLOGIES, IMPACT, SUSTAINABILITY

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Marino, Sara (Researcher in Methodologies of Archaeological Research, Department of Sciences of Antiquity, Sapienza University of Rome) - Kelany, Adel (Director of Archaeological Awareness Department in Aswan Antiquities Office, Supreme Council of Antiquities. Ministry of Tourism and Antiquities)

Session format: Regular session

The recent and historical development of quarries brought significant impacts on landscapes, biodiversity and non-renewable resources, including archaeological heritage. The analysis of the past and present impact of modern quarries, and the assessment of the risk they pose, are not secondary issues in the holistic protection of Cultural heritage. According to the directives and charters for environmental and archaeological protection and sustainable development in Europe, quarrying must be compatible with the prospects of an economy attentive to ‘green’ issues, taking care to enhance and strengthen cultural resources and landscapes. The issue is also reported as problematic by UNESCO, e.g. for the Syrian site of Crac des Chevaliers and Qal’at Salah El-Din, and is evident in many other cases worldwide.

Furthermore, the impact of the continued exploitation of quarries destroys ancient quarry cliffs, relevant for the study of past architectural practice.

The session aims to discuss the different European and non-European regulations, the different approaches and methodologies to tackle the problem of the relationship between quarries and archaeology. Furthermore, we want to consider the best protection practices adopted from the perspective of sustainable heritage planning. This session intends to host papers presenting case studies derived from preventive archaeology, but also documented through non-direct surveys on the landscape, such as aerial and satellite remote sensing, or through archival and bibliographic documentation. The goal is to understand how the problem is managed globally and if best practices and shared strategies can be identified and applied, as methodological and operational trajectories.

ABSTRACTS

1 QUARRIES AND ARCHAEOLOGICAL HERITAGE: A CONTRASTED PATH FROM DISCOVERY TO REJECTION

Abstract author(s): Vanzetti, Alessandro (University of Rome „La Sapienza“)

Abstract format: Oral

Quarries have been very important for archaeological discovery, for the recovery of materials and for the links with geological knowledge. For example, they have been essential partners in the understanding of the antiquity of the Earth and of humans, during the 19th century CE, e.g. in French Palaeolithic research. They have produced masses of artefacts and some contextual data for pre- and protohistory, such as the fat-earth quarries in Northern Italy, in the Bronze Age terramara district, in the same 19th century. They have also allowed archaeologists to observe the deep stratigraphies of landscape, as occupations and geological and environmental interaction, during the 20th century. In more modern times, they have also forced extensive research in some landscapes, extracting from the ground some of the best (up to now) archaeological data for an integrated reconstruction of past human systems, such as in the Traisental, Austria.

Anyway, quarries are clearly destructive, from a modern point of view, and they tend to force recovery in a way that is not adequate for today required detail in archaeological excavations. And in many cases quarries are simply destructive, without any chance of control and of the gain of useful information. For these reasons, opposition and rejection of quarrying is the dominant present mood.

This transformation in the relation between archaeology and quarries is relevant, and interesting neither only for the acknowledgement of the improved quality of archaeological data validation, nor for the psychological-like relations between “discovery “ and “growth“ (of the discipline), but it is relevant for the path of archaeology, walking out of objects to contexts.

This contested relation will be the subject of the presentation.

2 THE STRUGGLE FOR SURVIVAL, ARCHAEOLOGICAL SITES AND MODERN QUARRIES: MODELS OF SUCCESS AND FAILURE FROM EGYPT

Abstract author(s): Kelany, Adel (Supreme Council of Antiquities in Egypt - SCA)

Abstract format: Oral

The expansion in quarrying and mining of Egypt’s natural resources has become a necessity and an urgent matter in Egypt recently. Despite the importance of these natural resources in advancing the economy, modern extraction methods have a very negative side, which is the destruction of nearby archaeological sites, in particular vital evidence relating to ancient quarrying and mining that can span thousands of years.

The balance between the extraction of raw materials and the preservation of archaeological sites is a very difficult balance which requires a lot of archaeological work and cooperation between government agencies and the owners of private and public mining companies.

In 2006, the Supreme Council of Antiquities in Egypt established the first department specialized in studying the sites of ancient quarries and mines under the name: Ancient Quarries and Mines Department. This department has specialized in studying and recording the sites of ancient quarries and mines spread along the Nile Valley and the neighboring desert as a continuation of the ‘QuarryScapes’ EU funded conservation project. Balancing the imperatives of modern extraction of raw materials with the preservation of fragile archaeological sites such as quarries and mines (which are mostly located in remote desert areas), has led to development of numerous strategies of engagement with a range of stakeholders.

This paper will present models of success and failure that faced this administration in conserving archaeological material close to modern mining sites. It also analyzes the role of local laws and regulations in facilitating the protection

or destruction of archaeological sites, in addition to the difficult situation of that antiquities protection offices can encounter in their work.

3 ,A BLAST FROM THE PAST' - HOW PAST EXPERIENCES OF DEALING WITH ARCHAEOLOGY WITHIN QUARRY SITES HAS INFORMED TODAY'S APPROACH

Abstract author(s): Logue, Edith (Department for Communities Historic Environment Division)

Abstract format: Oral

This talk will discuss the impact of modern quarrying on archaeology and the built environment in Northern Ireland, the issues around protection and regulation in the past and how these are currently managed. The aim is to outline former difficulties faced by archaeologists and heritage professionals dealing with the quarrying industry and show how these have led to stronger planning legislation, better regulations and guidance and a more professional approach to archaeological protection and mitigation. This talk will also highlight the work that DfC Historic Environment Division, in partnership with the Mineral Products Association of Northern Ireland (MPANI) has undertaken in recent years to develop a cordial working relationship that produces positive results for both archaeology and the quarrying industry. This talk will also include an overview of what quarrying will look like in the future within Northern Ireland with a move towards a more sustainable industry and what impact will now methodologies and working practices have on our archaeological and built environment.

4 ARCHAEOLOGY IN MODERN QUARRIES OF THE UK: PLANNING POLICY, METHODOLOGIES AND IMPACTS FROM THE PERSPECTIVE OF A SMALL-TO-MEDIUM-SIZED ARCHAEOLOGICAL UNIT

Abstract author(s): Braun, Brandon - Guagenti, Alessandro (John Moore Heritage Services)

Abstract format: Oral

Material extraction at modern quarries radically alters the landscape, impacting not only the natural environment, but also historical and cultural environment. By its very nature, quarrying permanently removes the archaeological horizons in which any extant cultural features exist. In the UK, this risk of loss is mitigated by legislation and policy guidance as part of the planning process for any project, primarily through the National Planning Policy Framework (NPPF), which grew out of the PPG16 policy introduced in 1990, based on the 'polluter pays' principal. The NPPF was originally published in 2012, was updated in 2019 and is currently under review as of 2023.

Over that same period in the last decade, John Moore Heritage Services (JMHS) has undertaken more than a dozen developer-funded projects, ranging from desk-based assessments to various stages of fieldwork, at several quarry sites around England. Several on-going projects are distributed throughout the archaeologically significant areas of the Upper and Middle Thames valley, a number of which are presented here as case studies. This paper analyses these projects, examining how the methodologies and research aims satisfy the current requirements of the NPPF and how this has changed over time. It also addresses the importance of projects at quarry sites for a small-to-medium sized archaeological units such as JMHS, reflecting on the challenges posed and opportunities offered to the company and the archaeologists employed within them. At the same time, the paper emphasizes the relative strengths of heritage companies such as JMHS in the context of modern quarries, such as their ability to build durable professional relationships or to quickly adapt time scales and methodologies as needed for site/project specific circumstances. Finally, the paper discusses issues regarding the relevance of archaeology within the wider industry it is embedded within, in the context of quarry excavations.

5 CASALE RIZZO, HISTORY OF A DEFACED HERITAGE: ASSESSMENT OF ARCHAEOLOGICAL AND ENVIRONMENTAL DAMAGE

Abstract author(s): Amodio, Francesco (Stadt Zürich)

Abstract format: Oral

The archaeological site of Casale Rizzo (Corigliano Calabro, Italy), from the 1960s onwards, was affected by surface researches, including the first ones in the 1960s (by the Quilici) and later in the 1970s by the then Ufficio Scavi di Sibari (P.G.Guzzo). It was only in 1980 that the research group of the University of Rome La Sapienza conducted systematic research that led to the identification of a concentration of archaeological materials near the S-E slope, chronologically framing the site between the phases of the medium and recent Bronze Age. It was between 2004 and 2006 that radical earthworks/excavations, carried out in the vicinity of the N-E slope, brought to light other ceramic materials of the Protohistoric period and a bronze pin with an ornithomorphic protome head (1) recovered by Francesco Amodio. What has been carried out so far at Casale Rizzo over the years only confirms the presence of an archaeological deposit of significant importance, the archaeological potential of which has been known in the literature for over 50 years but, nevertheless, the area has been continuously exposed to irreversible risks since the construction of the provincial roads 252 and 197, which have impaired part of the N-E slope, and by the extensive

damage caused by the quarrying activities which, in the following years, have irreversibly compromised the morphology of the slope, thus permanently erasing much of the archaeological stratigraphy. These activities in fact, in addition to causing extensive damage and losses, have made the soils of the slopes extremely unstable, producing largely unpredictable long-term effects.

6 QU&HERI (QUARRIES AND HERITAGE) PROJECT: MULTIDATA ANALYSIS AND ARCHAEOLOGICAL RISK EVALUATION IN CENTRAL-SOUTHERN ITALY

Abstract author(s): Marino, Sara (Sapienza University of Rome) - Dore, Nicole (NAIS Nextant Applications & Innovative Solutions S.r.l.)

Abstract format: Oral

This paper presents the preliminary data of the QU&HERI project, focused on Lazio, Calabria, and Sicily promoted by the Sapienza University of Rome, in collaboration with the Italian Ministry of Culture (regional Offices for Cultural Heritage). The project's goal is to map historical, recent, and current quarries; multidata analysis is then performed, looking forward the mitigation of the archaeological risk, by keeping respect of extractive quarries. In fact, in central-southern Italy, cases of archaeological, paleontological, environmental contexts destroyed or heavily damaged by modern quarries are well-known. Anyway, many cases are uncertain or unknown, also because the archaeological legislation may hinder precise protection activities. It means that the total or partial destruction of archaeological landscapes is a strong risk. Our multidata approach to the problem seeks to provide a clearer picture: as first activity, we superimposed in a GIS environment the bibliographic and archival data to the multitemporal satellite analyses carried out both to monitor and to reconstruct the destroyed archaeological landscapes. A multitemporal analysis was performed over the homogeneous landscape units impacted by quarries. Contexts impacted or destroyed by quarry activity, can in fact gain relevant inputs from the multitemporal backward analysis of aerial images and large-scale topographical and technical maps, with the goal of reconstructing entire portions of the current invisible archaeological landscapes. A change detection analysis of the multitemporal data is presented, based on some contexts of northern Ionian Calabria, realised thanks to the collaboration with NAIS S.r.l. Both open access optical satellite images and commercial VHR images, were used. High-resolution images and multitemporal data are required for an evaluation of the quarries' impact over the territory: in fact, the frequent spread of unauthorized quarries of small size and short extraction periods is difficult to be detected, and only high resolution and high-quality analyses can provide satisfactory results.

7 AUTOMATIC SATELLITE-BASED DETECTION AND MONITORING OF QUARRYING ACTIVITIES IN HIGH-RISK ARCHAEOLOGICAL AREAS OF SICILY

Abstract author(s): Guarino, Giuseppe (University of Bologna) - Brucato, Alessia (University of Bari) - Tapete, Dedato (Italian Space Agency) - Masini, Nicola (Institute of Heritage Science - National Research Council of Italy)

Abstract format: Oral

Satellite imagery has been used extensively by many archaeologists to explore and monitor remote and hard-to-reach historical contexts which are, now more than ever, at greater risk of disturbance by calamitous events and human activities. The main causes of the irreversible loss of our historical and natural heritage are urban sprawl, intensive land use by agricultural and industrial development, effects of climate change, political instabilities and intentional looting activities. Among these, the increasing expansion of mining sector is one of the most relevant threats, threatening cultural and natural landscape worldwide. This is especially true in Sicily (Italy), where the territory is rich in limestone and such operations may happen despite regulations, regulatory framework and policy enforcement. With this contribution we would like to present a remote sensing-based workflow for the identification and monitoring through time of the quarrying activities in central Sicily, where many relevant historical contexts are exposed to this risk. Thanks to the variety of Open Access satellite repositories archives of multitemporal and multisensory images and numerous Free Libre Open-Source Software, in 2022 we successfully applied Machine Learning algorithms (non-parametric supervised classification with Random Forest Classifier) on multispectral satellite images (Copernicus Sentinel 2 Level 2A) covering the entire territory of Sicily. The classification obtained showed many active quarries near high-risk archaeological areas. Now, thanks to the collaboration with the Italian Space Agency and the National Research Council of Italy, we are focusing our work on multitemporal composites of overlapped images from Multispectral and SAR satellite datasets (Copernicus Sentinel 2 and 1, COSMO-SkyMed), aiming to a more detailed and diachronic perspective on this threat near specific sites. As done in the first phase of the research, the study and results will be performed and validated using QGIS and Google Earth Engine.

A. ARCHAEOLOGY AND QUARRIES - CASE STUDIES OF CONTRIBUTION OF GEOPHYSICAL MEASUREMENTS AS A PART OF PREVENTIVE ARCHAEOLOGY IN CZECH REPUBLIC

Abstract author(s): Krivánek, Roman (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic, Prague)

Abstract format: Poster

The Czech Republic has long been among the significantly industrialized countries in the Central European region. New social, but also economic changes and plans often affected many archaeological sites and large parts of the landscape. Extensive brown coal mining has continued here for many decades, changes in infrastructure and communication networks have initiated a boom in the mining of various building materials from stone to limestone to gravel and sand materials. The establishment and expansion of mines and quarries often irreversibly changed the landscape and the condition of many archaeological sites. Examples of timely applications of non-destructive geophysical measurements in the vicinity of quarries can also demonstrate effective procedures both for the implementation of rescue archaeological research and for changes in the demarcation of undisturbed parts of important immovable archaeological monuments.

A magnetometer survey at the Vražkov, Litoměřice district confirmed the continuation of a prehistoric polycultural burial ground in the eastern vicinity of the previously excavated sand quarry and initiated a new project archaeological investigation of the preserved part of the long Eneolithic burial mound. An extensive geophysical survey of the polycultural prehistoric and early medieval hillfort of Plzeň-Hradiště, district of Plzeň-město contributed to the definition of the extent of the old and already buried sand quarry inside the protected area of the site as part of the systematic archaeological investigation of the site's fortifications. A systematic survey of the inner part of the prehistoric and medieval hillfort in the Hostim, Beroun district provides a basis for the site protection of the previously partially disturbed by limestone quarries. Extensive surveys with a magnetometer at the Libkovice/Marianske Radčice, Most district in the forefield of the brown coal mine greatly streamlined the rescue archaeological research of the relics of the anti-aircraft defense firing position from the 2nd world war.

509 EMBODYING GENDER, PROBLEMATISING SEX: WEAVING TOGETHER THEORY AND METHOD IN THE EXPLORATION OF BODILY DIFFERENCE

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Peacock, Taylor - Thompson, Jess (Department of Archaeology, University of Cambridge) - McGuire, Erin (Department of Anthropology, University of Victoria)

Session format: Regular session

Tension is an inherent feature of (bio)archaeological studies of past bodies and identities. While sex estimation of the skeletal body is routine practice, whether it's morphologically or biomolecularly estimated, situating the skeletal body and the individual in a gendered world has proven challenging. Increasingly, critiques of how we approach skeletal bodies and identities have emerged alongside new theoretical applications in gender archaeology. Post-modernism, intersectionality, queer theory, and insights from new materialism and posthumanism, have all demonstrated ways we can traverse the gender landscape of the past. Alongside this, recent research in bioarchaeology and forensics has problematized sex estimation by bringing to the forefront the exclusion of non-binary and transgender individuals, as well as presentist notions of sex/gender and their application to archaeological contexts. Yet, the gulf between more-than-binary approaches to gender in the past and the practice of sex estimation in osteology remain.

In this session, we aim to bring together bioarchaeologists (who may be or more less theoretically-minded), social archaeologists, and other practitioners concerned with locating more-than-binary gender in past worlds and challenging essentialist notions of sex/gender in the past and present. We are interested in parsing the ways that osteological analyses and praxes, including methods of sex estimation, talk with and against recent and emerging discourse on gender identity and bodily difference. Papers which review the field, theoretical developments, or specific case studies from any period or region are invited. In connecting methods with theory, we aim to bridge the gap between theoretical critique and method, and in doing so find new ways of approaching gender, bodies, and bodily differences in the past.

1 WORKING TOWARDS A NON-BINARY APPROACH FOR ESTIMATING SEX FROM SKELETAL REMAINS

Abstract author(s): Albanese, John (University of Windsor; Simon Fraser University) - Reid, Sydney (University of Windsor) - Sierra-Serrano, Elena (Simon Fraser University)

Abstract format: Oral

Just as gender is considered a social construct, sex must be considered a biological construct. Sex can be defined using various biological frameworks: genetic, hormonal, anatomical, phenotypic, physiological, etc. For example, using chromosomal data, there are at least five sexes (X0, XX, XY, XXY, XYY) that occur in *Homo sapiens* at frequencies that are consistently measurable. Changing the biological framework will change the number of sexes and who is grouped into a given sex. Even when focusing only on skeletal variation, individuals are allocated to different groups when using different criteria. Within any given sample of humans, all the data have always shown that skeletal variation is continuous and does not fall into two discrete sexes; the number of categories for assessing variation varies with each approach for estimating sex; and allocation of specific individuals varies with the constructed categories, the skeletal elements assessed and the classification criteria. Furthermore, on an individual level, any one person will manifest a mosaic of traits, and these traits have been ascribed maleness and femaleness. A binary approach to sex limits our understanding of human skeletal variation, undermines the identification of unknown individuals in forensic contexts, constrains our understanding of past populations, and perpetuates harmful stereotypes about sex and gender. In this paper we deconstruct existing sex estimation methods as the critical steps to re-constructing a non-binary approach to sex estimation that will provide a better understanding of variation in *Homo sapiens* in the past and present.

2 HOW DO WE KNOW WHAT WE KNOW? A SYSTEMATIC ANALYSIS OF SKELETAL SEX ESTIMATION AND AMBIGUITY IN PUBLISHED STUDIES

Abstract author(s): Peacock, Taylor (Department of Archaeology, St. John's College, University of Cambridge)

Abstract format: Oral

In bioarchaeology, the current standard practice is to assign a binary sex estimation category to an individual as part of their skeletal profile, placing them into either “male,” “female,” or “intermediate.” From there, bioarchaeologists compare the differences between estimated sex categories. Feminist theorists, however, argue that the routine practice of sex estimation creates monoliths of sex/gender identities and overweights the importance of sex/gender for past people. To date, no studies have examined how bioarchaeological literature reports sex estimation data. Therefore, the current study explores how papers from six journals, across five years, report sex estimation, whether differences between the ‘sexes’ are compared, and how studies engage with intermediate individuals. Preliminary results from one journal (n = 121 articles) found that in articles where the sex estimation of the individuals was reported (n = 81, 67%), differences between the estimated sexes were not tested in 58%. Furthermore, 58% of articles (47/81) did not report any intermediate individuals and 14/81 reported either removing the individuals from the dataset or excluding them from sex comparisons. The results indicate that, as Agarwal (2012) found, sex estimation is reported even when not the focus of the study or the results. This focus on sex estimation has the potential to close us off from other forms of interpretation and other axes of difference. In doing so, we assume that the estimated sex is one of the essential features of an individual and their experience in the past. The absence of intermediate individuals also suggests a focus on the “correct” answer, supported by the rise of biomolecular and paleo-proteomic methods for sexing individuals. In assigning individuals to such binary categories, we cement a past that is focused on binary individuals rather than considering more complex identities and experiences in the past.

3 CRITICAL APPROACHES TO BIOCHEMICAL ANALYSES OF SEX: Y IT MATTERS

Abstract author(s): Shaw, Heidi - Gowland, Rebecca (Durham University) - Geller, Pamela (University of Miami)

Abstract format: Oral

Within the past decade, the advent of biomolecular methods of sex estimation (i.e., aDNA analysis and paleoproteomics) have revolutionized the way that bioarchaeologists understand the past. However, what chromosomal sex tells us about the “making of sex” within a specific culture, or how this links to gender identity or phenotypic appearance is open to question. Recent publications have highlighted the ethical and socio-political ramifications of uncritically applying biomolecular data to the interpretation of identity in past human populations. Such critiques have been particularly focused on the role of biomolecular analyses in the perpetuation of racism and colonial violence in living populations. We argue that it is imperative that we extend this critical reflection to include sex and gender identities in the past. Given the viral coverage of biomolecular analysis of sex and gender in archaeological burials we need to assimilate a greater sense of ethical accountability. We should ensure that binary data obtained from peptide and aDNA

analysis is interpreted reflexively to accommodate a range of potential sex-gender ideologies and sexual relations, as well as recognizing the limitations of what biochemical data can tell us. There are important ethical implications in how we, as bioarchaeologists, study, interpret, and disseminate studies of sex. History has taught us that our work has the potential to be used in harmful ways, which is why it is important to make room for more nuanced and theoretically informed approaches to the interpretation of biomolecular evidence for sex.

4 **COMMUNIST OSTEOARCHEOLOGY: A ROMANIAN CASE STUDY OF MARXIST-LENINIST BIOLOGICAL DETERMINISM**

Abstract author(s): Mower, Kate (University of California Riverside)

Abstract format: Oral

In 1920, Romanian anthropologist Francisc Rainer opened a small collection of human remains primarily for viewing by medical students in Bucharest. Over time, this became the „Francisc Rainer“ Institute of Anthropology under the umbrella of the Romanian Academy. As the institute acquired skeletal remains from archeological excavations across Romania, the remains were assigned sex, age, and ethnicity based on cranial types and other morphological structures. This process continued through the Communist period. This article analyzes the archeological articles in the Romanian archeological publication, *Studii și Cercetări de Istorie Veche*, which were published between 1950 and 1979 which include descriptions of skeletal remains found at Romanian archaeological sites. It analyzes what data was included to make sex, gender, and ethnic assignments for the remains. Archeologists worked with the paleoanthropologists at the Institute of Anthropology, but note in these articles that the Institute did not have the staff or specialists to handle so many remains as the archaeologists were excavating, and the archeologists, therefore, made these biological assignments on their own. Despite the fact that Marxist-Leninist archeological theory criticized culture-historical archeology as „bourgeois science“ -- leading to purges of culture-historical methods and theories -- often culture-historical biological constructions of sex and ethnicity led Romanian archeologists to assign sex and ethnicity of remains based on these so-called „bourgeois“ scientific methodologies. More often, though, sex and ethnicity were determined by the material culture found in the archeological context near the remains. Sex, in these cases, was not assigned by a biological determinist interpretation of the remains, but simply by the assigned gender of the material culture. This article offers the historical tension between culture-historical archaeological practices concerning sex, gender, and ethnicity and that of Marxist-Leninism as those tensions developed in Communist Romania.

5 **PROSPECTS IN ENGENDERING CLASSICAL GREECE: TOWARDS THE CONSTRUCTION OF CULTURALLY CREATED ENGENDERED BODIES AND IDENTITIES THROUGH AN INTERDISCIPLINARY APPROACH**

Abstract author(s): Vannet, Malo (Mission Archéologique Départementale de l'Eure - MADE) - Solomou, Anastasia (Independent Researcher)

Abstract format: Oral

With the development of gender and feminist theory bringing the complex and culturally determined nature of biological sex and gender to the fore (Butler 2004; Lorber 1996), archaeologists have been urged to reconsider the way in which past identities are interpreted (Jordan 2016; Harrell 2014; Arnold 2012; Costin 1996). Within the funerary arena, the spotlight has been placed on osteologists, which are considered to be the most capable in providing information regarding the sex and gender of the deceased. However, the theoretical and practical limitations of the sex-estimation methods used by osteologist and their subsequent interpretation and conflation with gender have begun to problematise researchers (Geller, 2005). This paper aims to highlight these limitations and re-formulate the questions asked by and to osteologists concerning the social identities of the deceased. Through this prism, a practical demonstration of prospective research pathways for the exploration of gender in Ancient Greece will be attempted, provided it is a greatly understudied context both with regards to osteological analyses and gender studies. This primarily includes the overview of engendered activities and lived experienced in Classical Greece. Focus will be drawn on the potential of the combination of this textual and contextual data with osteological and genetic data, with a view to creating a holistic approach to the identity and specifically the gender of the deceased, also exploring the way gender relates to and is connected to other aspects of identity, such as status, age, or ethnicity (Sofaer, 2013). This paper will also highlight deviant cases with a view to challenging the strict binary notion of gender portrayed onto Classical Greece.

6 UNSEXING THE ARCHAEOLOGICAL GAZE

Abstract author(s): Moen, Marianne (Museum of Cultural History University of Oslo)

Abstract format: Oral

For as long as archaeology has been an academic discipline, biological binary gender has assumed natural and therefore applicable to the past: historically established as determining a person's abilities and preferences, and shaping their social identity. Gender and feminist archaeology has addressed the problems this brings, offering alternative interpretations and challenging biases. And yet, it remains an engrained archaeological practice to differentiate material based on assumed gender.

When approaching for instance mortuary material, a first question asked is if the grave can be categorised as male or female. In this, osteological assessments and archaeological assumptions of gendered grave goods both play a part. As the established narrative goes, the two often correspond. And yet this is a partial truth at best: in many cases, graves determined as male and female contain other objects found with both genders, also presumably indicative of their social roles yet rarely considered equally significant to gender-diagnostic objects when ascribing identities. Very often, a considerable amount of graves contain no gendered objects at all. In other (perhaps rarer) cases, the two are directly opposed. Consequently, in order to maintain a version of the past inhabited by men (with weapons) and women (with jewellery), we need to ignore a considerable part of the actual material.

In this paper, I will lay out the case that the archaeological practice of gendering mortuary material needs addressing in two key ways. Firstly, in that the ongoing tendency to assign social roles based on sexed bodies needs further justification and cannot rely on ideas of natural gendered behaviours rooted in Eurocentric ideals. Secondly, that the primacy accorded to gender-diagnostic objects needs modification against other material goods that presumably are no less meaningful. In so doing, we may find a past less strictly binary, and more nuanced and relatable.

515 DECOLONISING PALAEOOLITHIC AND MESOLITHIC ARCHAEOLOGY: REFRAMING PRACTICES, VALUES, AND PERSPECTIVES [PAM]

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Milks, Annemieke (University of Reading, Department of Archaeology) - Grimm, Sonja (ZBSA - Centre for Baltic and Scandinavian Archaeology)

Session format: Discussion session

Archaeological practice is grounded in Western values, perspectives and practices. Communities historically labelled as hunter-gatherers have been, and still are, used as models for prehistoric know-how and organisation. Evidence of their material culture has been taken into (mostly Western) Museums and used for comparisons with archaeological material. This way analogies were made between societies with very different histories, including their immaterial behaviours and structures. These analogies often resulted in notions of evolutionary primacy, increasing racist pictures of non-Western societies as well as of the past. As non-Western individuals, perspectives, skills and contributions are still habitually understated and under-acknowledged in scientific and academic contexts, there is a need for more diversity in the scientific community to confront these racist pictures and acquire a more holistic understanding of the past.

Following a vote by our members, we propose to use the annual Palaeolithic and Mesolithic (PaM) Community discussion session at EAA2023 to facilitate a platform for case studies and conversations on 'where next' for decolonising archaeology of the 'Stone Age' (broadly construed). We seek contributions, and will welcome a wide range of formats (including but not limited to traditional presentations, case studies, interviews, film etc) covering a range of geographical, temporal, and social contexts on

- reburials
- repatriation of cultural objects and spaces
- reframing scientific projects and results
- community involvement
- decolonising the curriculum
- specific examples and suggestions to improve the diversity and inclusivity of archaeological research.

In particular, we invite contributions that centre the experiences of Indigenous students and scholars from under-represented communities and countries.

A key aim of this session is to listen, and to offer an inclusive and multidisciplinary space which amplifies under-represented voices, with the aim of a polyphonic story of our deeper pasts.

1 REFRAMING UPPER PALAEOLITHIC RESEARCH IN PORTUGAL: HOW TO OVERCOME M. HELENO'S BIAS?

Abstract author(s): Gameiro, Cristina (UNUARQ - Lisbon University)

Abstract format: Oral

M. Heleno was the director of the National Museum of Ethnology between 1929 and 1964, the professor of Numismatics and Archaeology at the Lisbon University (School of Arts and Humanities) and the director of numerous archaeological excavations throughout the country, spanning different time periods. Between 1937 and 1953 he conducted excavations at several Paleolithic sites: Vascas, Vale de Porcos, Casal do Filipe, Terra do Manuel, Terra do José Pereira, Vale Comprido, Olival da Carneira or Passal (in Rio Maior), Almoinha and Cambelas (in Torres Vedras). Nevertheless, most data concerning his works have remained unpublished. In fact, all his work had only one goal: finding the origins of the Portuguese people, and proving their European roots, against those who postulated an African origin. He believed in the correlation between an index-fossil, a culture and a race. His racist, nationalist and europeanist arguments can only be understood in the context of the Portuguese dictatorship, i.e. within a nationalist and colonial regime.

Despite the huge amount of Palaeolithic research conducted during the last thirty years – including the identification and excavation of worldwide important sites – to some extent M. Heleno's bias is still present in Portuguese Upper Palaeolithic research. For example: inland areas are less surveyed; lesser quality raw materials or uncharacteristic lithic series continue to be neglected; the use of French nomenclature and the search for parallels in Spain and France continue to be valued. This paper will discuss some procedures/measures aimed at reframing Upper Paleolithic research.

2 COLONIALISM AND THE EUROPEAN MESOLITHIC

Abstract author(s): Elliott, Benjamin (UHI Archaeology Institute) - Warren, Graeme (University College Dublin)

Abstract format: Oral

This paper responds to the multiple calls for decolonisation that originate from the session organisers, and large swathes of British and Irish society. It aims to explore various strands of decolonial practice within the context of Mesolithic archaeology; a subfield that has seen little postcolonial analysis or self-reflection to date. We go beyond the broader, established critiques of European prehistoric frameworks' colonial rootings, to identify the specific historic intertwining of Mesolithic archaeology and colonial hegemony. We argue that, far from these interactions serving as historiographical footnotes, Mesolithic research continues to reinforce these hegemonies today; both within popular culture and the academy. This plays out at the inter and intra Continental scales.

Having made these points, we then move on to explore areas of contemporary Mesolithic research practice that we believe hold previously untapped potential to challenge this dynamic, and contribute to the deconstruction of colonially-rooted power imbalances. Our focus here falls upon the ethics of ethnographic analogy, and the ontological turn within Mesolithic Studies.

3 DECOLONISING THE PALAEOLITHIC AND MESOLITHIC? SOME THOUGHTS FROM THE PERIPHERY

Abstract author(s): Porr, Martin (University of Western Australia)

Abstract format: Oral

In recent years, there has been a growing interest in the decolonisation of archaeological practices, epistemologies, representations, and research processes. While European Palaeolithic and Mesolithic archaeologists have for a long time failed to engage with critical social theory in any meaningful ways, more practitioners in the field have recently developed an interest in this direction as well. While this is certainly a positive development, it is also characterised by a considerable degree of insecurity and lack of orientation. The current interest can be seen as a reflection of ongoing processes of the negotiations of identity in relation to global processes of socio-economic and political structures, which equally affect the ancient and persistent centres and peripheries of the Europe-centred system of colonialism. As such, the current moment requires a much more intense engagement with the forms and effects of colonialism from a historical and contemporary perspective. These equally encompass intellectual, ethical, and political dimensions. However, while a critique of Western worldviews and their destructive legacies needs to form a key part of this process, strategies of decolonisation must also find productive and inclusive ways to arrive at a sustainable relationship between decolonising approaches and scientific practices and frameworks. This paper calls for a greater and more systematic engagement with the diversity of current postcolonial and decolonial thinking in other relevant fields to create at a balanced and sustainable disciplinary identity for Palaeolithic and Mesolithic archaeology. These consider-

ations are informed by a perspective from the periphery that is itself a product of European colonialism and requires constant navigating colonial legacies in practical and legislative as well as intellectual contexts.

4 **A CASE STUDY IN REFRAMING ARCHAEOLOGICAL PRACTICE: COMMUNITY-PARTICIPATORY ARCHAEOLOGY IN SOUTHCENTRAL, ALASKA**

Abstract author(s): Krasinski, Kathryn (Adelphi University) - Wade, Angela - Johnson, Norma - Seager-Boss, Fran (Chickaloon Village Traditional Council)

Abstract format: Oral

Collaborative community-participatory archaeology involves the descendant community members from the inception of a research question to funding, fieldwork, interpretation, and dissemination. By deemphasizing the focus solely on material culture, we broaden the archaeological vision to center Indigenous values, ethics, and practices which emphasize respect, consent, relationality, compassion, care, and patience. In this case study we integrate perspectives from descendant communities to understand landscape in relation to oral history and known archaeological sites. Re-thinking archaeological practice not only has the possibility of making it more ethical, but it will result in better science. When archaeology is people centered, it may improve health, well-being, and social inclusion. Community-based archaeology opens the potential for establishing or maintaining relationships with land as well as synthesizing knowledge truncated as a result of colonialism.

Indigenous knowledge often is underpinned by a holistic understanding of the interconnectedness of life and time. In this talk we raise several discussion points on how archaeology impacts Indigenous people including responsibilities to our communities and stewardship. While distributions of artifacts may be discrete, the significant cultural landscape may be much broader. Landforms may even have personhood. Initiating projects in consultation and consent with descendant communities would ensure methods are appropriate to the site, community, and research questions are effective techniques for minimizing negative impacts of research. Further, the language of science can be reductionist. Once artifacts are unearthed, they could be curated for future generations in cultural facilities designed and managed by the descendant community rather than in inaccessible repositories.

5 **A DISCUSSION IN REFRAMING ARCHAEOLOGICAL PRACTICE: COMMUNITY-PARTICIPATORY ARCHAEOLOGY IN SOUTHCENTRAL, ALASKA**

Abstract author(s): Wade, Angela (Chickaloon Village Traditional Council) - Krasinski, Kathryn (Adelphi University) - Johnson, Norma (Chickaloon Traditional Village Council)

Abstract format: Oral

Indigenous knowledge systems often are underpinned by a holistic understanding of the interconnectedness of life and time. In this talk we will raise several discussion points on how archaeology has impacted the Indigenous people of southcentral Alaska in the past and continues to impact our descendants and our knowledge systems including responsibilities to our communities and stewardship. While distributions of the artifacts may be discrete, the significant cultural landscape may be much broader. Landforms may even have personhood. Initiating projects in consultation and consent with descendant communities would ensure methods are appropriate to the site, community, and research questions are effective techniques for minimizing negative impacts of research. Further, the language of science can be reductionist and exclusionary. Finally, once artifacts are unearthed, they could be curated for future generations in cultural facilities designed and managed by the descendant community rather than in inaccessible repositories far from their originating communities.

A. **"NOT ALL ANIMALS ARE CREATED EQUAL": VIEWING HUMAN-ANIMAL RELATIONS THROUGH INTERACTIONS OF POST-MORTEM REMAINS**

Abstract author(s): Rasmussen, Jason (University at Buffalo)

Abstract format: Poster

Prehistoric communities have been viewed for decades in terms of modern societies. Assumptions about how they viewed their environment, wealth and interactions with other species were based on Eurocentric modernist concepts which developed thousands of years after these prehistoric communities lived as a form of colonizing the past to make it more easily recognizable to scholars in the present. But recent scholarship looking at how prehistoric communities such as the Mesolithic sites of Iron Gates Gorge (Serbia-Romanian border) and Star Carr (Yorkshire, UK) looking at the relationships between human beings and other neighboring species whose remains were collected and manipulated after death in similar ways as those of humans, often being included with human remains. Red deer (*Cervus elaphus*) and the domesticated dog (*Canis familiaris*) were popular species to be included in human burials and in some cases the primary burial itself in Mesolithic Europe suggesting that the connection between these species and humans was more complex than just a hunter/prey relationship. This poster will demonstrate the complex relationship between

humans and these species at two of the most heavily studied sites of Mesolithic Europe to see if there is evidence to suggest a view of animals as Persons. This line of questioning follows the work of Dr. John Chapman and Dr. Chantal Conneller which looks at the transformability of materials and persons in Prehistoric Europe through the use of their understanding of connections and essences within the materials themselves.

514 ADOPT A MONUMENT- COMMUNITY ACTION IN A CHANGING WORLD

Session theme: 3. Heritage Narratives and Representations

Session organisers: Richardson, Philip (Archaeology Scotland) - Doyle, Ian (The Heritage Council of Ireland)

Session format: Round table

Adopt-a-Monument and similar community-led stewardship of heritage is now over 30 years old. From Scotland to Finland, Ireland to Italy, across Europe and beyond projects have been developing ways of supporting local people to care for and share heritage that is important to them. As we enter the post-covid world, acknowledge the realities of climate change and begin to understand the potential for archaeology as a medium for good in the lives of real people it is perhaps a good time to reflect.

Caring for heritage and developing skills have been a huge part of these projects but Adopt a Monument projects have also sought to enable participants to overcome barriers to participation, by devising and providing accessible engagement opportunities which are relevant to everyday lives.

It is 10 years since the first Adopt a Monument session was held at EAA and in that time things have changed dramatically. Projects have been developed that vary widely in terms of scale, audiences and outcomes. Yet the fundamental aspect of community action remains. Given this we feel now is a good time to reflect, to catch our breath and to get ready to 'go again' and tackle challenges old and new head on.

In this session we seek contributions from those engaged in caring for and championing our common past. Through a wide range of papers and position pieces, from professional practitioners and communities we will aim to address how we can meet our challenges, understand what the current strengths and weaknesses of these approaches are and to understand what our options and opportunities are for the next 30 years?

516 EUROPEAN ARCHIVES OF AMERICAN ARCHAEOLOGY [EAA4AM]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Ziolkowski, Mariusz (Centre for Andean Studies, University of Warsaw) - Saintenoy, Thibault (Incipit-CSiC, Santiago de Compostela) - Hattori, Marcia (Universidad del Pais Vasco)

Session format: Discussion session

From the earliest contacts of Europeans with native American cultures during conquests and colonization, artefacts, especially crafts and art produced by the latter, have constituted objects of interest, description and, in some cases, were taken to Europe to supply antiquity collections. In later times, and in particular from the second half of the 18th century onwards, pre-Columbian monuments and objects became the subject of more scientifically oriented research, accounts of which often accompanied the shipment of archaeological objects to European collections. The famous Trujillo del Perú codex, published by Baltasar Martínez Compañón in 1782-1785, may be viewed as an example of such an early scientific archive. As this process continued and grew during the 19th and the first decades of the 20th centuries, the production of "scientific" narratives (chronicles, measurements, graphic documentation, cartography, photography, etc.) also developed on a great scale. Most of this data has generally been accumulated in private and institutional collections throughout Europe. Today, these archives constitute a great resource, in order to research the American past as well as to better understand the history of European research approaches and practices in the Americas.

During these last decades, the archaeological collections of artefacts produced by European scientific practices throughout the Americas have often been the subject of reflections and debates, in relation to their analysis, curation, exhibition, and in specific contexts to their repatriation to their place of origin. In comparison, few have been done about the non-artefactual data (mainly texts and images).

In this session, we would like to approach the question of the scientific documentation archives of European investigations in the Americas. How well-known and easy to access are they? What is their potential for research? What is their meaning and utility for indigenous communities and American (and European) states? We would welcome both presentations on specific archives (related or not to artefact collections), as well as more global/critical reflections about the historical contexts of their production, and about the issue of archives management for their common access and use.

Organising team also contains Carolina Orsini (Museo delle Culture de Milano) and Alexander Geurds (University of Oxford).

1 THE DISTRIBUTED ARCHIVE: PROVENANCE RESEARCH ACROSS EUROPE

Abstract author(s): Joyce, Rosemary (University of California)

Abstract format: Oral

This paper examines the way that „archives“ documenting archaeologically important materials are distributed across Europe, potentially impeding understanding of histories of collection by both the citizens of the source countries from which collections came, and scholars. The case study for this is part of a larger study of collecting practices that, between 1700 AD and the late 20th century, created collections in Europe and North America from the territory today comprising Honduras and neighboring nations in Central America. Collected prior to the emergence of a canonical emphasis on specific kinds of ceramics in culture history of the region, some of these materials represent significant aspects of the precolonial history of the region, but are under-utilized by and poorly understood by contemporary archaeologists. To begin to reconstruct their history requires reassembling documents now distributed across archives in museums, libraries, and other repositories. Chert (or „flint“) lithics from Honduras are a compelling example. They became a central focus by European prehistorians in the 19th century, for whom they figured as examples of global Neolithic technology. Archival documents clarifying how these objects arrived in Europe and circulated from private collectors to museums exist in multiple museums, some associated with artifact collections, others separated from any object collections. Changing nomenclatures for places may obscure connections. The tendency for archives to be organized around European collectors or museum personnel is particularly challenging. Our understanding of the archive also needs to include media that are now out of print that may be the only records of past collecting, some of which may only be available as rare books. Thus, the „archive“ for understanding a single chert object exists in the records of the Pitt-Rivers Museum, the British Museum, Cambridge’s Museum of Archaeology and Anthropology, but extends well beyond these places.

2 THE CO-PRODUCTION OF THE ARCHIVES OF THE CARIBBEAN: A CASE STUDY FROM MOSQUITO SHORE DOCUMENTS IN BELIZE

Abstract author(s): Auzina, Dita (Bonn University, Bonn Center for Dependency and Slavery Studies)

Abstract format: Oral

The utilization of historical documents produced in European-administrated colonial settlements in the Americas as a means of gaining insight into the societies of indigenous peoples has been a topic of significant contention within the fields of archaeology and anthropology. Conversely, many historians argue that practising an alternative interpretive approach, reading “against the grain,” is yielding insights into the lives of indigenous societies.

Despite the widespread examination of the collections housed in major European archives such as those in Seville and Kew, the contents of smaller archives located in the Caribbean and Central America have received comparatively limited attention. The Belize Archives and Record Service (BARS), for instance, holds a collection of documents produced by local communities of 18th-century Nicaragua and Honduras’ Mosquito Coast that has thus far been understudied.

These documents, which include wills, contracts, manumissions, and other legal and practical transactions, offer a unique window into the co-production of creolized societies in the Caribbean region, as they reflect the interactions and relationships between individuals of European, African, American and mixed ancestry. Following the documents referring to land ownership and enslavement of individuals, one is confronted with the fact that already in the 18th century, these processes do not overlap with people’s categories as racialized by their origins. Rather, they are more likely to reflect the racialization of individuals based on their abilities to establish their socio-economic status.

By using the case study of 18th-century Mosquito coast documents from BARS, I want to demonstrate that viewing the production of the 18th-century archives in the Caribbean as a product of Europeans creates false dichotomies and ignores the agency of people of African and American ancestry who were active co-producers of these archives.

3 EXPANDING “ARCHIVES”: CONSTRUCTING CONTEXTS FOR ARCHAEOLOGICAL SITES

Abstract author(s): Sheptak, Russell (University of California - Berkeley)

Abstract format: Oral

No settlement is an island. This paper presents results from ongoing research on the historical archaeology of Central America, showing how understanding a site on Honduras’s Caribbean coast also requires investigation of settlements in eastern Honduras in Belize. Our excavations of the fortress and town of Omoa in 2008 and 2009 documented late 18th century residences in the town of Omoa. Spanish and Central American colonial archives related to Omoa are the immediately obvious archival resources. This paper argues that these are insufficient source. One cannot write the history of the 18th century Spanish fort in Omoa, Honduras, without knowing the people, and history of the Brit-

ish Black River colony in Honduras's eastern Mosquito territory and the British Settlements in what today is Belize. The histories of those residents are scattered through numerous archives in England, Scotland, and Ireland. This paper presents case study in assembling scattered archives beyond museums and collection repositories, examining family histories, company records, and government records.

520 WHAT NOW, THEORETICAL ARCHAEOLOGY? THINKING THEORY IN THE FOURTH SCIENTIFIC REVOLUTION

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Carvalho, Daniel (Quantitative Archaeology Lab - Universitat Autònoma de Barcelona; UNIARQ - Center of Archaeology of the University of Lisbon) - Agosto, Frederico (UNIARQ - Center of Archaeology of the University of Lisbon; CFUL - Center of Philosophy of the University of Lisbon)

Session format: Regular session

In the last decades, archaeological theory entered a proficuous state. Multiple approaches emerged as well as new debates and discussions within the field. From new ontological perspectives, new materialisms and a shift on Big Data and technological advancements, theory encompasses, in its present state, a vast multiplicity of dimensions. The dawn of the Fourth Scientific Revolution – Artificial Intelligence, Big Data, Deep Learning, Genetics and others – has decisively changed archaeological practice and theory. The methodological changes, and new research goals associated with it, reshaped Archaeology as a field of study. Theoretical archaeology, following the overarching trends of Archaeology, was also decisively affected. But, in this process, what represents an epistemic breaking point from previous schools of thought? How is theoretical archaeology mutating in the wake of this scientific revolution? In a sense: quo vadis, theoretical archaeology?

This session aims to reflect upon this question and in the nature of the archaeological theory in-itself, in its current state. If theory changes direction, mutates or shifts, the forms that it takes are of utmost importance for archaeologists. And, perhaps, we, as a community, will be confronted with realities that are unexpected: theories that are returning to the archaeological discourse; perspectives not yet explored and ideas that are imposed or even relegated to a plane of non-existence, because of their characteristics.

Whatever the results, the goal of this session is precisely to engage in this debate. We welcome any archaeologists, students, practitioners or researchers to present their papers with their thoughts, experiences and opinions about the direction that archaeological theory is heading, as the most efficient way to walk a path is to do it with a destination in mind.

ABSTRACTS

1 THEORY STRIKES BACK. RETHINKING THEORETICAL ARCHAEOLOGY IN THE AGE OF ITS ONTOLOGICAL RECONFIGURATION

Abstract author(s): Carvalho, Daniel (UNIARQ – Center of Archaeology of the University of Lisbon; LAQU – Quantitative Archaeology Lab of Universitat Autònoma de Barcelona; FCT – Foundation for Science and Technology) - Agosto, Frederico (UNIARQ – Center of Archaeology of the University of Lisbon; CFUL – Center of Philosophy of the University of Lisbon; FCT – Foundation for Science and Technology)

Abstract format: Oral

Archaeological theory is going back to the basics. Here we are, in the 21st century, discussing what archaeology is, and what it needs to be done. We debate about ontology, identity and the temporal scope of the discipline, and how it relates to the outside world. We, as archaeologists, dwell within other areas, benefiting from their epistemological advances and ideas. Multiple branches – archaeologies of – proliferate at an ever-increasing rate, advocating new and never before seen approaches.

And yet, we are still discussing the same core elements. What is the reason behind a “retreat” within theory? Possibly because we have never truly advanced. A History of Ideas in Archaeology is still to be fully developed and the Philosophy of Archaeology knows few advocates and practitioners.

Entering a new scientific revolution, it is time to reflect – once again – on the nature of archaeology and how the archaeological can be defined. The role of theory must be discussed rather than presumed and the basis of Archaeology needs to be addressed, rather than taken for granted.

2 TOWARDS METAMODERN ARCHAEOLOGY

Abstract author(s): Radchenko, Simon (University of Turin)

Abstract format: Oral

Currently, the archaeological theory is presented by numerous simultaneously developing approaches such as post-humanism, flat ontologies, and agent-network theory. Being not introduced as a completed and ready-to-use theory, these concepts caused what is now described as a ‘quiet revolution’ in archaeological theorizing. The common motto of these approaches would be “Back to the things themselves!” Such a trend brought two new features to the landscape of archaeological theory today: focus on ontological questions and the high level of dispersion between different parts of archaeological theory. However, the concentration on the ideas of ontological turn brought a set of new questions. What is archaeological epistemology today? When and how did it change? What happens next with epistemology?

The epistemic driver for archaeological studies is formulated in terms of scaffolding and evidential reasoning, which today seems to be the most secure and reliable way to produce scientific knowledge. However, the advances of material-driven research and “flat ontologies” in general do not have a logical connection with these epistemic tools and methods. To provide the link between the epistemological instrument and the new state of ontology, one should search for a new theoretical solution that would absorb these ideas and the advantages of the Fourth Scientific Revolution.

This report endeavors to consider the metamodern cultural theory as a solution. Being a dominant way to describe the state-of-the-art in contemporary philosophy and culture, metamodern naturally links concepts considered in contemporary archaeological theory — a commitment to object-oriented ontologies, epistemic vacillation, devotion to the ideas and concepts of the Fourth Scientific revolution, an upgraded look on the transdisciplinarity, etc. I aim to discuss if metamodern might be a new fundamental structure that links archaeological theoretical concepts of different order into one holistic theory.

3 ARCHAEOLOGICAL THEORY DURING LATE CAPITALISM

Abstract author(s): Ribeiro, Artur (Christian-Albrechts-Universität)

Abstract format: Oral

Every now and again an archaeologist, usually white, male, and middle-class, will claim to have it all figured out. They will claim to know what is wrong with archaeology, all of it, as it is practiced from Japan to Colombia. They will argue that they have understood something about archaeology that thousands of archaeologists before them have never been able to understand. And of course, they will present to everyone, through multiple talks, books, and papers, an amazing new way of doing Archaeology™ that will revolutionize the state of the art and make everything better!

Archaeology has fully embraced late-capitalist and postmodern economics, where the market bets on fast-paced short-term profits, where NFTs and meme stocks have quickly risen and fallen, and where what matters is keeping the masses constantly seduced through shiny new products. However, in archaeology, instead of meme stocks or phone apps, what theorists love selling is their shiny and brand-new way of doing Archaeology™. Archaeological theory today jumps from fad to fad, it repackages and resells old French philosophy and claims it is new, it invents problems that did not exist and creates “solutions” that no one wanted or needed. And of course, people jump onto these theoretical hype trains because they have a fear of missing out.

Ironically, as this talk will argue, archaeological theory is at its best when it is reactionary and holds on to tried and true ideas, such as Marxist theory, practice theory, dialectical materialism, and semiotics – even though these are harder to sell in the late capitalist marketplace of ideas.

4 NAVIGATING MUDDY WATERS: COMPLEXITY THINKING AS A POSSIBLE GUIDELINE FOR STRUCTURING THEORETICAL INTEGRATION

Abstract author(s): Schlicht, Jan-Eric (Kiel University; CRC 1266 - Scales of Transformation)

Abstract format: Oral

In recent years archaeology has witnessed a dynamic development in theory involving notably ‘posthumanist’ perspectives like New Materialisms, Assemblage Theory, Actor-Network-Theory, as well as countering positions, bringing theory based on ethics, practice theory or Marxism back into the debate. Simultaneously ever more sophisticated computational methods, methods from biochemistry, genetics, and other adjacent natural sciences gained widespread prominence, so much so that one could say that scientifically oriented archaeological research has positioned itself firmly in the mainstream. While a lot of good things can potentially come from all these developments, there are certainly points of conflict: Scientific archaeology and its associated ideals are criticized for harbouring the danger of methodological monism, posthumanist positions are criticized in terms of ethics and metaphysical overcommitment, more classically humanist ideas from the humanities face allegations of being exclusionary and outdated, and some theoretical positions are deemed ‘unscientific’.

All this runs parallel to increasing specialization, leading archaeology to fragment, while concurrently the demand for 'interdisciplinary research' is growing consistently. Particularly in projects aiming to investigate complex processes and large questions, involving multiple scales at once this can lead to problems, especially when it comes to assessing questions of causality, narrative or generalizations. In many cases, the natural sciences gain the upper hand as they are perceived to provide 'more secure' answers, while on another note different theoretical positions from the humanities may find themselves in debates over whose metaphysics are correct. It is here where complexity thinking could aid in navigating the situation. Formulated as a decidedly heuristic perspective derived from complexity theory it may help in addressing poly-scalar relationships, thresholds between different scales and embracing the contingent and vague nature of the past we try to uncover, while offering potential to structure the integration of seemingly incommensurable positions under a methodologically pluralist framework.

5 „THEORETICAL CONFESSIONS OF AN ENVIRONMENTAL ARCHAEOLOGIST“ REVISITED: GOING WITH THE FLOW?

Abstract author(s): Gearey, Benjamin (Prehistoric Society; University College Cork)

Abstract format: Oral

In 2019, I wrote a paper entitled: „I didnt know you were into that kind of thing?“ Or theoretical confessions of an environmental archaeologist' (Gearey 2019), as an introduction to a volume containing papers reflecting on developments in the 20 years since the publication of *Environmental Archaeology: Meaning and Purpose* (Albarella, 2001). In this paper, I revisit some of my thoughts and reflections in this piece concerning the relationship between 'science' and 'theory'. In particular, I suggest that theoretical engagements at this interface are no different to the adoption of new analytical techniques or approaches. I take inspiration from Pétursdóttir and Olsen's (2018) discussion of 'theory adrift' to highlight how contact with such theories can take 'scientific' data into new and strange waters.

6 PROCESSUALISM 2.0? - AI AS ECHO OF MACHINE DETERMINISM IN SOCIAL ARCHAEOLOGY

Abstract author(s): Giroto, Chiara (LMU Munich) - Price, Henry (Imperial College London)

Abstract format: Oral

The power of Machine Learning (ML) and Artificial Intelligence (AI) to detect patterns in data with either reduced human supervision or none at all, paired with the ability to achieve suprahuman classification levels in many deployments of computer based statistical evaluations, such as medicine, finance, and advertisements has made it one of the most powerful – and dangerous – tools of modern science.

ML, portmanteau term for any technology which involves the detection of patterns in data by machines, has excited our discipline – a science often haunted by it's massive, interconnected, heterogeneous, and messy datasets with the desire to reconstruct interactions. In many ways it embodies the ability to ask post-processual questions of processually analysed data as current research visions are often driven by dynamics, interaction, concepts of hierarchical and vertical social structures and functionality. Often, they adhere to mainly post-processual ideas of causation, scapes of mind and space and their human perception. Differing from the beginnings of this theoretical paradigm today statistical data evaluation has become a central asset.

In many ways the enthusiasm for ML highlights how new technologies are adapted. However, it is questionable if any archaeological dataset meets the hallmark requirements of statistical analysis: true independence and representativeness of the original distribution. Therefore, the connection of social theories and remnants of past human interactions with their environment through space and time seemingly becoming tangible as a set of equations – without considering the ambiguity of humanity as a complex system merits the same critique as uttered in 1984. Human social history should never be reduced to a "suitable equation" (Miller/Tilley 1984).

In our paper we argue for a better understanding and acknowledgement of ambiguities, limitations and inbuilt bias of constricting a nonlinear complex system, such as human history to algorithms, simplifications, and inherently messy data.

(RE)-THINKING SMALL. BLADELETS AND MICROLITHIC PRODUCTIONS BEFORE THE ONSET OF THE UPPER PALAEOLITHIC AND LATER STONE AGE [PAM]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Carmignani, Leonardo (University of Leiden , Faculty of Archaeology) - Marciani, Giulia (University of Bologna, Dipartimento di Beni Culturali; University of Siena, Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente) - Schmid, Viola (Department Prehistory & WANA Archaeology; Austrian Archaeological Institute of the Academy of Sciences)

Session format: Regular session

This session is focused on microlithic productions, exploring possible reasons for this technological choice and highlighting potential differences between UP and pre-UP assemblages. The topics can cover different theoretical and methodological approaches, including use-wear, residue analyses, and chaîne opératoire approach.

Microlithic elements are a common and frequent trait in UP (Upper Palaeolithic) and early LSA (Later Stone Age) industries. However, the production of bladelets and other small tools is well-documented in industries preceding the first UP. They are also known in the MP (Middle Palaeolithic) mainly as the result of the extreme exhaustion of various reduction methods (e.g., Levallois, Discoid, and Laminar systems) or in the MSA (Middle Stone Age) as novel practice. Production of small tools has also been described for the LP (Lower Palaeolithic).

A universal explanation for the innovation or adoption of microlithic technologies does not exist. Microlitization can constitute an excellent solution as armatures for hunting or, in general, for composite tools, but their use as individual tool cannot be excluded. Among the microliths, bladelets occupy a central role. The spread of bladelets is considered, in fact, one of the markers of the emergence of the UP industries. However, their presence is not exclusively associated with the onset of UP and LSA industries. During the MP bladelet production is sparse, often debatable, and it is still unclear whether bladelets – or microblade – were intentionally produced.

Several questions remain unsolved. What is the specific role of microlithic technologies in pre-UP assemblages? What differences, if any, can be highlighted between the UP and pre-UP? Why is bladelet production in MP contexts extremely rare and found only in very small quantities? Can the anecdotal presence of microliths be related to specific functions or activities that occur much less frequently than others – thus, it is archeologically near-invisible?

ABSTRACTS

1 NEW DATA FROM UMHLATUZANA ROCK SHELTER (KWAZULU-NATAL) AND THE ONSET OF SYSTEMATIZED LITHIC MINIATURISATION IN SOUTHERN AFRICA

Abstract author(s): Schmid, Viola (Austrian Archaeological Institute, Austrian Academy of Sciences; Department of World Archaeology, Universiteit Leiden) - Sifogeorgaki, Irini (Department of World Archaeology, Universiteit Leiden) - Dusseldorp, Gerrit (Department of World Archaeology, Universiteit Leiden; University of Johannesburg)

Abstract format: Oral

The production of bladelets and miniaturized elements gleams as an innovative practice already in the southern African Middle Stone Age (MSA), however, the distinctive focus on microlithic technologies is associated with the appearance of the Later Stone Age (LSA). This phase distinguishes itself through drastic technological changes.

The site of Umhlatuzana Rock Shelter (UMH) comprises a long sequence including Howiesons Poort, late MSA, final MSA, and early LSA occupations. Although the site is known since the excavation in the 1985 directed by Jonathan Kaplan, the assumption of rotational slipping of the deposits led to doubts about the stratigraphic integrity. New excavations by Leiden University within the research project 'Finding resolution for the Middle to Later Stone Age transition in South Africa' demonstrated that the sequence was not compromised by large-scale sediment movement and is intact. Therefore, UMH constitutes an ideal case study to examine early expressions of systemized miniaturisation and cultural turnovers.

Herewith, we present technological and techno-economic data on the lithic assemblages from the new excavations at UMH following chaîne opératoire and petrographic approaches. We highlight that early LSA artisans had specific raw material selection patterns, incorporated a variety of reduction strategies involving different percussion techniques to produce bladelets and small elements, and relied very little on retouching their blanks. Our aim is to explore the trend towards and manifestation of microlithisation. By involving comparative data, we seek to reveal differences in the status of microlithic technologies and techno-cultural trajectories.

2 LITHIC MINIATURIZATION IN HIGHLAND HUNTER-GATHERERS: A LATE PLEISTOCENE (~30-11 KA CALBP) CASE STUDY AT SEHONGHONG ROCK SHELTER, LESOTHO

Abstract author(s): Pargeter, Justin (New York University; University of Johannesburg) - Mitchell, Peter (Oxford University)

Abstract format: Oral

Lithic miniaturization refers to the systematic production and use of small flakes and bladelets from small cores. Most archaeologists working in Africa associate lithic miniaturization with the Later Stone Age (LSA), especially those of the Robberg techno complex. A lack of comparative research, unified lithic recording systems, and sites with suitable assemblages have all hampered comparisons of Robberg lithic assemblages with earlier instances of lithic miniaturization during the Middle to Later Stone Age (MSA-LSA) transition. The paper presents the results of a study using attribute analyses to compare processes of lithic miniaturization at Sehonghong rock shelter across the MSA-LSA transition and Robberg. The study compares several main data classes across these assemblages including the evidence for blade production, bipolar technology, technological shifts and size changes, raw material selection, flaking efficiency, reduction intensity, and macroscopic evidence for use. Preliminary results show that raw material stress contributed little to ancient toolmakers' choices to miniaturize their toolkits. They selected bipolar reduction to produce short, narrow, and light flakes, to manage core reduction and rectify freehand reduction errors, to test nodules, and to immobilize freehand cores in a process known as 'anvil-assisted flaking.' Tool makers also appear to have selected freehand flakes more often than bipolar flakes for use and retouch. The presence of overlapping use traces on some worn flakes suggest small unretouched flakes are not as 'disposable' as commonly thought. Temporal trends suggest long-term continuity in many of the studies' key parameters with notable differences in flake and bladelet size and core maintenance strategies across the MSA-LSA and Robberg layers.

3 SMALL FLAKES DURING LATE LOWER PALAEOLITHIC AND THE ONSET OF THE MIDDLE PALAEOLITHIC: CASE STUDIES FROM SOUTHERN EUROPE AND LEVANT

Abstract author(s): Mathias, Cyrielle (Sonia and Marco Nadler Institute of Archaeology, Tel-Aviv University; UMR 7194 - Histoire Naturelle de l'Homme Préhistorique)

Abstract format: Oral

The presence of small flakes and small tools in the archaeological record has been identified in various geographical contexts before the Upper Palaeolithic, taking its roots early within Lower Palaeolithic Lithic Techno-Complexes (LTCs). In most cases for these earliest time periods, microlithic flakes/tools are represented in low proportions within lithic assemblages. However, this phenomenon can sometimes represent a techno-cultural feature, as shown in Central Europe or in the case of the Asinipodian defined by François Bordes in Southwestern France. More generally speaking, there is a diachronic tendency towards an increase in small flake productions during the Middle Palaeolithic. This augmentation is mainly due to the development of ramification processes (even if the correlation between Cores-on-Flakes and size reduction cannot always be established) and to the development of specific flake, point and even bladelet productions.

In this paper we will present the results of technological analysis of small tool productions in two different geographical areas: Southern Europe and the Levant. The timeframe represented corresponds to the transition between late Lower Palaeolithic and the onset of the Middle Palaeolithic, when we can observe important changes within lithic technical systems. The techno-cultural trajectories through the Middle Palaeolithic are different in these two contexts, with different chronologies and sometimes unique LTCs corresponding to regional traditions. We will present here the technical choices made by prehistoric populations and the role and significance of small productions within the lithic assemblages, following examples from various contexts (site types, mineral environment, mobility systems etc.). This will allow us to discuss the different options chosen and their causes.

4 MIDDLE PLEISTOCENE LIFEWAYS REVEALED THROUGH USE-WEAR AND RESIDUE ANALYSES OF MICROARTIFACTS FROM SCHÖNINGEN 13 II-3

Abstract author(s): Venditti, Flavia (Department of Early Prehistory and Quaternary Ecology, University of Tübingen) - Rodríguez-Álvarez, Bárbara - Serangeli, Jordi (University of Tübingen, Senckenberg Centre for Human Evolution and Palaeoecology) - Walter, Rudolf (Department of Early Prehistory and Quaternary Ecology, University of Tübingen) - Conard, Nicholas J. (Department of Early Prehistory and Quaternary Ecology, University of Tübingen; University of Tübingen, Senckenberg Centre for Human Evolution and Palaeoecology, ; Senckenberg Centre for Human Evolution and Palaeoecology, University of Tübingen)

Abstract format: Oral

Small and microartifacts represent an important component of lithic assemblages throughout the whole Paleolithic era. Although scholars are now aware of the importance of studying microartifacts in archaeology, their collection

is not always systematic and their analysis is not fully integrated into standard archaeological practice. Through this paper, we demonstrate the great potential of studying microartifacts for interpreting the lifeways, subsistence and tool use of Middle Pleistocene hominins.

We present a case study from the ca. 300,000-year-old locality of Schöningen 13 II-3 (northern Germany) where several dozen small and microartifacts (the great majority between 5 and 15 mm) were recovered in an area of ca. 64 m² in close association with an almost complete skeleton of an Eurasian straight-tusked elephant (*Palaeoloxodon antiquus*). We applied a holistic approach including morpho-technological analysis, experimental archeology, use-wear analysis and optical coupled with spectroscopic residue analyses for: 1) characterizing the flaking attributes on the knapped products; 2) determining the use of the microflakes; 3) testing the potential of microartifacts for reconstructing site function; 4) reconstructing technological and functional activities performed at the location of the elephant.

Our comprehensive techno-functional analysis shows that small and microflakes at Schö 13 II-3 are resharpening flakes. Several of them show traces of processing woody materials on their striking platforms, which correspond to the former working edges of tools. Microscopic residues compatible with vegetal tissues adhering on these platforms and sticking to the dorsal retouch scars corroborate this observation. Additionally, hominins used a sharp-edged, natural fragment of flint to process fresh animal tissues, which likely originates from butchering the elephant. These results provide evidence for curatorial behavior while documenting the production and/or maintenance of wooden tools. Moreover, they demonstrate the coexistence of curated and expedient technological behavior by the Schöningen hominins ca. 300,000 years ago.

5 WHY GOING SMALL? MICROLITHIC ADAPTATIONS TO MOBILITY, RAW MATERIAL AND FUNCTION IN THE IBERIAN PENINSULA. MIDDLE PALEOLITHIC

Abstract author(s): Rios-Garaizar, Joseba (Bizkaiko Arkeologi Museoa; Aranzadi Zientzia Elkartea) - Eixea, Alejo (Universitat de València, Departament de Prehistòria, Arqueologia i Història Antiga)

Abstract format: Oral

The production of small flakes is one of the characteristics of Iberian Middle Paleolithic. It has been documented in different chronologies, regions, and technocomplexes. However, there is not a univocal explanation for these small size flake productions. In the past we have tested different hypothesis (raw material constrains, tool exhaustion, mobility strategies, precision tooling) (Elston and Brantingham, 2002; Kuhn and Elston, 2002; Bourguignon et al., 2004; Dibble and McPherron, 2006; Mazza, 2006; Rios-Garaizar et al., 2015; Bilbao et al., 2019). while other authors have forwarded others that maybe are applicable to the Middle Paleolithic (as the standardization of production- Kuhn and Shimelmitz, 2022). We are going to review different scenarios of small flake production in the Cantabrian and Mediterranean regions of the Iberian Peninsula in order to: a) define what is small flake/blade production; b) assess if small production is present in every Middle Paleolithic assemblage; and c) understand the different roles of small flakes across different sites, chronologies and landscapes.

6 BLADELETS PRODUCTION ASSOCIATED WITH NEANDERTAL REMAINS DURING THE MIS 5 AT BAU DE L'AUBESIER (FRANCE)

Abstract author(s): Soressi, Marie - Carmignani, Leonardo (Leiden University)

Abstract format: Oral

If Middle Paleolithic blade production is now well-established, it is still unclear whether bladelets – or microlithic blade production – were intentionally produced during the Middle Paleolithic. Evidence suggesting Middle Paleolithic bladelet production is sparse, often debatable, and usually dated to MIS 3 and, less often, to MIS 4. We present the results of a detailed chaîne opératoire analysis applied to more than 100,000 lithic artifacts (including the microlithic elements collected through sieving) excavated in fourteen different layers at the Bau de l'Aubesier rock shelter in south-eastern France. The Bau de l'Aubesier contained several Neandertal and (pre) Neandertal remains. ESR, U-Th, and TL dates indicate that the oldest layers are at least 200,000 years old, while the top of the sequence (level 4) is ~110,000 years old. Bladelet production documented in level 4 is, to date, the earliest independent bladelet production in a sedimentary context radiometrically dated to MIS 5d and associated with Neandertal remains.

We suggest that new Middle Paleolithic bladelet productions will be discovered in the future and that a better understanding of their variability through time and space is a prerequisite to reconstructing the significance of these technologies some 50 to 200 ka before the proliferation of Upper Paleolithic blade and bladelet technologies.

Current knowledge does not help us clarify the lack of bladelet production during and prior to MIS 5 in Europe. Our study suggests the need to study, in detail, whole assemblages that have been recovered with sieving to recover the fine lithic fraction. Our study also highlights the need to standardize the terminology used to describe Mousterian bladelet production.

7 THE BOHUNICIAN ASSEMBLAGE FROM OŘECHOV IV (CZECH REPUBLIC) AND ONSET OF THE BLADELETS PRODUCTION

Abstract author(s): Bartík, Jaroslav - Škrdla, Petr (Institute of Archaeology of the CAS, Brno) - Nejman, Ladislav (School of Archaeology and Anthropology Banks Building, The Australian National University) - Demidenko, Yuri (Ferenc Rakoczi II Transcarpathian Hungarian College of Higher Education)

Abstract format: Oral

New evidence from the Moravian Bohunician site Ořechov IV demonstrates that the Initial Upper Palaeolithic (IUP) is more heterogeneous than previously thought. While Ořechov IV exhibits overarching technological similarities with key Bohunician sites, this assemblage contains several unprecedented elements. These include a significant bladelet element, miniaturization in the Levallois blanks and a new intensity of offquarry reduction. These differences are supplemented by differences in raw material composition, specifically an absence of exotic material, and high rates of artefact removal. It is tentatively suggested that these differences indicate the presence of diverse technological traditions and/or cultural groups in Moravia (Czech Republic) during the IUP.

8 MICROLITHISM IN THE ULUZZIAN: PRODUCTION AND USE

Abstract author(s): Marciani, Giulia - Arrighi, Simona (University of Bologna, Dipartimento di Beni Culturali; Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente, U. R. Preistoria e Antropologia, Università di Siena) - Rossini, Matteo - Ronchitelli, Annamaria (Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente, U. R. Preistoria e Antropologia, Università di Siena) - Colline, Carmine (Museo Civico Archeologico Biagio Greco) - Spinapolice, Enza (Università La Sapienza, Dipartimento di Scienze dell'Antichità) - Harvati, Katerina (University of Tübingen, Institute for Archaeological Sciences and Senckenberg Center for Human Evolution and Paleoenvironments; University of Tübingen, DFG Center for Advanced Studies 'Words, Bones, Genes, Tools') - Benazzi, Stefano (University of Bologna, Dipartimento di Beni Culturali) - Moroni, Adriana (Dipartimento di Scienze Fisiche, della Terra e dell'Ambiente, U. R. Preistoria e Antropologia, Università di Siena; Centro Studi sul Quaternario)

Abstract format: Oral

The Uluzzian is a techno-complex dated approximately from 45,000 to 40,000 years cal. BP, it has so far been identified in Italy and Greece, and it represents one of the first dispersals of *Homo sapiens* in Europe. The Uluzzian sites show a remarkable coherence as far as technological behaviour, presence of colouring substances, systematic use of bone tools and ornaments. It displays a sharp break from the partially coeval Mousterian techno-complex, both in technology/typology and subsistence strategy.

In this presentation we focus on the production and use of Uluzzian small tools: flakelets, bladelets and the hallmark of this technocomplex: the lunates, taking into consideration the evidence provided by some key caves in southern Italy: Grotta del Cavallo, Riparo Uluzzo C, Grotta di Castelcivita and Grotta di Rocca San Sebastiano.

Technologically, the Uluzzian aim is to produce bladelets and flakelets obtained by straightforward debitage, with the striking platform being made by a single or few removals, or by just a cortical platform, and the debitage surfaces being roughly managed. The knapping strategies are dominated by the use of the bipolar technique on anvil, which generates a low standardisation of the products.

This production brings considerable technical advantages and lower technical requirements. The technical advantages are related to the higher versatility in terms of initial supports, as well as the ease at obtaining bladelets and flakelets with sharp cutting edges and rectilinear profiles. These are all technical features that made these small products optimum components for composite instruments.

The lunates are curved-backed tools that characterised this technocomplex and are very abundant at Grotta del Cavallo, where their role as parts of composite projectile weapons was tested through a combination of usewear, residue analysis and experimental ballistic tests.

LITHIC ONTOLOGIES: RETHINKING THE MEANING OF KNAPPED LITHIC ARTEFACTS IN PALAEOOLITHIC AND MESOLITHIC EUROPE [PAM]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Little, Aimée (University of York; YEAR Centre) - Conneller, Chantal (Newcastle University) - Nyland, Astrid (Universitetet i Stavanger)

Session format: Regular session

Lithics, thanks to preservation bias, are the most commonly occurring artefacts on prehistoric sites and are regarded as essential technology in human (pre)history. From fire-making to hide-working, knapped lithic artefacts have played a fundamental part in everyday human life for millions of years. Studies of lithics have historically focussed on geological variation, typologies, mechanical functionality, and related spatial questions concerning intra- and inter-site variation. In the last four decades, the social dimensions of lithics have been recognised and articulated in various ways; perhaps most successfully through studies of technological chaîne opératoire and artefact biographies. Ethno-historical accounts reveal that even stone caught up in mundane tasks reveals different configurations of the world: tracing the interactions between people and stone reveals ways places and materials were understood and expressed. With the latter in mind, how do we move beyond reductive functional accounts and explore the social agency of lithics (as has been proposed for plants, humans, and animals)? In this session we welcome contributions that explore new ontological frameworks for knapped lithic artefacts, acknowledging their role as active participants, capable of extending and transforming bodies, and on occasion, interacting as gendered, sentient beings.

ABSTRACTS

1 THE ANIMAL IN THE STONE: PALEOLITHIC ONTOLOGIES AND STONE-TOOL TECHNOLOGIES

Abstract author(s): Barkai, Ran (Tel-Aviv University)

Abstract format: Oral

Significant cultural and biological transformations took shape in the course of the long Palaeolithic epoch and the relevant human adaptation strategies in the Old World. Within this framework, cycles of changes in lithic technologies are evident, however the question why these changes, innovations and developments took place remains unanswered. Stone tools are mostly regarded as extra-somatic means of adaptation, as solely functional objects in the service of humanity. I will argue that Palaeolithic stone tools were also conceived as mediators between humans and the animals they were dependent upon, and thus had a major role in the ontology and cosmology that guided human behaviour in the Palaeolithic. In this talk I will put an emphasis on the lithic-fauna nexus, in an attempt to correlate between faunal turnovers/transformations and possible related technological preferences. I will focus on the dependency of Palaeolithic human groups on large game and the significant relations between hunters and their prey, suggesting that human interactions with animals and stones were not only practical and economic, but based on ontological and cosmological conceptions. Thus, changes in the availability of major game animals might have necessitate a significant modification in human mode of adaptation, which is not only practically oriented. This talk will attempt at presenting a new model for reconstructing changes in human adaptation during Palaeolithic times with a focus on the reasoning behind transformations in stone-tool technologies.

2 THE STONE, THE DEER, AND THE MOUNTAIN: LOWER PALAEOOLITHIC SCRAPER TECHNOLOGIES AND EARLY HUMAN PERCEPTION OF THE ENVIRONMENT

Abstract author(s): Litov, Vlad - Barkai, Ran (Department of Archaeology and Near Eastern Cultures, Tel Aviv University)

Abstract format: Oral

Stone tools were essential for successful adaptation of Palaeolithic humans, leading to their embeddness in an array of practical, cosmological, and ontological conceptions. The archaeological record of the Lower Palaeolithic period in the Levant demonstrates that early humans were familiar with the landscape but were also highly depended on acquisition of prey animals to sustain their dietary needs. Patterns of continuity and change in stone scrapers, tools commonly associated with intensive processing of animal remains, might indicate technological adaptations related to shifting hunting practices or faunal fluctuations. An evident innovation in scraper technology emerged in the Late Lower Palaeolithic Levant, with the introduction of scrapers shaped by Quina retouch. Our investigations at the sites of Jaljulia and Qesem Cave show that Quina scrapers were often made of flint originating from the Samaritan highlands to the east of the sites, while most of the other flint tools were made from locally available flint. The home range of fallow deer, an ungulate frequently hunted by Lower Palaeolithic humans, includes the Samaritan highlands throughout the Pleistocene until biblical times. We suggest a possible nexus between fallow deer hunting grounds and the place of or-

igin of the stones used to produce Quina scrapers, presumably the tools used for processing fallow deer. The growing significance of fallow deer in human diet following the disappearance of megafauna made scrapers key tools in human existence. Consequently, the Samarian highlands and the mountains of Gerizim and Ebal, noticeable landscape nodes bearing both the essential ungulates and the stone selected for scraper production, gained supreme importance in the eyes of Late Lower Palaeolithic humans. We will present archaeological and ethnographic evidence in support of our claims, shedding light of the nexus between humans, animals, stones, and the environment.

3 LITHIC TALES OF BROKEN BONDS AND DEVASTATION IN MESOLITHIC WESTERN NORWAY?

Abstract author(s): Nyland, Astrid (Museum of Archaeology, University of Stavanger) - Damlien, Hege (Museum of Cultural History, University of Oslo)

Abstract format: Oral

Objects can have agency or charisma, and to maintain traditions of lithic production can be a social strategy linking ones' group affinity to an ancestral or social origin. Hence, lithics take an active role in remembrance, connecting people with their past, other groups, hence, reflecting ideas of people's place in the world. In our talk, we ask what happens if an external force challenges this role and the possibilities of continuing an established lithic tradition. Can lithics tell tales of broken social connections, or of established strategies for societal safety?

As part of the project 'Life after the Storegga Tsunami' (LAST), lithics from 27 sites, dating 7500-5500 BC, from the coast of Western Norway are analysed. We focus on blade production concepts, classifying attributes such as core preparation, blade curvature, platform angles or degree of cortex, on a large scale. The data supports our explorations of whether disturbances to social situations are reflected in knowledge transmission in production concepts. Here the 'disturbance' is a known large-scale tsunami hitting the the West Norwegian coast 8200 years ago.

We are comparing identified spatial and temporal expressions of lithics over time and space, discussing what identified continuity and change can represent. We cannot be certain that the tsunami encounter led to changes in lithic production, yet at one point, identified changes in production indicate a specific lithic concept or tradition stopped serving the community. Something did change. We thus return to what lithics are saying and how they take part or affect society. The question is no longer whether lithics talk, but what stories they tell about their extended role in human societies.

4 EXPLORING THE SYMBOLIC MEANING OF THE FLINT FIGURINES OF KHARAYSIN (EARLY NEOLITHIC, JORDAN): MORPHOLOGICAL ANALYSIS AND CONTEXT OF DEPOSITION

Abstract author(s): Ibáñez, Juan (Spanish National Research Council - CSIC) - Huet, Thomas (University of Oxford) - Muñoz, Juan (Pontifical Faculty of San Esteban in Salamanca) - Santana, Jonathan (University of Las Palmas de Gran Canaria) - Tapia, Jesús (Sociedad de Ciencias Aranzadi) - Teira, Luis (IIIPC-University of Cantabria)

Abstract format: Oral

Kharaysin is an Early Neolithic (PPNA and PPNB) site located in the Jordan Highlands (Zarqa). During the excavation of the funerary areas dated at the Middle PPNB period (circa 7,800 cal BC) some flint bladelets and flakes showing two pairs of notches were discovered. The double-notched bladelets and flakes did not show use-wear traces and were spatially associated to a funerary area. These objects, interpreted as human depictions, were published in Antiquity (Ibáñez et al., 2020). In this oral presentation we show 30 more possible figurines that were found in the 2021 and 2020 fieldwork seasons. The morphology of the objects is analysed, suggesting that the figurines represent both women and men. The location of the figurines is clearly associated with the primary and secondary burial contexts. Most probably, the figurines were used during funerary rituals, what stress the relevance of beliefs relating living and death individuals during the origins of the Neolithic in SW Asia.

5 STONE TOOLS AS SENTIENT BEINGS? NEW INSIGHTS INTO THE DIVERSE ROLES OF LITHICS IN MESOLITHIC MORTUARY CONTEXTS

Abstract author(s): Little, Aimée (University of York)

Abstract format: Oral

This paper proposes the question – is it possible that some lithics in Mesolithic graves represent sentient beings? Stone Dead, an AHRC-funded project has been gathering life history data (geology, technology, use-wear traces, depositional context etc) on lithic tools and their role in Mesolithic mortuary rites and rituals. Rather than being passive “accidental inclusions” or “personal toolkits” as is often proposed, their role appears to be far more complex, with wear traces on some lithic artefacts revealing information about their use in the funerary rites. Diverse treatments, including their employment in the mortuary rites, acts of destruction and special deposition, hint at deeper meanings: revealing the social agency of lithics placed with the dead. In some instances, parallels between the treatment of stone and human body forms within funeral contexts can be seen. Whilst the regular occurrence of unused/commissioned

single blade forms, and the placement of un-retouched blades and stone axes with non-tool users (infants, dogs), opens a discussion on what these objects might represent within the funerary sphere.

6 SLEEPING CREATURES: UNDERSTANDING PERCEPTIONS OF FOSSILS IN KNAPPED STONE

Abstract author(s): Conneller, Chantal (Newcastle University)

Abstract format: Oral

Sources of knappable stone, such as flint, often contain fossils. From the Lower Palaeolithic onwards stone tools and their chaînes opératoires provide evidence for people's engagement with fossils, usually of marine organisms such as echinoids, ammonites and bivalves. For people familiar with beaches and coasts, these fossils may have been conceived as familiar forms in unfamiliar materials; for other peoples these forms may have had more varied interpretations. This contribution will explore early prehistoric people's engagement with fossils, as found objects, and as inclusions in stone tools and knapping debris, drawing on early prehistoric evidence, in particular from the Upper Palaeolithic and Mesolithic of western Europe, I will investigate how interactions between people and fossils may have been bound up with ideas about the agency of materials. I will argue that through tracing technological interactions involving people, flint and fossils, we can understand how broader understandings of the world were generated.

523 IMMERSIVE TECHNIQUES AS TOOLS FOR PUBLIC OUTREACH IN ARCHAEOLOGY

Session theme: 3. Heritage Narratives and Representations

Session organisers: Lucey, Donal (Arcadis) - Schenck, Tine (ArchaeologistsEngage) - Krogsrud, Linn (Viken county administration)

Session format: Regular session

Archaeological public outreach has for a long time seen the need for a move away from traditional glass-case exhibits. Museums are suffering from declining visitor numbers and media such as movies and documentaries have increasingly taken over as a primary public source of information about archaeological pasts. The general public often wants to be more involved, to experience something rather than just see it. However, these experiences are increasingly produced by agents outside of the archaeological discipline. The draw of Viking markets, fictional novel series, or epic movies can perhaps be said to lie in the experience itself, of the feeling of being absorbed into another world.

As such, the success of many of these media lies in the application of immersive techniques to draw their audience in. Immersion, the subjective impression of participation in a comprehensive, realistic experience, is what spurs people to watch 'Rome', read historical fiction, engage in historical reenactment, use Augmented Reality or play 'Assassin's Creed'. A key feature of immersion is suspension of disbelief, which can make people experience these worlds on an emotional level, as if they were real. However, a significant problem with many immersive media is their lack of connection to the archaeological discourse and expertise, and the result is often biased, sensationalist, euro-/androcenic, or wholly inaccurate, and only reaches privileged groups. This session seeks to explore what it is about immersive techniques that works, its pitfalls, and how we can apply immersion firsthand as a tool in public outreach.

We invite speakers to discuss all aspects of immersion, both successful and unsuccessful attempts, as well as aims, ethics and problems with using immersion in archaeological outreach. We want to promote discussion of the role immersion should play in archaeological outreach going forward, and how archaeologists can influence immersive experiences.

ABSTRACTS

1 FULL POTENTIAL OF RE-ENACTMENT AND LIVING HISTORY? WHAT TO EXPECT FROM AND HOW TO WORK WITH VOLUNTEER HISTORY ENTHUSIASTS

Abstract author(s): Lenár, Vilmos (Eötvös Loránd University)

Abstract format: Oral

In recent years there has been a new wave in Hungary for interweaving experimental archaeology and a small segment of re-enactors and living historians, we could call „professionals“. They are professionals because the methodology they are working with is close to, or driven by a scientific approach. Presenting their results to the public both in and out of institutional contexts has a varying history in terms of public outreach and incorporating it within academic discussion. While there has been a lot of improvement in this relationship in Hungary, there is still an enormous room for more. However, for this the academic field should learn how can they use re-enactors to their full potential, while helping the „professional“ reenactors and living historians to improve in the field they put a lot of work into already by pure enthusiasm. With this there is also a need to understand what the guidelines are for the re-enactors and what is the best methodology to follow. And maybe the hardest part, how can institutions motivate the re-enactor commu-

nity to drive towards these professional guidelines. With archaeology getting closer to being hyperfocused, presenting these kind of results to public is more important than before. With this, „professional“ reenactment and living history can be the way forward, as it can provide accessible interactivity for the public. However, these fields need guidance, and not just from people who are part of both academic and the re-enactment or living history circles. But these people can, and more than ever should, communicate and help both fields to understand each other. The author of the paper tries this by using both the personal experience of 14 years as an active Roman military re-enactor and Hungarian examples from recent years.

2 ARCHAEOLOGY AND ROLEPLAYING GAMES

Abstract author(s): Sanders, Jeff (Society of Antiquaries of Scotland) - Tyrrell, Brian (Stout Stoa Press) - Simonen, Elizabeth (Writer) - Christie, Heather (ArchaeoPlays) - Beale, Gareth (University of Glasgow)

Abstract format: Oral

Can we combine the immersive group storytelling of roleplaying games with archaeological research? Can we do this in a way that is accessible, avoids stereotypes, and provides the opportunity for active involvement, rather than passive consumption, of the stories of the past? This is what we (a game designer, writer and three archaeologists) set out together to explore. This talk will chart the process of creating Carved in Stone, a setting guide for roleplaying games set in 7th century AD Pictish Scotland, from inception towards completion.

The work of creating a setting guide for roleplaying games, from initial research through to final design, has thrown into stark relief how archaeologists structure, communicate and disseminate information. Drawing on the experience of each of the team, we'll explore some of the challenges and opportunities that a role-play game provides to empower others to build an immersive experience drawing on rich archaeological information.

3 CARPE DIAMONDS! CRAFTING ROMAN BRISTOL AND THE USE OF MINECRAFT AS AN EDUCATIONAL TOOL

Abstract author(s): Lucey, Donal - Woodcock, Dean (Arcadis)

Abstract format: Oral

Minecraft is a video game which has been often used to recreate historic sites and buildings, whether by individuals playing in their leisure time or by institutions as part of teaching or outreach. However, its potential for recreating the past at a landscape level and for teaching people about how their local community looked in the past has barely been tapped. However, some excellent projects such as VALUE Foundation's "RoMinecraft" and Dig It Scotland's "Crafting the Past" have made great use of this aspect of Minecraft.

Crafting Roman Bristol is an ongoing volunteer project that aims to recreate a c. 20 square kilometre part of the Bristol region in Minecraft as it may have appeared during the Late Roman period c. 350 AD. This presentation will outline the desired teaching and outreach outcomes of the project and discuss the pros and cons of the software and methods being used. It will also explore how these methods can be shared to enable others to undertake similar projects, and present questions and issues raised by the project such as the balance to be sought between accuracy, guesswork and the need to create engaging experiences. Furthermore, we will outline the methods by which the project output will be used for outreach and potential avenues for improvement on similar projects in the future, touching upon the uses of Minecraft as an archaeological research tool and a format for public engagement that can be easily updated to accommodate new discoveries.

4 LOST DREAMS AND HIGH HOPES. CRAFTING AN IMMERSIVE HERITAGE STORY THROUGH A VIDEO GAME MEDIUM

Abstract author(s): Schenck, Tine (We are Human; ArchaeologistsEngage) - Dall, Jonas - Mennecart, Quentin - Merchak, Stéphanie - Fjellström, Markus (We are Human)

Abstract format: Oral

Video games have long had a huge draw on people worldwide, and the gaming market has now bypassed the movie market in terms of profit. Game experiences are no longer just had in teenage bedrooms, but reach players of all ages, genders and continents, on a variety of platforms.

This explosion of gaming interest has led to an increasing amount of independent game developers competing with traditional AAA actors such as Nintendo, Ubisoft and EA games. The indie market holds a large potential for creative new ventures, and is for a large part driven by ideals, art and social commentary more than profit. It is within this space we decided to make a game about cultural heritage.

We are Human game studio started working on a cultural heritage idea in 2019. This talk will walk you through the process of making a game from scratch from the code up, all the while not sacrificing neither content, style, graphics,

audiences or ethics to do so. We will discuss how the process has taken us through the early identification of theme and tone, ideas that stuck and ideas that didn't, task division, new beginnings and how to not give up when things are making slow progress. We'll talk about the crafting the story through gameplay and relationships, and how to tell a real story through the medium of a fictional one.

Lastly, this talk will discuss how we work to steer clear of colonialism in our representation of (analogous) cultural heritage, and how to tell a story of living cultures from an outsider point of view; a position that is in dire need of reflection when telling a story of a culture not your own.

5 REVERSING PRIORITIES FOR IMMERSIVE VIRTUAL REALITY RESEARCH AND EDUCATION IN ARCHAEOLOGY

Abstract author(s): Zubrow, Ezra - Bible, J. (University at Buffalo) - Lindstrom, Torill (University at Bergen)

Abstract format: Oral

The state of the field of immersive technologies for research, instruction and gaming has advanced significantly during recent years. This advancement is attributed to several factors including advances in compute capacity/speed, video graphics displays, switch network technologies, end-user simulation software and devices. However, most of the development has been driven by market uses rather than research or educational priorities.

This paper considers the reverse. What happens if one prioritizes research and educational uses above market uses. New priorities become critical. What archaeological research questions can be answered with immersive virtual reality? Questions about prehistoric perception, decision making, and memory to name a few. For example, neuroscience shows that body and mind representation are flexible and work well in immersive virtual reality. Because virtual reality is programmed, the form of the virtual body can be quite different from the participant's body -similarly for the environment. These differences and their impacts are measurable. Thus, one may use virtual immersion to explore the differential perceptual and cultural worlds of earlier hominids in comparison to modern humans.

What are some important archaeological educational uses of immersive virtual reality? They include understanding the diversity and similarities of past cultures; understanding the structure and transformation of societies and cultures over time; analyzing the impact of cultural contacts; integrating biological limitations on human behaviour, social organization, and the environment; and showing how these phenomena help understand modern societies.

The University at Buffalo and the University of Bergen have been active in integrating these technologies providing research and educational programs across their respective institutions for the last several years. They are constructing state-of-the-art immersive research and educational complexes that are described.

6 UIST UNEARTHED: CHALLENGES AND OPPORTUNITIES FOR CREATING IMMERSIVE DIGITAL EXPERIENCES AT HIDDEN ARCHAEOLOGICAL SITES

Abstract author(s): Gal, Emily - Rennell, Rebecca (University of the Highlands and Islands; UHI Archaeology Institute)

Abstract format: Oral

Uist, in the Outer Hebrides of Scotland, boasts internationally significant archaeological sites, exceptional preservation of remains, and diverse archaeological landscapes. Nevertheless, there are few upstanding remains, fewer still with any form of on-site interpretation and limited material in local museums. This is challenging for communities and visitors wishing to engage in more meaningful, immersive experiences at Uist's archaeological sites. To address these challenges, the award-winning Uist Virtual Archaeology Project has employed 3D digital visualisation techniques to reveal Uist's archaeological sites. Central to the project is a mobile app, Uist Unearthed. Using Augmented Reality (AR), Uist Unearthed reimagines five archaeological sites through interactive and lifesize AR reconstructions. The reconstructions are location triggered, with each one aligned at the site's original location to champion place-based interpretation.

The project is created and delivered by archaeologists at UHI Outer Hebrides with the house reconstructions and content therein informed by excavation data and consultation with the original excavators, ensuring that authentic archaeological data and stories are at the forefront of these experiences. Alongside AR, the project has experimented with a variety of multimedia approaches offering different levels of immersion – from animations, audio and 3D printed artefacts to Virtual Reality experiences. In this paper we reflect on the successes and challenges of using AR, VR and other creative media as public engagement tools, the value of 'authenticity', and balancing this with positive user experiences.

7 360 RECORDINGS OF ROCK ART - WHY AND FOR WHOM?

Abstract author(s): Vestrum Kirkhus, Lene (NTNU University Museum, Department of Archeology and Cultural History) - Stebergløkken, Heidrun (NTNU Department of Historical and Classical Studies)

Abstract format: Oral

People want new experiences, and at the same time we need new approaches showing rock art to the public. In Central Norway a lot of the rock art are not that visible in flat light, due to weathering among others. A lot of the rock art is only visible after dark with artificial lighting, how can we show the rock art for tourists during the summer when it barely gets dark? We want to present a pilot project from NTNU University Museum funded by The Directorate for Cultural Heritage, the Conservation program of rock art. This project also collaborates with the Department of Historical and Classical Studies and the archaeology program at NTNU. Student employees in collaboration with education staff and the project manager of the Conservation program at NTNU University Museum, are making 360 recordings which is annotated with information, tracings, scans etc. These objects can be experienced with low budget cardboard/desktop VR, which gives the public a possibility to visit the site digitally with a full 360 panorama of the rock art site. The archaeology program also collaborates with VR Learn (<https://www.ntnu.no/geografi/vr-learn>) and EMERGE (<https://www.ntnu.edu/sosant/emerge>), which also helps to implement this technology as one of the tools for education and dissemination for students and educators. In this way the students get experience in producing 360 recordings within a pedagogical frame, and experience with dissemination tools that is work related. The archaeology program gets 360 material that could be used and built on further by other students, og the University Museum will receive 360 recordings that could be used to give the public new ways of experience rock art in noninvasive ways that does not threat the fragile rock art.

8 IMMERSIVE TECHNIQUES IN THE UKRAINIAN HISTORICAL AND CULTURAL RESERVES. POSITIVE AND NEGATIVE EXPERIENCES

Abstract author(s): Ivantsiv, Yarema - Ivantsiv, Mariia (NGO)

Abstract format: Oral

Ukrainian experience of using immersive techniques on the example of open-air museums and the goal of the initiative SUN (Support Ukraine Network).

The times require urgent solutions and new approaches to the presentation of artifacts, research and interaction with the public, especially children and young people. Ukrainian museums and culture-history reserves also faced the need for reforms and began to look for solutions.

Important issue for us is the fight against myth-making and imposed stereotypes. The coverage of some historical periods in Ukraine is distorted and requires new research, presentation and the creation of a new image in public consciousness. The immersion method, digitization and of course media can best deal with this. But without a scientific basis, the results will not be high-quality, long-lasting, and in our case, will not provide a solid basis for the reconstruction of Ukraine. We are sure of this because we see from the experience of Ukraine that where the historical truth was hushed up or presented in a distorted format, there was a place for manipulation.

In the past years, we have successful examples of digitization in reserves, the creation of a number of 3D models of hillforts, augmented reality and the creation of a computer game based on a real monument, the completion of which was stopped by the war.

Together with our colleagues, from EXARC organization and Dr Aimee Little (York Experimental Archaeological Research, UK) we created SUN (Support Ukraine Network) - a support program for Ukrainians historical reserves, strengthening and promoting the development of experimental archeology in Ukraine.

9 ENGLAND TO EGYPT IN FIVE DAYS: THE UNTOLD STORY OF HARRY YATES

Abstract author(s): Tappenden, Catherine - Fraser, Adam (Arcadis)

Abstract format: Oral

Following the completion of providing masterplanning for Otterpool Park, the Cultural Heritage team at Arcadis found an opportunity for added enhancement and community engagement. The untold story of a record-breaking flight beginning in Lymppe, Kent and finishing in Cairo, Egypt, a young Canadian RAF pilot, Harry Yates and his crew crossed the dangerous terrain of Europe, the Mediterranean and North Africa as they hopped across land and sea on their way to Egypt facing trials and tribulations every step of the way. The climax of the story involved rescuing Lawrence of Arabia from being stranded on Crete. The reconstruction of this incredible journey has been made possible by funding provided by Arcadis Local Sparks to use various digital resources, without which the crucial elements of this journey would have been lost to history. Importantly, this project has contributed to placemaking for the existing local community and provides a story of interest for newcomers to the planned town.

The deployment of different technologies for this project has been vast, such resources included digitally archived dairy entries, a vital resource following the absence of the original records in following the first-hand account of the journey but its passengers. In conjunction with diary entries, historic photographs and film reels from archives and museums have enabled us to piece together the route with the aid of georeferencing within GIS software to find a lost aerodrome on the route. As well as previously recorded digital resources, we were able to capture our own digital resources using 3D cameras, creating as immersive experience as possible for our online resource of the only reconstruction of the Handley Page 0/400, the remarkable plane which made this journey.

10 “TRACES OF TRADITION”: A LOW-KEY IMMERSIVE EXHIBITION ABOUT TRADITIONAL CARPENTRY

Abstract author(s): Krogsrud, Linn (Viken county administration)

Abstract format: Oral

Buskerud heritage centre communicates traditional building techniques to craftspeople, homeowners and the public. The centre is located at an open-air museum in a historic mining town.

In 2019 the centre collaborated with the company Tidvis to create an exhibition. The two employees, a carpenter and an advisor, collaborated with Tidvis' historians, graphic designers and developers.

One part of the exhibit is a physical display centered on seven young carpenters from the late 17th c. onwards, with recreated toolboxes and biographies. Artefacts can be taken from the displays and taken to an RFID-reader – a projector then shows videos and pictures. The display does not take up floor space, and the exhibition can be combined with experimental heritage; demonstrating planing and other woodworking techniques.

Because of covid, few visitors could see the exhibition when it was opened in 2020. 2023 will be the first year that the exhibition will be shown to the public.

The other part of the exhibition is online and open to the public at www.sporavtradisjon.no. The tools and toolboxes from the display have been subjected to photogrammetry and can be viewed in 3D. All 3D-models are open source and can be viewed by people all around the world at www.sketchfab.com.

Included in the exhibit is a 360-video (with VR) of the old buildings in the museum – visitors can look at buildings from different time periods, and jump between different construction methods and architectural styles to get immersed into the time when the different carpenters lived.

The presentation will tackle the following questions:

- Is the exhibition a successful method to communicate traditional building techniques?
- Are the chosen aspects, biographies, tools and architectural history sufficient for people to gain knowledge?
- Is it engaging for everyone, or for certain groups?

11 IMMERSION THROUGH INTERACTION UNDER ABSTRACT CONDITIONS

Abstract author(s): Toulouse, Catherine (Lengyel Toulouse Architects) - Lengyel, Dominik (BTU University of Technology Cottbus-Senftenberg)

Abstract format: Oral

Immersion also works on an emotional level when suspense and sensationalism do not predominate, but when there are things to discover instead. The secret of success is the interaction aimed at solving problems, even if it is to discover a new world. When installing an interactive immersive application, the authors anticipated that the visitor would not only be interested in the exhibits and their exploration, but also in the process of creation as an experiment. The idea arose from the scientific necessity of making it possible to experience the hypothetical basis of a typology numbering several hundred individuals. Immersion revealed itself to be a suitable method for experiencing the hypothetical design process on a model scale - because virtual space has a concrete scale - in order to immerse oneself in the architecture, additionally, to try out alternative design features. What the architect's dream achieves a learning process in the humanities that builds on both experimentation and emotion. The hypothetical character of the scientific hypothesis also addresses the dilemma of inaccuracy, since the representation can reproduce it unambiguously. Both the origin of the hypothesis and its interactive experience connect the immersive experience with the archaeological discourse. The installation stood in the context of a film, photographs and a wooden model and was thus able to draw the visitors into its spell before they even entered. As key feature compared to conventional immersive installations, the authors see the implementation of different scales, as traditionally used in architecture, but not separated from each other, but with each other in a fluent alliance. The paper will present this example of a hypothetical ideal church for about 300 parish churches, a permanent installation in the Martin von Wagner Museum in the Würzburg Residence, and explain its goals and problems in public outreach.

VARCHI NEL TEMPO / DEEP IN TIME, BETWEEN ARCHAEOLOGY AND 3D STREET ART

Abstract author(s): Pelillo, Alessia - Zanasi, Cristiana (Museo Civico di Modena)

Abstract format: Oral

The presentation is a report of an unusual and effective museum's experience where 3D art street becomes an immersive tool to make the public aware about the buried reality of the Roman city.

The Roman colony of Mutina is preserved beneath the streets in the historic centre of Modena due to the Late Antiquity deposits of the flood.

In 2017, during the celebrations linked to the Roman foundation of the city, the Civic Museum of Modena choose new languages to make the buried reality of Mutina known, combining the past with the contemporary, organizing an event of extraordinary impact on the public.

A particular urban art is perfectly suited to bring to life a buried reality such as the one that Modena preserves: the '3D street art' based on the 16th-century technique of anamorphism, known to artists such as Leonardo da Vinci, is in fact capable of deceiving the viewer by giving the illusion of sinking into the ground.

The project was proposed to the best known international artists exponents of this technique, who enthusiastically welcomed the opportunity to combine their art with archaeology for the first time.

The presence of the works in the very places of the archaeological findings involved people of all ages, intrigued by the openings that gradually revealed aspects of Mutina, and added value to the visibility of Modena, conveyed online thanks to thousands of views.

Facing long queues to locate the exact spot from which to admire the three-dimensional effect, amplified by the optical instruments made available by the artists, or obtaining it with smartphones, discovering that one can interact with the work becoming part of it generated a surprising short circuit between archaeology, art and social media, and the participation of an audience not only local, but also from outside the region.

PERFORMING GLENCOE – CREATING IMMERSIVE SOUNDSCAPES IN HIGHLAND LANDSCAPES

Abstract author(s): Robertson, Elizabeth (University of Glasgow)

Abstract format: Oral

Glencoe as a landscape has often been subject to notions of romantic sublimity. These narratives of an empty, rugged, wilderness mask the archaeological realities of this landscape which was busy with the activity of human and non-human actors and supported a rich tradition of Gaelic language and culture.

Building on areas of digital immersive design, sound design and sensory archaeology studies, in this paper I will present some of the methodologies/creative practice I have developed as a digital archaeologist working with immersive techniques for public engagement. Using immersive, interactive soundscapes, my research explores creating new forms of interaction with Scottish Highland landscapes through their archaeological, historical and geographical dimensions.

Creative and innovative approaches to immersive experiences and game design show exciting potential for the way we can engage people with archaeology and heritage. My research has taken inspiration from work that uses elements of performance to create experiences that explore heritage spaces and play outside of the traditional boundaries of AR, VR and XR.

By engaging with a range of materials, from field recordings, oral history archives, excavation data, and my own creative responses, an archaeologically informed narrative can be created and performed back into the landscape as a means of creating immersive experiences of place. In this paper I will discuss some of the immersive experiences I've been designing – a headphone-based experience about a 17th century township, an interactive sound installation based around a shieling cluster and an interactive radio experience around the ruins of a 19th century cottage. Responding to place and addressing aspects of the nature of immersion, these contemporary digital interventions promote more nuanced interpretations of highland life that, as mentioned above, have often been subject to romantic stereotypes and a memorialised past.

NEW NARRATIVES IN INDUSTRIAL HERITAGE: EXPLORING ALTERNATIVE APPROACHES TO THE INDUSTRIAL PAST

Session theme: 3. Heritage Narratives and Representations

Session organisers: Spiwak, Alexa (University of Oslo) - Äikäs, Tiina (University of Oulu)

Session format: Regular session

Industry as a subject of archaeology and heritage studies has far-reaching connections beyond technological or socioeconomic considerations, extending to many facets of human and non-human life; these can include landscape

impacts, language, culture, memory, and present-day use of space. Ruins have long enflamed romantic imaginations, spurring a variety of artistic approaches to historical and contemporary ruins. These artistic endeavours are sometimes regarded as “ruin porn”, accused of lacking in consideration for the ethical and societal impacts that led to a site’s ruinous state. In the contemporary post-industrial world, we live among abandoned and dilapidated industrial spaces, making the myriad encounters we have with the industrial past impossible to avoid. Nevertheless, authorized discourse surrounding industrial heritage and industrial archaeology remains rather stagnant and bound to the traditions of the late 20th century, signalling a potential need for novel forms of engagement to help further the field.

In this session, we search for new ways to interpret and contextualize industrial heritage. This session welcomes alternative or artistic approaches to the study of the industrial past that may fall outside of the traditional definitions of industrial heritage and industrial archaeology. This can include, but is not limited to, papers on unauthorized engagements with the past, official and unofficial industrial heritage sites, studies of abandonment and abandoned industrial estates, ethnographies of industry, considerations of industrinatur, and human and non-human entanglements. Posters, art exhibitions, films or other formats are welcome; we ask that applicants indicate the format or medium of their choice when submitting an abstract.

ABSTRACTS

1 CREATING PAUSE: HERITAGE PLACEMAKING IN NORTHWEST WALES

Abstract author(s): Spiwak, Alexa (University of Oslo)

Abstract format: Oral

As an introduction to the session, this presentation explores the concept of heritage placemaking through art in the context of Northwest Wales’ extensive slate quarries. The late geographer Yi-Fu Tuan wrote that “... if we think of space as that which allows movement, then place is pause; each pause in movement makes it possible for location to be transformed into place” (1977: 6). This paper therefore explores various artistic endeavours, undertaken by a diverse range of people, which introduce meaningful pause in the post-industrial landscapes of Northwest Wales, including graffiti, photography and the curation of artifacts and other tangible experiences. Some artistic projects are deliberately designed to commemorate workers or “reanimate” the industrial past (Orange 2021), while others are unintentional but nonetheless impactful contributions to the landscape’s palimpsest of memories. I argue that such activities - although sometimes controversial - are representative of a process of heritage placemaking which is often independent of authorized heritage discourse.

2 RUINED PLACE IN THREE ACTS: THE COMPLICATED INDUSTRIAL HISTORY OF TRACY CITY, TENNESSEE

Abstract author(s): Westmont, V. Camille (University of Cambridge)

Abstract format: Oral

Tracy City, Tennessee, is a post-industrial community of some 1,500 people south of Nashville, Tennessee, USA. Coal was mined from the hills surrounding the community for nearly a century from the mid-1800s to the early-1900s. Historical memory and heritage tourism focus on the town between ca. 1880 and 1920 when the second largest coal producer in the USA was headquartered there. These narratives effectively collapse the 100+ years that have passed since the town’s industrial peak, ignore the industry’s use of forced labor, and erase the clear causation between the industry’s abandonment of the community and the community’s extensive modern social issues. This paper presents the history of this small American town as a series of ruinations. Framing industrial heritage as a set of overlapping and intertwining forms of environmental, social, and economic ruins helps center the persisting community’s current struggles while providing a critique of the glorification of industrial “progress”.

3 IMMERSING IN ARTISTIC EXPERIENCES IN FORMER INDUSTRIAL SPACES

Abstract author(s): Juola, Marjo (University of Oulu)

Abstract format: Oral

Interpreting and contextualizing industrial heritage through art can give former industrial spaces a new life, new ways to interpret culture and at the same time keep the history of the place alive. With an experiential approach I take a closer look at two artistic performances in former industrial spaces in Oulu, Finland. One of these performances takes the audience to an immersive journey by using dance/air acrobatic elements in a show ‘Depot’ at former city depot, and in the other a sound art collective uses the old pulp mill factory as an instrument. What these immersive performances can bring to these spaces? Art can change perception of the places and make them alive for those who encounter these places for the first time. By using former industrial places for artistic performance audience will get familiar with the history of these places and it can increase interest towards industrial heritage. Artistic interpretations

in their many forms can deepen our understanding of the meaning of the character of these places and their importance in the wider discourse within industrial heritage.

4 **LAND ART / LIGHT ART AND IBA EMSCHER PARK, GERMANY**

Abstract author(s): Orange, Hilary (Swansea University)

Abstract format: Oral

“The Ruhrgebiet has dared to open a large lighting construction site” said Karl Ganser in 1999, at the end of his directorship of the Internationale Bauausstellung Emscher Park Project, an urban development program led by the German federal state of Nordrhein-Westfalen from 1988 to 1999.

IBA Emscher Park aimed to revitalize the Ruhr’s economy, ecology, and culture and reorientate the region’s economy away from its declining coal and steel industries toward new forms of industry, services and culture. In a relatively flat region, coal waste is marketed as a ‘mountain’ range and these high points were utilised as pedestals for large scale light installations that paid homage to the region’s industry past. This paper draws on two years of research that focused on topography, industry and art. In it, I explore how waste heaps and light art played a key role in forming IBA’s night vision for IBA Emscher Park.

5 **CHORNOBYL VISUAL LEXICON: EXPLORING THE VISUAL FRAMING OF TOXIC HERITAGE FROM THE POINT OF VIEW OF PARTICIPATORY CULTURE**

Abstract author(s): Ojala, Veera (University of Turku)

Abstract format: Oral

Even though the Chornobyl exclusion zone (CEZ) is one of the most well-photographed and visually documented sites, little is known about the visual framing of the CEZ from the point of view of participatory culture. This study is investigating how the Chornobyl exclusion zone is represented on the open photo-sharing platform, Flickr, focusing on heritage framing from the point of view of participatory culture. Flickr, a social networking site founded in 2004, has a large portfolio of photographs that have been classified and categorized. Thus, it provides a prime container of visual information in the form of user-uploaded digital photographs with an almost 20-year time frame. Through three different points in time—2008, 2013, and 2018—this study explores the emerging photographic practises of the visitors to the exclusion zone. During these years, the exclusion zone was also transformed by the intentional marketing of the site for touristic purposes, and the exponential flow of visitors transformed its landscape into a dynamically developing tourism scape. By absorbing visual content analysis based on theoretically determined categories retrieved from the theoretical framework of social semiotics, this study examines and analyses the uploaded photographs by the visitors of the zone on the Flickr platform. With this approach, the study will shed light on the visitors’ practises of visual engagement with the heritage resources in CEZ. In addition to the dynamic context of touristification, the analysis of visitors’ visual engagements with the zone’s heritage artefacts reveals visitors’ evolving attitudes and pictorial interests in the context of participatory visual culture. Moreover, this study provides insights into the participatory culture as an agent, which changes the way in which heritage is viewed, perceived, and experienced.

6 **THE ROLE OF DOCUMENTARY FILM IN THE PRESERVATION AND PROMOTION OF INDUSTRIAL HERITAGE**

Abstract author(s): Draganic, Anica - Szilagyi, Maria (Cultural studies platform CULTstore; University of Novi Sad)

Abstract format: Oral

Despite its undeniable value, industrial heritage is often neglected or devastated due to a lack of public awareness or education, economic or other reasons. Documenting is a crucial part of the process of its identification and protection, which, due to the nature of certain types of heritage, is sometimes a particularly demanding task.

In contemporary society, the function of the mass media in protection and presentation is particularly significant. The messages generated through the documentary film effectively contribute to developing the wider population’s awareness of the values of tangible and intangible heritage that bears traces of past civilizations, building a socially responsible community and evolving an interdisciplinary, integrative conservation approach.

The paper will present the results of the Beer Routes through the Vojvodina project, which resulted in the development of an interactive virtual route and the recording of a documentary film about the oldest industry in the region. A presentation of the virtual route and a projection of excerpts from the film are planned.

7 POSTHUMOUS DIALOGUE AND RESURRECTION: WEAVING MATERIALISING STORIES WITH INDUSTRIALIZED WETLAND SITES

Abstract author(s): Fredengren, Christina (Stockholm University, Department of Archaeology and Classical Studies; Uppsala University, Department of Arthistory/Conservation)

Abstract format: Oral

On the first encounter with the aerial photos of the study area Tolkien's Mordor came to mind. This was an industrial landscape where a red smoking mound of dross and cinder towers over the surrounding land and jagged edges, cave down to gaping holes in the underground. The masses of materials were extracted leaving uneven surfaces exposed to weather and wind. Furthermore, some larger cavities were filled in with strangely colored waste waters. The eye could trace trails in the ground as the temporary roads for work-vehicles – diggers, dumpers and tractors. This is the industrial heritage of shale oil and uranium extraction. It is the negative imprint and shadow place of energetic excesses elsewhere. What brought me and artist Signe Johannessen was a curiously odd wetland find, that consisted of a human skull with animal body. This was found in connection with the extraction activities. Today, only some of the industrial buildings are heritage classified. However, the whole site here at Kvarntorp near Örebro in Sweden, is a ticking environmental bomb (as a politician called it) and could on these grounds be called out at a natureculture heritage of national interest. This paper challenges the authorized discoursed of industrial heritage through our co-joined speculative artwork and writings on more-than-human transtemporal entanglements.

8 THE NEGATIVE SPACE OF MODERNITY: ARTISTIC INTERVENTIONS WITHIN LANDSCAPES OF SUBTRACTION

Abstract author(s): Benjamin, Jeffrey (Columbia University)

Abstract format: Oral

A mining landscape, as a „landscape of subtraction“ (Francaviglia 1991, 22) can be considered a sculptural form in and of itself; perforated with adits, shafts, quarries, pits, kiln chambers as well as tailings and mounds of waste rock. The ever-shifting relationship between positive and negative space -- in an artistic sense -- is also a very useful concept for thinking about, looking at, and listening to industrial spaces in general. Because of this sculptural quality, industrial structures and mining landscapes tend to attract further artistic intervention. In 2017 and 2022, and as a part of my archaeological research into the Rosendale Cement Mining District in upstate New York, USA, I co-organized two outdoor (and underground) sculpture exhibits on the grounds of the Century House Historical Society in Rosendale. In this talk, I will present images and recordings of these works of art and offer some thoughts on the interplay of figure-field and positive and negative space within the context of the industrial past.

A. UNCOVERING THE HIDDEN STORIES OF QUARRY LIFE: PHOTOGRAPHS AND GRAFFITI IN DISUSED SLATE QUARRIES

Abstract author(s): Douth, Paul (Independent Researcher)

Abstract format: Poster

This presentation delves into the working environments of Welsh slate quarrymen by photographing the vast underground spaces left behind after extraction, including the equipment and graffiti they have left in the underground workings. The methodology of the study combines photography with historical research, with a focus on identifying individual quarrymen through their graffiti. By trying to find records and families of the workers, the study aims to put faces to names and understand the individual's contribution to the industry.

This presentation highlights the significance of these disused slate quarries as cultural heritage sites, not only for their historical value but also for the educational opportunities they provide. Through capturing these labyrinthian underground spaces through photography, the presentation aims to emphasize the importance of preserving these sites for future generations to preserve the history of quarry communities, memorialize the labours of quarrymen and further an understanding of the industry's impact on both the trajectories of local communities and Great Britain at large.

527 CONFLICT LEGACIES OF THE 20TH CENTURY

Session theme: 6. Contested Pasts & Presents

Session organisers: Theune, Claudia (Dep. Prehistory and Historical Archaeology, University of Vienna) - Ylimaunu, Timo (History, Cultural and Communication Sciences, Faculty of Humanities University of Oulu)

Session format: Regular session

From Scandinavia to Southern Europe, there are numerous legacies of empires, monarchies and dictatorships, for example, from the Russian Tsarist Empire, the German Empire, the Austrian-Hungarian monarchies, but also from

the National Socialist German Reich. Many of the material legacies were the subject of archaeological investigations. At some of the sites many relics can still be seen in the landscape, others lie underground. For example, battlefields (world wars, but also local wars or civil wars), massive (still preserved) war fortifications like the Atlantic Wall or the many internment camps.

Today's political map and borders in Europe run differently than in the early or mid-20th century, respectively many borders have been redrawn even after 1989/90. Today's archaeological investigations - partly in young successor states are carried out under different (political) conditions and general frameworks than 30 or 50 years ago.

Research questions that could be addressed in this session may concern the archaeological approach to such sites - also with regard to historiography and different narratives concerning such sites 80, 50, 30, or 10 years ago. Research questions can also concern the context of the legacies, the structure of the legacies, the question of how to deal (today) with so-called contaminated (or dark) sites. In addition, the value of contemporary archaeological research in exploring new facets of the sites' history could be addressed. Of interest are also what historical narratives, what culture of memory existed at such sites and how these have changed.

ABSTRACTS

1 „UNCOVERING THE HIDDEN HISTORIES OF THE BATTLE OF KOMARÓW: „PROJECT KOMARÓW 1914“ - INTEGRATED GEOPHYSICAL RESEARCH OF BATTLEFIELDS

Abstract author(s): Dziewickiewicz, Hubert (Faculty of Archaeology, University of Warsaw; Doctoral School of Humanities) - Misiewicz, Krzysztof - Małkowski, Wiesław (Faculty of Archaeology, University of Warsaw) - Dziewickiewicz, Aleksandra (Independent researcher) - Mieszkowski, Radosław (Faculty of Geology, University of Warsaw)

Abstract format: Oral

In Polish historiography, the Battle of Komarów is known as the battle fought on the fields of the Wolica Śniatycka village in 1920 between the Polish army and the Bolshevik army. However, it is important to remember that six years earlier, on September 26, 1914, the Russian 5th Army and the Austrian-Hungarian 4th Army faced each other in the same area. During the first two days of the battle, General Paul von Plehwe's army repelled attacks by the Austrian-Hungarian army led by General Moritz Auffenberg. However, on August 28, the situation changed, and on the night of September 1-2, the Imperial army began a retreat towards the Bug River.

To this day, relics of those battles, such as trenches, dugouts, shooting pits, and craters from the artillery fire of both armies, are visible in the forests. A large part of these structures were located in deforested areas and, as a result, over the years they have been leveled by the constantly developing agricultural economy. The Battle of Komarów site is an ideal research range.

Thanks to funding from the National Science Centre Poland as part of the Preludium Bis-2 competition (2020/39/O/HS3/01233), work began in August 2021 to develop an effective methodology for conducting non-invasive research of First World War battle fields. The task is based on conducting geophysical surveys using magnetic methods, electrical resistivity profiling, electrical resistivity tomography, and GPR. Additionally, the entire project is supported by modern remote sensing data (especially LIDAR), as well as historical data such as cartographic resources.

The purpose of this presentation is to introduce the research project and the results of the field work conducted so far, as well as to raise the issue of protection of this type of site.

2 DISAPPEARANCE AND REDISCOVERY: ARCHAEOLOGY AND COMMEMORATION OF GREAT WAR IN CARPATHIAN MOUNTAINS

Abstract author(s): Vojtas, Martin (Department of Archaeology and Museology, Faculty of Arts, Masaryk university) - Czarnowicz, Marcin (Institute of Archeology of the Jagiellonian University) - Drobňák, Martin (KVH Beskydy) - Fatula, Yuri (Memento Bellum) - Kapavík, Radim (Signum Belli 1914)

Abstract format: Oral

In the winter of 1914/15, the fights of the First World War reached the borders of the Kingdom of Hungary on the current Polish-Slovak-Ukrainian frontiers. The Russian army was prevented from entering Pannonia only by the divisions of the Austro-Hungarian and German armies on the ridges of the Carpathian mountains.

This region witnessed fierce clashes of thousands soldiers in an inhospitable environment, but subsequent events overshadowed it. The empires fighting here soon disappeared and the successor states were not interested in commemorating the events, except for the parts where their nation was mentioned.

The situation in the described area was additionally complicated by the events related to the Second World War, and by the ethnic cleansing and the displacement of people considered foreign by communist Poland. The memory of places associated with the commemoration of the Great War has gone with them. Graves and cemeteries were

neglected. Communist governments had no need to remind the struggle against the Russians. Since the 1990s, the region became the target of raids by treasure hunters with metal detectors, but also of interest for a new generation who wanted to know the history of their country and ancestors.

The purpose of our work will be to present the difficult and confusing history that led to the disappearance not only of the remnants of war and cemeteries established after the battles of the Great War, but also of the entire cultural heritage of the Carpathians, as well as attempts to restore the memory of the former inhabitants of the region and soldiers who lost their lives over 100 years ago in often fratricidal battles waged in this beautiful mountain scenery. An important element of the speech will be the presentation of excavations and social activities aimed at restoring memory.

3 «FLAGS OF OUR FATHERS». INTERGENERATIONAL BATTLEFIELDS IN SPANISH CIVIL WARS ARCHAEOLOGY (1833-1939)

Abstract author(s): Martin, Gorka (University of the Basque Country)

Abstract format: Oral

In July 1936, as a consequence of a failed coup d'état, the Spanish Civil War began. The legal government of the Second Republic confronted the conservationist military rebels. The war lasted for three long and bloody years, ending with the final victory of the latter. Since the 2000s, this conflict has drawn the interest of various archaeological research teams, and thanks to that, nowadays, it is one of the most popular topics in Spanish archaeology.

Despite the Spanish Civil War archaeology being very well-known worldwide, there were other civil wars in the 19th century, such as the Carlist wars, that are almost forgotten. These conflicts represented the clash between those who wanted to implement the liberal revolution (called liberals) and those who defended the preservation of the Ancient Regime, the Carlists. There were three internecine struggles: 1833-1840, 1846-1849, and 1872-1876. The different liberal governments won in all of them. Despite this, Carlism survived and played a crucial role on the rebel's side in the next confrontation, the Spanish Civil War. As a result of this long fighting history, many young Carlists marched to the war in 1833, 1846, and 1872 but also in 1936. Far from the popularity of the Spanish Civil War archaeology, recently, there has been a significant increase in the archaeological research about the Carlist wars.

What is more, the Spanish Civil War and the Carlist wars are heavily connected, not only historically but also archaeologically. The aim of this work is to explore the archaeological links between last major civil wars of Spain. Throughout the archaeological data gathered from various battlefields, military outposts and landscape archaeology in the Basque Country, we will provide new insights about this historical phenomenon, highlighting the value of archaeology as a tool for confronting and dealing with such a conflictive past.

4 WARFARE IN THE HEIGHTS: AN ARCHAEOLOGICAL APPROACH TO THE SPANISH CIVIL WAR IN MOUNTAINS CONTEXTS

Abstract author(s): Trejo, Alejandro (Incipit - Institute of Heritage Sciences)

Abstract format: Oral

Over the last two decades, an increasing scientific and social interest in the archaeological remains of the Civil War (1936-1939) has been developed in Spain. Even though a large number of studies have been carried out, only a few of them are focused on the investigation of mountain warfare contexts.

This contribution will provide the main results of my investigation developed in the Republican mountain defensive position of the Mirador of Casablanca (Granada, Spain). Using this case as starting point, I will also provide an overview of my current PhD research project developed at INCIPIT-CSIC (Spain).

A comparative study of three different mountain areas will be conducted during my dissertation: Sierra Nevada, Sierra de Guadarrama and Ubiñas Massif. Our main objective is to analyze the complexity of the military and equipment environment adaptation and its impact on soldiers' daily life and mental health.

The expected result will provide relevant innovative information about the development of the war, the organization of the repressive spaces, and the specific difficulties or warfare in high and middle mountains, such as logistical difficulties, the organization of defensive fighting positions and the adversities faced by the soldiers.

5 TWO STORIES ABOUT WAR GRAVES

Abstract author(s): Ciciurkaite, Ingrida (Vilnius University Faculty of History, Department of Archaeology; Kultūros vertybių globos tarnyba, NGO, Vilnius)

Abstract format: Oral

The 19th and 20th centuries were marked by very large-scale conflicts that resulted in severe loss of life, hardly left a country without graves of soldiers. The archaeology of war graves has recently become increasingly important histori-

cally and politically. It is gaining more public attention and clearly becoming an interdisciplinary object of research. The first investigations of war graves in Lithuania and neighbouring regions began during WWII, when mass graves were “exploited” in order to expose the illicit actions of opponents (by both confronting sides). In recent years it has again become relevant to investigate war graves, but now modern interdisciplinary research methods are used in collaboration with scientists of different fields.

The presentation focuses on two different narratives: the story told by the data of archaeological research – research of graves and burial sites (Napoleon’s campaign, the uprising of 1863, WWI, WWII, Lithuanian liberty fighters, soldier of WWII) and – the narrative formed by the occupational regimes. It discusses how Lithuanian and involved sides public mentality was shaped out. The data of archaeological researches reveal how people “unsuitable” to the regime were hidden in order to forget them, on the other hand the cult of fallen “liberators” was formed. The remains of commanders and participants of the uprising of 1863 or post WWII liberty fighters were despised and hidden, the graves of WWII German and Polish soldiers were destroyed in order to erase historical memory. On the contrary, obelisks are built for the invaders their remains are reburied in the central squares of towns. The purpose of the report is to talk and emphasize the hidden part of the history of Lithuania and other countries during the occupational regimes and the right to memory, that we can provide based on the data of archaeological research.

6 REMAINS FROM THE BATTLEFIELD: OVER- AND UNDER-DIAGNOSTIC ISSUES DUE TO LACK OF COLLABORATION AMONG SPECIALISTS

Abstract author(s): Kadikinaite, Jovita (Vilnius University)

Abstract format: Oral

During the Lithuanian wars of independence (1918-1920), from August to November 1920 multiple battles between Lithuanian and Polish militaries took place in and around the Vilnius district. The geographically strategic scene for such battles was in Lazdėnai, Elektrėnai municipality, with the battle of Rykantai (October of 1920). This presentation will focus on 14 skeletonized remains (most probably soldiers of Polish and Lithuanian origin) uncovered in Lazdėnai village. A standard anthropological analysis, i.e., obtaining the individual biological profile, assessing various pathological conditions, including perimortem injuries, followed by detailed descriptions and documentation of the lesions, was performed. Injuries such as gunshot wounds, blunt force traumas, and evidence of explosions were found upon inspection. The outcomes of this research could be divided into two sections: possible death scenarios of the individuals studied, and reconstruction of the battle course, combined with known historical and archaeological data. This study demonstrates the importance of not taking an individual out of the battle context. Due to fragmentation and poor preservation of the remains, it is easy to overlook the bits and pieces of information, or even to over-diagnose lesions that were not inflicted on the battlefield, thus drastically altering the interpretation of any action. Furthermore, despite some good examples of collaboration among specialists in different fields, this issue is still very relevant in Lithuania, because not taking artifacts and/or historical data into consideration when studying such remains compromises the results of the research by giving a very broad and ill-defined explanation of events.

7 REPRESENTING PAST AND PRESENT: ARCHAEOLOGY, COMMUNITY, AND COLLECTIVE MEMORY OF A WORLD WAR II AIRCRAFT CRASH SITE

Abstract author(s): Saul, Tiffany - Fracchia, Adam - Merian, Everett - Lauerhass, Audrey (Middle Tennessee State University) - Morin, Morgane (Bordeaux Montaigne University)

Abstract format: Oral

Beginning in the summer of 2021, field recovery operations in search of unaccounted for United States personnel have been conducted in France at the crash site of a heavy bomber aircraft. The international team of students and volunteers from the United States and Europe have partnered with the local community, many of whom have personal memory of the crash or have become connected to the event as part of local heritage. Through a student initiative, this project has incorporated local heritage by involving community members in the design and construction of an informational display for the village town hall. The preservation of select incident-related artifacts, the design of the portable display, and the archival and oral history research for interpretation have all been conducted in direct collaboration between archaeology students and local residents. This presentation explores the meaning and use of the crash site landscape and its material culture to more broadly impact the preservation of local heritage and how the rich educational experiences of archaeological fieldwork can create and unite perspectives of collective historic memory.

8 BEFORE THE DEATH MARCH TO VOLARY: NON-INVASIVE ARCHAEOLOGICAL INVESTIGATION OF GERMAN NAZI CAMPS SCHLESIERSEE (POLAND)

Abstract author(s): Konczewski, Pawel (Wrocław University of Environmental and Life Science) - Langowska, Kinga (University of Gdańsk) - Biernacka, Katarzyna - Kwiatkowska, Barbara (Wrocław University of Environmental and Life Science) - Sady-Bugajska, Agata (Independent researcher) - Szczurowski, Jacek (Wrocław University of Environmental and Life Science) - Konczewski, Piotr (University of Wrocław)

Abstract format: Oral

Volary, a town in southern Bohemia, is one of the symbols of the tragedy of the Death Marches – as the evacuations of German concentration camps at the end of World War II were called. The march, which had its finale near Volary, is one of the better documented because of the investigation undertaken by the U.S. Army after 118 dying women were released there on May 6, 1945. The beginning of their march took place 106 days earlier – near the town of Schlesiersee (now Sława, in Poland). In October 1944, approx. 2,000 Jewish women, mainly from Hungary and Poland, were brought there from the Auschwitz-Birkenau concentration camp. The women prisoners were housed in outbuildings on two farms, creating branches of the Gross-Rosen concentration camp: Schlesiersee I and Schlesiersee II. The women were sent to build field fortifications intended to stop the Red Army. The extremely harsh living conditions in these camps resulted in the deaths of dozens of female prisoners, even before the Death March. In order to recognize the material heritage of the Schlesiersee camps, non-invasive research was carried out through: remote sensing data analysis, surface and geophysical prospecting, and an inventory of vegetation. As a result, the following were recognized: the appearance of the camps, the roads the prisoners followed to work, the anti-tank ditches they dug and the trenches they used. The probable burial sites of the dead women were also located. The results of the research provided complementary information to surviving female prisoners' accounts of conditions of enslavement in this camps. They have also prompted discussion of the material legacy of the genocide, including elements previously outside public discourse, such as fortifications buried after the war and old trees that are living, albeit non-human, witnesses to the Holocaust.

9 EMPERORS AND BEGGARS AT THE WW2 GERMAN MILITARY- AND REFUGEE CAMP OF SØLUND (DENMARK)

Abstract author(s): de Vos, Julie (Aarhus University; Museum Skanderborg; INCIPIT-CSIC)

Abstract format: Oral

During the winter of 1944-45, millions of Germans had to flee West due to the Soviet offensive of the Eastern Front. A part of these refugees were surrounded in East Prussia (then German, now part of Polish and Russian territories), and the only way out was by boat over the Baltic Sea.

Between the months of February and April 1945, and after many weeks of dangerous escape, nearly 300.000 German civilians arrived to occupied Denmark and were interned in confiscated, public buildings by the German defense force. After the surrender of the Germans, the luck of the German civilians did not change much: On demand of the Allied and due to the lack of capacity of receiving the many refugees in a Germany in ruins, the refugees were interned in camps behind barbed wire in Denmark, where they organized themselves as small societies, at the margins of the rest of Denmark.

The refugees left only few visible traces (as opposed to the German defense force), and the narratives of the German civilians in post-war Denmark are not very well known. The memory of the refugees is marked by their own absence since the last refugees left Denmark in 1949. Recent archaeological investigations at the refugee camp Sølund in Skanderborg (Denmark) is aiming to reinstall a (material) memory of these refugees, a memory that is overshadowed by that of the presence of the soldiers.

10 POST-WAR UTILISATION OF SPACES AND INFRASTRUCTURES OF NATIONAL SOCIALIST FORCED CAMPS

Abstract author(s): Hinterdorfer, Peter (Universität Wien)

Abstract format: Oral

One of the most prominent features of the material legacies the National Socialist Regime has left behind in large parts of Europe, are the numerous forced camps that were part of its policy of terror, enslavement, and extermination. The infrastructures built for internment and forced labour, but also for administration and to house guards took up large areas. Additional elements, such as access roads and railway lines specifically built to serve the camp, spread even further. This is especially the case for larger camps whose numbers of prisoners were comparable in size to the populations of small towns and often exceeded the populations of nearby settlements. Thus, the camps changed the surrounding landscapes not only during the war, but significantly influenced the further development of regions dur-

ing the post-war era. Treatment of the material remnants of forced labour and concentration camps took different forms. In some places, camp buildings were adapted and repurposed as private homes or for public uses. In other cases, barracks were dismantled, but the area that had already been levelled, equipped with power lines, water supply and sewers and connected by access roads was used to expand a neighbouring town or build up a new settlement. Workplaces, initially built and used for the exploitation of forced labourers, fell into ruins, shaping the landscape for decades to come, or were taken over by private companies and continued to operate on the industrial and logistical infrastructures of a former camp. This paper examines the different concepts of utilisation of the infrastructural remains of former National Socialist Forced camps and their influences on the development of regional settlements and industries in the post-war era.

11 HOW THE FASCIST REGIMES OF MUSSOLINI AND HITLER INFLUENCED THE CULTURAL POLICY OF METAXAS IN GREECE DURING THE INTERWAR PERIOD

Abstract author(s): Petarouda, Georgia (Ionian University)

Abstract format: Oral

The results of World War I and the economic crisis contributed to the birth of fascist parties in Western Europe. Fascist leaders campaigned in western Europe (Mussolini and Hitler) using pompous speeches, rituals and parades in order to mobilize disillusioned masses and create pro-regime fascist youth organizations. The Asia Minor Catastrophe in 1922 led to the downfall of El. Venizelos and the imposition of the dictatorship of Ioannis Metaxas. As a strongly nationalist regime, it shared characteristics with the European fascist regimes of Mussolini and Hitler. From Metaxas's regime there was an attempt to subjugate the Past in order to be instrumentalized and to be used for propaganda purposes, having as main goal a National Renaissance through the creation of a New Greek Culture. In the present study, the purpose is to present the propaganda policies of Mussolini and Hitler that Ioannis Metaxas adopted in his cultural policy, the role of Greek Antiquity in this concept and how it affected the management of archaeological sites in Greece during the interwar period.

12 CONSERVING A FRAGILE PAST - RECORDING THE BUILT HERITAGE LEGACY OF THE TROUBLES

Abstract author(s): McQuillan, Liam - McBride, Emma (Department for Communities Historic Environment Division)

Abstract format: Oral

This year marks 25 years since the signing of the Good Friday Agreement, which formed the basis for societal change, peacebuilding and a period of economic revival and increased prosperity in Northern Ireland. Concurrent with these vital ongoing processes and dealing with the societal legacies of the late 20th century period, often known as "the Troubles", is the sometimes gradual (and sometimes rapid) deconstruction of the physical fabric that articulated the conflict in the landscape and streetscapes, from police stations, and army barracks, to peacewalls, prisons and internment camps. In a society with varied and multiple historical narratives about a difficult past these physical features on their own present historical fact by their very being. How to deal with this material however presents a challenge within society where the memory of events is very much alive, and this paper demonstrates some of the work being undertaken to record and try to capture the significance of surviving built heritage remnants, often denoted as "dark heritage".

13 WHO WRITES TIBET'S HISTORY? : MUSEUMS IN EXILE, NARRATIVE MAKING AND THE DISPLAY OF POLITICS

Abstract author(s): Dimri, Devina (University College London)

Abstract format: Oral

Museums are a powerful medium for storytelling. Given the trust and objectivity traditionally associated with museums, they are able to tell compelling stories about the past, packaging specifically mandated and produced versions of the past as objective history. This provides museums with the ability to shape historical memory. This paper looks at a South Asian museum in particular, which understands this transformative ability of the museum space and uses it for its community's larger socio-political interests.

Dharamshala's The Tibet Museum's permanent exhibition 'I am Tibetan and this is our story' presents to its visitors a history of Tibet and Tibetan people, one which as mentioned on the museum's introductory panel 'deliberately challenges China's version of Tibet's past and its distorted vision of the present'. The exhibition utilizes the power of museum storytelling to make its visitors believe its version of Tibetan past while also claiming to be 'not politically neutral' and thus disregarding the notion of the museum being an objective space. By doing this the museum not only becomes an immensely complex case study but also ends up situating itself in the larger battles of narratives that underpins most domestic and international conflicts.

This paper studies this unique museum and its display of a highly contentious international conflict as it navigates the constraints set by geopolitics, high expectations of the exiled Tibetan community and the pressure of meeting global standards. The study looks at the museum's design elements, displays and curatorial voice to form a deeper understanding of both conflicts and the ways museums become the battlefield for these conflicts.

528 WEAVING DEFENSE, LANDSCAPE AND SOCIAL ORGANIZATION FROM ANTIQUITY TO EARLY MODERN TIMES

Session theme: 6. Contested Pasts & Presents

Session organisers: Ødegaard, Marie (Museum of Archaeology, University of Stavanger) - Ystgaard, Ingrid (Norwegian University of Science and Technology) - Albris, Laurine (National Museum of Denmark)

Session format: Regular session

This session explores the physical remains of civil defence; the relations between defensive structures, social organization and contested spaces and landscapes from antiquity to modern times. War and threats of attack extend beyond the activities of specialized military forces. They include all groups of people engaged in and affected by them. Thus, defensive works do not necessarily belong to a strictly military sphere of society. Defensive structures and practices are created in interplay with varying social organizations, and found for instance in farming societies characterized by unstable political bonds and alliances, and societies engaged in or threatened by plundering warfare. Aspects such as social, military, territorial and fiscal organization both activate and are activated by investment in and maintenance of defensive structures, particularly in relation to states and state formations. Recognising how, when and where such defence structures worked is fundamental to understanding systems of military organization, defensive capabilities, and the nature of hostilities in the past.

This session will examine the problems and potentials of studying defence structures as part of social organization. What are the archaeological signatures of defence structures? How do defensive structures interact with the landscapes and social and military organizations of which they take part? How does the routinization of war and the threat of attack affect people and their institutions?

To this session we welcome studies from scholars applying new methodological and theoretical insights to military geography; the organization and form of defensive structures as a result of external threats, and the dynamics of social organization. We welcome papers that explore the wider landscapes of military action, including physical monuments (e.g. beacons, lookouts, hillforts, dikes, earthworks), and the social organization of civil defence landscapes.

ABSTRACTS

1 SHEDDING LIGHT ON BEACON SYSTEMS FROM THE VIKING AND MIDDLE AGES OF NORWAY

Abstract author(s): Nilsen, Markus (University of Stavanger)

Abstract format: Oral

This paper will present an ongoing PhD project titled, "Moulding the Military Landscape with Fire", studying fire beacons from western and central Norway. Beacons were part of the civil defence in the Viking and Middle Ages, designed to warn the population against enemy attacks. They were one of the most effective signalling systems and a crucial part of the military landscape. Despite their importance, little is known of their localisation, distribution and role in the social and military organisation at the time.

By using two case study areas, the counties of Trøndelag and Hordaland (part of current-day Vestland county) in central and western Norway respectively, and combining archaeological, historical and toponymic data in a geographic information system, I will discuss local and regional beacon networks. Beacon sites are identified and geolocated, and their coordinates are plotted on modern digital maps. Viewshed- and spatial analysis are utilized to discuss the placement of beacons in the landscape, how they functioned together in systems, and how these systems developed over time. Ties between beacons and settlements from the Viking and Middle Ages are established, uncovering how these warning systems were organized on a local and regional level.

2 THE SUCK-HIND TOCHAILT - ONE EVENT IN THE VERY ACTIVE KINGSHIP OF TOIRRDELBACH Ó CONCHOBAIR, HIGH-KING OF IRELAND, R. 1119-1156

Abstract author(s): Curley, Daniel (Rathcroghan Visitor Centre) - Timoney, Martin (Research Archaeologist)

Abstract format: Oral

Toirrdelbach Ó Conchobair's 1139 tochailt (Ir. construction) is made up of physical elements, some natural and some manmade. The Suck naturally flows southwards from west Roscommon towards Ballinasloe to join the Shannon at

Raghrabeg, southwest of Shannonbridge. The Hind flows eastwards from north of Athleague to Lough Ree on the River Shannon. Between the headwaters of the Hind and the Suck at Castlestrange Bridge, north of Athleague, an overall distance of 13.5 km, are the Ballinturly and Correal turloughs (seasonal lakes). Three lengths of works were constructed, linking the turloughs to each other and to the two aforementioned rivers. While it is locally believed today that Ballinturly was fed northwards from the substantial Suck, it is our contention that some of the limited waters of the upper reaches of the Hind were fed westwards to Correal. This use of water formed a barrier, protecting and regulating access into and out of the traditional territory of the Gaelic Ó Conchobair kings of Connacht in modern mid-Roscommon to the north, keeping the Ó Cellaig lords in modern south Roscommon, and many other opponents, at a distance throughout the medieval period. Some earlier non-Irish examples of linear boundaries are considered, but it is our belief that this tochtail is the result of the military-minded Toirrdelbach reading the landscape and altering it for his own benefit and protection.

3 HILLFORTS AND RELIGIOUS ACTIVITIES ON IRON AGE BORNHOLM, DENMARK

Abstract author(s): Albris, Sofie Laurine (National Museum of Denmark)

Abstract format: Oral

This paper discusses signs of ritual activities related to Iron Age hillforts on the island of Bornholm in the Baltic Sea (ca. 100 BC – 900 AD). Bornholm has within its 588 km² at least six Iron Age hillforts, of which we only have sporadic knowledge. Iron Age Bornholm was a hub of trade and connections throughout the Baltic Region and its landscape is rich in wealthy settlements, hoards, burial sites and menhirs. Yet the role of the hillforts in the island society is little understood. Often, the sites have several phases of use spanning from the Neolithic to the Medieval Period and are located on important boundaries. The paper explores faint evidence of Iron Age deposition practices and traces of Iron Age burials and monuments in relation to hillforts, indicating that the use of these structures went beyond mere military purposes. The paper discusses whether these may have been sites of many functions of which some were of a religious nature.

4 ESCAPE FROM THE CITY AND FORTIFY THE MOUNTAINS! A POSSIBLE TERRITORIAL CONTROL STRATEGY IN POST-ROMAN GALLAECIA?

Abstract author(s): Pereiro Fernández, Mario (Universidade de Santiago de Compostela)

Abstract format: Oral

At the beginning of the 5th century, the effective control by the Roman Empire of Gallaecia, in the NW of the Iberian Peninsula, disappeared. At the same time, a new player appeared in the game, the Suebi. This German contingent will be the seed of one of the first post-Roman states in Western Europe.

In the meantime, what do the people of Gallaecia do? The existence of strongholds throughout this territory is mentioned in historical sources. In recent years, a large number of bastions have been archaeologically documented, which are chronologically located in this period. They tend to be heterogeneous and adapted to the landscape in which they are integrated.

We believe that at the end of the Roman Empire (beginning of the 5th century) there was a strategy of construction and occupation of fortresses throughout the NW of the Iberian Peninsula. In this paper we will focus on the largest documented bastions in Gallaecia and their relationship with different Roman settlements, mainly cities.

5 THE MILITARY COMMUNICATION NETWORKS OF VIKING AGE NORWAY: BEACONS AND MARITIME DEFENSE SYSTEMS

Abstract author(s): Ødegaard, Marie (Museum of Archaeology, University of Stavanger)

Abstract format: Oral

What strategies did the Viking societies develop when facing recurrent attacks? This will be studied through the material remains of the Vikings' fear and preparedness; beacons set up in high or prominent positions in the landscape as a warning or signalling system of imminent threat. Beacons were ignited at the risk of attack and war and played a crucial role in alerting the population, mobilizing military responses and for communicating between places.

The study will use place-names, written evidence and landscape archaeology together to reconstruct the social and military geography of Norway in the Viking age. The paper will investigate how fear of an outsized rival posing an existential threat can act as a catalyst for response, making leaders and communities take on strategies to reduce risk and build resilience. It will investigate the beacon organization and maritime defense systems resulting from external threats and discuss how this affected and institutionalized their institutions.

6 BUILDING SOMETHING FROM NOTHING - WHO MADE THE FORTIFICATIONS OF THE HUNGARIAN-OTTOMAN BORDERZONE?

Abstract author(s): Nádai, Zsófia Csilla (Research Centre for the Humanities, Institute of Archaeology)

Abstract format: Oral

From the Battle of Mohács (1526), the expansion of the Ottoman Empire and internal conflicts tore the Kingdom of Hungary into three parts, and during the sixteenth and seventeenth centuries, most of the kingdom's territory became a military zone. From the middle of the sixteenth century Kisvárda castle (situated near today's northeast border of Hungary), a former aristocratic residence, owned by the Várdai family, became a borderline fort of the Habsburg party.

Regarding Kisvárda castle and the region's fortifications, we have at our disposal the site itself, written and archaeological data, contemporary depictions and secondary literature. From these sources, the financial, designer and constructor background of the early modern palisade structures can be reconstructed.
