HOW TO READ THE ABSTRACT BOOK

The Abstract Book is ordered by session numbers which were allocated during the session submission (i.e., the number sequence is discontinuous).

Author's affiliation is stated in brackets following the author's name; where authors share the same affiliation, it is only stated once.

Index of Authors includes all session organisers and only the main authors of contributions.

Please note that names, titles and affiliations are reproduced as submitted by the session organisers and/or authors. Language and wording of titles and abstracts are not revised.

29th EAA Annual Meeting (Belfast, Northern Ireland 2023) - Abstract Book

Names, titles and affiliations are reproduced as submitted by the session organisers and/or authors. Language and wording of titles and abstracts were not revised.

Technical editing: Magdalena Karabáš, Kateřina Kleinová (EAA)

Design and layout: Kateřina Kleinová (EAA)

Design (cover): Emily Good

ABSTRACT BOOK

Contents

2	Archaeology, Landscape and the Skyscape. How Material Archeology Is Woven with Different Ontological and Cultural Interpretations [SEAC-EAA].....	13
12	Modern Approaches to the Study of Landscape Improvement and the Creation of Sustainable Agricultural Systems.....	17
27	Archaeogaming: The Liminal Space Invader	23
30	Polychromy in Practice: Casting Colour onto Roman Artworks.....	26
32	The Public Interpretation and Presentation of Megalithic Monuments and Sites: Challenges for Best Practice.....	32
37	Heart of Stone: Medieval Perceptions of Stone	37
39	Multi-Proxy Approaches to Examining Human-Animal Interactions	44
44	Textiles in Archaeology, Conservation, and Museology: Finding a Way forward through Collaboration	51
45	Interpreting Neolithic lifeways: the impact of current theoretical knowledge and multidisciplinary approaches on understandings of Neolithic Europe and Western Asia	53
56	Archaeology and Conflict: Thinking Outside the Box	57
61	More than a Feeling: New Perspectives on Archaeology and Wellbeing	61
77	From the Ground-up: Perspectives on Animal-Human Relations from the Site to the Lab	66
90	Setting Archaeological Heritage Policy at the European Level: Putting It into the Hands of Archaeologists	69
92	Marginal Landscapes and Coastal Adaptations during Prehistory.....	72
93	Articulating Challenges in Post-Conflict Ethics, Archaeology and Archaeological Heritage	76
95	Public Archaeology in Development-led Archaeology [Public Archaeology Community].....	78
97	Depositional Practices in the Neolithic: Contacts, Interactions and Transformations.....	82
98	Seascapes, Sealanes, and Maritime Infrastructure in the Late Bronze and Early Iron Age Mediterranean.....	87
99	Snow- and Icescapes: Archaeological and Conceptual Explorations of Frozen Worlds.....	92
102	Mesolithic-Neolithic Transitions [PaM]	96
103	Working with Imperfection in Archaeology. Theoretical and Practical Approaches to Data Management.....	103
107	The Materiality of Lived Religion on the Atlantic Edge	110
111	Mirroring Worlds: Rural Domestic Spaces through Multidisciplinary in Late Antiquity and the Early Middle Ages	112
113	Byzantine Heritage in Peril: The Safety of Archaeological Sites (Heritage, Conservation, Preservation, Non-Destructive Methodologies)	117
116	Weaving New Cultural Narratives: Innovative Cultural Heritage Management for Post-Pandemic Societies.....	122
117	Archaeology: A Hospitable Discipline? How Accessible is Archaeology in Practice? Examining the Future of Inclusive Archaeological Practice	125
131	Between Miniatures and Models: Interdisciplinary Approaches for Analysing Small Objects Meanings, Uses, and Contexts in the Mediterranean and Surrounding Areas	128
136	Parish Burials and Memorials: Community Meanings and Engagement.....	131
139	Climate Change, Human Impact and the Challenges of Assessing the Sustainability of Archaeological Heritage..	132
141	Iron Age Biocultural Dynamics in Continental Europe and Britain: Patterns and Processes from a Multidisciplinary Perspective	137
143	Defining Site Functions in the Viking World: Weaving Narratives from Disparate Strands of Evidence.....	143

150	The Archaeology of Luxury: Craftsmanship, Consumption, and Desirability in Archaeological Perspective.....	147
153	Weaving Narratives of the Past Through Medieval Small Finds (AD 1000-1550).....	155
158	Digital Data and Early Medieval Carved Stones: Access, Interpretation and Visualisation	158
164	Coastal Archaeology in Small Islands: Research Perceptions, Biases, Methods and Approaches.....	161
165	Building under and above Ground during European Neolithic	166
169	Neolithic and Chalcolithic Large Blades. Identifying and Defining Exceptional Lithic Products	170
173	Advancing a Bioarchaeology of Health Inequality: Recent Developments and Future Directions	175
176	Terraces as Sustainable Historic Landscapes	182
180	The Story Session	186
181	Science, not Scientism, in Experimental Archaeology	190
183	The Wheel Has Come Full Circle: Technological Choice in Pottery Producing Communities of Central and Northern Europe (100BC–800 AD).....	193
184	Material Wealth? New Approaches to the Archaeology of Social Inequality and Complexity.....	197
185	The Agency of Value in Archaeological Heritage	203
195	Far away, so Close - The Current Debates about Post-medieval Cemeteries in Anthropological and Archaeological Studies.....	210
196	Landscapes and Archaeologies of Present Communities: Novel Engagements towards Enriching Global and Local Histories	219
199	Archaeological Narratives, Scales and the Issue of Social Complexity.....	221
202	Using Earthen Architecture as an Excuse: Productive and Social Practices in Prehistoric and Protohistoric Building.....	226
220	Places of Imagination: An Approach to Fictional Landscapes	235
226	Maritime Encounters along the Atlantic Façade in Prehistory.....	239
230	What Makes a Settlement? Comparative Perspectives on Settlement Structures and Patterns from Neolithic to Iron Age	243
234	Artefacts' Residue Analyses as a Tool for Decoding Past Daily Life	250
236	Early Medieval Towns in Europe: Between Legacy of the Roman Empire and „Barbarian“ Culture?	252
237	Pottery Beyond Typology. Prehistoric Vessel Biographies in the Domestic Sphere.....	258
241	Trading Genes For Customs: Reconstructing Cross-Cultural Connections Using Biomolecular Approaches	266
242	Forgotten Bodies, Invisible Histories: Addressing Overlooked Human Narratives in the Archaeological Record ..	269
245	Nature's Bounty: The Role of Gathered Wild Resources in Past Subsistence [ARCHWILD]	276
247	Encounters and Transformations on the Borders of the Roman Empire: From the Late Iron Age to Late Antiquity.....	280
248	Archaeology and the Climate Crisis: Resilience, Activism, and Pedagogy	287
255	“Warriors” and “Weavers”: Challenging gender stereotypes in Antiquity [AGE].....	289
256	Pleistocene Lithic Raw Materials Characterization to Interpret Mobility Patterns and Settlements Dynamics	294
257	Long-term Dynamics of Field Patterns and Land Use.....	300
265	How is art seen? Perception and Thought in Prehistoric Art [XSCAPE project]	307
267	Animals in Crisis: How Can Archaeology Contribute towards Solving Contemporary Problems in Animal Welfare?.....	311
271	The Other Side of the Coin: New Innovations in Numismatics	313
273	Dark Prehistory.....	316
277	It's a Matter of Space: The Materiality of Spaces of Negotiation and Social Competition from Prehistory to	

	Medieval Times	319
279	Commodity, Container, Consumption – European Stoneware between Regional and Global Trade Systems	324
281	Contemporary Archaeology and Community Involvement [Public Archaeology Community]	330
284	Fragmentation in and of Archaeology?	335
286	Agent-based Modelling for Archaeologists	337
288	New Perspectives on Childhood Archaeology Past, Present and Future: Papers in Honour of Grete Lillehammer	338
290	Transitions in Iron Age Europe: Environment and Foodways.....	343
294	Building Materials and Construction Techniques in Antiquity	349
297	On the Margins: Understanding the Centre - Periphery Interaction during the Transition to Farming [PaM].....	353
298	Companions, Competitors, Fellow Travelers – Biomolecular and Zooarchaeological Evidence of Human-Carnivore Interactions in the Past.....	356
299	From What Things Are to What Things Ought to Be: Ethical Concerns on Archaeological and Forensic Human Remains	364
301	Exotic Fibres	369
302	Dynamics of Early Agriculture in Europe and beyond.....	371
304	Different Stories for Different People? Shaping Narratives: From Individual Research Sites to Major Infrastructure Projects.....	376
305	Weaving and Wearing Narratives of Identity: Production, Trade, and Consumption of Textiles and Personal Jewellery as Markers of Identities [ComTex].....	379
306	Multiproxy Geoarchaeology to Understand Human-Environmental Interactions from Local to Global Changes.....	382
307	Contradictions or Complementarities? The Scientific Significance of Rescue Excavations and Their Implications for Archaeological Research	386
308	Materialities of Death, Rituals, and Beliefs: In Search for New Understandings of Burial Practice across High and Late Medieval Europe	392
311	Human Impact as a Primary Cause of Environmental Transformation: Urbanization in Central Asia and Iran from Prehistory to Historical Periods	397
315	Neanderthals in Mediterranean Landscapes [PaM].....	401
316	Mountains as Interaction Zones – Human Impact on the Alpine Landscape through Time.....	405
320	A Controlled Vocabulary for Archaeology: A Necessary Requirement for the Development of a Sustainable Research Practice into the 21st Century	408
323	Calabria beyond the Classical Period: The Longue Durée of a Mediterranean Region.....	415
324	Interconnections between Metal and Non-Metal Assemblages and Metal and Non-Metal Objects in Hoards	419
325	Tracing the History of Mediterranean Human-Environmental Systems Using Biomolecular Methods	425
327	Variations on ‘the Islamic’: Alternatives, Resistance and Contestation in Islamic Archaeology	430
331	The Experience of Stone: Materiality, Landscape, Expression	435
334	(In)visible Women in History of Archaeology	444
337	Visualising Mobility: Beyond Arrows on Maps.....	451
338	Settling Waterscapes in Europe II: Prehistoric Submerged Sites in Lakes, Bogs and Rivers - Part 1	453
339	Settling Waterscapes in Europe II: Prehistoric Submerged Sites in Lakes, Bogs and Rivers - Part 2	460
343	Medieval Monastic Settlements in the North: Archaeological and Environmental Studies.....	465
345	Stable Isotope Analysis of Archaeobotanical Remains	467
346	Blast from the Glass: Provenance, Occurrence, Corrosion and Preservation (Late Bronze Age to Pre-Roman	

	Times).....	473
347	Archaeological Identities. A Methodological Toolbox to Approach Identities	478
349	Revealing the Many Narratives of Tobacco: Towards an Interdisciplinary Archaeology of Tobacco and Consumption	485
350	Bio-Arch Methodologies to Assess Mobility in the Past: The Need for Interdisciplinary and Multi-Proxy Investigations.....	488
354	AGE for a Slow Archaeology, or How to Survive in the Neo-liberal Fast Academia [AGE]	495
355	The River Basin and Estuaries in the Antiquity: Environment and Settlement	496
357	Connecting a Continent: New Data on Central Asia from the Mesolithic to Bronze Age [PaM]	501
359	Positionality in the Archaeology of Mobility and Identity.....	506
360	Migration and Mobility in the Viking Age from the Baltic to the Black Seas: An Interdisciplinary Approach.....	509
361	Weaving Big Data for the Digital Middle Ages	514
362	Multi-proxy Approaches to Prehistoric Landscapes of the Central Mediterranean	517
363	Art and Archaeology – Towards a Framework for the Creation of Sustainable Narratives	522
364	Archaeology of the Limes - Roman Settlements and Roman Military Presence on the Margins of the Empire	526
365	'Beyond Spolia.' A Cross-Cultural Comparison of Re-Used Decorated Stones.....	531
366	Megaliths and Graphical Markers in Landscape: New Techniques of Documentation.....	534
369	Making an Impact: Developing Research in Applied Bioarchaeology.....	537
370	Reflecting on Digital Practice in Heritage Narratives.....	544
374	Weaving Global Standards for Archaeology: Universal Guidance Looms.....	550
375	How Far Would You Go? The Role of Mobility in Stone Age Hunter-Gatherer-Fisher Communities [PaM]	550
376	Fragmented Metalwork in Hoards and Other Deposits - Regional and Temporal Variations in the European Bronze Age.....	555
377	Multiscalar Approaches to Past Mobility: From Individuals to Populations, and from Objects to Technologies	559
378	The Mushroom Speaks: An Archaeology of Fungi Entanglements.....	562
380	Neanderthals of the North: Agency, Ecology and Climate in Challenging Landscapes [PaM].....	564
381	Linking Differently: Complex Behavioural Patterns Evolving from Prehistoric Networks	568
382	Breaking the Barriers. Tracing Palaeolithic Human Mobility across Mountainous Environments [PaM].....	570
386	Carved Features and Carved Landscapes. Investigating the Technical and Topographical Links between Quarries and Rock-Cut Sites	575
389	Roundtable Session of the EAA Community on the Illicit Trade in Cultural Material.....	578
390	Methods and Models for the Study of Human-Birds Relationships.....	579
391	Modelling Theory in Computational Roman Archaeology	583
392	Peaks of Data - Collecting, Managing and Analysing Archaeological Data from Mountain Landscapes	585
395	MERC Forum: Comparative Island Archaeologies in Medieval Europe	587
398	Body Ideals and Ideal Bodies: Materialities of Aesthetics and Their Social Role in Non-Literate Societies.....	589
399	Beyond Architecture: Neolithic Tomb Builders in Context.....	595
400	No Movement, No Trading, Simply Local: Creating Narratives around Local Resources in Prehistory	600
401	Biological Profiling of Cremated Individuals: Current Methodological Approaches and Limitations	609
403	Skills for the Future? [Teaching and training community].....	615
406	Urban and Underground Archaeology Exposed: 15 Years Cultural Heritage Experience and Public Outreach [Urban Archaeology]	615

408	Quality Measures for Mass- and Automated Recording of Archaeological Data	617
410	Socio-Cultural Dimensions of Water Management in Contexts of Water Scarcity	621
414	Water Management and Storage Systems in Antiquity: Archaeological, Historical, and Environmental Analysis of Hydraulic Structures	624
420	Never Let a Good Crisis Go to Waste: Collapse, Adaptation and Resilience in the Central Mediterranean around the 1200 BC	629
423	Written in Stone: Archaeological Approaches to Inscribed Stone Monuments	632
426	Uses of Material Culture in Visual Representations of 20th and 21st Century Conflict Heritage.....	634
427	Reshaping Medieval Desertion in Europe: Beyond the Late Medieval Crisis Paradigm.....	638
429	Stories for Sale. The Narratives of Heritage in Mass Consumption.....	641
437	Current research in the Americas [EAA4Am].....	644
438	Timber Buildings in Medieval and Post-medieval Europe	649
439	Sustaining Archaeology: Imagining the Futures of Archaeology.....	652
441	Cave Concerns: Methodological and Theoretical Developments in Cave Archaeology.....	655
443	Climate Change Adaptation in the Past and Solutions for the Future.....	660
448	Resizing and Redesigning the Urbanization Policy of the Danube Provinces in the late Roman Period (End of 3rd-7th c AD).....	662
456	Same but Different: Imitations in the Archaeological Record.....	666
458	Intertwined Technologies in Prehistoric Europe	669
465	Large Quantities of Scientific Data: Stepping Stones for Interdisciplinary Research in Archaeology.....	673
468	Gilding Textiles: New Archaeological Evidence and Scientific Developments on the Production of Metal Threads.....	680
471	Weaving Bridges between Funerary and Domestic Archaeologies.....	684
475	Extracting Pattern and Structure from a Complex Phenomenon? Technological Cohesion, Variability and Regional Signatures across the Eurasian Initial Upper Palaeolithic [PaM].....	688
476	A Matter of Time. Handling Chronological Data in Archaeology	695
477	Within the Cost for People and Earth: Climate Change and Archaeobotanical Heritage.....	699
480	Metals and Metalworking I – Archaeometallurgical Narratives of the Copper and Bronze Ages.....	702
482	Megaprojects and Historic Environments: A Sustainable Road Map to Mega Legacy?	706
483	Revisiting Archaeology and the European Far-Right	713
484	Glocalization of Identities in the Roman World	716
485	The Imprint of Weaning: New Methods to Approach Early Life Nutritional Conditions	718
487	Fortifications and Defensive Behaviour in Socio-Historical and Contemporary Contexts: Beyond Socio- Political Complexity and Eurocentrism	722
489	Rare and Precious. Recent Advances on the Analysis of Archaeological Wood [PaM, ARCHWILD].....	726
491	Atlantic Connections in the First Millennium AD: Ceramics, Trade and Anything Else?.....	730
495	Landscape Archaeology and Oral Tradition.....	733
496	Coordination, Dissemination, and Communication - Management Tasks in the Archaeological Work Environment.....	736
498	In and Out of Context: Weaving the Itineraries of Objects in Museums, Collections, and Storerooms	740
500	New Insights into Agricultural Practices and Their Environmental Conditions. The Contribution of Archaeometry.....	749
501	Pastures on the Edge: Marginal Landscapes and Alternative Social Forms.....	752

502	Coring Is Not Boring! Drillings in Combination with Other Non or Minimal-Invasive Methods for Investigating Archaeological Monuments [COMFORT]	755
504	Living among the Ruins. Re-Settlement and Identity Formation in Devastated Landscapes and Abandoned Cities	762
505	For an Archaeology of Households: Narratives, Landscapes, Materiality, Inequalities, Gender, Race, Ethnicity ...	768
506	Human Stories and Histories in the Era of Integrated Science	772
507	Modern quarries and archeology: protection issues, regulations, methodologies, impact, sustainability	779
509	Embodying Gender, Problematising Sex: Weaving Together Theory and Method in the Exploration of Bodily Difference	783
515	Decolonising Palaeolithic and Mesolithic Archaeology: Reframing Practices, Values, and Perspectives [PaM]	786
514	Adopt a Monument- Community Action in a Changing World.....	789
516	European Archives of American Archaeology [EAA4Am]	789
520	What Now, Theoretical Archaeology? Thinking Theory in the Fourth Scientific Revolution.....	791
521	(Re)-thinking Small. Bladelets and Microlithic Productions before the Onset of the Upper Palaeolithic and Later Stone Age [PaM]	794
522	Lithic Ontologies: Rethinking the Meaning of Knapped Lithic Artefacts in Palaeolithic and Mesolithic Europe [PaM].....	798
523	Immersive Techniques as Tools for Public Outreach in Archaeology.....	800
524	New Narratives in Industrial Heritage: Exploring Alternative Approaches to the Industrial Past	805
527	Conflict Legacies of the 20th Century	808
528	Weaving Defense, Landscape and Social Organization from Antiquity to Early Modern Times.....	814
529	Beyond Identities: Crafting Information in the Old World from the Bronze Age until the Late 1st Millennium BCE.....	817
530	Eurasia before and after the 8.2 ka BP Event – A Significant Horizon of Cultural Change? [PaM].....	821
531	Migration and Archaeology after the 3rd Scientific Revolution: aDNA, Isotopes and New Theoretical Perspectives	824
532	Symbolic Bodies – Understanding the Significance of Death and the Dead in Prehistoric Northern and Western Europe [PaM].....	829
534	Diversity in the Spread of Neolithic Lifeways: Exploring Regional Differences Across Eurasia [PaM].....	834
535	Precarious Living Conditions in the Past: A Multidisciplinary and Transchronological Approach.....	837
538	Assembling Hoards: Object Biographies, Past Lives and the Process of Collecting and Accumulating Objects into Hoards.....	841
539	New Research in Roman Ritual: Objects and Temple Sites.....	843
540	Zooming in/out/past the Viking Age: Integrating Local, Regional and Global Funerary Practices in the Baltic–North Sea–Atlantic Axis, AD750–1050	846
542	Reconstructing Biological Relatedness and Inferring Human Relations in the Past.....	848
555	All These Finds – Challenges and Possibilities on Large Urban Archaeological Excavations	855
557	The Sediment as an Artefact: Interpreting Human Behaviour and Activities through Geoarchaeological Analysis	860
560	Investigating past human mobilities through natural resources exploitation: latest results and developments	865
561	Responsible “Site” Seeing: A Discussion about Sustainable Archaeological Tourism That Enhances the Visitors’ Experience while Minimizing the Negative Impacts of Visitation [Heritage and Tourism community].....	869
563	Shaping Archaeology through Ethical and Community-led Activist Practices.....	871
564	Yesterday’s Yarns and Tomorrow’s Tales? The Relevance of Research Frameworks for a Sustainable Archaeology	874

567	Animals Make Identities: How People Expressed Their Social Affinities in the Stone Age? [PaM]	877
568	Beyond Bean Counting: Current, Emerging and Anticipated Approaches to Benefitting People and Places through Archaeology [EAA Public Benefits Advisory Committee]	880
570	A Twist in the Tale: Coiled, Spun and Rolled Stories from Artefact Studies	882
572	There Is More that Unites Us, than Divides Us. Taking Strategic, Collaborative Approaches to Managing and Delivering Archaeology.....	885
573	Interdisciplinary coprolite analysis	886
574	It Takes a Village: Interdisciplinary Bioarchaeological Research on the Role of Children in the Past	889
575	Radiocarbon Dating and Archaeology	895
578	Between the East and the West. Çatalhöyük' Contribution to the European Neolithic and European Archaeological Thought.....	900
600	Interpreting Ceramic Technical Data: Challenges in Approaching and Deciphering Prehistoric Societies through Their Pottery Production	902
601	Weaving Archaeology, Art and Literature: Narratives & Representations.....	907
602	Runes, Monuments and Memorial Carvings Network.....	913
603	Replicable Archaeology: Looking for Workflows and Data Management Strategies Fostering Data Reuse and Methodological Transferability in Archaeological Science	913
604	Staging Marginality: Linking Marginal Landscape, Social Power, and Subaltern Materiality.....	920
605	Multi-scalar Lives in the Early Medieval North Atlantic.....	922
606	Hearth and Home: Diachronic Approaches to the Archaeological Record	926
607	Linking Databases for Comparing Research: Show Your Fortification Information System [COMFORT].....	928
609	Multidisciplinary Approaches to Metals: From Ore Mining and Metal Production to Their Impacts in Human Life and Environment.....	931
610	New Ways of Telling the Histories. New Methods of Dissemination of Archaeology and Heritage.....	938
611	Heritage Goes to School. The Importance of Archaeological Dissemination in Education.....	942
612	Living and Dying in the Middle Ages: Bioarchaeological Approaches to Health, Disease, and Disability.....	946
614	Food culture(s) of Neolithic southeastern Europe: culinary traditions, cuisine and pottery	954
615	Some Like It Hot: Copper and Bronze Age Settlement Patterns as Response to Climate Change?	957
616	EAA Community for Climate Change and Heritage (CCH) Roundtable.....	961
618	Archaeologies of Religion and Symbolic Behaviour: Building Usable Digital Databases.....	961
620	Isotopes and Archaeological Theories of Complexity	962
621	'Specialisation, Standardisation and Diversity': Re-examining the Role of Mass Production in Archaeology.....	965
657	Through Infancy and Beyond: Bioarchaeological Perspectives of Childhood in the Past	969
660	Floor Debates. Analysis and Interpretation of Archaeological Floors and Occupation Surfaces	984
661	Pathogenic Disease in the Past.....	992
662	Run to the Valleys [PaM].....	995
664	The Anti-HABI Toolkit: Practical Workshop on Solutions and Measures for Preventing and Addressing Harassment, Assault, Bullying and Intimidation in Archaeology	999
665	Understanding Isoscapes	999
666	Prospecting Prehistoric Land Use and its Environment: Challenges and Perspectives for Investigating Lifeways of Hunter Gatherers and Early Farmers [PaM; Archaeological Prospection Community]	1002
669	How to Make Genders and Sexualities Visible in the Ancient Mediterranean?	1006
670	Neolithization of the Mediterranean: Integrated Approaches to Old Questions	1008

671	Rock Art, Landscape, and Settlements - Study of Context and Placement.....	1012
672	Hunter-Gatherer Animal Exploitation in the Pleistocene and the Archaeological Record [PaM].....	1017
674	Methods, Meanings and Maintenance - Approaches to Medieval Ecclesiastical Buildings.....	1022
676	Integrating Neandertal Legacy: Recent Results of Multi- and Interdisciplinary Research [PaM].....	1028
677	Early Christianity and Its Impact on Life during the Rise of the First East Central and Northern European Monarchies.....	1032
678	Metals and Metalworking II – Archaeometallurgical Narratives of the Iron and Middle Ages.....	1035
682	A Glimpse into the Inequalities along the Margins: Surplus Economy, Technological Change and Trade in the Western Mediterranean Hinterlands.....	1042
684	Forensic Archaeology in Europe: Contesting the Present.....	1045
685	Re-integrating the Environmental Archaeology of Europe’s ‘Wet’ and ‘Dry’ Neolithic Landscapes.....	1049
686	Following the Steps of Past Shepherds. Searching for Pastoralism in Mountain Areas.....	1055
687	Historical Archaeology or the Material History of the Modernity: Experiencing Landscapes around the Four Corners of the World.....	1060
688	Bioarchaeology of Girlhood, Maidenhood, and Motherhood in Past Societies. Reconstructing Women’s Life-History through Morphology, Histology, and Biogeochemistry.....	1062
690	In Search of Sustainable Pastoralism: Stories of Heritage, Resilience, and Collaboration.....	1067
691	Feeling and Learning about the Past: New Methodologies for Studying Archaeological Sites.....	1071
692	CRM Archaeo Workshop: A Stepping Stone to FAIR Practice.....	1073
693	Zooarchaeology and mobility in the Past: human-animal interaction in Archaeology from Palaeolithic to Medieval times [PaM].....	1074
694	Routed Archaeology IV: On the Path of Synergy.....	1081
696	Cloth Cultures in and beyond Viking Age [EAA ComTex].....	1084
697	So Different, Yet So Similar: Biocultural Identity and Plurality in the Medieval and Post-medieval World.....	1088
699	Stone, Brick and Mortar: Architecture of the Early Medieval Period in the Balkans.....	1092
701	Terracotta Figurines as Random or Deliberate Offerings. A Complex Context Revisited.....	1094
702	Interdisciplinary Integration in Reconstructing Agricultural Crop Histories.....	1097
705	Reconstructing Human-Environment Relationships in Extreme Environments: The Roles of Geoarchaeology, Zooarchaeology, and Archaeobotany in Water-Dominated and in Water-Deprived Landscapes.....	1102
706	On Land and Underwater. Detection and Evaluation of Archaeological Sites: Comparative Methodology on a European Scale [Archaeological Prospection Community].....	1105
707	Open Access Remote Sensing Data in Cultural Heritage Management, Archaeological Research, and Citizen Science.....	1109
710	Archaeological Approaches to Human Perception: Methods and Practice.....	1113
711	FAIR Reuse of Archive Data.....	1116
712	What to Do with Your Code? Tools and Best Practices for the Long-term Sustainability of Code Outputs in Archaeology.....	1119
713	Artefacts, Archaeological Science and European Identities in Iron Age Alps, Pannonia and the Balkans [EAA ComTex].....	1119
714	Repositories and Datasets as Operational Tools in Countering the Illicit Trafficking of Cultural Goods.....	1123
723	Strategies for Food Production in Prehistory.....	1124
724	Archaeo-Riddle: The Ultimate Challenge.....	1126
725	Islands, Monasteries and Water.....	1126
727	Centuriated Landscapes beyond the Western Mediterranean: Roman Impacts on Landscape Evolution.....	1129

728	Urban Phenomena in Archaeological Sites-Issues Related to Traits, Homogeneity, Diversity and Sustainability...	1132
729	EXARC: Reconstructing Past Narratives Through Experimental Archaeology.....	1137
730	Interdisciplinary Perspectives into Roman Commerce, Economy and the Acquisition of New Tastes during the Roman Period from the 4th Century BC Onwards	1145
731	General session.....	1153
732	European Research Council funding opportunities for you.....	1161
	Index of Authors	1162

2 **ARCHAEOLOGY, LANDSCAPE AND THE SKYSCAPE. HOW MATERIAL ARCHEOLOGY IS WOVEN WITH DIFFERENT ONTOLOGICAL AND CULTURAL INTERPRETATIONS [SEAC-EAA]**

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Balbi, Jose (Colchester Archaeological Group; Dirección de Cultura y Educación de Buenos Aires) - de la Vega, Hans Martz (Escuela Nacional de Antropología e Historia) - Iwaniszewski, Stanislaw (State Museum of Archaeology, Warsaw) - Mejuto, Javier (Archeoastronomy & Cultural astronomy dep, Space sciences. Universidad Nacional Autónoma de Honduras)

Session format: Regular session

This session is the continuation of the sessions of the last three years and belongs to the SEAC-EAA community. Our goals coincide with those of the community.

We consider that one of the aspects of the relationship between archeology and cultural astronomy has been the interconnection between celestial bodies and humans. The orientation of the archaeological structures towards certain stars or features of the landscape have been one of the greatest evidences of their ontological and cultural importance. By studying star alignments with ancient constructions, we can learn about the relationships of past human societies with celestial bodies, landscape, and phenomena. From our point of view, places with cosmic connections could have generated “new assemblages” (a term borrowed from Gilles Deleuze and Feliz Guattari) of objects, human and natural, revealing sets of practices and materialities situated in time. We propose to study them and give them a cultural and ontological meaning.

Therefore, some of the issues that the papers in this session should address are: is it possible to understand how people lived in their environment by observing and studying the landscape, the sky or any other aspect of an archaeological site? How technology and new techniques allow us to understand known data? What is the ontological relationship between people and their environment? How can the construction of old buildings be understood from a skyscape or landscape point of view? The purpose of the session is to carry out an archaeological study with multidisciplinary contributions. To achieve our goals, we supplement the archaeological data with those of other sciences.

ABSTRACTS

1 **IN SEARCH OF THE INKA - MAPUCHE BORDER. ARCHAEOLOGICAL ACCOUNT OF A MILITARY, CULTURAL AND LINGUISTIC CONFRONTATION**

Abstract author(s): Balbi, Jose (Colchester Archaeological Group)

Abstract format: Oral

The Mapuche ethnic group constitutes a series of aboriginal originating in South America, in the western zone of the Andes Mountains. At some point in history (and this is still a matter of discussion), benefiting from the Spanish invasion of America, they spread over the Andes and conquered vast territories on the eastern part, in what is now Argentina. When and how they came to occupy part of Patagonia is not the subject of this paper but the relation and fights against a series of tribes that a number of histories, accounts and others mention as „Aimaras“ or „Diaguitas“. The local tribes had divinities based on nature, including the sun, but they did not have the same feeling towards the rocks, very important in Inka cosmology and considered from a diabolical origin. Between them, we will find matching elements, both in beliefs, customs, symbology and architecture. We have surveyed areas further south of the traditional limits imposed on Inka expansion and we can affirm that the elements of material archeology, landscape and astronomical orientation found at the height of parallel 38° and 39°, corresponds to the Inka culture, expanding the current idea that locates them at the 32° parallel. It is there where the border was in 1532, when the meeting between Atahualpa and Pizarro occurred in Cajamarca, determining the end of the confrontations: The situation urges Atahualpa to require all the military, treasures and the end of the expansion, giving rise to the belligerent tribes can expand to the East. Our archaeological and museological research in the Argentinean Patagonia area leads us to this demonstration of contact and aims to provide us with some answers about whom the descendants of these ethnic groups really are, and who currently occupy these vast territories in the southernmost part of the world.

2 **EXTREME SOLAR POSITIONS ANALYSIS IN AYASTA ROCK SHELTER, HONDURAS**

Abstract author(s): Mejuto, Javier - Rodas-Quito, Eduardo (Universidad Nacional Autonoma de Honduras)

Abstract format: Oral

Ayasta is considered one of the main rock art sites in Honduras. Formed by three small consecutive rock shelters, it has a large number of scenes and stations archaeologically interpreted as a Proto-Lenca vestige, dated around the

year 1000 CE. Likewise, work has been done and continuous reference has been made to the anthropomorphic, zoomorphic and anthropozoomorphic elements of the site proposing ritual uses for the shelter. However, there is a great variety and quantity of astromorphs that allow an exhaustive analysis of the possible methodical astronomical observation and the use of this knowledge for the Proto-Lencans. In this contribution we explore some of the astromorphs that appear in the rock shelter of Ayasta, Honduras. In particular, the geometric elements in the winter solstitial and equinoctial events are analyzed. The probable relevance of the astronomical significance, both in solstices and in the equinoxes is supported by several solar astromorphs at the edges of the rock shelters and results of preliminary observations on site.

Finally, we present the preliminary conclusions of the data gathered in relation with interconnected shelters in the area and other astromorphs of this culture in Honduras.

3 THE LAST RESTING PLACE OF THE STARS IN THE KAWÁ SÍSQUI CAVE, GUERRERO, MEXICO: ARCHAEOASTRONOMY AND AGRICULTURAL CYCLES

Abstract author(s): Martz de la Vega, Hans (Escuela Nacional de Antropología e Historia / National School of Anthropology and History, Mexico) - Pérez Negrete, Miguel (Instituto Nacional de Antropología e Historia, México)

Abstract format: Oral

In Mesoamerica, there are few caves and rock shelters with rock art attributed to the Olmecs, and even less with some type of archaeoastronomical and landscape study. One of these cases is the Kawá Sísiqui Cave (also known as Cahuaziziqui), initially documented by Samuel Vilella Flores, who visited it in 1986 and disseminated it since 1989. In this presentation we will show some of the first ideas we have worked on, based on the observations and questions that Vilella Flores has made about the local horizon and the stars represented in the present paintings. We will also add details of the iconography based on his drawings and what can still be seen.

Undoubtedly, from those times, towards the end of the Early Preclassic period (1200 BC), the Olmecs already had a special interest in the ordering of time and space based on the agricultural cycle and their worldview, and this can be said because, precisely with them we have the first evidence of orientation of civic-ceremonial centers and architectural structures, as well as the record of the passage of the Sun through the local horizon and representations around maize, as one of its main deities.

From Kawá Sísiqui it is possible to observe the region of the great volcanoes of Mexico, such as Citlaltépetl-Popocatepetl, in addition to forming a natural alignment with them, which also marks the astronomical north, a suggestive direction to support certain ideas about representations of the main panel of paintings.

The shape of the cave allows to postulate a place of observation of the sky since it is the region of the horizon where the Sun and Venus reach their extremes. This is reinforced by the presence of a possible representation of the god of maize, another of maize itself, as well as germinating plants.

4 SPATIAL DISTRIBUTION AND LANDSCAPE OF SOLAR SYMBOLS IN THE PETROGLYPHS OF CHECTA - PERU

Abstract author(s): d'Ans Alleman, Barthélemy (Instituto Peruano de Astronomía; Planetarium Maria Reiche)

Abstract format: Oral

This contribution consists of the study of the orientations and arrangement of pre-Columbian petroglyphs of solar symbols found among the 450 stone blocks of volcanic origin in an area of 8000 square meters of the Checta archaeological site located 1000 meters above sea level in the western foothills of the southern Andes in the province of Canta Valle de Chillón in Peru. The chronology generally associated with this vast rock art complex would be linked to the Early Intermediate Period (200-600 BC) (Guffroy 1987). More recent studies maintain that it would be associated from the „Initial period“ of the Andean chronology (2000 - 1000 years BC) (Echevarría and Ruiz 2007). In other words, there are at least four different stages of rock production (Echevarria 2003). For this record, a non-invasive visual method was used, generating three-dimensional photogrammetric molds of the stone blocks and the raising of landscape profiles for each of the astromorphs in order to verify if they have use-function orientations related to the rising and setting of the sun on certain dates or if the panels present shadows or lighting in certain periods of time.

5 ARCHAEOASTRONOMICAL RESEARCH AT TENAM PUENTE, CHIAPAS, MEXICO

Abstract author(s): Iwaniszewski, Stanislaw (Posgrado en Arqueología Escuela Nacional de Antropología e Historia - Instituto; State Archaeological Museum, Warsaw) - Galindo Trejo, Jesús (Institute of Esthetic Research, National Autonomous University of Mexico)

Abstract format: Oral

The site of Tenam Puente, located in the eastern part of the Chiapas Highlands, has long remained absent from archaeoastronomical research. However, it was an important Maya city that flourished between the Classic and Post-classic periods (approx. 500 – 1100 CE). The Acropolis stands out among the architectural assemblages found on the site, with the most important civic and religious buildings. The northeast section of the Acropolis constitutes one of the highest points with a great domain of the Comitán Valley. In the present paper, we will present the results of archaeoastronomical research carried out within the Acropolis, including Structures 7 and 42, as well as their possible relationship with the surrounding area. Our study was performed in situ, with a survey by a theodolite supplemented with a Brunton compass and a GPS receiver. In our presentation, we will show how combining land- and sky-scape elements with the specificities of Maya ritual-mantic and solar calendars can offer a satisfactory explanation for the particular building orientation.

6 REFLEXIVITY AMONG THE STARS: REASSESSING ONE OF ARCHAEOASTRONOMY'S DEEPEST-HELD BELIEFS

Abstract author(s): Silva, Fabio (Bournemouth University)

Abstract format: Oral

A recent analysis of the history of archaeoastronomy as an academic endeavour has concluded that it never matured beyond what could be called an 'emerging field'. The ability to turn a critical eye upon itself, to reflect on its own assumptions and long-held beliefs, is a key ingredient in a field's ability to regenerate itself in light of new discoveries and methodological and theoretical advancements. This paper will argue that this is an aspect of a mature field of academic study that has been missing from archaeoastronomy, and one that continuously works to stymie dialogue with the sister fields of archaeology and anthropology. This point will be illustrated by focusing on the often repeated logic that, because there are many stars in the sky, and their rising and setting positions change over the centuries, it is easy to find a star that appears to fit any randomly selected structural orientation – an argument that is used to shun, dismiss and discourage stellar alignments. This argument is statistical in nature and, as such, it will be here tested by formalising it under a statistical framework. By doing this, it will be shown that a (properly researched) stellar alignment is no more no less likely than a solar alignment, thereby demolishing the long-held belief that stops researchers from seriously considering the stars as targets of alignments. In addition, the overwhelming evidence for the importance of the stars, constellations and the Milky Way in the historical and ethnographic records from all over the world, will be summarised and brought to bear on the busting of this myth. This talk aims to restore the role of the stars and Milky Way as key celestial targets that should be regarded on equal footing with the solar and lunar targets routinely employed by archaeoastronomers.

7 TOLOTZIN AND THE CONTINUITY OF TIME. THE ARCHITECTURE OF CERRO TOLOCHE AND ITS RELATIONSHIP WITH THE LANDSCAPE AND THE SKY

Abstract author(s): García Reyna, Ricardo Arturo (Escuela Nacional de Antropología e Historia)

Abstract format: Oral

The Cerro Toloche archaeological site is located on one of the peaks (2800 masl) of the Sierrita de Toluca, in the capital of the State of Mexico. According to technical reports, the site was occupied during the Postclassic period (900-1521 AD) and has been associated with the Matlatzincas (an ethnic group that lived in the Toluca Valley). According to historical sources from the 16th century, Cerro Toloche is associated with Coltzin or Tolotzin, an ancient deity of fire, who among his many associations is the account of time.

The architecture of the site exhibits a spatial orientation associated with the rising and setting of the solar disk at significant dates and intervals within the Mesoamerican count of time. Likewise, certain prominent features in the eastern and western local horizons indicate the rising and setting of the sun at significant moments, such as the solstitial extremes.

Relying on the theoretical approaches of the researcher Stanislaw Iwaniszewski (the agency of the forms of the landscape and the orientations of pre-Hispanic architecture as detonators of the social field of relations) in the present exhibition we seek to rethink Cerro Toloche beyond the approach that defines it as a site of pre-Hispanic astronomical observation, and rethinking it as a form of the landscape that carries an agency associated with the account and continuity of time, from which a series of relationships between the forms of the landscape, celestial bodies and human activities are activated.

8 A CELTIC EARLY CHRISTIAN ORATORY IN NEW ENGLAND?: VERMONT STONE CHAMBER #32

Abstract author(s): Tiede, Vance (Astro-Archaeology Surveys; Yale University alumnus)

Abstract format: Oral

While New England's drywall stone chambers are typically attributed to Anglo-American farmers AD 1600–1900 (Neudorfer 1980, 2-3), archaeological evidence also suggests an Early Christian monastic provenance ca. AD 500–1200 consistent with the "Terra Repromissionis Sanctorum" of the NAVIGATIO SANCTI BRENDANI ABBATIS (Goodwin 1946, Selmer 1959, Severin 1978).

Null Hypothesis: "There is no physical evidence of pre-medieval Celtic monastic provenance for Chamber #32, Windsor County, Vermont."

Methodology & Findings. Test for Presence/Absence along the following lines of evidence to falsify the Null Hypothesis:

– Astro-Archaeology: Solar alignments signaling the Divine Hours commemorating the crucifixion of Jesus prior to Passover (first Full Moon after the Vernal Equinox). The single window of Gallarus Oratory's (Séipéilín Ghallaraís, County Kerry) admits sunlight at 9am (Terce, 11rd Hour, Mark 15:25) on the Vernal Equinox. The single window of Vermont Chamber #32 admits sunlight on the Vernal Equinox which extinguishes on a Romano-British Chi-Rho (XP) at 3pm (None, 1Xth Hour, Mark 15:34), i.e., a metaphor for the death of "Christus Sol Verus" (Thomas 1985, Fig 5 (5), 89; Tiede 2001, Sedulius Scottus ca. 850).

– Iconography: Hiberno-Latin "nomina sacra" and Romano-British rock art. Vermont Chamber #32 petroglyphs include: XP (Greek: ChRist), A(lpha), O(mega), Antr(on, Greek: tomb) and a Sun Cross slab (Revelation 1:8, 21:6-7, 22:13; Fell 1983, 183; Thomas 1985, Fig 5(5) & (7), 89; Dexter 1986).

– Metrology: Floor-plan dimensions of Celtic Early Christian rectangular oratories. Rathlin O'Birne Isle #10 (County Donegal) and Vermont Chamber #32 share a common floor-plan, viz., a quasi-Pythagorean Triple (13:26:29) length-to-width ratio in commensurate 13x26 Justinian Byzantine "σπιθαμή" (Walsh 1983, 61).

– Palaeoethnobotany: Pollen/Phytoliths in sediment cores from Britain and Ireland plants introduced into New England ca. 1500–800 BP (<https://www.neotomadb.org/>). Three such possible plant species (Arctium minus, Brassica nigra, and Cirsium lanceolatum) were used in Algonkian Indian traditional medicine (Tantaquidgeon 1972, 115-116).

9 THE DIRECTION OF FREEDOM: LIBERTY PLIGHT IN COLONIAL MAURITIUS

Abstract author(s): Caval, Saša (Scientific-research center of the SAZU) - Cianciosi, Alessandra (University of Amsterdam)

Abstract format: Oral

Mauritius, an island in the SW Indian Ocean, was unpopulated until the 17th century. The Dutch brought the first enslaved people to Mauritius in 1639 from Madagascar. Throughout almost 200 years of slavery, the enslaved community developed their own elements of culture and negotiated their existence in Mauritius any way they could. The beacon of resistance was the establishment of a 'Maroon republic' in the southwestern cape of the island. The area is today protected as UNESCO Le Morne Cultural Landscape due to its exceptional testimony to maroonage (resistance to slavery) in terms of the mountain Brabant being used as a fortress to shelter escaped enslaved people.

This paper will address a burial ground called the Le Morne "Old cemetery," located southeast of Brabant Mountain. Our archaeological research of the cemetery revealed genetic links to Madagascar. However, observing the cemetery itself carefully, the burials and the landscape display other links both to Madagascar and the idea of freedom. The plight of enslaved on their deathbed and the freedom symbolism of the Le Morne mountain is written in the alignments of the graves at le Morne cemetery: over 40 graves at Le Morne cemetery were preserved for at least 200 years. Somebody was maintaining the graves every time the beach sand covered them. Throughout time, the original alignment slowly changed due north. The 'path' is visible in phases of the grave structures. The final (extreme) alignments are extremely vocal: the original azimuths of graves point towards the island of Madagascar itself, while the 'newest' alignment is directed toward the 'maroon republic'.

MODERN APPROACHES TO THE STUDY OF LANDSCAPE IMPROVEMENT AND THE CREATION OF SUSTAINABLE AGRICULTURAL SYSTEMS

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Albert, Rosa Maria (ICREA - Catalan Institution for Research and Advanced Studies; Dept. of Prehistory. Autonomous University of Barcelona) - Fallu, Daniel (UiT: The Arctic University Museum of Norway) - Walsh, Kevin (Department of Archaeology. University of York) - Alonso-Eguiluz, Monica (Maritime Cultures Research Institute - MARI, Vrije Universiteit Brussels) - Brown, Antony (The University Museum, The Arctic University of Norway, Tromsø; The Palaeo Lab, Geography & Environment, University of Southampton)

Session format: Regular session

The creation and demarcation of agricultural space is a social product that reflects the culture and history of societies. Cultivation of challenging or “marginal” land generally involves the physical alteration of the environment by felling trees removing superfluous materials, such as rocks, creating lynches and terraces, transferring water, and in some cases, creating and transporting soil and manuring. Hillside farming comprises arable and pastoral production systems that often work in tandem. Through the study of hillside agriculture and its landscape transformation, we aim to build narratives assessing agricultural systems’ development and sustainability.

The diachronic study of these socioecological trajectories involves traditional environmental and dating techniques, such as pedology, geochemistry, soil micromorphology, pollen and phytoliths, and radiocarbon dating, but also potentially new methods such as sedaDNA, biomarkers (e.g., faecal stanols, bile acids, waxes...) and direct dating of sediments (for example, luminescence methods). The development of these techniques is archaeologically essential even though they are all subject to similar taphonomic issues such as bioturbation (vegetable and animal), leaching and tillage-perturbation. However, when found in complex topography, geomorphology dictates that archives in the form of cumulative soils are likely to exist on colluvial slopes and in buried or mixed soil horizons. In this session, we invite contributions dealing with modern approaches to the study of landscape improvement and the creation of sustainable agricultural systems. Contributions from around the world are welcome.

ABSTRACTS

1 EXPANDING HORIZONS: NEW UNDERSTANDINGS SOILS AND THEIR INVESTIGATION

Abstract author(s): Doonan, Roger (Archaeological Research Services Ltd)

Abstract format: Oral

Soil is the most common material encountered on any archaeological site yet is, arguably, the most complex substance that an archaeologist ever encounters. Despite this complexity, or perhaps because of it, soil is often overlooked as it makes its way to the spoil heap. This paper argues that the spoil heap is a dismal resting place for archaeological soils especially in light of the significant cumulative investment that past communities have made in soil through activities such as terracing, manuring, and tilling. In terms of effort, energy, and extent, soils are likely our species greatest cultural inheritance.

Numerous systems for the classification of soil exist, yet it defies simple classificatory schemes by being at once cultural and natural and straddling physical, chemical, mineralogical, biological and ecological systems while also transcending time in being simultaneously both contemporary and historic. This far-ranging character of soil makes it a challenge to investigate and while there is an ever increasing arsenal of techniques available to the archaeologist there is a vital need to critically appraise the way we think about soil.

In this paper, some recent developments in method and techniques of soil investigation are reviewed, from capturing physical changes in terraced systems and quantifying energy inputs to considering hitherto unrecognised chemical signatures and activities in agricultural landscapes. It is argued that while the expanding toolbox for soil investigation should be welcomed it is essential that we continue to challenge our understanding of what we think soil is and how it works.

2 CARBON STABLE ISOTOPES AND RADIOCARBON IN CHARRED BOTANICAL REMAINS TO RECONSTRUCT HIGH RESOLUTION PALAEOCLIMATE REFLECTING ENVIRONMENTAL CONDITIONS IN SOUTHERN LEVANT

Abstract author(s): Boaretto, Elisabetta - Regev, Lior - Mintz, Eugenia - Ehrlich, Yael - Raj, Harsh - Caracuta, Valentina (Weizmann Institute of Science)

Abstract format: Oral

Charred wood and olive pits are frequently preserved in archaeological sites in Israel, from the past few thousand years. If dated by radiocarbon, these botanical remains represent an information archive of the past climate conditions represented by the stable carbon isotopes ($\delta^{13}\text{C}$) ratio. In particular olive pits provide multiple advantages as a proxy, allowing for higher resolution of climate reconstruction, both spatially and temporally, reflecting the environment in which the olive trees were growing, and humans were living. An analysis of modern trees and olive pits was performed to assess the reliability of these proxy to reconstruct the climate and for example to connect the $\delta^{13}\text{C}$ and aridity index. Specifically, threshold $\Delta^{13}\text{C}$ for olive trees under severe drought stress was identified. We have also verified with radiocarbon dating of single tree rings along the radiocarbon bomb peak the annual growth of tree rings and the possibility of several consecutive missing rings. Integrating carbon stable isotopes ratio as the stable isotopes as $\Delta^{13}\text{C}$ and radiocarbon dating of each archaeological sample, we reconstruct the climate conditions for the past few thousand years in Israel identifying arid and wet periods synchronized with cultural and social changes.

3 REE TRACKING ANTHROPOGENIC ACTIVITIES AT THE NEOLITHIC STRATIGRAPHIC SEQUENCE OF COVA DE LES CENDRES

Abstract author(s): Gallelo, Gianni - García-Puchol, Oretó (University of Valencia) - Pardo-Gordó, Salvador (University of La Laguna) - Bernabeu, Joan (University of Valencia)

Abstract format: Oral

Rare Earth Elements (REE) due to their particular characteristics have been employed to different anthropogenic soils, demonstrating that this is an effective tool to understand the contribution of human activity in archaeological stratigraphic sequences, pushing forward the current limitations of traditional chemical and sedimentology techniques. This study shows the first application of REE concentrations in Cova de Les Cendres archaeological site. The site displays one of the few complete sequences from the earliest moments of the Neolithic to the beginning of the Bronze Age in the western Mediterranean region. The sequence presents a series of levels interpreted as corral fires resulting from the stabling of ovicaprids. The bottom of the section covers the Neolithic sequence, between c. 5500-5000 cal BC interpreted as a multifunctional settlement, where, together with livestock farming, there is also an important presence of agricultural activities and use of marine resources. REE concentrations, calculated ratios and anomalies, provide significant details regarding human activities and the post-depositional processes. Finally, to reinforce our hypotheses we cross-referenced our results with sedimentological, archaeobotanical, and zooarchaeological data and the archaeological record. Data were analysed using multivariate statistics. The results present a new picture of the anthropogenic contribution to the development of the strata in the cave profile.

4 METHODS FOR IDENTIFYING THE REMAINS OF WILD AND DOMESTICATED PLANT SPECIES

Abstract author(s): Andreu Diez, Oriol (Universitat de Barcelona - UB) - Pellicer, Jaume (Institut Botànic de Barcelona - IBB, CSIC-Ajuntament de Barcelona) - Boaretto, Elisabetta (Weizmann Institute of Science - WIS) - Albert, Rosa María (ICREA - Catalan Institution for Research and Advanced Studies; Universitat Autònoma de Barcelona - UAB)

Abstract format: Oral

The domestication of plants and the development and expansion of agriculture, through the construction of terraces, were pivotal moments in the history of humanity. In this regard, phytoliths may be crucial in distinguishing ancient crops from their wild ancestors and from other wild grasses. Nevertheless, despite all the advances in recent years in the taxonomic identification of cereal phytoliths, mainly through morphometric analyses, there are still some limitations that hinder their ability to identify past crops. Polyploidy events are frequent in plants, and in the case of cereals such as wheat, these events have been decisive due to its adaptive potential to different environments. For instance, prior studies show that an increase of the ploidy level in *Triticum* sp. affects phytolith production in the papilla cells. Our goal is to enhance the taxonomic identification of cereals by investigating how the genetic imprint and human influence on domestication processes affect phytolith formation. To do this, we investigated the influence of ploidy level in the morphology of siliceous phytoliths, by developing a novel technology that uses flow cytometry to estimate the genome and karyotyping. We incorporated several varieties of wheat from *Triticum* sp. (*T. monococcum*, *T. diccoides*, *T. dicoccum*, *T. durum*, and *T. aestivum*) and barley (*Hordeum vulgare*), including their known wild ancestors (*Aegilops speltoides* & *Hordeum spontaneum*), to our current reference collection in order to study the genealogy and the

polyploidization history of wheat and the domestication process in barley. We believe that the research will enhance our ability to identify cereals at archaeological sites, including cereal cultivation on agricultural terraces.

5 MICROARCHAEOLOGICAL STUDIES AS A TOOL TO EXAMINE THE USE OF ANCIENT AGRICULTURAL SYSTEMS

Abstract author(s): Albert, Rosa Maria (Autonomous University of Barcelona; ICREA - Catalan Institution for Research and Advanced Studies) - Alonso-Eguiluz, Monica (Multidisciplinary Archaeological Research Institute - MARI, Vrije Universiteit Brussel)

Abstract format: Oral

The integration of various microarchaeological approaches including phytoliths, ash pseudomorphs, fecal spherulites, aqueous microremains such as diatoms and sponge spicules, and FTIR, has significant advantages for both archaeological and paleoenvironmental research. Their study can teach us about past human activities such as farming and grazing strategies, pre and post-depositional sedimentary processes, and the availability and conditions of the water. In this talk, we will give a few examples of how this integrated strategy of multi-analytical applications has helped to considerably increase our understanding of the landscape, paleoenvironmental conditions, and agriculture and grazing practices in hillsides and terraces of various archaeological contexts and from various geographical locations. Examples will include works in various settings from South America and the Levant, where the application of these studies on hillsides and terraces is being implemented more frequently. We'll also provide examples from the research that we did in Europe within the frame of the Terrace project (i.e. Sicily, Norway, UK, etc.). The major goal is to assess the feasibility of this multi-analytical approach throughout Europe while taking into account the study sites' geographic location, their environmental conditions, and any postdepositional processes that might have an impact on the preservation of these microremains.

6 SEARCHING FOR CROPS. APPLICATIONS OF HIGH-RESOLUTION MICROARCHAEOLOGICAL TECHNIQUES TO EUROPEAN AGRICULTURAL TERRACES

Abstract author(s): Alonso-Eguiluz, Mónica (Multidisciplinary Archaeological Research Institute-Vrije Universiteit Brussel) - Albert, Rosa María (ICREA Research Professor; Autonomous University of Barcelona)

Abstract format: Oral

Agricultural terraces are ubiquitous in the European landscape. Their construction and use span several chronological periods, with their first record dating back to the Neolithic. In addition to their impact on the landscape and on the environment, the ability to enlarge crop production areas by building terraces allowed for an improvement in crop quality, yield, and variety, which helped to boost societal complexity and demographics. To better understand these processes, the TerrACE project has developed a high-resolution research protocol to be applied in agricultural terraces systems from Europe, with no chronological distinction. This multi-scale analytical research includes, among others, the analysis of biogenic microremains to identify past cultivars.

We present here the results obtained from the analyses of various microremains including phytoliths, ash pseudomorphs, fecal spherulites, aqueous siliceous microremains (diatoms and sponge spicules), and Fourier Transformed Infrared Analyses (FTIR) from different agricultural terraces across Europe. Four of them are located in UK (Plantation Camp, Blick Mead, Gueswick and Charlton Forest), four in Norway (Bjorskin, Homlong, Skotek and Smoge, Norway), and five in southern Europe (Soave, Castronovo (Italy), and Anavlochos, Panormos and Bouzi (Greece)). Phytoliths were abundantly identified in northern European sites, with Blick Mead being the only site where no microremains were recovered. The C3 Pooid subfamily predominated at those locations where phytoliths were identified. Furthermore, the results point to barley as being cultivated at Plantation Camp. In addition to phytoliths, diatoms were identified in large numbers in the Norwegian sites. Spherulites and ash pseudomorphs, on the other hand, were not found in any of these sites. In contrast, only Castronovo exhibits phytoliths in the southern European sites. Along with phytoliths, spherulites and ash pseudomorphs were present at this site. The microremains of Castronovo all seemed to have experienced combustion processes.

7 THE GEOARCHAEOLOGY OF A BRONZE AGE AEGEAN ENGINEERED AGRICULTURAL LANDSCAPE AT CHOIROMANDRES, EASTERN CRETE

Abstract author(s): Fallu, Daniel (Arctic University Museum of Norway) - Vokotopoulos, Leonidas ("Minoan Roads" Research Project)

Abstract format: Oral

With the rise of societal complexity in the Aegean region came an intensification of agriculture and a necessary elaboration of agricultural technologies. Agricultural terraces appear to be a significant part of this agricultural toolkit, appearing to increase significantly in use between 2000 and 1500 BCE in association with palatial centers on the

mainland and in Crete. The ERC-funded project Terrace Archaeology and Culture in Europe (TerrACE) has developed a new toolkit for examining these important landscape archives, including mapping via high-resolution photogrammetry, radiocarbon and optically stimulated luminescence dating, geochemistry, soil micromorphology, phytolith analysis and environmental DNA. In particular, the combination of pOSL and pXRF allows for the high-resolution stratigraphic control necessary for reconstructing terrace construction and use.

The site of Choiromandres in the vicinity of the palace of Zakros on the East Coast of Crete presents a unique opportunity to examine the elaboration of terracing during Minoan palatial administration. The site, a series of terraces surrounded by an enclosure wall and with an associated series of water reservoirs, appears to date some time shortly after the eruption of Thera. Optically-Stimulated luminescence and Radiocarbon dating from terrestrial snail shells were used to better understand the timing of early terrace construction on the site. Comparison between portable luminescence curves, pottery chronology, and chemostratigraphy, allow for the reconstruction of changes to the landscape over time. The geochemistry and relative luminescence curves show both the initial check-dam like accumulation of sediments as well as later addition of soil material for cultivation. Phosphorus levels indicate possible manuring. The unique geo-engineering of the Choiromandres valley by the Minoans will be placed in its appropriate environmental context, examining the climate in the aftermath of the Thera eruption as well as the development of agricultural terracing across Bronze Age Europe.

8 INVESTIGATING THE ALPINE TERRACED LANDSCAPE AROUND THE BRONZE AND IRON AGE SETTLEMENT OF RAMOSCH-MOTTATA (GRISONS, CH)

Abstract author(s): Della Casa, Philippe (University of Zurich) - Abderhalden, Angelika (Fundaziun Pro Terra Engiadina) - Lambers, Karsten (University of Leiden) - Kothieringer, Katja (University of Bamberg) - Maechtle, Bertil (University of Heidelberg) - Roepke, Astrid (University of Cologne) - Ranzinger, Mario (University of Heidelberg alumnus)

Abstract format: Oral

The Bronze and Iron age settlement of Ramosch-Mottata is located on an elevated ridge at 1517 m a.s.l. within the terraced landscape of the Lower Engadine in Switzerland. Reconstructing the settlement and the surrounding activities is an essential path towards understanding the origin and development of the highly specialised vertical economic system in the Alps and its socio-economic implications. Since the 1980s-90s, a prehistoric onset of agricultural practices was postulated in the vicinity of the settlement by pollen and pedological analyses. Using an interdisciplinary approach, including geophysical prospection, (geo-)archaeological survey and soundings, followed by micromorphological, archaeobotanical, and geochemical analyses as well as different dating methods in the catchment area, different situations have been chosen for new analyses. At Chantata (1636 m a.s.l.), a prehistoric terrace with stone construction could be evidenced with combined methods. Different phases of use from the Bronze to the Iron age are documented by (geo)archaeological investigations, including a former tillage horizon evidenced by micromorphological features. The extension of the terrace was estimated by ERT and soil coring. The second site of focus is the potential area of a source with irrigation channels, directly beneath the prehistoric hilltop settlement. As access to water must have been of importance for the settlement and the domestic animals related to it, an excavation was carried out in order to analyse the sediment sequence. Interestingly, the use of this place already starts in the late Neolithic, and continues throughout the occupation periods of the settlement. For a more detailed picture, radiocarbon dating was applied on a series of materials including charcoal, pollen, and charred cereal remains (probably from domestic refuse). This new research allows for a much more detailed discussion of prehistoric agro-pastoral techniques and evolutions in inner-alpine valleys.

9 KNOWLEDGE TRANSFER AND THE TERRACE CULTURE OF JERUSALEM'S HIGHLANDS BETWEEN THE IRON AGE AND THE LATE ISLAMIC PERIODS

Abstract author(s): Gadot, Yuval (Tel-Aviv University)

Abstract format: Oral

Terraces attracted the attention of scholars from a range of disciplines covering geomorphological and hydrological processes, ecological modelling and human-environment interplay, as well as human subsistence strategies and social history. Studies conducted in the highlands of the southern Levant have shown that the construction of terrace walls for dry farming began during the Hellenistic period and that most of the walls seen today built along the slopes are dating to the last 700 years, periods during which the southern Levant was under the Mamluk and Ottoman empires.

This paper will debate the motivation behind terrace constructions during these 700 years. Building on over 150 dated soil samples from different parts of the highlands of Jerusalem, collected and published by a number of research teams, we will first present a long range view of terrace construction events in light of historically known land management reforms.

In the second part of the lecture we will present a high resolution study of terrace construction along Ein kerem river, a short tributary of the Soreq river. By examining the spatial stratigraphy and absolute chronology of terrace walls and plot fencing as well as documents related to land endowments, we will try and tie between construction of terraces and land ownership mechanism and exploitation strategies.

10 TRACING LOESSIC SEDIMENTS AND A HISTORY OF COLLUVIATION AND LAND USE ACROSS A CHALKLAND LYNCHET SYSTEM OF EASTERN BELGIUM

Abstract author(s): Pears, Ben (University of Southampton) - Lang, Andreas (University of Salzburg) - Fallu, Dan (Tromsø Museum, UiT) - Van Oost, Kristof - Zhao, Pengzhi (UCLouvain) - Tarolli, Paolo - Cucchiari, Sara (University of Udine) - Walsh, Kevin (University of York) - Brown, Tony (University of Southampton; Tromsø Museum, UiT)

Abstract format: Oral

Readily identifiable and distinctive loess (windblown) deposits cover large areas of central mainland Europe including Belgium. In many cases these sediments have been mapped across chalkland landscapes and due to their particular textural and mineralogical characteristics (well drained and fertile) have been intensively cultivated in the past. This has led to major tillage-driven colluviation and sediment storage within terrace and lynchet features. This paper presents detailed geoarchaeological results from a substantial chalkland lynchet system at Sint Marten-Voeren in the Limburg Province of eastern Belgium.

Analysis of both in situ and reworked loess from a hillside transect using a range of analytical techniques particularly pXRF, alongside a detailed Optically Stimulated Luminescence (OSL) chronology have enabled a robust chronostratigraphy to be determined from hilltop to valley bottom. Results from the research has shown that the elemental signature of loess at the sample site can be traced through the assessment transect and has illustrated a complex history of cultivation and colluviation from the Iron Age to present day, with particularly extensive sediment transfer in the early medieval and medieval periods associated with a major expansion of agriculture including hop cultivation.

11 COMBINING METHODS TO UNDERSTAND PRE-HISPANIC AGRICULTURE IN TERRACES LANDSCAPES OF THE VALLEY OF SONDONDO, PERU

Abstract author(s): Aparicio, Patricia (Pontificia Universidad Católica del Perú; Universidad de Oviedo) - Korstanje, Alejandra (Instituto de Arqueología y Museo. Laboratorio de Arqueobotánica. Universidad Nacional de Tucuman; Instituto Superior de Estudios Sociales - CONICET/UNT) - Taddei Salas, María (Instituto Superior de Estudios Sociales - CONICET/UNT; Universidad Nacional de Tucuman) - Fernández Mier, Margarita (Universidad de Oviedo)

Abstract format: Oral

Terraces are the most evidence of landscape transformation in the highland of the South-Central Andes of Peru; they represent a magnificent and complex solution to create cultivation areas where geographical and climatic conditions were not ideal. Despite their relevance to studying different aspects of complex societies in pre-Hispanic times, terraces were either ignored or just considered a complementary topic in scholar's research.

Our team focuses on the study of the agrarian landscape and pre-Hispanic agriculture, excavating terraces at different sea levels in the valley of Sondondo, Peru. Moreover, we have excavated in other complementary areas as storages and livestock corrals to understand the complex assembly at the agrarian systems from the Early Intermediate Period until Inca times in the area.

In this contribution, we will present the archaeobotanical technique employed in our research: the multiple analysis of microfossils in soil. This method combines geoarchaeology with the study of micro remains such as phytoliths, starches, diatoms, etc. In summary, this analysis has provided further knowledge of the types of crops cultivated, allowing the identification of farming changes, which are also linked with dating results. Moreover, our technique determines several strategies to improve agricultural work. The results of our analyses demonstrate that traditional interpretations require revision, especially those hypotheses on the cultivation of maize.

12 LANDESQUE CAPITAL AND PRE-COLUMBIAN TERRACING TECHNOLOGY IN CONTRASTING CONTEXTS: THE HIGH ANDEAN PLATEAU AND THE EASTERN FORESTS OF NW ARGENTINA

Abstract author(s): Zuccarelli Freire, Veronica - Roberts, Patrick (Max Planck Institut für Geoantropology) - Pey, Maria Laura - Vaquer, José María (CONICET-Instituto de Arqueología FFyL, Universidad de Buenos Aires)

Abstract format: Oral

Landscape archaeology investigations in the past decades have revealed that even environments commonly considered 'extreme', such as the Neotropical forests or desertic regions, far from being pristine, were extensively transformed by past human societies with repercussions for their biodiversity and soil morphology that persist to this day (Piperno & Pearsall 1998, Erickson 2006, Arroyo Kalin 2016). In fact, agricultural

soils are some of the largest artifacts created by human populations. Specific and transgenerational activities aimed at promoting soil fertility - e.g. use of organic fertilizers, burning, the use of agricultural terraces. Particularly terracing is a well-known landscape modification that expanded in the Andes since ca. 1500 BCE to improve soils for cultivation and to manage seasonally scarce water. We aim to discuss how this technology allowed pre-Columbian peasants inhabiting diverse biomes-the high arid Andean plateau and Eastern forests of NW Argentina- to adapt to changing environmental conditions. This approach includes geoarchaeology, archaeobotanical and isotope analyses in soils, and spatial modeling to address two contrasting cases in the Andean and circum-Andean region of NW Argentina: Cusi Cusi (Jujuy, Argentina) sites dated between 1200 CE to post-colonial times; and El Alto-Ancasti mountain range (Catamarca, Argentina) sites, dated between 500-1000 CE.

13 **FIELD EVIDENCE AND GEOARCHAEOLOGICAL INVESTIGATIONS OF TERRACES IN VERNAZZA CATCHMENT, CINQUE TERRE (LIGURIA, NORTH ITALY): FROM MULTIPLE USES TO ABANDONMENT**

Abstract author(s): Ghislandi, Sabina - Rellini, Ivano (Università di Genova - DISTAV, Dipartimento di Scienze della Terra, dell'Ambiente e della Vita) - Panetta, Alessandro - Piu, Caterina - Menéndez Blanco, Andrés - Stagno, Anna (Università di Genova - DAFIST, Dipartimento di Antichità, Filosofia, Storia, Geografia)

Abstract format: Oral

This paper focuses on the research performed on terraced landscape of Liguria (North Italy) by the Italian team of IRIS project. The whole region has been subjected to intense agricultural exploitation leading to the construction of hundreds of kilometers of peculiar dry-stone walls. Cinque Terre is one of the most impressive examples and here we illustrate the results from a multidisciplinary study of this specific area.

Terraces provide stable topographic base for crops and favour soil moisture conservation in the crop root zone. Since the XV century, these rural terraces have represented great importance for the landscape, covering high portion of coastal slopes. However, the progressive abandonment of the rural activity since the last century is causing an important deterioration of the terraces and action is called for environmental and social reasons.

We present the case study of the terraced vineyard of the catchment of Vernazza (La Spezia), investigated through pedological and soil micromorphological approaches. The results showed a complex soil profile with buried horizons, where the pedogenesis was influenced by ancient management history alternated to phases of abandonment and consequent slope instability. This study included the observation of the historic traces related to the cultivation and transhumance, offering the basis for the improvement of a sustainable agricultural production and enhancement of the vineyards in this area.

The international IRIS project is taking a novel and interdisciplinary approach to advance the socially and environmentally sustainable conservation, protection and use of upland landscapes in Europe. The JPI Cultural Heritage project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement N. 699523.

A. **TIMING THE USAGE OF AGRICULTURAL SPACE: OPTICAL DATING OF AGRICULTURAL TERRACE DEPOSITS**

Abstract author(s): Lang, Andreas - Snape, Lisa - Bahl, Chiara - Mauz, Barbara - Brown, Tony (Natural Sciences, Tromsø University Museum, UiT)

Abstract format: Poster

Agricultural terraces are common features of cultivated hillsides across the world and have recently attracted increasing attention as archives of land-use practices. Such terraces originate from various soil translocation processes and throughout usage are subject of frequent reworking. Establishing chronologies for agricultural terraces usage is, thus, notoriously difficult. Here, we report results from optically-stimulated luminescence dating of terrace sediments that (i) originate from a wide range of locations across Europe stretching from the Polar circle to the Mediterranean; (ii) are derived from various host lithologies including igneous rocks, Triassic sedimentary rocks, Neogene marine deposits, and Pleistocene glacial and periglacial sediments; (iii) represent a range of cultivation styles including labour intensive manual techniques as well as mechanised tillage; and, (iv) cover a wide span of time periods from the Early Bronze Age through to modern times. Reliable chronologies of optical ages, consistent internally

and in agreement with independent age information, were established on silt-sized quartz extracts from loess derived terrace deposits and on sand-sized quartz grains derived mostly from

sedimentary host rocks. OSL signals of quartz extracted from deposits with igneous and turbiditic host rocks are often not of sufficient quality for optical dating purposes.

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Biittner, Katie (MacEwan University) - Smith Nicholls, Florence (Queen Mary University of London; iGGi) - Aycocock, John (University of Calgary)

Session format: Regular session

While formal scholarship on the archaeology in and of video/digital games has increased in the last decade, archaeogaming remains in a liminal space within academic discourse. While similar topics are investigated and methodological challenges are shared, archaeogaming is neither digital archaeology nor is it media archaeology. Archaeogaming is also not simply the study of digital artefacts but a developing community of scholarship that interrogates the materiality and intangibility of contemporary culture. Further, archaeogaming is not “archaeology plus computer science” but a field of research with its own developing but distinct praxis. As such we are defining archaeogaming as not interdisciplinary research but rather as the transdisciplinary field of inquiry into the digital games we play and the technologies and cultures that shape them. By situating archaeogaming as transdisciplinary, we are acknowledging the challenge of finding a place for archaeogaming in the various disciplines that engage in it but also the increasing necessity for “archaeogamers” to have diverse inter- and intra-disciplinary training and perspectives in their work.

The aims of this session are threefold. First, the session will illustrate the various approaches for the study of digital games. Second, we aim to address some of the successes and challenges in undertaking contemporary archaeologies that push the boundary of traditional archaeological practice. Finally, community-building: we want to foster a dialogue between archaeogamers who represent not just archaeology but other disciplines such as computer science, engineering, and media studies. As such, we are inviting papers that examine the methodological and theoretical practices used in archaeogaming today and which represent the multidimensionality and transdisciplinary nature of this work. Case studies that address methodological and theoretical aspects are also welcome.

ABSTRACTS

1 AZTEC PIXELS PICKAXED: TRANSCENDING EXTRACTIVE ETHNO-GRAPHICS AND ARCHAEO-AFFORDANCES IN DIGITAL MESOAMERICA

Abstract author(s): Fitzgerald, Joshua (Churchill College, University of Cambridge; McDonald Institute of Archaeological Research)

Abstract format: Oral

Today’s digital gaming controllers and keyboard-and-mouse combos, more often than not, participate in archaeology with as much care as that afforded to the subsequent swings of an indelicate pickaxe as it might have once crashed down in and pulled back up some ancient object or bit of bones from Mexican soil. If a player’s tools for play are only dull-headed and tactless artifacts of colonialism—though rasterized with millions of stimulating pixels—how might gamers still find value in the discipline of archaeology or another’s cultural heritage? The proposed paper answers this question by explicating the history of archaeogaming’s entanglements in Mexican archaeology. I target game developers’ dalliances in Classic and Postclassic Mesoamerican, from ancient Teotihuacan to sixteenth-century Tenochtitlan, to expose gamer culture’s successes and failures since the 1980s. This includes examples drawn from educational games recently used in U.S. and U.K. primary and secondary schools (Excavate! Mesoamerica DiG-iT!, 2017; BrainPOP, 1999–present), however, my focus is on popular commercial games and developers, exploring archaeogaming aspects, such as site surveys, structural analysis and reconstructions, object study, and related ethnographic material use. In this, I include a variety of the industry’s approaches (i.e., Aztec, 1982; Age of Empires II, 1999–2022; Theocracy, 2000; Age of Empires III, 2005–2020; and Yaopan, 2021) and apply affordance and signification theory to reveal ways in which game developers shape experiences and teach players about archaeology (Gibson, 1974; Norman, 2013). Aiming for more than a critique, my goal is to encourage archaeologists to become more entwined in decolonial methods in their game interventions. I argue that critical engagement with Indigenous epistemologies coupled with advanced archaeology will best equip the discipline’s adoption of more games in our classrooms and laboratories. Instead of simply replacing a pickaxe swing with pixels in our toolset, gamers require culturally-responsive archaeogaming.

2 “ARCHAEOLOGY – HISTORY UNCOVERED”. CASE STUDY: THE IRON-AGE-DANUBE ELEARNING APP

Abstract author(s): Hellmuth Kramberger, Anja (University of Ljubljana; Alma Mater Europaea – Institutum Studiorum Humanitatis) - Mele, Marko (Universalmuseum Joanneum GmbH)

Abstract format: Oral

So you're an archaeologist, how interesting! How about the dinosaurs and the pyramids?" A sentence that probably every archaeologist has heard in this or a similar way. However, the reality of the most archaeologists is rarely shaped by spectacular finds and adventures, as they are mostly represented in the media, especially in movies and television shows. Within the framework of the Interreg Danube Transnational project "Monumentalized Early Iron Age Landscapes in the Danube River Basin" (Iron-Age-Danube) we developed an eLearning App to guide the user in a playful way through all stages of archaeological work. Thus, starting with all necessary preparation for the excavation project and the writing of applications, to the use of different prospecting methods, the actual work on the archaeological excavation, the processing of the findings and their final archiving, presentation in the museum or in a publication. The user of the App is accompanied on his journey through the different phases of archaeological work by two characters, the archaeologist and his mascot „Tomi“. In the learning mode, the user can explore these different work phases in several consecutive scenes by interacting with objects and thus receiving specific information about them. In game mode, the user is asked questions and has to try to select the right objects.

3 WORLD HERITAGE SITE AS AN AR PLAYGROUND: CASE SUOMENLINNA

Abstract author(s): Rynnänen, Anne (University of Oulu)

Abstract format: Oral

Augmented Reality (AR) has grown from a novel technology into a concept that is familiar especially through mobile applications. One such mobile application, made into a game, can be found in a world heritage site in Helsinki, Suomenlinna Sea Fortress (building started in 1748). The site-specific game guides its users through places within Suomenlinna using GPS, AR and a story that touches on different time periods of the Sea Fortress. AR is used at three different locations in the game.

It can be argued that the nature of places AR is used in changes, as there is a new element into the way a place is constructed and how it is experienced. Suomenlinna case study approaches this argument with a question: how does AR impact the experience of place for the user when they move from one location to another? This is studied by observing research participants' behavior as they play the game by moving within Suomenlinna. In addition, the participants are interviewed on their experience after they have played the game.

The analysis places particular interest into the movement of the players within Suomenlinna as guided by the game, how they experienced navigating with the game and how (if at all) the three AR points impacted their experience of the Sea Fortress.

The study forms one part of a doctoral thesis that focuses on the impact of AR on the meaning of place in cultural heritage sites. This is a continuation to the multimodal approach Rynnänen (MA, MSc in Business) has applied throughout her studies, including her first master's thesis on the impact of location-based mobile advertisement on the meaning of place. Her multidisciplinary approach has since been refined by working in the game industry for seven years. The Suomenlinna game was done in collaboration with her then employer.

4 ATTACKING THE ANCIENT: TRANSDISCIPLINARY ETHICS IN ARCHAEOGAMING

Abstract author(s): MacLeod, Alexander (MacEwan University)

Abstract format: Oral

The act of modifying video games and the culture surrounding the modding community present uniquely modern ethical dilemmas for archaeologists regarding ownership. In this paper, I investigate the ethical concerns presented by the case of Defense of the Ancients (DotA), a custom game mode for the game Warcraft III: Reign of Chaos. This popular mod has significantly influenced video game culture and design. By looking at the contributions to game culture made by modders and the surrounding modding community, we look at how mods contribute to games through accessibility, additional content, entertainment, and cultural interactions. Using DotA, I look at how major archaeological associations' codes of ethics cannot keep up with the expectations and needs of Archaeogaming and cannot accommodate the intricacies of a transdisciplinary field. Ownership claims are challenging to navigate due to legal definitions of authorship, copyright, and recurring legal disputes regarding intellectual property. As a research site, DotA is influenced by these ethical issues without an obvious path forward and no previous precedence relevant to the site. To accommodate a clear and progressive path forward, ethical interpretations of the past must be redefined to fit the needs of the future in a culture surrounded by digital media.

5 THE LEGACY OF GAME CARTRIDGES: THE FAIRCHILD CHANNEL F & THE GAMING INDUSTRY

Abstract author(s): Russell, Paige (MacEwan University)

Abstract format: Oral

Before CDs, DVDs, and digital downloads there was the game cartridge. In the history of video games, the importance of the game cartridge cannot be understated as the medium allowed for a new industry to take off economically and creatively. To explore this importance, this paper takes a look at the Fairchild Channel F, which is regarded as the first video game console to use interchangeable ROM cartridges. The creation, as well as specifications, of the Fairchild Channel F game cartridges are examined and used to showcase the development of the video game industry.

Using the transdisciplinary nature of Archaeogaming, I hope to highlight how the game cartridge influenced, and continues to influence, the video game industry and the growth of technology. As cultural artefacts, game cartridges are also influenced by these same factors of industry and technology. I also argue for the acknowledgement of game cartridges as important artefacts that can be used to start examining cultural and technological change. There is a necessity for acknowledgement as the video game industry moves onto optical disc and digital formats that are viewed as making cartridges obsolete.

6 PROTOTYPES IN THE ARCHAEOLOGICAL RECORD: RAISING THE CURTAIN WITH ELECTRONIC THEATER

Abstract author(s): Biittner, Katie (MacEwan University) - Aycocock, John (University of Calgary) - Therrien, Carl (Université de Montréal)

Abstract format: Oral

Prototypes are simply tests of ideas but they are not simple in terms of what they can reveal about a technology. Archaeology has developed several frameworks for understanding technologies; the framework applied here is the chaîne opératoire, which traces the acquisition then transformation of raw materials into various forms. While prototypes are rarely explicitly addressed in archaeological studies, their analysis can illustrate the complexities of the technological choices made by authors and agents in the chaîne opératoire. Further, prototypes occupy a unique, liminal space in technological organization – they are a useful object (a material proof of concept), yet are intentionally created to be discarded. We make this more concrete through a close look at Electronic Theater, a prototype, unreleased Commodore 64 game developed by Dona Bailey and Paul Allen Newell for Activision in 1984-5.

Electronic Theater is an early entry into what contemporary gaming culture calls the “visual novel” genre. This fuzzy genre, which still eludes clear-cut definition, often proposes flexibility to their players in terms of ludic engagement: one can explore branching narratives, and some of these titles reward the thorough exploration of the structure with a “real” ending. The flexible nature of this engagement is at odds with some of the common defining elements of games and this borderline status means that it has often been neglected in historical investigations.

We show Electronic Theater through the lenses of archaeology, game history, and computer science, drawing on developer interviews, source code, and a running version of the game.

7 ACCURACY, NOT AUTHENTICITY: HOW ASSASSIN'S CREED ODYSSEY LEVERAGES ARCHAEOLOGY FOR RESONANCE

Abstract author(s): Zanesco, Andrei (Concordia University)

Abstract format: Oral

Over the past sixteen years, Ubisoft's Assassin's Creed (2007-2023) series has grown to encompass a staggering host of historic and geographic locales. From the crusade-era Jerusalem (2007) to the Republic of Pirates (2013), and recently even Ptolemaic Egypt (2017) and classical Greece (2018). In parallel, numerous disciplines have matched releases in the franchise with critiques of cultural representation (El-Nasr et al. 2008; Magra 2021), colonialism (Shaw 2015; Murray 2017; Mukherjee 2017) and spatial reconstruction (Atkinson 2017; Westin & Hedlund 2016). In particular, titles set in antiquity have elicited responses from archaeologists interested in the potentials and limitations of the franchise for developing new archaeological models and understanding remote societies (Casey 2018; Bondioli et al. 2019; Arbuckle-Macleod 2021).

However, much of the research emerging has focused on the game as an archaeological model, as opposed to the use of archaeological model for legitimizing or masking broader colonial impulses (Politopoulos et al. 2019). This presentation argues that Assassin's Creed Odyssey (2018), in particular, elides notions of archaeological nationalism, problematic realities and favors blockbuster (Acland 2020) engagements with the space. In other words, Odyssey relies on archaeological accuracy to legitimate a version of classical Greece that conforms to present day sensibilities, upholding an articulated form of resonance (Apperley 2010; Chapman 2016; Guesdon 2018).

The research presented here uses a 150-hour study of *Odyssey* using game studies methods (Fernández-Vara 2015; Consavo and Dutton 2006; Bogost 2006, 2007) that dovetail sporadically with Andrew Reinhard's theorization of archaeogaming (2018). Concretely, this case study presents a systematic view of how Greece is constructed to favor accurate-seeming environments, audio, narrative, and historic elements that are actually closer to tropes drawn from legacy media. Ultimately, *Odyssey* is discussed as a hyperreal representation of Greek stereotypes. (Eco 1986).

A. PLEASE DON'T ATTACK ME, I'M JUST AN ARCHAEOGAMER: SURVEYING ASSASSINS CREED VALHALLA

Abstract author(s): Bureau, Alexis (Grant MacEwan University)

Abstract format: Poster

Assassins Creed Valhalla is an open-world story-based video game that balances historical science fiction with accurate Viking culture and history. This balance allows players to experience Viking culture personally as they complete the game. Through archaeogaming methods, I surveyed the site of Saint Albanes Abbey in *Assassins Creed Valhalla*. For surveying, I used an in-game function based on a flying raven's perspective. By doing this, the camera perspective switches to an aerial perspective that mimics how the raven would view the landscape as it was flying. This feature aids in both imagery and placing waypoints on the landscape without using the in-game map function. Waypoints are markers placed using the map or raven function to guide the player to the desired location marked while displaying the distance in meters. Using meters as an in-game unit makes it easier for archaeogamers to complete a digital survey of the area and buildings within Saint Albanes. Digital surveying exposes both archaeologists and players to interactions with material culture. This creates a personal, historical, and scientific perspective on Viking culture by creating new interpretations of artifacts and experiences through digital media. However, the challenges of ethical digital surveying are presently based on the game's narrative design. In *Assassins Creed Valhalla*, it is possible to complete an ethical digital survey of Saint Albanes Abbey. Despite the difficulty of placing markers while controlling the raven and the inconsistency within the surveying. It is possible to create an accurate survey with accurate distances using an error range of approximately 5 meters. Additionally, with the limitations included, size and villager interactions showcase the need for modding adjustments, and more archaeogamers to survey the site are essential for future work.

30 POLYCHROMY IN PRACTICE: CASTING COLOUR ONTO ROMAN ARTWORKS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Campbell, Louisa (University of Glasgow) - Kremer, Gabrielle (Austrian Archaeological Institute)

Session format: Regular session

Recent interdisciplinary innovation in the fields of materials science and digital heritage have had a transformative impact on our understanding of how artworks, architecture and artefacts were presented to Roman audiences and the way contemporary audiences can engage with them in the museumscape and digital arena. Polychromy is pivotal to this interface since colour is a central component of the lived experience that creates connections between people, places and things. Yet, colour is often under-represented in archaeological reports and barely acknowledged on information boards in exhibition spaces.

Non-invasive technologies, including pXRF, Raman Spectroscopy, multispectral imaging and microphotography, permit the rapid in situ analysis of curated Classical sculptures and precious frescoes to fingerprint original surface treatments and pigments. Where appropriate, laboratory-based analytical techniques, including SEM/EDS, GC-MS, micro-Raman, FTIR-ATR, light microscopy of cross-sections, amongst others, provide a deeper granularity and precision to our interpretations.

This session will explore how new interpretive frameworks and the application of these and other emerging techniques on Roman statuary, sculpted reliefs, inscriptions, artefacts and architectural features have altered their perception and facilitated their authentic reconstruction using cutting-edge digital technologies. We welcome contributions from researchers considering all aspects of polychromy practice in Roman contexts, including those with a focus on frontier contexts where the dynamics between cultural traditions, artistic skills, raw materials and availability of pigments may differ greatly from other provincial settings. Papers may include, but are not restricted to:

- Materials science methodologies in polychromy research;
- The role of colour in Roman visual media;
- Digital reconstruction in research and museums;
- Provincial horizons.

1 NIKA PRASINE - THE COLOURS OF CIRCUS FACTIONS AS MARKERS OF IDENTITY?

Abstract author(s): Grosser, Frederik (Staatliche Museen zu Berlin, Antikensammlung)

Abstract format: Oral

Imperial Rome is often described as a culture of spectacles and chariot races were undoubtedly the greatest spectacle in the Roman Empire. Hence, it is no surprise that images of charioteers and chariot races can be found in nearly every context and in almost every media of the Roman imperial period as well as of Late Antiquity. Such images reflect not only the thrill of the races. Especially the preserved images – mostly mosaics and mural paintings – on which colours can still be traced, reveal also a lot about the organisation of the races and the role of the four circus factions: the Whites, Reds, Blues, and Greens. Belonging to one of those factions was not a triviality but part of a bitter, violent, and sometimes even deadly rivalry. Consequently, the colours of the factions were marks of identification: they constituted, perpetuated, and supported a communication system about belonging, loyalty, affection, antipathy, and rivalry. Images served as the media in this communication process. The presentation therefore aims to investigate how colours of the four circus factions on images of charioteers and chariot races were used in this environment to communicate specific values, ideas, and a sense of belonging.

2 UP-CLOSE: MODELLING THE POLYCHROME-MATERIAL AESTHETICS OF ROMAN MARBLE PORTRAIT BUSTS

Abstract author(s): Abbe, Mark (University of Georgia) - Chappell, Stephen (Independent Digital Artist)

Abstract format: Oral

The marble portrait bust, so patently unfashionable today, possessed a vibrant and immediate charge in Roman antiquity in no small part because of its life-like and artful painting – now absent. Sculpted portrait busts dynamically expanded the more ubiquitous practice of portrait painting on two-dimensional panel into three dimensions, increasing the presence of their individual subjects into the physical space and fluid environmental lighting of the viewer. Their coloration – visually prominent and defining – was readily legible from afar and invited and rewarded close scrutiny. This collaborative paper attempts to experimentally model something of the visual effects of the nuanced coloration and painting on a pair of high-quality marble portrait busts representing Septimius Severus (r. 193-211 CE) and Julia Domna in the Eskenazi Museum of Art (Bloomington, Indiana). Dating from the first decade of the third century and associated with a Roman metropolitan workshop, the remarkably well-preserved pair allows a rare opportunity to closely explore the surface polishing on portrait busts from the high imperial period. Though only a very limited amount of ancient polychromy remains on the pair, other forms of informative portrait painting survive in diverse media, including the contemporary “Berlin Tondo” from Egypt. Our concern, however, is not to attempt to reproduce the precise coloration of the busts in antiquity, but rather to experimentally model something of their aesthetics that married sculpted marble and the art of painting.

3 ‘COLOURS REVEALED’: THE INVESTIGATION OF POLYCHROMY ON ROMAN MONUMENTS FROM THE DANUBIAN PROVINCES

Abstract author(s): Krickl, Robert - Kremer, Gabrielle (Austrian Archaeological Institute / Austrian Academy of Sciences) - Linke, Robert (Bundesdenkmalamt)

Abstract format: Oral

A four-year Heritage Science Austria project of the Austrian Academy of Sciences is dedicated to the study of paint residues on stone monuments from the Roman Danubian provinces Noricum and Pannonia by combining interdisciplinary methods of scientific analysis, documentation and evaluation. The presentation introduces the approach as well as the applied techniques of non- and micro-invasive investigations and gives an overview on the results achieved so far. Selected examples of objects from the Archaeological Museum Carnuntinum and from other collections in the studied area are used to show what information can be gained from the preserved substance and what further research questions can be derived from it. The problems of interpretation are presented and discussed against the background of archaeological-art historical, but also museological aspects. What are the possibilities and limits of methods for identification and localization of pigments on objects in museal display? Which external influences and installation conditions could have been decisive for the state of preservation of the coloured surfaces? Where are the justifiable limits of visualization in the museum environment, given the current state of knowledge, and what questions arise from this for the further research project?

4 STUDIES ON THE POLYCHROMY OF TREVERAN FUNERARY MONUMENTS - FIRST STEPS

Abstract author(s): Kloeckner, Anja - Kelp, Ute (Goethe-University Frankfurt, IAW)

Abstract format: Oral

In terms of their polychromy, Treveran funerary monuments represent one of the most important and best-preserved ensembles of Roman sculpture. Residual paint can still be seen with the naked eye. As early as the 19th century, traces of colour were observed and in some cases meticulously reproduced in drawings. Systematic studies, however, are lacking to date.

Within the frame of our DFG-funded project “Contextualising Treveran Grave Monuments” that started in 2022 (https://www.uni-frankfurt.de/128552583/Trier_Grabdenkmäler_im_Kontext), a pilot study centres on the colour coding and polychromy of these Roman grave monuments. We build on the documentation carried out during our previous projects on these monuments.

We will present first steps in studying the polychromy of Treveran funerary monuments; following the hypothesis that colouring particularly emphasised individual decorative elements, motifs at different places and sides of the monuments are related to each other. Colour creates connections that are not apparent from the sculptural design alone. These aspects can only be evaluated if the colour materials and tones are precisely determined. But scientific analyses of the colour residues on limestone and sandstone monuments for this region and period are still a desideratum. In order to develop scientific standards, we aim to explore the technical possibilities for the reconstruction of the original colours. By choosing one monument, various non-destructive, minimally invasive methods of analysis will be tested to assess the potential for further research. An overview of the colour materials and painting techniques will be used to map the colour texture on a digital 3D-model of the monument. Depending on the density of information obtained, a reconstruction of the original colouring can be considered.

Our analysis of this poorly preserved and still underestimated level in visual representations of Roman time will help to picture the impact these funerary monuments had on their viewers, ancient and modern.

5 COLOURFUL FUNERARY IDEOLOGY IN NORTHERN ETRURIA DURING ROMANIZATION: HELLENISTIC URNS FROM VOLTERRA AND CHIUSI

Abstract author(s): Zubajová, Marína - Ceccarelli, Letizia (Department of Archaeology and Museology, Faculty of Arts, Masaryk University)

Abstract format: Oral

Colours played an important role in Etruscan funerary contexts: we observe this not only on the frescoes in the tombs of Tarquinia, but also on the urns of northern Etruria (late 4th-1st centuries BC). An example are the well-known terracotta urns from Chiusi, literally bursting with colours. However, very little research has been done on the pigments especially those used on stone urns from Volterra and Chiusi. These urns are studied exclusively from the iconography point of view but their „materiality“ or how they were painted have never been studied. Due to the humidity in the tombs, the pigments on these urns were almost completely faded, so at first glance it seems that these now „bare“ urns were not even painted. The purpose of the paper is therefore to present the results of a recent study focused on the colours and the composition of pigments on Etruscan urns. The research of pigments was conducted in collaboration with the PhD supervisor L. Ceccarelli and the Politecnico di Milano. The analysis of the pigments was conducted with a non-destructive technique using an pXRF. Both the supports and the preserved pigments were analyzed on alabaster, tufa and terracotta urns at the Volterra Museum and the Chiusi Museum. At the same time, a very rare motif of a large eye on the wings of Etruscan demons, whose depictions the PhD student is researching for her dissertation project, was explored. On a few urns, this motif is shown in painting, suggesting a probably purely Etruscan motif on the Hellenistic urns of northern Etruria. The results of this research will be presented in the paper as well.

6 THERE WILL BE BLUE - MULTISPECTRAL IMAGING IN HERITAGE MANAGEMENT

Abstract author(s): Steigberger, Eva (Bundesdenkmalamt) - Krickl, Robert (Austrian Academy of Sciences)

Abstract format: Oral

Modern analysis using techniques that don't disturb the surface and do not need to destroy however small parts or pieces of a monument open up new perspectives not only for archeological research but also for heritage management. The presentation will give a quick overview on said techniques and its potential for heritage management. The Monuments Authority's archeology Department initiated and financed a project in 2019 to investigate the possibilities. Together with the partners at Brunn Heimathaus, Mannersdorf am Leithagebirge, Museum Lauriacum and in our own depot at Mauerbach multispectral pictures were taken and surprising results are presented

The feasibility study focused on noninvasive techniques with portable devices that can be applied under conditions in museums – without moving objects from their place of display and sometimes even under protective glass. Important was the cross checking of methods and the evaluation of respective advantages and limitations. (Equipment and

expertise provided by Forschungsinstitut Dr. Robert Krickl and University of Vienna) Main methods included X-ray fluorescence spectroscopy, Raman-spectroscopy and multispectral imaging techniques. The talk will mainly focus on the latter.

Analysis was carried out on following objects:

the spolium of a 4th century roman grave from Brunn am Gebirge (Lower Austria) – a gravestone from the museum in Mannersdorf (Lower Austria), gravestones from Vienna/Vindobona from a rescue excavation in Ottakringer Straße (Vienna) with polychrome paintings and Roman murals from Lauriacum (modern day Enns, Upper Austria) were documented.

From a heritage management perspective, method and feasibility for modern heritage management and the decision making process in restauration and conservation will be outlined and discussed. Analysis in regards of preservation, conservation history of objects in museums and expected condition will be presented and future use of this combined methods in said processes evaluated.

7 COLORFUL INDICATIONS OF (EX)CHANGE: AN EVALUATION OF PIGMENT PRODUCTION AND TRADE IN THE PERIPHERAL PROVINCE NORICUM

Abstract author(s): Rodler, Alexandra (Research Group Object Itineraries, Department Historical Archaeology, Austrian Archaeological Institute, Austrian Academy of Sciences; Department of Lithospheric Research, University of Vienna) - Baragona, Anthony J. (Freelance, affiliated with Institute for Conservation, University of Applied Arts) - Tober, Barbara (Faculty of Classical Studies, Department of Classical and Early Aegean Archaeology, University of Salzburg)

Abstract format: Oral

The Roman period was particularly colorful – people processed certain raw materials to use them as colorants and their material qualities and provenance mattered. Yet, little is known about where these materials came from and where they were processed. Some materials, such as cinnabar, are rare in nature, which is reflected in their application in ancient art; other mineral pigments were produced from easily available resources and were likely an output of metal- and glass production- and trade networks.

Through mineralogical-petrographic and geochemical analysis on both pigment and wall painting samples, we evaluate production processes and raw material provenance of cinnabar and Egyptian blue paint from Noricum after it became part of the Roman Empire in the 1st c. BCE. We compare this to Italian examples and to reference data to reveal if raw material trade and/or processing was centralized or if mineral pigment production- and trade networks relied on a multitude of suppliers.

While pigment provenance research is still in early stages compared to metal, glass or ceramic artifacts, works like ours contribute to reconstructing economic networks that existed between Roman provinces as well as to a better understanding of the cultural significance of ancient colorants and their relevance for archaeological research.

8 ADDING COLOUR TO EARLY ROME: INVESTIGATING ARCHAIC DECORATED MUDBRICKS FROM THE ROMAN FORUM

Abstract author(s): Sauer, Nikoline (University of Cambridge)

Abstract format: Oral

Over the last decades, new archaeological evidence and a growing body of science-based research have started to alter the way we understand the history of early Rome. This study aims to investigate two mudbrick fragments found during excavations of the Temple of Castor and Pollux in the Roman Forum in the 1980s. The mudbrick fragments dating back to the 6th century BCE are coated with lime plaster decorated with red, blue, purple and white bands. Mudbricks from both this region and period are extremely rare, but to find well-preserved mudbricks decorated with four different colours is exceptional. The Archaic mudbricks are to be studied by non-destructive and micro-destructive methods: XRF, Raman, LA-ICP-MS, SEM-EDS, XRPD and FTIR. The investigation will enable the characterisation of raw materials and ceramic technology and provide information on provenance. The study allows us to revisit old archaeological material by means of new methods and investigate a unique material group from a key archaeological site, which can elucidate the architectural decoration of 6th-century Rome and contribute to novel insights into the society and organisation of the early city.

9 ARCHAOMETRIC STUDY OF PIGMENTS IN THE ROMAN WALL PAINTINGS OF LIMONUM (POITIERS, FRANCE)

Abstract author(s): Iuliano, Adriana - Galluzzi, Francesca - Pianet, Isabelle (Archéosciences Bordeaux, UMR 6034 CNRS, Université Bordeaux Montaigne, Université de Bordeaux) - Carrive, Mathilde (Hellénisation et romanisation dans le monde antique - HeRMA, UR 15071, Université de Poitiers)

Abstract format: Oral

Roman influence expanded in Gaul from the 3rd century BC and culminated with the conquest and definitive administration of the region under Augustus, bringing with it new construction and decoration techniques, including wall painting. Gallo-Roman decorative traditions, initially strongly influenced by Italian models and techniques, are known for gradually acquiring their autonomy and originality in the second half of the 1st century AD. This raises questions on possible changes in the choice of pigments and raw materials by craftsmen of the time.

Painting production in southern Gaul is well studied and documented from an archaeological and artistic point of view. In the last ten years, archaeometric studies have also been carried out, albeit limited to a single or a group of close, contemporary buildings, therefore not allowing an understanding of the evolution of practices employed in ancient painting.

This research focuses on the archaeometric study of a large corpus of wall paintings in the Roman province of Gallia Aquitania, that of the painted plasterwork of the ancient city of Limonum (today Poitiers, France). Several lots from old and recent excavations, most of which including multiple polychrome decorations, were analysed in order to identify the colour palette used in wall paintings. By applying a multi-analytical protocol consisting of physico-chemical techniques, both in situ and in the laboratory (including digital and optical microscopy, hyperspectral imaging, pXRF, FORS, amongst others), it was possible to characterise the original pigments and painting techniques, as well as the way past colours were prepared, combined and applied in the wall paintings of Limonum.

10 AQUILEIA, A COLOURFUL ROMAN CITY. THE POLYCHROMY OF ROMAN SCULPTURES IN THE NATIONAL ARCHAEOLOGICAL MUSEUM OF AQUILEIA

Abstract author(s): Lenzi, Sara (Università di Pisa) - Angelini, Ivana - Deiana, Rita (Università degli Studi di Padova) - Novello, Marta (Museo Archeologico Nazionale di Aquileia) - Salvadori, Monica - Zoleo, Alfonso (Università degli Studi di Padova)

Abstract format: Oral

The National Archaeological Museum of Aquileia, a Roman city close to the Adriatic Sea, nowadays in north-eastern Italy, hosts a permanent exhibition of Roman sculptures with many traces of polychromy. The colours of mosaics and wall paintings of Aquileia are well known to the scholars, but the colours of the sculptures are widely unknown and rarely cited in literature.

Among the sculptures with an easily recognizable polychromy (architectural decorations, funeral reliefs, statues), some were chosen, in order to give new and unpublished information about the colours on marble and stone of the Roman Aquileia. A head of Apollo, a female head, a funerary stela of a young girl and other objects with traces of polychromy were studied with the support of archaeometric analyses (among them, FORS and Raman spectroscopy). This paper will show the results of the first and second campaigns of analyses, carried out in the museum of Aquileia between September 2022 and February 2023.

11 THE ROLE OF COLOUR IN THE CULT OF MITHRAS: SOME EXAMPLES OF STONE MONUMENTS FROM CARNUNTUM

Abstract author(s): Silnovic, Nirvana (Österreichisches Archäologisches Institut)

Abstract format: Oral

The importance of colour in Roman visual culture has been emphasized by a number of recent studies dedicated to sculptural (and architectural) polychromy. Indeed, colour was for the Romans a basic unit of perception and a source of value and meaning attached to the objects. However, despite the growing awareness of the essential role of colours in visual communication in both public and private contexts, their potential meanings are rarely explored. The PolychroMon project (Heritage Science Austria/Austrian Academy of Sciences, 2021-2025), dedicated to the study of the polychromy of Roman stone monuments from the Danubian provinces, takes socio-religious significance of colour as one of its main focuses. For this purpose, special attention is given to the monuments of the Mithras cult which occupy a prominent place in the collections of the Archaeological Museum Carnuntinum and Kunsthistorisches Museum in Vienna. Based on selected examples, several important questions about the use of colour in the cult of Mithras will be explored. Was there a specific colour code in the local cult of Mithras? What was the function of colour in the ritual context of the cult? What religious ideas were expressed with colour?

12 POLYCHROMY IN PRACTICE: REDISCOVERING PIGMENTS ON SCULPTED RELIEFS FROM NORTHERN BRITAIN

Abstract author(s): Campbell, Louisa (University of Glasgow)

Abstract format: Oral

Frontier regions were, by their very nature, dynamic and complex cultural contexts. These unique environments stimulated hybrid practices negotiated through the reception, perception, use and reuse of Roman material culture that stretched to methods and materials used in polychromy practices which brought iconic sculpted reliefs to life. Focussing on innovative methodologies to investigate and interpret Roman artefacts from the Empire's north-western frontier, this paper develops multi-disciplinary approaches to the non-destructive analysis of iconic monumental inscriptions and relief sculptures carved into sandstone and limestone from Northern Britain.

New evidence will be presented for polychromy in practice through traces of previously unknown pigments adorning Distance Sculptures unique to the Antonine Wall in Scotland and iconic altars from the Mithraeum at Carrawburgh on Hadrian's Wall. These revelations have a transformative impact on our interpretations and representations of sculpted reliefs and monumental inscription from the frontier, revealing new dimensions and adding new layers to our understanding of how they performed for ancient audiences. They permit new insights into artefact assemblages; exploitation of previously untapped research potential of curated collections; and authentic digital reconstructions. This work derives from a broader research project examining the effectiveness of emerging technologies on a range of material culture classes.

13 COLOUR TRACES ON ROMAN MONUMENTS FROM NORTHERN MOESIA INFERIOR

Abstract author(s): Alexandrescu, Cristina (Institutul de Arheologie Vasile Parvan)

Abstract format: Oral

Besides the marble monuments from the territory of the province of Moesia inferior, dated to the pre-Roman and Roman times, the colour traces on the pieces carved in local stones (limestones, sandstones) have not been the object of detailed investigation, given their rarity and poor state of conservation. The present contribution provides an overview of the finds (votive altar, funerary stelai and architectural elements) from the northern part of the province, and of the non-invasive investigations carried on up to now. The comparative analysis with other similar finds from the Roman provinces (e.g. Pannonia, Gallia) highlights both the existence of this kind of monuments in this remote region of the empire and the need of dedicated studies and search for suitable methodological approach when dealing with stone monuments, even if fragmentary. In addition, the benefit for the valorisation and presentation of individual monuments in the museum exhibition will be considered.

14 POLYCHROMY OF FUNERARY MONUMENTS AND ARCHITECTURE IN EAST-CENTRAL GAUL: A REVIEW OF RESEARCH

Abstract author(s): Edme, Anne-Laure (Inrap Grand-Est, Châlons-en-Champagne; UMR 6298 ARTEHIS) - Delferrière, Nicolas (Université de Toulouse Jean Jaurès; UMR 5608 TRACES) - Ribolet, Mathieu (UMR 6298 ARTEHIS)

Abstract format: Oral

Since 2014, the careful macroscopic observation of traces of polychromy preserved on Gallo-Roman lapidary blocks in the museums of Bourgogne-Franche-Comté and the Grand-Est region has made it possible to bring together a substantial corpus of varied polychromatic traces, mainly on funerary monuments (steles, fragments of aediculae or mausoleums) of the ancient cities of the Aedui, Sequani, Lingoni and Senoni. Our work on the subject continues, at an irregular but sustained pace, to complete this corpus thanks to new archaeological discoveries or thanks to the restoration of some ancient blocks, which makes it possible to reveal elements that were no longer visible. In addition, analyses can be carried out on these occasions, although unfortunately not often enough. For the past two years, we have also added to our research the study of architectural blocks that come from ancient buildings of the Senonese city, not specifically funerary. The aim of this paper is to propose an assessment of all our observations and studies to show the diversity of the use of polychromy on lapidary in a Gallo-Roman provincial context.

15 PAINTING TO COMPLEMENT SCULPTURE: THE UNIQUELY PAINTED DETAILS IN THE GALLO-ROMAN COLLECTIONS OF CENTRAL-EASTERN GAUL (BOURGOGNE-FRANCHE-COMTÉ AND GRAND-EST, FRANCE)

Abstract author(s): Delferriere, Nicolas (Université de Toulouse Jean Jaurès, UMR 5608 TRACES) - Edme, Anne-Laure (Inrap Grand-Est, Châlons-en-Champagne)

Abstract format: Oral

Among the various coloured elements that can be found on Gallo-Roman sculpture, some correspond to coloured backgrounds and rubricatio around details, others to the colour enhancement of certain already sculpted details (hairs or objects), but there are elements that are only painted and which therefore attest to the particularly close work between the sculptor and the painter. These may be details of eyes, hair, clothing, or architectural or plant details. The aim of this paper is to show the potential of these types of coloured highlights, which testify to the variety of practices in the implementation of polychromy. The preserved elements also give us a glimpse of the important information that we have lost with the fading of the polychromy on many of the provincial sculptures. The examples used come mainly from funerary monuments preserved in large numbers from the collections of Gaul in the Centre-East (Gallia Lugdunensis and Gallia Belgica), mainly from the current regions of Burgundy-Franche-Comté and Grand-Est in France.

16 THE RED AND THE STONE: SOME OBSERVATIONS ABOUT POLYCHROMY OF ROMAN ARCHITECTURE IN AGEDINCUM (SENS, FRANCE)

Abstract author(s): Ribolet, Mathieu (UMR 6298 ARTEHIS) - Delferriere, Nicolas (UMR 5608 TRACES; Université Toulouse Jean Jaurès)

Abstract format: Oral

Located in the western part of Gallia Lugdunensis, the city of Agedincum (Sens, France) is well-known for being the ancient caput civitatis of the Senones. Such a status ensured the development of monumental architecture over the first centuries AD. A few of these important monuments were discovered by archaeology, such as an amphitheater, a forum or an important extra-urban religious complex.

The urban architecture of Agedincum is yet very partially known. As in many other cases indeed, the city was completely covered over from the medieval period. Thus, trying to reconstruct the ancient city mostly relies on studying hundreds of architectural stones and sculptures, all reused within a late antique city wall and discovered from the 19th century.

Traces of polychromy are still preserved on the surface of many architectural stones of Agedincum : scholars noticed it from the 19th century and early tried to understand what colored roman buildings looked like, though they were unable to reconstruct anything credible. Recently, new studies about the lapidary collection of Agedincum led to deal with the question of the color of its ancient monuments : observing and analyzing the traces and trying to reconstruct whole façades should allow a better understanding of the antique visual environment.

In this lecture, we intend to focus specifically on red color, which is the most frequently visible on architectural blocks. Red seemed to have been used for different purposes : preparing surfaces, painting backgrounds, underlining frames or patterns, adding details. From different examples of Agedincum, we will try to identify these different cases and to study its technical and stylistic characteristics.

32 THE PUBLIC INTERPRETATION AND PRESENTATION OF MEGALITHIC MONUMENTS AND SITES: CHALLENGES FOR BEST PRACTICE

Session theme: 3. Heritage Narratives and Representations

Session organisers: Jameson, John H (ICOMOS ICIPI/ ICAHM; U.S. National Park Service, Retired) - Sebire, Heather (English Heritage)

Session format: Regular session

From the Neolithic period with the arrival of farming and use of pottery at least 6,000 years ago to the beginning of the Bronze Age, people used megaliths (large stones), earth, and wood to build grandiose monuments. The number and sheer diversity of these structures is astonishing, from massive stone rows and circles to barrows, chambered tombs, and earthwork enclosures. Our knowledge of the category of monuments known as Megaliths has increased considerably in the last ten years as documented in the recently published *Megaliths of the World* volumes (Laporte et al 2022).

Many of these sites survive today in a ruinous condition and are not easily legible to the public, so the challenges and complexities surrounding the management and public interpretation of these sites are often formidable. We pose

these questions: What strategies have been most effective in providing opportunities for public audiences to appreciate site significance and resource meanings? For example, how have local communities been allowed to participate in decision making processes for management and interpretation schemes? What community-level programs have been developed? How effective are these strategies? What are the present and future trends in managing and interpreting these sites, many of which may be in areas affected by changing weather patterns?

This ICOMOS-endorsed session presents best practice strategies for public interpretation for the incredible quantity and complexity of Megalithic sites in Europe and around the world. Continuing collaborative efforts that began in the UK in 2013, our goal is to gather extensive multinational examples that can be extrapolated into an internationally relevant best practice guidelines document on the Public Interpretation and Presentation of Megalithic monuments and sites.

ABSTRACTS

1 BRÚ NA BÓINNE: INTERPRETATION AND COLLABORATION

Abstract author(s): Gleeson, Pauline (National Monuments Service; Department of Housing, Local Government and Heritage) - Breen, Claire (National Monuments Service)

Abstract format: Oral

Brú na Bóinne: the archaeological ensemble of the Bend of the Boyne and one of the World's most important prehistoric landscapes, was inscribed on the UNESCO World Heritage List in 1993. Four years later a dedicated interpretative centre opened within the World Heritage Property on the banks of the River Boyne and since then this has been the entry point for visitors to the renowned Neolithic Passage Tomb complexes of Newgrange and Knowth.

In 2017 planning commenced on a project for the renewal and updating of the centre to provide a more interactive and immersive visitor experience, embracing new digital technologies and incorporating new research. The passage tombs at Brú na Bóinne contain the largest assemblage of megalithic art in Europe and the project provided an opportunity to present this information to the public in dramatic form and raise awareness of its significance. This paper examines the experience of the National Monuments Service, the expert archaeological advisors and the Office of Public Works Guide Service in the development of the new public interpretative centre at Brú na Bóinne. It explores the challenges, the complexities and crucially the collaboration required to ensure the accurate interpretation of this immensely rich archaeological landscape.

2 MANAGING A MOUNTAIN OF DATA – THE DOWTH HALL PASSAGE TOMB EXCAVATION

Abstract author(s): Ni Lionain, Cliodhna (Devenish; UCD School of Archaeology) - Meegan, Eimear (The Discovery Programme; Virtual Lab, TU Dublin) - Mendoza, Jessica (Carleton Immersive Media Studio, Carleton University) - Murphy, Maurice (Virtual Lab, TU Dublin) - Williams, Ken (www.shadowandstone.com)

Abstract format: Oral

In 2017, the ruins of a large passage tomb were found in the UNESCO World Heritage Site of Brú na Bóinne during a programme of archaeological monitoring at Dowth Hall, Co. Meath (Ireland). Dating back to at least 3100 BC, the passage tomb has witnessed various interventions, including partial destruction, over the course of its long life. Its surviving remains, which include two megalithic chambers and six kerbstones, have been recorded using both traditional archaeological methods and newer digital technologies, including photogrammetry. The 18-month long excavation has produced a huge dataset, which now poses both a problem and an opportunity regarding the management, presentation, and preservation of this unique resource.

As we begin to scale the foothills of this mountain of data, this paper will explore the possibilities of virtual presentations of archaeological data, both in terms of in situ remains and reconstructions, with a particular focus on a general public audience. The Dowth Hall dataset is also a significant research resource for archaeologists, and its accessibility and ease of utility for researchers is an important objective. To achieve this, we are exploring the potential of Historic BIM (Building Information Model) for the long-term curation and presentation of the data, as well as for site management and monitoring. As part of this process, we have begun to develop workflows for the conversion of the digital survey data into 3D solid models with associated semantic attributes. The complex and irregular nature of prehistoric monuments is a challenge for HBIM, but this approach has many advantages, particularly in the automation of documentation for recording, analysis and conservation, and presentation using VR and game engines. If successful, this could be a useful tool for monitoring of other prehistoric world heritage sites.

3 RE-IMAGININGS: CREATIVE DIALOGUES AND APPROACHES TO THE PRESENTATION AND INTERPRETATION OF MEGALITHIC MONUMENTS

Abstract author(s): Wexler, Jennifer (English Heritage)

Abstract format: Oral

Britain features an impressive range of megalithic monuments, such as Stonehenge and Avebury as well as numerous lesser known sites. Often shrouded in layers of speculation and folklore, these iconic monuments have spurred myths and wonder that persist today. These are resonant and inspirational places for communities to connect both to nature and the past. This paper will look at how can we present the complex, layered archaeology and histories of these sites while also cultivating curiosity and dialogues around ideas of deep histories, landscapes, and our connection to place and nature through the use of creative interpretation strategies. By collaborating with artists and storytellers, how can we draw out these archaeological stories in new and engaging ways to connect with diverse audiences as well as local communities? Case-studies will include recent examples from museums and archaeological site contexts, including the World of Stonehenge Exhibition at the British Museum (February – July 2022) and reinterpretation schemes at Grimes Graves, Thornborough Henge, and Stonehenge, managed by English Heritage.

4 POTENTIAL OF INTERPRETATION FRAMEWORK METHODOLOGIES TO CONTRIBUTE TO THE PUBLIC INTERPRETATION AND PRESENTATION OF MEGALITHIC MONUMENTS AND SITES

Abstract author(s): Mills, Nigel (Nigel Mills Heritage)

Abstract format: Oral

Principles of good interpretation as understood by professional heritage interpreters (e.g. Association for Heritage Interpretation, USA National Association for Interpretation, Interpret Europe) should underpin all aspects of the public interpretation and presentation of archaeological monuments and sites.

The Interpretation Framework methodology first developed for the complex archaeology of the Hadrian's Wall World Heritage Site from 2011 has significant potential for application to other archaeological complexes including those addressed in this session. The methodology is especially useful in situations where there may be multiple sites with potentially similar and competing narratives, enabling development of diverse narratives and complementary visitor offers. The methodology is now widely used across the Frontiers of the Roman Empire World Heritage Cluster and has been applied also in developing community focused interpretation of prehistoric landscapes.

The paper will briefly explore the principles of good interpretation before moving on to describe the Interpretation Framework methodology and its application to interpretation and public presentation of archaeological monuments and sites.

5 THE BATTLE OF A MURADELLA (FORNELAS, GALICIA, SPAIN): CONFLICT, COMMUNITIES AND DISSEMINATION AROUND AN ATLANTIC CAIRN

Abstract author(s): Ayán, Xurxo (NOVA University of Lisbon) - Paulos-Bravo, Rodrigo (Complutense University of Madrid)

Abstract format: Oral

A Muradella is a mysterious pile of stones at the top of a mountain in the interior of Galicia, in the northwest of the Iberian Peninsula. This monument miraculously survived the opening of tracks, the reforestation and the summer fires. It has remained until today due to its role as a border landmark between peasant communities. In July 2022 the authors of this paper began a scientific project to elucidate the archaeological nature of this site. Finally, we have shown that it is a cairn-type megalithic monument dating from the Final Neolithic, unique in Galicia.

In this paper we will analyze the conflictive process of patrimonialization of this monument. We will show the legal conflicts between border communities, the economic interests that come together in this monument and the problems we had to value this place of memory. We believe that sharing our experience can be useful for other colleagues working in similar contexts. Our socialization strategy was based on transparency, on the real-time disclosure of the progress of the research on social networks, and on the real integration of the neighbors in the project. In fact, the research has been promoted and financed by two neighborhood associations. Our work with the media and the elaboration of didactic material has led to A Muradella being studied in primary schools in Galicia. We have achieved all this in a period of eight months. In this period, a mysterious pile of stones has become a tourist resource, an identity reference and a unique monument in Galician archaeology. On December 31, 2022, the entire village of Fornelas went up to A Muradella to celebrate the end of the year, after we released the results of the C-14 dating that show that this cairn was built between 4700 and 4600 cal BP.

6 SIGNED, SEALED, DELIVERED! THE MEGALITHIC MONUMENTS PRESERVED IN THE MOAT OF THE FRENCH NATIONAL MUSEUM OF ARCHEOLOGY OF SAINT-GERMAIN-EN-LAYE

Abstract author(s): Simon-Millot, Rolande (Musée d'Archéologie National - Domaine national de Saint-Germain-en-Laye et UMR 6298 ARTEHIS „Archéologie-Terre-Histoire-Sociétés“ Université de Bourgogne-CNRS-MCC) - Mertz, Jean-Didier (Laboratoire de Recherche sur les Monuments Historiques - LRMH-USR3224) - Pariat, Jean-Gabriel (Service départemental archéologique du Val-d'Oise - SDAVO et UMR 7206 - Anthropologie biologique et Bio-archéologie - ABBA)

Abstract format: Oral

The french National Archaeological Museum, created in 1862 in the former royal castle of Saint-Germain-en-Laye, near Paris (France), has housed megaliths since 1870, not only inside its reserves but also outside the castle, in the moat and in its courtyard. This special collection concerns not only polishers, menhirs and others upright stones but also two large covered passages entirely reconstituted in the moats: the passage grave of Conflans-Sainte-Honorine (Yvelines), acquired by the museum in 1872, transported and reconstructed on site in 1873 and the one known as “Trou des Anglais” in Aubergenville, donated to the museum in 1892, transferred in 1901 and rebuilt in the moat next to the first.

Even today these two great monuments are visible in the moat of the castle but they have not been visited for a long time. Many damages caused by the presence of ivy have been observed, as well as the risk of collapse of orthostats or surface alterations of sandstone and limestone slabs suffering from stone disease caused by urban pollution. The museum has been engaged for two years now in the search for a solution. Unaccustomed to the management of “out-door” collections, it contacted the Historic Monuments research laboratory as well as the Val d'Oise archaeological service, which already manages and supports the conservation and presentation of many megaliths in Parisian region. The idea is not only to bring its monuments back to life, but also to make them accessible to the public again. Another aspect to be valued will be the link with the town of Saint-Germain-en-Laye: the moat is indeed visible not only from the museum but from the public square. How can the local community reclaim these monuments that it sees every day but does not recognize?

7 TURNING ANCIENT GRAVES INTO MODERN ATTRACTIONS. A NOVEL SIGNAGE SYSTEM FOR WESTPHALIAS MEGALITHIC TOMBS

Abstract author(s): Kopner, Lea (Altertumskommission für Westfalen; Universität Münster)

Abstract format: Oral

The Altertumskommission für Westfalen (Antiquities Commission for Westphalia) is committed to making research on the Westphalian megalithic tombs accessible to the local public. One measure in this context is equipping these sites with specially developed information pillars in the form of large, stylised boulders made from steel. These act as a uniform signage system for the Westphalian megalithic graves, but also show the connection to the European cultural route “Megalithic Routes“. Since 2014, the Commission has been a member of the related association, whose aim, among other things, is to promote the cultural and touristic value of European megalithic sites while improving their protection as part of the common cultural heritage. The brand character of the elements and the associated connection to a European network is particularly appealing to the municipalities.

The Westphalian section bears the name “Weg der großen Steine” (“Path of the Great Stones”). Its stations, the sites of the megalithic tombs, are designed in close cooperation with the respective municipalities. Apart from the pillars, the grave surroundings are restored to create attractive destinations. Text panels on the stelae provide information about the European Cultural Route and the respective Neolithic culture (Funnel Beaker or Wartberg Culture) with its special features in lifestyle and burial customs. There is also more detailed information on the respective grave, its research history and finds. A second, digital level of knowledge with further information and additional media can be accessed via a QR code. This way, the latest research results can be quickly presented to the public.

So far, six sites have been equipped with steel elements. Among them is one location where the megalithic tombs are no longer visible. By installing the units, the site is once again a marker in the region, as the burial sites were originally.

8 ARCHAEOLOGICAL MONUMENTS, MATERIAL MEMORIES AND LONGUE DUREE ANDEAN HISTORIES IN THE ATACAMA DESERT (ILUGA, TARAPACÁ, 100BC-AD1900)

Abstract author(s): Uribe, Mauricio (Universidad de Chile) - Saintenoy, Thibault (thibault.saintenoy@incipit.csic.es) - Urizar, Carlos (Magíster de Arqueología Universidad de Chile) - Urrutia, Francisca (Magíster de Arqueología Universidad de Tarapacá)

Abstract format: Oral

For Andean peoples, since the Formative/Neolithic period (± 1800 BC), it has been argued that burial mounds evoke the idea of hills or mountains, which represent the physical legitimisation of the use, exploitation or control of territories. In this sense, the very process of constructing and demonstrating ceremonialism in the burial mounds would reflect common logics of identity, power and competition through ancestral relationships that were being developed and that would have repercussions in later periods up to the present day. As a way of evaluating these approaches, we present the study of the Iluga Túmulos site, adjacent to the well-known Atacama Giant geoglyph, which comprises a ceremonial complex of 72 hectares in the middle of an agricultural complex of 4150 hectares, in the centre of the driest desert in the world. It has more than 120 artificial mounds, some megalithic elements, productive areas, public sectors such as plazas or ponds, mud residential structures and cultivated fields that extend across the pampa. The burial mounds have a wide temporal range, dating from the Formative period (American Neolithic) to the Late Colonial and Hispano-Colonial periods. This continuity constitutes a particularity of the site, reflecting in their construction and occupation, the participation of different cultural and political groups that managed the monuments according to their particular interests. Consequently, these Andean expressions challenge the imaginary of modernity that promotes the desert as a hostile and dehumanised space. In contrast, our study coincides with the vision of the local villagers who conceive of this space as fertile, productive and nourishing. Therefore, in order to document and value these symbolic technologies, local forms of water management and work organisation must be recognised, validating and making traditional knowledge visible as an alternative for the ecological restoration of the desert, affected by industrialisation and current climate change.

9 INTERPRETING A PREHISTORIC ICON FOR A GLOBAL AUDIENCE; CHALLENGES AND OPPORTUNITIES

Abstract author(s): Sebire, Heather (English Heritage)

Abstract format: Oral

Following on from the seminar known as The Challenges and Opportunities for Interpretation and Presentation of Megalithic Sites and Monuments in Salisbury in 2013 some ten principles of interpretation were suggested as universal to these sites.

The principles include how to interpret the widespread adoption of farming and a more settled life; a fundamental change in the way that people interacted with the landscape; an insight into the social and symbolic meaning of these monuments; how the sites were conceived, built and used by people on foot; how our understanding of their society is based on a partial physical record; that megaliths invoke a strong human response; that the monuments in the landscape are often separated from the collections usually displayed or stored in a museum and that the resource of many of these sites is vulnerable.

This paper will illustrate some aspects of how these principles were thought to have universal application with a case study from Stonehenge in the UK where an award-winning Visitor Centre was opened at the end of 2013. In the Visitor Centre there are permanent and temporary galleries as well as an outdoor gallery with a reconstructed Neolithic village all of which and including Stonehenge itself help to convey to visitors an idea of the meaning and identity through time that the earthworks and stones of Stonehenge represent.

10 CIRCLES OF STONE: STONEHENGE AND PREHISTORIC JAPAN: AN EXERCISE IN COLLABORATION AND INTERPRETATION

Abstract author(s): Kaner, Simon (Sainsbury Institute for the Study of Japanese Arts and Cultures) - Sebire, Heather (English Heritage) - Bouchard, Dominique (English Heritage; Research Centre for Museums and Galleries, University of Leicester)

Abstract format: Oral

English Heritage has welcomed colleagues and students from Japan to Stonehenge for several years though collaboration with the Sainsbury Institute for the Study of Japanese Arts and Cultures and the University of East Anglia. This collaboration led to the idea of a temporary exhibition at the Stonehenge Visitor Centre showcasing the prehistoric Jomon Prehistoric Sites of Northern Japan World Heritage Site and Niigata Prefectural Museum of History, Nagasaki.

In 2022, English Heritage in partnership with the Sainsbury Institute and the University of East Anglia produced Britain's first ever exhibition about Japanese stone circles at Stonehenge World Heritage Site. The 'Circles of Stone' exhibition tells the remarkable story of parallels between neolithic cultures and communities who, while thousands of miles apart, have many similarities.

This paper will address the many challenges and opportunities of managing an exhibition with colleagues almost 6000 miles away: how it was possible to bring artefacts to Stonehenge from Japan including a spectacular flame pot and interpret the connections for the global audience that Stonehenge attracts. It also will explore the challenges of interpreting deep history for visitors unfamiliar with Japan's prehistoric histories, and the opportunities provided by this multi-sector international collaboration for collective learning and sharing of best practice.

11 THE SALISBURY SEMINAR: „CHALLENGES FOR BEST PRACTICE IN THE PUBLIC INTERPRETATION AND PRESENTATION OF MEGALITHIC SITES IN WESTERN EUROPE“

Abstract author(s): Jameson, John H (ICOMOS)

Abstract format: Oral

A seminar was organized in Salisbury, England in the fall of 2013 with the aim of beginning a discussion on the characteristics and challenges for best practice in the public interpretation and presentation of Megalithic sites and landscapes. Although the working group focused on sites in Western Europe, our findings have application to Megaliths globally. Organization was led by John Jameson (ICOMOS ICIP, NPS Retired) and Heather Sebire (English Heritage) with several other leading specialists in the field from other countries in Western Europe taking part. Our goal was to address the challenges and opportunities, tied to defined site characteristics, for interpretation public outcomes and offer a list of best practice exemplary case studies. The agenda included: (1) Participant presentations (principally public interpretation and community outreach case studies and examples -- what has worked and what has not worked, etc.); (2) Resource immersion (local site tour); (3) Participant breakout sessions on observed and suggested best practice examples; (4) Breakout session reports; and (5) production of an Outcome Summary to lay the groundwork for the development of an Illustrated Best Practices Guidelines Document with international application and relevance. The seminar included a field trip to Stonehenge where an award winning Visitor Centre was opened at the end of 2013. It was hoped that we could produce at least a start at developing the best practice document. This presentation will address, in today's context, the findings, case study examples discussed, and general contributions of the seminar.

37 HEART OF STONE: MEDIEVAL PERCEPTIONS OF STONE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Berryman, Duncan (Centre for Community Archaeology, Queen's University Belfast) - Reid, Aisling (Queen's University Belfast) - Surace, Valentina (University of Messina)

Session format: Regular session

Stone was a widely used material throughout the Middle Ages. It was used in buildings of all social statuses, in industry or agriculture (e.g. for loom weights or plough stones), and also for sculpture. Regular contact between people and stone will have resulted in perceptions of the material. Stone is a perpetual material, thus it was often reused—e.g. Roman inscribed stones in medieval churches across Europe and prehistoric rock art on slabs in Irish souterrains.

Stone was conceptually complex in medieval culture; for theologians like the thirteenth-century scholar Albertus Magnus it was a 'lively' material with idiosyncratic personality traits. In a similar vein, Leonardo da Vinci's fable about a stone imagines the world from a petrine perspective. Such thinking clearly anticipates Jane Bennett's recent research into Vibrant Matter and reveals much about how and why stone was conceived as a 'living' entity in medieval culture.

This session seeks to expand on our knowledge of stone in a later medieval context and to explore it from many different perspectives. Combining archaeological data with insights from multidisciplinary studies will enhance our understanding of the choices made in selecting stone for buildings and monuments. It will also shed light on its broader conceptualisation in medieval culture.

Some topics we would like to cover include (but are not limited to):

- The use of stone in medieval buildings (as opposed to timber or other materials)
- The choice of stone for sculptures and funerary monuments
- Medieval perceptions and knowledge of stone
- The re-use of earlier stones in later medieval contexts, or the re-use of medieval stones in modern contexts
- The symbolism associated with stone and stone objects
- The trade of stone as a building material
- The intersection of medieval and modern thinking about stone

1 THE MORTAR WRECK - A 13TH CENTURY SHIP CARRYING A CARGO OF STONE

Abstract author(s): Cousins, Thomas (Bournemouth University)

Abstract format: Oral

In late summer 2019 a shipwreck was discovered in Poole Bay, Dorset carrying a cargo of what appeared to be random rubble.

Further investigations into the wreck revealed it to be a mid-13th century ship, making it one of the oldest shipwrecks in England. The ship was carrying a cargo of over 30 tonnes of unworked stone, as well as three grave slabs and over 30 stone mortars made from Purbeck Marble.

The quarrying and production of Purbeck stone was one of medieval England's major industries with thousands of marble artefacts adorning cathedrals and churches across the country and as far away as the Baltic from Royal Effigies to baptismal fonts.

The work on the wreck is only just beginning but questions have already been answered on the nature of the medieval stone trade and maritime logistics in the 13th century. The study of the wreck has also disrupted the conventional historical views of how and where the stone was exported from locally as well as the typological dating of Purbeck Marble artefacts.

2 RE-USE OF DRESSED LIMESTONE DETAILS IN THE CHURCHES OF ESTONIA

Abstract author(s): Kadakas, Villu (Tallinn University)

Abstract format: Oral

Limestone has been the dominant stone for making both the walls and the dressed details in northern Estonia, especially the layers of Lasnamägi Stage of which the whole medieval Tallinn and the churches along the northern coast were built. Re-used details have been noticed in various late medieval buildings by the 20th century scholars merely as filling material in the masonry. However, recent field studies have brought to light information that part of the dressed details (pillars, corbels, etc) with simple geometric forms may have been re-used in their original function, especially within the churches of northern Estonia. The hardness and brittleness of the stone of Lasnamägi Stage has constrained its use for sculpting. Usually, the details were given only geometric forms, which are characteristic to a long period. However, as the medieval archives of Estonia have been almost completely lost, in many cases these dressed details are the only basis for dating the whole building.

On the other hand, the hardness of the stone of Lasnamägi Stage has facilitated survival of the dressed details during demolition and their re-use in original function. Recent field studies indicate e. g. that part of the vault supports (pillars) may have had an earlier "life" as supports of timber ceiling either in the existing or in the previous church nave.

The aim of the paper is to illustrate and discuss the limits and possibilities to identify re-use of dressed stone details in their original function, as well as the overall benefits what can be achieved with systematic implementation of the theory and methods of buildings archaeology when studying medieval architecture, especially with limited written resources.

3 LIMESTONE, LIME PIT, QUICKLIME, SLAKED LIME, LIME MORTAR

Abstract author(s): Jancar, Mojca (Terarhis, Ljubljana, Slovenia) - Ravnik, Mateja (Intitute for the Protection of Cultural Heritage of Slovenia, RU Celje)

Abstract format: Oral

Limestone is a type of carbonate sedimentary rock, which metamorphosed by heat and pressure produces marble. Both forms have numerous uses in construction, agriculture, art and industry. Limestone is hard, durable and readily available as it commonly occurs in easily accessible surface exposures. In the Middle Ages it was a very popular building material for churches and castles in areas where it occurs. As building material can be used in many various forms such as block or brick, decorative moulding, gravel or as a raw material for the production of lime.

Our research will focus predominantly on the use of limestone in the Middle ages as a part of the mortar that binds building elements together. We will try to show its journey from the quarry to the finished building and the work involved. We will also show, what impact the production of quicklime and slaked lime had on the environment and people.

4 ALL THAT REMAINS - RE-EVALUATING THE WORK OF 12TH C. STONEMASONS IN IRELAND UNDER THE REIGN OF THE O'CONOR KINGS

Abstract author(s): Dempsey, Gary (Atlantic Technological University - Galway City)

Abstract format: Oral

The study of historical buildings often focuses on techniques, material, and motifs, rather than the hands that worked the stone. The research behind this paper seeks to develop a personification of stonemasons in Ireland between 1100 – 1699. Examining the socio-economic of three distinct periods (1100 – 1200; 1200 – 1550; 1550 – 1699) where social change greatly affected the work of stonemasons. This paper will focus on the early period of 1100 – 1200, at a time when the O'Conor Kings were developing both a regional and national strategy. This aspect of Irish history is often overlooked in terms of importance, with focus generally being placed on the development of Anglo-Norman settlements.

The role of the stonemason in the O'Conor plan is an important one. While previous studies have suggested the Connacht Kings were not interested in church building (Kalkreuter 2001, p. 68, O'Keeffe 2003), fragmentary Romanesque sculpture at sites in the west demonstrate that the development of construction of stone churches was much more advanced in the region than previously discussed.

The paper will discuss the role of the stonemason in developing the ambitions of the O'Conor kings in 12th Century Connacht, and look at how the O'Conors may have had an unintended hand in the development of other better known Romanesque sites in Munster and Leinster. The paper will also examine the treatment of 12th Century stone buildings in later medieval periods and discuss how the decisions of stonemasons 'to do away with sculptured perceived to no longer be in fashion' (Moss, 2010, 123) at some sites, but retention of signification features at others has led to a misrepresentation of the extent of 12th Century stonework in Connacht.

5 PILLAR OF THE COMMUNITY: HOW THE ROLE OF STONE IN CASTLE CONSTRUCTION ALTERED COMMUNITY TASKSCAPES AND LIVED EXPERIENCES

Abstract author(s): Redmonds, Arthur (University of Exeter; University of Cardiff)

Abstract format: Oral

The construction, occupation, and abandonment of Later Medieval castles had significant consequences on the communities surrounding them. Lived experiences and memory were significantly altered whilst elite models of social order were stamped upon the landscape. The utilisation of stone was at many sites a significant part of this process, a textural reminder of inequality. Indeed, theoretical perspectives can be used to demonstrate that stone usage underlines the processes and thinking by which power and authority were constructed in Medieval England.

In order to provide theoretical insights into the Medieval relationships encapsulated in stone, this paper will look mainly at the rhythms that interacted with the masonry castle. To facilitate this, inspiration is drawn from Tim Ingold's famous paper 'the temporality of the landscape' which coined the term taskscape to refer to the landscape as a set of interconnected rhythms and temporal flows associated with dwelling. If we begin to assess the rhythms associated with stone, and contrast them with their surrounding landscape, we can begin to explore how the stone castle disrupted and warped the taskscapes around them.

Using a variety of smaller case studies, and viewed through the theoretical ideas associated with Tim Ingold's taskscape, this paper will explore three different aspects of the castle and stone relationship. Firstly, how stone castle construction used unfamiliar techniques, materials, and craftsmen to realign local temporal and spatial relationships within the landscape through disrupting community rhythms. Secondly, how the textural and material reality of these castles helped set elite castle holders aside from natural rhythms, and underlining a sense of timeless authority. Finally, in the vein of the work of Sally Smith, this paper will look at how the quarrying and reuse of castle stone might provide valuable insights into the resistance of local communities against elite social order and the castle.

6 STONE MORTARS, A MAINLY CULINARY TOOL IN LATER MIDDLE AGES: STONE CUTTING AND SCULPTURE LINKED TO BUILDING INDUSTRY?

Abstract author(s): Verbrugge, Geert (Inrap - National Institute for Preventives Archaeological Researches, Châlons-en-Champagne; Centre Michel de Bouïard, CRAHAM UMR6273) - Delmont, Estelle (Inrap - National Institute for Preventives Archaeological Researches, Achicourt; UMR 7041, équipe « TranSphères »)

Abstract format: Oral

From in the first significant study on this kind of tool, G.C. Dunning underlined – besides their reuse as building material – their close link to the construction materials industry, that whether in England (Purbeck Marble, Quarr and Weldon Stone), or on the Continent (Caen) in his King's Lynn study (Dunning 1977: 321, 324 and passim). Since then, the discovery in the 1970s of unfinished mortars in a Caen's stone quarry suggests a specialized activity along

the bank of the Orne, river connecting the norman city to the sea. For the Purbeck Marble, the recent discovery of the 13th century “mortar wreck” west of the Poole Bay (Dorset) now concretely illustrates a full shipping load combining mortars, grave slabs and building stones .

We will take stock of the contribution of recent studies on the continent with a special interest to the questions of its manufacturing. Indeed, for two decades, preventive archaeology has provided lots of new data illustrating plenty and diversified productions, for several of them by the rivers and the North Sea . A few rare unfinished exemplars are also to be noted. Considering the traces of stone cutting it is possible to approach the tools used for their manufacture. These are generally of an all-purpose limited variety suggesting a stonemason, in accordance with the functionality of this preparation utensil, mainly culinary in the late Middle Ages. Nevertheless, the shaping sometimes combines different finishing of the surfaces (base, container, etc), but in a limited number of cases also elaborate decorations, for instance some few combining faces and geometric patterns. The latter suggest the contribution of a sculptor’s workshop. In this regard, in Paris, the 13th century book of crafts and guilds provides details about morteliers, whose statutes are close to those of stonemasons.

7 **STANDING FOREVER OVER THE CROPS AND ANIMALS: CONSTRUCTING AGRICULTURAL BUILDINGS FROM STONE IN MEDIEVAL BRITAIN**

Abstract author(s): Berryman, Duncan (Queen’s University Belfast)

Abstract format: Oral

The majority of medieval buildings that we see today are constructed from stone. This is a bias in survival, as timber was by far the most common construction material within medieval farmyards. Stone buildings were many times more expensive than their timber counterparts and took longer to construct, due to additional labour to quarry and transport the material. However, there were evidently many lords who decided to invest in stone buildings rather than timber. This paper will investigate the factors behind the choices of materials and why lords might decide to build in masonry. Castles and churches reveal little in this context, thus this paper shall focus on the manorial buildings of Britain and Ireland, particularly the agricultural buildings. Agricultural buildings were essential for the production of food and thus the survival of societies; therefore the archaeology of these buildings can tell us much about these societies and the social importance of those who ordered the construction of the farms.

8 **STONE RULERS: STYLISTIC VARIATIONS IN VERONA’S SCALIGER TOMBS**

Abstract author(s): Reid, Aisling (Queen’s University Belfast)

Abstract format: Oral

This paper explores the Scaliger tombs situated outside the church of Santa Maria Antica in Verona. Surrounded by ornate railings, the mausoleum contains the tombs of the celebrated Della Scala family, who ruled the region during the thirteenth and fourteenth centuries. The earliest tombs on the site typically replicate the stylistic conventions of medieval royal tombs, which were often carved from porphyry, as is seen, for example, in the red sarcophagus of Theoderic (c. 454-526) in Ravenna, or indeed the tomb of Roger II (1095-1154) in the Cathedral of Palermo. The Della Scala tombs of Cangrande I (1291-1329), Mastino II (1308-51) and Cansignorio (1340-75), however, are entirely different to their predecessors. Monumental in size and striking in their gothic complexity, they indicate a seismic shift in funerary culture. Built after the 1348 black death, the tombs are also sculptural testaments to changes in the way death itself was conceptualised in post-plague Verona. All three monuments feature two large, individualised representations of the deceased person, in contrast to the relatively anonymous tombs of their forbears. In each case, the lower register features a body prone on a catafalque, counterposed by an armed, lively equestrian figure above. Extending the research of Erwin Panofsky, Fernanda da Maffei and Mauro Cova, among others, I consider how and why such stylistic changes occurred. I argue that variations in the later monuments stem partly from anxieties surrounding legitimacy of the Scala rule, which was frequently challenged. Positioned high up, the three horsemen are seated like warrior saints who survey their territory and eternally preserve in stone the post mortem reign of the deceased. They enact a stone resurrection of the defunct person below and in doing so, they undermine the boundary between the living and the dead to permanently preserve the Della Scala rule.

9 **THE EVOLUTION OF STONE-LINED GRAVES: AN EARLY MEDIEVAL IRISH PERSPECTIVE**

Abstract author(s): Richardson, Clair (Queen’s University Belfast)

Abstract format: Oral

The study of funerary remains in first-millennium AD Ireland has been transformed in recent years through the discovery and excavation of a wide range of cemeteries, large-scale dating programmes, and major synthesis of funerary data (e.g., Mapping Death Project). There is now considerable scope for fine-grained analysis of burial data, to understand the complexity and development of burial rites through time.

This paper presents preliminary data from research which suggests potential for developmental change in stone-lined graves from 'rough-hewn', sub-angular stone-lined graves to slab-lined graves around the 6th century AD in Ireland. The most common burial furnishing in early medieval Ireland was that of stone or slab linings (often with lintels). Two separate categories of stone-linings are analysed; rough-hewn, sub-angular, rounded stones placed around the circumference of the graves and slab-lined graves with or without a lintel top and paved floor.

A sample of 78 radiocarbon dates from human remains, excavated from slab-lined and rough-hewn stone-lined graves are analysed. These suggest that, although there is an overlap around the 6th century, rough-hewn stone-lined graves are often earlier in date than slab-lined, often lintelled, graves indicating a growing preference for more elaborate encasements of the human body. The potential for this data to illuminate changing fashions/traditions, a move from ancestral burial grounds to larger cemeteries, and processes of Christianisation are analysed.

10 HOW AND WHY WERE STONES CONCEPTUALISED IN MEDIEVAL RELIQUARIES IN THE MIDDLE AGES?

Abstract author(s): Robinson, Ashleigh (Queen's University Belfast)

Abstract format: Oral

In this paper, I explore medieval thinking about crystals and stones. More specifically, I analyse a bejewelled reliquary Arm of Saint Patrick currently on loan to Ulster Museum in Belfast, which originally would have contained a relic of the saint.

I demonstrate that each stone that decorates the reliquary represents a different purpose and meaning in relation to the Shrine of Saint Patrick. Currently, there is a lack of research into these stones and it is this gap in knowledge that I hope to fill.

Drawing partly on medieval texts like *The Aberdeen Bestiary* and *The Etymologies of Isidore of Seville*, for example, which both feature stones, I consider how and why stone decorations were an important part of medieval reliquaries like the one in Ulster Museum. Drawing partly on Jane Bennett's theory of vibrant materialism, as well as Bruno Latour's Actor-Network theory, I demonstrate that the stones in reliquaries of these types are not simply decorative but were also believed to impact their surroundings.

I initially analyse the formal qualities of the Arm before considering how it might have functioned in its original context. Authors like German Dominican friar and theologian Albertus Magnus (1200-1280), as well as the respected poet Marbod of Rennes (1035-1123) first recognised the significance of stones. Finally, I show that Arm reveals much about medieval thinking on stone, especially within devotional contexts.

11 „DUBBED WYTH FUL DERE STONES“: THE LIVELINESS OF STONE IN ‚SIR GAWAIN AND THE GREEN KNIGHT‘

Abstract author(s): Lundy, Niamh (Queen's University Belfast)

Abstract format: Oral

This project will examine stone in the celebrated medieval poem, ‚Sir Gawain and the Green Knight‘. Stone is a key motif in the text; it is replete with stony mountain-scapes, gems and rocks.

I argue that ‚Sir Gawain and the Green Knight‘ reveals much about medieval understandings of stone, which evidently was not simply a lifeless resource to be manipulated for humanity's profit, but a fundamental aspect of the natural world which held in it histories, experience and understanding.

The Green Knight is presented as a fantastical stone-like creature himself; he is half-man and half-mountain. As nature personified, he encourages the reader to reflect on their own insignificance when compared with the formidable power of the world.

Drawing partly on eco-theorists like James Lovelock, as well as the materialist approaches of Jane Bennett, I suggest here that there is much that we might learn from this text; by thinking more carefully about nature, it encourages us to develop a more positive relationship with our surroundings and indeed the earth under our feet. Such thinking is more important now than ever, given the current climate crisis we are living through after centuries of desecrating the earth.

12 SET IN STONE: LIVING STONE IN CHAUCER'S ‚FRANKLIN'S TALE‘

Abstract author(s): Alarcon, Laura (Queen's University Belfast)

Abstract format: Oral

In Chaucer's ‚Franklin's Tale‘, medieval stone plays a pivotal role; it is conceptualised not as a static body but instead demonstrates independent agency that allows it to move and exert power as if it were a living being. This paper will investigate the apparent liveliness of medieval stone and enrich current understandings of it by exploring the complex ways in which it features in literature of the period.

Much like Chaucer's literature, which clearly demonstrates the vital qualities of stone and these concepts, Jeffrey Cohen's cultural study of stone similarly highlights its complexity, focusing on its force and soul as understood in the Middle Ages. So too, Jane Bennett's theory of vibrant matter asserts that all matter might be conceived as 'vital' or 'alive', rather than a static entity; in this regard, her ideas reiterate the approach to stone apparent in Chaucer's Tales. This paper will further develop research into medieval stone by reading it in relation to recent critical theory of this type.

The paper broadly situates Chaucer's depiction of stony landscapes in relation to wider medieval thinking about stone. It then turns to critically engage with Jane Bennett's work.

To conclude, the paper will argue for more research on medieval stone as a means to rethink how we understand the natural world around us and overcome the problems of the anthropocene.

13 **LIVING STONE: EXPLORING THE VITALITY OF STONE IN THE ABERDEEN BESTIARY**

Abstract author(s): Nelson, Amy (Queen's University Belfast)

Abstract format: Oral

In the Aberdeen Bestiary, the anonymous author tells of two fire-bearing stones, one male and one female, which reside on top of a mountain. Such is their nature that when the female draws near the male a fire is kindled and the mountain and its surroundings are set alight (fol. 94r). The tale of the fire-bearing stones reveals how the lithic possessed a transformative and potentially destructive kind of agency in the middle ages. In this essay, I propose that stones were conceived as innately lively in medieval thought – used as building materials, healing talismans, for allegory-making and even in magical rituals – stones played an important role in medieval life. I employ the Aberdeen Bestiary as a touchstone from which to explore the medieval conception of the lithic. By including gemstones such as topaz, sapphire and jasper in their classificatory project, lapidary texts, encyclopaedias, and bestiaries elevated stone to almost living status. Recent studies on non-human things and objects have examined the efficacy inherent in stone. Political theorist Jane Bennet argues that inert matter wields a vibrant materiality while medievalist Jeffery Jerome Cohen excavates the wealth of stories on stone to consider its aeonic companionship with man. Indeed, as the material of our first weapons and most lasting structures, stone brings the past and present into intimate proximity. Thinking geologically allows us to look beyond anthropocentricity. By revisiting the vitality of stone in the middle ages, we can renew contemporary conversations on stone and ultimately liberate the lithic from stony silence.

14 **"GIMMAS" AS EMBODIMENTS OF VITALITY IN EARLY-MEDIEVAL ENGLAND**

Abstract author(s): Walsh, Ciarán (Queen's University Belfast)

Abstract format: Oral

In many of the Anglo-Norman romance narratives of the later Middle Ages there was an obvious link between gemstones and "vitality" – the quality which distinguishes living beings from inanimate objects. In these poems – such as *Le Roman d'Éneas* and *Le Roman de Troie* – gemstones appear in close proximity to animated automata, as well as in tombs, as a means of preserving the body, and in spaces set aside for physical recuperation. In the later Middle Ages gemstones were more than merely precious, exotic and luxurious objects – at least in the allegorical world of romance literature, they were treated as objects that were, though not themselves necessarily alive, vessels for vitality.

Gemstones also appear frequently in texts from early Medieval England, both in English and Latin. They appear in travellers tales, hagiography, poetry and lapidary texts. Despite their prevalence, however, their significance in relation to the concept of vitality – Old English "feorh" – has never been fully explored. This presentation will therefore investigate the connection between gemstones and vitality in early-medieval English sources, a connection which differs in many important ways from the highly-symbolic treatment of gemstones found in later-medieval texts.

Integrating aspects of archaeological theories such as Malafouris' Material Engagement Theory this presentation will be more conscious of the material nature of stone than a traditional literary analysis. By understanding the physical properties of gemstones – including properties mistakenly attributed to them in the early Middle Ages – I will demonstrate how gemstones, literary or physical, were used as conceptual tools rather than straightforward allegories. This will provide a new perspective on how the Anglo-Saxons conceptualised vitality as a quality separate from mind, body and soul but, nevertheless, associated with physical objects and properties – especially the ability to emit heat and light.

15 REENCHANTING THE ROCKY LANDSCAPE: MEDIEVAL MAGIC IN THE GHOST STORIES OF M.R. JAMES

Abstract author(s): Mitchell, Victoria (Department of English, Queen's University Belfast)

Abstract format: Oral

What is the „archaeological uncanny“? Specifically, why is excavation both revelatory and unsettlingly familiar? According to Gabriel Moshenska, the answers to these Freudian questions are problematised in the ghost stories of M.R. James, a “young Victorian archaeologist” who later turned to writing antiquarian tales of spectral hauntings. James’ translation of *Twelve Medieval Ghost Stories* (which depicts a series of shape-shifting spectres), and magician John Dee’s *Diary*, illustrate his interest in medieval culture and the numinous potential of all matter. Focusing on two texts, *Oh Whistle and I’ll Come To You My Lad* and *A Warning To The Curious*, this paper draws on Jane Bennet’s theory of vibrant matter, as well as Jeremy Cohen’s exploration of „uncanny stone“, to argue that James views the landscape as having a destructive agency that seems to reiterate medieval thinking about the vital qualities of stone. At a time of unprecedented Anthropocene unburials via volcanic eruption and rising sea levels, the Jamesian landscape provides a timeless reminder that man cannot control the elemental forces that exist beneath his feet.

16 MACHEN, VIBRANT MATTER, AND PROTESTANT ANXIETY

Abstract author(s): Bresland, Daniel (Queen's University Belfast)

Abstract format: Oral

This paper explores stone in the work of Arthur Machen, by closely reading his short story, ‘The Inmost Light,’ from *The House of Souls* (1894). The story features a scientist who traps his wife’s soul inside a stone, only for a non-human force to inhabit her body. It reveals much about Machen’s conception of the material universe and its apparent ‘lively qualities’.

This paper situates Machen’s depiction of stone within the wider context of medieval thinking about the agency of matter. I demonstrate that the agency Machen attributes to stone reiterates medieval thinking about the numinous world and is therefore at odds with his Protestantism, causing him anxiety. Clearly, Machen’s horror at the prospect of ‘vibrant matter’ stems from his Anglican background.

I draw on a range of Machen scholarship, including Deborah Bridle’s work on Machen’s fictional portrayal of the occult, as well as Gabriel Lovatt’s thinking on ‘The Inmost Light’ and Cartesian Dualism. I demonstrate that Machen seeks to explore preconceptions about matter.

Combining Machen scholarship with Jane Bennett’s ideas in *Vibrant Matter*, as well as Caroline Walker Bynum’s research into *Christian Materiality*, this paper fills a gap in research into the historical thinking about stone as it appears in ‘The Inmost Light’. In this regard, I highlight Protestant anxieties regarding matter in the Victorian age.

17 MILLSTONE GRIT AND KENTISH RAG: MEDIEVAL STONE IN 1970S TELEVISION

Abstract author(s): Wallace, Craig (Queen's University Belfast)

Abstract format: Oral

This paper will analyze the depiction of stone in *Red Shift* (1978) a BBC Play For Today adapted from Alan Garner’s novel, and the television ghost story *The Stone Tape* (1972), written by Nigel Kneale. In *Red Shift*, protagonists from the Roman occupation of Britain, the English Civil War, and from the 1970s experience the landscape around Mow Cop in Cheshire as contemporaries. There is no sense of chronological distance between them. Stone buildings and artifacts weave and pleat through layers of time. The millstone grit is quarried to build the cottages inhabited by generations of people who occupy the landscape, as well as a folly castle, an anachronism built to look like a medieval ruin. The stone is a figure for the complex conceptualization of time in the text, an archaeological imagination in which past, present and future are perceived simultaneously. A 3500-year-old stone artifact also connects the protagonists, interred and excavated on the site. The characters who share the landscape across generations experience ghostly visions of stone buildings yet to be built. In the ghost story *The Stone Tape*, the haunted house is built on the foundations of an older building, reusing the stone. Spectral visions are stored in the stone and played back on a loop, projected out from the material, like a recording medium. Translucent spectres appear against the stone screen. The stone is Kentish rag, a sort of greensand “quarried since Roman times”. It is suggested that since most of “medieval London was built of this stuff”, it might “explain a lot of ghost stories”. Again, there is an archaeological imagination, with deeper layers of stone containing older recordings. The reuse of earlier stone as a building material in an archaeologically layered landscape is a figure in these texts for a multidimensional conceptualization of time.

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Findlater, Judith (Queen's University Belfast) - Beglane, Fiona (Atlantic Technological University, Sligo) - Montgomery, Ryan (Queen's University Belfast)

Session format: Regular session

Animals are essential to humans in providing food, traction, companionship, and secondary products such as dairy products, wool, hides and craft materials, as well as being significant indicators of status and identity. This session aims to demonstrate how multi-proxy approaches can be used to investigate different approaches to animal husbandry and/or the use of animal products.

The study of animal remains from archaeological contexts allows us to determine such factors as the species present in the ecosystem at the time, variances in livestock quantities, exploitation of wild species, as well as symbolic and socio-economic value to humans. Animal remains can also be utilised in scientific techniques to indicate dietary and mobility patterns that can provide comparative data for humans and can also inform on changes in husbandry methods and animal movements across landscapes and through time.

The session will bring together current research on human-animal interactions and provide an opportunity to gather a range of perspectives from various European countries and chronological periods. Papers are invited that utilise a multiproxy approach to answering zooarchaeological questions. This may include but is not limited to palaeoenvironmental, artefactual, isotopic, proteomic, and aDNA studies. It is hoped that these will demonstrate how zooarchaeology can shed light on the diversity of past human societies and the varying roles of animals within these.

ABSTRACTS

1 LATE PLEISTOCENE PALAEOENVIRONMENTS OF THE VÂRGHÎȘ GORGES AREA (EASTERN CARPATHIANS, ROMANIA), BASED ON VERTEBRATE FAUNAS FOUND IN PALAEOLITHIC CAVE SITES

Abstract author(s): Vasile, Stefan (University of Bucharest; Emil Racoviță Institute of Speleology) - Petculescu, Alexandru (Emil Racoviță Institute of Speleology) - Dumitrașcu, Valentin (Vasile Pârvan Institute of Archaeology) - Robu, Marius (Emil Racoviță Institute of Speleology) - Cosac, Marian - Murătoreanu, George (Valahia University of Târgoviște) - Vereș, Daniel (Emil Racoviță Institute of Speleology)

Abstract format: Oral

The karst system of the Vârghiș Gorges (Perșani Mountains, Romania) includes numerous caves with well-preserved Upper Pleistocene sediment accumulations that yielded Middle Palaeolithic artefacts associated with fossil vertebrates. The large mammal remains show evidence of anthropic interaction, but appear to have mostly accumulated naturally, by carnivore activity. Megafaunal remains mostly belong to cave bears, ibexes, indeterminate large bovids, and wolves, with boar, horse, woolly rhino, red fox, or cave lion remains occurring rarely.

The small vertebrate remains are more abundant, and, therefore, statistically relevant, and offer more information on the Late Pleistocene local environments. The herpetofaunal assemblages include hylid and ranid frogs, lacertid lizards, and natricid and colubrid snakes. The identified taxa support the presence of forested areas, but also of open grasslands, in the vicinity of the gorges. These conclusions are further supported by the small mammal assemblages identified, which include 13 rodent and insectivore taxa. Some taxa (e.g., the common shrew, the bank vole) also prefer shrubberies or deciduous forests, whereas others (e.g., the common vole, the narrow-headed vole, the European hamster, the steppe lemming) inhabit grasslands. The occurrence of the snow vole shows that rocky terrain was also present, as was a permanent body of water, where water voles and marsh frogs lived.

Alongside radiocarbon and luminescence data, the small mammals also helped date the cave sedimentary successions as starting during the latest glacial interval (MIS3), and transitioning to postglacial times. The relative abundances calculated for several taxa (the common vole, the narrow-headed vole, the snow vole, and the common shrew) clearly identify one of the cooling intervals corresponding to the Last Glacial Maximum in the sedimentary succession.

2 THE EVOLUTION OF ANIMAL PALEOECONOMY IN THE COASTAL ENVIRONMENT. A CASE STUDY FOR THE HAMANGIA SITES (VITH-VTH MILLENNIA BC, ROMANIA)

Abstract author(s): Balasescu, Adrian (University of Bucharest, ArchaeoSciences Division; Institut of Archaeology, Romanian Academy) - Voinea, Valentina (National History and Archaeology Museum Constanța) - Radu, Valentin (University of Bucharest, ArchaeoSciences Division; National Museum of Romanian History)

Abstract format: Oral

Archaeological researches realized in the past few years for several Hamangia sites, located in Dobruja region (S-E Romania) such as Cheia, Techirghiol, Constanța, dated to the Eneolithic period has revealed a rich fauna represented mainly by domestic mammals, but wild mammals are also present, as well as a number of aquatic resources. Wild horses, seal and various species of dolphins are among the remains identified.

During this time span, the Black Sea level was rising due to marine transgression and coastal line is constantly evolving. Also due to the tectonic movements and a more pronounced sinking of the continental shelf at the end of this millennium, the prehistoric coastal settlements were flooded and abandoned.

This presentation explore the evolution on animal paleoeconomy during this period affected by major costal transformations. Hamangia agro-pastoral communities based on animal husbandry make trips to the Dobrogea region to find the best pastures. Isotopic analysis has revealed that the herds were moving right to the sea shore for consumption of mineral-rich coastal plants.

After 4500 BC the increase of the Black Sea level has, consequently, the formation of the marine lagoon areas starting from south to north and flooding of coastal wetlands. There is now a growing interest in exploiting marine resources, but adapting to the new constraints of these ever-changing conditions does not seem to be enough. Gradually, the Hamangia communities are assimilated by the graphite ceramic communities, coming from the south of the Balkan Peninsula, much more adapted and for which the animal resources of the environment are an important part of their subsistence strategies. From this cultural symbiosis, the cultural complex Gumelnita - Karanovo VI was born.

This work was supported by a grant from the Romanian Ministry of Education and Research, CNCS-UEFISCDI, project number PN-III-P4-ID-PCE-2020-2369.

3 MULTI-PROXY EXPLORATION OF MIDDLE BRONZE AGE ANIMAL HUSBANDRY AT THE EDGE OF THE FENS, LINCOLNSHIRE, ENGLAND

Abstract author(s): Osborne, David (University of Nottingham)

Abstract format: Oral

Domesticated animals were an important part of prehistoric communities and analysis of their remains can cast light on their movement as part of their husbandry as well as offering a proxy for the day-to-day mobility of their human companions. A study of these mobilities helps to reanimate our understanding of life in past societies and how they made use of resources in the landscapes in which they lived.

This paper discusses the mobility of animals at smaller scales of both temporality and distance and seeks evidence of seasonal movements for grazing. From a study area in Lincolnshire and the Fens in eastern England, bones and teeth of cattle, sheep and pigs were obtained from two sites excavated in advance of development. These represent two different types of grazing, with one site near Lincoln being a more inland, freshwater environment, while that near Langtoft was close to the fen-edge and the area subject to marine incursions in prehistory. Isotope analysis of carbon, nitrogen and sulphur in bones and teeth is used to explore the differences in the grazing environments at these two locations in the Middle Bronze Age and the potential use of the fen salt marshes as a seasonal resource. The isotope analysis is complemented by X-ray Fluorescence spectrometry (XRF) analysis of soil samples taken across enclosures and a possible droveway at the fen-edge, to investigate their use in the penning and movement of animals along the droveway to and from the fen saltmarshes.

By combining the different insights offered by isotope and XRF analyses, a picture should emerge from this research of the small-scale movements that were part of Bronze Age daily and seasonal life and animal husbandry on the fen-edge.

4 THE ROLE OF ANIMALS IN THE LATE BRONZE AGE AT BRINJEVA GORA ABOVE ZREČE

Abstract author(s): Leskovar, Tamara (Centre for interdisciplinary Research in Archaeology, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Toškan, Borut (Research Centre of the Slovenian Academy of Science and Arts, Archaeological Institute) - Omahen Gruškovnjak, Manca (Museum of Gorenjska) - Črešnar, Matija (Centre for interdisciplinary Research in Archaeology, Department of Archaeology, Faculty of Arts, University of Ljubljana; Institute for Protection of Cultural Heritage of Slovenia) - Potočnik, Doris - Ogrinc, Nives (Department of Environmental Sciences, Jožef Stefan Institute) - Gerritzen, Carina (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel) - Goderis, Steven (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel) - Snoeck, Christophe (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel)

Abstract format: Oral

Brinjeva gora above Zreče is a multi-period (fortified) hilltop settlement, most intensively inhabited in the Late Bronze Age (Ha A/Ha B) and in the Roman period. It is associated by three cemeteries, two of which are of interest to us, namely a Middle Bronze Age (Bd B) burial mound with five inhumation graves and a Late Bronze Age (Ha A/Ha B) with 78 cremation graves. Excavations in the various parts of the complex lasted over a decade and yielded important findings, especially about the Late Prehistory of the wider area. They yielded, among other archaeological finds, human and animal remains. The latter are mainly from the settlement, while the human skeletal remains come from the above-mentioned cemeteries.

By combining macroscopic, microscopic and isotopic analyses of human and animal remains, we investigate the role of (various) animals in the diet, mobility, and economy of the Late Bronze Age population inhabiting the area. First, macroscopic and microscopic analyses of the human and animal skeletal remains were performed. A biological profile was established for human individuals. Based on the animal remains, the occurrence of different animal species and the age at death of each animal were determined. Macroscopic and microscopic analyses were followed by isotopic analyses (C, N, O, and Sr). Additionally, plants (trees, shrubs, and grasses) were collected from the geologically colourful surroundings for Sr baseline. The obtained results were combined in order to better understand the demography of the population, husbandry practices, and the use of animal products in everyday life of prehistoric Brinjeva gora above Zreče.

5 DIVERSITY IN THE BIG MUD MEADOW (OR NAGY SÁRRÉT): COMPARING ANIMAL HUSBANDRY AT BRONZE AGE OTOMANI SETTLEMENTS

Abstract author(s): Duffy, Paul R. (Cluster of Excellence Roots, Christian-Albrechts-Universität zu Kiel) - Györgyi, Páritka (University of Michigan) - Bartosiewicz, László (Stockholm University)

Abstract format: Oral

Archaeologists focused on the Middle Bronze Age of the Great Hungarian Plain often claim that population aggregation at tell sites meant they were important nodes on the landscape focused of trade, ritual, and legitimization of social hierarchy. Although the social significance of tell sites remains debated, the size of populations at these settlements undoubtedly often ran into the hundreds, requiring different and sometimes more complex organization of farming schedules than approaches that dominated in the Neolithic. In this paper, we compare animal and plant isotopic data from the Bronze Age tell site of Vésztő-Mágor and the nearby open settlement of Tarhos-Gyepesi-Átkelő. With 7 m of stratified deposit, the tell settlement of Vésztő-Mágor, dating from the Middle Neolithic to the Middle Bronze Age, is the highest tell site east of the Danube in the Carpathian Basin. Nearby, the site of Tarhos-Gyepesi- Átkelő is a small Middle Bronze Age farmstead, where excavations exposed a burned wattle and daub structure. Focusing on the Middle Bronze Age we compare faunal assemblages and nitrogen and carbon data from animal remains to identify differences in household herding economies at the two sites within a detailed radiocarbon chronology.

6 NEW PASTURES: LIVESTOCK AND LIFEWAYS IN IRON AGE IRELAND

Abstract author(s): de Groene, Donna (Department of Archaeology, University College Cork) - Hamilton, Derek (Scottish Universities Environmental Research Centre, University of Glasgow) - Crabtree, Pam (Institute for the Study of the Ancient World, Medieval Studies and Kevorkian Center, New York University) - Garrett, Zenobie (Department of History, University of Limerick) - Johnston, Susan (Department of Anthropology, George Washington University) - Crowley-Champoux, Erin (Department of Geography-Anthropology, University of Southern Maine) - Cleary, Kerri (Archaeological Consultancy Services Unit) - Long, Trish - Troy, Carmelita (Rubicon Heritage) - Becker, Katharina (Department of Archaeology, University College Cork)

Abstract format: Oral

The Irish Iron Age (ca. 700 BC–AD 400) has been one of the most enigmatic periods within Irish Archaeology due in large part to a lack of settlement evidence, which – when combined with the dominance of herbivore bone assemblages and horse tack in the archaeological record – was thought to indicate highly mobile pastoral lifeways. Large-scale excavation programs of recent years and the widespread application of radiocarbon dating has led to Iron Age settlement sites becoming recognized more widely. The idea that people were non-sedentary has been challenged, but, little is still known about subsistence practices and settlement modes.

Excavations at the exceptional ‘Royal sites’ of Tara, Co. Meath, Dún Ailinne, Co. Kildare and Navan, Co. Armagh produced cattle, sheep/goat, pigs and horse remains.. Although discussions of animal husbandry practices were, for a long time, limited to these assemblages, there has been an understanding they may not represent regular settlement practices. The more recently excavated sites provide the broader context necessary for understanding these assemblages and will allow the development of more robust models of animal husbandry and mobility – animal and human – in Iron Age society.

New Pastures, funded by the Irish Research Council (COALESCE/2022/1717) will assess evidence for animal husbandry in Iron Age Ireland from the published and grey literature, and integrate zooarchaeological, isotopic and aDNA analysis to shed new light on animal management in the Irish Iron Age, as well settlement modes and patterns of mobility. By using domestic animals as a proxy for human mobility patterns, the outcomes will provide insights into the movements and connections of people in the Iron Age, building data-based models for Iron Age lifeways.

This paper will present the project design, as well as the results of the initial phase of data collection and analysis of this project.

7 SHARED IDENTITIES OR OBJECTIFIED COMMODITIES? ATTITUDES TOWARDS DOMESTIC LIVESTOCK IN THE IRON AGE AND ROMAN PERIODS

Abstract author(s): Stallibrass, Sue (University of Liverpool)

Abstract format: Oral

During the Roman period there were enhanced developments of towns and market economies and, in some regions, the imposition of large numbers of professional military personnel. Most of the civilian population continued to live and farm in rural areas, inhabiting landscapes that they had shared for generations with people, animals, plants and beliefs. Individuals (of any species) were known in person or by repute. In contrast, some urban dwellers and most of the military personnel were dependent on other people to produce animal resources. Many were not familiar with sentient domestic livestock on a daily or life-long basis, only encountering them post-mortem as processed commodities. Were these different lifestyles associated with different perspectives regarding animal identities: eg as intimate kin or objectified commodities?

Archaeologists pay particular attention to burials or associated bone groups when attempting to study the individuality of specific dead animals. Often, these are companion species such as horses and dogs. But by far the most common companions to rural populations were domestic livestock ie cattle, sheep/goats and pigs. Their bones are usually recovered as dispersed, broken remains, making it much harder to investigate an individual animal’s identity and biography.

This holistic paper considers a range of types of evidence and ways of thinking to discuss how individual domestic livestock related to people’s daily lives, kinship groups, economies and philosophical world views.

It considers data from ethnographic studies, behavioural science, and economic and political history to argue that rural communities recognised multi-species identities, whilst military organisations had very different views regarding domestic livestock.

It suggests how material evidence from archaeozoology, landscape archaeology, settlement structures, geoarchaeology and biomolecular studies can be used to investigate this hypothesis.

8 **THIG AIR MO CHÙLAIBH: AN INVESTIGATION INTO THE ROLE OF DOGS FROM PREHISTORIC TO MEDIEVAL IRELAND**

Abstract author(s): Montgomery, Ryan (Queens's University Belfast)

Abstract format: Oral

Dogs feature richly in Irish legend and history and are commonly found in an archaeological context; with the earliest confirmed canine remains in Ireland dating to the Mesolithic Period. Little is known about the role of dogs in Irish society, however, or how this may have changed over time. To answer this question, this study uses a multi-proxy approach by comparing osteological and contextual evidence with an isotopic study. Focussing on the prehistoric sites of Haughey's Fort, Co. Armagh and Medieval Carrickfergus, Co. Antrim, osteological examination, and isotopic sampling will offer an insight into the condition, diet, and mobility of the dogs from these sites. Supplementing this data, a review of published reports and grey literature from throughout Ireland provides a more complete overview of the perception of dogs in Ireland across various periods and sites and how this manifested into the various roles inhabited by canines and their place in Irish society.

9 **HAND IN PAW: THE RELATIONSHIP BETWEEN DOGS AND HUMANS WITHIN A ROMAN RITUAL SHAFT IN SURREY, ENGLAND**

Abstract author(s): Green, Ellen (University of Reading)

Abstract format: Oral

The ways in which bodies, both human and animal, are treated after death provides us with an important window into past attitudes, beliefs and practices. Despite human and animal remains often being found together within a variety of structured deposits from Roman Britain, few studies have directly compared the treatment of bodies. This is most likely due to discrepancies between the methods used to record animal and human remains, which can make direct comparison challenging. However, within comingled disarticulated deposits, such comparisons can often be the best way to understand the role of each species within the acts through which the deposit was formed. This study uses a first century AD quarry shaft in Ewell, Surrey, England as a case study to show the potential of such mixed analysis. The shaft contained the comingled, disarticulated remains of 91 dogs and 20 humans within four basal deposits. Using a variety of taphonomic and palaeopathological methodologies in order to reconstruct how the bodies, both human and canine, were treated after death, this study was able to show evidence of curation and post mortem manipulation of both, ranging from potential defleshing to the removal of skulls. The similarities and differences between how humans, dogs and other animals within the deposit were treated can help illuminate the unique position of dogs within Roman Britain and what role they may have played within the rituals enacted at this site.

10 **FEEDING CARRICKFERGUS: THE USE OF MULTI-PROXY TECHNIQUES IN DETERMINING HOW THE MEDIEVAL TOWN OF CARRICKFERGUS, CO. ANTRIM, FED ITSELF**

Abstract author(s): Findlater, Judith (Queen's University Belfast)

Abstract format: Oral

This paper aims to show that by using various methodologies such as isotopic and proteomic analysis, zooarchaeology and historical record research, information of how the frontier port town of Carrickfergus, Co. Antrim fed itself throughout the medieval period can be ascertained.

The variance in the species represented through time will be shown as evidenced by the zooarchaeological data from faunal assemblages from the medieval layers of the town for the main domesticated animals of cattle, sheep, goats and pigs. It is known that it is difficult to distinguish between the bones of sheep and goat and the attempts made using a variety of methodologies, that included biometrics, morphological traits and proteomics will be shown that indicated the relative frequencies of the two species present. The results of the analyses and the implications recovered will be discussed.

Carbon and nitrogen isotope analysis to determine dietary indicators of the main domesticated animals mentioned above will be discussed. This analysis included the additional use of sulphur and strontium isotopic analysis on selected samples to determine potential mobility indicators. The data presented will provide information on the variances between the different species sampled as evidenced through the results obtained.

The use of historical record research will also be discussed that will highlight the value of including such material in conjunction with the study of zooarchaeology during the medieval period. Details of episodes of epizootics that would have affected animal husbandry, which subsequently would have had an impact on the social-economic values of the domesticated animals will be discussed in the paper.

The use of multi-proxy analysis in the research of the faunal assemblage material of Carrickfergus, Co. Antrim, provides a comprehensive picture of animal husbandry of the main domesticate species throughout the medieval period.

11 FOODWAYS IN POST-MEDIEVAL IRELAND REVEALED THROUGH ORGANIC RESIDUE ANALYSIS AND FAUNAL REMAINS

Abstract author(s): Dunne, Julie (University of Bristol) - Beglane, Fiona (Atlantic Technological University, Sligo) - Flavin, Susan (Trinity College, Dublin) - Evershed, Richard (University of Bristol)

Abstract format: Oral

Organic residue analysis is commonly used to investigate prehistoric vessels to determine diet, foodways and animal management strategies worldwide. The technique allows the differentiation between various foodstuffs, including non-ruminant and ruminant carcass fats, dairy, aquatic and plant products. However, it is less commonly used to explore historic period foodways and has never before been attempted on post-medieval pottery.

Here, we carried out a large-scale study of absorbed lipid residues from around 200 glazed and unglazed vessel forms, including cooking pots, olive jars, pipkins, baking/chafing dishes and storage jars. These were selected from a number of different domestic and elite sites across the island of Ireland, including Carrickmines Castle, Merchant's Road, Galway, Killeland, Carrickfergus, Naus and Dunboy, Cork. Preliminary results confirm a dominance of ruminant meat (cattle, sheep and goat) cooking in vessels, with dairying only taking place in meaningful quantities at Carrickmines Castle, notably confirmed by the large faunal assemblage.

12 REINDEER CASTRATION IN THE PAST AND PRESENT: TRADITIONAL KNOWLEDGE AND AN OSTEOLOGICAL TOOL TO TRACE HUMAN-REINDEER RELATIONSHIPS THROUGH TIME

Abstract author(s): van den Berg, Mathilde (University of Oulu)

Abstract format: Oral

One of the major questions in the study of human-animal relationships concerns the origins and transformations of reindeer breeding and herding systems of the many reindeer herding communities inhabiting the circumpolar North. Reindeer have been a source of livelihood and sustenance and have shaped the cultures of such communities for several thousands of years. Castrated reindeer have played and continue to play an invaluable role in reindeer herding communities; without castration, the domestication of the reindeer itself could never have taken place. Castration is important for reindeer taming, control, training, community ritual practices, food supply, and herd management. In particular, the practice of 'half castration' (where either part of the testicular duct or testicular gland is kept intact), which is unique to reindeer management, is an ingenious tool, having both roots in traditional indigenous land management and having critical economic, cultural, and practical implications. This presentation integrates biological, ethnographical, and archaeological data and analysis on reindeer castration and broader questions relating to reindeer domestication with a focus on Fennoscandia, where reindeer herding is traditionally practiced by the Sámi. This project 1) mapped the socio-economic, cultural, and historical relevance of reindeer castration among Sámi and Finnish reindeer herders in Fennoscandia, 2) created innovative osteological tools to document reindeer castration in the archaeological record, and 3) applied gained insights on ancient reindeer bone assemblages from Fennoscandia. The evidence of this practice within different contexts through time helps gain understanding of incipient and the transformation of human-reindeer domesticating relationships. Here I present the final results of this research project.

A. SMALL CARNIVORES BETWEEN HYENAS, BEARS AND HUMANS. THE UNIT 3 OF COVA DEL COLL VERDAGUER SITE (BARCELONA, IBERIAN PENINSULA)

Abstract author(s): Gabucio, Maria Joana (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili) - Sanz, Montserrat - Daura, Joan (Grup de Recerca del Quaternari - GRQ-SERP, Departament d'Història i Arqueologia, Universitat de Barcelona)

Abstract format: Poster

Zooarchaeological and palaeontological assemblages, especially those located in karstic cavities, are usually the product of the activity of several taphonomic accumulating agents. This is also the case of the Upper Pleistocene site of Cova del Coll Verdaguer (Barcelona, Iberian Peninsula), where hyenas accumulated most of the ungulates, bears used the cave to hibernate and for birthing cubs and humans occasionally visited the cave. The main aim of this study is to investigate the role played by small carnivores in the formation of Unit 3 (chamber Sala Sal de Llop). For this purpose, we analysed *Lynx pardinus* and *Vulpes vulpes* remains, on the one hand, and leporid remains, on the other, applying different taphonomic (breakage and surface modifications) zooarchaeological (skeletal parts frequencies, age at death) and spatial methods (GIS, geostatistics, refits). Regarding small carnivores, the results indicate a predominance of adult individuals, a fairly complete anatomical representation (especially in the lynx), the refitting of several elements (in the case of lynx, many of them clustered in the same area), and the presence of tooth marks in some remains. This last point shows that some carnivore bones were consumed by other carnivores, as their prey or as scavenged carcasses. Concerning leporids, all age categories are represented (adult individuals predominating), the most abundant elements are the coxae and those from the distal segment of the appendicular skeleton, and evidence

of carnivore damage has been identified in several remains. The combination of these analyses shows that the small carnivores did not play a merely passive role, but were also accumulators of leporid remains. In this way, this study will shed more light on the relationships between human groups and different carnivore taxa at Cova del Coll Verdaguer and, by extension, in the European Upper Pleistocene.

B. RATTUS: A MULTIPROXY STUDY OF HUMAN-RAT INTERACTIONS IN EUROPEAN HISTORY

Abstract author(s): Orton, David - Green, Eleanor - Feider, Michelle - Presslee, Sam (University of York) - Guiry, Eric (University of Leicester, UK) - Jenner, Mark - Holland, Pen - Wales, Nathan (University of York)

Abstract format: Poster

The black and brown rat are among the most globally successful commensal species, and the most significant for European history. Each has spread far beyond native ranges in Asia by colonising niches around human settlements, likely reaching Europe in the Iron Age and 18th century respectively. The resulting association with shifting patterns of human settlements and communications makes rats potentially valuable indicators for key archaeological questions of urbanism, migration, and trade – if we can understand the extent of their dependence on humans. At the same time, rats have profound impacts on human societies as food pests and agents of disease, most notoriously – if controversially – implicated in historic plague pandemics.

RATTUS is a 5-year project (2023-2027) aiming to chart the intertwined histories of rats and humans in Europe from late prehistoric origins to the 19th C. Although based firmly in zooarchaeology, the project applies a broad suite of complementary methods to address these interrelated themes:

- ZooMS collagen fingerprinting to confirm identifications and particularly to distinguish black rats from brown rats;
- direct radiocarbon dating to check and refine chronologies;
- ancient DNA to track dispersal routes and connections and to assess the impact of plague;
- stable isotopes to understand variations in dietary niches through time and between site types;
- analysis of early modern written sources to trace the spread of the brown rat and its impact on European black rat populations;
- ecological modelling to simulate dynamics of rat populations and their movements within human networks, drawing on each of the above.

This poster introduces the aims and scope of the project, showcases some first results, and outlines how the diverse methodological strands will be brought together.

C. BRINGING MACHINE LEARNING TO TAPHONOMY. IDENTIFYING CARNIVORE TOOTH MARKS IN BONE SURFACE WITH ML ALGORITHMS: CROCODILES AND WOLVES

Abstract author(s): Abellán Beltrán, Natalia (UNED; I.D.E.A. - Institute of Evolution in Africa)

Abstract format: Poster

Traditionally, the study of Bone Surface Modifications (BSM) has been done by classifying them systematically, which has produced very different results if done by one team of scientists or another. Tooth marks are a big part of BSM. They can be found in any archaeological assemblage and have been studied thoroughly during the past two decades. The importance of their well recognition is knowing what taphonomy calls “agency”, so that further interpretations about the origin of the archaeological site can be made. In previous studies, pits have proved themselves to be good tools to distinguish some carnivores from another’s (crocodile from felids, for example), but they fail when comparing animals from the same family order, which are much more similar.

In this sense, what has been never done is trying to discern among carnivores just by looking at scores. They have always been considered to be more variable, hence less useful.

In the present work, Machine Learning (ML) algorithms (CNNs) are used to compare crocodile and wolves tooth scores. The main goal is to spread the use of ML in Archaeology, as well as to test the limits of this new method, in an attempt to make our science much more objective, reducing to minimum the personal bias introduced by the investigator.

TEXTILES IN ARCHAEOLOGY, CONSERVATION, AND MUSEOLOGY: FINDING A WAY FORWARD THROUGH COLLABORATION

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Lukesova, Hana (The University Museum of Bergen) - Gleba, Margarita (Università degli Studi di Padova)

Session format: Workshop

Organised by the new EAA Community for Textile Archaeology and Conservation, the proposed workshop opens a discussion on the retrieval, study, conservation, and display of archaeological textiles in museums from the point of view of different disciplines: Archaeology, Conservation, and Museology. Even though it may seem striking, these disciplines often do not share the same aims. While archaeologists are looking for evidence, conservators aim to preserve it and museum curators want to make it understandable and accessible to a wider public. Looking for integrated solutions and a common language through examples of best practices in order to find a compromise acceptable to all stakeholders are the main goals of this workshop. The way to achieve them is through a comparison of practices in various European countries and raising ethical dilemmas that are often solved following local cultural traditions. At the same time, the workshop aims to explore and promote a conscious diversity instead of creating blind standardization based on discussing case studies concerning current practices and attitudes applied in the past.

Following this target, the workshop will be divided into five parts:

1. Brief presentations of various case studies from the past
2. Discussion of the past strategies
3. Brief presentations of various case studies from the present
4. Discussion of current strategies
5. Looking for the best practices for the future following the principle of diversity and sustainability through close collaboration of the stakeholders from the different disciplines involved.

We hope that the outcome of the workshop will be a white paper, which can be further developed in the future in partnership with specialists working on similar issues (other relevant EAA Communities, UNESCO, ICOMOS, ICOM-CC, E.C.C.O., etc.) to form a basis for future national and international practices.

However, online audience is welcome, only passive participation is possible.

ABSTRACTS

1 TEXTILE RESEARCH WITHIN THE REVERSEACTION PROJECT: UNIVERSITY AND MUSEUM IN PARTNERSHIP

Abstract author(s): Kwaspén, Anne (McDonald Institute - University of Cambridge) - Escobar Toro, Adriana (Museo del Oro - Colombia) - Martinon-Torres, Marcos (McDonald Institute - University of Cambridge)

Abstract format: Oral

How can complex technological systems to create luxury goods develop and be sustained in the absence of coercive political authorities? The REVERSEACTION project aims to answer this question by investigating art and technology from pre-Hispanic societies in Colombia. Textile artefacts are one of the key materials of this project, which will be analysed scientifically for information on their source(s), manufacturing techniques and life-histories. The objective is to investigate a wide range of archaeological textiles and production tools, with a view to integrating these data with other strands focused on metals, ceramics and lithics. For this purpose, a partnership has been established between the University of Cambridge and the Museo del Oro in Bogota, which holds the largest textile collection in Colombia, in addition to relevant expertise. In April 2023, a first working visit to the museum will take place during which textiles will be technically analysed, and samples will be taken for scientific analysis of the dyes and radiocarbon dating.

Based on the experience from the first few months of collaboration, this presentation will assess the challenges and potentials of archaeological textiles research in partnership with a major museum, and as part of a larger project going beyond textiles. Issues to be discussed will include research collaboration and knowledge exchange between specialists, constraints in sampling and contextual information.

2 **ARCHAEOLOGICAL TEXTILES FROM THE TREASURY OF THE NATIONAL MUSEUM OF THE HISTORY OF UKRAINE: PROBLEMS OF CONSERVATION, RESTORATION, EXHIBITING**

Abstract author(s): Velychko, Eugenia (National Museum of the History of Ukraine)

Abstract format: Oral

Unique textile fragments are stored in the Treasury of the National Museum of the History of Ukraine (former Museum of the historical Treasures of Ukraine), saving and exposing which is currently an important task. These are finds from Sokolova Mogyla, Mykolaiv region (silk, silk with golden thread embroidery, felt; dated the 1st century), Chugunno-Krepinka, Donetsk region (silk (?), leather, textile from the golden thread; dated 1st-2nd century), Church of the Tithes, Kyiv (silk with metal and glass decorations; dated the 13th century). Currently, all textiles require conservation. The main challenge is the choice of methods. All examples are unique combinations of different materials: bark (placed under the textile)-silk-golden threads, leather-silk-golden threads, or silk-metal-glass. In all cases, the difficulty in choosing a methodology lies in finding the right one for all materials in each combination. For some textiles, the situation is complicated by the restoration made in the 80s XXth, no documents about which have been preserved. Some examples had been filled with glue according to the old methods (such is the fate of, for example, unique silver thread textile). Naturally, it would like to determine whether it is reversible and whether it is possible to conduct additional research.

The issue of exhibiting these unique textiles is also essential. It should solve the problem of not only the most presentable display of textiles but also save in their original form for future generations.“

3 **HISTORICAL WOMEN'S DRESSES AND PROBLEMS OF RECONSTRUCTION**

Abstract author(s): Grupa, Malgorzata - Grupa, Dawid (Nicolaus Copernicus University)

Abstract format: Oral

In archaeological studies, women's silk dresses are a small percentage in relation to the much more frequently discovered remains of men's clothing or typical sack-like grave dresses. The state of preservation of women's dresses varies greatly. Sometimes they are preserved in such a way that they can be described in detail from the very beginning of the conservation work. Usually, these are dresses composed of many elements and the individual details have nothing to do with contemporary modelling. It is an art to be acquired by learning each element, how they are put together and the sizes associated with the width of the skirts worn on different types of petticoats. After conservation treatments, perhaps the most arduous work is to prepare the individual pieces of the dress for duplication. Here, each piece must be marked in such a way that, after several months of fabric conservation work (cleaning, disinfection, impregnation, stabilisation of impregnation processes), it can be placed in the correct place in the constructed gown.

These are usually combinations of five or even up to ten pieces in a single dress element. Only thoughtful handling and very detailed documentation allows for the correct juxtaposition of the whole. These are just some of the challenges with this type of work. They usually last about a year, but the end result is a fully reconstructed dress prepared for a museum exhibition. Gowns from archaeological excavations in Poland are unique finds that differ fundamentally from each other, not only in the details of the cut, but also in the embellishments, which are made of silk pasamons. They are a great repositories of knowledge about women's fashion in the 17th-19th

4 **HOW TO STUDY A TREASURE FROM A MUSEUM STOREROOM? AN ONLINE EXHIBITION AT THE NATIONAL MUSEUM OF DENMARK**

Abstract author(s): Mossakowska-Gaubert, Maria (University of Copenhagen)

Abstract format: Oral

My presentation will focus on the potential and limitations of the study of a museum's textile collection by archaeologists, historians, art historians and conservators.

The National Museum of Denmark (NMD) holds 112 textile fragments from Roman, Byzantine, and Early Medieval Arab Egypt. The collection was created during the period from 1886 to 1964, and four stages in acquisition of objects can be distinguished. All of textiles, with one exception, are in the museum's storeroom. The aim of the online exhibition "Archaeological Puzzles in a Museum: Egyptian Fabrics from the 1st Millennium AD at the National Museum of Denmark" is to give an insight into the history of the collection and the textiles therein. The exhibition is also an opportunity to present some of the problems a researcher encounters when trying to "reconstruct" the history of a collection. Investigations of the Copenhagen's textiles have among others uncovered some of the methods of textile analysis and documentation carried out in the past (e.g. M. Hald's studies made in the 1930s). In some cases, it has been possible to establish the approximate archaeological context from which they came (e.g. textiles from UCL, probably originated from Petrie's excavations). An important aspect of the research was to trace 'doublets', i.e. possible connections between fragments of the same fabric divided and dispersed in different collections, or coming from

different fabrics but woven in the same workshop or using same pattern-sheet (especially fabrics from R. Forrer). However, many questions could not be answered.

This exhibition is the result of a collective work conducted within the RECONTEXT research project (2021-2022). The project was funded by Louis-Hansens Fond and Beckett-Fonden and led by Maria Mossakowska-Gaubert. Hosted by the Centre for Textile Research, Saxo Institute, University of Copenhagen, RECONTEXT was conducted in close collaboration with the NMD.

45 INTERPRETING NEOLITHIC LIFEWAYS: THE IMPACT OF CURRENT THEORETICAL KNOWLEDGE AND MULTIDISCIPLINARY APPROACHES ON UNDERSTANDINGS OF NEOLITHIC EUROPE AND WESTERN ASIA

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Menemenli, Yasemin (Umeå University) - White, Lisa (Queen's University Belfast)

Session format: Regular session

Archaeologists often attempt to study Neolithisation solely in terms of subsistence mode and treat it as a 'package' that includes a linear transition to the domestication of crops and animals, and the appearance of settled lifestyles and technologically advanced materials. This 'package' is usually accompanied by the emergence of complex social organisation, population growth, and the development of cultural innovation. However, current scientific evidence from Western Asia and Europe indicates that Neolithisation occurred in a multiplicity of time, space, and place. Consequently, the need for a reconsideration of current scientific methodologies and theoretical understanding, alongside the application of multidisciplinary methods, is increasingly warranted. This includes the study of mortuary records, which play a fundamental role in understanding Neolithic lifeways by providing insights into the socio-economic, political and cultural dynamics of these communities. Information on population origins, genetic connections, dietary intake, population profiles, and chronologies of site use can all be derived from the scientific analysis of human remains, while investigations of funerary rites can reveal aspects of the world views and ideologies of these past people.

This session welcomes papers focussing on the following: -

- What does current scientific evidence tell us about Neolithisation processes in Western Asia and Europe?
- How can multidisciplinary studies, that integrate theoretical and methodological approaches, help us understand Neolithic lifeways in Europe and Western Asia?
- How can scientific techniques (e.g. isotopes, aDNA, radiocarbon dating GIS), and mortuary studies aid our understanding of early farming communities?

ABSTRACTS

1 DETERMINING DEATH: LIFE AND DEATH AT NEOLITHIC MILLIN BAY, CO. DOWN

Abstract author(s): White, Lisa (Queen's University Belfast)

Abstract format: Oral

The excavation of a Late Neolithic cairn at Millin Bay, Co. Down, in 1953, revealed a complex and unique megalithic structure, with some affinities to the Irish passage tomb tradition, yet unlike any other megalithic monument in Ireland. A feature of the unusual tomb was a 'long cist' containing human remains, art, and pottery linking the site to the great passage graves of Newgrange, Co. Meath, and Carrowkeel, Co. Sligo, highlighting the significance of the monument. The collection of human remains recovered from the cist comprised at least 14 individuals, representing the largest assemblage of Neolithic human remains in the north of Ireland. While an initial report on the skeletal material was provided by anatomists in the 1950's, this paper presents the results of a new study of the Millin Bay human bone assemblage utilising new scientific methods in bioarchaeology, including aDNA, multi-isotope analysis, radiocarbon dating and modern osteoarchaeological methodologies. Re-investigation of the human remains from Millin Bay has produced significant data pertaining to those buried within the tomb and has explored the nature of a suite of complex funerary rituals undertaken by the living, including the acts of dismembering, defleshing, and burning of their dead. Millin Bay is an unusual site which has provided a unique insight into death in prehistoric Ireland and helped inform our understanding of how the site is considered within the wider narrative of Neolithic Ireland and Europe.

2 INTERPRETATIONS OF EARLY NEOLITHIC LIFEWAYS IN BRITAIN: NEW INSIGHTS FROM STABLE ISOTOPE ANALYSIS OF INCREMENTAL DENTINE

Abstract author(s): Ostrum, Brett (Department of Archaeology, Durham University) - Gröcke, Darren (Department of Earth Sciences, Durham University) - Scarre, Chris (Department of Archaeology, Durham University) - Fowler, Chris (School of History, Classics and Archaeology, Newcastle University) - Cummings, Vicki (School of Natural Sciences, University of Central Lancashire) - Montgomery, Janet (Department of Archaeology, Durham University)

Abstract format: Oral

Isotopic studies have greatly advanced our understanding of Early Neolithic lifeways in Britain (c. 4000–3400 BC) over the last few decades, especially in regards to reconstructing typical dietary practices and residential mobility patterns. Other factors that may have influenced a person's lifestyle within their community, however, such as age, biological sex, and health status, have been discussed very little in relation to the isotopic data. This is partially due to the nature of skeletal assemblages from this period, as many Early Neolithic mortuary monuments in Britain were used as communal burial sites, with the remains of individuals becoming disarticulated, fragmented, and comingled over time. This has made it difficult to employ standard osteological methods that are based on the (mostly) complete skeleton for many of these assemblages, including using a life course approach. Stable isotope analysis of incremental tooth dentine, however, can provide information about a past individual's diet and mobility patterns over many years, and may reveal short-term changes in diet, mobility, and health status from early childhood through to young adulthood depending on the specific teeth analysed. Here, we will discuss how isotopic data from incremental dentine can be used to reconstruct individual life histories to further our understanding of Early Neolithic farming communities in Britain. Stable carbon, nitrogen, and sulphur isotope results from incremental dentine will be presented from several sites. In addition to characterising the typical diet and mobility patterns of each individual analysed during their early life, this technique also enables us to look for similar patterns among individuals from the same group that may be related to sociocultural aspects of age. Comparison of results from sites in different geographic areas also provides an opportunity to discuss potential indications of regional variation in early agricultural lifestyles within the isotopic data.

3 RECONSTRUCTING LATE NEOLITHIC LIFEWAYS USING MULTI-ISOTOPE ANALYSES OF HUMAN ENAMEL, DENTINE, AND BONE FROM THE LEGAIRE SUR MEGALITHIC GRAVE, SPAIN

Abstract author(s): Griffith, Jacob (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Cheung, Christina (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel; Department of Anthropology, Chinese University of Hong Kong) - James, Hannah - Veselka, Barbara (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Ordoño, Javier (Department of Archaeology and New Technologies, Arkikus) - Spros, Rachèl (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Fernández-Crespo, Teresa (Departamento de Prehistoria, Arqueología, Antropología Social y Ciencias y Técnicas Historiográficas, Universidad de Valladolid; Research Laboratory for Archaeology and the History of Art, School of Archaeology, University of Oxford) - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel)

Abstract format: Oral

Isotopic analyses have cemented themselves as important tools for reconstructing the lifeways of prehistoric people. In recent years, the development of multi-tissue and incremental sampling, alongside multi-isotope approaches means that we can now recreate these lifeways in greater detail than ever before. Instead of representing individuals with one sample, multi-sampling can track the intricacies of how diet and mobility may change over a lifetime. This has been paramount to understand the prehistoric way of life, as, we can now recreate age-related changes in diet and mobility, as well as certain anthropological behaviours (i.e., weaning practices), which were previously unobservable without a written record.

The study presented here combined the use of multi-tissue sampling (bone collagen, tooth enamel, and tooth dentine) with incremental sampling, in order to track age-related changes in multi-isotope proxies (C, N, O, Sr) within 19 Neolithic individuals from the Legaire Sur megalithic grave, Álava, Spain (ca. 3400–2300 BC). The aim was to reconstruct diet and mobility histories of the people who occupied Legaire at that time to the highest resolution physically possible. To reconstruct dietary lifeways, our approach combined the incremental dentine sampling of 19

permanent molars alongside 18 bulk bone collagen samples. The results allowed us to model not only complex age-related changes in diet, but also the varying breastfeeding strategies implemented at Neolithic and Copper Age Legaire. Further, mobility lifeways were demonstrated through the tracking of O and Sr isotope variations from the enamel of serially forming molars (M1, M2, & M3). These results indicated a varying level of geographical mobility, dependant on individual. For the first time, we present these integrated dietary and mobility profiles of each individual from this recently excavated site, discuss what these reveal about the complex lifeways at Neolithic Legaire, and review the potential of our methods.

4 GENDER AND MOBILITY PATTERNS AT THE BEGINNING OF FARMING IN SE MORAVIA

Abstract author(s): Morell-Rovira, Berta (Archaeology of Social Dynamics Research Group. IMF-CSIC) - Tvrdý, Zdeněk (Moravian Museum. Anthropos Institute) - Díaz-Zortia Bonilla, Marta (University of Tübingen, Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters) - Bickle, Penny (University of York. Archaeology Department) - Tóth, Peter (Masaryk University, Department of Archaeology and Museology) - Přichystal, Michal (Institute for Archaeological Heritage, Brno) - Bedáňová, Alžběta (Moravian Museum, Institute of Archaeolog.) - Masclans, Alba (Archaeology of Social Dynamics Research Group. IMF-CSIC)

Abstract format: Oral

New insights into the experiences of gender and kinship in Central-European Early Neolithic communities have been recently approached in recent years from different methods, such as isotopic analysis, DNA, use-wear analysis or osteology. As a result, these communities have been related to early signs of patrilocal exogamic practices, gender-differentiated demographic and dietary patterns, sexual division of labour, and interpersonal violence. These proposals have as a common denominator a high level of internal dynamism as farming spread through Central Europe. Though some general patterns can be identified across the main Linearbandkeramik area, questions as to heterogeneous gender identities and whether or not generalized patterns apply everywhere remain debated. This presentation aims to explore the presence of patrilocality and its possible consequences regarding women's quality of life and female gender construction within the first European farming communities of south-eastern Moravia (Czech Republic and Slovakia). Specifically, new data on the mobility ($87\text{Sr}/86\text{Sr}$ & $\delta^{18}\text{O}$) and the dietary patterns ($\delta^{13}\text{C}$ & $\delta^{15}\text{N}$) of some of the most well-known Linearbandkeramik funerary contexts of this area will be presented, considering the differences on grounds of sex and gender. The role of temporality in the analysis of these proxies will also be approached through Bayesian Modelling of new sets of ^{14}C dates, in order to examine if certain patterns could be related to some kind of temporal framework on an intra-inter-site level.

5 THE COLORING MATTER OF THE SCHEMATIC ROCK ART : FROM THE COMPLEMENTARITY OF THE ANALYSIS METHODS TO THE CREATION PROCESSES

Abstract author(s): Théron, Coline - Bordet, Pierre (Institut Néel, Centre National de la Recherche Scientifique, Université Grenoble Alpes, Institut polytechnique de Grenoble - Grenoble Institute of Technology, Centre National de la Recherche Scientifique : UPR2940) - Chalmin, Emilie - Defrasne, Claudia (Environnements, Dynamiques et Territoires de la Montagne, Centre National de la Recherche Scientifique : UMR5204 / FRE 2641, Université Savoie Mont Blanc, Centre National de la Recherche Scientifique : UMR5204) - Hameau, Philippe (Laboratoire d'Anthropologie et de Psychologie Cliniques, Cognitives et Sociales, Université Nice Sophia Antipolis 1965 - 2019, Université Côte d'Azur, Université Nice Sophia Antipolis 1965 - 2019 : EA7278, Université Côte d'Azur : UPR7278) - Le Turnier, Marianne (Environnements, Dynamiques et Territoires de la Montagne, Centre National de la Recherche Scientifique : UMR5204 / FRE 2641, Université Savoie Mont Blanc, Centre National de la Recherche Scientifique : UMR5204) - Martinetto, Pauline (Institut Néel, Centre National de la Recherche Scientifique, Université Grenoble Alpes, Institut polytechnique de Grenoble - Grenoble Institute of Technology, Centre National de la Recherche Scientifique : UPR2940) - Schmitt, Bernard (Institut de Planétologie et d'astrophysique de Grenoble, Université Grenoble Alpes, observatoire des sciences de l'univers de Grenoble)

Abstract format: Oral

Neolithic schematic rock art, with its presence over a vast geographical area from the Iberian Peninsula to Italy, and with more than 140 sites in southern France, constitutes in our view a new and particularly efficient way of approaching Neolithic societies and makes a new and certainly complementary contribution to the understanding of neolithic cultural geography, dynamics and lifeways. We will focus here on the physico-chemical analysis of the coloring matter of schematic rock art which provides information on various aspects of societies.

The research into the characterization of coloring matter first informs on the know-how, the techniques used to make pictorial matter (grinding, use of binder, heating). It used also gives information on the circulation of the matter, the uses of the territory and the social practices associated to rock art. Moreover, the physico-chemical characterization of pictorial matter allows for a better understanding of the structure of graphic systems, their syntax (by proposing

groupings of figures based on their composition, by identifying relative chronologies...), an essential aspect of understanding the cognitive nature of graphic systems, particularly of non-figurative ones.

We will present our work in progress on one major schematic rock art site, Otello rock shelter, in Bouches-du-Rhône (France), chosen for the abundance of the iconography, the polychromy and the chronological succession of different graphic phases and the presence of coloring geological materials in the rock shelter and around. We will present our methodology and the complementarity of the analytical methods. We will highlight the importance to work at different scales, from grain size to wall dimension, with both non-invasive (non-contact analysis, directly on the rock) and non-destructive (a micro-sample is taken and kept after analysis) approach, and both with point and imaging analyses.

6 WAVES GENTLY LAPPING UP AGAINST THE SHORE: A NEW THEORETICAL FRAMEWORK AND MODEL FOR CHARACTERIZING NEOLITHIZATION PROCESSES IN WESTERN ASIA

Abstract author(s): Menemenli, Yasemin (Umea University)

Abstract format: Oral

In endeavouring to understand the transition to farming archaeologists use models. These models have met with varying levels of success. Fundamentally, most archaeological models are inadequate. These characterize Neolithic transitions with a focus on subsistence and envisage a 'package' which includes domesticated crops and animals, the appearance of settled lifestyles, and technologically advanced materials. This 'package' is usually accompanied by the ultimate emergence of complex social organization, population growth, etc.

The available models often draw a sharp boundary between the 'so-called' Mesolithic and Neolithic periods and treat the process of transition as a linear progression towards the rise of modern civilization. These models often focus on the origins and the causes of the transitions and rarely touch on the processes of Neolithization. Therefore, many previous attempts to study the transitions to Neolithic lifeways are stuck within a mainstream archaeo-anthropological framework which does not realistically allow enough flexibility for one to discover the different avenues through which we can study the subject matter.

With this in mind, it is apparent that the currently available archaeological evidence, collected from the Middle East and Turkey, produces an extremely complex image that challenges earlier models, and opposes the idea of a linear transition to farming, indicating multiplicity in time, space, and place.

This article introduces a new conceptual theoretical framework herein called Multiple Wave Theory and a new model, aimed at characterizing Neolithic processes in the Middle East and Turkey, which attempts to place these transition events in a more realistic chronological and social context using a range of theoretically grounded and holistic methodologies.

A. FROM BITS TO BEHAVIOUR: QUANTIFYING HUMERAL ACTIVITY-RELATED CHANGES IN NEOLITHIC COMMINGLED SKELETAL ASSEMBLAGES FROM BELGIUM AND FRANCE

Abstract author(s): Liagre, Elle - Knüsel, Christopher (UMR5199 PACEA, University of Bordeaux) - Villotte, Sébastien (UMR7206 Éco-Anthropologie, CNRS, MNHN, Université Paris Cité. Musée de l'Homme; Quaternary environments & Humans, OD Earth and History of life, Royal Belgian Institute of Natural Sciences; Unité de Recherches Art, Archéologie, Patrimoine, Université de Liège)

Abstract format: Poster

The scientific analysis of human remains serves as one of the main avenues to improve our understanding of Neolithic lifeways. However, the often fragmented and/or commingled state of the remains gives rise to various methodological obstacles, which often leads to exclusion of such contexts from analyses. One of the ways to address these concerns is to shift the study focus from complete individuals towards single skeletal elements. In this context, a novel method, based solely on the humerus, is proposed and applied to Neolithic assemblages from the Meuse Valley (Belgium) and the Paris Basin (France).

The non-invasive method applies 3D imaging to quantify osseous alterations of the medial epicondyle of the humerus, an anatomical area that is particularly important for identifying physical activities performed during life. Based on comparison with clinical medical studies, these osseous alterations are likely linked to activities involving the upper limbs and manipulative behaviours of the hands, such as the throwing of objects, the use of axes and stone tool manufacture. When taken a step further, this method can be a means to study sexual division of labour in past communities, and yield insights into other sociocultural phenomena such as craft specialisation and subsistence changes. In short, this method explores the potential of these often disregarded contexts and can aid our understanding of early farming communities in Belgium and France.

Session theme: 6. Contested Pasts & Presents

Session organisers: Munawar, Nour A. (Doha Institute for Graduate Studies; Center for Conflict and Humanitarian Studies) - McAtackney, Laura (University College Cork; Aarhus University)

Session format: Regular session

Damaging archaeological remains, sites, or facilities is by no means a recent phenomenon and has been taking place in conflict zones and spheres for centuries. Destruction of archaeology is not limited to specific geographical areas or to any particular pasts and so can include many contexts, forms of damage, intentions, and aftermaths. We argue that conflict should be understood in broad terms, not simply as military actions but also structural violence and the long-term and naturalized outcomes of settler colonialism.

Since the beginning of the 20th century, destruction of cultural heritage has become a major characteristic of violent conflict, from wars of mass destruction to colonial practices. We wish to consider - what are the overlooked outcomes of violent conflict? Violent destruction has the potential to provide cultural memory with incidents that can be later materialized and memorialized, for good or ill. The destruction of some forms of cultural heritage can also allow for new discoveries, particularly in multi-layered cosmopolitan areas, that can enrich historic records and understandings of place. Less often explored, is the treatment of the material world in the aftermath of violent conflicts, which includes, often politicized attempts to remove or direct material survivals to hide or obfuscate the roles of protagonists as part of the post/conflict 'normalization' processes.

This session invites contributions to 'think outside the box' regarding how we study violent conflict and consider how it influences archaeology as a discipline, its practices, and methodologies, and simultaneously how we can help develop approaches to working with archaeology in the aftermath of wars. We welcome papers discussing theories, methods and case studies connecting archaeology and heritage in conflict across the world, including creatively imagining future ways to improve archaeological practices in post/conflict contexts.

ABSTRACTS

1 THE BATTLE AND THE WAR: WHAT DOES HERITAGE DO WITH COMPLEX STORIES?

Abstract author(s): May, Sarah (Arup)

Abstract format: Oral

A short research project investigating community priorities in post conflict reconstruction challenged my understandings of both heritage and conflict. Conflict is sometimes presented as an aberration, something which disrupts the normal life of agriculture, trade, building monuments. But conflicts don't have such neat beginnings and endings. Archaeology and heritage as practices often create beginnings and endings for things which are much more complex. The heritage practices which attend reconstruction serve two linked purposes, to create the timeline in which the conflict is finished (and had a beginning and end), and to naturalise the power relations which are asserted through the settlement. As such, the experiences of those who lived through the conflict may be deliberately erased. They may choose this themselves, to assert the conflict as an aberration. To investigate conflict is to trouble that settlement. In this paper I will draw on interviews with people displaced by conflict to explore how archaeology can respond to their needs.

2 MODERN AND CONTEMPORARY CONFLICT REMAINS: TO ERASE OR TO PRESERVE, IS IT THE QUESTION?

Abstract author(s): Mura, Mathilde (Archaïos)

Abstract format: Oral

Remains of modern and contemporary conflicts in the Middle East materialize a painful history. Stigmas of war have damaged ancient heritage place, archaeological sites and scarred the landscape over hundreds of kilometers. Military traces are considered as a destructive agent and as such are often rapidly razed or backfilled. Yet, they are witnesses of significant events that have shaped the Middle East and sometimes defined identities and communities.

This paper aims to question the importance or necessity of preserving the remains of war in post-conflict contexts. It will address the ethical issues of destroying modern remains from a social science, historical and archaeological point of view, as well as the impact on survivors and victims of the conflict. The question of who wishes to conserve and who wishes to erase should also be addressed, and whether it is a matter of cultural diplomacy, national identity, contested narrative or a deeply rooted community will, to engage or not into a memorial work.

This paper explores whether conservation is actually the issue regardless of who is the decision-maker, and who undertakes the actions. Rather, it suggests the essential question is elsewhere. Should a governmental directive from the antiquities directorate to remove all traces of contemporary conflict be considered comparable to a foreign archaeologist's decision to bulldoze contemporary layers to reach ancient levels on an archaeological site? Or the choice of a farmer backfilling a military trench to regain his economic activity? Would a community project to build a memorial be received the same way as interest of a contemporary conflict archaeologist to study and preserve these warfare remains? And would either project have the same impact in the recovery process of the victim's community? This approach should also raise the question of neutrality and debate whether it is achievable in this matter.

3 THERAPEUTIC DESTRUCTION: DEALING WITH A TRAUMATIC PAST AFTER CUBAN REVOLUTION

Abstract author(s): Hernandez de Lara, Odlaner (Syracuse University)

Abstract format: Oral

After the military coup of March 1952 led by former president Fulgencio Batista, Cuba entered in a dictatorship that resulted in a bloody violence with extreme state repression which included imprisonment, forced exile, murder, disappearance of people, and the display of corpses in public spaces. By 1958 a former colonial fortress became a torture and detention center known as the Escuadrón 41 of the Rural Guard in the city of Matanzas. Its destruction after the Cuban Revolution, presents it as an atypical case study, illustrating a process of forgetting that contrasts with the national master narratives. At the time, Fidel Castro's government transformed the former military barracks into schools, becoming one of many powerful symbolic narratives of breaking with the recent past. However, that is not the case of Escuadrón 41, which has been intentionally forgotten and erased from the official histories, showing this conflictive time as an external and distanced phenomenon not related with the local communities. Here, I present the first archaeological results in a multitemporal site, showing how destruction is conceived as a therapeutic process to deal with a traumatic past.

4 MATERIAL MEMORIES OF THE KARELIA BY THE DISPLACED KARELIANS AT THE POST-WWII PERIOD

Abstract author(s): Ylimaunu, Timo (Univeristy of Oulu)

Abstract format: Oral

Finland had to settle down some 300 000 to 400 000 Karelians as the aftermath of the World War II. Stalin and the Soviet Union demanded Finland to cede almost the entire region of Karelia, more than 10 % of country's area to the Soviet Union. Karelian people had to leave behind their home regions, their ancestral grave grounds, and their contemporary homes. Karelians were settled down in different regions in Finland. The memory of the Karelia was maintained by different material and immaterial ways, as the most visible way was to erect monuments in the graveyards since the early-1950s. In this paper will be discussed when and how these monuments were erected. One important question is that how the post-war period political elite reacted to these Karelian monuments and material memories of the lost Karelia during the era when Finland had to create and establish new and so-called trustful relationship with Stalin and the Soviet Union.

5 SICILY, SITES AND WORLD WAR 2: THE IMPACT OF MILITARY ACTIVITIES ON THE ISLAND'S ANTIQUITIES

Abstract author(s): Crisà, Antonino (Prince Mohammad Bin Fahd University)

Abstract format: Oral

World War 2 (WW2) can be considered the worst and most destructive conflict in the human history. Military operations and bombing killed not only millions of people but also caused much destruction in urban areas devastating entire cities, monuments, historical buildings and sites.

Considering its substantial cultural heritage, Italy represents a remarkable context in which WW2 put the preservation of historical buildings (e.g. churches) and antiquities at serious risk. Since June 1940 Italy was critically hit by enemy bombing and became a major war theatre starting from July 1943 when the Allied landed in Sicily and then advanced towards the north. As a consequence, the Italian government actualised a series of measures to preserve its heritage.

In particular, Sicily, an island rich of archaeological sites and antiquities, played an essential role during the war being extremely close to the northern African frontline. Based on substantial sets of records, my recent project entitled Cultural Heritage in Danger: Archaeology and Communities in Sicily during the Second World War (1940–45) (Ghent University, 2019-22) aimed to outline the effect of war on Sicilian antiquities.

The scope of my contribution is to present some final and fresh research data through the analysis of selected case studies. First, I introduce my project in the wider context of WW2 and cultural heritage safeguarding. Second, I assess a variety of Sicilian sites (Agrigento, Palermo, Solunto, etc.) in which military operations and bombing caused substantial or less considerable damages. Third, I demonstrate how military authorities often damaged ancient monuments for the impelling necessity of defending the Italian nation occupying sites and building up bunkers, anti-aircraft positions and trenches. Finally, such ‘invasive’ activities generated frictions with safeguarding authorities who were mostly interested in preserving sites and antiquities.

6 IS THIS FOR PEACE... OR WAR? EXPLORING CONFLICT-RELATED MATERIALITIES DURING THE SPANISH COLONIZATION OF TĀNO’ LĀGUAS YAN GĀNI (MARIANA ISLANDS)

Abstract author(s): Carbajo, Matilde - Villena Rodríguez, Noelia - Ramírez Corredor, Yvonne (Universidad Pompeu Fabra) - Moral de Eusebio, Enrique (Universidad Autónoma de Barcelona; Universidad Pompeu Fabra)

Abstract format: Oral

Modern Age conflict-related material culture is primarily analyzed in relation to European war and military tactics, this is especially true for the Tāno’ Lāguas yan Gāni (Mariana Islands). Traditional historiography has referred to the armed conflicts that resulted from the Spanish colonization of the archipelago (ca. 1668-1700 AD) as the “Spanish-CHamoru wars.” In doing so, this body of historical literature has framed such confrontations within European “war-peace” logics that equate the parties involved. Historical archaeologists have cautioned against the use of written sources to guide the interpretation of the archaeological record (i.e. Voss 2007), as this can lead to misinformed explanations of Indigenous materiality but also perpetuate the narratives that underpin colonial enterprises. In this paper we combine documentary and archaeological insights on both European and CHamoru (i.e. Indigenous) conflict-related materialities to challenge the notion of “war” in early modern conquest situations. We explore the CHamoru material culture and practices associated with armed confrontations to determine how the Spaniards strategically used or ignored them. We also argue that the CHamoru conflict logics were broken, leaving their related-material culture (such as the peace-making tortoise shell) symbolically ineffective since. Finally, we claim that the very materiality of European weaponry and war facilities was used not only to cause physical harm but to impose and sustain, through threat and fear, a colonial order in the archipelago.

7 POST/CONFLICT SURVIVALS AND ERASURES: TRACING PRESENCES AND ABSENCES IN BELFAST, NORTHERN IRELAND

Abstract author(s): McAtackney, Laura (University College Cork; Aarhus University)

Abstract format: Oral

Often our archaeological studies of modern conflict stop with the cessation of physical violence. But this paper will argue that an archaeological lens can – and should – be extended to reveal how the post/conflict context is navigated in terms of what survives and what is erased. Using the case-study of Belfast, Northern Ireland, this paper will reveal that the process of ‘normalization’ – that was a key focus for both authorities and communities after a long-term and low level civil conflict – has significant but unequal material consequences. Through a number of sub case-studies, which include security infrastructure, townplanning and mural-memorials, this paper will discuss how conflict and peace are both absented and presented – and even absented and later re-presented – in uneven ways in the post/conflict city. Ultimately, this paper will argue that post-conflict archaeologies can reveal the different priorities of materializing peace that change over time and also indicate the power dynamics between those who attempt to materially absent difficult pasts and those who aim to subvert deliberate erasures and reveal enduring social injustices.

8 ETHICALLY EXCAVATING MEMORY: INVESTIGATING THE DIGITIZATION OF THE MOBILE METHODOLOGY THROUGH AUTO-ETHNOGRAPHIC INTERVIEWS ON TROUBLES-ERA BELFAST

Abstract author(s): Meaklim, Lindsay (University of York)

Abstract format: Oral

Mobile interview methodologies are increasingly used in the Humanities to study place and landscape, including for archaeological research on recent conflicts. However, such methodologies can be exclusionary, resulting in participants with disabilities or infirmities being unable to provide information on their own experiences in contested environments. Using these methodologies on recent conflicts also raises ethical issues, as they could potentially retraumatise participants or others impacted by the conflict under study. A digital alternative allows participants to share their understanding and experiences of conflict, without the practical and ethical issues that the conventional method could raise. This study investigates such an alternative approach to the conventional in-person mobile methodology by digitising the methodology, using Google Earth and Google Streetview to conduct a digital tour. The digital tour was compared against the in-person method by interviewing three participants using both methods, in a conflict

archaeology study of the Troubles in Northern Ireland (1969-1998). Participants were asked to show the researcher how the conflict intersected with the material environment of where they lived in Belfast for each interview. The conventional in-person approach did provide more information (albeit over a smaller geographic area) on Troubles-era Belfast, but the digital provided sufficient information to be considered as an alternative if the in-person method could not be used, or as an initial screening stage to prepare participants for the in-person interview.

9 SHANKILL POPPIES AND POETRY: REMEMBRANCE AND IDENTITY IN ONE OF BELFAST'S URBAN CONFLICT LANDSCAPES

Abstract author(s): Winterburn, John (Independent Researcher)

Abstract format: Oral

Shankill Road is a major thoroughfare that runs west of Belfast city. It bisects a working-class area that rapidly expanded during the growth of the Belfast linen industry in the 19th century.

It is a linear, urban conflict landscape that maintains a collective memory of twentieth-century conflict. Its residents sent their sons to fight and die on the Somme in 1916. Hundreds lost their lives during a devastating Luftwaffe raid during Easter 1941, and it was the epicentre of Loyalist paramilitarism and a focus for violent conflict during The Troubles (1968-1998).

This paper theorises a visitor's perspective of how conflict is remembered and memorialised along Shankill Road and its hinterland. It focuses on the poppy, a divisive symbol on the island of Ireland but regarded by many as the 'universal symbol of remembrance and memory'. There are many representations of this flower along Shankill Road, perhaps more than any other street, appearing in wreaths, cemeteries, roadside memorials, crosses and murals. Like countless other places in the UK and Western Europe, the poppy is used to remember people, places and events.

However, on Shankill Road, the representation of the poppy is evolving. Together with poetry from the Great War, the flower is used to link to the remembrance of the Somme fallen, to legitimise paramilitary combatants 'killed on active service' and to remember those slain by adversaries. The poppy symbols delineate a ceremonial parade route through an urban conflict landscape and reinforce Shankill's identity as British, protestant and monarchist.

10 FROM BATTLEGROUND TO COMMON GROUND: HOW COMMUNITIES BECOME STEWARDS OF CULTURAL HERITAGE THROUGH SHARED NARRATIVES ABOUT THE PAST

Abstract author(s): Benard, Cheryl (ARCH International)

Abstract format: Oral

Our organization focuses on communities in post-conflict, who undertake grassroots efforts to rebuild social cohesion on the basis of a shared bond to sites and traditions of their cultural heritage.

The people of Alqosh, Iraq, a Christian village, have safeguarded a historic monument in their town - the Shrine of Prophet Nahum. Acknowledged by all three religions, his burial place was principally a pilgrimage site for Jews. His shrine was a place of prayer for the health of a loved one, for a happy marriage and a successful pregnancy - common human desires that overcross any differences in religion, language or ethnicity. When the historic building was near complete collapse and our organization temporarily stabilized the structure, local residents urged us to fully restore the site as soon as possible, their sense of stewardship and an expectation of us not to leave anything unfinished had an immense impact on how we conducted fundraisers and meetings and eventually were able to begin sooner than seemed possible at first. Through our work in Iraq, Syria, and Afghanistan, as well as with endangered sites in Europe, we have found that cultural heritage is a tool for "reverse-engineering" the power of disputative narratives to focus instead on shared hopes, concerns and cherished traditions. This includes intangible heritage such as children's stories, folktales and other practices that have analogous content in nearly every culture, and that can generally be shared without controversy. The proposed presentation will focus on case studies from ARCH's work in Iraq, and in Austria (repurposing of an alpine lodge that was twice burned to the ground in both World Wars in the tri-border region of Austria, Slovenia and Italy, but has now been re-designated by grassroots civil society groups as a place for shared celebrations, and for appreciation of nature).

Session theme: 3. Heritage Narratives and Representations

Session organisers: Ripanti, Francesco (Trinity College Dublin) - Sayer, Faye (University of Birmingham) - Fushiya, Tomomi (University of Warsaw) - Luck, Amy (University of Birmingham) - Sloan, Brian (Queen's University Belfast)

Session format: Regular session

Over the last decade the interaction between the arts, humanities, and social sciences, including archaeology, has been of growing interest and importance. Research has repeatedly demonstrated that cultural heritage-related activities can break down barriers to public participation and have a positive impact on individual and community wellbeing. The relationship between archaeology and wellbeing has not emerged out of the blue: it is aligned with specific goals in the Agenda for Sustainable Development and the Horizon Europe Strategic Plan. Wellbeing provides archaeology with an invaluable opportunity to widen groups of stakeholders, diversify demographics of both participants and professionals involved, demonstrate its impact on society and secure funds for projects.

Archaeology can impact everyone through activities such as object-handling sessions, excavation, and photography workshops in a historic landscape. Confirmed outcomes include improved socialisation, happiness, self-esteem, and reduction in stigma. Should archaeologists research wellbeing? May wellbeing be a game-changer for archaeology? Or is it a passing fad? Taking into account the themes and methods identified in recent volumes curated by Darvill et al. (2019) and Everill et al. (2022), this session aims to examine the recent developments and challenges in this emerging research area, expanding the discussion of the following points:

- The contribution of specific fields of study within archaeology (i.e. experimental archaeology) to wellbeing
- Interventions on archaeology and wellbeing in different domains (i.e. contract archaeology, urban planning, community healthcare)
- Methodologies and tools for impact assessment of individual and community wellbeing (i.e. specific scales, mixed-method analysis)
- Focus on the so-called vulnerable and under-represented groups (persons with disabilities, women, older persons, children, asylum seekers and refugees)

We welcome any paper focusing on the previous points and investigating the relationship between archaeology and wellbeing. We also encourage submitting data-informed papers and focusing on case studies from non-anglophone countries.

ABSTRACTS

1 BROADENING PERSPECTIVES: ARCHAEOLOGY AND WELLBEING IN THE MEDITERRANEAN

Abstract author(s): Ripanti, Francesco (Trinity College Dublin)

Abstract format: Oral

Research on archaeology and well-being has shown consistent and promising results in recent years, although much work still needs to be done. In 2020, the European Union launched the “Preparatory Action: Bottom-up Policy Development for Culture & Wellbeing in the EU”. The resulting report (CultureForHealth) is the first pan-European scoping review of the role of culture for wellbeing, but does not include archaeology as a potential contributor.

This session aims to strengthen the case for archaeology as a potential driver of wellbeing by exploring recent developments and challenges in the field. In particular, this presentation will introduce the session and present the results of a questionnaire conducted as part of the “Linking community archaeology and wellbeing in the Mediterranean” (LOGGIA) project. Given that the majority of archaeology and wellbeing projects and research to date have been carried out in Northern Europe and the UK, these preliminary data provide a basis for discussing how to expand archaeology-based interventions in wellbeing.

2 WELL-CITY SALISBURY: EXPERIENCES OF DELIVERING AND EVALUATING A SOCIAL PRESCRIBING PROJECT

Abstract author(s): Luck, Amy - Sayer, Faye (University of Birmingham) - Chalmers, Leigh (Wessex Archaeology; Well-City Salisbury)

Abstract format: Oral

Well-City Salisbury is a 3-year social prescribing project which supports people with low to medium mental health needs by delivering free, 8-week creative courses and volunteering opportunities. Courses are facilitated by the project's four partner organisations; ArtCare at Salisbury District Hospital, The Salisbury Museum, Wessex Archaeology and Wiltshire Creative – alongside local artists experienced in supporting people with mental health needs.

Researchers from the University of Birmingham are the project's independent evaluators, acting as a critical friend to help shape the project's evaluation methods and understand the impact of the project on both its participants, staff, and the community. As the project enters its third year, in this session we will critically and collaboratively reflect on our experiences of delivering a social prescribing project and consider how evaluation methods develop, specifically to measure the impact of creative cultural heritage projects and how these methods have supported partners and participants to understand the impact this project has on their wellbeing.

3 PROMOTING WELLBEING THROUGH ARCHAEOLOGY IN CORPORATE AND OTHER PROFESSIONAL ENVIRONMENTS

Abstract author(s): Orsini, Celia (Gaia Caecilia – Archaeology for Wellbeing)

Abstract format: Oral

This paper explores the ways in which archaeology and cultural heritage can help promote wellbeing in corporate communities and/or professional units in the form of non-medical therapeutic interventions. Archaeology for Well-being - Gaia Caecilia was created in 2021 to attempt to tease out how archaeology could be utilised in organisations to improve the mental wellbeing of their employees and work culture. To do so, a series of workshops were shaped using Cultural Heritage Therapy as a theoretical backdrop in association with tangible exercises and activities. The workshops are aimed to suit corporate environments and to serve amongst expatriated communities using the past as a grounding experience, helping individuals to connect with the land, and the enviroing communities. This recent experience has revealed more than a few challenges, including the terminology used to engage stakeholders and participants, the format of activities proposed and the language used to compete against the vast and fast-growing wellness industry. This contribution is an attempt to discuss the ways to reach a wider audience, without compromising content and remaining relevant, that is to say helpful, to the people the workshops are meant to serve.

4 HEALTH AND WELLBEING IN COMMERCIAL HERITAGE RESEARCH AND DEVELOPMENTS

Abstract author(s): Brem, Anne-Lieke - Sprengers, Wim (Arcadis)

Abstract format: Oral

At Arcadis we are dedicated to "Improving quality of life". The Dutch Heritage Team consists of 15 employees, who are eager to incorporate heritage – integrally, including archeology – in any type of (commercial) development: large- and small-scale projects, infrastructural projects, developments of the natural landscape, and advisory services for local, regional, and national governments.

Now, we are expanding our horizon by developing a 'health and wellbeing' domain. Easier said than done, since we are so often bound to strict formatting and limited budgets and timeframes. Nonetheless, it is the Dutch government's intent to enact the Environment and Planning Act in 2024. It combines and modernizes laws for spatial planning, housing, infrastructure, the environment (including heritage), nature and water. All these fields contribute to our quality of life, health, and wellbeing. And it forces governments to initiate participation processes. In addition, it is the Dutch government's intention to ratify the Faro Treaty. As it seems, this would be an excellent moment to implement the – for our team – new domain of 'health and wellbeing'.

Some of the subjects to incorporate in this new domain are quite straightforward, like the preservation of natural and green assets and creating recreative routes along heritage sites to encourage physical exercise. Other subjects – even though they are equally important – seem to be more difficult to implement, like object-handling and socializing.

Since we are still in a pioneering phase, we would like to explore the restrictions and possibilities of integrating health and wellbeing in commercial heritage research, to discuss how heritage can be used to achieve goals of health and wellbeing in future developments, to give some examples on how we could have integrated health and wellbeing in past projects and to gain valuable insights to further develop this domain.

5 TURNING POLICY INTO PRACTICE FOR ARCHAEOLOGY AND WELLBEING

Abstract author(s): Monckton, Linda (HE - Historic England)

Abstract format: Oral

The concept of wellbeing, embedded into some governments' policies, continues to grow in importance as a way of articulating social benefit. Whilst art and nature are commonly linked in the public's imagination to increased wellbeing outcomes, especially as a result of responses to covid lockdowns across Europe, archaeology is not (yet) given the same status in general literature or in policy, although this is changing.

Historic England published its first Wellbeing and Heritage strategy in 2022, this sets out our approach to considering wellbeing but what does it look like in practice? This paper will briefly introduce a strategic approach to wellbeing and then look at recent research into the specific wellbeing benefits of volunteering with archaeology and heritage carried out for us by the University of Lincoln.

It will then highlight three case studies in England (1) piloting wellbeing through archaeological monument management in Oxfordshire; (2) creative archaeological practice as therapy for vulnerable young people with archaeological partners; (3) working with community health and social prescribing.

Through these studies I will address the following ‘what works’ questions – how can wellbeing objectives help diversify participation with archaeology? How can wellbeing inequality be addressed working with people encountering disadvantage? In reality, how can we capture wellbeing benefits? What are the challenges and opportunities for archaeology and heritage working within local healthcare systems? The paper will end with a practical summary of issues and parameters for project design and implementation.

6 AMPHORA (AUTHENTIC AND MEANINGFUL PARTICIPATION IN HERITAGE OR RELATED ACTIVITIES) GUIDELINES FOR MENTAL HEALTH AND WELLBEING

Abstract author(s): Everill, Paul (University of Winchester) - Burnell, Karen - Makri, Eva (Solent University) - Baxter, Louise (Bournemouth University)

Abstract format: Oral

Taking part in heritage projects, including archaeological fieldwork, has become an increasingly popular way to improve mental health and wellbeing. But there can be times when projects might not have the right infrastructure to make sure that both the participants and the historic remains are well looked after.

In 2020 a team of researchers from Solent University, University of Winchester and Bournemouth University, with the support of Historic England, carried out a study that brought together a panel of 44 stakeholders in a Delphi consultation. The research informed a set of best practice guidelines to help make sure that both the historic environment and participants are looked after when they join ‘therapeutic’ heritage-based projects, and that the best possible results can be achieved safely.

This paper will present the background to the AMPHORA guidelines, the process by which they were determined through stakeholder consultation, key aspects of guidance – including the importance of working collaboratively with mental health experts and the involvement of those with lived experience – and the potential application of AMPHORA to a range of settings.

7 BETWEEN VISIBLE AND PERCEIVED: A NEW APPROACH TO LINK HERITAGE, COMMUNITY AND LANDSCAPE

Abstract author(s): Lombardi, Matteo (Ferrara University)

Abstract format: Oral

The relationship between the community and the environment is a central theme in the European Green Deal: how could the EU community approach a deep transformation towards a more sustainable society able to confront instances such as climate change, energy crisis and pandemic consequences? Cultural Heritage in this sense represents the common roots that connect people and spaces, generating a community at the micro and macro scales. The same connection, if positively addressed, could have positive effects on individuals’ mental and physical health. On this, the World Health Organisation stated that supportive environments are fundamental for individual and community well-being. Since the introduction of theories about community-assigned heritage values, it emerged the need to establish a methodological approach that could enable a multidisciplinary investigation of the heterogeneous set of factors that links archaeological-heritage landscapes and local communities. This paper approaches the issue by proposing a transdisciplinary methodology based on exploiting the full potential of 3D data combined with Heritage Community analysis. Starting from an analysis of the local communities’ perceptions (questionnaires and interviews), the workflow will include GIS-based visibility analysis to link physical and perceived features. In summary, this research believes that decoding such features and links, bridging research, local community perceptions and tools for planning could foster cultural democracy, place attachment and well-being.

8 FEELING USEFUL: CONSIDERING MENTAL WELL-BEING AMONG OLDER PARTICIPANTS IN ARCHAEOLOGICAL PROJECTS

Abstract author(s): Breen, Frances (Bournemouth University)

Abstract format: Oral

Feeling ‘useful’ to and valued by oneself, family, friends, and society has been shown to have a dramatic impact on mental and physical health of older people. This research focussed on people over the age of 60 as these represent a poorly documented but growing constituency. While younger people, military veterans and those who have sought assistance for their mental well-being have already been the subject of study in archaeological settings, older people have not despite large numbers supporting archaeology and heritage projects. There have been no studies investigat-

ing whether taking part in archaeological projects has an impact on older participants' feelings of 'usefulness' and how this could help us better understand the extent and potential benefits for older people's mental well-being.

A two-stage approach was developed, although its implementation was constrained by the COVID-19 pandemic restrictions in force during this project. This study sought firstly to examine and quantify the volunteering opportunities available through archaeological organisations in England to provide context for the project, and secondly by conducting a series of focus groups to explore the concept of usefulness from those who have participated in archaeological projects. From the focus groups four broad themes were identified: Fulfilment; Connectivity; Health Impact and Ageing.

Although the study was limited in scale, participants overwhelmingly reported beneficial impacts on mental well-being as a result of taking part in archaeological projects. As a pilot study this work revealed important insights that if multiplied have implications for those 60+ age-group communities across the country, and for the development and support of archaeological and heritage-based projects and their contributions to well-being. Collaboration with the health sector could have a huge impact on health and well-being and could frame how community organisations feed into the discourse and build on the agenda for health and well-being in communities."

9 CREATING COMMUNITY - CITIZEN SCIENCE AT AN URBAN EXCAVATION IN FINLAND

Abstract author(s): Jokela, Janna (Aboa Vetus Ars Nova Museum) - Aalto, Ilari (University of Turku; Aboa Vetus Ars Nova Museum)

Abstract format: Oral

Urbanization is a global megatrend that continues to pose challenges for individuals fitting into a community. Community archaeology can be a way to address the social challenges connected with urbanization by strengthening the participants' sense of being included in the story of their home city. In this paper, an ongoing urban community archaeology project in Turku, Finland, is brought up as a case study. The Aboa Vetus Ars Nova Museum is situated in the middle of the old town of Turku. The archaeological section of the museum was constructed around medieval ruins in the 1990s, and archaeological activity has continued at the site ever since. For several years, the museum has organized archaeology courses and presented the excavations to the interested public. In 2018, the museum widened its' community archaeology programme by including volunteers in both the excavations and in post-excavation activities. Over the years, this volunteer activity has been built up to the standards of citizen science. In 2020, the effects on wellbeing for both course participants and the volunteers were evaluated, and almost all participants felt that the experience had positively impacted their wellbeing. More importantly, the volunteers felt that partaking in the activity had deepened their relationship to Turku. The project had broadened the participants' idea of their home city to include not just the present but the past as well. Many community archaeology projects tend to rely on an existing community, while this case study shows that a community can also be successfully created through archaeological activity.

10 SUBJECTIVE WELLBEING OF STUDENTS DURING FIELDWORK TRAINING

Abstract author(s): van den Dries, Monique (Faculty of Archaeology, Leiden University)

Abstract format: Oral

Conducting archaeology as a volunteer activity or as entertainment is considered to contribute to the positive well-being of participants. This is what archaeology and heritage students interested in the societal value of their field of research learn. Due to the Covid 19 pandemic, the question came up whether university students when conducting archaeological fieldwork as part of their university training, would experience positive wellbeing effects as well. In 2021 this was studied for the first time among students who had been restricted in their fieldwork activities for over a year due to the Covid 19 pandemic. When they could do fieldwork for the first time during their Bachelors, they were asked to indicated emotions during four moments during fieldwork and the associated work in the lab afterwards. The tool used to measure subjective wellbeing is the 'wellbeing umbrella' (as developed by University College London).

This presentation will show the first results of the survey.

11 'MAKE YOUR OWN VOTIVE': IMPROVING LEARNING AND ENHANCING WELL BEING THROUGH MAKING

Abstract author(s): Morris, Christine (Trinity College Dublin)

Abstract format: Oral

Handling and making objects can make an important contribution to learning, bringing sensory dimensions to understanding technology, style and functions of objects; thus I use handling/making as building blocks in my teaching of university students. In the context of the pandemic, I had dual concerns about the absence of physical engagement with objects and their materiality (during the long period classes pivoted online) and about the individual and collective well being of our students, so I decided to redesign a traditional activity where we handle and talk about votive offerings

from healing sanctuaries. In the revamped activity I asked each student to make their own votive offering, to photograph and catalogue it, and then place it in an experiential/experimental space by writing a prayer or other piece of creative writing about it. There were no restrictions as to materials or form – as a way to encourage creativity – though many students took their cue from the types of human, animal and anatomical offerings one typically encounters at healing sanctuaries, past and present.

In this paper I describe and reflect on the effectiveness of the activity: did it (as I had intended and made explicit in discussion) create a space or an opportunity to help students to focus on their own well-being and that of their family and friends? And if so, has that impact continued beyond covid or fizzled out? In the discussion, I use three years of collected data from this activity, together with student reflections made at the time of making the votive, plus additional interviews conducted some time later.

12 **MAPPING THE CONNECTION BETWEEN REPRESENTATION AND WELL-BEING OF MINORITIZED DUTCH CITIZENS**

Abstract author(s): Kerkhof, Miyuki (Leiden University)

Abstract format: Oral

Culture – and the ways it is managed – is often a way in which inequalities are maintained and legitimized. Culture can however also be an instrument for positive societal change, and has the potential to improve well-being (Everill and Burnell, 2022). Current heritage practices (conservation, education, participation and representation) insufficiently appeal to and include the most disadvantaged groups of people, while we know that they are disproportionately affected by health inequalities.

In the Netherlands, an estimated 100,000 people are survivors of sexual violence, 90% of the victims are women (CBS, 2020). Half of the victims develop post-traumatic stress disorder (Rutgers, 2017), but not all survivors seek help even though they seek recognition and continued care (Hutschemaekers et al., 2019). Is there a way to harness cultural heritage to facilitate healing?

One in ten Dutch people live with a disability (CBS, 2017). While Dutch museums are striving to improve their accessibility, do these museums also broaden their exhibitions to represent people with different disabilities? And in what ways? Do disabled people find their portrayals and narratives representative?

This paper maps how these two disadvantaged groups experience their representation in Dutch cultural heritage and how it impacts their well-being. Through qualitative interviews, we gain knowledge on the lived experiences of highly underrepresented and stigmatized groups of people.

The paper will contribute to an expanding area of interdisciplinary research that not only benefits vulnerable groups with diminished health, it also seeks to inform inclusive heritage practices by engaging both women survivors and people with disabilities as stakeholders in this study.

13 **'BEYOND THE BINARY': FUNERARY ARCHAEOLOGY, GENDERED IDENTITY, AND ITS IMPACT ON MENTAL HEALTH AND WELLBEING**

Abstract author(s): Newbury, Dulcie (University of Bradford)

Abstract format: Oral

Archaeology can be used to critically engage with the present, inform our views of gender identities, and challenge contemporary biases, as well as enhance our understanding of the past and improve contemporary mental health and wellbeing. Today, gender inequality and discrimination impact mental health and wellbeing, with individuals in the queer community showing higher rates of mental illness, often linked to issues faced as a result of their identity.

This research uses archaeological materials to challenge interpretations of gender by eliminating predetermined ideas of identity based on binary sex and gender, with the aim of utilizing archaeology in gender debates today. The binary idea of sex and gender is not representative of identities and limits our understanding of people and identity today, and in the past. To determine the influence archaeology has in contemporary society and on wellbeing, academic and public facing workshops were conducted in May-November 2022 in Bradford. The aim of these workshops was to determine the role archaeology can play in informing, accommodating, and enhancing contemporary discussions surrounding sex and gender identity, with the goal of using these discussions to enhance mental health and wellbeing. The workshops required participants to work in small groups to engage with archaeological and contemporary case studies focused on sex and gender. The materials used challenge the binary concepts of sex and gender. This can provide individuals with a sense of history and community, which is proven to improve mental health and wellbeing.

The workshops showed that participants feel that the sessions and the use of archaeology can improve contemporary mental health and wellbeing by challenging cultural norms and highlighting diversity beyond the binary, both in the past and present.

14 STRANGERS NO MORE - FINDING CONNECTION IN A SHARED PAST

Abstract author(s): Schultz, Sophia (ARCH International)

Abstract format: Oral

In our work in Iraq, Afghanistan, Greece and Austria, we have witnessed how cultural heritage-related activities positively impact community wellbeing.

We know first-hand from our partners in the town of Alqosh in Iraq, that they have been disappointed over the years by strangers with helpful ideas but not much lasting impact.

We have learned how new friendships lead to productive professional relationships that often start small but can be maintained easily over years if one shares an interest in the general wellbeing of everyone involved (a young teacher in Alqosh once ran over to the site we restored in his town, to take a much-needed photo for us. This led to his deeper interest in our work, and consulting us on an exhibition, where he proactively flagged common mistakes (f.ex. the font used for his native language Neo-Aramaic) to help us succeed and his town to benefit.)

We have learned that shared heritage being presented at in-person events brings much joy and curiosity, f.ex., when we organized an event for children at an International Festival, where Buddhist children glued together our Bamiyan Buddha puzzle, while their parents learned about the most famous site of Afghanistan.

Lastly, we have learned about the unifying power of culture; this we observed at our Rumi Day in Washington DC, where the Indian ambassador and the Afghan ambassador both quoted their personal favorite Rumi poems. And we have also, over the years, observed this in Neapolis and Elafonisos in Greece, an island and a city where residents formed new “cross-border” connections based on their passion to protect the world’s oldest underwater city Pavlopetri.

I would like to give a presentation about real-life examples of how public participation in cultural heritage leads to community wellbeing with a focus on living people and their stories.

15 CREATING SOCIAL SPACES FOR WELL-BEING AT MUSEUMS AND LIBRARIES

Abstract author(s): Karlsson, Anna-Karin (Kalmar County Museum; Tingsryd Municipality) - Wollentz, Gustav (Nordic Center of Learning and Creativity)

Abstract format: Oral

Museums have a unique opportunity to let people engage not only with the past, present, and future, but also with other visitors. As such, museums can be facilitators for so-called low-intensity meetings. We here refer to unexpected interactions between people who would otherwise not have met, transcending social backgrounds, ethnicity, and age. A contributing factor to well-being is people’s ability to connect with others. Museums can, in a fundamental way, ease this by creating spaces of low-intensity meetings. Furthermore, objects and interactive elements can even create a socially meaningful exchange that go in multiple temporal directions: past, present, and future.

This paper presents the results of a pilot project where we traced synergies between how museums and libraries create social spaces. It could be concluded that areas where the architecture were encouraging people to physically engage with each other through objects and interactive design, to share personal stories and perspectives, were spaces where the most spontaneous meetings took place.

If museums gained a deeper understanding of how to facilitate low-intense meeting, by for example tracing synergies to other sectors, such meetings could be better incorporated in future exhibitions, contributing to well-being and social cohesion.

77 FROM THE GROUND-UP: PERSPECTIVES ON ANIMAL-HUMAN RELATIONS FROM THE SITE TO THE LAB

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Almeida, Nelson (Uniarq - Centre for Archaeology of the University of Lisbon) - Ribeiro, Artur (Christian-Albrechts-Universität zu Kiel)

Session format: Regular session

In recent years, much progress has been made in the study of human-animal relations. By de-centring the human, animals have become much more prominent in archaeological studies. In addition to this, advancements in isotope analysis have helped us understand the role of many animals in the past. Finally, archaeologists have come to realize that animals were not always subordinate to human rule; that many animals in the past were social beings alongside humans, and that they have more agency than previously assumed.

Before these developments, however, human-animal relations needed to be inferred primarily from their positioning, quantity, taphonomy, and location within archaeological sites. In fact, much of what we know about human-animal

relations stems precisely from onsite analysis. Whether it is funerary structures with both human and animal burials, collective structures which contain animal comingled with human remains, the intentional burial of animals, ritual meat offerings, or the deposition of feasting remains, there is still much to understand about the status and role of animals. Furthermore, much of this understanding relies on the knowledge of what is an intentional (or structured) deposition and what is a secondary deposition, or even what “waste” meant to past people.

The aim of this session is to combine both the study of animal-human relations as they appear onsite and what they tell us from lab work, independently of chronology. Overall, we intend to uncover animal-human relations in a holistic manner, demonstrating that human-animal affinity covers the entire spectrum of natural, economic, and social relationships.

ABSTRACTS

1 EXPRESSIONS OF BODY AND FORM: EXPLORING ANIMAL, HUMAN, AND OTHER-THAN-HUMAN RELATIONSHIPS AT NUNALLEQ IN SOUTHWEST ALASKA

Abstract author(s): Paskulin, Lindsey (ADaPT Laboratory Facility, Department of Anthropology, University of British Columbia) - Masson-MacLean, Edouard - Britton, Kate - Knecht, Rick (Department of Archaeology, School of Geosciences, University of Aberdeen) - Speller, Camilla (ADaPT Laboratory Facility, Department of Anthropology, University of British Columbia)

Abstract format: Oral

Since time immemorial, animals and humans have occupied overlapping spaces and led interweaving lives. In the Arctic, relationships between humans and animals are central to Inuit, Iñupiat, and Yup'ik Indigenous worldviews and form the basis for lifeways in northern regions. Bone, ivory, antler, and other animal-based raw materials represent a significant portion of Arctic archaeological assemblages, and are used in the creation of adornment pieces, ceremonial regalia, and tools for hunting, fishing, and crafting, among others. Nevertheless, due to physical modifications made in the creation of these objects, knowledge is limited concerning their taxonomic origin. Advances in high-resolution mass spectrometry allow for the recovery of protein from archaeological material for taxonomic determinations of otherwise unidentifiable material. Collagen peptide mass fingerprinting, or Zooarchaeology by Mass Spectrometry (ZooMS), has been recently optimized to be minimally invasive, permitting its application to culturally sensitive material including bone, ivory, and antler belongings. We applied minimally-invasive ZooMS to belongings at Nunalleq, a pre-contact village in Southwest Alaska, to address questions concerning raw material selection as it informs and is informed by the final modified form. Through the analysis of zoomorphic and anthropomorphic figurines and items of adornment, this study aims to identify taxonomic origin and investigate the relationship between raw material selection and animal symbolism in the creation of memory, personhood, and concepts of the body.

2 ABUNDANCE OF NON-ADULT OVICAPRINE BONE REMAINS AT THE ARCHAEOLOGICAL SITE OF GUINEA (EL HIERRO, CANARY ISLANDS)

Abstract author(s): Fumero, Emilio (University of La Laguna)

Abstract format: Oral

El Hierro is the smallest and westernmost island of the Canary Islands archipelago. Despite having several emblematic archaeological sites, little is known about its indigenous inhabitants before the European conquest in the 15th century. What we do know about these societies is that their precarious economy (due to the limitations of the territory) was eminently pastoral. The site of Guinea was excavated between 1993 and 1994. These interventions made it possible to characterise it as a habitat site and to identify the signature of an important human activity with several areas of material concentration. The zooarchaeological record of this site is striking when compared with other islands, both for the variety and quantity of wild species which in most contexts are very sporadic and which here seem to be the result of the need to supplement the products obtained from livestock. This preliminary study focuses on the abundance of immature ovicaprine remains in relation to the rest of the faunal record. When considering different levels separating the areas of activity, we observe that between 15% and more than 40% belong to non-adult goats or sheep. When the analysis is made considering all remains of each level together, we see that, out of more than a thousand bones, between 20% and more than 30% belong to juvenile sheep and goats. In addition, most of the bones are thermoaltered and many show cut marks related to fleshing. Our hypothesis, following the traditional view of these human groups, is that the abundance of non-adult faunal remains reflects a strict birth control regime for the livestock, which ensures that resources are not spent on non-productive animals and also that milk is not used to feed the young.

3 THE WASTE AND THE WILD: NON-DOMESTIC ANIMAL REMAINS AS EVIDENCE OF COMPLEX HUMAN-ANIMAL RELATIONSHIPS

Abstract author(s): Crowley-Champoux, Erin (University of Southern Maine)

Abstract format: Oral

Archaeological remains from late Iron Age and Early Medieval Irish sites (dated to ~1-1100 CE) demonstrate a strong relationship between humans, livestock, and commensal animals. Most research into human-animal relationships in agricultural contexts tend to focus on the major livestock species and, occasionally, canine and feline companions. Though small, however, there is often a 'wild' or 'other' category on the list of taxa in zooarchaeological reports. These oft-overlooked animals tend to be rodents, fish, and birds. Because these taxa represent a small contribution to the total dietary breadth or economic focus of the site, their presence in the assemblage is usually attributed to natural causes, an incursion, rather than as evidence of relationships that the community had with their environment and with these animals. This paper explores the importance of wild species in these contexts, their importance in economic and social relationships, and the potential for understanding complex relationships that human communities had with their environments and 'other' animals.

4 FROM PREY TO SOMETHING ELSE? THE HORSE AND RED DEER IN PORTUGUESE PREHISTORY (CA. 12.000 - 4.000 BP)

Abstract author(s): Almeida, Nelson (UNIARQ, Centre for Archaeology of the University of Lisbon) - Barreira, João (CEAACP, Centro de Estudos em Arqueologia, Artes e Ciências do Património; O Legado da Terra, Cooperativa de Responsabilidade Limitada)

Abstract format: Oral

Starting from the faunal record, we will discuss the different papers that equids and red deer had in the economic and non-economic spheres of prehistoric groups. Western Iberia, more specifically the current Portuguese territory, is presented as a case study during the ca. 12.000 – 4.000 BP period. Hence, we will review evidence on the dynamics related to these species over the long duration, among hunter-gatherers, agro-pastoralists, and the first metallurgists.

Red deer are some of the most recurrent animals in faunal records and graphic representations, while the importance of equids seems to have been different, especially from a quantitative economic standpoint. The exploitation of these species diverged during this large period, as well as their representation in artistic cycles, or their use in other possible symbolic practices. These aspects will be assessed by crossing data related to the exploitation of these animals for economic purposes, with information on their use as part of "meaningful" contexts (structured depositions), as a representation (rock art), or as a base for representation (modified remains).

A. PALEOECONOMICAL AND PALEOENVIRONMENTAL STUDY OF A CUCUTENI-TRYPILLIA SETTLEMENT FROM IASI, ROMANIA

Abstract author(s): Malaxa, Daniel (Iași Institute of Archaeology)

Abstract format: Poster

Following the preventive archaeological research undertaken in the municipality of Iași (Iași County, Romania) - on the streets of Sf. Andrei, no. 51 and Palace no. 4 - vestiges dating from the Cucuteni-Trypillia culture, B2 stage (Chalcolithic period) were also discovered. Among them is a ritual pit, with a very rich inventory, made up mainly of ceramic fragments and faunal remains.

Animal husbandry and hunting were the most important activities for obtaining animal protein for this prehistoric community, but as an additional source of food, fishing and molluscs gathering could be also practised.

The domestic taxa identified were: *Bos taurus* (domestic cattle), *Ovis aries* (sheep), *Capra hircus* (goat) and *Sus domesticus* (domestic pig), and the wild ones were: *Bos primigenius* (aurochs), *Cervus elaphus* (red deer), *Equus ferus* (wild horse) and *Sus scrofa* (wild boar). The domestic species were exploited mainly for secondary products and only when they reached a mature age were slaughtered for the primary products.

Based on the identified wild taxa, the palaeoenvironment at the time of operation of the studied settlement was estimated as predominantly steppe with a forest relatively close to the settlement. Also, the presence of the river shell indicates the existence of a hydrographic artery near the settlement.

B. ARCHAEOZOOLOGICAL APPROACH TO URBAN SETTLEMENTS OF MEDIEVAL MOLDAVIA: CASE STUDY OF THE SITE FROM TÂRGU NEAMŢ (ROMANIA)

Abstract author(s): Stanc, Simina Margareta - Bejenaru, Luminița (Alexandru Ioan Cuza University of Iași) - Diaconu, Vasile (History and Ethnography Museum of Târgu Neamț)

Abstract format: Poster

This work aims to evaluate the animal resources and their use in the medieval urban settlements of 14th-16th centuries from Târgu Neamț (Neamț County, Romania). In the last decade, the archaeological excavations in this medieval town revealed traces of several dwellings and household complexes, rich in materials consisting in ceramics, iron objects, animal remains.

Animal remains are described in terms of their frequencies, based on the number of remains and the minimum number of individuals, and of selection by age and sex.

The archaeozoological analysis emphasizes the importance of animal husbandry (mammals and birds) in the local economy, and a low representation of hunting (mostly mammals) and fishing. Cattle (*Bos taurus*) dominate the assemblage, representing about 58% from the total identified remains; pig (*Sus domesticus*) follows in frequency (12%), then sheep/goat (*Ovis aries*/*Capra hircus*) with 7%. Horse (*Equus caballus*) was consumed, as it is proved by the butchery marks identified on few bones.

Results of age at death and sex estimations indicate that cattle herd management was aimed at ensuring milk production, draft force, and securing breeding stock; pig was raised mainly for meat and fat.

A comparative archaeozoological study shows similarities of the analysed settlement with other towns of Medieval Moldova (i.e., Siret, Baia, Vaslui, Târgu Trotuș).

This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-III-P4-PCE-2021-1180, within PNCDI III.

C. HUMAN-ANIMAL INTERACTIONS IN THE MEDIEVAL MONGOL CITY OF COSTEȘTI (REPUBLIC OF MOLDOVA)

Abstract author(s): Bejenaru, Luminita - Stanc, Simina („Alexandru Ioan Cuza“ University of Iași, Faculty of Biology) - Vornic, Vlad (National Archaeological Agency, Chișinău) - Bacumenco-Pîrnau, Ludmila (Romanian Academy - Iași Branch, Institute of Archaeology)

Abstract format: Poster

The western periphery of the Mongol Empire (The Golden Horde) extended in the 13-14th centuries to the east of the Carpathians. Under the “Mongol peace”, in 14th century, several Mongol cities developed in favourable economic conditions, among them being the urban settlement from Costesti (Republic of Moldova). The Golden Horde city from Costesti, with an estimated area of about 400 hectares, represented an important political centre, with its own monetary issue. Archaeological excavations have revealed clear evidence of the Golden Horde culture, represented by numerous ceramic vessels, both common and luxury ones, glass and steatite vessels, bronze mirrors, pieces of jewellery, a rich collection of coins etc.

This study discusses human-animal interactions in this Mongol urban site of 14th century, in terms of archaeozoology. Animal remains are described as frequencies, selection by age and sex, body part representation, and butchery patterns. The results show a specialised way of animal exploitation and consumption. The main animal species used in the food economy were sheep/goat (*Ovis aries*/*Capra hircus*), cattle (*Bos taurus*) and horse (*Equus caballus*), similar to other contemporary Mongol settlements. The hunting records a very low rate during the Golden Horde period, this could be another characteristic of Mongolian big cities.

This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-III-P4-PCE-2021-1180, within PNCDI III.

90 SETTING ARCHAEOLOGICAL HERITAGE POLICY AT THE EUROPEAN LEVEL: PUTTING IT INTO THE HANDS OF ARCHAEOLOGISTS

Session theme: 3. Heritage Narratives and Representations

Session organisers: Viragos, Gabor (EAA Heritage Advisory Committee; Hungarian National Museum) - Fries, Jana (EAA Heritage Advisory Committee)

Session format: Regular session followed by a roundtable

This session, organised by the EAA's recently-established Heritage Advisory Committee, will consider the role of the EAA and related organisations in directing international policy in relation to the management and protection of

archaeology. We say 'directing' rather than 'advising on' or 'guiding' policy in order to recognise that although members of the EAA and similar bodies have no legislative powers, we are those who are most immediately and directly concerned with the current and future condition of our discipline and the material with which we engage. Accordingly, we believe that policy and regulation relating to our activities should be driven by and designed for us, rather than by other agendas. Such a concern goes into all those areas that may affect archaeological and heritage work – such as policy on agriculture, infrastructure work (including flood protection), utilities (e.g. water and energy), natural heritage preservation, development, etc.

We invite contributions from EAA members across Europe which will provide insight and opinion on the following topics:

- What is the proper role of the EAA in setting policy on archaeological and heritage matters?
- What are the key issues we should address in considering policy initiatives?
- Is advocating for legislation for protection of the archaeological heritage enough – or should we do more? If so, what?
- How do we engage with the different roles, organisational structures and authority of associations of European nation states, specifically the European Union and Council of Europe?
- How do we influence policy in those countries that do not belong to either the EU or CoE but whose actions and policies affect the treatment of archaeology in European countries?

ABSTRACTS

1 THE ROLE OF PROFESSIONAL ARCHAEOLOGICAL SOCIETIES IN FORMULATING NATIONAL AND SUPRANATIONAL CULTURAL POLICIES – AN EXAMPLE OF YUGOSLAVIA

Abstract author(s): Lorber, Crtomir (Independent researcher)

Abstract format: Oral

Archaeology is a part of cultural policies however it struggles to formulate a discussion with regional, state, and European institutions, although archaeological societies are operating in every EU member state. In the history of archaeology these societies had an important role and EAA shouldn't be absent from formulating EU cultural policies. For its role we can look to history as EAA faces similar challenges to those faced in the past. We can look for answers to the session's questions by analysing similar supranational organisations such as the Archaeological Society of Yugoslavia (ADY), which unified six national archaeologies of former Yugoslavia. We will discuss:

- The advisory role of ADY in the formulation of Yugoslav cultural policy, both on national and international levels.
- The functions and initiatives of ADY – its involvement in the formulation of the Yugoslav heritage legislation and structuring of archaeological institutional network, its contributions to the archaeological publishing activities etc.
- The legal status of ADY and its influence on legislative processes.
- The federalisation of ADY, focusing on the relationship between the Yugoslav and Slovene archaeological societies.
- ADY in the Yugoslav foreign policy focusing on the planned internationalisation of the Yugoslav archaeology.
- The legacy of the supranational ADY in the South-eastern Europe.

Understanding the Yugoslav experience, successes and failures, offers an argument in favour of the EAA as a tool of the development of European archaeology. Past experiences show a supranational archaeological association can work successfully on different aspects of cultural policy, as long as it is properly supported and it develops alongside the wider society. EAA could be instrumental in coordinating the views of national archaeological societies on European issues, formulating a coherent role for these societies in EU legislation and the continued internationalisation of archaeology in the EU.

2 CLAIMS AND RIGHTS OF ARCHAEOLOGISTS IN SICILY AS POLITICAL ACTION FROM A EUROPEAN PERSPECTIVE

Abstract author(s): Valbruzzi, Francesca (Museo Interdisciplinare di Messina) - Giannitrapani, Enrico (Confederazione Italiana Archeologi)

Abstract format: Oral

As archaeologists actively involved in the research and protection of the archaeological heritage preserved in Sicily, we strongly support the direct involvement of archaeologists in determining present and future policies for the European archaeological heritage. However, here we urge EAA and HAC's awareness of the current dramatic situation of the Sicilian heritage and the constant professional downgrading of archaeologists within the regional administration. Since 1975, Sicily has a partial autonomy on cultural heritage, even if limited by the national legislative codes. At the end of

the 1970s, advanced reforms were approved by the progressist government of Piersanti Mattarella, later assassinated by Mafia, including law no. 80/1977, „Regulations for the protection, enhancement and social use of the cultural and environmental heritage of the Sicilian Region“. It had the grand ambition of creating a virtuous circuit between scientific research, contextual heritage protection and cultural promotion of local communities, with a key role for archaeologists and other specialists in decision-making. After that reforming season, almost a utopia, imposture prevailed in Sicily. Over the last 50 years, regional governments have unlawfully brought heritage under strict political control and systematically excluded archaeologists from their directive functions. None of the Sicilian superintendencies, museums or archaeological parks is today directed by archaeologists but by „managers“ with no specialist skills and qualifications. The archaeologists working in the regional administration, universities, and professional archaeology have united in denouncing the anomalous power of regional politicians over the heritage institutions, asking to be put back in charge of those institutions to ensure the conservation of the regional heritage and its correct social use. Our paper discusses the criticalities of this system and the dramatic working condition of archaeologists but also aims to be a strong and clear political act of denunciation and a request for support from the European scientific community.

3 EUROPEAN ‘CONTACT ZONES’ FOR ARCHAEOLOGICAL POLICIES - SOME HISTORICAL CONSIDERATIONS

Abstract author(s): Schlanger, Nathan (Ecole nationale des chartes, Paris; UMR 8215 Trajectoires, Paris)

Abstract format: Oral

Just how are archaeologists, as professional researchers and heritage managers, able – or expected – to influence relevant policies at European-wide level? The fora where such policies are devised or fixed can be difficult to access, and fairly impenetrable in terms of their specialised language and consensus-striving practices. The harmonisation of national or state-party differences often dominates over the achievement of satisfactory scientific and heritage goals – especially in the case of relatively “hand off” competencies such as culture and heritage. To better identify some ‘contact zones’ where archaeologists may gain audience and audibility, it may be useful to take a step back and consider some milestones in the internationalisation of archaeology over the past century or so.

To better identify some ‘contact zones’ where archaeologists may gain audience and audibility, it may be useful to take a step back and consider some milestones in the internationalisation of archaeology over the past century or so.

4 WHY ENGAGING WITH THE EU AND AN EU LAW CREATING A PAN EUROPEAN ARCHAEOLOGICAL PLAYING FIELD IS ESSENTIAL

Abstract author(s): Forrestal, Colin (Independent Researcher)

Abstract format: Oral

As was highlighted in Session 778 at EAA Barcelona 2018 conference and in a presentation to the 2022 EAA Budapest conference session 436, the laws and practices concerning archaeology across Europe vary considerably in scope, practices and legislation and what is needed is an EU heritage and historic environmental law to create a level playing field.

This presentation will attempt to persuade you that while the creation of the Heritage Advisory Committee is a good start by the EAA in what it should consider to be its ultimate aim of being a pan European regulatory organisation, specifically being the central regulator and guardian within the EU. The Heritage Advisory Committee is right to put the EAA’s own house in order, both in codes of practice and ethics, for the time when the EAA becomes the regulatory body in the EU.

This presentation will argue that the EAA should be working with the EU commission and parliament to encompass various current EU directives applicable to the Heritage and Historic Environment into an EU directive that creates a basic pan EU law that protects, and legislates the European Heritage and Historic Environment including licencing all archaeological practitioners (including metal detectorists) at specific level of competence like a number of EU countries do, with the EAA having a ‘policing’ role and powers to ban people from exploiting the heritage and Historic Environment and pass them on for prosecution if necessary. This ‘law’ would also include marine and wetland environments as well as terrestrial. So, setting a ‘Gold Standard’ for the world to follow.

This directive/law would not stop EU member states increasing protection where it was deemed to be necessary, but it would create a minimum standard and a harmonisation of current member state laws. In other words, a level playing field.

5 SCIENCE COMMUNICATION IN PUBLIC ARCHAEOLOGY AND ITS ROLE IN DIRECTING POLICY

Abstract author(s): Banerjee, Rowena (University of Reading) - Flintoft, Paul (York Archaeological Trust; University of Reading)

Abstract format: Oral

Environmental archaeology has a key role to play in both directing heritage policy and in contributing scientific evidence to policy making in areas such as agriculture, nature conservation, and development, which affect archaeological, and heritage works with the potential of synergising the two. Effective science communication of environmental archaeological evidence in heritage narratives on archaeological sites and through public archaeology is essential for showcasing the importance of this sub-discipline and raising awareness for the pivotal role it has to play in engaging with the current challenges for human societies, heritage protection, and in leading archaeology and heritage policy.

In 2009, Karl Butzer reflected on 35 years of the *Journal of Archaeological Science* as an explicitly interdisciplinary medium, linking archaeology with the natural sciences, and one that emphasizes methodological innovation, noting that during this period the journal steadily grew. This growth in archaeological science research is not only represented in the expansion of *Journal of Archaeological Science* and the addition of *Journal of Archaeological Science: Reports* in 2015, but also sees this research published in an array of other scientific archaeology journals. Despite this vast and growing body of archaeological science research, the translation of the collection and range of scientific data from archaeological sites, the preparation processes of samples, and the explanation of results in general remains superficially explained to visitors to a heritage site or museum, if at all, and arguably experimental archaeology centres and citizen science projects could be better fora for science communication and engagement.

In this paper, we explore effective communication of environmental archaeological evidence and advocate for its integral role in policy making in conjunction with other bodies such as Government Agencies, National Parks and UNESCO Global Geoparks, and tourism initiatives such as the Council of Europe Cultural Routes.

6 EUROPEAN ARCHAEOLOGY HERITAGE POLICY: FRENCH PERSPECTIVES

Abstract author(s): Marx, Amala - Salas Rossenbach, Kai (INRAP - National Institute for Preventive Archaeological Research)

Abstract format: Oral

Starting from a specific national context and its archaeological heritage policy, we will try to give an overview of the French perspectives, not only on the national situation, but also on a broader European and global basis.

In France, the creation of an archaeological heritage policy and a national institute for preventive archaeology (not development-led archaeology) was desired and more than supported by archaeologists. They mobilised and fought for a stronger policy to protect the archaeological heritage. After 20 years, what can we learn from this experience of a partially public and centralised preventive archaeology policy?

Based on this observation, we will discuss the role of an organisation like the EAA in the development and protection of the archaeological heritage system in France, Europe and worldwide. We will try to highlight the importance of the European level from a political point of view and how to influence policy in countries where the principles of the Malta Convention are not applied. We will also mention the current and future challenges for archaeological heritage in terms of policy initiatives and how archaeologists can address them.

92 MARGINAL LANDSCAPES AND COASTAL ADAPTATIONS DURING PREHISTORY

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Moutsiou, Theodora (Archaeological Research Unit, University of Cyprus) - Menelaou, Sergios (Fitch Laboratory, British School at Athens) - Reepmeyer, Christian (Deutsches Archäologisches Institut)

Session format: Regular session

Critical reassessment of established theoretical conceptions of island social and cultural evolution, in association with new archaeological discoveries around the globe, have resulted in a new understanding of human interactions with the sea, ecological niche creation and adaptive responses, especially during climatically challenging times. On many islands and neighbouring coastlines research on the full extent of this unique human ecological plasticity as well as the web of interconnections between environment, climate and the organisation of the social landscape of early prehistoric societies have provided remarkable new evidence in recent years.

This session aims to critically explore the question of marginality and border-crossing across varied seascapes and coastscapes, and invites case studies drawn from, particularly, but not limited to, the Mediterranean. We invite contributions from various sources – archaeology, remote sensing, geomorphology, material analysis – that help build better insight into human prehistory, from the Palaeolithic to the Middle Bronze Age, on presumed marginal landscapes and adaptive responses to new, coastal environments, especially during episodes of climatic fluctuations. We

particularly welcome presentations on human interaction with maritime environments and of areas located on the periphery of what are archaeologically considered mainstream cultural processes. We aim at improving our understanding of the capacity of early prehistoric societies to engage and thrive on presumed inhospitable landscapes in challenging times of climate change.

ABSTRACTS

1 ON ROUTES, TOOLS AND SEA-VESSELS: THE 'SEAROOTS 2022-2024' PROJECT

Abstract author(s): Papoulia, Christina (University of Crete) - Chliaoutakis, Angelos (Institute for Mediterranean Studies - IMS-FORTH) - Zervoudakis, Panagiotis - Kotinas, Vasileios (University of Crete) - Reppos, Athanassios - Reppos, Nikolaos (Reppos Boatyard)

Abstract format: Oral

The relationship between human communities and the sea is a reciprocally transformative one. Buoyant vessels permitted prehistoric communities to gain further control of the ecosystem since it was possible to traverse large bodies of water and transport objects and animals. This, almost unavoidably, led to the colonization of new, unfamiliar places. Despite the differences in character and scale between the first rudimentary crossings and the fully organized maritime networks of the later periods of prehistory, the study of routes, networks and technology holds immense research potential.

The last 20 years, diachronic surveys and targeted excavations on islands of the Ionian Sea proved that we have much more to learn about Stone Age lifeways in this part of the world. A two-year research project focusing on the Central Ionian Sea islands and the opposite mainland coasts aims to provide a deeper understanding of a 'peripheral' area in terms of (a) Palaeolithic routines and dispersals and (b) Neolithic networks of socio-economic exchange. In contrast to the quest for 'origins' and 'revolutions' the SeaROOTS project seeks to investigate the process towards the development of a maritime lifestyle. To do so, it employs an interdisciplinary toolkit for the analysis of decision-making processes and mobility networks as influenced by the dynamic relationship with the fluctuating landscapes and seascapes and claims a multifaceted reconstruction of the human-sea relationship that is based on three proxies: a) archaeological stone tools, b) experimental sea-vessels and c) artificial communities.

2 SEASONALITY ON AN INHOSPITABLE ISLAND: THE ASPHENDOU CAVE PETROGLYPHS

Abstract author(s): Strasser, Thomas (Providence College) - van der Geer, Alexandra (Naturalis Biodiversity Center)

Abstract format: Oral

The Asphendou Cave petroglyphs are located high in the Alpine zone of the White Mountains of west Crete (ca. 720 masl). Crete has been an island for over 5 mya. Its geographic isolation brought about the dwarfing of the endemic Pleistocene megafauna. Most of the endemic fauna went extinct before the end of the Pleistocene. One of these, the dwarf deer (*Candiacervus ropalophorus*), is represented in petroglyphs on the speleothem of the cave's floor.

The cave is located aside a steep ravine that connects the north and south coasts over very rugged terrain. It is in a high-altitude environment and is not easily accessible from the coasts. Its petroglyphs are a series of superimposed representations dating from very recent times to the Palaeolithic. The Ice Age dating for the bottom most glyphs is based on the depiction of quadrupeds that went extinct in the Terminal Pleistocene. Having isolated the quadrupeds from the superimposed glyphs that confuse the iconography below, a coherent image of the animals emerges. One can see that it is a representation of forty male deer (*Candiacervus ropalophorus*). All the males have annually deciduous antlers, some of which are quite lengthy. This may suggest a fall season, perhaps during the rut. These specific individuals would be ideal for hunters because they are adult males and may indicate a hunting strategy that does not focus on doe and fawns.

3 "IT'S A MATTER OF PERSPECTIVE": DECIPHERING MARGINALITY BETWEEN THE AEGEAN SEA AND ANATOLIA THROUGH A DIACHRONIC APPROACH

Abstract author(s): Menelaou, Sergios (British School at Athens; University of Cyprus)

Abstract format: Oral

For half a century several theoretical models and different approaches have been introduced and were gradually established in the investigation of human-sea interactions in the context of the Eastern Mediterranean. A special interest was then placed onto Aegean (prehistoric) archaeology, on the one hand due to the wealth of evidence and number of sites, but also thanks to the diverse land- and seascapes, natural adaptive responses, and range of methodologies. The geo-cultural region of the eastern Aegean, including the off-shore Greek islands and the western Anatolian (Turkish) coastline, has remained relatively underexplored, despite its nodal geographical significance for the investigation of theoretical issues related to ancient maritime connectivity, crossing of borders, and transforma-

tion of cultural identities. This paper aims to explore selected case-studies from the wider region, with a focus on the islands of the northeast Aegean, in order to develop a narrative of how their spatial character, meaning, and cultural dynamics were altered over time during prehistory. Building on previous and current analysis, this endeavour takes into consideration how shifts in archaeological narratives are also affected by biases in modern political borders and changes in intellectual trends and will try to integrate various means of evidence from material analysis, archaeology, and border theory.

4 'IN THE SHADOWS OF A GIANT'. A COASTAL ANALYSIS PERSPECTIVE ON EARLY BRONZE II-MIDDLE BRONZE II SARONIC GULF (GREECE)

Abstract author(s): Nuttall, Christopher (Swedish Institute at Athens; University of West Attica)

Abstract format: Oral

The Early Bronze II (EB IIA) phase in Greece marked the peak of a regional system of contact known as the so-called „International Spirit“ network. This system connected the Greek mainland, West Anatolia, and Crete, and was driven by Aegean islanders. The Saronic Gulf, which lies between the Peloponnese and Attica and consists of a long coastline and several islands and peninsulas, was a hub of settlement activity during EB IIA, with numerous settlements located along the shoreline and on the islands. However, by the end of this period, there was a decrease in settlement activity in the region, with several sites being abandoned. The exception was the large, long-lived settlement of Kolonna on Aegina island, which gained prominence in the Middle Bronze Age. This paper uses archaeological data, field-walking survey data, and novel coastal analytical methods to understand the changes in coastal activity between the EB IIA and MBA and determine whether coastal activity did indeed stop, why this may have happened, and how this dynamic landscape was inhabited over time.

5 SETTLING THE EASTERN MEDITERRANEAN ISLANDS: PERSISTING NARRATIVES OF HUNTER-GATHERER MARGINALITY AND THE CASE OF CYPRUS

Abstract author(s): Moutsiou, Theodora (Archaeological Research Unit, University of Cyprus)

Abstract format: Oral

Island colonisation by pre-agricultural communities in the Mediterranean region has recently become contentious with the discovery of a series of potential sites associated with maritime adapted, foraging people. This is in line with global research providing evidence for a substantial maritime capacity of hunter-gatherer people and settlement of often-isolated island settings from the Late Pleistocene onwards. The island of Cyprus stands out as an enigmatic case of hunter-gatherer marginality considering its large size, distance and visibility from the surrounding coastline. A Terminal Pleistocene (~12kya) human presence is largely explained as short-term exploratory visitations organised by Late Epipalaeolithic fisher-forager-hunters from the Levantine coast, followed by the arrival of agropastoralist populations who settled the island in one major diffusion event, responding to demographic pressure on the mainland. This paper summarises current views on island marginality and using the case study of Cyprus, argues that new island cultural reconstructions require a revision of conventional field methodologies and site location models. Since early populations favoured different ecological niches/resources compared to subsequent permanent farming lifeways, an emphasis on evidence of early human occupation in hitherto neglected areas, such as the coastal and upland landscapes of the island is needed. Predictive geospatial modeling and preliminary field results across Cyprus, discussed in this presentation, support the call to revisit narratives of marginality, remoteness and isolation on the island-level and within island environments.

6 RECONSTRUCTING COASTAL AND ESTUARINE LANDSCAPES SINCE THE DAWN OF HUMAN ARRIVALS: A CASE STUDY FROM SOUTHEAST IRELAND

Abstract author(s): Schuldenrein, Joseph (Geoarchaeology Research Associates)

Abstract format: Oral

Pioneering research on the human ecology of Southeast Ireland was initiated by Green et al. in the 1980's. Patterned distributions of Mesolithic artifacts across a 4-5 m high till plain overlooking the beach afforded a window on the earliest human occupations of this diverse landscape. Over the past 40 years independent efforts by local archaeologists and geologists showed that the beach sealed in and preserved earlier geomorphic settings. Their data pointed to changing landforms and discrete occupational settings through time. Alterations to terrain were the product of sea level fluctuations and climate change. Preliminary indications were that dynamic marine incursions, erosion, and estuarine dynamism were key to isolating variability in ancient subsistence landscapes. Since 2018 an interdisciplinary team of archaeologists and geomorphologists from Ireland and the U.S. implemented a sub-surface testing program at the Fornaght strand, a magnificent stretch of beach that yielded near surface evidence of in situ (ie. Bronze to Iron Age) human occupation post-dating the Mesolithic by at least 5000 years. Buried peat bogs capping and

interspersed with deep gleys underscored the complex movements of cyclic transgressive and regressive phases of shoreline encroachment and erosion. The organic sediments coupled with limited but diagnostic molluscan collections and pollen profiles provide absolute dates for episodes of riverine, brackish and marine sedimentation. Taken together the diagnostic archaeological settings and the dated elements of the substrate are contributing to a comprehensive picture of beach history in the Waterford Estuary. At the same time GIS based re-analysis of the artifact complexes on the upper (till) terrain refines our understanding of human adaptive strategies since the earliest human groups made their imprint on the landscape.

7 THE STOREGGA TSUNAMI - A MESOLITHIC DISASTER?

Abstract author(s): Kilhavn, Havard (University of Stavanger)

Abstract format: Oral

In this talk, I will discuss how we perceive the vulnerability of Mesolithic people, and how Mesolithic people themselves perceived vulnerability in the natural environment, based on preliminary results from the ongoing project LAST – Life after the Storegga Tsunami (Norwegian Research Council nr. 302858), exploring the social impact of the Storegga tsunami that hit the western coast of Norway and beyond 8200 years ago.

The overarching concern of research on the tsunami event has been to construct the tsunami as a Mesolithic (natural) disaster, inferring “disastrousness” from the perceived impact of the tsunami, which itself has been inferred, re-constructed and re-imagined based on a combination of empirical evidence for tsunami run-up, theoretical, large-scale mathematical modelling of the tsunami wave heights, and trendlines in summarised probability distribution models (SPD) of radiocarbon dates.

When discussing the social impact of natural phenomena like tsunamis, and concepts like hazards, resilience, and vulnerability, it is often a challenge to incorporate different levels of scale, both different kinds of large-scale data and the small scale, human “phenomenological” experience of people the ground. I will argue that our perception of the vulnerability of Mesolithic people who experienced the tsunami, and the corresponding notion of the tsunami as a disaster, to a large degree is a consequence of the large-scale of the data that have been used. By using a new, mathematical tsunami model, capable of estimating small-scale tsunami run-up along reconstructed Mesolithic shorelines, in combination with smaller-scaled case-studies of how the tsunami might have impacted specific Mesolithic sites, it might be possible to nuance both our own perception of the vulnerability of Mesolithic people, as well as gaining a glimpse of how these people themselves might have perceived this extreme, natural event.

8 SUBMERGED ARCHAEOLOGICAL LANDSCAPE PROSPECTION, ANALYSIS AND DISSEMINATION IN AUSTRALIA AND BEYOND

Abstract author(s): McCarthy, John - Benjamin, Jonathan (Flinders University) - O’Leary, Michael (University of Western Australia)

Abstract format: Oral

We will discuss the work on submerged landscape research in Australia by our team, building partly on lessons learned from underwater prospection and survey in Europe and the Levant. We describe surveys targeted on sub-tidal regions of Northwest Australia, undertaken initially through the Deep History of Sea Country project, which led to the discovery of the first submerged Aboriginal archaeological sites in the seas off the Australian continent. We describe subsequent research building upon these initial discoveries in a wide variety of ways. We also consider the ongoing impact that these discoveries have had on public and developer awareness of this sensitive archaeological landscape in Australia. Awareness of the existence of submerged landscapes has been preserved in many Aboriginal oral traditions but there has been very limited knowledge of it among the general public. This is being addressed through the development of digital resources, such as VR, interactive games and animations as well as documentary films. There is now a pressing need to characterise this archaeological receptor in the face of climate change, development pressure and ongoing natural processes. Finally, we describe some of the novel technological approaches being trialled to find and quantify more ancient underwater sites around the Australian coast.

9 OBSIDIAN EXCHANGE AND SEA-LEVEL RISE: A CASE STUDY FROM EASTERN INDONESIAN OF POST-ICE AGE RAW MATERIAL TRANSPORTATION

Abstract author(s): Reepmeyer, Christian (German Archaeological Institute)

Abstract format: Oral

Seafaring is a critical factor in human migration and the development of an interconnected globalised world. This paper investigates the global intensification of maritime interaction in the period after the Last Glacial Maximum (LGM) when sea-levels rose episodically until around 8000 years ago. It has been argued that associated loss of landmass was a critical contributor to this pattern, however, inundation was not equally distributed depending on the bathym-

etry of the coastal shelf. The aims of this paper are on new archaeological evidence for early maritime mobility based on lithic raw material transportation in the key regions of Island South East Asia.

Island Southeast Asia (ISEA) is an island-rich area of the tropics and was a maritime 'cradle' for the dispersal of the genus Homo as witnessed by the arrival of hominins on Java and Flores around one million years ago, early maritime dispersal to the Sahul (Australia and New Guinea) landmass of homo sapiens at >55,000 years ago and the more recent Austronesian expansion 5000-3000 years ago marked by human colonisation of remote Pacific islands.

Archaeological archives in Eastern Indonesia provide unique evidence for factors impacting this development, including environmental and sea-level change, subsistence patterns and population growth. New evidence for voyaging at the end of the Pleistocene, the time period ending ~12,000 years ago, represented by exotic stone tools in archaeological sites suggests that innovations in maritime technology were ongoing and ancient 'hunter-gatherer' people made regular voyages between islands.

93 ARTICULATING CHALLENGES IN POST-CONFLICT ETHICS, ARCHAEOLOGY AND ARCHAEOLOGICAL HERITAGE

Session theme: 6. Contested Pasts & Presents

Session organisers: Young, Ruth (University of Leicester) - Newson, Paul (American University of Beirut)

Session format: Regular session

Ethics are fundamentally important to all forms of archaeological theory and practice and are embedded within many professional codes of conduct. The ethics of archaeological engagement with conflicts around the world have also been subject to scrutiny and debate. While archaeology and archaeological heritage are increasingly viewed as significant elements of post-conflict work, with much to contribute to rebuilding stable and secure societies, there has been limited explicit acknowledgement and deliberation of post-conflict ethical issues and challenges for archaeologists. This conference session is intended to stimulate discussion around major ethical issues as they relate to the problems, and possible future directions of post-conflict archaeology and archaeological heritage.

We invite abstracts from colleagues working in post-conflict situations with concern for the ethical implications of their work. We are interested in discussing, from an ethical standpoint, the myriad challenges and ramifications of post-conflict work. A sample of the types of ethical questions, many of which intersect, and would benefit from fruitful discussion include: Should an ethical stance be based on global/Western-oriented protocols or be local and contingent? Should archaeologists be ethically accountable? How can the idea of accountability be incorporated into project planning, funding, and reporting? Whose post-conflict ethics do we privilege: government, heritage bodies or communities? In this session, we would like to explore these and many other potential questions in addressing and/or ameliorating ethical problems in post-conflict archaeology.

ABSTRACTS

1 RAISING SOME OF THE ETHICAL ISSUES POST-CONFLICT ARCHAEOLOGISTS SHOULD BE CONSIDERING

Abstract author(s): Young, Ruth (University of Leicester) - Newson, Paul (American University of Beirut)

Abstract format: Oral

Over the last 70 years, the importance of archaeology and archaeological heritage in post-conflict situations has increased, and the overt acknowledgement of this importance has likewise increased. Accordingly, archaeology is understood as having a significant role to play in a variety of post-conflict concerns from constructing national and community identities, to contributing new interpretations of the past. Major institutions such as UNESCO have invested heavily in post-conflict restoration and rebuilding programmes such as 'Revive the Spirit of Mosul'. In many post-conflict countries a range of institutions – both government and non-government – have also put a great deal of time, money, and effort into post-conflict archaeological heritage initiatives, and these have all involved archaeologists, many from western nations.

In this paper, we would like to stimulate discussion and consideration of the ethical responsibilities of archaeologists working in post-conflict situations. Drawing on various case studies and our own experiences as European archaeologists working in non-European post-conflict regions, we will begin by foregrounding some key issues concerning ethics and ethical responsibilities. For example, there are questions around the presentation of post-conflict archaeological work by regimes or other groups in ways that could be deemed unethical or that are not in line with a project's stated goals. Additionally, are there ever situations where it can be considered ethical to work with a regime that has been accused of war crimes against its own people? We do not pretend to have answers to these questions, but we do want to engage critically with such issues and begin to consider multiple ways to respond to them.

2 ANTICIPATING CHALLENGES TO POST-WAR ACCOUNTABILITY IN THE DESTRUCTION AND ABUSE OF ARCHAEOLOGICAL HERITAGE IN UKRAINE

Abstract author(s): Delacruz, Michael (Oxford University; Blue Shield International; Newcastle University)

Abstract format: Oral

The current war in Ukraine has had a demonstrable and devastating impact on archaeological heritage, and cultural heritage more broadly, throughout the conflict area. Thousands of archaeological artefacts have been damaged, destroyed, or stolen to include the wholesale extraction of collections from the regional history museum in Kherson in late October 2022; additionally, satellite imagery and eyewitness accounts attest to extensive damage to significant archaeological sites in the Black Sea littoral and elsewhere in occupied territory, and, since the occupation of Crimea in 2014, there has been substantial evidence to suggest that illegal excavations have been a persistent phenomenon. The 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict and its two protocols were designed to establish a normative regime by which those responsible for such occurrences would be held accountable for violations of international humanitarian law. This paper will recount the principal observations of Blue Shield International (BSI) during extensive consultations and assessment activities in Ukraine amidst the conflict to identify impediments to the effective implementation of the Convention. Ranging from inadequate pre-conflict protective and preparatory measures, lack of harmonisation between domestic and international law, minimal established protocols for the forensic collection of evidence related to potential heritage crime, and poor integration and communication between heritage, governmental, and security sectors, these challenges to the practicable employment of its provisions will be described. Likewise, the efforts to address these issues with the assistance of a wide range of international and national-level actors will also be examined, reinforcing the fundamental assertion that the prospect of effective post-conflict accountability is largely dependent on the steps taken to establish normative, peacetime standards and protocols well before conflict begins.

3 HERITAGE DOCUMENTATION IN CONFLICT: WHO CARES ABOUT MONUMENTS (WO)MEN?

Abstract author(s): Munawar, Nour A. (Doha Institute for Graduate Studies)

Abstract format: Oral

Destruction of cultural heritage in the Middle East and North Africa (MENA) region has become a major characteristic of the Arab uprisings (2010-2022). Cultural heritage sites have been deliberately targeted by the so-called treasure-hunters who have exploited political instability and security absence to shamelessly plunder ancient relics in Syria, Iraq, Libya, Yemen, and elsewhere. Simultaneously, the rise of Islamic State of Iraq and the Levant (Daesh) and the high-profile of looting incidents in Syria and Iraq have signified the importance of documenting the different types of heritage risks.

Documentation of damaged heritage has become an indispensable task for the post-conflict recovery of the concerned societies, predominantly during times that witnessed a relatively considerable number of armed conflicts, political and social instabilities, and natural disasters. The increasing worldwide interest in documenting how war and violence have been damaging heritage has provoked local enthusiasts to document heritage in conflict zones which ultimately threatened their lives and the lives and wellbeing of their families. This paper argues that heritage documentation can be hazardous as well as a tremendously critical task; however, this should not erase or obfuscate the ethics of archaeological practices during conflicts. By exploring the attempts and initiatives of various international and national organizations and entities to document heritage in conflict zones, this paper emphasizes that the ramifications of heritage documentation, as a (post-)conflict practice, can have a far greater impact than the conflict itself on individuals and practitioners documenting heritage on-situ.

4 ETHICS, PRAGMATISM, AND THE INTEGRATION OF ARCHAEOLOGICAL PRACTICE AND CONFLICT TRANSFORMATION

Abstract author(s): Horning, Audrey (School of Geography, Archaeology and Palaeoecology)

Abstract format: Oral

Ethics and practice lie at the heart of this consideration of archaeology in post-conflict settings. Building on literature from peace and conflict studies as well as social justice movements, I consider the role and responsibilities of archaeologists as we grapple not only with our positionality in the present, including our roles as citizens and scholars, but the ethical choices involved when we mobilize the past in aid of the future. I address recent critiques of engaged archaeologies and argue for the central importance of both empirical honesty and an underpinning in pragmatic philosophy as we frame our explorations of the past for purposes of conflict transformation and social justice. I draw specifically from my own work in embedding archaeology and heritage with conflict transformation in Northern Ireland to argue for a pragmatic approach to archaeology in post-conflict settings that engages archaeological evidence as an active component of a peacebuilding dialogue that is challenging and constructive rather than uncritically conciliatory. A

pragmatic orientation that acknowledges the real-life consequences of our work can be an effective paradigm for a future-oriented, epistemologically honest, and ethically-grounded archaeology.

5 IDENTIFYING MEMORY, MEANING, AND ETHICS IN OBJECTS RECOVERED FROM POST-CONFLICT ARCHAEOLOGICAL INVESTIGATIONS OF MILITARY CASUALTY SITES

Abstract author(s): Peixotto, Becca (HJF in support of DPAA) - Renshaw, Layla (Kingston University London)

Abstract format: Oral

The bodies and personal effects of military casualties from World War I and II are still recovered from conflict sites around the world. Archaeologists, anthropologists, and forensic scientists including those working on behalf of the United States Defense POW/MIA Accounting Agency (DPAA) or European organizations, work to identify and repatriate the dead following local and home country expectations and policies.

This paper explores the multiple identities of these sites, and associated artefacts. It considers the divergent understandings of material culture inherent in different disciplinary paradigms, depending on whether the site is primarily a place of forensic investigation, of conflict archaeology, or a potential heritage site and lieu de memoire.

Forensics prioritises the recovery of human remains, producing a hierarchical categorization of objects depending on their evidential value in reconstructing the identity of the dead and the circumstances of their death. This means a focus on objects in proximity to the deceased, including possessions, clothing, and life support equipment. These diagnostic materials may be analysed nearby or, for US casualties, repatriated to the United States for analysis. The fate of the wider material assemblage of materiel and debris is less clear cut. Commonly scheduled for destruction to avoid exploitation by relic hunters, re-use as memorabilia, or other forms of commodification, some conflict artefacts carry highly charged emotional and political associations.

Recent claims by local communities to retain conflict artefacts as part of their cultural heritage, destabilise these policy norms. We consider examples of how the disposition of artefacts can constitute a positive collaboration with communities where the conflicts were fought. We explore the association of memory and place, contrasting the meaning and value of those objects repatriated back to the United States with objects that remain, assessing the ethical tensions of divergent understandings and relationships to the past at these sites.

6 „A NEW RELATIONAL ETHICS“ FOR HERITAGE: WHAT FUTURE FOR ITS PEACEBUILDING POTENTIAL?

Abstract author(s): Viejo Rose, Dacia (University of Cambridge)

Abstract format: Oral

Fifty years after the ratification of the Convention Concerning the Protection of the World Cultural and Natural Heritage, the state of this heritage appears to be in dire straits facing onslaughts from a multi-headed hydra that has seen the destruction of ecosystems and lifeways around the world. Where, one wonders, has that left the peacebuilding mission of that Convention and of the very notion of World Heritage? Today, heritage is understood by critical heritage scholars as a process of meaning-making with constantly evolving associative values that make it highly political. This approach to heritage can shed light on the relationship between cultural heritage and violence, but to do so demands an analysis of the complex underlying motivations for destruction and, consequentially, the diverse forms of repair that might best respond to it. This challenge was further accentuated by the 2020 Sarr-Savoit report on the restitution of African heritage that called for a „new relational ethics“. How heritage is embedded in cultural/social/political networks and neglecting to consider how overt violence is part of an ongoing process of damage rather than an explosive expression of it has meant that past responses have often fallen short of repairing relations and the harm caused. Drawing on various examples and the work on the reparations done by different courts and governments, in this presentation, I argue that we need to consider new modalities of repair if heritage is to serve peacebuilding aims.

95 PUBLIC ARCHAEOLOGY IN DEVELOPMENT-LED ARCHAEOLOGY [PUBLIC ARCHAEOLOGY COMMUNITY]

Session theme: 3. Heritage Narratives and Representations

Session organisers: Oldham, Mark (NIKU - Norwegian Institute for Cultural Heritage Research) - Benetti, Francesca (Independent) - Watson, Sadie - Faccia, Kate (MOLA - Museum of London Archaeology)

Session format: Regular session

Especially since the Faro Convention, we have seen a European policy focus on having the general public more involved in archaeology and heritage. As arguably the type of archaeology that people encounter most in their everyday

lives, either as passers-by, infrastructure users, or as those who commission work, development-led archaeology is a crucial arena for the implementation of this policy focus.

This session will examine how such pan-European goals can be implemented and achieved in each nation state. Are there commonalities that allow for shared practice, or must we tailor a public-oriented development-led archaeology to the particulars of each nation's statutory, regulatory and bureaucratic system?

The concept of public benefit is often used as a means to mesh archaeological (social?) and commercial interest, and thus is a topic of interest for this session, as are discussions of the co-option of the UN's development goals. In addition, explorations of bureaucratic regimes and the overlaps and discrepancies between policy and practice are very much welcome.

ABSTRACTS

1 DEVELOP-LED ARCHAEOLOGY AT THE CROSSROADS: FROM A LOCAL ANALYSIS TO A GLOBAL PROPOSAL

Abstract author(s): Campos-Lopez, Teresa (University of the Basque Country - UPV/EHU; GIPyPAC - Research Group in Heritage and Cultural Landscapes)

Abstract format: Oral

The aim of this contribution is to propose a reflection, hopefully lucid, but above all, critical and committed on the preventive or development-led archaeological practice as a powerful weapon in order to increase of its presence in society, with a special consideration on the Autonomous Community of the Basque Country (Spain) as a case of study. In fact, this approach means to assess that there is no better example of what Public Archeology should be than the actions carried out from development-led archaeology. In this sense, these resources, among others, should be valued when socializing this practice.

After an analysis and diagnosis of a situation, our goal is to propose different future work lines to get over this situation of paralysis and exhaustion in which the archaeological practice finds itself, after the economic crisis and in a post-pandemic scene. We propose that this situation –must- forces us to make a reflexion and, especially, to debate, to develop new management models, in addition to reach new interpretations that allow us to face challenges and address the uncertainties that loom on the horizon.

In fact, this proposal for this meeting is based on the reflection carried out from a practice of development-led archeology that could be understand within taking into account what Public Archaeology is, for which it is an inseparable pairing and that must be implemented.

It is, therefore, a discipline that addresses a broad and complex issue, where different fields and multiple perspectives find their place: the commercial, the researcher, the informative, the educational and social perception, together with other legislative, regulatory and administrative approaches, with political and economic meanings, both in global and local scales and, above all, a reflective self-criticism and a constructive will for a common future.

2 PREVENTIVE ARCHAEOLOGY, RESTITUTION OF RESULTS AND PUBLIC INTERESTS, WHERE DO WE STAND?

Abstract author(s): Guillon, Mark (Institut National de Recherches Archéologiques Préventives France; University of Bordeaux)

Abstract format: Oral

Since the late 2000s, there has been an increase in the number of symposia and roundtables devoted to preventive archaeology since excavations of this type have become the norm. Such conferences have highlighted several key features of preventive excavations, not least: the scientific contributions made by the excavation of large areas in both rural and urban settings, the environmental impact of preventive excavations, and communication to the public of the discoveries made in all fields linked to the excavation of buried heritage. In addition, the publication of many specialised works in related disciplines using these archaeological results demonstrate the growing impact of preventive excavations.

Our team been able to contribute to these debates on several occasions, whether in France, in Europe, or more globally, through our specialities of funerary archaeoanthropology and physical anthropology. As professionals, we regularly disseminate the results of our preventive archaeological projects to the public; communication of our findings may take the form of conferences, site visits, workshops, or publications that help ,popularize' our activities, etc. Given this experience, in our presentation, we wish to raise the issue of the most effective ways in which to convey findings to the public. Above all, we wish to consider the implications of the investments made by public and private constituencies. This paper proposes sharing reflections on our current approaches, and asking what the state of the

art on this issue is in France and Western Europe. We will also examine the different ways in which the notion of public interest has been linked to preventive archaeology. We are interested not only in the formulation of results, but also the evolution of school and university teaching content. Finally, we plan to explore the means by which we may evaluate the reception of these developments by the public.

3 UTILISING A MULTIDISCIPLINARY APPROACH FOR COMMUNITY ENGAGEMENT IN SCOTTISH COMMERCIAL ARCHAEOLOGY

Abstract author(s): Johnston, Emily (The University of Edinburgh)

Abstract format: Oral

Whilst community archaeology has developed as a practice-led discipline, my research aims to examine the theory and value behind community engagement, in a developer-led context. As developer-led archaeology is often the setting in which the public interact with archaeology, it is important to examine these interactions to understand how to engage different audiences at each stage of the process. My research aims to create a matrix of engagement techniques which embeds theory into the practice.

By utilising a multidisciplinary approach to community engagement, my research draws upon different theoretical schools to understand how to develop a meaningful, inclusive and sustainable methodology. Crucially, this research aims to discern the value of different engagement techniques, by considering different stakeholders and audiences in a commercial setting. The structure of this framework provides flexibility to navigate pan-European legislation.

This research utilises Scotland as a case study, as literature and practices often approach UK-based practices as a whole, despite different planning policies and legislations in each of the devolved nations. Recently, Scotland has produced new legislation which embeds archaeology as a form of public benefit into the planning system. Additionally, since 2012, Scotland has implemented several strategies for increasing public participation in the historic environment – the most pertinent here being Scotland’s Archaeology Strategy. This research evaluates the effectiveness of these strategies for community engagement within a developer-led context, and considers a selection of case studies to discern trends amongst the current practice.

This presentation will explore the methodology behind creating a framework for community engagement, which is adaptable to the different settings of commercial archaeology within different local and regional legislative contexts. This framework has the ability to create legacy for current and future communities, striving to build upon the UN’s goals for sustainable development.

4 WHAT WE NEED IS A TOOLKIT! EXPLORING CHALLENGES AND POTENTIAL SOLUTIONS TO ENHANCING PUBLIC BENEFIT IN DEVELOPER-LED ARCHAEOLOGY

Abstract author(s): Jones, Cara (Chartered Institute for Archaeologists)

Abstract format: Oral

The opportunities of engaging wider audiences with the work that we do as archaeologists is recognised as an important consideration when undertaking any element of archaeological work. However, the active delivery of public archaeology is still not ubiquitous within developer-led archaeology – it is often delivered with non-standardised methods with little evaluation of impact.

Yet we know that supporting the delivery of public archaeology through developer-led archaeological investigations is one of the key areas that can contribute to the delivery of public benefit. Within the UK, when that process does take place, it is often instigated at the planning application stage.

Recent research by the ClfA Voluntary and Community Special Interest Group highlighted that embedding requirements for public archaeology (at the planning application stage) can be challenging. The research highlighted a need to provide support for archaeological advisors and practitioners on the delivery of public engagement activities through a range of different archaeological interventions.

In response to the results of that research, and supported by funding from Historic England, ClfA is working with Dig Ventures to produce a toolkit to enable these audiences to deliver public archaeology activities in developer-led projects. This new resource seeks to support the sector to enhance public benefit outputs through new guidance, signposting to existing resources and highlighting innovative case studies.

Drawing on the collective work completed by the ClfA Voluntary and Community Special Interest Group, Dig Ventures and ClfA, this paper will look at recent data which identified the challenges of supporting the delivery of public benefit and explore ‘toolkit shaped’ solutions to addressing the identified issues. This paper will conclude by exploring if resources (such as toolkits) might support a more widespread and standardised approach to incorporating public archaeology within a developer funded project.

5 CHILDREN, EDUCATION AND ARCHAEOLOGY IN DEVELOPMENT-LED PROJECTS

Abstract author(s): Oldham, Mark (NIKU - Norwegian Institute for Cultural Heritage Research)

Abstract format: Oral

On a recent development-led project in central Oslo, archaeologists from the Norwegian Institute for Cultural Heritage Research - NIKU) have focused on engagement with young children from local kindergartens and schools. This engagement has been undertaken as an integral part of the archaeological project, and as such has been funded by the developer – in this case the Norwegian railway administration, Bane NOR.

These two linked and age-tailored outreach programmes have taken place on site (for the kindergarten children, aged 2-6) and in the classroom (for the schoolchildren, aged 8-9). The different ages and the different sites for the programmes provide their own opportunities and challenges, and so planning and development in advance was crucial. This paper will use this project as a case study to expand on how development-led archaeology can play a role in education, and in broader terms to think about how young children can engage with, discuss and think about concepts such as time and chronology, change and development, and even archaeology and heritage management.

6 ANCIENT APPIA LANDSCAPES PROJECT: CULTURAL LANDSCAPES AND EXPERIENCES OF COMMUNITY ARCHAEOLOGY

Abstract author(s): Santoriello, Alfonso - Musmeci, Daniela - Vigorito, Marianna (University of Salerno)

Abstract format: Oral

The Ancient Appia Landscapes (AAL) project promotes the spread of historical, archaeological and environmental knowledge according to the Faro Convention, through the reconstruction of ancient landscapes along the Via Appia in the Benevento area (Campania, Italy). The research began in 2010 with preventive archaeological investigations (Development-led Archaeology) and led to the reconstruction of the itinerary of the consular road between the ancient cities of Beneventum and Aeclanum. It also paved the way for the identification of environmental phenomena as well as the population and settlement dynamics that shaped the rural fabric with socio-economic and productive activities.

The strategies adopted over more than a decade of research have enabled communities to be actively involved in the operational phases of the project as well as in the implementation of activities and initiatives to enhance cultural heritage.

The available knowledge constitutes a reservoir of information that people can use, with a bottom-up approach, in the co-planning of interventions aimed at sustainable development, both economic and social, of this inland area between Sannio and Irpinia.

The considerable environmental and cultural resources constitute a previously under-exploited territorial patrimony that can represent the starting point for growth and for the general improvement of the quality of life.

In this contest, the AAL project collaborates to the candidature of the Via Appia in the Unesco World Heritage List, promoted by the Ministry of Culture: it is an initiative of international scope which focuses on authenticity and integrity values of this cultural asset as a landmark of the widespread heritage, both material and immaterial, of southern Italy.

7 MEMORIES OF EGGEBY - CREATING MEANINGFUL OUTREACH IN CONTRACT ARCHAEOLOGY

Abstract author(s): Nelson, Matthew (Linnaeus University)

Abstract format: Oral

An archaeological excavation is a window to the site that is limited in time, every contract archaeology project differs from each other and can tell multiple different stories to different people. These unique archaeological events can however become even more meaningful and memorable encounters with the historic landscape and its hidden memories if the professional territory of contract archaeology could listen to and adapt to the interests and individual needs of the public.

In 2020 the archaeological contractor Stiftelsen Kulturmiljövård conducted a pre-excavation at the archaeological site consisting of an abandoned village, Eggeby, in the Swedish parish of Skärkind, Östergötland. It is a multitemporal place with more than a thousand years of history accumulated in the landscape, a treasure trove for collecting memory-objects and narrating stories about the people who lived there, both through historical records and through decoding the stored memories of finds and features.

The contract archaeology project used aspects of “public archaeology” as a tool for outreach rather than the traditional methods, in order to create more participation and dialogue in the project. Archaeologists could here be seen as custodians of space-time that transform the accumulated history of a place and objects into meaningful information and narratives. I participated as an archaeologist in the excavation, meanwhile conducting a case study on the dissem-

ination work and how the targeted public related to the archaeological process and site. In my presentation I will show a few solutions used in recent excavation projects and share some experiences.

A. DECONSTRUCTION AND RECONSTRUCTION OF ARCHAEOLOGY FOR 'THE WEST LINK' IN GOTHENBURG, SWEDEN

Abstract author(s): Bramstång Plura, Carina - Skredsvik, Andreas - Nordström, Emma - Nordin, Petra (National Historical Museums, The Archaeologists)

Abstract format: Poster

Several major archaeological discoveries have been made in Gothenburg in recent years. A medieval defensive tower, a stone sundial, testicle daggers, and several boat wrecks have appeared in the news. These are just some of the discoveries archaeologists made when investigating historical remains of national interest in Sweden's second largest town, Gothenburg.

There are several large infrastructure projects currently underway in Gothenburg, not least 'the west link' project (Västlänken) which includes a new rail tunnel with three underground stations. Extensive archaeological excavations are being carried out in connection with the project, the results of which will be used in exhibitions and in the landscaping of the new stations and surrounding areas.

Within the city's moat there are both the remains of fortifications as well as traces of the earliest residents of Gothenburg from when it was built in the 1620s. During the excavations an old harbour with several boat wrecks was discovered, making it possible for us to investigate shipping history, customs, and much more.

Outside Gothenburg's city moat, a medieval fortification on the hill Gullberg was investigated. The structures and artefacts from the fort inform us about both everyday chores and conflict at the medieval stronghold. Furthermore, the Johanneberg Estate gardens at Korsvägen, a farmland estate created to supply food to Gothenburg's inner city, were also excavated. The diverse history of these estates reflects almost 300 years of human endeavour, trade, and burgeoning industrialisation.

Together with the city council and other authorities, plans are being made to use the archaeological findings to highlight the city's historical narrative. Amongst other things, a tower from the Gullberg fort will be rebuilt, and the Johanneberg Estate Garden will be made into a public park. Exhibitions related to the excavation are also planned in the underground stations.

97 DEPOSITIONAL PRACTICES IN THE NEOLITHIC: CONTACTS, INTERACTIONS AND TRANSFORMATIONS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Iversen, Rune - Bjørnevad-Ahlqvist, Mathias (University of Copenhagen) - Hofmann, Daniela (University of Bergen)

Session format: Regular session

Neolithisation brings with it a changed character and focus on depositional practices. Neolithic depositions can take many forms and vary in complexity. Depositions are related to a wide range of features including pits, house structures, flint mines, stone axe quarries, enclosures, megalithic and non-megalithic monuments, middens or various parts of the landscape. Furthermore, their contents vary across regions and phases as they can hold pottery, figurines, flint and stone axes, sickles, weaponry, ornaments, food remains, animal bone and even (parts of) human individuals.

What can these depositions tell us about Neolithic societies and their contacts? Depositional practices contain relatively visible, 'public' elements and less observable characteristics, which would need more sustained, direct contact to pass between groups. Therefore, depositional practices were central for the creation of community identities, social cohesion and worldviews, potentially over large areas, but they also show numerous local and regional idiosyncrasies. These patterns of differences and similarities across and between regions can help us to tease out multiple possible links. In this, the details of depositional practices (e.g. fragmentation, arrangement, use of colour etc.) are as important as the items themselves and their location. By investigating sets of complex, but linked practices, we can begin to explore the character and intensity of interactions and communication between Neolithic societies and address the importance of a wide range of depositional practices for social reproduction and change.

With this session, we would like to focus on what depositions and their transformations can tell us about contacts and interaction between and within Neolithic communities. Hence, we welcome papers from all over the world focusing on a wide spectrum of Neolithic depositional practices and their material correlates.

1 UNDERSTANDING LATE NEOLITHIC SOCIAL IDENTITY IN LIGHT OF DEPOSITIONAL PRACTICES

Abstract author(s): Erdem, Deniz (Middle East Technical University)

Abstract format: Oral

In the Neolithic period, burial rituals were one of the important elements of the formation of the social structure. It is possible to say that a social life structured through human, object and space burials. In this context, burial rituals applied in Late Neolithic settlements (6500-5500) in a wide geography including Northern Mesopotamia, Northern Syria and Southeastern Anatolia regions were examined in two main groups as public and segregated. The aim of this study is to reveal the relationship between the ritual acts and the social structure in the region and to examine the object, human and space relations that the rituals point to in the Late Neolithic communities in general.

The study indicates that in the Late Neolithic Period burial practices for associating objects, places and people with each other were routinely practiced. The differences observed in the way these relations are established contain clues about the establishment of the social structure. Therefore, the boundaries drawn between “ritual” and “routine” need to be rethought in order to understand the social structure of the period and the nature of social transformation. On the other hand, the practice of burying objects or settlements with routine cycles seems to be a factor that prevents “alienation of objects” and thus accumulation of personal or group capital. However, new relationships that are tried to be established between ceramics, seals and similar portable objects, places and bodies; It points out that new alternatives are emerging in the perception of time-space and identities, and therefore in the methods of recording and controlling history.

2 DELIBERATE HOUSE BURNING IN THE LIGHT OF THE DEPOSITIONAL PRACTICES IN THE NEOLITHIC OF THE GREAT HUNGARIAN PLAIN

Abstract author(s): Füzesi, András (Hungarian National Museum - Magyar Nemzeti Múzeum) - Raczky, Pál - Szilágyi, Márton (Eötvös Loránd University) - Bittner, Bettina - Kovács, Gabriella (Hungarian National Museum - Magyar Nemzeti Múzeum)

Abstract format: Oral

The Great Hungarian Plain and its Neolithic communities had special regional characters due to the alternative path of the Neolithization process. The Neolithic cultures in the southern part of the Plain had strong south-eastern European relations through the water system of the Tisza river and its tributaries, while in the north they had few specific adaptations.

The early agricultural communities of eastern origin needed several centuries to domesticate the local natural environment. Depositional practices allowed us to emphasize certain aspects of everyday life. Neolithic communities deposited a selection of particular items to communicate the importance of related activities. Their depositional practices created special places in the landscape. These spots(/centres) of cultural landscapes condensed traces of certain subsistence activities and symbols of ritual life, while the (deposited?) items and conditions may have encoded the knowledge of Neolithic people. The subsistence practices reached their maximum efficiency in the Late Neolithic. Ritual life, including depositional practices, developed into a colourful mosaic system in this time.

Deliberate house burning was a widely used ritual practice. This led to the establishment of tells and tell-like settlements in the Late Neolithic (5000-4500 BC) of the Great Hungarian Plain. The complex and entangled ritual process incorporated various rites from earlier periods, such as ritual grinding, feasting, dancing, etc. However, a unique new feature appeared: the participants created a monument by furnishing the house, which provided a detailed picture of the former communities’ mental image of a household. Many such furnished houses have already been excavated in Hungary and its neighbours. Beyond a comparative analysis of these contexts, our presentation is strongly based on our current research in Hódmezővásárhely-Kökénydomb. In 2022, we started an excavation of a burnt house and its foreground, where much information could be detected about Late Neolithic depositional practices.

3 WASTE MANAGEMENT AND HOUSEHOLD’S ORGANISATION: THE LBK SITE OF TĚŠETICE-KYJOVICE (CZECH REPUBLIC)

Abstract author(s): Denis, Solène (CNRS UMR 8068 TEMPS) - Tóth, Peter (DAM, Masaryk University) - Plutniak, Sébastien (CNRS UMR7324) - Mališková, Johana - Hossa, Branko - Valent, Martin (DAM, Masaryk University)

Abstract format: Oral

In the LBK area, the population settling down led to villages, where farming communities inhabited longhouses which share similar features across Europe. However, in contrast to the uniform architecture, different conclusions are related to waste management and the activities connected with the life organisation within the village. These opposing

views can be summarised as follows: (1) archaeological material contained in the lateral pits is interpreted as directly related to the house activity; (2) contrasting to that, discards are interpreted as not directly related to the house activity but to other occupation phases of the village. The consequences of interpreting the house's activity and the economic organisation within the villages are enormous and need to be clarified to understand better the social organisation of the farming communities. These issues will be discussed in the example of the LBK site of Těšetice-Kyjovice (Czech Republic). Refitting analysis, in particular, is used to assess the relationships between a house and four pits. A particular approach, coined "Topological Study of Archaeological Refitting", will be applied to the pottery material. This method draws on concepts and procedures from graph theory to model the network of connections observed between refitting ceramic fragments. It will help to understand better the rhythm of filling formation and help to discuss the waste management system. The observation will be supported via the technological analysis of lithics and the identification of learning networks. Understanding the waste management of pottery and lithics will help test different scenarios of potential household interactions.

4 NOT EVERY PIT IS A PIT-HOUSE. LATE NEOLITHIC DEPOSITIONAL PRACTICES AT THE SITE DOLSKO – SPODNJE ŠKOVCE IN SLOVENIA

Abstract author(s): Tolar, Tjaša - Tožkan, Borut (ZRC SAZU, Institute of Archaeology) - Kramberger, Bine (Institute for the Protection of Cultural Heritage of Slovenia)

Abstract format: Oral

We are presenting the results of the study focusing on the deposition of pottery, stone tools, animal bones, and plant remains found in a large pit at the Late Neolithic site Dolsko – Spodnje Škovce in Slovenia. Pits of this kind are typical of Slovenian Late Neolithic sites, where they are most often interpreted as pit-houses. The present study includes the most comprehensive archaeobotanical data and analysis of animal bones to date in the context of such depositional practices in Slovenia.

The pit in question has a size of approximately 11 m × 7 m. Its irregular shape, the multi-layer deposition, the lack of architectural remains, the significant amount of pottery (6282 sherds) and animal bones (560 pieces), as well as fragments of charcoal and stone tools are all typical characteristics. Analyses of the distribution stone tools and pottery, archaeozoological and archaeobotanical analyses, and the results of radiocarbon dating gave us more detailed information on what was deposited in the pit, how and when.

Finally, a comparison with contemporary Late Neolithic sites in Slovenia and neighbouring regions enabled us to establish the differences and similarities between prehistoric pit depositions in different, but chronologically and culturally related regions, and the possible interactions between them.

5 LARGE SETTLEMENTS OF BRZEŚĆ KUJAWSKI CULTURE AS PLACES OF GRAVE DEPOSITION AND CEREMONIAL CENTERS (4350-4000 CAL BC)

Abstract author(s): Wiececzek, Kalina - Czerniak, Lech (Institute of Archaeology, University of Gdańsk)

Abstract format: Oral

In the "Danubian World", burying the dead within settlements is one of the typical phenomena characterizing burial practices, and has its roots in the distant heritage of the Anatolian Neolithic. However, in the Neolithic of Central Europe, this tendency had been gradually disappearing and in the second half of the 5th millennium it distinguished almost exclusively the Lowlands of present-day Poland and the Brześć Kujawski culture (4350-4000 cal BC; hereinafter: BKC). This seemingly conservative phenomenon is contrasted by a high amount of copper among grave offerings and a lot of diversity of grave goods. Isotopic studies confirmed the correlation between the presence or absence of copper in the graves and the diversity of the diet of the deceased (Budd et al. 2020. 'Antiquity').

The BKC settlement system was based on clusters consisting of farmsteads and hamlets surrounding a large settlement densely built up with long houses. The settlement had a central function, due to its location, size, and long period of use, but also because it was a burial place for the community of the entire cluster. The burial of the deceased could therefore take the form of a communal ceremony celebrating the return to the 'ancestral settlement'. This was conducive to the integration of the entire community, but also likely aided the public display of the status of the deceased, expressed through the grave goods. In the paper, we will present the results of the analysis of the relationship between the place of burial within the settlement (house interior, clay extraction pits, communal space, defensive ditches) and the sex, age and status of the deceased. We will also consider whether the appearance of rich grave goods present in the BKC refers to the position of individuals or rather, through these individuals, to the competing groups (probably extended households).

6 NEOLITHIC DEPOSITION PRACTICES AND THE CONNECTIONS BETWEEN CENTRAL AND NORTHERN EUROPE

Abstract author(s): Müller, Michael (Institute of Prehistory (FU Berlin))

Abstract format: Oral

The largest known number of depositions in Central and Northern Europe is from the time of the Funnelbeaker culture (4,100–2,800 BC). The most frequent objects composing these depositions are flint axe heads, followed by amber beads, ceramic vessels, copper items and flint blades.

In my paper, I will present some possible connections between depositional practices of the Funnelbeaker culture and Neolithic cultures of Central Europe between the 6th and 4th Millennium BC. Beginning with the Linear Pottery Culture (5500–5000 BC) and increasing in number in the following central European Middle Neolithic period (5000–4400 BC), these depositions seem to have been carried in the same manner over millennia. They all show a recurring selection of objects, with a prevalence of different types of stone axe heads, including their preforms, or raw materials. The items were often reaching extraordinary sizes and were placed in special arrangements at the borders of the inhabited areas.

When it comes to the origins of the Funnelbeaker deposition practices, it remains rather unlikely to find them in the preceding Ertebølle culture (5500–4100 BC), due to the quantitative lack of recurring hoards with stone tools, especially flint axe heads. Conversely, I will discuss the hypothesis that the bearers of the Michelsberg culture (4,400–3,500 BC), as possible initiators of the Funnelbeaker culture, could have transferred that model of Neolithic depositions into Northern Europe where it is even traceable until the Younger and Late Neolithic (2800–2200 BC). During the Funnelbeaker time, the deposition practices were further developed and continued in their own dynamic, which had a decisive influence on the developing strong social networks.

7 RITUALS OF CULINARY PRACTICES. DEPOSITIONS OF FOOD AND VESSELS IN THE MIDDLE NEOLITHIC FUNNEL BEAKER CULTURE OF DENMARK

Abstract author(s): Claudi-Hansen, Lone (Museum Vestsjælland)

Abstract format: Oral

Food is intimately woven to both rituals and daily life in the Middle Neolithic Funnel Beaker Culture (ca. 3300–2800 BC). The ritual sharing and sacrifice of food and vessels has strong economic, cultural, and ritual ties and food must have played a crucial role in negotiating social relations. In eastern Denmark vessels and food remains are generally found in three different depositional contexts: 1) in and outside the megalithic passage graves, 2) in wetlands as offerings and 3) in contexts of discard, storage and ritual deposits at settlements. It was not only the material qualities of the vessels that played a key role in rituals and everyday activities, but most of all their now vanished content - food and beverages. The use-wear traces on the vessels differ in the three different contexts, reflecting differences in conservation, but also a variety of uses prior to the deposit. In this paper, the use-wear traces on vessels are examined in order to investigate how the pottery was used prior to the deposit in contexts of respectively ritual and profane character. Was particular food associated with specific depositional practices?

8 VESSELS FOR THE ANCESTORS

Abstract author(s): Gebauer, Anne Birgitte (National Museum of Denmark)

Abstract format: Oral

The Neolithic period in southern Scandinavia marks the beginning of a range of depositional practices related to hoards on dry land, wetland sacrifices and the ancestor cult. Investments in depositions of different kinds increased considerably when ploughing was introduced and cultivated areas expanded about half a millennium after the introduction of agriculture and continued for about four to five centuries. During this period votive offering of pottery became an important part of the burial rites leading to a ceramic production of outstanding quality and level of decoration. The large contingent of different types of pots was probably the remains of burial feasts. The vessels communicate the identity and status of the sponsors of the event but also reveal contacts and interaction among communities locally and regionally. Different aspects of these complicated practices involve the use of different types of ritual and domestic pottery, arrangement of the vessels as well as different degrees of fragmentation. The complexity of the repeated offerings reflected an in-depth knowledge of tradition and competence within the religious sphere. These practices evolved in connection with the building of megalithic tombs with accessible chambers but continued for a period of 150–200 years after the construction. The competitive feasting that was part of the burial rites was thus prolonged for several generations. Eventually these large public events were replaced by more simple burial rites where the role of pottery was much reduced or completely replaced by depositions of flint axes. The aim of this paper is to discuss what depositions related to the ancestor cult in the Funnel Beaker Culture can tell us about the early farming communities in southern Scandinavia between 4000–2800 BC.

9 DEPOSITIONAL PRACTICES AS NETWORKS OF INTERACTION ACROSS THE NORTH SEA IN THE EARLY NEOLITHIC

Abstract author(s): Bjørnevad-Ahlqvist, Mathias (University of Copenhagen)

Abstract format: Oral

Why are there so many similarities in ritual aspects of Neolithic life across the North Sea? In this paper, we explore this question through an interdisciplinary and mixed-method social approach, investigating the potential interconnectivity between several case study areas in Denmark, Britain, and Ireland in the period c. 4000-3300 BC. Rather than focusing on the impressive monumental constructions that these regions share, we focus depositional practices, comparatively smaller scale and conventionally subject to less archaeological interest. In our combined approach, we employ diverse statistical analysis, qualitative observations, and interdisciplinary interpretive frameworks to investigate different forms of practices, including hoards, pit deposits and grave goods. Analysis of this material is used to discuss the connections and disconnections between these different forms of practices. We then extend these findings into a discussion of the scales of societal interaction and cultural transmission of beliefs and social behaviour, which may be said to support these practices, across different areas of the North Sea.

10 TREE THROWS, PITS AND PALAEOCHANNELS: DEPOSITION IN THE EARLY NEOLITHIC IN NORTH WEST BRITAIN

Abstract author(s): Dickson, Antony - Brown, Fraser - Evans, Helen (Oxford Archaeology North)

Abstract format: Oral

Recent excavations in front of a new road scheme at Windy Harbour, North Lancashire, England has revealed exciting new evidence for early Neolithic occupation including structures, hearths, middens and associated features. Occupation activity also included the deposition of artefacts and other cultural material in anthropogenic and natural features used as repositories for chipped stone, fragmented stone axes, shattered stone, Carinated bowl pottery and charred plant remains. The worked stone component included exotic material such as pitchstone from the Isle of Arran, Scotland, rock crystal and fragmented Group VI axe blades from the Langdale axe production sites in Cumbria. Current interpretations see this depositional activity enmeshed within the everyday routines of inhabitation and potentially relating to the final phase of occupation.

Sites elsewhere in the north west region have also produced evidence for structured deposition. For example, a palaeochannel at Stainton West, Carlisle, Cumbria contained wooden tridents (the only known comparators being from Ireland), other items of worked wood, de-hafted and intact Group VI axe blades, a large assemblage of coarse stone tools and flint blades made on raw material from outside the region. However, unlike the situation at Windy Harbour there was no evidence for occupation features, such as pits and structures, implying that deposition related to different ways of expressing inhabitation.

This paper will explore the contexts of early Neolithic deposition from across the region and explain the patterns of similarities and differences they represent. It will place the depositional practices within a chronological framework. It will also seek to interpret this activity within the context of landscape occupation at a time when community identities were undergoing change at the beginning of the Neolithic in the United Kingdom.

11 INDEBTED TO THE UNDERWORLD AND EACH OTHER? AN EXPLORATION OF DEPOSITION AT TWO NEOLITHIC MONUMENTS IN DORSET, S. ENGLAND

Abstract author(s): Greaney, Susan (University of Exeter)

Abstract format: Oral

A close examination of assemblages of artefact and ecofacts deposited within shafts during the Neolithic period can shed light on the engagements that people had with place, and with each other. This paper will explore depositional practices at two Neolithic monuments in Dorset in southern England, Maumbury Rings and Monkton-Up-Wimborne, monuments which both emulate natural sinkholes and shafts found nearby. By exploring the materials, colours, affordances, and associations of the deposits placed deep within them, the wider connections and relations of these assemblages will be traced. It will be argued that substances and objects can be involved in social relationships, and that the deposits in these shafts can shed light on specific negotiations between people, materials and the underworld, including debt relations. In turn, this can reveal potentially unequal relationships between different groups of people in the Neolithic period, whose lives were entangled with materials, objects and places, and the journeys between them.

HOUSE, MIDDEN AND PIT. UNDERSTANDING THE EVIDENCE FOR “THE BIG FEAST” DURING THE LATE NEOLITHIC IN ORKNEY, SCOTLAND

Abstract author(s): Becher, Julia (BioArCh, University of York; CEPAM, Université Côte d’Azur; Archaeometry Working Group, University of Tübingen) - Regert, Martine (CEPAM, Université Côte d’Azur) - Edmonds, Mark (Archaeology Department, University of York) - Card, Nick - Mitchell, Anne - Towers, Roy - Blatchford, Jan (University of the Highlands and Islands; Ness of Brodgar Trust) - Craig, Oliver (BioArCh, University of York)

Abstract format: Oral

The Late Neolithic in Britain is known for its remarkable ceremonial complexes, ranging from large stone circles to stone buildings dating between 3200 and 2200 cal. BC. Especially the Orcadian Neolithic, Scotland, belongs to one of the most prominent places within the political landscapes of the time. Recent excavations at the Ness of Brodgar revealed the largest pottery assemblages of its kind in Britain in addition to one of the largest bone collections in Neolithic Scotland allowing exceptional conditions for in-depth analysis to reconstruct the past. Distinctive Grooved Ware pottery vessels were deposited across the site’s many structures and spaces, including house structures, middens and pits. At least some of this pottery is likely to have been used in large-scale communal feasting, while other deposits may reflect the more day-to-day use of vessels for storage, cooking and food consumption.

Previous organic residue analysis (ORA) studies on Grooved Ware assemblages revealed clear markers for animal fat processing, however, small sample sets were used ($n < 40$) for inter-site comparisons without a clear understanding of intra-site functions. The presented organic residue study (ORA) investigates 340 pottery samples, comparing various activity zones within the Ness of Brodgar on a spatial and chronological scale. This represents the largest dataset collected from a single Grooved Ware site based on organic residues. Analyses of a combined biomarker and compound specific isotope approach (GC-MS and GC-C-IRMS) demonstrate excellent lipid preservation, with results showing the evidence of plant, ruminant adipose and dairy processing within the ceramic vessels. This allows us to investigate (1) possible changes in ceramic use over time, (2) possible differences between contexts, (3) the extent to which degree pottery uses reflect the resources available, and (4) if rather rare or specific resources, such as beeswax, oils, resins, or fish, were also being prepared in ceramic vessels.

A. AUROCH BUCRANES BURIALS IN A NEOLITHIC MICHELBERG WOODEN CASED WELL FROM UPPER RHINE PLAIN (ALSACE, FRANCE)

Abstract author(s): Raynaud, Karine (Bureau d’Etudes Eveha) - Ferrier, Antoine (INRAP)

Abstract format: Poster

As part of the construction of the Strasbourg ring road, several archaeological sites have been excavated between 2015 and 2017 on the low terrace of lehm, on the west bank of upper Rhine plain.

On one of these sites (Fegersheim Secteur 2) was discovered a large Neolithic settlement, with several storage pits, waste pits, human burials, water wells but without any post holes or architectural elements. Until further informed, material culture corresponds to the culture of Michelsberg, which begins in the 4th millennium. The remains, not very dense, are distributed up to 300 m on both sides of a thalweg occupied by two streams.

One of the water wells discovered in this archaeological context has a rectangular wooden casing, installed in the center of a vast excavation with a U-shaped profile. Two bucranes, one of an adult male auroch and the second belonging to a young male cattle, were discovered interstratified in the filling sediment of this large pit. They are laid flat, connecting by their bony ankles; this intentional deposit also include two whole pottery. If calibrated radiocarbon date is expected, ceramic identification lead to a middle Michelsberg chronology, well known in upper Rhine plain. In this poster, we will try to highlight the possible links between the bucrane deposit of Fegersheim and the tradition of faunal deposits in the enclosures maintained by the communities of Michelsberg. In addition, we will study the symbolic significance of this ritual deposit and try to show whether and how this practice, probably a foundation deposit related to water wells, could be considered new in the cultural area of Michelsberg.

SEASCAPES, SEALANES, AND MARITIME INFRASTRUCTURE IN THE LATE BRONZE AND EARLY IRON AGE MEDITERRANEAN

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Martin Garcia, Jose (The Hatter Laboratory) - Manolova, Tzveta (Université libre de Bruxelles) - Muñoz Sogas, Judith (University of Barcelona) - Mauro, Chiara (Universidad Complutense de Madrid)

Session format: Regular session

In Mediterranean archaeology, the importance of the sea extends far beyond a mere geographical label. It is an ever-present unifying variable that profoundly shaped the reality of communities living along its shores, bringing into

close contact peoples inhabiting three continents in a way impossible to achieve without it. Whereas the Late Bronze Age and Early Iron Age represent the first major turning point in the scale and intensity of Mediterranean-wide interconnectedness, the crucial role of maritime infrastructure (ships and harbours) in both enabling and actively shaping this profoundly impactful process remains vastly understudied compared to other archaeological markers of connectivity. Instead, ships are often treated as invisible conveyors, with little to no consideration of their usefulness in answering questions beyond that of technological developments and transfers. An integrated approach that considers maritime infrastructure within its broader cultural and socio-economic context can provide a much fuller picture in terms of the mechanisms and priorities behind the process of growing Mediterranean-wide interconnectivity. Ship-building traditions moreover offer an important and thus far largely overlooked perspective on the complex dynamics of the critical LBA-EIA transition, allowing to trace both remarkably long-lived practices and abrupt changes which can be meaningfully tied to broader historical and cultural phenomena.

We welcome papers dealing with maritime infrastructure (anchorage, harbours, ships), seascapes, maritime actors, long-distance networks and connectivity in the Mediterranean during the Late Bronze Age and Early Iron Ages.

ABSTRACTS

1 **POTENTIAL SAILING MOBILITY IN THE LATE BRONZE AND EARLY IRON AGES IN THE EASTERN MEDITERRANEAN: INTER-REGIONAL CHALLENGES AND INTRA-REGIONAL OPPORTUNITIES**

Abstract author(s): Gal, David (Department of Maritime Civilizations, University of Haifa)

Abstract format: Oral

A recent PhD research has developed new methods for measuring potential sailing mobility of Mediterranean merchant ships in Antiquity, both for direct sailing passages and for breeze assisted coastal sailing. Most previous quantitative works have evaluated sailing passages using averaged wind, consequently losing details of the characteristic variability of Mediterranean winds. Their sole measure of mobility has been a representation of sailing speed on direct crossings. Moreover, these Mediterranean studies have not considered the effect of human factors on mobility, for instance, the choice of whether to sail or to wait for better conditions. The developed methods use meteorological resources at the highest spatial and temporal resolutions to expose the recurring wind variabilities and patterns which are the key to potential mobility. The methodology converts meteorological 'big data' in the order of billions of records to millions of simulated sailing passages, providing a basis for statistical analysis of potential sailing mobility. Inclusion of criteria-based human factors, i.e. the assumed preferences and limits of the mariners of the period, provides practical measures of mobility, representing not only sailing speed, but also time spent waiting for favourable winds and the probability of conducting feasible passages at given times of the year.

In the eastern Mediterranean basin, these methods have been applied to explore the difficulties of westbound sailing during the summer season facing contrary Etesian winds. Both direct passages and breeze assisted coastal sailing have been examined and mobility bottlenecks have been identified. Conversely, the mapping of potential sailing mobility has also exposed opportunities for cross-wind passages under the effect of the same Etesian winds, leading to deeper understanding of mobility factors in intra-regional maritime trading links.

2 **PATTERNS OF MOVEMENT AND MOBILITY: THE PLACE OF SHIPS WITHIN NETWORKS**

Abstract author(s): Krieger, Anja (Independent Researcher)

Abstract format: Oral

It is generally agreed upon that ships form parts of networks. It is in their inherent nature to connect places and traveling by sea was oftentimes easier, and probably cheaper, than traveling over land. As a consequence, the use of network analysis has gained a lot of traction within the field of maritime archaeology within the past years to better understand the different degrees of interconnectedness within the Mediterranean. The application of network theory to archaeological data, however, brings with it several challenges. This paper discusses two recent approaches to maritime networks that specifically include data from shipwrecks: one is Thomas Tartaron's multi-scalar model of nested geographies for the Bronze Age and the other is Elizabeth Greene's analysis of individual ships as ego-networks. Drawing from both approaches, the talk's main focus of this paper will then be on discussing four LBA and EIA shipwrecks, Ulu Burun, Cape Gelidonya, Tanit, and Elissa, as examples of different patterns of mobility and movement within the Eastern Mediterranean.

3 **SAILING AT NIGHT: A QUANTITATIVE APPROACH TO NIGHTTIME VISIBILITY OF THE SHORES AND MARITIME TRAVEL IN LBA AND IBA**

Abstract author(s): Mauro, Chiara Maria (Universidad Complutense de Madrid) - Durastante, Fabio (Università di Pisa)

Abstract format: Oral

Recent advances made in the studies of ancient seafaring have repeatedly acknowledged the role played within the same by visibility. In particular, in the Mediterranean Sea—which is an almost enclosed maritime space filled with islands—mutual visibility had long stood at the heart of maritime connections, theoretically allowing one to go from one side to another without ever losing sight of the land. Since the '70 numerous studies have tried to evaluate from what distances the coast could be seen. However, the majority of these studies have frequently employed an over-simplified and incomplete treatment of 'visibility'. For this reason, the aim of this contribution is to foster a concept of visibility that is more inclusive and compliant with reality. Specifically, we would like to assess to what extent visibility could be reduced during nighttime and how the decrease in visibility at night could have possibly affected ancient seafaring practices within the Mediterranean context. Whilst the considerations that we express in this contribution could be virtually applied to any chronological context, we have decided to ground our contribution in the time frame between the LBA and the IBA (i.e. between the 14th and the 8th cent. BC). This choice has been motivated by two main observations. On the one hand, there are abundant testimonies referring to this period speaking in favour of the practice of nocturnal seafaring. On the other hand, during this period fixed maritime infrastructures aimed at improving visibility at night were still not fully developed. This means that—even if alternative measures to increase visibility at night might possibly have been already in use in certain maritime areas (e.g. fires burning on top of coastal towers or religious structures)—light signals were still not so widespread and its presence was not systematic along the Mediterranean shores.

4 **MARITIME TRADE NETWORKS AND INTERCONNECTIVITY IN THE LEVANTINE SOUTHERN COASTAL PLAIN DURING THE LATE BRONZE-IRON I TRANSITION**

Abstract author(s): Killebrew, Ann E. (The Pennsylvania State University)

Abstract format: Oral

This paper explores long-distance networks and connectivity in the Levantine southern coastal plain during the 14th through 12th centuries BCE. Two centuries of Egyptian imperial influence during the Late Bronze IIA–B created a relatively stable environment that facilitated long-distance trade and interconnectivity with the eastern Mediterranean world. However, increasing volatility during the final decades of the 13th and early 12th centuries BCE disrupted these networks. Following the withdrawal of New Kingdom Egypt from the southern Levant and the collapse of the Hittite empire, the established Late Bronze Age elite socio-economic structures suffered devastation. In its place, other less centralized polities survived the crisis and even flourished, as evidenced by more informal exchange networks, migration, colonization, and other social interactions. The Late Bronze II and the transition to the Iron I period will be examined at several key sites located in the southern coastal plain, including Ashdod, Tel Miqne-Ekron, and Ashkelon. These results will be compared and contrasted with the archaeological evidence emerging from neighboring coastal regions in the Levant.

5 **THE EMERGENCE OF THE PHOENICIAN MEDITERRANEAN PHENOMENON: ENVIRONMENT, HISTOIRE ÉVÈNEMENTIELLE AND AGENCY**

Abstract author(s): Gilboa, Ayelet (Zinman Institute of Archaeology, University of Haifa; School of Archaeology and Maritime Cultures, University of Haifa)

Abstract format: Oral

Regarding Levantine maritime activities after the collapse of the Bronze Age world, a near-consensus prevails among scholars: Since the 'Sea people' invaded large parts of the southern Levant, and possibly also of Syria, only the Lebanese coast remained unscathed, which is where maritime infrastructures, tradition and know-how remained, eventually generating the Phoenicians' westward maritime expansion. Instead, I argue that ample archaeological evidence demonstrates that what should be termed the earliest Iron Age maritime Phoenician ventures were first launched from the Carmel coast, today in northern Israel, mainly from its main harbour town at Tel Dor (subsequently to be joined by polities in south Lebanon). This was dictated primarily by environmental factors: Dor's natural anchorages, wind regime in the Eastern Mediterranean, landmarks visible by sailors from afar and the accessibility of mountains with their arboreal products close the sea. In addition, however, socio-political factors were at play: the collapse of imperial Egypt, of the Syrian coast, and not long afterwards—of the Cypriot Bronze Age apparatus. Considering all these aspects in tandem, alongside the role of individuals in the Levant and in Egypt in maritime connectivity, enables a comprehensive interpretation of the development of early Phoenician maritime endeavors.

6 **MEDITERRANEAN TRADE CIRCUITS. HOW DID CERAMICS TRAVEL IN THE LATE BRONZE AGE MEDITERRANEAN? THE CASE OF TELL ABU HAWAM**

Abstract author(s): Martin Garcia, Jose (The Hatter Laboratory)

Abstract format: Oral

Sailing largely depends on the sail type. Triangular and orthogonal sails are appropriate for upwind and crosswinds, while square sails are only suitable for tailwinds. During the Late Bronze Age, ships carried just one mast with a single square sail, being only able to navigate with tailwinds, preferably following the sea currents, which in the Mediterranean follow a counterclockwise circular trajectory.

As a result, many scholars defend that, in the Mediterranean, ships traveled in a circle following the main currents, stopping in almost every harbor along the way. However, the Mediterranean also has local currents and seasonal winds that allow ships to make shorter journeys, reducing travel costs and permitting navigation all year. Additionally, the political and economic alliances influenced trade relationships and routes.

Because of it, I think traders traveled in small harbor-specific circles. The difficulty is how to trace these individual connections. Through an analysis of the imported ceramics from the Late Bronze Age anchorage or proto harbor of Tell Abu Hawam, I will offer an example of specific harbor connections and a methodology to detect them.

7 **REGIONAL EFFECT OF RIVER SILTING ON MARITIME TRADE IN THE LATE BRONZE/IRON AGES: THE HAIFA/AKKO BAY AS AN EXAMPLE**

Abstract author(s): Artzy, Michal (Hatter Lab., RIMS, University of Haifa) - Giaime, Matthieu (Hatter Laboratory, School of Archaeology and Maritime Cultures, University of Haifa; ASM UMR5140, Université Montpellier 3, CNRS, MCC)

Abstract format: Oral

The gradual silting of the Qishon River on the Haifa/Akko Bay in the 14th-12th centuries BCE affected the maritime trade. Analysis of the geomorphological changes – at the scale of the Bay and at the Qishon mouth – concurrent with the imported ceramic from the ‘The lands of the Sea,’ Greece, Cyprus, the Levantine coast and Western Anatolia found at Tell Abu Hawam and Akko, point to a transformation in the nature of the imported ceramics of the period.

Both sites show a similar record of imported ceramics during the earlier years of the Late Bronze IIIb period, namely the 14th and first part of the 13th centuries BCE. Following the silting of the Qishon river, an increase in habitation and imports, albeit slightly varied, on the tops of ramparts of Tel Akko where the backdrop of the coast and the Na’aman River allowed for the continuation of the maritime trade into the later part of the 13th and early 12th centuries BCE.

8 **CHANGE VERSUS CONTINUITY ACROSS THE LBA-EIA TRANSITION: A VIEW FROM THE SHIPS**

Abstract author(s): Manolova, Tzveta (Université Libre de Bruxelles)

Abstract format: Oral

The transition between the Late Bronze and Early Iron Age in the eastern Mediterranean was a tumultuous period marked by profound geopolitical and social transformations. Not all regions however were impacted evenly, with some re-bouncing far quicker than others, while a handful of actors greatly benefitted from the ensuing power vacuum. One particularly important avenue for gaining a strategic advantage was the ability to maintain and expand long-distance maritime networks in the beginning stages of the Early Iron Age. Shipbuilding traditions offer an important and thus far largely overlooked perspective on this process and the varied regional responses, allowing to trace both remarkably long-lived practices and abrupt changes which can be meaningfully tied to broader historical and cultural phenomena. The paper will examine salient examples of Late Bronze age ship types that were either passed down or disappeared from regional shipbuilding traditions during the Early Iron Age, with a particular focus on the seafaring cultures of Cyprus and the Levant.

9 **SHIPS PASSING IN THE NIGHT: MARITIME INFRASTRUCTURE, POLITICAL ECONOMY, AND THE LIVED EXPERIENCE OF SAILORS**

Abstract author(s): Fuller, Elliott (University of Toronto)

Abstract format: Oral

Through the close contextual analysis of material assemblages from four Late Bronze Age Eastern Mediterranean foreshore structures, I offer a new interpretation which moves beyond purely morphological and functional analysis by employing a historical framework. In recent years, a debate has emerged over the role of the maritime infrastructure from the Minoan site of Kommos on Crete. One position, maintained by the site’s excavators, is that the infrastructure represents ship sheds—structures meant to house sailing ships and keep them dry during the winter

season. The other position, put forward by two coastal geoarchaeologists, is that they were storage areas for the goods offloaded from ships. While important for determining the function of the Kommos structure and Minoan nearshore infrastructure in general, this discourse has precluded broader syntheses of the data. Therefore, I intervene in this dialogue by reconsidering the evidence from Late Bronze Age Eastern Mediterranean foreshore buildings. Instead of focusing on their morphology, where most attention has been devoted, I examine their contents. Tableware, tools, personal trinkets, and hearths have been reported from several of these buildings in the Aegean and on Cyprus, but the findings have yet to be contextualized in existing interpretations of such structures. I argue that these finds represent the material remnants of temporary occupation of the structures by sailors calling into port. Such a proposal does not foreclose the other interpretations suggested above. Rather, I view harbour infrastructure as multifunctional, with the structures fulfilling different functions depending on the time of year and the needs of its users. I also consider the implications of my interpretation for broader issues of maritime exchange, political economy, and the lived experiences of sailors.

10 A LATE BRONZE AGE “NAVAL STATION” AT KALAMIANOS (SARONIC GULF), GREECE?

Abstract author(s): Pullen, Daniel (Florida State University)

Abstract format: Oral

The Saronic Harbors Archaeological Research Project (SHARP) has documented the Late Bronze Age harbor town at Kalamianos and its hinterlands, on the Saronic Gulf coast of the Corinthia, Greece, through intensive survey, architectural recording, and subsurface sonar. The small community of the Middle and earlier Late Bronze Age was expanded into a walled town of the Mycenaean palatial period with buildings and streets oriented to the harbor; substantial labor and capital investments in field terracing and buildings are also evident in the hinterland. Subsequent local subsidence and eustatic change near the end of or after the palatial period have made the harbor mostly unusable, and part of the town is now underwater. Twelve centuries later the Roman period geographer Strabo (1st cent. BCE-1st cent. CE) identified the town of Eiones on the Saronic Gulf, from the Homeric Catalogue of the Ships (Iliad Book 2), as a “naval station” (nafstathmon); his description of Eiones fits our understanding of the archaeology of Kalamianos and its harbor. That is, the people from the town of Mycenae came to Eiones (Kalamianos) in the palatial period, created a new town and naval station which later disappeared from view (most likely due to earthquake-induced subsidence), and now is no longer usable. The term “naval station” is mostly associated with military activities throughout Greek literature.

The implications of this identification of Kalamianos as a naval station are evaluated in light of our current understanding of the archaeology of maritime culture, both commercial and military, of the Mycenaeans and other Late Bronze Age peoples of the Aegean. The lack of identifiable maritime infrastructure outside of Crete, including at Kalamianos, suggests that such installations were not essential for maritime activities elsewhere in the Aegean.

11 THE GALLEY CULTURE OF THE AEGEAN FROM THE LATE BRONZE TO THE EARLY IRON AGE

Abstract author(s): Nakas, Ioannis (Independent researcher)

Abstract format: Oral

Towards the end of the Bronze Age a new type of oared vessel appears in the iconography of the Aegean. This new type of galley, a low, swift vessel equipped with a curved stern, a raised forecastle and a ram or cutwater, was most likely the first purpose-built warship in the region and survived the dramatic end of the Bronze Age and well into the Early Iron Age, becoming the ancestor of all later oared vessels of classical antiquity. Made for speed and manoeuvrability, it was an ideal ship for warfare, piracy and short travels within the unique seascapes of the archipelago. The predominance of this type of ship in iconography, even during the Submycenaean and Protogeometric periods, when representative art is nearly non-existent, indicates its importance in contemporary culture, something also reflected in the Homeric tradition. A galley culture must have thus existed within the communities of Late Bronze and Early Iron Age Aegean, a culture in which galleys played a great role both as functional vessels and as symbols of power, being the most advanced technological products of their time and in need of substantial resources and labour force to be built, maintained and operated. This galley culture and the role it played in the development of contemporary civilisation is the subject of this paper.

12 “GO TO THE DISTANCE”: LATE BRONZE AGE PORTS OF INTERACTIONS

Abstract author(s): Falezza, Angela (University of Oxford)

Abstract format: Oral

The Mediterranean Sea has constantly acted as an arena of interactions between independent areas and peoples, becoming a means of connectivity rather than division and allowing the exchange of artefacts, people and ideas. There is significant evidence for contacts between the Aegean world and Southern Italy in the Late Bronze Age. However, Aegean imports in Italy demonstrate shifting patterns of distribution and type of artefacts over this time. Moreover,

recent investigation on the process of social organisation of local communities in Late Bronze Age Southern Italy have shown profound differences from the contemporary Aegean palace societies. Today as in the past, different cultures have come together and interacted across the Mediterranean. These interactions have been influenced by many different factors which can be identified and studied.

Ports are naturally an important gateway for interactions across the Mediterranean Sea as the first point of contact for people travelling via sea, becoming place of gathering and interactions of different nature between cultures. I believe that ports provide a good scenario for investigating the social changes resulting from the interactions of different cultures, as the presence of facilities for both goods and their traders takes them beyond the economic sphere into the social one, providing cultural passage points. This paper will address whether the characteristics of ports of interactions were unique to specific geographical areas or whether were more widely shared across the Mediterranean. The identification across different ports of interactions of some common patterns of behaviour, such as the presence of communal feasting activities, suggests that similar dynamics of interactions were taking place between different cultures.

13 ON THE NATURE OF PHOENICIAN COMMERCE IN THE EBRO BASIN: AN ENDOGENOUS PERSPECTIVE

Abstract author(s): Muñoz Sogas, Judith - Álvarez, Ramon - Asensio, David - Jornet, Rafel - Menéndez, Pau - Morer, Jordi - Noguera, Jaume (University of Barcelona)

Abstract format: Oral

Many studies have tried to understand the nature of Phoenician commerce in the Western Mediterranean and the motives for these traders to exchange their products in the North-East of the Iberian Peninsula. In this context, indigenous societies have been ignored numerous times, and seen as acculturated or even inferior populations with no decision power in this exchange network.

However, evidence from the Ebro area has pointed out an endogenous explanation for these Phoenician seafarers to commercialize with indigenous groups. These exchanges seem to concentrate in areas where the presence of complex societies that include elites is attested prior to the arrival of foreign merchants. These Phoenicians would have supplied the local elite's demand for prestige goods, materialized in amphorae from the South of the Iberian Peninsula, destined to the commensality practices of the local elites.

These long-distance contacts are attested all over the Ebro basin, in different levels of intensity. Firstly, the maximum intensity area from the river-mouth, via Aldovesta, to the mining area of Molar-Bellmunt-Falset, and, secondly, a peripheral area beyond arriving at the region of Matarranya, reminding us that all cultural groups and their social complexities should be considered when attesting the nature of commerce.

99 SNOW- AND ICESCAPES: ARCHAEOLOGICAL AND CONCEPTUAL EXPLORATIONS OF FROZEN WORLDS

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Ilves, Kristin (University of Helsinki) - Hillerdal, Charlotta (University of Aberdeen)

Session format: Regular session

Any northerner is familiar with the transformative power of snow and ice that are literally creating different geographies in northern landscapes. There are even seasonal geographical features such as sea ice ridges forming every winter, sometimes given local place names of their own. Snow, ice and cold are part of a physical reality that has defined both personal and cultural identity of northerners as well as the identity of places. Yet the possibilities of the winter landscape remain largely unexplored in archaeological research.

Today, snow often creates chaos in transportation, frustrating rail commuters and travellers, and frozen waters are perceived to be void of motion hindering the movement of ships and the materials they contain. Historically, however, the northern winter roads on ice and snow were of utmost importance and freezing of the ground awaited. Compared to summer, long northern winters made it possible to utilize shorter networks through faster winter roads. Military campaigns in winter have been constitutive elements in the history of several Nordic regions. Frost-nails, mounts for shoes and horseshoes to protect from slipping on ice are the strongest and most frequent archaeological evidence associated with winter, snow, and ice. Archaeologists are also increasingly discovering skis, skates, sledges, and sleighs as well as remains of winter hay barns and trapping systems. Researchers are becoming more alert to archaeological signatures of day-to-day life in snowy landscapes.

Far from isolating, the frozen landscape provides ice roads and snowy transport routes, lays the ground for sociability, winter fairs and markets, facilitates lumbering, hunting, and trapping, and even war. It connects islands with the main-

land, but also forces ships to shore. In the far north, winter commands darkness and demands light. In this session we invite expeditions into the northern winter landscape, both physical and conceptual.

ABSTRACTS

1 NORTH OF THE WALL: ARCHAEO-ECOLOGICAL APPROACHES TO SCOTLAND'S ELUSIVE PALAEO-LITHIC PAST

Abstract author(s): Britton, Kate (University of Aberdeen)

Abstract format: Oral

For more than a century, Palaeolithic Scotland was missing from the textbooks, presumed non-existent. A low-density of archaeological finds was compounded by a research tradition that had persistently excluded the possibility of human settlement at the extreme edge of north-west Europe prior to the start of the Holocene (c.11,700 yrs ago). Perceptions of environmental hostility during the Late Glacial period in the region are at odds with decades of palaeoclimate and palaeoenvironmental research, and the recent discovery of unequivocal Late Upper Palaeolithic sites has finally provided indisputable evidence for human activity in Late Pleistocene Scotland. Research continues to be held back, however, by both a lack of widespread investigation and a lack of conventional archaeological finds – new approaches are needed.

With specific reference to the Late Upper Palaeolithic archaeology of Scotland, this talk will explore the perceptual barriers that can inhibit archaeological research in glaciated and deglaciating landscapes, as well as challenges of understanding the human past where little conventional archaeological evidence belies an undoubted human presence. This talk will introduce a new research initiative from the University of Aberdeen focused on the 'People, Animals, Landscapes and Environments of Late Glacial Scotland'. Using an archaeo-ecological approach centred on palaeontological (non-anthropogenic) faunal remains, PALaEOscot will employ radiocarbon dating, and biomolecular and isotopic analyses, to reconstruct Scotland's Late Pleistocene living landscapes. New data will be integrated with existing palaeo-environmental, -ecological and archaeological data, with the goal of modelling the constraints and potentials of contemporary human dispersals. This planned programme of research will illuminate human and animal life in Scotland at the end of the Last Ice Age and explore new ways of approaching low visibility archaeology in northern environments.

2 'ON THE ICE HOWEVER ONE NEVER, OR SELDOM, MEETS ANY DIFFICULTY'. FROZEN WORLDS OF THE NORTH, OLAUS MAGNUS AND ARCHAEOLOGY

Abstract author(s): Ilves, Kristin (University of Helsinki)

Abstract format: Oral

In 1518-19, Olaus Magnus – a Swedish scholar and the last (nominal) Catholic archbishop of Uppsala, travelled to the northern parts of Fenno-Scandinavia on behalf of the Vatican authorities to collect information about the region's nature as well as the people and their customs, everyday life, beliefs, and folklore. Many years after his journey, in 1539, Olaus Magnus published a map, today known as *Carta marina*, one of the largest printed maps of its time. In 1555, he published an extensive, more than 800-paged work titled *Historia de Gentibus Septentrionalibus* – A Description of the Northern Peoples. The book, one of the oldest ethnological studies in Europe, was intended to complement the map, and many illustrations in this historical account are redrawings of details from the map. Both works represent a mixture of facts and fantasy but are nonetheless considered to provide many valuable insights into the 16th century North. Close-ups of *Carta marina* and descriptions in *Historia* are full of information and demonstrate the presence and vitality of life and movement both on land and the seas, which were clearly heavily trafficked also during winter-time. It seems moreover that in the book there is almost always winter. This contrasts with the archaeological studies of past life in Northern areas whereat winter, snow and ice have been rendered marginal and insignificant. In this contribution I would like to give an overview of how winter appears in the work of Olaus Magnus, with an interconnected emphasis on the possibility of archaeologically studying maritime networks in frozen worlds.

3 URBAN WINTER LIFE AND THE SEASONALITY OF SOCIAL ORGANISATION

Abstract author(s): Haugan, Kristine (Museum of Cultural History, University of Oslo)

Abstract format: Oral

Seasonal transformations of landscapes is a concept often discussed in relation to seasonal settlements and landscape archaeology, but rarely studied within urban archaeology. With this paper, I explore the frozen world of medieval Oslo by engaging a combination of materials, stories and spatial aspects to approach the seasonality of social organisation.

The physical nature and circumstance of medieval Oslo changed drastically from season to season. As a summer town, Oslo flourished through the Middle Ages, slowly turning into a dominant port of Eastern Norway. As a winter town, however, Oslo's situation in the very depth of the Oslo fjord made it completely unapproachable from the sea. This does not mean that urban life came to a halt during those winter months. Although still unpractical, land travel was more pleasant in winter than in summer and objects such as sledges portrays activities related to travel and trade. The frozen bay confining the town simultaneously allowed for a temporary, but recurring, urban space. Inhabitants of Oslo made the most of this space, utilising the ice surface as a workplace, a recreational area, and even a space for fighting battles on foot.

In this paper, I explore the materiality and spatiality of urban winter life in medieval Oslo as a way to approach the concept of seasonality. Even though research on seasonal aspects of society has a long history within e.g. prehistorical settlement archaeology, the concept has these last, few years been increasingly explored within a wider range of archaeologies.

4 ANCIENT HIGHWAYS ON SNOW AND ICE

Abstract author(s): Lindstrom, Torill Christine (University of Bergen) - Zubrow, Ezra (University at Buffalo)

Abstract format: Oral

Snow and ice can cause all kinds of troubles, even accidents, in our modern transportation, travelling, commuting, and communication. But it was not necessarily so in ancient times. Admittedly, large amounts of newly fallen snow would have caused problems also then, but when the snow had settled, become compact, perhaps even with a hard crust, it created wonderful opportunities for travelling far and fast, even between remote areas. Ice provided similar advantages on lakes and rivers. Hardangervidda, the largest highland plateau in Northern Europe, separates the eastern and western parts of Norway, – but also connects them. Normannsslepene, paths across Hardangervidda, may be thousands of years old, and were used all year round, some routes primarily in late winter. This paper will present the traditions, various means of transport (skis, sledges, “sleper”, horses, dogs), the varied uses of the paths (hunting, moving cattle, people, goods, bishops); and the different peoples using them, continuously, from Mesolithic hunter-gatherers to modern groups. In addition, comparisons will be made to other ancient highways on snow and ice in the northern world including those used by Finns, Inuits, Tungus, Chukchees, Samis, and others. – Maps and pictures will be presented

5 DASHING THROUGH THE SNOW: AN INTERDISCIPLINARY EXAMINATION OF HORSES & WINTER TRAVEL IN VIKING AGE SCANDINAVIA

Abstract author(s): Ita, Seluvaia - Rose, Samantha (University of Aberdeen)

Abstract format: Oral

Rather than have the winter mean a time of survival, what if the winter months transformed landscapes inaccessible in summer into possibilities? What would this transformation mean in the “spiritual” aspect of earth, the Otherworld, and one’s mindset with a landscape that is ever changing? What material culture can be found to suggest this new access and what do their context suggest about the conceptual ideas of landscapes and seasonality? Like waterways, bogs, or forests, wintered landscapes were liminal spaces. In some Icelandic sagas, the otherworldly activity increases with the coming of winter. In these stories, hauntings get more and more persistent around Jól. The pagan origins of Jól, although unknown, suggest that winter was not an inactive time of year since, as seen throughout Heimskringla, people would travel from location to location to celebrate. This requires access and the ability to navigate a frozen world of powdery snow and treacherous ice, requiring both human and animal gear, in particular horse crampons (broddar). Horses as both physical and mythological creatures can access nearly any landscape, and the presence of skeletal remains and equipment in graves is significant. In this talk, archaeological finds are contextualized with the written accounts and vice versa, balancing what people thought with what people left behind, leading to explorations in living landscapes and the Viking Age Norse role in the cosmos.

6 LETS SKATE TOGETHER - BONE SKATERS AS MEANS OF TRANSPORT

Abstract author(s): Messal, Sebastian (Lower Saxony State Service for Cultural Heritage)

Abstract format: Oral

Ice skates made of bone – usually made from the metapodia of cattle or horse – were used to improve the mobility in snow- and icescapes. During winter, frozen lakes and rivers had to be seasonal used as transportation routes to connect frozen landscapes and bone skates could be used to move heavy loads over ice and snow. Bone skates are therefore known to be very numerous from Northern Europe and especially in the North and Baltic Sea regions. Their use can apparently be traced back to the Neolithic period, but bones skaters only appear in larger numbers from the Roman Iron Age onwards. Their peak as means of transport in terms of quantity was in the early Middle Ages, and

they can be found in large numbers within find assemblages e.g. from Slavic fortifications and settlements along the southern Baltic coast. Written and pictorial sources even testify to the use of bones skates up to modern times.

The paper wants to summarise the actual state of research and to present a general overview about this artefact type associated with winter, snow and ice.

7 WINTER LANDSCAPES OF NORTHERN EUROPE – SEASONALITY AND LANDSCAPES IN STONE AGE ROCK ART

Abstract author(s): Gjerde, Jan Magne (NIKU - Norwegian Institute for Cultural Heritage Research)

Abstract format: Oral

Temporal changes in the landscape are of vital importance for hunter-fisher-gatherers. The surroundings and temporal changes guided activities and the way of organizing lifeways of hunter-fisher-gatherers in northern Europe throughout the past. This would differ within the regions of northern Europe, e.g., coastal northern Norway, inland central Sweden, or lake districts of Finland. Living in winter landscapes, the cynegetic activities of hunter-fisher-gatherers in the north would change dramatically with the seasons of the year. These changes are represented in the rock art by depictions of scenes and compositions related to “seasonal” activities where even animals and the morphology of the animals indicate the time of year. Stone Age rock art is a window to some of the major innovations important to people living in winter landscapes (skis, snowshoes) or seascapes of the north (boats). Most Stone Age rock art sites would have been accessible throughout the year. Rock carvings in the tidal zone and near rapids would be free of snow during the winter months, while the paintings on vertical rock cliffs would be exposed and even more visible and accessible in winter. The canvas of the study is comprehensive fieldwork during the last 20 years in northern Europe, studying rock art, rock art sites and their location during different seasons of the year. I furthermore argue temporal changes in nature have implications not just for the interpretation of rock art and rock art sites. Moreover, living in winter landscapes would have been important for people’s movement in seascapes and landscapes and part of their geographical knowledge during the Stone Age of northernmost Europe. In turn this would have impact on how we study and interpret the lifeways of people inhabiting Frozen Worlds of the past.

8 ‘THERE’S A CERTAIN SLANT OF LIGHT’* THE INTERPLAY OF LIGHT AND DARKNESS, ICE AND SNOW IN THE NORTHERN FENNOSCANDIAN WINTER

Abstract author(s): Hillerdal, Charlotta (Department of Archaeology, St. Marys Building, University of Aberdeen)

Abstract format: Oral

Winter holds northern Fennoscandia in its grip for six months of the year. In conceptual terms winter is often imagined as hostile and motionless, a frozen world waiting to be awakened by spring, engulfed by cold and darkness.

But even in the darkest winter you will have the interplay of light; when the midwinter sky brightens with colour for a few hours even though the sun won’t make it over the horizon, in the perfect reflective surface of a snow-covered lake under the full moon on a crisp winter’s night, when the sky comes alive with the Northern lights - the fire foxes, the ancient souls, faint reflections of battle.

Like snow and ice, light and darkness are variable and dynamic – defining space, restricting and enabling movement and transportation, capturing the mind.

In this presentation I want to explore the interplay of light and darkness in the premodern Fennoscandian winter landscape and the possibilities and limitations the play of light offered the human inhabitants of this frozen world.

*Emily Dickinson

9 WALKING ON THIN ICE: NEW METHODS EXPLORING VITAMIN D STATUS IN THE PAST AND A CASE STUDY FROM NUNALLEQ, ALASKA

Abstract author(s): Czére, Orsolya (University of Aberdeen) - De Roos, Baukje - Duncan, Gary (The Rowett Institute, University of Aberdeen) - Britton, Kate (University of Aberdeen)

Abstract format: Oral

Vitamin D deficiency is linked to a wide range of adverse health effects, the risk of which are increased for populations living at latitudinal extremes where limitations are placed on the dermal synthesis of vitamin D₃ due to insufficient sunlight, particularly during winter. This represents a significant health challenge for populations living in the circum-polar north, past and present. The consumption of food sources with high vitamin D content, however, can mediate this risk. Indeed, traditional subsistence strategies in high-latitude areas are often focused on food sources rich in vitamin D₃, such as salmon and marine mammals.

Recent developments in biomedical sciences have offered non-invasive means of quantifying vitamin D status in individuals through the determination of 25(OH)D₃ content in hair. Where this tissue is preserved, this technique has

the potential to allow an empirical indication of vitamin D status in archaeological individuals and can permit co-analysis with dietary indicators. Here, we will present intra-strand 25(OH)D₃ data extracted from archaeological hair samples for the first time. Our case study focuses on hair recovered from non-mortuary contexts from the pre-contact Yup'ik site of Nunalleq (1450-1650 AD), Alaska. The detection of seasonal variability (d₁₈O, d₂H) of 25(OH)D₃ content in incremental samples of hair, in tandem with the analysis of dietary (d₁₃C, d₁₅N) indicators, reveals important new insights into dietary seasonality, and links to vitamin D status at the site. The potential role traditional subsistence foods play in contemporary vitamin D health will also be explored.

We warmly thank Qanirtuuq Inc, Nunalleq Museum, and the people of Quinagak for permissions to undertake this research.

102 MESOLITHIC-NEOLITHIC TRANSITIONS [PAM]

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Templer, Michael (Research Associate, University of Neuchâtel, FLSH, Institut de Préhistoire) - Paraskevi, Elefanti (Research fellow, University of the Peloponnese, Laboratory of Maritime Archaeology, Department of History, Archaeology and Cultural Management) - Måge, Bjørnar (Museum Lolland-Falster) - Soares, Joaquina (UNIARQ-Archaeological Centre of the University of Lisbon and MAEDS - Museum of Archaeology and Ethnography of the Setúbal District/AMRS)

Session format: Regular session

The aims of this session are to present recent archaeological evidence or interpretations regarding Mesolithic/Neolithic transitions, as well as regional syntheses, from as many sites or regions as possible, and thus contribute to the broader understanding of this key period in the evolution of humankind. A Mesolithic hunter-gatherer with a pot is no more to be labelled Neolithic than are the present-day hunter-gatherers who have largely succeeded in maintaining their traditional life-ways, notwithstanding having acquired some present-day industrial attributes. The 'either/or' dichotomy and arbitrary dating of the 'event' is an academic convention which is giving way to a growing appreciation of the complexity and duration of the Mesolithic/Neolithic transitions across Europe. Contact between migrant Neolithic agro-pastoralists, with their specific life-ways, tool-kits and potentially different life-views, with incumbent Mesolithic hunter-gatherers (and sometimes collectors and fishers as well) took many and diverse forms. Whilst it is clear that over time the Neolithic way of life prevailed, the transitions to farming or assimilation into farming communities could have been more or less rapid, although in some instances they are known to have taken almost a millennium.

ABSTRACTS

1 THE MESOLITHIC-NEOLITHIC TRANSITION IN THE NORTHERN PONTIC REGION

Abstract author(s): Demchenko, Olha (Odessa I.I. Mechnikov National University)

Abstract format: Oral

The mainstream neolithization hypothesis, dominant in current Ukrainian scholarly, was proposed in the middle of the 20th century. It concentrates on ceramics and posits an early neolithization of the Northern Pontic Region at the end of the 7th mill. BCE, yet it distorts the logic of the historical processes and artificially separates this region from the current scheme of European Neolithization. The very early chronology also raises numerous doubts. Radiocarbon dates are represented unevenly. Some old assays were refuted by new ones obtained recently. The archaeological indicators of agrarian lifestyles remain ill-defined. A recent review of previously studied osteological faunal remains from several sites has shown the absence of domesticates. There are no reliable paleobotanical studies that could test the agrarian lifestyle. Despite the numerous known cemeteries and art objects, the symbolic aspects of the meso-neolithic transition dynamics and the innovations in material culture (ceramics) lack adequate attention. We consider the Meso-Neolithic transition period in the region lasted for about a thousand years and represented a spectrum of hunter-fishers-gatherer strategies broader. Three main sub-regions can be distinguished here: the Bug-Dniester region as the zone closest to the Neolithic cultures of SE Europe, with the highest rate of Neolithic items among local foragers; Azov Sea region occupied by foragers of the steppe plain zone with clues of animal husbandry and Western Asian influences; and Dnipro Rapids riverine region frequented by forager-fisher societies. Neolithic material innovations occurred in an uneven and punctuated fashion and did not lead to cardinal changes. Endogenous factors (e.g. favorable socio-economic conditions shaped by local foragers) played a crucial role in the Mesolithic-Neolithic transition.

2 THE MESOLITHIC-NEOLITHIC TRANSITION IN THE AEGEAN: A REVIEW OF THE GREEK EVIDENCE

Abstract author(s): Elefanti, Paraskevi (University of the Peloponnese, The Maritime Archaeology Laboratory)

Abstract format: Oral

Human settlement history and interaction during the Final Upper Palaeolithic, Mesolithic and initial Neolithic is one of the most hotly debated issues in Aegean prehistory. It is closely linked with two current research themes. How did hunter-gatherer societies adapt to the changing conditions of the Holocene and how did the long-lived hunter-gatherer way of life come to an end with the beginning of the Neolithic. The origin and establishment of the first Neolithic farming communities in Greece has raised vivid academic discourse over the last decades as it largely encapsulated two contrasting models, the indigenist and diffusionist. A critical point in the discussion of how the earliest farmers constructed their brave new world, either founding themselves in empty, unfamiliar and possibly hostile territories or on familiar lands that had the chance to accustomed themselves to after long term interactions with the indigenist populations is the Mesolithic period. The archaeological footprint of this period, however, is extremely vague. A number of factors count to this effect, including the short duration of the period spanning from the beginning of the Holocene at around 11,7 ka BP until the appearance of established Neolithic farming communities in Greece by at least 8,5 ka BP, the lack of archetypical technological traits, the few excavated and securely dated sites and possible sparse settlement distribution. In this paper I shall take a closer look at the very thin slice of the chronological phase attributed to the Greek Mesolithic by reviewing the main cultural traits in settlement, subsistence and technology as they have been formulated over the last decades of research, in order to reassess the cultural reality in which incoming farmers were one way or another enmeshed.

3 A NEW APPROACH TO THE CULTURAL, SOCIAL, AND ECONOMIC DOMESTICATION OF SICILY

Abstract author(s): Speciale, Claudia (IPHES-CERCA - Catalan Institute of Human Palaeoecology and Social Evolution; Department of Historical Studies - University of Gothenburg) - Giannitrapani, Enrico (Independent Researcher) - Forgia, Vincenza (Department of Culture and Societies - University of Palermo) - Bazan, Giuseppe (Department of Biological, Chemical and Pharmaceutical Sciences and Techniques - STEBICEF, University of Palermo) - Gullì, Domenica (Archaeological Superintendence of Agrigento, Sicily) - Iovino, Maria Rosa (Independent Researcher) - Lo Vetro, Domenico (Department of History, Archaeology, Geography, Arts - SAGAS, University of Florence)

Abstract format: Oral

The neolithisation of Sicily, the largest of the Mediterranean islands, conveniently placed at the crossroads of the routes from North to South and from East to West, has been a relatively recent issue within the debate dealing with the acquisition of the Neolithic lifeways. The narrative for the beginning of the Neolithic in Sicily has long suggested it took place on the island only in an advanced phase, with the arrival from the eastern Mediterranean of the elements of the “Neolithic package” already developed, through the cultural mediation of south-east Italy or directly from the East. Only after excavating some key sites in western Sicily, such as Uzzo and Kronio caves, has an early Neolithic phase been defined, although controversially accepted and interpreted. However, the debate has been limited to whether such an early phase originated here through diffusion or as an evolutionary process developed by the last hunter-gatherer communities. Crucial aspects such as the different modes of production, interaction with the environmental resources, and social structures have yet to be fully addressed. The appropriate question to ask to the archaeological record should be not just how Sicily entered the domestication process, but also why. The classificatory perspective widely adopted to interpret the Sicilian prehistory further constrains the discussion, leaving room for the acritical acceptance of a rigid dichotomy: societies

classed as hunter-gatherers did not have domesticates, while any societies with domesticates had agriculture. There is little space for a “middle ground” that, instead, is surprisingly large, quite diverse and sometimes long-lasting in other Mediterranean contexts. In the contribution, therefore, we aim to explore the possible existence of such a “middle ground” through an analytical enquiry into the main cultural, economic, chronological and paleoenvironmental aspects which characterise the late Mesolithic and the Early Neolithic (~7000-5000 cal BCE) of the island.

4 COLOURFUL TRANSITIONS: CHANGES IN OCHRE USAGE PATTERNS AMONG THE MESOLITHIC AND EARLY NEOLITHIC SOCIETIES IN CENTRAL AND EASTERN BALKANS

Abstract author(s): Kosciuk-Zalupka, Julia (independent researcher)

Abstract format: Oral

Usage of colorants, and ochre among those, could be perceived as a typical element of culture of the prehistoric societies. It was utilized in various forms in both secular and sacral contexts.

For this short study, there were taken under consideration terrains of Central and Eastern Balkans. Thanks to the observation of a wider chronological horizon, starting from the Mesolithic and continuing into the Early Neolithic, there could be noticed changes in the patterns of ochre utilization. The pigment was discovered in the archeological layers of 40 sites. Both utilitarian and sacral contexts were described. Yet, the most important feature was the slight transition in the proportions of ochre appearance. In the older, Mesolithic layers, that colourant was connected to both of the mentioned spheres, with appearance in graves and on the tools of everyday use. Nevertheless, the mortuary customs of the societies inhabiting especially the Danube Gorges changed slightly during the transitional period: in the older graves whole bodies were covered with pigments (ochre or graphite), whereas in the younger ones — ochre was discovered on females and kids bodies, localized on their pubic areas. Moreover, the numbers of utilitarian discoveries with ochre were dominating during the Mesolithic and the transitional period. Later, in the Early Neolithic, the number of the utilitarian discoveries decreased, showing a growing interest in the equipping of the graves with various goods, including ochre lumps or powder.

Such decrease of ochre traces on tools could indicate the general changes, appearing in the material culture. On the other hand, intensification of adorning of the deceased with red pigments strongly suggests also transitions in the ritual sphere, with simultaneous gaining on meaning of the symbolism of colours.

5 **TAKING THEIR TIME: EMERGING EVIDENCE FOR THE LATE MESOLITHIC AND EARLY NEOLITHIC TRANSITION IN THE EASTERN IRISH SEA ZONE**

Abstract author(s): Brown, Fraser - Dickson, Antony - Evans, Helen (Oxford Archaeology)

Abstract format: Oral

Recent excavations for the UK's National Highways' Windy Harbour to Skippool road development (near to Poulton le Fylde, Lancashire, north-west England), have revealed exciting new evidence for late Mesolithic and early Neolithic inhabitation. Of particular interest was the repeated occupation of the same locations, by late Mesolithic and early Neolithic communities, along the wetland dryland interface of the Lytham/Skippool valley. This took place within a dynamic, liminal, landscape, which was subject to a series of marine transgressions/regressions. Consequently, the stratigraphic, artefactual and palaeoenvironmental evidence was well preserved in anoxic environments. Domestic structures dating to both the Mesolithic and Neolithic periods have been recorded, along with evidence for votive practices and a wide range of artefact assemblages, middens, hearths and reworked tree throws. Preliminary dating from some of the sites has produced radiocarbon dates spanning the late fifth to early fourth millennia cal BC, suggesting some continuity across the Mesolithic/Neolithic cultural horizon. This potentially chimes with the evidence from other sites across the north-west region, most notably Stainton West, near to Carlisle.

This presentation will describe the new evidence and discuss it in its regional context, using the results from recent commercial excavations and community fieldwalking surveys. An interpretation will then be proposed, in accordance with the themes of the session overall.

6 **INVESTIGATING THE TRANSITION TO THE NEOLITHIC IN BRITAIN THROUGH LIPID RESIDUE ANALYSES AND COMPOUND-SPECIFIC RADIOCARBON DATING**

Abstract author(s): Wiltshire, Isabel (Organic Geochemistry Unit, School of Chemistry, University of Bristol) - Cramp, Lucy (Department of Anthropology and Archaeology, University of Bristol) - Knowles, Timothy (Bristol Radiocarbon Accelerator Mass Spectrometry Facility, School of Chemistry, University of Bristol) - Pollard, Joshua (Archaeology, School of Humanities, University of Southampton)

Abstract format: Oral

There has been much debate regarding the timing, origins and spread of Neolithic material culture and practices in Britain and Ireland. The beginning of the Neolithic period in Britain is usually placed around the start of the 4th millennium BC, or slightly earlier, when new evidence for structures, practices and material culture (including ceramics) emerge. Archaeogenetic data has provided strong evidence that the introduction of agriculture was principally the result of migration by continental farmers to Britain. However the nature of this migration, its timings and potential origins, and how the Neolithic subsequently spread and became established in Britain are still in question.

Ceramics were a novel technology introduced during the transition to the Neolithic in Britain, and have been recovered from some of the earliest Neolithic contexts across the country. They therefore provide an invaluable resource for investigating this transition period. Lipids preserved in the clay of archaeological pottery can be identified and characterised using cutting-edge analytical techniques to provide information on vessel function, diet, and subsistence practices. Furthermore, a novel methodology for the compound-specific radiocarbon analysis of absorbed fatty acids in pottery allows for the direct dating of ceramics and the opportunity to date regions or periods where traditionally datable materials are rare or absent.

Here, over 600 early Neolithic pottery sherds from across England, Wales and Scotland were analysed and 40 new compound-specific radiocarbon dates were obtained on fatty acids from these vessels. These analyses provide new insight into early Neolithic diet, pottery form and function, and the timings of the origin and spread of ceramics, which taken together produce a more nuanced narrative for the transition to the Neolithic in Britain.

7 NEOLITHIZATION LIGHT, A PERSPECTIVE ON THE MESOLITHIC/NEOLITHIC TRANSITION ON LOLLAND IN SOUTHERN DENMARK

Abstract author(s): Måge, Bjørnar (Museum Lolland-Falster)

Abstract format: Oral

From 2013 to 2022, Museum Lolland Falster carried out extensive archaeological investigations prior to the construction of the Fixed Link tunnel under the Fehmarn belt. During the investigations, we uncovered an entire Stone Age landscape with a fjord, beach areas and settlements in the hinterland.

The most intensive use of the coastal area was proven from the last part of the Mesolithic and up through the Neolithic. The material testifies that, even though there were some changes in the way of life in the transition between the Mesolithic and the Neolithic, there was also a high degree of continuity.

Even though the population in the area seemingly started to use ceramics and keep a small livestock already in the late part of the Mesolithic, many other elements of their daily life continued as before. For instance, ritual depositions of axes, spears and other objects in the shallow fjord started at the end of the Mesolithic and continued well into the Neolithic period.

Fishing in the early Neolithic was, as in the Mesolithic, to a large extent only done with leisters.

Our results show that the introduction of agriculture was a long and gradual process in the area and the various Neolithic elements did not come as a single package but more bit by bit.

Not before 6-700 years into the Neolithic, more significant changes in traditions appear: It is then, that the fishing strategy changed with the establishment of large stationary fishing facilities and the introduction of new grave forms with the construction of large stone graves. There is also a change in the ritual deposition pattern and indications for more grain cultivation are found.

8 EARLY ANIMAL MANAGEMENT IN THE DUTCH WETLANDS: NEW MULTI-PROXY EVIDENCE ON THE TRANSITION TO FARMING IN NORTHERN EUROPE

Abstract author(s): Brusgaard, Nathalie - Kooistra, Jildou (University of Groningen) - Kootker, Lisette (Vrije Universiteit Amsterdam) - Schepers, Mans - Raemaekers, Daan - Çakiırlar, Canan (University of Groningen)

Abstract format: Oral

The timing and nature of the Mesolithic-Neolithic transition in the Netherlands, north of the Linearbandkeramik (LBK) zone, is unresolved. Despite a wealth of well-preserved sites and faunal assemblages, these Dutch wetlands have remained behind in the northern Europe debate, owing partly to the lack of new methodological applications and multi-proxy analyses. This paper presents the results of extensive stable isotopic ($\delta^{13}C$, $\delta^{15}N$, $\delta^{18}O$, $87Sr/86Sr$) and zooarchaeological analyses carried out on cattle/aurochs, pigs/wild boar, and sheep/goats, integrated with archaeobotanical insights, from Neolithic Swifterbant Culture sites in the Dutch wetlands. These new data are part of the culmination of the 3-year project 'The Emergence of Domesticated Animals in the Netherlands'.

The stable isotopic and zooarchaeological analyses provide new evidence for the earliest cattle management north of the LBK zone. Moreover, they demonstrate the flexibility of prehistoric societies in northern Europe. The findings prompt reconsideration of sweeping statements about the Neolithisation process north of the LBK zone to make space for more regional approaches and local trajectories.

9 GRADUAL OR PUNCTUATED? TIMING THE FIRST AGRICULTURE AND ANIMAL HUSBANDRY IN THE DUTCH WETLANDS

Abstract author(s): Dreshaj, Merita (Groningen Institute of Archaeology)

Abstract format: Oral

The fifth millennium BCE in the Dutch wetlands witnessed several remarkable novelties in the subsistence patterns of Swifterbant culture, namely the emergence of pottery production, animal husbandry, and cereal cultivation. Given the importance of these changes and the perplexing nature of the data, much debate has centred on the timing and duration of these events. Because these novelties appear to occur across the entire fifth millennium BCE, the most popular model is that of a gradual and long transition to agriculture, triggered by the contact with LBK culture from 5300 BCE onwards. Short Early and Short Late models, on the other hand, stress the punctuated nature of these processes. To investigate this, we selected the keystone sites featuring the earliest evidence of domesticated animals,

animal husbandry and cereal cultivation, with the goal of establishing precise site chronologies. We screened legacy data and conducted radiocarbon dating on carefully selected material, and combined old and new data within Bayesian models. As a result, we were able to pinpoint these subsistence novelties with considerably greater precision and discuss the nature and pace of these events, challenging the previously proposed interpretations. Our study forms a significant contribution to the debate on the Neolithisation of northern Europe.

10 **IN IBERIA, THE TRANSITION(S), NON-LINEAR AND REGIONALLY SPECIFIC, LASTED SOME 1500 YEARS AFTER NEOLITHIC MIGRANTS FIRST ARRIVED CA. 5600 BC**

Abstract author(s): Templer, Michael (Neuchâtel University)

Abstract format: Oral

The evidence suggests that the first Neolithic migrants arrived on the Mediterranean coast of the Iberian Peninsula between 5700-5500 BC, bearing the North Italian Impressed Ware pottery. This first wave was followed by migrants bearing Cardial Ware, which originated in the South of France. These migrants, largely avoiding areas occupied by hunter-gatherers, navigated down the Mediterranean eastern seaboard of Iberia into the Atlantic and up the Atlantic coast beyond the Tagus estuary. Interaction between the migrants and the Mesolithic hunter-gatherers varied over time and space, so that the Transitions need to be viewed from the perspective of at least the 7 substantially different geographic regions of 1) The eastern Mediterranean seaboard, 2) The Alboran Sea and the Algarve, 3) The Atlantic seaboard as far as the river Tagus, 4) The western seaboard north of the Tagus, 5) The Pyrenean foothills and Ebro basin, 6) the Cantabrian coast and 7) the Central Meseta. We will rapidly review some of the factors impacting the regional contacts and Transitions bearing in mind such issues as geology and geography, climatic factors, the rise in sea-level, sedimentation, the relative paucity of open-air sites, Neolithic attributes (e.g., material attributes, life-ways, settlement patterns, belief systems and burial practices), genetic evidence, demographic factors, as well as the evidence to support resistance, acceptance, integration and the time span between the first appearance of Neolithic migrants and the incorporation of the autochthonous population into the Neolithic way of life.

11 **RECONSTRUCTING NEOLITHIC COMMUNITIES IN THE HIGH MOUNTAIN SITE OF ELS TROCS (HUESCA, IBERIAN PENINSULA) FROM POTTERY TECHNOLOGY**

Abstract author(s): Quevedo-Semperena, Izaro (Universidad de Valladolid; Sociedad de Ciencias Aranzadi) - Tejedor-Rodríguez, Cristina (Universidad de Valladolid) - Cubas, Miriam (Universidad de Alcalá; Sociedad de Ciencias Aranzadi) - García Martínez de Lagrán, Iñigo (Universidad Nacional de Educación a Distancia) - Royo Guillén, José Ignacio (Gobierno de Aragón) - Garrido Pena, Rafael (Universidad Autónoma de Madrid) - Arcusa Magallón, Héctor (Professional archaeologist) - Rojo Guerra, Manuel Ángel (Universidad de Valladolid)

Abstract format: Oral

Pottery is one of the most abundant archaeological materials found at archaeological sites and one of the most characteristic elements of the Neolithic period in South Europe. In the Iberian Peninsula, morphological and decorative analysis have so far been carried out, but it is only in recent years that studies have begun to develop a broad perspective including raw materials identification, technological choices and the use of pottery.

This paper explores an emblematic case study in Iberia focused on the pottery assemblage from Els Trocs Cave (Bisaurri, Huesca, Spanish Pyrenees) dated from ca. 5312–2913 cal BCE. Located in a mountain landscape, the site has revealed an enormous pottery collection and particular characteristics of exploitation of the environment. Pottery analysis has implemented an approach combining macroscopic and technological analyses. Technological choices have been explored through mineralogical analysis of 248 thin sections obtained from the same number of vessels. A systematic petrographic description focused on the clay matrix, mineralogical fraction and textural features is able to propose different groups of manufacture. The data suggest that the raw materials used were available in the surroundings, which allows us to propose a local technology. Different sources and ways to prepare the clay were used in the manufacturing of the vessels.

Exploring the correlation between technology and morpho-decorative features allows us to test with previous work whether or not morphological features can be used to define these groups. The aim is to explore whether there is any kind of social organization or differentiation in relation to the technology of pottery production, all within a diachronic perspective over the two millennia of use of the cave.

THE MESOLITHIC-NEOLITHIC TRANSITION IN THE SOUTHEAST OF THE CENTRAL PLATEAU OF THE IBERIAN PENINSULA: A STATE OF THE ART

Abstract author(s): Lozano-López, Néstor (Universidad Nacional de Educación a Distancia - UNED) - Cubas, Miriam (Universidad de Alcalá; Sociedad de Ciencias Aranzadi) - Mingo, Alberto (Universidad Nacional de Educación a Distancia - UNED)

Abstract format: Oral

The Southeast of the Central Plateau (Spain) is a crucial region to explore the connections between the Mediterranean coast and the inland Iberian Peninsula. Mesolithic and Early Neolithic sites on the Mediterranean coast of Iberia are well-known. However, there is little information about the last hunter-gatherers and the spread of domesticated plants and animals to the interior and its chronology. Furthermore, there has been little attention by the scientific community to the Mesolithic-Neolithic transition in the Southeast of the Central Plateau in comparison with other Prehistoric chronologies, such as the Bronze Age.

A good number of the sites known were excavated in the context of commercial archaeology or were discovered and excavated as a consequence of research projects focused on other chronologies, such as the Paleolithic. Moreover, most known Epipaleolithic, Mesolithic and Early Neolithic sites have not been excavated, so they only provide materials recovered on the surface. Radiocarbon dates of stratigraphic levels in well documented archaeological excavations regarding the Mesolithic-Neolithic transition are also extremely scarce.

In recent years the research interest on the Mesolithic-Neolithic transition in this area has increased and various projects are currently taking place, which are providing relevant information about the Neolithisation process. Although still insufficient, the growing number of sites and projects focused on this period are shedding light on various aspects of the economy, material culture, social structure, etc. of the last hunter-gatherers and the first farmers in this region. In this contribution we present a summary of the archaeological information focused on the Mesolithic-Neolithic transition in this territory.

CULTURAL INTERACTIONS IN THE 6TH MILLENNIUM BC OF SOUTH-WESTERN IBERIA

Abstract author(s): Soares, Joaquina (UNIRQ- Lisbon University; MAEDS- Museum of Archaeology and Ethnography of the District of Setúbal)

Abstract format: Oral

The archaeological record of the early Mesolithic is very fragmentary in the Portuguese Southwest Coast, which is interpreted as the outcome of a very low demographic density. The void in the archaeological map of the early Mesolithic is filled onwards the last quarter of the 7th millennium, transition to the 6th millennium cal BC. Our narrative starts from that moment, when demographic density increases and mobility adjusts to the concept of territory organized around aquatic ecosystems.

We follow the difficult decision-making process in favour of adopting or rejecting the food production economy (livestock and agriculture) and the corresponding peasant way of life. Several resilient Mesolithic communities (e. g. Vidigal) persist in their traditional way of life, selectively and sparsely adopting the novelties of Neolithic material culture (pottery and polished stone) in the last quarter of the 6th millennium, transition to the 5th millennium cal BC. Other groups in their close vicinity, as in the case of the large site of Vale Pincel I (Sines), adopted agriculture very early (second quarter to mid-6th millennium cal BC). On this Atlantic boundary, technological and economic innovations of Mediterranean origin were disseminated through regional interaction networks and locally integrated at different rhythms. In this process of hybridization by cultural osmosis, from which many links are missing, Neolithic society appears to have been built within the local Mesolithic communities.

AUROCHS TO CATTLE: INVESTIGATING THE MESOLITHIC - NEOLITHIC TRANSITION IN THE BASQUE COUNTRY USING SEQUENTIAL CARBON, OXYGEN, AND STRONTIUM ISOTOPES

Abstract author(s): Kelly, Hector (School of History Archaeology and Religion - SHARE, Cardiff University) - Griffith, Jacob (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel) - Madgwick, Richard (School of History Archaeology and Religion - SHARE, Cardiff University) - Alcantara Fors, Roger (School of History Archaeology and Religion - SHARE, Cardiff University; Departament de Prehistòria, Universitat Autònoma de Barcelona) - Ordoño, Javier (Department of Archaeology and New Technologies, Arkikus) - Alday, Alfonso (Departamento de Geografía, Prehistoria y Arqueología, Universidad del País Vasco - UPV/EHU) - Snoeck, Christophe (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Department of Art Sciences and Archaeology, Vrije Universiteit Brussel)

Abstract format: Oral

The human-induced aseasonal reproduction cycle of cattle, which in natural conditions would usually produce calves only in the spring months, was a crucial achievement for the success of production economy, since it ultimately enabled humans to produce meat and dairy products year-round. It is theorised that the implementation of this practice played a key role in the increasingly restricted territoriality of the Mesolithic-Neolithic transition communities (ca. 5700-5300 BC) in the Basque Country. This is some centuries before sedentism became widespread with the consolidation of agriculture. As such, observing changes within the natural rhythm and/or certain patterns in the mobility of both supposedly domesticated and wild bovids of this transitional period (i.e., cattle and aurochs, respectively), could suggest human influence, and potentially the introduction of husbandry practices.

This study presents a high-resolution incremental enamel isotope analysis of 10 deciduous bovid premolars to explore the introduction of such practices in the Mesolithic-Neolithic transition of the Basque Country. The teeth, recovered at the famous transitional site of Mendandia (7500–5350 cal. BC), were analysed individually to reveal time-resolute fluctuations in carbon ($\delta^{13}\text{C}$), oxygen ($\delta^{18}\text{O}$) and strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) isotope ratios. Our results revealed an extension of the expected natural birthing seasons, providing evidence of early husbandry controls onto the bovids within the Mesolithic-Neolithic transitional period. Further, strontium profiles indicate a substantial level of animal mobility, potentially linked with short movements (e.g., transterminance) between the seasonally occupied settlements (mostly rock shelters) evidencing the restricted territorial networks characteristic of the period in the Basque Country. This demonstrates that complex and choreographed patterns of animal management were employed relatively early during the Mesolithic-Neolithic transition in this region, and shows the validity of the methodological approach used here to enhance the understanding of this particularly important process in the history of humankind.

NATURE MAINTAINS ITS HOLD: KEEPING THE 'SHOCK OF THE NEW' AT BAY IN NW IBERIA

Abstract author(s): Higginbottom, Gail (INCIPIT - Consejo Superior de Investigaciones Científicas-CSIC)

Abstract format: Oral

This presentation reviews old and new material pertaining to the coming of new life-ways to NW Iberia, including subsistence activities. Coming 1000 years later than the full Neolithic of the south on this same peninsular, Galicia shares qualities with the neighbouring region of northern Portugal in terms of material culture, life ways and likely belief systems. Intriguingly, these both contain overlapping references to the south whilst remaining unique in their local responses, sometimes centuries later. Picking up on the presenter's earlier idea that NW dolmens become the Athēnaea of those societies still transitioning, we will see something of how the 'new' was integrated into what was already known, rather than vice versa. Most particularly, rather than seeing themselves as domesticators of a World, they still maintained that the forces of Nature contained Life's guiding principles. Thus, in this way, the 'new' was absorbed into and lived beside all previous concepts of subsistence, the wildlife modes. Through the examination of research done on palaeo-environmental records and material culture from the early to later Neolithic, this paper will demonstrate how Galician dolmens hold the key to the knowledge and understanding of past people and their world as they transition from one 'set' of life ways' to another.

INVESTIGATING LITHIC TOOLKIT SPATIAL DISTRIBUTION DURING THE JOMON-YAYOI TRANSITION IN JAPAN

Abstract author(s): Carrignon, Simon (McDonald Institute For Archaeological Research, University of Cambridge) - Shoda, Shinya (Nara National Research Institute for Cultural Properties; University of York) - Maynard, Glynnis (Department of Archaeology, University of Cambridge) - Crema, Enrico (Department of Archaeology, University of Cambridge; McDonald Institute For Archaeological Research, University of Cambridge)

Abstract format: Oral

The transition from hunting and gathering to farming in Japan was triggered by the arrival of migrants from the Korean peninsula. These migrants brought with them new cultural practices, including different lithic technologies and social structures. However, the adoption of these new customs was far from being uniform, reflecting the complex and geographically diverse forms of cultural interaction between migrant communities and incumbent hunter-gatherers. Understanding the factors behind these patterns can be challenging, as the observed differences are the result of a mix between cultural interactions, ecological adaptation, and geographical isolation. In this study, we analyse the diversity of lithic toolkits from 1381 archaeological sites throughout Japan during the Yayoi period to try to understand these patterns. We combined data collected in archaeological reports with methods from population genetics to determine if the differences in toolkit assemblages at each site can be explained by ecology, or cultural affiliation, or simply geographic distance. Evaluating the importance of such factors is challenging as traditional methods like Mantel test or cluster analysis have limitations in contexts with high spatial and temporal autocorrelation, uneven sampling, and sparse data. This paper proposes a set of new tools to address these limitations and gain a deeper understanding of the relationship between different toolkit assemblages during a time of cultural, social, and technological change.

WORKING WITH IMPERFECTION IN ARCHAEOLOGY. THEORETICAL AND PRACTICAL APPROACHES TO DATA MANAGEMENT

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Tobalina-Pulido, Leticia (Incipit - Institute of Heritage Sciences) - Castiello, Maria Elena (Institute of Archaeological Sciences - IAW, University of Bern) - Herrera Malatesta, Eduardo (Aarhus University)

Session format: Regular session

One of the most problematic issues when working with humanistic data, and specifically with archaeological data, is their imperfection. The data is ambiguous, partial, imprecise, uncertain. This imperfection, which can be intrinsic to the data themselves or be generated later with its processing, makes it difficult to produce reliable results. Speaking of imperfection quickly leads us to think of “lack of perfection”, but we are not necessarily alluding to it. Within it would encompass “uncertainty, typing error, imprecision, missing and uselessness” (Achich, 2019) but also incoherence, incompleteness and redundancy (depending on the authors) as sources of data imperfection.

In recent years, some researchers have become increasingly interested in the need to address in their research, especially those using databases, the problem of data imperfection and all the implications that this entails. Despite this, not many researchers have yet delved into this aspect in their research. The session we propose aims to bring together researchers who are or have worked on the imperfection of archaeological data in its broadest sense, from theoretical reflections to proposals for managing the imperfection or part of it (uncertainty, inaccuracy, incompleteness, etc.) in any chronological period and application, both during the collection of data in the field or its processing in the laboratory.

This session proposes an open forum to co-create knowledge on the subject of: How can we address the imperfection (any of its properties) of archaeological data? How should we manage data to obtain more honest results and how can we design best practices for establishing scientific transparency? Is it possible to propose archaeological data management standards? What are the options?

Proposals for managing the imperfection of archaeological data.

How can we represent and manage the imperfection of archaeological dating? What strategies should we use in data collection to “reduce” imperfection?

1 OPENING PANDORA'S BOX: ARCHAEOLOGICAL DATA IMPERFECTION AND THEIR MANAGEMENT, SHARING, AND REUSE

Abstract author(s): Batlle Baró, Sabina (Universitat de Barcelona)

Abstract format: Oral

The benefits of opening archaeological data are multiple and broadly described in the literature. Among them, increased transparency, collaboration and reproducibility are all factors that can potentially help identify -and even reduce- data imperfection.

However, at the same time, opening imperfect data could escalate this imperfection, and make it useless for others to reuse. In view of this situation, different questions arise: how should we document imperfection? How do we deal with imperfection when reusing archaeological data? Is imperfect data really reusable?

Using as a basis the experiences and perspectives of Catalan Archaeology researchers collected in a series of in-depth, semi-structured interviews, we will approach the issues that arise around data imperfection when managing, sharing and reusing archaeological data. We will assess the implications of open data and data imperfection and explore the possibilities that open data can bring to the management of archaeological data imperfection, while trying to evaluate the impact data sharing and reuse can have to this same imperfection.

2 BEYOND UNCERTAINTY: BEST PRACTICES FOR EXPLORING AND MODELLING UNCERTAINTIES IN REGIONAL ARCHAEOLOGICAL DATASETS

Abstract author(s): Herrera-Malatesta, Eduardo (Center for Urban Network Evolutions, Aarhus University)

Abstract format: Oral

Archaeological data is intrinsically uncertain. The material remains that archaeologists register in the field are the fragmentary result of complex past human lives. What we call data is not an empirical reality found in the field, but rather an arbitrary classification. Archaeological classifications respond to specific research questions adjusted to historical, environmental and cultural contexts. A classic example in the arbitrary history of archaeological classifications is the notion of 'site', particularly in the context of regional surveys. For decades, archaeologists have searched for categories to classify the material evidence in the field and from this several definitions have been proposed, e.g., 'sites', 'non-sites', and 'off-site'. Within regional archaeology, matters get more complex when we face the fact that the systematic total area survey (the ideal method to reduce uncertainty in regional archaeology) is not a method that can be applied to every environment. Additionally, regional archaeologists frequently integrate within their datasets, archaeological sites recorded in past small-scale and site-based projects, that also applied very different methodologies. Furthermore, when the aim of a project is to study regional patterns by applying spatial analysis, a key question arises: how can we be certain that the available pattern is a representative sample of the patterns in the past? In this presentation, I will use two databases from northcentral Venezuela and the north-western Dominican Republic to 1) exemplify the typical uncertainty types in regional archaeological data, 2) explore concrete solutions on how to reduce uncertainties and prepare the data for computational analysis, and 3) present a series of uncertainty quantification methods to assess both the databases and the spatial analysis models created from them. Overall, this paper aims at providing best practices solutions for archaeologists facing highly uncertain regional datasets and willing to apply computational methods to understand past regional patterns.

3 THE IMPERFECT DATA OF SYSTEMATIC SURFACE COLLECTIONS AND SOME POSSIBLE SOLUTIONS

Abstract author(s): Gergácz, Rebeka (Hungarian National Museum)

Abstract format: Oral

During systematic surface collection surveys, a lot of data is accumulated with the finds, that need to be processed further, in order to carry out research. At the moment, archaeologists have more and better tools for this than ever before, but due to the multiple steps of data collection and management, our data can become damaged. When analysing survey results, one has to consider potential inaccuracies and data damage, otherwise, it is easy to reach false conclusions.

When writing my master's thesis about a systematic surface collection on a multi-period prehistoric site complex (Százhalombatta – Százhalom and its vicinity in Hungary), I had to face the problem of data imperfection in many ways. Some of this came from research conditions (e.g. surface coverage, light conditions), while some were due to human error, caused by the different levels of the participants' experience, inattentiveness while taking notes on the field, and the uncertainty of dating the finds.

To get as reliable results as possible, I attempted to solve these issues - or at least minimise their impacts - in a number of ways. By preparing the fieldwork and the participating students better, and developing a new data processing method to deal with uncertainly dated finds, a huge improvement was made. In this presentation, I explore the several layers of data imperfection in the case of systematic surface collections through the example of the fieldwalkings of Százhalombatta – Százhalom and propose some possible solutions for them.

4 FACING THE STUDY OF THE SETTLEMENT PATTERNS CONSIDERING THE IMPRECISION AND UNCERTAINTY OF ARCHAEOLOGICAL DATA

Abstract author(s): Tobalina-Pulido, Leticia (Incipit - Institute of Heritage Sciences) - Medina Gordo, Sonia (Universitat de Barcelona)

Abstract format: Oral

One of the most challenging issues when we dealing with archaeological data (and humanistic data in general) is its imperfection. In other words, the archaeological data are ambiguous, partial, imprecise and uncertain. This, which may be inherent in the data itself or be generated after the data have been processed, makes it difficult to produce trustworthy and reliable results. In the last decades, the growth of data has become more evident due to the generalised use of databases. In addition to the growth of data volume, there was an increase in the variety of data, which came from a diversity of sources and the techniques used became more and more diverse. Within the diversity of the data, one of the key challenges is to know the degree of so-called „data imperfection“ (degree of inaccuracy, imprecision, incompleteness, ambiguity or vagueness). Some authors have proposed theoretical or practical approaches to deal with this problem, either with varying degrees of success. However, they are usually complex approaches to apply in day-to-day archaeological research. In this paper we firstly present the main issues of archaeological data for the study of settlement dynamics in the Iberian Peninsula, starting from the general characteristics and focusing on some cases as examples to illustrate these problems. Thus, several ways of dealing with the assessment and representation of the imprecision and uncertainty of archaeological data are proposed concerning some of its most significant variables, such as the dating or the function of settlements. The proposals will be applied to a set of test data and the strengths and disadvantages of using one or the other will be discussed. In all of them, the aim is always to make their practical application simple and accessible to all researchers, whatever their level of computer skills.

5 ARCHAEOLOGICAL DATA AND TACTICAL SIMULATION: MAKING THE MOST OF WHAT WE HAVE

Abstract author(s): Cortell-Nicolau, Alfredo - Crema, Enrico (University of Cambridge)

Abstract format: Oral

For a long time, archaeologists have assumed the problems of their data as a necessary evil they just had to deal with. The poor quality of the archaeological record has served as an excuse to justify a general lack of power in statistical analysis and inference. All this while, in addition, we build our hypotheses on data that is systematically not sufficiently assessed.

In this communication we present how tactical simulation can help us to further scrutinise and make the most of our data. Tactical simulation is a specific modelling technique which focuses on the improvement of methods and data. In general, it consists of simulating specific datasets where different hypotheses and methods can be tested (e. g. Capturing specific rates, parameters or values, understanding parametric and/or data configuration, what if experiments, etc.). Because all these operations are performed within a controlled environment, they provide the possibility of obtaining bespoke methods that can be further generalised and tested against real data.

Although the method has been used more or less frequently in Archaeology, its standard procedure does not seem to be currently generalised. How can we test different methodological proposals in contexts of data scarcity? How can we measure the power of our analysis? In this work, we will show the basic meaning of this methodology, as well as present different case examples. We will show the underuse of relevant methodological tools such as power analysis and what-if experiments and, hopefully, will propose some solutions to help archaeologists dealing with problems derived from data insufficiency.

6 DATA VERACITY AND COMPLETENESS IN SOCIAL NETWORK ANALYSIS (SNA)

Abstract author(s): Grant, Dermot (Trinity College Dublin)

Abstract format: Oral

Distribution patterns of artefacts can help identify social and commercial ties and tell us about human behaviour, including network formation. In addition, the evidence of connections between sites includes the study of ancient written sources and inscriptions. How much of this data can be considered a sufficient representative sample in creating network connections using SNA? Should we consider that the preference for, or fortunate availability of artefacts at specific sites is biased, and possibly the scholarly opinions thereon? Can this data and resulting networks be tested

or verified by other means? This presentation will consider these issues using a case study of commercial exchange in the Aegean and Eastern Mediterranean during the Archaic, Classical and Hellenistic periods. The case study constructs links between locations (nodes) from the evidence of exchange and commercial connection based on primary sources (textual and archaeological) examined, analysed and published by contemporary scholarship to determine the likelihood of a commercial connection.

7 TALES FROM TWO RIVER BANKS? SPANNING A DIGITAL DIVIDE BETWEEN DEVELOPMENT FUNDED ARCHAEOLOGICAL PRACTICE AND RESEARCH FUNDED ARCHAEOLOGICAL PRACTICE

Abstract author(s): May, Keith (HE - Historic England) - Taylor, James (University of York)

Abstract format: Oral

The Matrix project (AHRC grant AH/T002093/1) has recently examined issues arising when trying to find, access, interoperate and synthesise digital data from different archaeological projects, and especially the stratigraphic and interpretive methods used in post-excavation analysis work.

The Matrix project has identified noticeable differences in the completeness of the data that gets digitally archived from archaeological research in the UK, especially in the quantities and re-usability of data deposited as the result of commercially funded archaeological investigations as opposed to Research funded archaeological investigations (e.g. university or national agency funded).

In this 'Tale of two River Banks' there seem to be considerable differences and divergence in the archaeological processes used on either side, and therefore inconsistencies in the digital archive products. Along with common issues encountered elsewhere across Europe and globally that affect choices and adoption of standards in archaeological fieldwork, the paramount underlying issue is probably funding sources. Continued changes in methodological approaches and adoption of technology can also seriously influence or determine what data does, or does not, end up in the publication, let alone the archive.

The Matrix project has made several recommendations for improving the digital records of stratigraphic data, including better use of Data Management Plans (DMPs) and proposed establishment of an International Convention on Archaeological Stratigraphic and Chronological Methods and Data. Outcomes include a follow on R&D project to develop an "Archaeologists Guide to Good Practice – Handbook" for Stratigraphic Analysis. The aim of this new project is to draw together the collective expertise of the main contractors that undertake archaeological fieldwork as part of the development control process in the UK and, in consultation with other stakeholders from the sector, explore a consortium approach to distil, document and support best working practice and develop online resources for archaeological post-excavation analysis work.

8 ON THE TRANSFORMATION OF CELTIC COINS INTO DATA AND KNOWLEDGE

Abstract author(s): Moeller, Markus - Roesler, Katja (RGK - Romano-Germanic Commission DAI)

Abstract format: Oral

The project ClaReNet: Classification and Representations for Networks. From types and characteristics to linked open data for celtic coinages (<https://clarenet.hypotheses.org/>) explores the benefits and limitations of the digital turn in numismatics by testing new classification methods using the examples of three different Celtic coinages. Celtic coins are less standardized formally and structurally compared to other ancient coinage. Numismatics, however, analyzes them with methods developed on highly standardized coinages. Their methodology thus encounters resistance from the object itself, which has led to the existence of multiple contradictory coin classifications.

In our project ClaReNet, we study how numismatists deal with less-than-perfect coins (struck off centre, poor conservation state) and address uncertainties in their designations, descriptions, orientation and classifications. Since Celtic coins are available in large numbers, we are, on the one hand, developing automated procedures using Artificial Intelligence to help uncover and reduce uncertainties in the numismatic analysis of these numerous objects. On the other hand, we are creating a flexible database in order to display the uncertainties. Finally we will address uncertainties in knowledge production, how they shape numismatic practices and whether or whether not there are path dependencies.

9 ON BABIES AND BATHWATER: STRATEGIES FOR DEALING WITH IMPERFECT DATA IN (BIO) ARCHAEOLOGY

Abstract author(s): Kaiser, Jessica (Uppsala University)

Abstract format: Oral

The transition in archaeology from field notebooks and pro-forma sheets to spreadsheets and databases has affected not only how we store and preserve our data, but also how we disseminate and share datasets. With technologies

such as GIS and 3D modeling becoming more or less ubiquitous, archaeological projects increasingly generate large volumes of born-digital data that require new solutions for data archiving and management. This has led to the creation of digital repositories specializing in archaeological data archiving (e.g. ADS, tDAR, Open Context), and a move toward open data which is also visible at the policy level, in that many funders now require data management plans as part of the grant application. Most practitioners today subscribe - at least in theory - to the principles that research data should be Findable, Accessible, Interoperable, and Reusable (Wilkinson 2016). However, archaeological data is in itself imperfect, incomplete, and theory-laden, and not always easy to describe in a structured way so as to readily enable reuse or aggregation with other datasets even if the data are freely shared. Bioarchaeological data provide a case in point. Calls for standardized descriptions of bioarchaeological data to enable data aggregation occurred fairly early in the discipline, culminating in the publication of the Standards for Data Collection from Human Skeletal Remains in 1994 (Buikstra & Ubelaker), a resource that is widely used by bioarchaeologists worldwide. Despite the use of standard recording methods, however, re-use of bioarchaeological datasets from archaeological contexts by researchers other than the data collectors remains uncommon. Partly, this is often due to the difficulty of assessing exactly how the standard recording methods were applied, or in other words which choices were made in the process of collecting the data. This paper will discuss strategies for making such process-data more transparent in (bio) archaeological datasets.

10 FROM A PERFECT ROMAN THEATRE TO AN ILL-FATED DISCOVERY. THE MUSEUM OF LISBON - ROMAN THEATRE (PORTUGAL)

Abstract author(s): Brum, Patrícia - Grilo, Carolina - Fernandes, Lídia (Museum of Lisbon - Roman Theatre)

Abstract format: Oral

The management of the archaeological information on the Roman Theatre, since its date of discovery in 1798, is nowadays in charge of the Museum of Lisbon – Roman Theatre. Yet, there were many contributors for this sets of data and several approaches to its registry, accompanying the history of Lisbon’s urban archaeology. The effort of reading an urban site, throughout the interventions not only along the centuries and years, but also in its complex geography of overlapping new buildings and the present-day city, offers many challenges that will be addressed in this presentation.

With increasingly accessible digital online tools, the systematic approach to the data collected can be seen in a seemingly standardized way, beyond the diversity of information. But how should we deal with undocumented processes, lack of or incomplete documentation? We try to overcome the difficulties with a multi analytical approach from the mineralogical, iconographic, architectural and mathematical studies, among others. How does this cross to overcome the mentioned imperfection. Particularly with long-term interventions on the site disturbed by multiple interferences and without a defined or yet accomplished purpose. How do we fill in the blanks of the uncertainty of past and future interventions?

11 WORKING WITH PERFECTLY IMPERFECT DATA: AN AUTOETHNOGRAPHIC REFLECTION ON DATA COLLECTION, PROCESSING AND DISSEMINATION (METDECT PROJECT)

Abstract author(s): Kurisoo, Tuuli (Tallinn University)

Abstract format: Oral

In this paper, I use autoethnography to share my experiences with collecting, processing and disseminating data in the course of MetDect project*. MetDect database includes information about metal-detected artefacts from Estonia in a long temporal scale (Stone Age–Modern Period). There are many challenges that make this data even more imperfect than archaeological datasets usually are. In my talk, I will point out the main issues that influence the quality of this data, but my focus will be on mitigation strategies that I have used.

I will separately address problems that I faced during data collection phase (inherent limitations of source material) and data processing phase (digitizing data, using existing ontologies and vocabularies). Lastly, I will say a few words about research and public outreach activities that are based on MetDect dataset.

*MetDect: Metal-detected past: a study of long-term developments in settlement patterns, technology and visual culture on the example of metal-detector finds from Estonia

12 HOW TO UNRAVEL THE TANGLE. USING LEGACY DATA TO INTERPRET SOME KEY SITES IN BRONZE AGE SOUTHERN ITALY

Abstract author(s): Palazzini, Flavia - Pizzuti, Elisa - Vanzetti, Alessandro (Sapienza - Università di Roma)

Abstract format: Oral

Over the last decades, the rapid spread of technologies has enabled thorough data digitization processes. Digital conversion has frequently resulted in standardization procedures and data consolidation. Anyway, information stored in non-machine-readable formats is still prevalent in archaeology, and particularly for legacy data: the term “imperfection” appears to be quite appropriate when referring to it. This paper will address the problems of working with data from past excavations, seen as a promising but challenging field, full of imperfections and information losses (e.g. labels corrupted by time, hard-to-read handwriting, details scarcity and data leakage). The analysis builds on some Bronze Age case studies in Southern Italy (such as Torre Castelluccia and Porto Perone near Taranto, Apulia, Italy). Archaeological research in this area was particularly intense between the early 1900s and the 1960s, but many sites remain unpublished or only partially known. Excavation data from these contexts require an in-depth reexamination to gain a more comprehensive perspective on their occupation history and network relations. A significant step in information retrieval is the transition from a physical to a digital archive (here: MS Access database) to counter the risk of further damage and loss. This research aimed to answer some of the following questions: when does the maximum data loss occur? How much is gone, beyond the possibility of repair? How could we ascertain and fix the damage and formulate interpretive hypotheses? In fact, first-hand experience reveals that information is often lost not only throughout the excavation and documentation processes but also during the conservation stage (e.g. in archives, storages, and museum collections). We hope that our experience can be translated into a qualitative and possibly quantitative model for evaluating the loss of similar legacy data.

13 LIMITS, INCOMPLETENESS, AND POTENTIALITIES OF PREHISTORIC SICILY, BETWEEN ARCHAEOLOGICAL DATA, BIG DATA, OPEN DATA, AND DIGITALISATION: A CRITICAL REAPPRAISAL

Abstract author(s): Giannitrapani, Enrico (Arkeos - Servizi integrati per i beni culturali s.c.; Confederazione Italiana Archeologi)

Abstract format: Oral

Data are the basis on which archaeological praxis is built. Since its beginning as an academic discipline, archaeology has transformed its scope from recovering and archiving ancient objects to recovering and archiving information on those same objects. We moved from the object’s recovery to the self-explanatory meaning of material culture (i.e., the presence of polished lithics and pottery was sufficient to define a Neolithic context) to its use to infer Middle Range theories, up to contextual and phenomenological interpretations of archaeological evidence. We moved from archiving data (objects) in museum cages to paper media to the digital revolution. The challenge is to transform archaeological data into Big Data, intended as a complex system covering the entire workflow (acquisition, storage, signalling, dissemination, archiving, selection, and processing) using the ever-increasing storage and elaboration capabilities of computers within an open and co-shared environment. Data processing and analysis in archaeology is bounded and limited by a still prevailing proprietary conception of data and their quantitative and qualitative incompleteness. The case study of prehistoric Sicily is therefore presented. Here, all the problems mentioned above are still prevailing: the use of a classificatory approach to the data, the limited use of stratigraphic methods and scientific analyses, the low-level degree of digitalisation, the lack of open data are crucial issues that need to be addressed if we want to propose a more effective and innovative narrative of prehistoric Sicily. The quantitative and qualitative incompleteness of archaeological data are discussed through some specific examples (Neolithisation and consolidation of Neolithic lifeways, adoption of metallurgy). Finally, the results of the Calib_Sicily project, with the acquisition, statistical elaboration, and open dissemination of all radiocarbon/AMS dates available for prehistoric Sicily, are presented, including the evaluation of the data list incompleteness, as well as the quality control procedures applied to its validation.

14 THE IMPORTANCE OF IMPERFECT ARCHAEOLOGICAL AND GEOSPATIAL DATA AT THE THEBAN NECROPOLIS (LUXOR, EGYPT)

Abstract author(s): Jiménez-Higueras, Ángeles (University of Granada)

Abstract format: Oral

The aim of this contribution is to show how the study of the sacred landscape of the Theban necropolis during the New Kingdom is based on imperfect data. The partial nature of these data is due to different reasons: the area remains unexcavated in its entirety; each archaeological mission uses its different georeferenced system, its own topography and cartography because of the lack of geodesic points in the Theban necropolis, etc. In consequence, some results of

the studies of the territorial distribution based on GIS tools are uncertain or incomplete. This is an obstacle that must be dealt with, especially in a discipline so reluctant to adopt new technologies as Egyptology.

With these premises in mind, this talk intends to address the problem of working with imperfect data. However, if these data are managed properly, they can be useful in the reconstruction of the ancient Egyptian landscape. The adoption of new theories (such as an approach from the Landscape Archaeology) and of new methodologies (based in digital technologies such as the use of Geographical Information Systems -GIS-) is helping to reduce imperfection and to improve the management of archaeological and geospatial data. There is an urgent need to create a topographical unified and consistent UTM coordinate system that would be used by all the missions working in the Theban necropolis. All the missions need to speak the same language in order to understand each other's data, and this will only be possible if a unified system is created.

15 **UNCERTAINTY IN ANCIENT EGYPTIAN AND SYRO-MESOPOTAMIAN SETTLEMENTS. CAN AORISTIC ANALYSIS HELP?**

Abstract author(s): Gómez Senovilla, Silvia (University of Vienna)

Abstract format: Oral

When dealing with the study of ancient settlements, it is frequent that methods such as GIS are used to show a particular outcome. However, when used merely as a visualization or locational tool, spatial software may fall short of providing adequate results if the researcher is dealing with spatio-temporal gaps in the archaeological record. The result ends up being a presentation of architectural production -buildings-, located at one particular point in time and space but falls short of providing an account of the processes and changes happening in and between those settlements. Just as timelines are artificially presented in a straight line, where change is marked by (known) events as if there were no transitional stages in between, settlements and houses are treated as static entities, and the presence of gaps is minimized when datation terminology such as "Middle Bronze Age" is used. An analysis of occupational dynamics in ancient settlements is challenging when occupancy is only presumed.

Due to the intrinsically incomplete nature of the archaeological record, how can we adequately frame gaps and uncertainty in settlement archaeology? In this contribution, I aim to present how I approach the treatment of the uncertainty and inconsistency of my data with the introduction of statistical methods, particularly aoristic analysis, while trying to open the discussion to what type of data may be suitable -or not- for such analysis.

16 **TO BE, OR NOT TO BE? GOING BEYOND TWO-VALUED LOGIC FOR AN EARLY MEDIEVAL LANDSCAPE CHARACTERISATION**

Abstract author(s): Medina Gordo, Sonia (Universitat de Barcelona)

Abstract format: Oral

Uncertainty is ubiquitous in many aspects of archaeological practice, and the achievement of unequivocal knowledge about an object or situation seems difficult in our discipline. We archaeologists are continually confronted with data that are incomplete or missing for our purposes, so there is always room for imperfection in knowledge-making process. In historical landscape studies, the situation is relevant because we consider many imprecise variables such as chronology, the geography of a territory or the functional attribution to certain spaces in order to characterise a landscape. From an archaeological approach, this characterisation is usually studied by analysing different remains together both chronologically and spatially. By doing so, we may infer the typological definition of an archaeological site, its formal similarity to other archaeological sites, or whether these categorisations may suggest that they are all part of the same process; even if only in probabilistic terms. The problem arises when there is no evidence of self-reflection in our datasets and we end up presenting complex observations as true/false statements.

Data imperfection thus becomes an issue that cannot be avoided in HSS research, both theoretical and applied. In this contribution, I will consider a possible multi-valued logic approach, the so-called fuzzy logic, and apply it to specific problems of landscape characterisation with sources of diverse nature. I will focus on the particular case of early medieval mountain areas, examining (1) the different ways in which studies have processed the landscape traces to present the historical complexity; (2) how these approaches have ended up establishing an Aristotelian image of the configuration of medieval territories as something that is, or is not, of a certain shape and (3) what aspects of the process of data management we as humanists can improve to interrogate this past taking an introspective perspective of the information.

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Goldstein, Avner (Boston College) - March, Eleanor (University of Exeter)

Session format: Regular session

Papers in this session explore the material culture of lived religion on the edge of the European Atlantic, from the Iron Age through the end of the Middle Ages. Following the successful EAA 2022 session “The Materiality of Lived Religion Under and After Rome,” we wish to continue discussions exploring the opportunities and interpretative challenges of using material culture for understanding ritual and religion. This year, particular attention is given to the materials, practices, performances, and experiences of religion in regions that lie along the European Atlantic, including Ireland, Great Britain, the North Sea, France, and Iberia. As well as introducing listeners to the particular materials of religion that are the focus of the paper, presenters should also address at least one of the following issues: the impact that Atlantic environments and landscapes had on ritual practices and understandings, or how lived religion’s material expressions were impacted depending on whether they were found at the centre or on the margins of empires, kingdoms, territories, communities, or societies. This session provides a space for serious discussion between practitioners working in different time periods, places, and disciplines about how to think about and use material evidence to reconstruct the lived experience of religion along the Atlantic’s edge.

ABSTRACTS

1 THE MATERIALITY AND MEMORY OF THE PAST IN IRON AGE ORKNEY

Abstract author(s): Clements, Sheridan (Cardiff University)

Abstract format: Oral

The brochs of the Iron Age are perhaps some of the most iconic surviving archaeological sites of the Northern Atlantic, a source of interest for archaeologists and the public alike. Just as the landscape today is filled with the traces and remains of the past, however, some structures of the Neolithic and Bronze Age were likely visible within the Iron Age landscape. Encountering these remnants would have been part of the everyday lived experience of Iron Age Orcadians, who would have had their own interpretations and understandings of these, stored and shared within their collective memories.

Based on the preliminary results of PhD research, this paper examines the possible religious significance of Neolithic and Bronze Age ruins to the Iron Age peoples of Orkney. Many of these earlier monuments and settlements saw significant levels of activity during the Iron Age, especially the construction of brochs or broch-like structures. Possible Iron Age understandings of these features are gleaned through recontextualizing and situating these reuse practices within other materially visible memory practices such as the treatment of human remains and placed depositions, as well as their socio-economic contexts, such as the perceived insularity or conservatism of the region, and environmental and agricultural change.

In this way, the reuse of earlier settlement sites and monuments could be interpreted as attempts to connect to supernatural spirits or ancestors tied to place or land, and therefore part of a longer-term continuity of practice and connection between people and place within the Iron Age of Orkney.

2 BRIDGES AS SPACES OF RELIGION IN ROMAN BRITAIN

Abstract author(s): Goldstein, Avner (Boston College)

Abstract format: Oral

People living in Britain during the Roman period lived and made religion in all kinds of spaces, not just in just formal temples. One kind place we see rituals regularly enacted across Britain are on bridges, from which people casted votive objects into water, set up altars, and/or offered sacrifices. The ritual deposition of objects in riverine settings was popular in Britain as well as other places in northwest Europe (Kessel and Nijmegen), both during and well before Rome’s presence. Bridges, too, were highly symbolic and political gestures that were used during Rome’s military expansion in Britain, and bridges played a large part in religious practice at Rome. This paper explores bridges in Roman Britain as specifically religious spaces, ones where different kinds of people felt empowered and called to connect ritually with the waters they meant to cross. It traces ritual deposition on bridges across the whole of the Roman period across Britain, occasionally comparing these practices with contemporary ones we see at Rome, as well as earlier Iron Age practices. The evidence raises important questions for the materiality of bridges and the rituals that were enacted there, and whether we can speak of a specific provincial British way of thinking about an otherwise widespread and longstanding practice.

3 BURYING BEAKERS AT THE EDGE OF THE WORLD: THE CONTINUATION OF A MATERIAL MORTUARY PRACTICE IN BRITAIN AFTER ROME'S FALL

Abstract author(s): Fleming, Robin (Boston College)

Abstract format: Oral

In Britain, both under and after Rome, people sometimes placed small, footed vessels next to the heads of the dead. This paper characterizes and traces this burial practice from the time when Britain sat within the Roman Empire to the period after it had fallen outside of it. Its point is to 1) provide a corpus of material that allows us to see the ways the materiality of some ritual practices continued, despite Britain's transition from a Roman province to a place at the edge of the world, 2) to see how this transition changed the way people made or acquired this material of religion, and 3) how, despite Britain's move from center to periphery, the basic look and ritual function of these vessels stayed the same. Although Britain was no longer part of the Empire, these vessels hint that some households in Britain continued to deploy objects in their ritual practices that evoked the globalizing material culture that members of provincial societies across the Roman world had used for centuries.

4 RELIGION, RITUAL AND WHITE QUARTZ: THE PHENOMENON OF PEBBLE BURIAL IN THE EARLY MEDIEVAL IRISH SEA ZONE

Abstract author(s): Shiner, Marion (Dyfed Archaeological Trust) - Hemer, Katie (UCL Institute of Archaeology)

Abstract format: Oral

During the early medieval period, deliberate inclusion of white quartz pebbles within the grave was a funerary rite afforded to some of the deceased by communities living around the Irish Sea. Frequently, cemeteries containing pebble graves were located in close vicinity to the sea, with quartz outcropping as a feature of the surrounding landscape. Scholarly interpretations of this funerary practice frequently link it with a chapter in the Book of Revelation, and some authors also note the possibility of syncretism with pre-Christian belief. This paper presents the results of research into the funerary treatment of children in Ireland and Wales between the first and the ninth centuries AD. The study found evidence to support the hypothesis that the inclusion of white quartz pebbles in early medieval graves represents the material expression of syncretic religious belief. Moreover, the evidence suggests that belief in the agency of white quartz may have found particular expression during periods of intense social stress.

5 „THE WAY OF THE BIRDS“. AN OSTEOARCHAEOLOGICAL ANALYSIS OF BIRDS IN THE ÅLANDIC BURIAL TRADITION DURING LATE IRON AGE

Abstract author(s): Frid, Marcus (Stockholm University)

Abstract format: Oral

An analysis of cremation burials at two Late Iron Age burial fields in the Åland archipelago was performed to deepen the knowledge about how birds were used in the Ålandic burial tradition during the Iron Age. The island group is situated in the Baltic Sea between Finland and Sweden where burial customs in general differed and where, it seems, the choice of the species of birds were different compared to the mainland. The results of the study show that waterfowl, especially goosander (*Mergus merganser*), redbreasted merganser (*Merganser serrator*) and eider (*Somateria mollissima*) were the main species of choice in the burial ritual on Åland. This is a clear distinction from the Swedish mainland where hens, roosters, waterfowl such as geese are the most common, with birds of prey in specific burials. The material has more in common with Finland where the waterfowl had an important role. The recurring species of birds on different burial fields are rather similar, perhaps reflecting a shared symbolic worldview as expressed in the burial rituals on the Islands. The primary literary sources which touch upon old Norse religion indicate that the hen or rooster had the function of rebirth and awakening the dead in the afterlife. In the Finno-Ugric mythology the seafowl was seen as being part of the world's creation as well as having the ability to travel between the, the dead and the Gods. In many ways, the waterfowl on Åland might have taken on a role similar to the one that the domestic hen had on the mainland. The inclusion of waterfowl may have been a reasonable substitute for the domestic hen in the burial ritual as in Sweden. This might be a regional expression of a population with cultural heritage from both the Finnish mainland and the Swedish mainland.

6 THE WESTMINSTER OF THE WEST: THE MATERIALITY OF LIVED RELIGION WITHIN THE MONASTIC CHURCH OF TEWKESBURY (GLOUCESTERSHIRE, ENGLAND)

Abstract author(s): March, Eleanor (University of Exeter)

Abstract format: Oral

Tewkesbury Abbey was one of the foremost Benedictine institutions in the west of England, if not the country during the medieval period. At the time of Henry VIII's dissolution of the monasteries in the second quarter of the sixteenth

century, it was one of only twenty-four houses recorded with an annual income of over £1000. To date, the perceived lack of archival sources has concentrated research upon the surviving fabric of the church which, in line with traditional approaches to monastic and church archaeology, has focused upon disentangling the main phases of its architectural development.

A paper presented in this session at EAA 2022, showcased the potential that a truly interdisciplinary, multifaceted approach had for repopulating the complex network of religious belief, practice and performance at Tewkesbury with people, texts, architecture and material culture. This year, particular attention is given to Tewkesbury's position in the west of England, on the border with Wales, the periphery of the English Kingdom. Arguably, this geographical position became a defining feature of the site, facilitating its development and ensuring its success and wealth. Through a short series of case studies, looking in particular at patronal commemoration and popular devotion, it is argued that despite its situation on the edge, Tewkesbury was an important religious centre. Not only was it a seat of secular power but it was also a venue for the performance of Christian rituals and displays of personal piety closely entwined with material culture. It developed as the Westminster of the west, showcasing elaborate and influential examples of religious architecture, and keeping abreast of devotional trends in royal, ecclesiastical and lay circles.

111 MIRRORING WORLDS: RURAL DOMESTIC SPACES THROUGH MULTIDISCIPLINARITY IN LATE ANTIQUITY AND THE EARLY MIDDLE AGES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Olivé-Busom, Júlia (Autonomous University of Barcelona) - Berrica, Silvia (Universidad de Alcalá) - Herran, Mikel (Leicester University)

Session format: Regular session

Across many regions, the materiality of rural settlements, specially of their domestic context, tends to be poorly studied and represented. Furthermore, between Late Antiquity and the Early Middle Ages (4th to 12th centuries), the countryside greatly transformed: changing settlement patterns, trading routes and connections all contributed to the emergence of new modes of living.

This session aims to connect the domestic spaces of rural settlements dated from these periods with other rural contexts, such as cemeteries or production areas, that were also part of the living and organisation dynamics of the communities that inhabited them. Particularly, we want to focus on approaches that study faunal, environmental, spatial or bioarchaeological data arising from funerary contexts, husbandry and crop dynamics, and/or production centres and domestic spaces, and that are oriented at gaining more knowledge on the associated rural settlements and/or integrating pre-existing knowledge. Additionally, this session is aimed at new findings that result from systematic excavations in a broader context of Landscape Archaeology and that are providing accurate and promising information, with the use of new technologies (geomagnetic, spectrometers, Lidar, drones, etc.) and archaeometric analyses. Communications that dwell on Human-Animal or Human-Plant interactions, trade and exchange, populational dynamics (such as domestic and artisanal spaces related to materiality), paleoenvironment, landscape archaeology, and/or living conditions and that connect these ideas with the rural domestic settlement they represent are welcome.

ABSTRACTS

1 THE TRANSFORMATION OF SPACE: BETWEEN DOMESTIC AND WORKSHOP (VII-IX CENTURIES)

Abstract author(s): Berrica, Silvia (University of Alcalá)

Abstract format: Oral

Workshops and ovens found in various excavations play a crucial role in establishing the early medieval economy. I positioned the area of the Sierra de Guadarrama as an important territory to determine the rural dynamics in the work of iron in the centre of the Iberian Peninsula between the Visigothic period and the Emiral period. In fact, the research that is being carried out in the mountainous area to the north of Madrid is essential to understand mining exploitation, metallurgical manufacturing, and the successive distribution of products -ingots and utensils-. One of the most decisive issues is learning to distinguish between primary and secondary centres and detailing the medieval ovens, difficult to find in bibliographic resources. The ceramic workshops found also help to establish the distribution and production of ceramics within the site and in the mountain towns. For this reason, I proposed an analysis of the productive and commercial system of resources in the central region to make known the material remains of artisan work and to determine its economic and social aspects. Of the Iberian Peninsula, through the typologies of the workshops found in the excavation of the Dehesa de Navalvillar (Colmenar Viejo, Madrid). Through a detailed analysis of

the two artisanal areas and the archaeological materiality, I will present unpublished data to explain the early medieval production and economy in the Central Plateau during the Early Middle Ages.

2 **CASTRO DE GUIFÕES (NORTHWEST OF PORTUGAL): A SETTLEMENT AT THE CROSSROADS BETWEEN THE RURAL WORLD AND ATLANTIC COMMERCIAL CIRCUITS**

Abstract author(s): Arezes, Andreia (Faculty of Arts and Humanities - University of Porto; CITCEM) - Magalhães, Catarina (FCT; CITCEM)

Abstract format: Oral

The Castro de Guifões is a settlement that benefits from a strategic spatial location. It is probably one of the key aspects of its broad diachronic occupation between the Protohistory and the Early Middle Ages. The Castro was built overlooking the estuary area of River Leça and, since the pre-Roman period, played an essential role as an anchorage point articulated with the Atlantic trade routes and on redistribution activities. In effect, artifact recovery at the site is extensive and attests to the connections established with various geographies. As the Roman conquest consolidated from the 1st century BC, along with local pottery, new types of containers became progressively more representative. Among them are the Roman amphorae, especially those from the Guadalquivir valley.

Throughout Late Antiquity, new occupation strategies were implemented, and the settlement, although transformed, continued to show signs of vitality. In some cases, previous constructions were reused; but new structures were also created. Regarding the artefactual component, it should be noted that together with domestic pottery and locally made dolia, other types of materials were present at the Castro. Some of them were imported: as an engraved fragments of glass from the Rhineland or refined African Red Slip, demonstrating that the site maintained an active flow of exchanges that went beyond the territory of the Iberian Peninsula. In parallel, recent archaeobotanical studies have shed light on the paleoenvironment and the use of resources at the Castro during Late Antiquity. The introduction of new species has been identified, along with the maintenance of consumption of others that had long been part of the landscape of the Northwest.

This presentation aims to present the data collected in the scope of the Research Project in Archaeology focused on Guifões since 2016 and discuss perspectives for future studies.

3 **AN EARLY ISLAMIC SETTLEMENT IN THE MOUNTAINS OF CADIZ. A NEW COMMON MODEL FOR USING THE COUNTRYSIDE?**

Abstract author(s): Mateos-Orozco, Ana (University of Seville) - Gutiérrez López, José María (Museo Histórico Municipal de Villamartín)

Abstract format: Oral

Exploiting the countryside was one of the economic bases during the Middle Ages. In Iberia, after the Muslim Conquest, different changes in society took part. Constant migration and effective Islamization resulted in a new system for occupying, profiting and thus, transforming the landscape.

In this presentation, we will discuss and compare the archaeological remains of an early Islamic settlement in the mountains of Cadiz, the archaeological site of Torrevieja (Villamartín, Cádiz). We focus our research on pottery, analysing typologies and technology, with the main goal to contrast them with the pottery record identified both in similar rural settlements and in the urban sphere. We will add the analysis of fauna that were already made, to give a complete picture of the settlement and its possible relation with farming and livestock.

Finally, we will compare the settlement and its record with analogue and similar archaeological sites nearby. The aim is to propose a new model of occupation in the area, probably common and characteristic for early Islamic new communities that settled down in the countryside and, presumably similar to the one suggested for other regions of the Islamic world.

4 **COPPER PRODUCTION AND OASIS DEVELOPMENT IN THE MEDIEVAL MOROCCAN SAHARA**

Abstract author(s): Lazarescu, Raluca - Ioana - Fenwick, Corisande (University College London) - Bokbot, Youssef (Institut national des Sciences de l'Archéologie et du Patrimoine) - Charlton, Michael - Fitton, Thomas (University College London) - Mattingly, David - Sterry, Martin (University of Leicester)

Abstract format: Oral

Morocco was a major copper exporter in the middle ages and brass ingots were reportedly traded from Saharan Morocco to West Africa in exchange for gold. However, little is known about the development or organisation of the medieval copper industry or the relationship between copper metallurgy and the sedentarisation of the NW Sahara. This paper presents new data on copper production in the medieval Moroccan Sahara from the EVERYDAYISLAM and OASCIV projects and argues that locally sourced copper was exploited as an adjunct to oasis agriculture.

The OASCIV project in the Wadi Draa of Morocco, an important secondary route for Saharan trade, has established a new chronology for oasis development in the north-west Sahara. It is now clear that settlement and oasis agriculture commenced in the Draa between the 4th–8th centuries—well before the Muslim conquest of Morocco—and increased significantly from the 9th century with a peak in the 11th–13th centuries, contemporary with Almoravid and Almohad rule of the Draa. This paper integrates the settlement data with the results of archaeometric analyses by SEM-EDS, LA-ICP-MS and lead isotope analysis. The results suggest small-scale extraction of copper from local sources, and copper production, with smelting in bowl furnaces from the 4th century. Evidence of copper metallurgy is found at many Iron Age and Medieval sites, suggesting that copper was worked at the domestic scale to make everyday objects and ornaments. While recent analyses from al-Andalus suggest a dominance of brass in the middle ages, alloy data indicates that the majority of objects (97%) in the Wadi Draa are pure copper and only a minority are brass. This paper highlights the technological dimension of the Moroccan rural landscape between the 4th–13th centuries, offering new perspectives into oasis society and exploring how changing metallurgical traditions contributed to new modes of living.

5 CONSTRUCTING EARLY MEDIEVAL PEASANT LANDSCAPES. A MULTISCALE APPROACH TO DOMESTIC SPACES, FUNERARY AREAS, AND PRODUCTIONS SYSTEMS IN WESTERN IBERIA

Abstract author(s): Prata, Sara - Cuesta-Gómez, Fabián (IEM - NOVA FCSH)

Abstract format: Oral

The post-Roman centuries lead to deep changes for communities in the countryside. The past ten years of research on Portuguese inland territories has offered new insights into this previously elusive period. While we will be using a comparative regional approach, this paper focuses mainly on archaeological data gathered from the territory of Alto Alentejo (Central Portugal). Our findings combine evidence from different research methods and scales of assessment. These include field-surveys, spatial analysis, excavations, material culture, and radiocarbon dating, along with a critical review of legacy-data from previous works in the region.

It seems clear that in Alto Alentejo, while most villa estates show evidence of abandonment and reuse, new smaller farmsteads are built in the surrounding areas. The new rural settlements materialize a distinct form to interact with the landscape: there is a clear shift in the scale and range of agricultural practices, the management of natural resources, and the relationships established amongst farmsteads. Evidence gathered so far includes settlements composed of domestic buildings, press facilities for olive oil and wine and small family managed gravesites (5th–8th c.).

This is a fertile ground to explore the complexities of daily life and social dynamics in early medieval communities. Looking into individual settlements in their context allows us to explore the social construction of reality and detect patterns for broader socio-economical practices. This paper will explore these issues while also considering the life cycle of individual households and the endurance of rural settlement patterns.

6 ELUSIVE BUT NOT FORGOTTEN. THE RURAL MOZARAB COMMUNITY OF SANTA COLOMA D'ÀGER (8TH TO 11TH CENTURIES, NE SPAIN)

Abstract author(s): Olivé-Busom, Júlia (Universitat Autònoma de Barcelona; Group EcoPast - GI-1553, Universidade de Santiago de Compostela) - Brufal, Jesús (Universitat Autònoma de Barcelona) - López-Costas, Olalla (Group EcoPast - GI-1553, Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University; Laboratorio de Antropología Física, Facultad de Medicina, Universidad de Granada)

Abstract format: Oral

The Christian necropolis of Santa Coloma d'Àger is located in north-eastern Iberia, in an area known as the valley of Àger. It was in use from the 5th until the 11th centuries CE. People were interred there during the Islamic conquest of the Iberian Peninsula (8th to 11th centuries). Later on, and despite of being a Christian population, they lived through the Al-Andalus period, presumably under Islamic rule.

Although the necropolis has been excavated and is currently being researched by a multidisciplinary team, the rural settlements in which the population interred there lived are sparsely known. Moreover, there are no written sources that allude to the inhabitants of the valley of Àger during the Al-Andalus period. As a result, the bioarchaeological study of the skeletons of the necropolis can provide crucial information on how this population lived and organised its everyday life.

In this communication, we present the information on this population we obtained through the anthropological, palaeopathological, and isotopic study of the skeletons. The pathological markers of the skeletons are compatible with those more commonly found in archaeological populations, especially those mediaeval populations based on a rural economy. In addition, our isotopic results show that their diet was mainly based on C3 plants, such as wheat and most of the cereals and vegetables available in the region, a trend that is common in most mediaeval Iberian populations. It is also consistent with the archaeobotanical record and textual sources of the region. However, this population dis-

plays $\delta^{15}\text{N}$ values that suggest a lower access and consumption of animal protein (meat, eggs, dairies) than some of the surrounding populations. We explore the implications that these data have for our current understanding of the Islamic conquest and way of life in Al-Andalus.

7 'WIND OF CHANGE'. FUNERARY LANDSCAPE TRANSFORMATIONS IN THE NW IBERIAN PENINSULA (5TH-8TH CENTURIES AD)

Abstract author(s): Blanco Torrejón, Laura (University of Santiago de Compostela; Newcastle University)

Abstract format: Oral

The north-western part of the Iberian Peninsula comprises an important number of funerary remains that have been ignored by scholars as a way to understand the evolution and transformations of the society during the Early Middle Ages. Funerary areas are not only the representation of funerary and ritual practices, but also a connection point between the community and its landscape. On this paper, the simultaneous use of Archaeology of Death and Landscape Archaeology aims to understand the development and interactions between cemeteries, communities and landscape. During the 5th-8th centuries, the arrival and spread of Christianity in Western Europe was considered a turning point in funeral practices and burial customs. The Christian-like burial is traditionally characterised by a regular W-E orientation, absence of grave goods, and funeral structures that are restricted to pits and stone-cists sarcophagus. However, new data provided by recent excavations as well as the development of new studies around the topic have shown a very different dynamic in the north-western part of the Iberian Peninsula. Drawing on this new approach, nearly 400 funeral sites have been analysed based on a diachronic evolution of the funerary trend (not only the burial morphology and grave goods' variations, but also the configuration of the funerary space as a place of power -Härke, 2001-). During these centuries, funerary areas suffer alterations in their distribution patterns as well as in their interaction with the surrounding environment. Thus, it creates a different funeral landscape from the one observed during the Roman Empire and which will become a direct expression of the Christianisation of these spaces.

8 A CLEARANCE CAIRN FIELD AT FARSTORP, SWEDEN. CULTIVATION, GRAZING, BURIALS, RITUALS AND LAND RIGHTS

Abstract author(s): Petersson, Maria (Arkeologerna, SHM)

Abstract format: Oral

Around 200 – 550 AD a multi-faceted landscape of clearance cairns was created and in use at Farstorp, in the highland area of southern Sweden. Manured fields with a limited time of use (ca. 25 years has been suggested) were circulated within a large area. Reuse of stone-cleared areas was part of the strategy. Over time cattle grazing was the main trait in the area. Among the clearance cairns were scattered graves, built of clearance stones. Some contained burnt human remains, others were empty. Some of the clearance cairns were well built and grave-like. These sometimes contained burial-like features, but no human remains. The building material was clearance stones from surrounding arable land, sometimes with a surface layer of fire-cracked stones. Inside and adjacent to these, burnt animal bones, intact pots, single beads, a tweezer etc had been deposited. This find material has parallels in small ritual places of limited local importance.

Fire-cracked stones and burnt animal bones are interpreted as waste from ritual meals, consumed during spring and autumn farm work. Depositions of grinding stones support the assumption that fertility of the land was an important ritual theme. Participants of these meals might be members of the household that held the land rights.

A few human bones were deposited in each grave (but one), possibly from deceased members of the owner family who might be expected to act in favour of their living descendants, to enhance fertility in general. Such deposits may also have demonstrated and consolidated land rights.

9 APPARENTLY EQUAL: A SOCIAL ANALYSIS OF RURAL DOMESTIC ARCHITECTURE IN EARLY MEDIEVAL CENTRAL IBERIA (7TH -10TH CENTURIES)

Abstract author(s): López García, Juan Pablo (Universidad Autónoma de Madrid; Terra Levis-MASAV) - Tejerizo García, Carlos (Università di Genova)

Abstract format: Oral

The analysis of domestic architecture in the early medieval central and northern Iberia rural world has had a very late emergence due to the lack of archaeological excavations. Until the turn of the century, there was not enough evidence to build an archaeology of domestic architecture and less to carry out deep analyses regarding economic, social or political issues.

However, in the last two decades hundreds of excavations in early medieval rural contexts were carried out, which fostered the appearance of the first typologies of early medieval rural architectures and also the first social and critical

approaches to early medieval societies through household archaeology. One of the ideas that emerged from these studies is that, far from traditional approaches which considered these societies as simple, their architecture was much more complex than expected. Moreover, the deep analysis from a territorial basis came to the realization of the existence of regional traditions framed by different social and economic factors and also the presence of subtle social inequalities at the level of local communities. In this paper we will present the first results of an ongoing project aimed at investigating early medieval landscapes in the Sierra de Ávila, located in the central part of the Iberian peninsula. In this paper, we will not only deeply characterize the domestic architecture of different early medieval sites, considering the existence of a territorial building tradition, but also to describe the social structuring and economies behind the constitution of rural household economies.

10 **PESTY ENTANGLEMENTS: LIVING WITH ECTOPARASITES IN THE EARLY MEDIEVAL ATLANTIC ARCHIPELAGO**

Abstract author(s): Brody, Rachel (Boston College)

Abstract format: Oral

This paper investigates ways to interpret evidence of ectoparasites from early medieval rural settlement sites in Ireland and Britain and asks what are the implications of these domestically centered entanglements. The invertebrates under discussion include scavengers of host skin—the human flea (*Pulex irritans*) and louse (*Pediculus humanus*), the bed bug (*Cimex lectularius*), and non-biting flies (*Musca domestica*)—which, besides being uncomfortable and unpleasant annoyances, were also agents for the transmission of parasitic infections to humans and other animals. Furthermore, evidence for the presence of these ectoparasites in domestic spaces is not limited to paleoentomological data but also small finds such as fine-toothed combs, which early medieval people created and used as a response to the unpleasant nature of playing host to buggy pests. Together these different modes of material evidence give alternative insights into the lived domestic experiences of rural early medieval people; they can allow us to make inferences on health, sanitation, and disease.

11 **A VALID BENCHMARK? COMPARING THE ARTEFACT ASSEMBLAGES OF DEER PARK FARMS, CO. ANTRIM AND DRUMCLAY CRANNOG, CO. FERMANAGH**

Abstract author(s): McDowell, Jacqueline (Historic Environment Division Department for Communities) - Boyd, Rebecca (Irish Archaeological Consultancy)

Abstract format: Oral

Deer Park Farms (DPF), an enclosed farmstead site excavated from 1984 to 1987, and Drumclay Crannog, excavated in 2012/13, are two of Ireland's most remarkable early medieval rural sites. Both featured rich material cultural assemblages comprising thousands of artefacts as a result of unexpected waterlogged preservation conditions. With similar cultural assemblages and overlapping chronologies from the 7th to 14th centuries, DPF and Drumclay are benchmarks of the quality and quantities of artefacts which rarely survive in more typical dryland conditions.

At DPF, McDowell undertook an in-depth analysis of artefact deposition and taphonomic processes of c.3800 artefacts (McDowell, 2004). This established a benchmark for understanding patterns of distributions at an early medieval Irish farmstead integrating analyses of both built domestic spaces and external farmyard areas. These patterns threw particular light on the taphonomic processes by which they were incorporated into the archaeological record. There were clear distinctions between objects found in 'as used' situations, e.g. craft debris indicating workspaces, and those found in 'end-situations' such as abandonment or destruction contexts. In turn, these patterns informed the detailed interpretation of living conditions and human-environment interactions at DPF (Lynn & McDowell, 2011).

At Drumclay, 3-D coordinates for over 3000 organic and inorganic artefacts were recorded. The ongoing post-excitation programme, by IAC Archaeology, funded by HED, provides the perfect opportunity to contrast the materiality of DPF, a dryland farmstead, with Drumclay, a wetland crannog. The spatial data, combined with Drumclay's extensive architectural record, allows us to re-visit the deposition processes and question if DPF's 'as used' and 'end-situation' conclusions are repeated or varied at Drumclay. Using this comparative spatial data, we can project outwards from these benchmark sites to consider how their 'embarrassment of riches' of a very visible materiality contrasts with the 'impoverished material culture' of Ireland's dryland early medieval rural settlements.

A. **FARMING AND RESILIENCE ON THE LATE ANTIQUE HILLTOP SITE ZIDANI GABER**

Abstract author(s): Tratnik, Vesna (Narodni muzej Slovenije) - Lozić, Edisa - Tolar, Tjaša (Institute of Archaeology, ZRC SAZU)

Abstract format: Poster

The poster presents the research of the agricultural hinterland of a hilltop settlement on the Zidani gaber, Slovenia. This settlement was built and fortified in the 6th century. Located high in the hills and west of the main road connect-

ing Emona and Siscia, it flourished after the lowland settlements and towns in its vicinity were abandoned in the early 5th century.

Field investigations at the site were limited to small-scale trial trenching and the collection of small finds is numerous, but most came to museums as chance finds, with no further details. Therefore, for this study, we relied on other research methods and tools from the fields of spatial technologies and natural sciences. The analysis of LiDAR (Light Detection and Ranging) images allowed us to determine the layout of the settlement with its main lines of communication. Analysis of the role of visibility (GIS) provided a valuable insight into the possible function of the settlement. We also conducted an archaeobotanical analysis of the recovered crop remains and evaluated the results in terms of potentially suitable farmland (GIS). Analysis of the economic potential of the settlement indicates that there is suitable pastureland in the immediate vicinity, but no arable land. Therefore, we assume that the economic supply of the settlement had to adapt; the share of arable farming decreased and the share of pasture farming increased. Despite these adjustments, arable farming in the lowlands continued to be essential for the supply of the settlement, so we assume at least a partial continuity of the agricultural use of the lowlands.

B. WINE AND IRON. RESEARCH OF AN EARLY MEDIEVAL HAMLET ON THE SITE PRŽANJ NEAR LJUBLJANA, SLOVENIA

Abstract author(s): Pavlovic, Daša (National Museum of Slovenia)

Abstract format: Poster

A rural lowland village was discovered at the site of Pržanj near Ljubljana (central Slovenia), dated between the 5th and 12th centuries. The site was intensively populated in two phases, late antique (5th – 6th century) and early medieval (7th – 9th century).

Poster presents details noticed during archaeometallurgical, archaeobotanical and archaeometric analysis. Those details are giving us an insight into the transition between Late Antiquity and Early Middle Ages and how these transitions may reflect on the materiality of one rural settlement. We suggest some traditions, taste and knowledge survived the transition, but also the settlement had to change dramatically with time in order to survive, and new relations between space and activities were established.

With archaeometallurgical analysis we discovered that lime was used in ore smelting processes, the process already known in antiquity, thus it may indicate a specific metallurgical knowledge preserved on this site into the Early Middle Ages. Archaeobotanical analysis surprised with the discovery of grape wine seeds, suggesting that know-how in grape cultivation and possibly wine production continued even after the mayor settlement and demographic shift in the area. Analysis in pottery ornamentation showed the same.

In the second phase, the settlement changed from agricultural settlement into a metallurgical production site with no obvious residential area. Archaeometric analysis showed some pottery inclusions were iron slag and, on some sherds, landed drops of melted iron, indicating that pottery was produced on the site and was used in the direct vicinity of the melting furnaces.

The last presented detail is the discovery of two oriental mosaic glass beads of halophytic glass. Because other elements of domestic life are missing in the settlement, we suggest that these beads are more likely to indicate trade rather than remains of female jewellery.

113 BYZANTINE HERITAGE IN PERIL: THE SAFETY OF ARCHAEOLOGICAL SITES (HERITAGE, CONSERVATION, PRESERVATION, NON-DESTRUCTIVE METHODOLOGIES)

Session theme: 3. Heritage Narratives and Representations

Session organisers: Veikou, Myrto (University of Patras) - Vroom, Joanita (University of Leiden) - Tsvikis, Nikos (Institute of Mediterranean Studies - FORTH)

Session format: Regular session

For the first time the International Association of Byzantine Studies (AIEB) and its newly created Commission for Byzantine Archaeology (CBA) propose a session for the EAA Meeting. In doing so, our intention is to disseminate recent archaeological work conducted in our field and to build a broader academic and collegial environment.

Byzantine archaeology, the archaeology of the millennial Eastern Roman empire, traditionally covers a huge geographic area incorporating the Eastern Mediterranean, Southeastern Europe and the Black Sea, extending in periods westwards all the way to cover Italy and much of Northern and Eastern Africa. Nowadays, areas governed by different climate regimes, populated by different people, and regulated under different authorities represent a broad spectrum

of cultures where sites are treated in various ways. In these areas, since the 19th century, versions of Byzantine archaeologies have flourished at different paces and often with contrasting aims.

In this session we aim to address modern challenges of Byzantine archaeology as a wide-spanning international field. Sites can vary from long-standing excavations initiated in the conditions of late colonialism to state-of-the-art contemporary projects reflecting meta- technological breakthroughs. Nonetheless, everywhere archaeology, including Byzantine archaeology, is confronted by extreme social conditions, sometimes exponent local growth or sudden geometric recession of state or national economies, aggressive touristic and housing development, climatic challenges and extreme weather patterns, problems in archaeological finds' storage, resources and infrastructures for sites' management, or even just plain old ravages of war and conflict. We call upon a broad-spanning group of specialists, involved in the excavation, study and management of Byzantine archaeological sites across the Mediterranean, South-east Europe, the Black Sea and beyond to participate in our session and present key-aspects of these challenges and possible policies of counteracting them. The session besides will be also accepting poster presentations.

ABSTRACTS

1 PROTECTING AND PROMOTING THE CULTURAL HERITAGE OF MEDIEVAL SAI (SUDAN): A CONTRIBUTION TO DISCUSSING BYZANTINE ARCHAEOLOGICAL MANAGEMENT

Abstract author(s): Hafsaas, Henriette (Volda University College) - Tsakos, Alexandros (University of Bergen)

Abstract format: Oral

Christian Nubia is one of the three regions of northeast Africa that adopted Christianity as the state religion during the medieval centuries - roughly coinciding with the Byzantine millennium. The other two regions were Egypt and Ethiopia, but only Nubia and Ethiopia remained Christian states throughout the medieval era. Apart from Christianity, Nubia belongs to the Byzantine ecumene, as exemplified by the use of the Greek language for religious and administrative purposes, the titles of secular and religious authorities, and the religious iconography, to mention only the most relevant evidence.

The Christian past of the medieval Nubian kingdoms has left numerous archaeological sites of various sizes and importance. Their threats and salvage have followed the trajectory of the archaeological heritage of Egypt and Sudan in general (e.g., dam building, mechanized agriculture, and gold mining). Cultural heritage management in Sudan also faces challenges due to the gradual changes in the religious and linguistic landscape since the introduction of Islam and Arabic. Despite these challenges, significant investments have been made in Sudan archaeology through initiatives like the Merowe Dam Archaeological Salvage Project, the Qatar-Sudan Archaeology Project, and research grants through the European Research Council. The research approaches have evolved, with a stronger focus on community involvement. The recent political upheavals have also impacted the care for the country, its people and its past.

We will present our earlier efforts at cultural heritage management and community involvement on Sai Island in northern Sudan through our investigations of the medieval era on the island in 2009 and 2010. The proposed contribution aims at adding a Nubiological and Sudanological perspective to the discussions of the management of Byzantine and Byzantine-like archaeological heritage.

2 THE MANAGEMENT OF BYZANTINE HERITAGE IN A FORMER CONFLICT ZONE: THE CASE OF CYPRUS

Abstract author(s): Vionis, Athanasios (University of Cyprus)

Abstract format: Oral

This contribution discusses a success story of heritage management in Cyprus through the pilot study of a late medieval religious/sacred monument in the Larnaca district, carried out in the framework of the Unlocking the Sacred Landscapes of Cyprus project (EXCELLENCE/1216/0362), a collaboration between the University of Cyprus and the Department of Antiquities of the Republic of Cyprus. In an attempt to answer the basic question of "who owns the past", this case study not only provides a paradigmatic and fascinating case in terms of heritage management but also in terms of the reception of the Byzantine/medieval sacred spaces and landscapes today. The aim is to examine how the state, local communities and visitors at the site make claims to, remember and experience religious and secular monuments of the Byzantine/medieval past and their surrounding landscapes, while also investigating how such claims are managed, negotiated and contested. The history and conservation of the monument discussed, the church of Panagia Astathkiotissa, located on a previously conflict zone, unpacks the various discourses in contested areas, and opens the way for re-examining abandonment, conflict, and management practices by local communities and the state.

3 OBSERVATIONS ON THE MANAGEMENT OF BYZANTINE RELIGIOUS BUILDINGS IN KONSTANTINIYYE AROUND 1450S AND THEIR CURRENT STATE OF PRESERVATION AND PRESENTATION

Abstract author(s): Akture, Zeynep (Independent Scholar; Turkish National Commission for UNESCO's Tangible Heritage Expert Committee (Vice President))

Abstract format: Oral

Re-functioning of the Hagia Sophia Museum as the Grand Mosque of Ayasofya has been the most widely followed managerial decisions lately taken about a Byzantine heritage asset, partly due to the potential risk religious use outside of a controlled museum environment may cause for the preservation of the World Heritage monument in its integrity. Among arguments brought up by local conservation experts to ensure intact preservation of the monument's unique figural decorations during the re-functioning and their continued visual accessibility by visitors was the quasi-mythological narrative on the limitedness of physical change introduced during its first conversion into a mosque in the period of Mehmet II. Such narratives characteristically portray Mehmet II almost as a protector of Byzantine heritage who also had a private collection of relics from the pilgrimage churches of Constantinople.

This paper aims to contribute to a critical assessment of this portrayal by presenting research outcomes on the past and current state of preservation of the Byzantine religious monuments that are known to have been demolished or re-functioned in the period of Mehmet II on administratively and symbolically key sites for re-structuring the Ottoman Empire and its capital, under the following grouping:

- (mostly non-religious) domination symbols in and around imperial palaces
- imperial image-making religious monuments and complexes
- imperial institutions (mainly for education)
- religious spaces for the empire's multi-ethnic communities

Conclusions reveal urban design decisions by Mehmet II and renovations by non-Muslim communities other than the Orthodox Greek, making use of the rights brought by the 1856 Edict of Reform, among reasons for the gradual loss of the city's Byzantine religious heritage that has been reduced to comparatively minor and unhighlighted material traces on a thoroughly rewritten palimpsest.

4 BYZANTINE ARCHAEOLOGY OF ISTANBUL THROUGH A CULTURAL HERITAGE PERSPECTIVE: THE LAND WALLS, THE CHURCH OF ST. POLYEUKTOS, THE THEODOSIAN HARBOR

Abstract author(s): Altan, Baris (Brandenburg University of Technology) - Ercan Kydonakis, Ayşe (Independent Scholar)

Abstract format: Oral

The architectural heritage of Istanbul, with respect to its Byzantine past, has been ideologically instrumentalized, particularly over the span of the last two centuries. Archaeology which materializes the past, played a critical role in these endeavours, along with the architectural restoration and conservation projects that 'museumize' cultural heritage discourses. Stakeholders, governmental bodies, and institutions that are tasked to discover Byzantine Constantinople, and to protect its physical remains, have taken varying attitudes over the years, in parallel to their political inclinations, manipulating what heritage to bring to light, make visible, protect, or neglect and forget.

By providing an overview of watershed moments in the history of the Byzantine archaeology in Istanbul and a retrospective analysis of the processes of architectural conservation projects, this paper focuses on a number of Byzantine sites, which are under the directorship of different stakeholders such as Istanbul Archaeological Museums, Istanbul Metropolitan Municipality, and the Directorate of Pious Foundations. Three iconic archaeological sites, notably Theodosian Land Walls, the Church of St. Polyeuktos, and the Theodosian Harbor will be analyzed in detail with respect to their legal status and the conditions of archaeological fieldworks, the circumstances of the subsequent restoration initiatives, as well as the methods of communication with wider public with respect to the equilibrium between archaeological fieldwork and intangible heritage preservation. In doing so, this paper relates to a bigger picture that discusses various practices of urban archaeology in multi-layered historical cities like Istanbul in regard to varying approaches to Byzantine archaeology and cultural heritage policies towards Byzantine urban heritage, often resulting in controversial outcomes.

5 STILL AN ANNOYING RELATIVE? BYZANTINE ARCHAEOLOGICAL REMAINS IN EXCAVATION AND RESTORATION PROJECTS OF 'CLASSICAL' SITES IN GREECE

Abstract author(s): Tsivikis, Nikos (Institute for Mediterranean Studies, FORTH)

Abstract format: Oral

Archaeological work carried out by various institutions in numerous sites across Greece has been innovative in many ways and offering breakthroughs in our understanding of the past communities in both rural and urban contexts. Twenty-first century archaeological practice in Greece has moved away from the old distinctions between 'good' and 'bad' antiquities in terms of their periodization (e.g. Classical against Roman/Medieval/Byzantine/Ottoman) or their building qualities (e.g. Stone/Marble-built against Brick/Mudbrick/Wooden-built) amongst many such qualitative dipoles. Or has it not? Aim of this paper is to critically revisit the older hierarchical model and the current processes of prioritization amongst different date historical remains and the attitudes in preservation and restoration stemming from this process. Our case studies will come from current multi-period archaeological projects in Greece, usually cities and settlements with long historical life and multilayered stratigraphies covering the still 'desirable' remains of the Classical past. In these we will examine the fates and fortunes of post-classical remains, both in their physical qualities and their role in interpretative models.

6 COUNTERACTING DESTRUCTION BEFORE DOCUMENTATION: LOOTING OF ARCHAEOLOGICAL HERITAGE IN THE HINTERLAND OF CHALKIDA (GREECE)

Abstract author(s): Vroom, Joanita - Kolvers, Ritchie (Faculty of Archaeology, Leiden University)

Abstract format: Oral

The first fieldwork-season of the 'Hinterland of Medieval Chalkida' Project (HMC-project) was undertaken in the summer of 2022. During this season, the team members quickly realized they were not the first to identify the value of heritage sites in the region under study. Of the three Byzantine/medieval sites which were surveyed intensively, all three showed signs of clandestine excavations, looting, and quite serious treasure hunting with the use of metal detectors. We decided that these traces of the wilful destruction of the stories of these sites and of cultural heritage in general should inspire archaeologists to make the best of the situation. Indeed, in the 2023 campaign of the HMC Project one of the looter pits was extended to form a properly executed trial trench.

In the longer term, archaeologists should draw conclusions about how to protect their archaeological sources in tune with the times. We suggest that since metal detectorists are plundering sites, survey teams should be allowed to bring their own metal detectors. During the 2022 fieldwork-season the HMC team uncovered nearly a dozen coins and several interesting metal finds without a metal detector – indicating that there is still enough left to be found. Hence, bringing a metal detector by archaeological teams will increase the number of relevant finds, and it will safeguard archaeological information that might otherwise be lost forever.

Also, we suggest that it is essential to cooperate with local communities and make them aware of the significance of their own cultural heritage. We experienced that if local communities were informed about our archaeological activities, there was a significant increase in the understanding of the scientific value of Byzantine/medieval sites in their region. We are convinced that armed with such an understanding, locals will be more inclined to help defend these sites against potential looters.

7 THE BYZANTINE PHASE OF THE SITE OF AMARYNTHOS (EUBOEA, GREECE) AND THE EXCAVATION OF THE SANCTUARY OF ARTEMIS AMARYSIA

Abstract author(s): Krapf, Tobias (Swiss School of Archaeology in Greece) - Greger, Daniela (University of Lausanne)

Abstract format: Oral

The site of Amarynthos in Central Euboea is mostly known for the remains of the ancient sanctuary of Artemis Amarysia. The discovery of one of the last great cult places known from literary sources has become such a sensation that it easily diverted the attention from the numerous later finds of the region: although the reuse of ancient blocks in Byzantine churches played a key role in the location of the sanctuary and the excavations conducted by the Swiss School of Archaeology in Greece and the Ephorate of Antiquities of Euboea have revealed domestic and funerary structures from a Byzantine and Post-Byzantine settlement, these contexts have not received the same recognition. In an effort to protect and promote Byzantine heritage, this paper will present the medieval finds and highlight the difficulties linked to their excavation and preservation in the shadow of the Artemision.

Raising awareness about the Byzantine landscape of Amarynthos area is an important instrument to ensure its protection, especially since Medieval remains incur a disproportionately high risk of destruction. While some monuments have been transformed through continuous use, Byzantine archaeological layers are often located close to the surface

and are thus particularly impacted by the heavy urbanisation of the region. The diachronic survey of the area around Amarynthos launched in 2021 has revealed a number of medieval sites which need to be protected. Especially when religious and socio-political interests are at odds with archaeological concerns, it is essential to share the importance of the Byzantine remains with the local population and visitors alike in order to gain a wider appreciation of the Byzantine heritage and the necessary support for its protection.

8 UNCONQUERED AND WELL-FORTIFIED? NOT ANYMORE: THE PELOPONNESIAN FORTIFIED SETTLEMENT OF GARDIKI IN AN ERA OF CLIMATE AND ECONOMIC CRISIS

Abstract author(s): Kalantzis-Papadopoulos, Dionysios (University of Leiden)

Abstract format: Oral

Located atop a precipitous rocky outcrop of the Arcadian Mt. Hellenitsa, the fortified settlement of Gardiki boasts a dominating position over the uplands of the Southwestern Peloponnese. In the past, its critical location provided the Byzantine Despotate of Morea with an excellent offensive base against the nearby Crusader lands in Messenia for almost two centuries (13th-15th c.). A typical example of a late medieval Byzantine *kastropoliteia* (i.e. fortified town), the site and most of its structures developed over an inhospitable, steep uphill terrain, carefully chosen for its exceptional defensible capabilities. However, after the settlement's destruction by the Ottomans in 1460, Gardiki was left completely abandoned and essentially in limbo until its re-discovery in 1840/41 by J. A. C. Buchon. Ever since the site would only occasionally appear as short notice in various publications of scholars recording the diachronic cultural heritage of the Peloponnese. To this day, Gardiki remains a mostly neglected medieval site left to ruin atop its isolated ridge. The dangers against its remaining standing structures are always-present since its abandonment in the 15th c. A.D.: anthropogenic activities like systematic looting and goat-grazing wreaked havoc on Gardiki's remains for centuries, along with the naturally occurring process of erosion. Accompanied by the newly-arisen byproducts of climate change, such as summer wildfires and severe winter storms, these phenomena threaten not only Gardiki itself, but many similar fortified settlements located in the Peloponnese and beyond. All these challenges call for the urgent introduction of countermeasures by the local communities, authorities, and foremost, by the long-absent academia.

9 THE UNDERGROUND AS PLACE OF WORSHIP. BYZANTINE HERMIT CAVES AND UNDERGROUND CHURCHES IN CALABRIA THROUGH DIGITAL SURVEY

Abstract author(s): Stilo, Francesco (Mediterranean University of Reggio Calabria)

Abstract format: Oral

The research deals with issues related to the theme of the underground as a place of worship, in a dialogue between architecture and archaeology. The use of the underground in Christianity refers both to the cultic purpose (hermit caves, rock churches, crypts) and to the sepulchral purpose. The rock phenomenon is widespread in the Mediterranean area, and in particular expresses, in southern Italy, the moment of maximum propagation between the tenth and eleventh centuries, in close relationship with the Italian-Greek monastic nuclei. For Calabria, rupestrian testimonies consist largely of natural caves and caverns adapted to the purpose or of excavations that are difficult to trace back to sub-terrestrial architectural experiences or to well-defined architectural models.

Through the investigation it was possible to ascertain that to date, for Calabria, the phenomenon is still very obscure, both due to the general absence of dating elements, and due to the chronic lack of written sources (except for hagiographic sources), and, lastly, due to the almost total absence (with rare and commendable exceptions) of archaeological investigations. Among the elements that put the investigated archaeological sites at risk, in addition to those that typically threaten rocky contexts (mainly soil erosion and landslides), there are human factors generated by public inattention to the value of such sites.

The synthesis of a campaign of digital photogrammetric surveys is presented, aimed at documenting the selected case studies, and at the production of itineraries for the knowledge of the Byzantine hermit caves and the underground as a place of worship in Calabria. From this point of view, the production of digital surveys has allowed the creation of a database consisting not only of photographs and graphics but also of three-dimensional point clouds, meshes and textured elements (digital replicas of cavities and details) useful for preserving this Cultural Heritage.

10 CARIČIN GRAD (JUSTINIANA PRIMA): RESEARCH, RESTORATION AND PRESENTATION

Abstract author(s): Ivanisevic, Vujadin (Institute of Archaeology, Belgrade) - Đukanović, Dubravka (Institute for the Protection of Cultural Monuments of Serbia) - Bugarski, Ivan (Institute of Archaeology, Belgrade)

Abstract format: Oral

Caričin Grad is one of the best preserved early Byzantine cities, revealing several fortification lines around the urban core, suburbs, workshop areas, a water supply system which included the aqueduct and dam, and a fairly untouched landscape. This all makes the site unique and gives its researchers the opportunity to study the issues of its establishment,

short life and monuments in a most comprehensive way. Its remains provide a possibility for truthful presentation of this unique heritage.

The long-lasting excavations, ongoing from 1912, were performed primarily within the city limits. Owing to the use of modern technologies - geoelectrical and geomagnetic surveys are being carried out since 1980, GPR surveys since 2015, and LiDAR scanning since 2011 - the outer defences were documented, as well as numerous buildings, which has had a huge impact on our understanding of the city's size and its urban planning. This knowledge has been deepened by traditional field surveys, which all led to the obtaining of accurate ground plans of the forts in the vicinity and the reconstruction of the 21km-long aqueduct route.

This broad approach also dictated a significant enlargement of the protected area of Caričin Grad as an immovable cultural property, from some 0.9 km² to 10 km², now encircling the entire aqueduct line, while the area of the site is already included into the Nature Park Radan, which is crucial for the preservation of landscape and biological diversity.

Moreover, a special investment programme has been launched by the Government of the Republic of Serbia, aiming at preservation and presentation of Caričin Grad, the cultural-historical centre of southern Serbia. Restoration should not be overwhelming and go beyond the reliable presentation of architectural remains. The study of the site's monuments, especially its numerous churches, has already been facilitated with the creation of detailed 3D models.

11 PAST, PRESENT AND FUTURE OF THE BYZANTINE COLLECTION OF THE NATIONAL MUSEUM OF HISTORY OF UKRAINE

Abstract author(s): Skulbodenko, Artem (Treasury of the National Museum of History of Ukraine)

Abstract format: Oral

Since the first archaeological activities in the 19th century, many pieces of byzantine culture had been found throughout Ukraine. Ukrainian Pontic steppes, the Crimean Peninsula and territories related to them saw a huge population migration of different ethnic groups throughout the 4th – 8th centuries. They actively relied on trade and diplomatic relations with Byzantine Empire. Moreover, Kyivan Rus' was the main cultural and trade ally of the Byzantine Empire in Eastern Europe in the 10th – 12th centuries.

The rise of the interest in history among Ukrainian intellectuals of 19th – early 20th century provoked the creation of massive private collections. The Bohdan and Varvara Khanenko Collection of Western and Eastern art was the biggest of them all. After the passing of the owners, it contributed greatly to newly created Ukrainian museums in Kyiv. Artifacts of Byzantine provenance were among the most precious of the collection's pieces.

Since 2014, when the Russian-Ukrainian war began with the occupation of the Crimean Peninsula, many Ukrainian museums were damaged or robbed. Ukrainian historians and archaeologists had been rethinking the context of Ukrainian archaeological and museum heritage. Safety and preservation became as important as implementing new approaches for scientific research and popularizing Ukrainian history and museum culture.

This paper explores the roots, history of accumulation, current state, and future challenges of the Byzantine collection of The National Museum of History of Ukraine. In the wake of the Russian aggression, its entire existence needs to be revised with a comprehensive approach.

116 WEAVING NEW CULTURAL NARRATIVES: INNOVATIVE CULTURAL HERITAGE MANAGEMENT FOR POST-PANDEMIC SOCIETIES

Session theme: 3. Heritage Narratives and Representations

Session organisers: Chroni, Athina (Hellenic Ministry of Education and Religious Affairs; National Technical University of Athens) - Hamari, Pirjo (Finnish Heritage Agency) - Nilhamn, Bonnie (University of Helsinki, Doctoral Programme in Geosciences; "Nilhamn" - Dutch Museum and Cultural Heritage consult company)

Session format: Regular session

The COVID-19 pandemic functioned as a catalyst in helping cultural heritage (CH) management professionals to adopt and experiment with new management and engagement models, for which there is a growing need. On one hand, safeguarding cultural heritage, increasingly under threat due to anthropogenic activity and physical disasters, with climate change emerging as a key component, calls for an urgent global rethinking of the ways we manage our heritage assets. On the other hand, the sudden loss of contact and engagement possibilities with physical audiences and the public forced on a sudden reorientation in the ways these contacts could be maintained in meaningful ways.

The "new normal", as shaped out during and after the COVID-19 pandemic, highlighted new technologies and new ways of engagement as the way forward: new or improved ways of providing on-line access to shared CH assets, working together with communities in valorising CH, innovative methodologies of CH management, hybrid procedures for social involvement, and new models of scientific collaboration. That this is the way, is supported by several CH management charters and conventions, which have advocated for expanded public participation and open data/

open access processes, leading to the implementation of new participatory cultural practices and the formation of new management paradigms. We are still only beginning to understand the value and impact of such approaches.

In order to both understand the value as well as the challenges in new CH management models for post-pandemic societies, this session is inviting contributions to examine e.g.:

- How the sector has responded to the need for new approaches in access and management
- How the role of professionals in the cultural sector has been re-shaped
- What new public engagement methods and processes have been developed
- What the new heritage narratives are which can be shaped in participatory processes

ABSTRACTS

1 OPEN ARCHAEOLOGY: THE SOCIAL NARRATIVE

Abstract author(s): Chroni, Athina (Hellenic Ministry of Education and Religious Affairs; National Technical University of Athens)

Abstract format: Oral

Open access-open data as emerged from the science sector, has very quickly emerged as a trend and practice in the field of culture as well, thus complying with the values-based approach model of cultural heritage management, emphasizing the values attributed to cultural heritage by different interest groups of people. The Faro Convention on the Value of Cultural Heritage for Society/The Council of Europe 2005 proposes a more comprehensive and holistic view on the notion of cultural heritage and emphasizes the important role of people's participation and engagement in cultural procedures.

Nevertheless, an extensive controversy already arises on issues of cultural heritage management, whether exclusively to professionals or not. As expected, archaeology, forming an extensive thematic field in culture, in its overall procedure from excavational to laboratory work and, finally, dissemination to the public, has formed the leading "battle-field": open archaeology and community involvement as a way of raising public awareness in the direction of protecting cultural heritage and preserving cultural memory and identity, as well as weaving an innovative social narrative, form the main points of concern of the specific paper.

2 RELEVANCE, IMPACT, AND CULTURAL HERITAGE: OR HOW TO SURVIVE IN SYSTEMIC CHANGES

Abstract author(s): Hamari, Pirjo (Finnish Heritage Agency; University of Helsinki)

Abstract format: Oral

The heritage sector has a fundamental self-understanding that cultural heritage is valuable as an asset for societies. In contrast, in public debate heritage is increasingly pitted against expectations of economic value, usefulness, and value to society. This perceptual divide has become even clearer during the COVID-19 pandemic, and in an increasingly fragmented, fast-paced, digital, and polarised society. How to argue that heritage is relevant and makes a positive difference in such disruptive times?

An increasing body of evidence shows that heritage in different formats has economic significance. Other forms of value, however, are also increasingly highlighted, and these relate to the cultural and social value of heritage. This paper proposes to approach these from the Faro Convention point of view: understanding the value of participation and communities, understanding impact and relevance. It examines how the sector is part of a systemic change, and how this creates a need for rewording and rethinking its relevance. It proposes that new management and operating models, based on the Faro approach, will help strengthen the sector as they emphasise community- and impact-oriented approaches.

As a practical example of such new management models, it will introduce the MOI impact framework, developed in a European-wide co-operation project. This self-evaluation framework for museums and cultural organisations helps organisations identify internal development areas connected to impact, and helping them identify potential development areas in their activities and ways of working in a dialogical manner. This will help organisations to find their impact goals and refocus their work to be more relevant and sustainable.

3 APPLIED TECHNOLOGIES AND HUMAN SCIENCES FOR WEAVING COLLECTIVE MEMORY

Abstract author(s): Megalooikonomou, Pavlos-Stylianios (National Technical University of Athens) - Chroni, Athina (Hellenic Ministry of Education and Religious Affairs; National Technical University of Athens)

Abstract format: Oral

The concept of collective memory, introduced by Maurice Halbwachs in 1925, was based on ideas of Emile Durkheim, declaring that societies require continuity and connection with the past to preserve social unity and cohesion. Cultivating a relationship with the past, enhances societal well-being in the present and enhances the sense of belonging to a wider community. Furthermore, remembering is vital for sustaining plurality and diversity in terms of a global citizenship, ensuring solidarity and human rights while protecting cultural rights and preserving individual and collective identity and consciousness. Collective perception of the past is highly affected by developed information communication technologies, such as the internet, affecting us, both as individuals and as a society, on the way of creating, storing, and recalling information.

Cultural disasters, as the fire damage of the National Museum of Brazil in 2018 and of the Notre Dame of Paris one year later, combined with extreme situations as the COVID-19 pandemic and the war in Ukraine still going on, call for urgent cultural plans and actions on cultural heritage integrated management issues: documentation-preservation-monitoring-highlighting. The heterogeneity of cultural assets results in a complex universe of requirements: applied sciences and new technologies have proven to be successful in documentation and data management; as a result, they have already gained a leading role in the specific field, also adopting and proposing participatory documentation procedures, such as crowdsourcing and participatory GIS projects, combined with the substantive (re)use of digital assets as well as with advanced technological achievements mostly in the scientific fields of VR/AR/MR, of chatbots, as well as of digital storytelling. The related procedure to be adopted on a case-by-case basis will be the main component to play the decisive role on issues of shaping collective memory of our times as well as of the times to come.

4 BUILDING A BRIDGE BETWEEN THE CULTURAL HERITAGE AND THE VISITORS VIA VR: VISITING EPHEBUS VIRTUALLY

Abstract author(s): Denker, Ahmet (Istanbul Bilgi University; University of South Florida)

Abstract format: Oral

The further away Covid pandemic slips into the past, the more it unravels how everything has been reshuffled in the cultural heritage (CH) management. In the face of the disappearing visitors around the world, reaching the CH has undergone radical changes, forcing the creation of new contact ways where visitors can gain remote access. Enabling online access to the CH assets and sites shaped the 'new normal' during the coronavirus lockdown. The impact of this 'new normal' is likely to continue to be upon us decades down the line.

The goal of this article is to look at exactly what innovative solutions VR technology can bring, both for museums and heritage sites, and for their visitors, in such extraordinary times (there's always the apprehension it could hit worse again). Although we may still be years away from building a truly seamless bridge between the visitors and the CH virtually, we should now assess where we are and consider where we are headed. The ancient city of Ephesus, which is home to one of the seven wonders of the world is discussed as a case study in this context.

Ephesus, the metropolis of Rome in the East, is undoubtedly one of the best-preserved historical cities in the world – a place where the past greets you around every corner. This is what spurred the author to bring Ephesus to her visitors during extraordinary times like the coronavirus using VR. The ability of the 'new normal' to engage the viewer, to evoke a mood, a sensation, and a presence is scrutinized within the context of visiting Ephesus virtually.

5 VENI VIDI ... : PUBLIC CULTURAL HERITAGE MANAGEMENT

Abstract author(s): Nilhamn, Bonnie (Helsinki University)

Abstract format: Oral

The last three years' pandemic has forced the Cultural Heritage field to rethink its manners of engaging and reaching out to the public. The last year 2022, when the pandemic ceased, we finally could slowly return to normal life... or did we? Did we really want to go back to "normal", as it seems that these years of self-reflection have changed both our field's circumstances and our public.

It is the duty of the archaeologist, as of the scientist, to reach and impress the public, and to mould his words in the common clay of its forthright understanding." (Sir Mortimer Wheeler 1956, p. 224)

Heritage management as a concept has transformed, and today we want to do more than "reach out and impress" our audience. The dialogue has increased, and with it, our perception of participation and ownership. The outreach work of museums, (local) heritage societies and professional archaeologists towards the public have been defined as Public,

Community, Open Archaeology etc., all with their own twist. For simplicity here, we may divide the engagement and outreach focus into two main fields: Science communication and Participation. We have discussed this vividly during the previous EAA 2021 and 2022, mainly focusing on tools and methods. In this paper, we are going to do a quick recap of public Cultural Heritage Management, looking back on the past and present and discuss the future where these tools and methods have brought forwards new concepts of participation, (communal and individual) ownership and even appropriation. Can we still win the audience?

A. WORKING TOWARDS AN INTEGRATIVE APPROACH: COASTAL AND MARINE CULTURAL HERITAGE AND MARINE PROTECTED AREAS IN THE MENA REGION

Abstract author(s): Nikolaus, Julia - Tews, Sophie - Ray, Nick - Breen, Colin (Ulster University)

Abstract format: Poster

Over the past two decades Marine Protected Areas (MPAs) have emerged as one of the primary legislative initiatives used to protect the marine environment, recognised as an integral management mechanism used to address climate change and as a driver for sustainable community development. To date, these areas have been used primarily to protect the natural environment. However, there is a clear justification and need to integrate, oftentimes extremely vulnerable, cultural heritage into this MPA network. The integration of both tangible and intangible cultural heritage into these frameworks would support enhanced social cohesion, and a strengthening of place-making. The Maritime Endangered Archaeology project (MarEA) has recently started to develop a model that would allow for a more inclusive and meaningful integration of coastal and marine cultural heritage to MPAs.

The main task of the MarEA is to rapidly and comprehensively documents and assess threats to the maritime and coastal archaeology of the Middle East and North Africa (MENA). Through quantifying the nature and extent of the cultural resource it is anticipated that the project's digital platforms will provide readily available, open access data to MPA managers and will encourage deeper engagement with the heritage resource. This poster will discuss how to actively consider the integration of coastal and marine cultural heritage into existing individual protected area plans to create sustainable and resilient protection strategies for both, natural and cultural heritage. This will pave the way for us to consider ways in which existing boundaries could be extended to facilitate greater inclusion of coastal heritage, and to consider the potential for future designation and protection.

117 ARCHAEOLOGY: A HOSPITABLE DISCIPLINE? HOW ACCESSIBLE IS ARCHAEOLOGY IN PRACTICE? EXAMINING THE FUTURE OF INCLUSIVE ARCHAEOLOGICAL PRACTICE

Session theme: 3. Heritage Narratives and Representations

Session organisers: Sommen, Marloes (Enabling Archeologie) - Clements, Sarahjayne (Enabled Archaeology Foundation; University of Hertfordshire)

Session format: Session with keynote presentation and discussion

How accessible is the past? And how accessible is studying the past? Is it equally accessible to everyone? How welcoming is the discipline we operate in? What exactly do we mean when we speak of accessibility? Do we also consider feeling welcomed as part of accessibility? And what makes us feel welcome? Is it a representation of people who look like us? Is it the availability of aids? Is it the use of inclusive language? Could finance also play a part in accessibility? Can everyone afford to visit or study our heritage, and what do our earnings as archaeologists have to do with our well being?

We believe that archeology can and should be more accessible, diverse and inclusive! Archaeology belongs to everyone and everyone who wants a place in it should be given those opportunities. We want to provide the tools to make archaeology accessible to everyone within the triangle of education, the workplace and public outreach. We collaborate wherever possible to draw on the collective experience of others and to share best practice which is why Enabled Archaeology Foundation and Enabling Archeologie have partnered up on this session to take this international. Accessibility of the past, for us, means both the physical/mental/social accessibility of arriving at a place where the present is accessible. To arrive at this inclusive place, we have a joint goal of creating awareness and embedding equality, diversity and inclusion into all areas of the heritage sector.

What can we as archaeologists learn on these matters from each other? From practices in different countries, other disciplines within the field of heritage but also other disciplines beyond heritage.

Our session will consist of a short opening element about the EAF, EA and DAN: what we stand for, what we do and how we cooperate. We have two keynotes presented by two exciting presenters, a set of excellent papers from scholars across Europe, and a panel discussion with a high-profile guest to stimulate the debate. Our first keynote speaker

will tell us more about accessible and inclusive pedagogies for archaeology students and our second keynote speaker will remind us what the added value is of working integrally, crossing regional, national but also disciplinary borders.

ABSTRACTS

1 **ARCHAEOLOGY AND ACCESSIBILITY: THE ROLE OF SCHOOL AND DIGITAL TECHNOLOGY TO THE ACCESSIBILITY TO THE PAST**

Abstract author(s): Dimopoulou, Sotiria (Archaeologist)

Abstract format: Oral

This paper aims to present how school education contributes to knowledge and accessibility to the past. Is it possible to enable students to visit museums and archaeological sites mentally through educational programmes? Could this mental visit be an incentive for physical presence?

The paper also focuses on the fact that in today's multicultural school environment it is very important that students learn more about archaeological science and broaden their knowledge. The contribution of digital technology is also very important because it makes archaeological sites, – often unknown to the public –, accessible. Beyond this, and because today's education is based on digital technology, it becomes more attractive for both teachers and students to participate in such interactive activities. We will also examine how far this process enhances diversity and integrates the participants into a collective social experience without discrimination. Is it possible to break down preconceptions about countries with an important cultural heritage through archaeology? How far does the archaeologist contribute and how? Is it feasible for this educational system to be included in special schools with people with disabilities?

2 **PROFESSIONAL ARCHAEOLOGY, ALTERNATIVE VOICES AND CULTURAL SUSTAINABILITY**

Abstract author(s): Gerberg Høstrup, Sebastian (Aarhus University)

Abstract format: Oral

Many alternative viewpoints revolving around our past are continuously having an impact. Their public attraction coupled with the incommensurable nature in their relations to current scientific paradigms has led to a widespread hatred towards such viewpoints within professional archaeology. A general lack of functioning forms of involvement with alternative archaeology has led to a stalemate and efforts directed at engagement has seemingly evolved to a need for distancing professional archaeology entirely from that of alternative viewpoints. Archaeology therefore finds itself in an awkward position regarding the many alternative voices which find their way to the public. This paper questions earlier as well as present forms of professional engagement with alternative discourses, and from theoretical perspectives such as epistemological anarchism and democratic relativism a series of rationales behind facilitating new methods of involvement with which archaeology can recommence engaging the phenomenon are presented. These suggestive remarks emphasize a broad professional collaborative effort coupled with a positive discourse and the use of public inclusion as all being essential regarding future efforts guided towards involvement with the alternative archaeologies.

3 **SURVEYS ON SURVEYS ON SURVEYS: EXPANDING OUR DISCIPLINARY KNOWLEDGE TO IMPROVE ACCESSIBILITY**

Abstract author(s): D'Aprix, Michael (University College London)

Abstract format: Oral

Our understanding of what archaeology is, how it is done, who does it, and with what tools is at an all-time low and this lack of disciplinary knowledge creates a major hurdle for accessibility. This hurdle originates in the discipline's reliance on a 'craft process' where knowledge is passed from archaeologist to archaeologist in an almost hereditary method; experiencing, seeing, and feeling are the most important factors to learning how to be an archaeologist.

This incredibly valuable practice is becoming unsustainable as the diversity and innovation of archaeology expands. A mereological problem is developing where we can no longer understand how different parts of our diverse discipline work together. Archaeology is becoming inaccessible despite our best efforts to make archaeology as accessible as possible. Increasingly variable methods, standards, qualifications, and basic definitions make it difficult to communicate effectively and makes it difficult to teach or guide individuals to becoming an archaeologist.

This paper will address the complicated landscape of archaeology and how its increasing fragmentation has led to an overwhelming process that restricts accessibility. To overcome this issue, we must begin to utilize the most valuable resource in our field – a population of informed and knowledgeable practitioners who can help us understand the realities of archaeology from the bottom-up.

We can no longer divide our knowledge into smaller and smaller chunks and must start to understand, analyze, and make decisions informed by knowledge collected from the entire discipline, not specific groups, individuals, or organizations.

Much of the research necessary to understand archaeology on a more granular level is already being conducted albeit in a piecemeal and fragmented manner. This paper calls for an overarching and collaborative approach to surveying and understanding our field so we can make more well-informed decisions about our discipline's future.

4 CULTURAL SUSTAINABILITY THROUGH ACCESSIBILITY: EVALUATION TOOLS APPLIED TO THE NATIONAL ARCHAEOLOGICAL MUSEUM OF TARANTO (ITALY)

Abstract author(s): Frascella, Selene (University of Barcelona)

Abstract format: Oral

The approval of the Sustainable Development Goals has given a strong impetus to research on sustainability and cultural sustainability (UNESCO 2001). Despite efforts in this direction, a clear definition of the latter hasn't yet been formulated (Soini, Dessein 2016). The debate is still open. Nevertheless, what unites all the different ways of understanding this concept is the need to guarantee access to heritage as a prerequisite. Cultural sustainability cannot take place unless we first guarantee everyone a relationship with the heritage that is free of physical, cognitive, and social barriers. In this sense, the level of accessibility of heritage can be considered one of the indicators of cultural sustainability. However, measuring and evaluating accessibility can be challenging. This is due to the multiplicity of aspects, both qualitative and quantitative, that need to be considered, as well as the scarcity of resources that cultural institutions often face. In this context and in the framework of the project Intangible Cultural Heritage Confronting the Challenges of Cultural Sustainability (PID2021-123063NB-I00), the present research intends to contribute to this study field by presenting the results of non-participant observations of the audience at the National Archaeological Museum of Taranto (Italy). This method makes it possible to assess, through specific indicators, the effectiveness of the set-up as a means of communicative mediation between audience and exhibited works. Based on the degree of interaction between visitor and exhibition elements, these data make it possible to understand whether the museum's solutions meet the audience's needs and, above all, whether they constitute physical, perceptual, or cognitive barriers to heritage accessibility. In conclusion, this paper will demonstrate how through simple actions, often related to undervalued elements and requiring limited economic efforts, we can achieve better results regarding accessibility, measure the exhibition's role in cultural sustainability and, consequently, contribute to its practice.

5 ARCHAEOLOGICAL RESEARCH, INCLUSIVENESS, AND MUSEUMS: TRANSFORMING ARCHAEOLOGICAL NARRATIVES INTO A VEHICLE TO BUILD SOCIAL JUSTICE AND EQUALITY

Abstract author(s): Romagnoli, Francesca - Prados, Lourdes (UAM - Universidad Autónoma de Madrid)

Abstract format: Oral

The interpretation of the past in contemporary western societies is biased by Eurocentric and androcentric misconceptions. This is evident in archaeological museums in which only a part of the society is represented and valued as active in the construction of past cultures. A reassessment of exhibition contents from the viewpoint of feminist, gender, queer, and decolonial archaeologies is essential to foster inclusion and equality claiming the rights of representation of groups usually invisible in archaeological museums. We present a novel research project aimed at making visible such social groups: women, childhood, elderly persons, other ethnic groups, and other gender constructions. To reach this aim is basic to strengthen the collaboration between scientific research in archaeology, museum studies, and the socialisation of archaeological knowledge. We present and discuss some examples from the National Archaeological Museum in Madrid. The final goal is to make the museums inclusive spaces fostering collective social reflection and in which all the members of society could find themselves as active agents in the construction of the past. This is possible because the archaeological and scientific data show this diversity, and we are now able to tell the stories of groups invisible to this date. Embedding this diversity is a responsibility of Archaeology in the XXI century to build a more equal and just society in the present. To make a real social impact in archaeological museums it is basic that inclusive perspectives are systematically integrated in the permanent exhibition and not confined in temporary, thematic itineraries. Our project also includes the search for feasible solutions allowing the museums to easily implement their permanent exhibitions with gender perspective contributing to the generation of more inclusive museographies and, consequently, a better society. Some of these solutions will be briefly presented and discussed in this work.

6 HERITAGE FOR ALL? OPTIMIZING WAYS OF PRESENTING CULTURAL HERITAGE PLACES

Abstract author(s): Toreld, Christina (Bohusläns Museum) - Lindskog, Daniel (Arkeologibyrån) - Lindholm, Kristina (Bohusläns museum)

Abstract format: Oral

How can cultural heritage places become accessible for all? Is there such a thing as universal design when it comes to presenting cultural heritage? In our rights perspective-based project DigroKult we have investigated how people with visual and cognitive disabilities experienced filmed, audio-described and live guided tours in a series of cultural landscapes with prehistoric och historic remains in Bohuslän, Sweden. Our aim was to design more understandable and engaging cultural heritage experiences through the film-media, taking into account all aspects and preferences provided by our target groups. Building on our findings from the project we would like to discuss how cultural heritage places can best be made accessible to a wide public, regardless of ability or disability. By offering a wide range of different on-site and digital methods of presentations, we may both promote easy access to heritage places and at the same time minimize negative impact on the sites.

131 BETWEEN MINIATURES AND MODELS: INTERDISCIPLINARY APPROACHES FOR ANALYSING SMALL OBJECTS MEANINGS, USES, AND CONTEXTS IN THE MEDITERRANEAN AND SURROUNDING AREAS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Scaro, Agustina (Institute of Andean Ecorregions (CONICET) - Calomino, Eva (University of Granada)

Session format: Regular session

In recent years, specific analyses have been undertaken on small-sized objects, considered “special” finds in various archaeological sites in the Mediterranean and surrounding areas. Several categories have been proposed for their study and comparison, such as “models”, “miniatures”, “miniaturised items”, or “special finds”. In past research a wide variety of elements made of different raw materials (containers, figurines, amulets, seals, personal ornaments, domestic or recreational tools, among others) have been tentatively interpreted as religious or artistic objects. Today, new questions seek to quantify, contextualise and interpret these objects to understand their role in various practices of past societies.

This session aims to address interdisciplinary approaches to the study of small objects, problematising the proposed categories, their contexts, meanings, and possible roles. We encourage the participants to propose reflections on interdisciplinary theoretical and methodological aspects that underlay the concepts of miniature, model, and “special finds”, considering the type of objects included within these categories, and their explanatory capacities, the role of small objects in symbolic and ritual practices and daily activities, and in the interactions and influences between societies.

In the hope of comparing categories and theoretical and methodological aspects for the study of small objects, and their meanings and uses, as well as issues connected to their conservation and public presentation, we welcome papers from various contexts from prehistoric times to the contemporary period that contribute to a greater understanding of the Mediterranean and surrounding areas.

ABSTRACTS

1 MINIATURE ANCHORS, FISHING WEIGHTS... OR BOTH?

Abstract author(s): Yamasaki, Mari (Polish Centre of Mediterranean Archaeology, University of Warsaw) - Meneghetti, Francesca (Cyprus American Archaeological Research Institute)

Abstract format: Oral

The most salient class of material culture that stands for Bronze Age seafaring in the Mediterranean is constituted by stone anchors. These objects, first identified as anchors by Honor Frost in the 1960s, are large stones, roughly triangular or trapezoidal in shape, with one rope hole at the top and, in the so-called composite anchors, two additional stock holes at the bottom corners. Their size was widely diverse, from well over a ton to just a few kilograms.

This paper focuses on the smaller end of the category, on anchors so small that they could not be used in steadying even the lightest fishing boat. Ever since their discovery, the question was: are these examples of miniature stone anchors or are these fishing weights and, as such, not a case of miniaturised objects at all? Indeed, a very effective method called set-long-line fishing employs stone weights to hold the line to the bottom of the seafloor. However, admitting that these could be fishing tackle, their anchor-like shape would not have been functional. On the contrary,

particularly in the case of the composite stones, this would have made the weights less efficient in keeping the line in place!

We will review the evidence using theoretical and methodological approaches drawn from archaeology and neighbouring disciplines, for an interdisciplinary study of small objects; and seek an answer to the question: are these miniature anchors, fishing weights... or both?

2 FUNERARY FAKE FOOD: LEAD FEASTING UTENSILS, TERRACOTTA FOOD, AND SYMBOLIC CONSUMPTION IN PRE-ROMAN SOUTHERN ITALY

Abstract author(s): Hoernes, Matthias (University of Vienna)

Abstract format: Oral

Food, foodstuffs, and the objects used in the preparation and consumption of food have always been central to people's daily lives and to their sense and expression of social identity. This paper examines food-related miniatures and models from pre-Roman southern Italy in order to understand the role of food, its symbolic consumption, and the significance of „special objects“ in ritual practices. It examines two groups of „fake food“ objects that appeared in many funerary assemblages in Campania, Calabria, Basilicata, and Apulia in the 4th century BCE: firstly, feasting utensils made of lead, such as roasting spits, firedogs, candelabra, knives, and forks, and secondly, food-shaped terracotta objects such as fruit, bread, cheese, and sweets. The paper collects and classifies these objects, contextualises them within the burial assemblages and interprets the evidence at both local and supra-regional levels, also by comparing the funerary fake-food objects with items from cult places, as well as with images in contemporary funerary painting in some of these regions. Based on concepts of symbolic consumption and material citations, the paper aims to show how food-related miniatures and models had the potential to express social identities and to link the deceased and the living, the household and the tomb, as well as different places and times.

3 JUGGLING SIZE, TYPOLOGY, AND PEOPLE: AN INTERDISCIPLINARY STUDY OF THE SMALL-SIZE POTTERY FROM LATE BRONZE AGE CYPRUS

Abstract author(s): Meneghetti, Francesca (Cyprus American Archaeological Research Institute)

Abstract format: Oral

Miniatures and miniaturisation are common to many cultures and periods worldwide. However, scholarship has consistently focused on them only in the last decades. That left a gap in the study of small objects, which are usually interpreted as votives or cheap copies when found during excavations, following an interpretative bias that frequently does not take into account the context, objects' features and actors involved with them. Thus, how can we recognize in the archaeological record these artefacts and study them with the minimal bias possible?

To this end, the paper proposes an interdisciplinary approach to examine the small-size pottery from Athienou-Bamboullari tis Koukounninas (Cyprus). Dated between the 16th and 12th cent. BCE, Athienou-Bamboullari tis Koukounninas is a long-lived site located in the eastern Cypriot hinterland, whose Stratum III (late 16th-end of 13th cent. BCE) yielded circa complete 10000 vessels, among them a high amount of so-called miniature pots. Despite the final publication of the excavation, we do not know the exact quantity of the miniature pottery or the criteria used to identify it as such. Its function falls under the catchall votive umbrella, while it is unclear whether its context could be ritual.

Therefore, using a combination of archaeological analysis and anthropological theories, such as miniaturisation, ritual-ity, haptics and apprenticeship, the paper seeks to solve some issues around this small but mighty material.

4 POTTERY UNGUENTARIA. AN INTEGRATIVE APPROACH TO SMALL OBJECTS PRODUCTION AND CIRCULATION ACROSS THE WESTERN MEDITERRANEAN (6TH TO 1ST CENTURIES BC)

Abstract author(s): Scaro, Agustina (Institute of Andean Ecoregions - CONICET-UNJu)

Abstract format: Oral

The first pottery unguentaria appeared throughout the Mediterranean in traders' hands and were distributed from Palestine to the Iberian Peninsula. In general, they have not been the subject of comprehensive systematic studies. The main papers aimed to establish morphological typologies of chronological value, with contemporary use and manufacture periods since they may have been discarded or used as funerary goods once they were empty. The function of these small vessels is not evident. Due to their characteristics and reduced size, they have been called unguentaria, balsamarii, or lacrimarii, considering them as small containers of aromatic oils or cosmetic lotions related to funerary rites. This interpretation responds to unguentaria main finding in tombs, although other uses must not be disregarded, for example in cosmetics. This paper aims to present theoretical-methodological alternatives to evaluate these small finds in Western Mediterranean during the 6th to 1st centuries BC from an integrative perspective that includes qual-

itative-quantitative ceramic studies with archaeometric, contextual, and network analyses, looking to characterise the technological traditions linked to their production, as well as their uses and meanings, exploring their metaphorical, iconic, and skeuomorphic value. Considering the relationship between the life-cycle of this specific ceramic production and the networks established among the societies that produced and used them, ceramic unguentaria as analysis subjects will provide information on the way pottery production and circulation processes were linked to changes, continuities, and innovations in technological traditions, as well as their implications in the constitution of practice and identity communities structured throughout the Western Mediterranean.

5 THINKING THROUGH PEAK SANCTUARY RITUALS: APPROACHING THE MINDS EMBODIED AND EMBEDDED IN ANTHROPOMORPHIC FIGURINES FROM CRETAN PEAK SANCTUARIES

Abstract author(s): Solomou, Anastasia (Independent Researcher)

Abstract format: Oral

Minoan peak sanctuaries were in use from the EMIII/MMI-LMIA/LMII periods in Crete. A range of interpretations have been suggested regarding the nature of these sites, with that of spaces for the performance of religious rituals involving drinking, feasting, and deliberate ritual breaking of objects such as figurines or cups being most widespread. One of the defining characteristics of these sites are the clay anthropomorphic figurines, which are observable in large quantities on nearly all such sites, and which are seldom associated with other contexts. The exclusivity of these artefacts renders them one of the most suitable areas of research with a view to re-examining and re-interpreting peak sanctuaries, providing information regarding the differentiating qualities of these sites in relation to other ritual or domestic ones. This paper explores the clay anthropomorphic figurines which depict an individual standing upright, with raised arms, folded at the elbow. The analysis follows a materialistic and cognitive approach, drawing on concepts of the distributed mind with a view to highlighting the role of these objects as part of a larger cognitive network, as a shared exographic memory system, shared by the participants of the peak sanctuaries throughout Crete. Through this approach the figurines are seen as vital active constituents of the cognitive processes taking place in these sites.

6 "SPECIAL FINDS" IN THE JEWISH QUARTER OF LORCA CASTLE: THE STUDY OF METAL OBJECTS

Abstract author(s): Molina-Campuzano, María Isabel (University of Murcia)

Abstract format: Oral

This proposal focuses on the study of metal objects recovered from the late medieval Jewish quarter of Lorca castle (Murcia, Spain). It was located in the south-east of the Iberian Peninsula and it was a defensive, residential and symbolic place for power during the Middle Ages. In addition, this castle occupied a defensive role as an active border zone between the Christian and the Islamic areas of influence (Castilian kingdom and Nasrid Kingdom of Granada).

Since 2009, an interdisciplinary team from the University of Murcia has been leading a research project, in order to define the particularities of the Jewish presence in Lorca from a strictly material perspective. Within the framework of interdisciplinary, this research includes an archaeological study of metal objects recovered from the domestic area of the Jewish community. The aim is to explain some of the "special finds" (such as horse and personal ornaments, thimbles, rods) and the archaeological context of their discovery (houses and spaces), since the provenance of metal objects is often unknown. Furthermore, another objective is to determine the possible usefulness of the pieces (daily activities) and the possible exchanges and influences that took place between Christian society and the Jewish minority located in the castle (14th-15th centuries).

To conclude, this paper presents one part of an interdisciplinary study of the Jewish castle of Lorca, with a recent research project (Séneca - 21979/PI/22) and it also takes part of the PhD I am carrying out at the University of Murcia.

7 EGYPT AND THE WESTERN MEDITERRANEAN. TOWARDS AN UNDERSTANDING OF EGYPTIAN SPECIAL FINDINGS IN THE IBERIAN PENINSULA

Abstract author(s): CALOMINO, EVA (Departamento de Prehistoria y Arqueología. Facultad de Filosofía y Letras, Universidad de Granada)

Abstract format: Oral

It is a well-known fact that Egypt has had great influences, maintaining various types of commercial and political relationships, with other institutions and social groups in several areas of the eastern, central, and western Mediterranean. It is towards the beginning of the first millennium BC that there is a considerable increase in the archaeological record in the Phoenician colonies of the West, the western Mediterranean being integrated into the circuit of exchanges and relations more assiduously and including the appearance of Egyptian objects in such sites. It becomes evident that the problem of the presence of such objects found in the western Mediterranean -specifically in the Iberian Peninsula- is

closely linked to the mercantile and intermediary activities of the Phoenician colonies, which were related to Egyptian and Levantine port centers -in addition land routes- and with other commercial colonies. Although works and publications have been addressed about the understanding of the Phoenician case, the exchange routes and the archaeological sites and Phoenician-Punic objects in the western area, collections and sets of objects of Egyptian origin in the Iberian Peninsula -which some authors recognize as 'orientalizing'-, an exhaustive identification and systematization has not been carried out in the Iberian Peninsula about the diverse sets of Egyptian objects, their finding contexts and the possible relationship with areas of commercial origin and exchange. Among these sets, various objects classified as 'small finds' have been found -which usually include figurines, scarabs, amulets, seals, jewelry, etc-. The communication is a proposal to incorporate the study of special findings of Egyptian origin found in archaeological sites of the detailed area and to preliminarily interpret how their study contributes to the knowledge of the relations between the eastern and western Mediterranean towards the first millennium BC.

136 PARISH BURIALS AND MEMORIALS: COMMUNITY MEANINGS AND ENGAGEMENT

Session theme: 3. Heritage Narratives and Representations

Session organisers: Mytum, Harold (University of Liverpool) - Lipkin, Sanna (University of Oulu)

Session format: Discussion session

Churches and their associated burial grounds represent one of the most visible elements of heritage in many communities across Europe. These heritage assets may be managed by church or local authorities, but they are visited and valued by local communities even if they are now closed to new burials. This session explores how projects from a variety of countries have engaged local communities in recording, analysing, managing, or interpreting their churches and burial grounds. Local heritage assets such as these provide excellent resources for formal and informal schools and adult education, and they can also be interpreted to enhance tourism. Natural and cultural conservation can be promoted, although papers may explore how conflicts between competing priorities have been resolved. Many churches and graveyards provide valuable quiet places in urban environments, and archaeological perspectives can demonstrate how such spaces can enhance wellbeing and community identity. Some churches have active congregations that do not appreciate the heritage dimension of the places in their care, and those now redundant can be given new significance through archaeologists encouraging public engagement and providing interpretation. This session explores the many ways in which archaeologists and communities engage with churches and burial grounds and shares best practice and innovative approaches.

ABSTRACTS

1 DEVELOPING A COMMUNITY APPRECIATION OF MONUMENTS BEYOND THEIR TEXTS: EXPERIENCES IN ENGLAND AND WALES

Abstract author(s): Mytum, Harold (University of Liverpool)

Abstract format: Oral

The community recording and interpretation of burial grounds has been a popular enterprise in England and Wales for decades, but until recently efforts were largely concentrated on recording the inscriptions. Recent projects have updated the Council for British Archaeology recording system and produced advice documents and examples of interpreting the material aspects of memorials. This paper considers the earlier system and the revised version, and how it has been used – or ignored – by local communities. The community value of burial grounds is not only related to heritage, and the charity Caring for God's Acre provides training and encouragement to engage with these landscapes as places of both natural and cultural heritage. The varied approaches to conservation and management have to build on existing community interests and assumptions, but can challenge the latter by training and exposure to new ways of appreciating the resource. Moving the community beyond an appreciation of churchyard ecology and inscriptions is the challenge faced by archaeologists, but there is some evidence that the richer understanding coming from an archaeological approach is taking hold in some locations.

2 AT THE HEART OF THE COMMUNITY: TRANSFORMATION OF THE PARISH CHURCH AND GRAVEYARD OF ST MARY'S, KILKENNY

Abstract author(s): O Drisceoil, Colín (National Monuments Service)

Abstract format: Oral

For eight centuries the medieval parish church of the Blessed Virgin ('St Mary's') was at the heart of the local community but it had fallen into serious dereliction in the late 20th century. Between 2014-17 state and local authorities, community organisations, architects, archaeologists, designers and builders worked collaboratively to transform the

thirteenth century church and its graveyard from this dereliction into the award-winning 'Medieval Mile Museum'. Archaeological excavations (by the speaker) that were undertaken in tandem with the conversion brought to light extensive medieval and early modern funerary, structural and artefactual remains that effectively materialised the key spiritual roles the church played for the merchant and wider urban community throughout its long history. Whilst these discoveries challenged the progress of the project, the level of community interest in the excavations ensured that archaeology was proactively and enthusiastically used to define an architectural solution. The result is a successful melding of the old and the new that has restored the church to its rightful place at the heart of the urban community as a major new tourist attraction for the city.

3 COMMUNITY AND ARCHAEOLOGY AT ST PATRICK'S ROMAN CATHOLIC CHURCH, TOXTETH, LIVERPOOL, UK: EVOLVING RELATIONSHIPS

Abstract author(s): Fairley, Anna - Mytum, Harold (University of Liverpool)

Abstract format: Oral

St Patrick's is a historically significant Catholic church in Liverpool which was completed in 1827 and is still in use. The church members recently contacted the Department of Archaeology at the University of Liverpool for advice on how to manage their heritage. This has led to an evolving relationship between the church authorities, community volunteers, and the wider community that has involved recording and investigating various aspects of the heritage. This has included work in the crypt and its burial pits and vaults, as well as in the graveyard studying the extant memorials. This paper will explore the ways in which archaeological professionals, students, parish members and the local community have been involved with or have learned from these collaborations. We will also consider how different aspects of the past matter more to the various stakeholders, and that these different interests lead to success if they are held in positive balance.

4 CHURCH BURIALS AND MEMORIALS: EXPERIENCES WORKING WITH THE PARISH AND THE PUBLIC IN HAUKIPUDAS, FINLAND

Abstract author(s): Lipkin, Sanna (University of Oulu) - Kallio-Seppä, Titta - Tranberg, Annemari (Museum of Torne Valley) - Väre, Tiina (University of Oulu)

Abstract format: Oral

This paper will present our experiences with working with Haukipudas Parish in Oulu. In collaboration with the parish, we have surveyed the 17th and 18th-century church burials below timber floor and conducted scientific research on the remains and associated coffins and fabrics. In addition, we have documented the old grave memorials and cemetery flora in the parish's old cemetery that is no longer in use. For local people the cemetery bears both memories of communality and kinship and they have expressed how it should be cherished in the future. As our work has raised public interest, the parish representatives wanted to open a museum exhibition at the church. This exhibition, opened in September 2022, represents our latest research results and is located in the old sacristy of the church. In addition, with local museums we have produced a series of temporary exhibitions. We find that these exhibitions have been an easily approachable way to give the audience a possibility to discuss death that is often found a difficult and troublesome topic. Our experience is based on both discussion with the parish representatives, the audience, and the feedback surveys on the exhibitions.

139 CLIMATE CHANGE, HUMAN IMPACT AND THE CHALLENGES OF ASSESSING THE SUSTAINABILITY OF ARCHAEOLOGICAL HERITAGE

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Castiello, Maria Elena (Institute of Archaeological Sciences, University of Bern; Incipit-CSIC) - Morera Noguer, Núria (Universitat Autònoma de Barcelona; German Archaeological Institute) - Antolín, Ferran (German Archaeological Institute; IPAS, University of Basel)

Session format: Regular session

Archaeological heritage is currently affected by a large number of natural hazards that are a direct consequence of climate change: frequent extreme weather events, erosion, aridification, flooding, sea level rise, fires, the melting of permafrost, landslides, etc. and by a certain share of damages caused by human aggression or intervention. Climate change and its impacts on human societies has proved to be the cause of increased urbanisation processes and changes in land use and land cover, which will further develop in unprecedented population displacements in the next future. This is inevitably going to damage still uncover and unknown archaeological sites, affect existing exposed ones and generate new difficulties for the sustainable preservation of archaeological heritage at a scale we have not experienced before.

This session would like to gather different approaches to site vulnerability assessment, from remote sensing analysis, to site monitoring, including big-data and modelling practices developed within such a framework. The goal of the session is to discuss methodological challenges, the value of different scales of analyses and the difficulties in obtaining a full view of the multiple scales of hazards that can affect archaeological heritage today and in the future for a better and more strategic protection and research policy. Success stories of sustainable site protection measures after risk assessment are also much encouraged.

ABSTRACTS

1 THE CHERISH TOOLKIT: MONITORING AND UNDERSTAND THE IMPACTS OF CLIMATE CHANGE ON THE CULTURAL HERITAGE OF OUR SEAS AND COASTS

Abstract author(s): Shaw, Rob - Corns, Anthony - Pollard, Edward (The Discovery Programme) - Barker, Louise - Driver, Toby - Genders Boyd, Hannah (Royal Commission on the Ancient and Historical Monuments of Wales) - Davies, Sarah - Robson, Patrick (Department of Geography and Earth Sciences, Aberystwyth University) - Craven, Kieran (Techworks Marine)

Abstract format: Oral

The CHERISH climate change and coastal heritage project began in January 2017. Phase 1 of the project, which ran until June 2022, involved the survey and investigation of some of the most iconic coastal locations in Ireland and Wales. A variety of methods were employed by the CHERISH team to monitor and understand the past, present and near-future impacts of climate change on the rich cultural heritage of our seas and coasts.

This paper summarises the findings within the CHERISH Good Practice Guide which shares our experiences and practices by detailing the CHERISH 'toolkit' – the technologies and methods we employed. The guidelines focus on individual methods within our 'toolkit', and provide overview, analysis and evaluation across a standardised set of criteria covering aspects such as applicable environments, scale of coverage, resolution and accuracy, cost and outputs.

For each toolkit approach a case study showcases how the method was employed at a CHERISH study site. The CHERISH 'toolkit' represents an integrated and multidisciplinary approach; the individual methods were rarely used in isolation. We have therefore drawn together the analysis of individual methods as a visual overview for comparison to help guide users and decision making. Here, we also examine which are best employed to monitor weather and climate change impacts in the coast zone. In addition we showcase the integrated approach with our final set of case studies bringing the 'toolkit' together using the example of two study sites, Dinas Dinlle coastal hillfort in Wales and Ferriter's promontory fort in Ireland.

2 ASSESSING THE RISK OF THE ARCHAEOLOGICAL HERITAGE OF NORTHEASTERN AFRICA. A BAYESIAN NETWORK APPROACH

Abstract author(s): Laguna-Palma, David (Department of Prehistory and Archaeology, University of Granada) - Palacios, Olga (Laboratory of Quantitative Archaeology, Department of Prehistory, Autonomous University of Barcelona) - Mokránová, Katarína (Centre for Urban Networks Evolutions, Aarhus University)

Abstract format: Oral

Archaeological heritage in northeastern Africa is currently under anthropic and environmental processes causing a fast-paced disappearance of sites. Whilst the forces of change are visible (e.g., urban expansion, road building, agricultural intensification, socio-political conflicts, and climate change), their long-term consequences are poorly understood.

In this study we develop a predictive model assessing the probabilities of disappearance of archaeological heritage of the Marmarica region (NE-Libya/NW-Egypt), stretching from the Eastern Mediterranean coast to the inland oasis of Al-Jaghub and Siwa bordering the Libyan desert. Since there was not a prior reliable dataset of the archaeological sites located in this region, we have built a reliable dataset using satellite imagery and historical resources to locate them and, with paleoclimatic models to characterise their landscape conditions. With this data, we have built a predictive Bayesian network model quantifying the importance of the anthropic and environmental factors for the disappearance of the heritage and predicting the risk of some still preserved sites to be destroyed in the future.

Our model shows the potential to predict the degradation or the loss of archaeological heritage, by accounting for and predicting the destructive effects that human and natural phenomena have on archaeological sites. The model accounts for the threats to archaeological sites posed by climatic variability, increased precipitation, sea level rise, natural erosion, wind-weathering, agriculture, and urban development, with the possibility to account for additional anthropic and environmental variables through the use of a transparent and reusable script.

3 REMOTE SENSING SUPPORT IN THE AFTERMATH OF CLIMATE-RELATED IMPACTS ON ARCHAEOLOGICAL SITES: FLOODS, WILDFIRES AND EROSION

Abstract author(s): Marzban, Pouria (German Archaeological Institute - DAI - Scientific Computing Unit, Central Research Services; German Research Center for Geosciences - GFZ – Section 2.1, Physics of Earthquakes and Volcanoes) - Iacono, Elvira - Fritsch, Bernhard - Ducke, Benjamin (German Archaeological Institute - DAI - Scientific Computing Unit, Central Research Services)

Abstract format: Oral

Extreme climate events, which are set to occur at increasingly higher frequency, cause severe damage to cultural heritage sites. The German Archaeological Institute (Deutsches Archäologisches Institut; DAI), together with its partner organizations, has initiated the KulturGutRetter emergency framework (www.kulturgutretter.org) to assist with heritage disaster recovery around the globe. Our team's role is to provide cost-effective and rapid remote sensing support to damage assessment and planning on the ground. We provide recent case studies from Pakistan and Sicily, and discuss approaches to monitoring damage using remote sensing and GIS. In the case of Pakistan, we analyzed back-scatter changes in radar data from Sentinel-1 to compute flood extent. Five vulnerable sites were part of the assessed area, some of which were partly submerged and damaged in the event. We used Very High Resolution (VHR) satellite imagery to assess damage in more detail. In the case of Sicily, our focus was on the archaeological park of Selinunt on the south-western coast. Here, several wildfires had been reported, especially during Spring and Summer. We used Multispectral (MS) data from Sentinel-2 and applied the dNBR (difference Normalized Burn Ratio) to estimate the extents of burned areas. Again, we further evaluated the affected sites using VHR satellite imagery. In addition, we analyzed coastal erosion of nearby areas. In all cases, we used auxiliary GIS datasets from various sources to better understand the extents and areas of damages to sites. Our GIS-based desktop assessment was supported by aerial imagery, photogrammetric models, geological maps and archaeological plans, as well as field survey data, to provide local details. The result is a multi-source data package which can be used further for long term monitoring of sites or to help archaeologists to better understand and manage the situation locally.

4 PREDICTING SITES AT RISK DUE TO CLIMATE CHANGE: NEOLITHIC SITES IN THE NW MEDITERRANEAN AS A CASE STUDY

Abstract author(s): Morera Noguera, Núria (Universitat Autònoma de Barcelona; German Archaeological Institute) - Castiello, Maria Elena (Institute of Archaeological Sciences, University of Bern; Incipit-CSIC) - Antolín, Ferran (German Archaeological Institute; IPAS, University of Basel)

Abstract format: Oral

Archaeologists are more and more concerned about the risks menacing archaeological heritage due to climate change. It becomes urgent not only to protect sites that are already known but also to establish priorities to conduct systematic prospection work in areas suitable for past human occupation before it is too late. Since the systematic investigation of all areas at risk will not be possible, informed decisions will need to be made fast. One way of achieving informed decisions is to base them on rich datasets that allow to generate predictions on where new sites could most likely be located. Because this will be a time-dependent factor, both influenced by changing settlement patterns and past climate, these predictions will need to be temporarily constrained for a particular time slice in the past.

This paper will focus on the Neolithic period in NW Mediterranean area (from the Ebro to the Rhine rivers), an area where we have several thousands of radiocarbon dated sites between 5800 and 2300 BC. Based on this large dataset, a machine learning approach was used to predict settlement location in different time periods: 5900-5300, 5300-4500, 4500-3100, 3100-2300 BC. This paper will focus on the potential of these maps as a basis to predict areas with high-risk under climate change using GIS. For this purpose we will cross-analyse these predicted locations with existing models on climate-change derived processes (sea-level rise, land-slides, sea events, erosion and aridification) with the goal of identifying the most urgent areas to be investigated in the near future with a focus on the Neolithic period. The ultimate goal would be to generate similar models for different time periods and the many challenges of the approach would be a great basis for discussion in this session.

5 LARGE-SCALE ARCHAEOLOGICAL HERITAGE DOCUMENTATION AND THREAT ASSESSMENT IN THE INDUS RIVER BASIN: FROM THE TRANSNATIONAL TO THE LOCAL

Abstract author(s): Suganya, Kuili (University of Cambridge) - Besga, Iban (Catalan Institute of Classical Archaeology) - Jabbar, Junaid (University of Cambridge) - Gregorio de Souza, Jonas (Universitat Pompeu Fabra) - Khan, Afifa (University of Cambridge) - Orengo, Hector (Catalan Institute of Classical Archaeology; Catalan Institution for Research and Advanced Studies) - Roberts, Rebecca C - Tomaney, Jack - Vafadari, Azadeh - Petrie, Cameron A (University of Cambridge)

Abstract format: Oral

This paper presents the work of the ‘Mapping Archaeological Heritage in South Asia’ (MAHSA) project, which is creating an open access database of archaeological sites in the Indus River basin (Pakistan and northwest India). This is a tool for heritage management, threat monitoring, and public information in the face of threats from urban encroachment, agricultural expansion, and natural disasters. We highlight the process by which locations of archaeological significance are documented. We explore the factors which contribute to the preservation of an archaeological site, such as ascribed cultural significance. We also consider the factors that contribute to destruction, including infrastructure development, or uses and modification of archaeological mounds for agriculture or industry (for example, mining and brick kilns).

We outline the MAHSA project workflow, which is engaged in the documentation of archaeological settlement mound features across the Indus River basin and surrounding regions. Using historical maps, we identify potential archaeological mounds using manual methods and machine learning, the latter proving to be effective in extracting data on potential archaeological sites at scale. The detected mound data stands valid only with cross-verification from legacy data, satellite imagery, and, most importantly, ground-truthing in the field. Validation of hundreds of unknown (and known) archaeological mounds in the Indus River Basin and surrounding regions is being carried out through systematic data collection using Open Data Kit (ODK), a customized android based digital survey form.

The process of assessing archaeological significance becomes challenging when one starts observing structures (e.g., shrine, tomb, and cemetery) at these mound locations. We discuss: (a) the cultural significance of subtle, modern looking structures; and (b) ways of relating to the past as a place through markers, oral histories, customs, and rituals. Such considerations are important in the preparation of cultural protection measures and can likewise support sustainable infrastructure development policies.

6 CLIMATE CHANGE AND COASTAL ARCHAEOLOGY IN THE MIDDLE EAST AND NORTH AFRICA: MAPPING PAST DISTURBANCES AND ASSESSING FUTURE THREATS

Abstract author(s): Westley, Kieran (School of Geography & Environmental Sciences, Ulster University) - Andreou, Georgia (Archaeology, University of Southampton) - Nikolaus, Julia (School of Geography & Environmental Sciences, Ulster University)

Abstract format: Oral

Climate change is acknowledged as one of the key threats facing coastal archaeology today with particularly severe impacts coming from flooding and erosion. However, many places, such as multiple countries across the Middle East and North Africa (MENA) region, lack secure baseline data on the location and condition of archaeological sites, key threats and likely impacts on these sites. This presentation will outline ongoing research by the Maritime Endangered Archaeology (MarEA) project, which aims to document and assess threats to marine and coastal archaeological sites across MENA. Climate change-related work done by MarEA has been, to date, carried out at two scales of analysis. Firstly, regional-scale threat assessment which aims to summarize trends in threat and vulnerability across the region and over the coming century. Secondly, local- to site-scale studies which seek to provide detailed information on past disturbances and future threat at a scale appropriate for heritage management. In addition to estimating the likelihood of future threats, this research also highlights the complexity of change in the coastal and marine zone where both “natural” and “anthropogenic” forces interact to modify (sometimes exacerbating) the potential impact of climate change. An example of this is accelerated coastal erosion caused by illegal sand mining which, although unrelated to climate change, has the potential to locally enhance its destructive effects on coastal archaeological sites. Examples are presented from ongoing work in Libya and Oman. The overall intention of this presentation is to illustrate methods which could redress the frequent absence of baseline data on climate change impacts and coastal cultural heritage in the MENA region, and also provide information which can be used to refine projections of climate change impact in the near future.

7 AN ARCHAEOLOGICAL HERITAGE UNDER THREAT IN THE NADROGA-NAVOSA PROVINCE (VITI LEVU, FIJI): FIRST ASSESSMENT AND THE NEED FOR ACTION

Abstract author(s): Duval, Hervé (CReAAH - UMR 6566; Société Jersiaise) - Lancini, Loredana (CReAAH - UMR 6566, Le Mans Université) - Nunn, Patrick (University of the Sunshine Coast) - Compatangelo-Soussignan, Rita (CReAAH - UMR 6566)

Abstract format: Oral

The archaeological heritage of the Fiji Islands is subject to the consequences of climate change but also, and above all, to a strong anthropization, which results in a rapid and extensive urbanization process. Industries established for several decades have contributed to initiating this phenomenon by destroying or heavily impacting archaeological sites whose heritage value is particularly important to local populations. As a matter of fact, in this society where oral transmission is still very much alive, collective memory is of crucial importance for the understanding of sites closely related to ancestors and the development of modern villages. In fact, the destruction of this heritage, whatever the cause, constitutes an unprecedented loss for the locals and an archaeological challenge of primary importance.

This paper proposes to provide an assessment based on the results of the 'Environmental Changes and Heritage in Atlantic and Pacific Hillforts' project, the aim of which was to carry out surveys on lost sites whose location was known by local populations and shared through their oral traditions. A presentation of several sites makes it possible to report on the situation in the province of Nadroga-Navosa and the discussion proposes to extend to coastal sites threatened by very active erosion. After this general observation, solutions are proposed to protect this threatened heritage. Over time, the Fiji population has had to adapt their living spaces to the rhythm of climate change and today this topic is like a mirror in which the archaeologist can decide to be either an observer or an actor (activist?).

8 MOVING OBJECTS INTO THE MOUNTAIN: A SOLUTION TO A GROWING CRISIS

Abstract author(s): Vinje-Christensen, Sigrid - Espedal, Mette (University Museum of Bergen)

Abstract format: Oral

Archaeological collections can be subject to numerous hazards if stored in unsuited and dated storage facilities. An example of this can be seen at Bryggens Museum, located in Bergen, Norway, where the archaeological collections face several threats connected to climate change and human impact.

The storage at Bryggens Museum was built in 1976 and was at the time a modern and up to date storage facility. However, over the years technology and knowledge of storing objects has advanced and the facilities are no longer fit for purpose. The collections are stored in the museum basement, located below sea level. With the museum situated close to the harbour, just under 100m from the sea, climate change, causing the sea level to rise, will ultimately lead to flooding, and the entire collection of approximately 650.000 objects could be compromised.

With unstable and humid conditions outside, it is important that the storage secures stable relative humidity conditions. However, the climate control system has malfunctioned on several occasions, as well as the water pipes that run in the ceiling have had leakages in the past, further increasing the relative humidity in the storage. This combination has previously led to several mould outbreaks, and despite a mould sanitation project to solve the issue, mouldy objects continue to be discovered.

The collection consists of several material groups, including leather, metal, and glass, and thus calls for different storage conditions. Unfortunately, this is not possible in the existing storage in the basement of the museum. The solution to all these hazards is a new purpose-built storage, inside a mountain hall, where the emphasis has been placed on long-term storage and sustainability.

A. MONITORING THE NATIONAL ARCHAEOLOGICAL RESERVE. ASSESSING THE PHYSICAL CONDITION OF MORE THAN 4000 SITES

Abstract author(s): Os, Bertil - Bouwmeester, Jeroen - Eerden, Monique - Mauro, Guido (Rijksdienst voor het cultureel erfgoed)

Abstract format: Poster

One of the tasks of the Dutch Cultural Heritage Agency is to protect cultural heritage so that future generations can learn about, enjoy and connect with their common ancestry. To protect archaeological sites from developments and to ensure that the information they contain is preserved in the event of a threat, the Dutch government has listed some 1460 archaeological monuments, comprising more than 4000 individual sites. But what is the current state of these sites?

To answer this question, the agency set up a monitoring program. The monitoring program had two main objectives:

- to assess the physical condition of all monuments in order to estimate the resources needed for restoration and conservation where necessary;

- to involve and inform landowners, particularly private landowners, in the maintenance and conservation of the sites.

The monitoring scheme consisted of a visual inspection and a probing plan to assess the integrity of the ground and the conservation potential. Conservation potential was estimated by proxy using parameters such as redox boundary depth, carbonate availability and lithology. In order to involve the landowners, a passport was developed for each monument. This passport included information on the location, boundaries and archaeological information (period, type) and was offered together with a monument shield.

It took twelve teams of two archaeologists about two years to complete the monitoring work. A further year and a half was needed for data processing and reporting.

In this presentation we will introduce the method and report on the physical status of the archaeological monuments in the Netherlands, the most important threats and remedial solutions, as well as some examples of passports.

141 IRON AGE BIO CULTURAL DYNAMICS IN CONTINENTAL EUROPE AND BRITAIN: PATTERNS AND PROCESSES FROM A MULTIDISCIPLINARY PERSPECTIVE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Milella, Marco (Institute of Forensic Medicine - Department of Physical Anthropology - University of Bern) - Zink, Albert (Eurac Research - Institute for Mummy Studies) - Armit, Ian (University of York) - Laffranchi, Zita (Institute of Forensic Medicine - Department of Physical Anthropology - University of Bern) - Zingale, Stefania (Eurac Research - Institute for Mummy Studies)

Session format: Regular session

The Iron Age is a time of great interest from a biological and cultural perspective in both Britain and continental Europe. The geographic and chronological heterogeneity of this period, however, calls for the application of multidisciplinary research approaches, able to evaluate and compare observed biological and sociocultural patterns. Inspiration for this session are two recently funded multidisciplinary research projects on Iron Age biocultural dynamics (CELTUDALPS and COMMIOS). The session seeks to bring together contributions from a wide range of specialists involved in the bioarchaeological, isotopic, and paleogenetic investigations of Western European and British Iron Age contexts. The main aim is to provide a platform for scientific exchanges between different experts and promote a multidisciplinary discussion of a range of topics including (but not necessarily limited to) Iron Age social differentiation, diet, mobility, population dynamics, family relationships, and their biological and cultural correlates. The session will also be an ideal platform for sharing and discussing updates and results of the CELTUDALPS and COMMIOS projects.

ABSTRACTS

1 THE CELTUDALPS PROJECT: A MULTIFACETED PERSPECTIVE ON LATE IRON AGE TERRITORIAL MOBILITY AND GENETIC VARIATION IN NORTHERN ITALY AND SWITZERLAND

Abstract author(s): Milella, Marco - Laffranchi, Zita (Department of Physical Anthropology - Institute of Forensic Medicine - University of Bern) - Stefania, Zingale (Institute for Mummy Studies, Eurac Research, Bolzano) - Löscher, Sandra - Arenz, Gabriele (Department of Physical Anthropology - Institute of Forensic Medicine - University of Bern) - Coia, Valentina - Paladin, Alice - Zink, Albert (Institute for Mummy Studies, Eurac Research, Bolzano)

Abstract format: Oral

The steady increase of biogeochemical and biomolecular data is refining traditional anthropological and archaeological hypotheses about the genetic history and territorial mobility patterns of European human groups during the Late Iron Age. Compared with other geographic areas, however, only few data are yet available for those “Celtic” groups occupying the Northern Italian and Swiss territories during this period. Even fewer are collaborative research projects trying to compare these different types of information for these geographic areas. The resulting knowledge gap is especially relevant given the archaeologically and historically documented networks (cultural, commercial, and migratory) between the two sides of the Alps in this period.

With CELTUDALPS we aim to address these issues by means of a multidisciplinary analysis of a large (ca. 300) individuals representing La Tène cultural groups inhabiting modern Switzerland and Northern Italy between the 4th -1st centuries BCE. By applying a range of methods including the analysis of ancient DNA and isotopic ($\delta^{15}\text{N}$, $\delta^{13}\text{C}$, $\delta^{34}\text{S}$, $\delta^{18}\text{O}$, $87\text{Sr}/86\text{Sr}$) data, and the quantitative analysis of funerary patterns, CELTUDALPS aims to: (a) estimate the differences and similarities in territorial mobility between these groups; (b) reconstruct their genetic history and variation; (c) explore the possible links between mobility, kinship patterns, and social organization in each area. Here, we present the theoretical background and research design of the project, illustrate the state of the art of the project with examples selected from our most recent results, and discuss the planned next steps of our research.

2 „CELTS“ UP & DOWN THE ALPS. NEW ISOTOPIC INSIGHTS ON MOBILITY IN PRE-ROMAN VERONA (NE ITALY, 3RD -1ST C. BCE)

Abstract author(s): Laffranchi, Zita (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Zingale, Stefania (Institute for Mummy Studies, Eurac Research, Bolzano) - Salazar García, Domingo (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València; Department of Geological Sciences, University of Cape Town) - Lösch, Sandra - Arenz, Gabriele (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Coia, Valentina - Paladin, Alice (Institute for Mummy Studies, Eurac Research, Bolzano) - Salzani, Luciano (Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Verona, Rovigo e Vicenza) - Zink, Albert (Institute for Mummy Studies, Eurac Research, Bolzano) - Milella, Marco (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern)

Abstract format: Oral

The European Late Iron Age (4th -1st centuries BCE) features intense trade networks and movements of people. The settling in the Italian peninsula of transalpine human groups exemplifies the dynamism of this period. Preliminary isotopic data ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$ and $\delta^{18}\text{O}$) from a subset (N=49) of individuals from Seminario Vescovile (SV-Verona, Italy 3rd -1st c. BCE) highlighted few nonlocals in this pre-Roman necropolis. Here, we expand our previous analyses of SV, by means of a larger sample (N=127, i.e., ca. 70% of buried individuals) and the inclusion of additional isotopic ratios, in order to provide a more solid estimate of territorial mobility, and of the possible links in this community between provenance, sex, and funerary treatment. To this aim we analyzed the isotopic ratios of sulfur ($\delta^{34}\text{S}$; N=127 - 61 adults and 66 nonadults) and strontium ($^{87}\text{Sr}/^{86}\text{Sr}$; N=57: 51 adults and 6 nonadults) from respectively bone collagen and dental enamel. We used as proxy of locally bioavailable $\delta^{34}\text{S}$ and $^{87}\text{Sr}/^{86}\text{Sr}$ ranges two standard deviations from the isotopic mean of archaeological faunal remains and modern plants, and checked for individuals falling outside this range. We then explored differences between sexes and funerary features in $\delta^{34}\text{S}$ and $^{87}\text{Sr}/^{86}\text{Sr}$ by means of Mann-Whitney tests. Human $\delta^{34}\text{S}$ and $^{87}\text{Sr}/^{86}\text{Sr}$ ratios average $5.7 \pm 1.7\text{‰}$ V-CDT and 0.709756 ± 0.001430 respectively. Minimum estimates of nonlocals range from 3 (2.5%) for $\delta^{34}\text{S}$, to 8 (14%) based on $^{87}\text{Sr}/^{86}\text{Sr}$. At least in two cases, these show isotopic values suggesting an alpine/transalpine origin. Isotopic data do not show an association with individual sex or funerary treatment. These new results call for a revision of previous estimates of mobility at SV, and supports a link between this human group and both alpine and transalpine contexts.

3 GENETIC HISTORY OF LATE IRON AGE (4TH - 1ST CENTURY BCE) HUMAN GROUPS FROM BOTH SIDES OF THE ALPS

Abstract author(s): Zingale, Stefania (Institute for Mummy Studies, Eurac Research, Bolzano) - Laffranchi, Zita (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Paladin, Alice (Institute for Mummy Studies, Eurac Research, Bolzano) - Lösch, Sandra (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Dori, Irene (Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Verona, Rovigo e Vicenza; Department of Biology, University of Florence) - Müller, Felix (Bernisches Historisches Museum, Bern) - Kaeser, Marc-Antoine (Laténium, parc et musée d'archéologie, Neuchâtel) - Coia, Valentina (Institute for Mummy Studies, Eurac Research, Bolzano) - Milella, Marco (Department of Physical Anthropology, Institute of Forensic Medicine, University of Bern) - Zink, Albert (Institute for Mummy Studies, Eurac Research, Bolzano)

Abstract format: Oral

During the Late Iron Age (La Tène, 4th-1st centuries BCE), various human groups sharing cultural elements, commonly referred to as “Celts”, were involved in migration processes and settled in the Italian Peninsula after crossing the Alps. The current knowledge of these people is largely drawn from osteological, isotopic, archaeological, and historical evidence. However, the genetic history of these groups from both north and south of the Alps remains unexplored.

This paleogenomic study aims to analyze if the cultural similarity of these people is reflected in their genomic makeup. Moreover, it intends to study the genetic relationships between different La Tène groups from north and south of the Alps, and other ancient and present-day populations from Europe.

We performed molecular analyses (shotgun and nuclear capture data – approx. 1.3 mio SNPs) on 194 individuals from 13 Swiss and North Italian Late Iron Age archaeological contexts. Ancient DNA data allows to determine the genetic sex in 119 individuals, comprising 76 XX and 43 XY, including 52 subadults. With the additional support of mitochondrial DNA data, we detected genetic relatedness among three individual pairs within two different Swiss archaeological sites, and one case in the North-Italian site of Seminario Vescovile.

Comparative analyses show a genetic similarity between the ancient Swiss and Italian individuals. Additionally, their genomic diversity overlaps with that of especially western and south-western European present-day populations. However, the results suggest a genetic discontinuity between Late Iron Age individuals from Northern Italy and present-day populations from the same geographic area. On the other hand, the comparison with published data infers a stronger genetic affinity among European Iron Age groups.

4 NEW INSIGHTS ON CELTIC MIGRATION IN ITALY AND HUNGARY THROUGH THE ANALYSIS OF NON-METRIC DENTAL TRAITS

Abstract author(s): Piccirilli, Erica (Department of Cultural Heritage, University of Bologna) - Sorrentino, Rita (Department of Biological and Geological Sciences-BiGeA, University of Bologna) - Lugli, Federico (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia; Department of Cultural Heritage, University of Bologna) - Bortolini, Eugenio (Department of Cultural Heritage, University of Bologna; Department of Archaeology and Anthropology, IMF-CSIC - Spanish National Research Centre) - Silvestrini, Sara (Department of Cultural Heritage, University of Bologna) - Cavazzuti, Claudio (Department of History and Cultures, University of Bologna) - Gottarelli, Antonio (Department of History and Cultures, University of Bologna) - Belcastro, Maria Giovanna (Department of Biological and Geological Sciences-BiGeA, University of Bologna) - Hajdu, Tamás (Department of Biological Anthropology, Faculty of Science, Institute of Biology, Eötvös Loránd University) - Benazzi, Stefano (Department of Cultural Heritage, University of Bologna)

Abstract format: Oral

Non-metric dental traits were used to evaluate the biological relationships among Iron Age contexts attesting the Celtic presence in Hungary (Sopron-Krautacker and Pilismarót-Basaharc), continental and non-continental Europe (Hallstatt, Munsingen-Rain, Yorkshire), and northern Italy (Monte Bibele and Monterenzio Vecchio for which strontium isotopes were analysed to identify likely Etruscans and Celts). Biological distances among Celts and Scythians (Tápiószele) from Hungary, 13 Iron Age central-southern Italic sites, and an Italian Bronze Age necropolis (Scalvinetto) were also investigated.

Dental morphology outlined the divergence between Celts and the Italian autochthonous samples, plus a significant biological closeness of Hungarian and Italian Celts, supporting historical records mentioning a common origin for Celts migrated eastwards and southwards, and attested by several recent studies on Celtic migration.

A strong local background concerns all the autochthonous Italian samples, where the northern Italian Bronze and Iron Age local communities (Scalvinetto, Monte Bibele and Monterenzio Vecchio locals) share a branch, suggesting the existence of migratory routes in Bronze and Iron Age northern Italy.

Interestingly, a Scythian-related background emerges both in Celts from Hungary and Italy, suggesting that they could share a similar non-Celtic ancestry from the Steppe, the original Scythian homeland. In line with recent genetic studies, we might suggest that both Iron Age Celts from Hungary and Italy could have inherited a “Steppe-related ancestry”, coming from a westward flow of Bronze Age Steppe populations, probably arrived in the Carpathian Basin during Bronze Age and genetically influencing the local Iron Age descendants. Since supported by the lack of Scythian-related background in Celts from core and western sites, we propose the existence of a westward migratory route bringing people from the Carpathian Basin to Italy, here establishing an intake of eastern genes then merged with the rearrangement of biological variability in Europe due to Iron Age Celtic migration.

5 IRON AGE COMMUNITIES IN CENTRAL EUROPE: INVESTIGATING SOCIOCULTURAL CHANGES BY COMBINED BIOARCHAEOLOGICAL AND MATERIAL EVIDENCE (“ELEMENTS”)

Abstract author(s): Danielisova, Alzbeta - Bursák, Daniel (Institute of Archaeology of the Czech Academy of Sciences, Prague)

Abstract format: Oral

The socio-cultural image of Europe in the Iron Age is traditionally assumed to be a result of interaction between the indigenous substrates and external cultural inputs caused by ‘migrations of foreign cultural components’. In central Europe, the Danube served as the primary communication corridor through which the long-distance impulses connected the Mediterranean to the areas north of the Alps and West to the East. During the early and middle La Tène period (5th – 4th cent. BC), a rapid spread of material culture, influenced by the Middle Rhine, the Swiss plateau, and Bohemian lowland regions, reached the territories that became to be further known as the ‘La Tène Europe’. During the 3rd – 2nd cent. BC we see this direction somewhat reversed with major influences coming from the Mediterranean connecting the areas north of the Alps. Such ‘impulses’ have caused profound changes in La Tène society, affecting the organisation of settlements, local dietary patterns, specialised technologies, and finally also burial customs. Our project ‘ELEMENTS’ is aimed at investigating whether these transformations were induced externally, by the new incoming groups disrupting the traditional continuity of the local communities, or whether these notable changes were more coherent with the endogenous development of the local people, processing the inputs mediated by increasing long-distance contacts. We aim to test the theory of whether spreading and adopting new ways of life connected with economic innovations resulted also in the adoption of common cultural or ideological models that facilitated communication and created social links between individual groups that did not need permanent relocation of people to be put in practice. We employ an interdisciplinary approach based on a combination of the structural analyses of local cemeteries (demography, kinship, mobility, diets) with technological and provenance analyses of costumes and personal objects.

6 COMPREHENSIVE STUDY OF THE GALLIC SITE OF THÉZY-GLIMONT USING STABLE ISOTOPE SYSTEMATICS OF BODY REMAINS

Abstract author(s): Clauzel, Thibault (Univ Lyon, Univ Lyon 1, ENSL, CNRS, LGL-TPE, F-69622) - Richardin, Pascale (Centre de Recherche et de Restauration des Musées de France C2RMF, Palais du Louvre, Porte des Lions; TEMPS–Technologie et Ethnologie des Mondes PréhistoriqueS, CNRS UMR8068, Université Paris 1 Panthéon Sorbonne & Paris Nanterre) - Fourel, François (Univ Lyon, Université Claude Bernard Lyon 1, CNRS, ENTPE, UMR 5023 LEHNA, F-69622) - Flandrois, Jean-Pierre (Université de Lyon, CNRS, UMR 5558, Laboratoire de Biométrie et Biologie Evolutive) - Lécuyer, Christophe (Univ Lyon, Univ Lyon 1, ENSL, CNRS, LGL-TPE, F-69622; also at Institut Universitaire de France)

Abstract format: Oral

Gallic populations occupied most of Western Europe during the late Iron Age. They are increasingly studied as they experienced major variations at the climatic and political scale. However, knowledge about their cultural legacy is scarce, due to a predominantly oral transmission of culture and traditions and the lack of written sources. Thézy-Glimont, in Northern France, is an archaeological site which was excavated in 2013 in the context of rescue archaeology. These works highlighted a total of 17 rectangular graves containing human and animal remains aligned along rows and dating between the third and second century BCE. The careful deposition of humans and animals, intentionally aligned in each grave, led to the interpretation of these finds as “offering graves”. An open question relates to the geographic origin and social status of the buried individuals. The analysis of stable isotopes from bone and dental remains of humans and animals from the site may offer insights about these aspects. Oxygen isotope data of bioapatite phosphate groups show they experienced mean air temperatures of approximately 10°C, which is comparable to present day temperatures in the region. This result accords with paleoclimatic studies suggesting a warm episode in Europe during the late Iron Age. Stable isotopes of carbon and nitrogen from bone collagen highlight for humans a mixed diet based on C3-plants and a minor contribution of meat from cattle. Additionally, three human skeletons were incrementally sampled to study intra-individual variability in stable isotope values. Results suggest that the individuals had a consistent lifestyle and were probably locals. Hypotheses are discussed regarding the social status of these individuals and the ritual practices associated with their burial. This study illustrates how a comprehensive understanding of archaeological contexts and of the interaction between individuals and their physical environment can be achieved using stable isotope analysis.

7 UNEARTHING THE DEAD IN THE LONG IRON AGE OF SCOTLAND: LARGE-SCALE DATA ANALYSIS OF POST-MORTEM TREATMENT FROM 1300BC – AD1000

Abstract author(s): Legge, Michael (University of York)

Abstract format: Oral

The COMMIOS project represents a unique opportunity to conduct the largest, most wide-ranging analysis of Iron Age funerary treatment in Britain thus far. The multidisciplinary nature of the project allows for the integration of biomolecular data (human osteology, isotope analysis and ancient DNA) and robust archaeological frameworks. Underlying more site-specific analyses is a relational database synthesising Iron Age human remains across mainland Britain, taking an holistic approach to the mortuary record, including inhumations and cremations, bone bundles and disarticulated remains.

Scotland adopts the Long Iron Age chronology which encompasses, in its latter stages, the spread of Christianity, and ends with Viking incursions c.AD 800-1000. The Roman presence was intermittent and limited to southern Scotland; even there, Iron Age communities remained relatively unaffected by the Romanisation that occurred elsewhere in Britain. This unique (pre-)history, the continuation of the Iron Age for hundreds of years beyond AD43, creates an opportunity for a significant time transect approach to funerary data, while providing a valuable comparative assemblage for studying other regions.

This paper presents the results of the COMMIOS database for Scotland, illustrating the wealth of data that is available for study, the value of large-scale analysis in understanding chronological and geographic shifts, and the ways in which traditional archaeological data can be interwoven with the scientific approaches of aDNA, isotope analysis and human osteology. Patterns in post-mortem treatment are explored, from depositional context, to skeletal position, to burial accompaniments. Evidence for post-mortem skeletal manipulation, complex funerary processes, and the meaning of the dead, are discussed on a local and regional scale.

8 LIFE AND DEATH IN IRON AGE WALES: RESULTS FROM RADIOCARBON DATING, HISTOLOGICAL AND STABLE ISOTOPE ANALYSES FROM CASE-STUDY SITES

Abstract author(s): Bricking, Adelle (Amgueddfa Cymru/National Museum Wales; Cardiff University) - Davis, Oliver - Madgwick, Richard (Cardiff University)

Abstract format: Oral

The study of human remains provides us with our most direct window onto the Iron Age population in Wales. However, burial evidence from Wales has been understudied compared to areas such as Yorkshire and Wiltshire. This is due in part to poor preservation as acidic soils destroy much of the osteological material—for example, Rowan Whimster (1981) identified only eight records of Iron Age burial in the whole country. This led to the popular assumption that the lack of human bone means that the majority of burial rites were “archaeologically invisible”, particularly excarnation within hillforts. However, a more recent reappraisal of the published and unpublished literature on excavations of Iron Age sites by Oliver Davis (2017) has shown that the corpus of burial material in Wales is much larger than previously recognised. This provides an opportunity to assess funerary rites and treatment of the dead, mortality profiles, health, diets and origins of the Iron Age population in Wales.

This paper presents the results of recent radiocarbon, histological and isotope analysis from two sites with the largest assemblages – RAF St Athan in the Vale of Glamorgan and Dinorben in Conwy. By combining contextual study of this material with isotopic and micro taphonomic analysis, the aim of the project is to directly address how we understand mortuary practices, but also to reveal new insights into life through diet and origins of later prehistoric populations in Wales.

9 THE ROMANS ARE COMING! INVESTIGATING TEMPORAL LIFESTYLE CHANGES THROUGH MULTI-ISOTOPE ANALYSIS OF IRON AGE AND ROMANO-BRITISH INDIVIDUALS FROM YORKSHIRE (UK)

Abstract author(s): Robert, Prudence (Department of Archaeology, University of Durham; Isotope Bioscience Laboratory - ISOFYS, Ghent University; Department of Archaeology, Ghent University) - Liscakova, Katarina (Department of Archaeology, University of Durham) - Gröcke, Darren (Stable Isotope Biogeochemistry Laboratory - SIBL, Department of Earth Sciences, Durham University) - Nowell, Geoffrey (Department of Earth Sciences, Durham University) - Loeffelmann, Tessi (Department of Archaeology, University of Durham; Department of Chemistry, Research Unit: Analytical, Environmental & Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB) - Kancle, Lauren - Caffell, Anwen - Swann, Natalie - Moore, Joanna - Montgomery, Janet (Department of Archaeology, University of Durham)

Abstract format: Oral

Excavations at Yapham Lane, East Yorkshire, revealed a rural settlement with remains of skeletons dating back to the Late Iron Age and the Romano-British periods. A multi-isotope analysis of seven adults and two subadults was conducted to shed light on this population's diet, health, mobility, and origins.

The results of the incremental dentine collagen carbon and nitrogen isotope analysis and bulk rib carbon and nitrogen isotope analysis suggest that the Iron Age individuals heavily relied on terrestrial animal protein throughout their lives. The Romano-British individuals, however, show more dietary variation, and some may even have consumed marine resources. This is consistent with the introduction of various new foodstuffs following the Romanisation of Britain. Irrespective of the time period, this population appears to have suffered from nutritional or physiological stress during their childhood, as indicated by their carbon and nitrogen isotope incremental profiles and the presence of non-specific stress indicators on their skeletons.

Strontium, lead radiogenic, and stable oxygen isotope compositions were determined using enamel from the canines of eight of the individuals. Results suggest that the group was predominantly local and sedentary. However, whilst the Late Iron Age individuals have isotope compositions that are consistent with the local geology and climate, the Romano-British individuals appear to have had more diverse origins, consistent with evidence from other sites. Three Roman individuals provided oxygen, strontium and/or lead isotope compositions which fall outside the range expected for Yorkshire and most other areas of Britain. Two of them provide carbon and nitrogen isotope compositions that corroborate these results: they may have changed dietary habits between childhood and adulthood.

The multi-isotope analysis of these individuals offered a unique insight into the lifestyle changes experienced by a rural population of East Yorkshire following the transition from the Iron Age to the Roman period.

10

BURIED WHOLE, IN HALF, IN FRAGMENTS: BIOMOLECULAR, OSTEOLOGICAL AND FUNERARY APPROACHES TO THE HUMAN REMAINS FROM DANEBURY IRON AGE HILLFORT

Abstract author(s): Bleasdale, Madeleine - Fischer, Claire-Elise - Castells Navarro, Laura (University of York) - Büster, Lindsey (University of York; Canterbury Christ Church University) - Primeau, Charlotte (University of Warwick) - Reich, David (Harvard University) - Hamilton, Derek (Scottish Universities Environmental Research Centre - SUERC) - Evans, Jane (British Geological Survey - BGS) - Armit, Ian (University of York)

Abstract format: Oral

Danebury Hillfort (c.550 - c.100 BC) is one of the best known Iron Age sites in Britain. Excavations between 1969 and 1988 were carried out by a team led by Barry Cunliffe (Cunliffe 1995), and the site has formed the basis for much discussion on the scale and nature of British Iron Age society. Approximately 300 deposits of human remains (e.g. pit burials, partially articulated remains, isolated skulls) were recovered during excavations; however, relatively little is known about the buried community, their relations and provenance. The complexity that characterises this site requires a multidisciplinary approach, including synthesis of the extensive archaeological data combined with the osteological analysis of the human remains, AMS-dating and biomolecular data to investigate social dynamics as well as geographical mobility.

91 individuals have been sampled for aDNA whole-genome capture analysis, of which 41 have also been analysed using a multi-isotope (Sr-Pb-O-C) approach. Preliminary results suggest good DNA preservation allowing testing for biological relatedness, as well as genetic diversity. Previous isotope results of animals from Danebury show significant levels of mobility at the site and surrounding area (Hamilton et al. 2019). These data have been used as a proxy for human mobility to successfully challenge previous concepts of Iron Age communities having led relatively sedentary lives. By analysing human teeth using mobility isotopes (primarily strontium and lead) for the first time, this paper provides direct isotopic insights into childhood residential origins for the Danebury community. Eventually, this work will be embedded in the wider Hampshire Iron Age landscape, including comparisons with Suddern Farm and Viabes Farm.

11

'TIL DEATH DO US PART: EXPLORING THE BIOLOGICAL RELATEDNESS OF DOUBLE BURIALS IN IRON AGE EUROPE

Abstract author(s): Büster, Lindsey (University of York; Canterbury Christ Church University)

Abstract format: Oral

Advances in ancient DNA analysis have revolutionised our ability to study the relationship between biological relatedness and socially constructed kin. Using data from the COMMIOS Project, this paper will explore the potential of ancient DNA evidence to shed light on the phenomenon of double burials. Genetic data have already confirmed the biological relatedness of individuals in so-called 'mass graves', which suggest a single, often violent, mortuary event followed by quick (and likely unceremonious) 'disposal'. Double burials, however, so often cited in the literature, pose different challenges in their interpretation. Who were these individuals and how is it that they were interred in a single grave? Was their burial governed by tempo: by which any individual(s) who died around the same time shared a grave (and associated funerary rites)? Or do these graves represent designated family plots, necessitating either the re-opening of existing graves or the curation of one or more bodies before final deposition? Only a truly multidisciplinary approach which includes osteological, taphonomic, histological, archaeoanthatological and now ancient DNA evidence can move us closer to unpicking the complex stories of Iron Age life and death.

12

LIFE WITH AN ARROW IN THE SKULL: A SCYTHIAN WARRIOR AT THE NORTHERN BLACK SEA REGION CROSSROADS

Abstract author(s): Potekhina, Inna (Institute of Archaeology of the National Academy of Sciences of Ukraine) - Nykonenko, Dmytro (National Reserve Khortytsia)

Abstract format: Oral

During the Early Iron Age, the Northern Black Sea region was a unique contact zone between nomads, constantly moving along the Great Steppe following the sun, and Greek navigators, who expanded the borders of the ecumene and settled local sea coasts. The warlike tribes of the Scythians created a state entity on this territory, leaving behind the most vivid trace.

Combat injuries, as a manifestation of the military character of Scythian regular life, are recorded in human remains. Most often the wounds were inflicted by arrows. However, recorded cases of an arrow injury to the skull are rare. A Scythian warrior who survived such injury, and maybe fought many battles after, is unique. The skeleton of the 40-45 years old male comes from the burial of the 4th century BCE at the "Kanfarka" cemetery. The man belongs to the local sharply dolichocranic and broad faced Caucasoid group. He was wounded in the parietal bone, the arrowhead

was broken off, and only its fragment point remained in the skull. The latter did not damage the brain but caused a small subdural hematoma. Despite the possible neurological problems caused by trauma to the skull, the warrior did not stop his physical activity. This is evidenced by traces of later injuries and pathologies on his skeleton.

The cemetery is located on Khortytsia — the largest island of the Dnipro River. The peculiarities of the burial construction, custom, and burial place give the case uniqueness. The island was one of the few places of convenient crossing between the banks of Dnipro, it was located at the end of the waterway that connected the deep steppe regions with the Black Sea and the Greek colonies. It was situated at busy crossroads of trade and nomadic routes and had significant strategic importance.

13 DINING IN TUVA: DIET AND MOBILITY IN A LATE IRON AGE AGRO PASTORAL COMMUNITY OF SOUTHERN SIBERIA (2ND-4TH C. CE)

Abstract author(s): Caspari, Gino (University of Bern; University of Sydney) - Milella, Marco - Laffranchi, Zita - Arenz, Gabriele (University of Bern) - Sadykov, Timur (-) - Blochin, Jegor (-) - Keller, Marcel (University of Bern; University of Tartu) - Kapinus, Yulia (-) - Lösch, Sandra (University of Bern)

Abstract format: Oral

The traditional concept of „nomadic“ cultures as mobile and economically simple is nowadays increasingly displaced by more nuanced interpretations. Much of the scientific literature on diet and mobility of Eurasian pastoralist populations focuses on the Bronze Age and Early Iron Age. As a result, the relative underrepresentation in these analyses of more recent contexts hampers a full discussion of possible chronological trajectories. This study explores diet, mobility, and their social correlates at Tunnug1 (Republic of Tuva, 2nd-4th centuries CE) on a set of 65 humans and 12 animals by means of a combined analysis of stable isotopes of carbon, nitrogen and sulfur ($\delta^{13}C$, $\delta^{15}N$, $\delta^{34}S$) from bone collagen and their comparison with the available anthropological, archaeological, and archaeothanatological evidence from the site. Demographic and isotopic patterns were compared using nonparametric tests and Bayesian models. Finally, isotopic data were compared with evidence of intentional perimortem skeletal injuries and funerary features. The results suggest that: 1) diet in Tunnug1 was mainly based on C4 plants (probably millet) and animal proteins; 2) a few individuals were nonlocals, although their geographical origin remains unclear; 3) there are no differences in diet according to sex or funerary treatment. On the other hand, individuals with perimortem lesions show isotopic values suggestive of a lower consumption of millet and animal proteins. This study provides new data on the sociocultural variability of the agro pastoral societies of southern Siberia during the late Iron Age, and supports the economic relevance of millet for these communities.

143 DEFINING SITE FUNCTIONS IN THE VIKING WORLD: WEAVING NARRATIVES FROM DISPARATE STRANDS OF EVIDENCE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Russell, Ian (Institute of Irish Studies, University of Liverpool) - Mytum, Harold (Archaeology, Classics & Egyptology, School of Histories, Languages and Cultures, University of Liverpool) - Boyd, Rebecca (Irish Archaeological Consultancy)

Session format: Regular session

The roles of many Viking-Age sites are often difficult to determine, even when they contain clear archaeological signatures like structures, working areas, or burials. Viking-Age archaeologists weave their interpretations using a variety of different sources and evidence - archaeology, history, placenames, artistic styles, linguistics. Archaeologists are inhibited by limited excavation trenches or artefact survival, while historians face the limits of the archives. Despite these constraints, we tout certainty in our identification of a site as a Viking-Age one based on combining multiple strands of evidence.

Much of this confidence comes from earlier tendencies to classify and categorise sites as one thing or another, a winter camp, burial site, Type 1 house or Petersen Type sword. Yet, Gero (2007) and Joyce (2006) emphasises the potential of ambiguity and the creative way we construct narratives in archaeology. Ambiguity can be a positive interpretive force, but it is one that is rarely seen in Viking-Age interpretations.

In this session, we invite papers which explore the methods and processes of interpreting datasets whilst considering questions of ambiguity and reinterpretation. We take the parameters set by Sindbaek and Lund (2021) to define the Viking Age. This is not an ethnic definition but materially defined ways of living AD 750/800 - 1050 within Scandinavia and northern Germany, the diaspora of eastern and western Europe, and the North Atlantic islands and Newfoundland. We welcome fluid and alternative narratives, and more critical dissection of the combination of analytical and creative skills that we apply within Viking-Age archaeology.

1 SIGHT, SOUNDS AND SENSES: DEFINING THE FUNCTION OF VIKING CAMPS FROM DISPARATE STRANDS OF EVIDENCE

Abstract author(s): Russell, Ian (Institute of Irish Studies, University of Liverpool)

Abstract format: Oral

The historical sources contain many records of Viking overwintering camps or of raiding or some form of aggressive military activity and its become almost engrained into our belief that these camps were mainly temporary in nature and usually always militaristic in function and form. We know where many of these camps were but what did they actually look and sound like ?

Yes, the camps had a military function and the finding of ships nails and weapons are testament to that, and yet the evidence from Woodstown of ship repair hints at an activity that requires iron working, iron smelting and carpentry. Evidence of lead, silver, glass and iron working and even spinning and weaving demonstrates craft or manufacturing activities; stone tools at the finishing of blades; lead weights and silver of a trading economy. Analysis of animal bone indicates the presence of cows, sheep, goats and horse which must have been corralled within a field system at least of similar size as the camp itself for grazing or stabling. There is even evidence of domestic animals at Linns.

The historical texts also mention the presence of women in these sites, and broaches, spindle whorls etc, provide material evidence for their presence. There is even archaeological evidence of children from Woodstown. These activities hint less at an armed camp you want to avoid and more at a centre of trade, economy and material goods you want to obtain. Less feared camp and more accepted market community.

By using both historical, archaeological and material culture evidence, this paper will attempt to demonstrate by comparisons with the camps at Woodstown, Linns, Torksey and Aldwark that these camps had a multi-function, more as a market domestic community rather than a fully functioning military camp whose sole function was raiding.

2 "ABSENCE OF EVIDENCE IS NOT EVIDENCE OF ABSENCE," ADDRESSING THE ROLES OF WOMEN IN EARLY VIKING AGE ENCAMPMENTS

Abstract author(s): West, Elizabeth (University of Liverpool)

Abstract format: Oral

Early Vikings within Britain and Ireland and continental Europe often conjure images of bearded warriors with violent intentions of raiding and pillaging. Discussions of activities within Viking encampments during the ninth and early tenth centuries are almost exclusively confined to male activities, with the contributions of women often relegated to a brief comment on their existence before moving on. The presence of women is simply illustrated with a mention of spindle whorls or brooches, and little is done to expand upon the significant roles women played as part of the support system surrounding these fighting forces. Women in the encampments held various roles from specialised crafts-women to water bearers. As corner-stones of the supply chain, they were also essential contributors and consumers of the thriving domestic economies that surrounded these transient communities.

This paper will focus on the Viking camp environment, seeking to demonstrate the presence of women amongst fighting forces. Evidence from multiple sources confirms their presence, including the identification of female skeletal remains within the Repton charnel grave and contemporary literature which mentions women within both the Great Viking Army in England and the siege force in Paris. However, artefacts that suggest a female presence in Viking camps have been considered ambiguous, rather than proof of female involvement. One example is jewellery made for women being interpreted as gifts for relatives back in Scandinavia, rather than as personal ornaments worn by females on site. Archaeological evidence from sites such as Aldwark, Torksey and Woodstown, alongside methods from experimental archaeology used to clarify the products of tools found on these sites, will be used in conjunction with contemporary accounts from chroniclers to confront the ambiguity surrounding women in encampments. Traditional interpretations will be challenged and a new approach proposed that focuses on female activities.

3 NOT JUST FOR MEN: THE POWER AND STATUS OF VIKING AGE WOMEN IN CHURCHYARD BURIALS IN THE ATLANTIC ARCHIPELAGO

Abstract author(s): Ramsey-Brimberg, Danica (Independent Researcher)

Abstract format: Oral

Outside of Scandinavia, the narrative of conversion and Christianisation has largely been tied to men aligning themselves with Christianity through marriages and alliances, underscoring efforts to achieve power and status in the Atlantic Archipelago. Yet, Viking Age furnished graves with female-sexed skeletal remains or gender-associated graves goods have been uncovered in churches, chapels, and monasteries, suggesting burial at sites locally associated with

power and status was not solely for men. While the complex narrative has been explored regarding Scandinavia and Iceland (Garipano 2014; Wicker 2012) and men in eastern England (Hadley 2008), an in-depth analysis of burials has not been undertaken for women throughout the Atlantic Archipelago. Notable examples are at Finglas, Co. Dublin, Ireland (Sikora 2010); Saffron Walden, Essex, England (Evison 1969); St. Patrick's Isle, Isle of Man (Freke et al. 2002); and Iona, Scotland (Campbell et al. 2019). The geographical scope allows comparison among areas already Christianised, but with different political, economic, and social influences. Combining multiple sources of evidence affords a greater understanding of how gender played a role in locating certain individuals at ecclesiastical sites between the eighth and eleventh centuries. Sources include burials, churches, laws, wills, place and personal names, runic inscriptions, and geography. Once the pre-existing presence of a church has been established, the composition, organisation, and placement of the grave with female-sexed skeletal remains and/or female-associated grave goods will be analysed and compared to wider patterns of the burials of medieval women and of individuals of power and status. As the most recent work has been by men (McLeod 2011 & 2018), this new narrative on the burial of Viking Age women affords a different perspective. While not necessarily of the same status as men, women were not superfluous or passive participants in settlement, something evident by the graves being placed in churchyards.

4 WEAVING THE NARRATIVE THREADS OF TEXTILE ARCHAEOLOGY: TABLET-WEAVING

Abstract author(s): Gould, Georgia (University College London)

Abstract format: Oral

Medieval Scandinavian tablet-weaving and textile production have been discussed in academic publications for over a hundred years, often in archaeological journals and partial book releases. However, in much of the corpus of academic literature, analysis is clinical, examining the woven structures and fibres of these bands in limited context.

Tablet-weaving has been used functionally as edging to strengthen garments or as strong borders to tapestries. However, textiles can be seen sometimes as a form of woven art - either fixed in decor, portable or wearable - due to the woven technique or motifs of their constructed design. There has been less attention devoted to the roles of woven ornamentation as potential decoration or their function as woven art. This makes the contextual study of art important when researching textiles, as they are sometimes comparable with jewellery, picture stones, wooden items and metal structures. Although there is some ambiguity in reconstruction, the use of experimental archaeology in recreating both the tablet-woven bands, garments and textiles allows for a further insight to reinterpreting the often-fragmented textile pieces.

It is necessary to reinterpret the role of tablet-weaving not only as a functional textile accompaniment either produced in a home or in an organised production unit, but also as pieces of woven art. This then needs to be placed within its wider contemporary context against contemporary textiles in order to gain potential insight to the societies from which they came, their migratory patterns and international trade routes. In this paper, I will use several tablet-woven artefacts (e.g. the Viking Age textiles from the Oseberg ship burial, Norway) to demonstrate how this interdisciplinary methodology combining textile archaeology, art history and experimental archaeology can provide a conduit to understanding the role of textiles and tablet-woven bands within an early medieval Scandinavian and Northern European setting.

5 SITE METRICS AND CONTINUUMS OF NORTH ICELAND VIKING AGE SETTLEMENT PATTERNS

Abstract author(s): Steinberg, John (UMass Boston) - Zoëga, Guðný (Hólar University) - Bolender, Douglas (UMass Boston) - Catlin, Kathryn (Jacksonville State University)

Abstract format: Oral

A settlement survey of Viking Age farmsteads in North Iceland has yielded a series of site metrics that suggest there was substantial variation during the initial occupation of the North Atlantic island. The 30 Viking Age sites investigated are in a well-defined continuous region. The sites all have midden deposits associated with domestic occupations and probably some sort of dwelling. The metrics collected during the survey include location, environment, site size at the end of the Viking Age, establishment and abandonment dates, movement of the main farmstead, the presence of churches, Christian cemetery organization, and the suggestion of specialized production or consumption (seen in fuel, slag, seeds, and bones). Most of the site metrics are poorly correlated (e.g., the presence or absence of churches and the presence or absence of barley). While the correlated metrics (e.g., site size and establishment date) shed light on the processes of colonization, the general lack of broad associations suggests tremendous variation in sites during the long settlement of Iceland. The variation both confirms and challenges existing interpretations and assumptions about the nature of the settlement of the previously uninhabited landscape. Using one or two metrics, there are obvious site types (e.g., settlement and post-settlement sites, continuously occupied and abandoned sites). When multiple metrics are applied, the lack of correlation and the ambiguity in this dataset becomes clear. Thus, using a site's place along a series of continuums provides a new perspective on the variation in site types during the initial rapid settlement and the following long-term development of the region.

6 UNWEAVING THE VIKING AGE HALL

Abstract author(s): Dickinson, Stephen (Independent researcher)

Abstract format: Oral

Viking Age halls, often presented as key elements of central places of the period, can sometimes be reified as symbols of élite settlement across Scandinavia and the North Atlantic Viking diaspora. Halls can be unambiguously represented as the pinnacles of Viking Age monumental display, achievement, power and ritual expression. Check-lists of criteria and artefacts that determine and define monumental architecture and its rôles can become, sometimes by default, our definitions of site meaning and of status.

In seeking - and perhaps pre-empting - rôles for these buildings, we may be missing more nuanced and multivocal considerations of their functions and status. Anthropological studies of the buildings of traditional societies indicate that, often, the houses built and used by these societies not only stand for social groups, but represent the world around them, and embody the people who erect and who dwell in them.

Archaeological data from the 6th to the 8th centuries indicates that Anglo-Saxon 'great hall' complexes, and the cultures that empowered and encapsulated them, were in decline by c.AD 750 in England, to be replaced by more private and exclusive expressions of élite style and display. Evidence from Scandinavia, Scotland and Northern England suggests that halls from the Viking Age ninth century onwards were intimately embodied with the societies responsible for their building, maintenance and social relevance - and enmeshed within new sets of ambiguities in relation to our understanding of their immediate social, monumental and cultural environments.

Clarifying new contexts for the understanding and articulation of Viking Age architecture need not entail the replacement of one set of definitions with another, rather, that these contexts need to be assessed on their own terms in our evolving explorations of their comprehension.

7 THE NORSE AND THE SEA: LANDING PLACES IN SCANDINAVIAN SCOTLAND

Abstract author(s): Sanmark, Alexandra - McLeod, Shane (Institute for Northern Studies, University of the Highlands and Islands)

Abstract format: Oral

This paper will present early results of the ongoing research project The Norse and the Sea: The Maritime Cultural Landscape of Scandinavian Scotland. This project investigates the maritime cultural landscape in Scandinavian Scotland (c. AD 790-1350), through an interdisciplinary approach using archaeological, written and toponymic evidence and addresses the overarching questions of connectivity and communication in Norse Scotland. The term 'maritime cultural landscape' was originally coined by Norwegian archaeologist Christer Westerdahl to denote 'the unity of remnants of maritime culture on land as well as underwater'. This formed part of his ground-breaking analytical framework developed for the Bothnian/Baltic area and which has been successfully applied in Scandinavia, Germany and the North Atlantic. This concept is virtually unexplored for Scandinavian Scotland, despite being equally applicable to this area. By bringing this innovative research framework combined with archaeological and geophysical fieldwork to Scotland, this project is generating new data on maritime culture and enabling important study of this geographic area from a whole new perspective.

This presentation will focus on the identification and investigation of Viking age and Norse landing sites on the western seaboard of Scotland. Despite the maritime element of the Viking-age settlement process, very few landing sites have been identified and the few that are known have not been investigated in detail. This is in large part due to the ambiguous and multi-purpose aspects of the sites themselves. In this paper, the methodology of locating landing sites in the Hebrides through a combination of toponymic, archaeological and written evidence in conjunction with Fetch analysis is explored. The key traits of landing sites are studied as well as the roles of landing sites as nodes in the wider communication network between Ireland, Scotland, and Scandinavia.

8 AN INTERDISCIPLINARY FIELD APPROACH ON NORSE LANDING PLACES IN WESTERN SCOTLAND: FIRST RESULTS FROM THE ISLES OF EIGG AND COLONSAY

Abstract author(s): Lu, Erman - Wilken, Dennis (Christian-Albrecht-University of Kiel) - Sanmark, Alexandra (University of the Highlands and Islands) - Kalmring, Sven (National Historical Museums, Sweden) - McLeod, Shane - Jennings, Andrew (University of the Highlands and Islands)

Abstract format: Oral

The joint British-German AHRC/DFG Research Project 'the Norse and the Sea: The Maritime Cultural Landscape of Scandinavian Scotland' aims to investigate the maritime cultural landscape in Scandinavian Scotland through an interdisciplinary approach using archaeological, written and toponymic evidence, as well as geophysical and remote sensing techniques to address the overarching questions of connectivity and communication of the Norse in western Scotland. So far two sites, the Bay of Laig on the Isle of Eigg and the Kiloran Bay on the Isle of Colonsay, were

selected for detailed investigation and fieldwork. The sites were selected from a shortlist of likely harbours/landing places based on topographical study, analysis of place-name and archaeological remains. The aims of the fieldwork were to understand the landscape conditions of the presumed landing places and to locate and investigate possible archaeological remains.

Non-invasive geophysical surveys and test pits were incorporated into the field campaigns. This paper presents the first results of these fieldworks, presenting a combination of electromagnetic induction (EMI), ground penetrating radar (GPR), and LiDAR data as well as test pits that were opened at select locations for ground truthing reasons. The starting point of both remote sensing surveys were, in addition to suggestive place-names such as 'Sròn Laimhrige' (Rock of the Landing Place) in the Bay of Laig, two prominent finds: two pieces of boat stems on Eigg and a Viking ship burial on Colonsay. The presented approach combining different field and historic methods tries to increase the scope for discussion of variety and ambiguity in the datasets as well as interpretation and re-interpretation of the datasets.

9 A GOOD HAVEN AT SANDAY: USING HRAFNS SAGA SVEINBJARNARSON TO CONSIDER ANCHORAGES AND LANDING SITES IN THE LATE NORSE HEBRIDES

Abstract author(s): Randall, Peter (University of the Highlands and Islands)

Abstract format: Oral

This paper will present a case study of potential anchorages and landing-sites on the Isle of Sanday, investigated on the basis of an account from Hrafn saga Sveinbjarnarson. Though the account concerns the anchorage of an Icelandic merchant ship in 1202, utilisation of the seascape is to be considered in the *longue durée* due to the continuation of naval technologies and maritime practices from the Viking Age into the Hebrides' Late Norse Period.

The relevant passage will be summarised and analysed with regard to its historicity and narrative. Hrafn saga offers detail on the Icelanders' experience at anchor, the practicalities of sailing and navigation, and interactions between the Icelanders and local Hebrideans. It provides insight into how the crew conceptualised and utilised places along the Hebridean coastline. However, the saga does not provide sufficient detail to determine if the same anchorages and landing-sites were used by the local population, and the text cannot be used to pinpoint sites.

It is, therefore, critical to incorporate topographic, toponymic, and oceanographic data. Coastal features will be considered using approaches developed for identifying Viking Age landing-sites across the North Atlantic. The investigation of Scottish Gaelic toponyms in Sanday and the neighbouring isles enables the identification of relevant locations and allows for consideration of Sanday's position relative to wider sea routes. Finally, mapping out wind fetch data with GIS demonstrates feasible sailing routes on approaching and leaving the isle.

In this multidisciplinary approach there is potential for the identification of maritime sites that often leave little material trace. Skaldic verse, names in the landscape and even windspeed allow us to envision anew how Norse sailors understood and utilised the coastline. In this way, the paper will challenge oft-assumed limitations of site-identification, and invite questions regarding the distinctions drawn between sites of anchorage, landing and assembly.

150 THE ARCHAEOLOGY OF LUXURY: CRAFTSMANSHIP, CONSUMPTION, AND DESIRABILITY IN ARCHAEOLOGICAL PERSPECTIVE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Gomes, Francisco (UNIARQ - Centre for Archaeology of the University of Lisbon; School of Arts and Humanities of the University of Lisbon) - Meo, Francesco (Department of Cultural Heritage of the University of Salento)

Session format: Regular session

Luxury as a concept has had many and often conflicting meanings and connotations throughout history. Seen as morally dubious throughout Antiquity and the Middle Ages, it received a mostly positive spin beginning in the Early Modern period but is nowadays once more under critique. However, the archaeological record for most, if not all, periods is rich in evidence for the production, circulation, and consumption of differentiated crafted products imbued with added material, aesthetic, and social value.

In the interpretation of these goods and their significance, the anthropological language of 'prestige' has been dominant. In this session, we wish to explore the potential of 'luxury' as a complementary conceptual framework, drawing on recent research which highlighted desirability as a key feature of past high status material culture. This session aims to bring together case studies, from Antiquity and beyond, illustrating the complex interplay of material qualities and socially assigned values which set specific crafts and products aside as valuable, desirable, and ultimately luxurious.

Focusing on craft activities, we invite participants to reflect on the connections between production – including discussions of craftsmanship, specialization, and 'branding', and how they affect the perceived desirability of goods – and

consumption, taken as a socially and politically laden phenomenon. Methodological discussions on how to identify and interpret luxury productions in the archaeological record are especially welcome, as are insights into the role of long-distance trade in creating trans-cultural languages of luxury.

In promoting a cross-craft, cross-cultural, and integrated comparative approach, we hope to promote a reflection on luxury as a contextual, situational, and relational category and to explore its conceptual utility for an exploration of social relations, craft development and creative expression in the past.

ABSTRACTS

1 SHARED LUXURY? COLLECTIVE ACTION AND COMPLEX TECHNOLOGIES IN STATELESS SOCIETIES

Abstract author(s): Martinon-Torres, Marcos - Benzonelli, Agnese (University of Cambridge) - Campos Quintero, Lina (Museo del Oro, Colombia) - Crawford, Rosie - Klesner, Catherine - Kneale, Catherine (University of Cambridge) - Legarra Herrero, Borja (University College London) - Quintero Guzman, Juan Pablo - Saenz Samper, Juanita - Uribe Villegas, Maria Alicia (Museo del Oro, Colombia)

Abstract format: Oral

Most anthropological and sociological studies of luxury focus on consumption: they emphasise desirability and rarity, and the associated prestige, as the defining elements of luxury items. From this perspective, luxury is assumed to reinforce differences between the 'haves' and the 'have-nots' in a community.

The REVERSEACTION project (www.reverseaction.org) is fostering an understanding of luxury that is defined by production rather than consumption. Luxury items are thus those that materialise exceptional expense in materials provision, skills and/or labour, and not geared towards subsistence – but without assumptions about ownership, power structures, and craft organisation. This perspective allows for the identification of luxury products in societies without coercive authorities or attached craft specialists, where some degree of cooperation or collective action must have been required.

This presentation will outline some case studies from the prehistoric Aegean and pre-Hispanic America with evidence of complex, non-utilitarian, 'luxury' technologies. Scientific analyses and contextual information allow the reverse engineering of these artefacts, their life-histories, and the underlying sociotechnical systems. We argue that, in some instances, complex and exotic artefacts were shared among many, and their production and use reinforced horizontal ties within a community rather than vertical differences.

Overall, we challenge the fallacy that complex 'luxury' technologies are the preserve of hierarchical societies with strong, pyramidal and coercive division of labour, as well as an ethnocentric understanding of luxury that is in clear need of revision.

2 APPLICATION OF GEOSPATIAL ANALYSES FOR THE IDENTIFICATION OF LONG-DISTANCE TRADE ROUTES IN EGYPT AND EASTERN SUDAN

Abstract author(s): Zaia, Sara (Harvard University)

Abstract format: Oral

The fabulous land of Punt is mostly known for its representation on the wall reliefs of the temple of queen Hatshepsut at Deir el-Bahari and the tale of the Shipwreck Sailor. The ancient Egyptians undertook long voyages to Punt to obtain precious materials, such as frankincense, myrrh, ivory, ebony, and animal skins, imbued with mystical significance, and crucial to perform rituals necessary to maintain the cosmic order of Maat and to grant the pharaoh the right to rule over Egypt. Although the archaeological investigation of the last decades has suggested that part of Punt was in Eastern Africa, modern Eastern Sudan, Eritrea, and Somalia, the information regarding the organization of trade expeditions to Punt is scarce and incomplete. Through remote sensing and GIS analyses the present study identifies the most efficient long-distance trade routes connecting Memphis (modern Cairo) and Kassala (identified as part of Punt). Such routes cross the Egyptian Eastern desert, run along the Red Sea coast, and traverse the Sudanese Eastern desert to reach Kassala.

3 A NEW LOOK ON NEAR EASTERN IVORY EXCHANGE: THE CASE OF THE SOUTHERN LEVANT

Abstract author(s): Shochat, Harel (University of Haifa)

Abstract format: Oral

Extensive excavations in the southern Levant have yielded hundreds of artifacts made of the highly valued and prestigious material of ivory dated to the mid-second to mid-first millennium BCE. Most were found as caches in temples or palaces, but they are also routinely recovered from other public, cultic, and domestic contexts. To date, most

scholarly interest has focused almost exclusively on art historical analyses of the more elaborately decorated items, but the raw material origins of these ivories and their geographic provenance remain unknown. The Levantine Ivory Research Project (LIRA) investigates how ivory artifacts, and their meanings were embedded in Canaanite and other Levantine societies.

We developed an integrative investigation protocol for studying the ivory exchange using an interdisciplinary approach. The core archaeological practices were applied to study distribution and consumption trends. We applied analytical methods - microscopy, spectroscopy, stable isotopes, and proteomics - to document molecular information embedded in the ivory objects, thus tracing their taxonomic origin and geographic provenance.

Here, we demonstrate the successful application of a network approach in outlining the ivory exchange biography for the first time from an empirical perspective. Spatial, chronological, typological, and contextual dispersal trends are interpreted to reconstruct the cultural role of ivory and its local exchange mechanism. The proteomic and stable isotope analyses successfully trace the raw material sourcing pools to sub-Saharan landscapes of east African savannas. It allows us to reevaluate Egypt's and Nubia's agency in the luxurious material supply chain network and in shaping its inter-regional exchange as expert trade from its sources to the end markets.

4 NEAR EASTERN KOINE AND LUXURY ITEMS CONSUMPTION IN THE NEO-ASSYRIAN EMPIRE AND BEYOND

Abstract author(s): Baaklini, Adonice (Sorbonne University, UMR Orient et Méditerranée; Eveha International)

Abstract format: Oral

During the first half of the first millennium, a relative cultural homogeneity can be noticed throughout the Near East, whether in the territories integrated to the Neo-Assyrian Empire, or in its peripheral areas. That koine is characterised by luxury items – mainly tableware, glyptic, and sculpture – initially used at the Assyrian court and by the Assyrian elites. The question of the formation of that koine, and the way that Assyrian related material culture spread around the Near East and the Eastern Mediterranean, is a significant one. Scholars traditionally explained the spread of that new material culture by the will of the Assyrians: colonisation, cultural imperialism, installation of Assyrian administrators and armed forces, etc. This paper proposes another model of interpretation. Indeed, the luxury nature of the items that translate the cultural koine could tentatively be explained by the elite competitive emulation and conspicuous consumption, giving a more prominent role to the local elites of the imperial provinces and peripheral states. The aim of this paper is to show that this last explanatory model is the most suitable according to the archaeological remains, when discussing their nature, chronology, and distribution.

5 FROM PRODUCTION TO DESTRUCTION: THE INHERENT SOCIAL VALUE OF THE SCULPTURES OF KUNULUA (TAYINAT HÖYÜK) IN HATAY, TURKEY

Abstract author(s): Denel, Elif (American Research Institute in Turkey) - Zaher, Rana (Tayinat Excavations)

Abstract format: Oral

Monumental sculptures of the Iron Age Syro-Hittite kingdoms of southeast Turkey and north Syria have long been investigated along with furniture inlays of bone and ivory. The artistic traditions across different media served to determine regional artistic traditions and inter-regional influence as part of trade relations and cultural exchange. Within this framework, portable luxury goods with distinctive decorative and artistic elements have been traditionally singled out as bearers of aesthetic values particular to the elites. As such, portable objects were also highlighted for their potential of cross-cultural exchange of technique and knowledge. However, large-scale stone sculptures with their specific artistic and materialistic characteristics also stand out as luxury items associated especially with the highest levels of societies.

Several monumental sculptures discovered in the Tayinat Höyük excavations, conducted first in 1930's by the Oriental Institute and then since 2006 by the University of Toronto, illustrate the power strategies of the local rulers and the elite in the kingdom of Kunulua. Whether or not the craftsmen responsible for the creation of these large-scale sculptures were itinerant, they reflect rulership and elite ideals within the larger region. In other words, these ideals were not specific to each kingdom, but were commonly shared across cultures and regions. Excavations revealed that sculptures were discarded, some after suffering deliberate damage, possibly as expression of change in political domination. This paper will investigate the influential and reciprocal relationship between monumental sculpture and portable luxury goods and the performative disfigurement of these objects as an act of devaluation of the materials from which they were created along with an act of annihilation of what these objects represented.

6 DESIRABLE OBJECTS 3000 YEARS AGO IN CENTRAL EUROPE - TEXTILES WITH GOLD THREADS

Abstract author(s): Groemer, Karina (Natural History Museum Vienna)

Abstract format: Oral

Throughout history, gold-woven textiles and garments have been special luxury goods, often reserved only for the religious and social elites.

The Old Testament, whose oldest passages were probably written down in the 9th century B.C. according to a long oral tradition, tells us in the Book of Exodus (Ex 39:1-3) about the production of priestly garments. The Greek poet Homer also praises golden garments in his works *Odyssey* and *Iliad*, whose creation historians date to the end of the 9th century BC.

Woven fabrics in which, for example, gold wires or strips were included for decoration are found in Central Europe primarily in the Late Bronze Age and Hallstatt Period. A new find with gold threads comes from the gold treasure of Ebreichsdorf in Austria, whose structure clearly indicates that they were once woven into a textile. Interdisciplinary analyses of the gold and handcraft techniques have been applied to understand the complex interplay between the material, socially assigned values and trade as well as social networks. Comparative objects from c 1200-1000 BCE are known from other sites in Austria, Hungary and Bavaria, such as Vösendorf, Óbuda or Várvölgy.

The gold textile from Ebreichsdorf thus fits into a series of very high quality textiles, which understandable as trans-cultural language of luxury, in ancient times were virtually the symbol of royalty and divinity. Even cross-chronological, in modern times, gold threads were used for coronation robes or liturgical vestments, for example.

7 WAS THE SCYTHIAN GOLDEN CLOTHING EXCLUSIVELY FUNERARY?

Abstract author(s): Lifantii, Oksana (National Museum of History of Ukraine)

Abstract format: Oral

Wealthy Scythians are known not least due to their clothing embroidered with gold. There is even a name, “golden people” that in most cases was used due to the Saka costume. However, the same idea of richly gold-adorned garments was popular among Scythians, who lived westward from Saka in the Northern Black sea area.

There is a belief among mostly Russian specialists (S. Chernikov, N. Onayko, L. Elnitskiy, D. Zhuravlev, L. Firsov, V. Gulyaev) that the Scythians only used such gold-decorated garments only as a funeral and did not wear them during life. Some of them, resp. V.Gulyaev and E. Savchenko proposed the existence of “special groups of funerary artisans” who made a series of gold appliques and other jewellery specifically for funeral rites.

However, nowadays, there is plenty of evidence of the usage of such clothes and only a few cases of freshly made appliques in some Scythian tombs. The main arguments favour using such clothes are numerous deformations and alterations of appliques that once were sewn on them (e.g. finds from Tovsta Mohyla, Chortomyk, Haimanova Mohyla, Kul-Oba tumulus and many others).

I could not also fully agree with the dramatically opposed belief that such golden clothes were always used during the owner’s life (due to S.Polin). In some cases, appliques edges can be with burrs that can point to a lack of usage during the owner’s life. However, such cases are rare and primarily characteristic for some appliques that probably replaced the lost ones. It is almost impossible to find a complete set of one dress decorations without traces of usage.

8 THE SOCIAL LIFE OF ‘TRINKETS’: CONCEPTUALIZING LUXURY IN THE SOUTHERN PORTUGUESE IRON AGE THROUGH ADORNMENT OBJECTS

Abstract author(s): Gomes, Francisco (UNIARQ - Centre for Archaeology of the University of Lisbon; School of Arts and Humanities of the University of Lisbon)

Abstract format: Oral

The Greek word ‘athrymata’, meaning trinkets or curios, is still sometimes used in scientific literature in reference to a broad spectrum of small objects introduced through Phoenician and, later, Punic trade in various cultural contexts around the Mediterranean. The intellectual and conceptual background for such a terminological choice – including an historiographical devaluation of Phoenician crafts and a persistently negative view, albeit from different angles, of Phoenician trade practices – would be well worth exploring. However, and more importantly, it is necessary to develop contextual studies to understand whether such a terminology really accounts for the ways in which local communities viewed and consumed these objects.

The so-called “Orientalizing” Period of Southwestern Iberia is a good laboratory to explore this issue and its conceptual implications. In fact, the trade and consumption of craft goods, some of which in precious, rare and/or exotic materials, was one of the cornerstones of the establishment of social, political, and economic relations between the Levantine groups who settled in the area in the early first millennium BCE and the local communities, and particu-

larly their elites. Having long been recognized as key in the ensuing development of the regional Iron Age social and political structures, these goods, which have been interpreted through the anthropological language of prestige, can equally be said to constitute the building blocks of a social language of luxury with strong socio-political overtones.

Such readings have focused on specific goods and crafts, like metalwork and ivory carving, but a vast array of other 'exotica' have deserved less consideration. This presentation focuses on the substantial assemblages of smaller adornment elements present in Southern Portuguese contexts, deploying a contextual analysis to assess the social significance of these objects, which illustrate not only the contextual, but also the relational significance of luxury as a social category.

9 THE WEALTH OF TEXTILE CRAFTSMANSHIP IN MOTYA

Abstract author(s): Ferrante, Nina (Sapienza University of Rome)

Abstract format: Oral

The 'precious garments' mentioned by Diodorus Siculus when describing the spoils of the island of Motya (Sicily, Italy) lead one to reflect on the role textiles played in the ancient city.

In archaeological terms, textile production often leaves no obvious traces. In Motya, however, the archaeological remains of textile tools, used for weaving, are remarkable. Excavations conducted over more than a century and recent research carried out as part of my PhD at Sapienza University of Rome have yielded a wealth of data that partly allow us to reconstruct textile production on the island.

There is evidence of a large quantity of loom weights in Motya, often grouped together, which may have belonged to specific loom sets and, in one lucky case, the imprint of the warp-weighted loom, with its associated loom weights, has also been preserved.

Also noteworthy are the markings placed on the body of many loom weights, which may have indicated the value of the garments made, as well as the weaver's or buyer's mark, or may have had a functional purpose in weaving.

On the island, in fact, there were probably also very valuable fabrics made using tablet weaving, and there were also craft areas where the dyeing of valuable garments took place.

Tablet weaving, known in Peninsular Italy since the Bronze Age, was mainly used to make the borders of valuable fabrics, creating complex decorative patterns with the use of coloured and precious yarns.

All this data indicates a very rich and diversified production of textiles in a society, where different cultures and traditions intertwined.

In this paper, through the analysis of archaeological, literary, and iconographic evidence, aspects of Motya's textile craftsmanship will be outlined.

10 ITEMS AND LUXURY PERCEPTION IN THE PRE-ROMAN SOCIETIES OF SOUTH ITALY

Abstract author(s): Meo, Francesco (University of Salento)

Abstract format: Oral

Items are considered of luxury only if a society recognizes them as such. They therefore vary according to the social structure, but also depending on the real economic capacity and access to goods that each society has.

Luxury items that are purchased and spread among the populations are recognized by societies as "trendy". In some cases the same goods are found in archaeological contexts of different populations, bought by the aristocracies to emulate the prestige of those of the place of origin.

However, even if the same objects are in use in the same period, the social structure of the populations implies a different use. As an example, some decorative patterns applied in the Greek towns of South Italy on temples were instead used, in some indigenous populations, as decoration of aristocratic dwellings by those who wanted to demonstrate their status.

This paper therefore intends to analyse some aspects of luxury by contextualizing them in societies and in different chronological periods.

11 LUXURY IN HELLENISTIC MACEDONIA. THE CASES OF GOLD AND IVORY PIECES OF FURNITURE AND PRECIOUS WEAPONRY

Abstract author(s): Stamatopoulou, Vasiliki (The Greek Ministry of Culture / The Hellenic Open University)

Abstract format: Oral

Luxury permeates every aspect of elite life in Hellenistic Macedonia. The immense profits from the Asian campaign of Alexander III and the Macedonians arrived with the veterans in Macedonia and were spent, among other things, on

creating elaborate domestic and funerary interiors including extravagant pieces of furniture that were later placed in tombs as grave offerings.

The splendor of the elaborate decoration of these pieces of furniture with a plethora of costly materials - ivory, glass, gold, silver, gilded stucco, and heavy textiles, is examined in this paper as a social phenomenon. Artifacts decorated in this manner and with these materials until then had been used only for chryselephantine statues of gods. Hellenistic nobles reposing on pieces that looked appropriate to a god, appeared elevated in the sphere of the divine, manifesting superhuman grandeur and power.

After having lived for long as warriors and having acquired power through war, men of this class further declare their wealth and military power with luxurious armor and weapons decorated with precious materials and elaborate motifs.

The possession of these objects was a demonstration of prestige and social status, it identifies, separates, and glorifies the social group represented by the possession of such objects which is the class of the hetairoi, who flank the Macedonian king.

The paper also seeks to identify the production workshops and their distribution network, which, due to the superior quality of these products, seem to have had a long and well-established tradition.

12 **ICONOGRAPHY IN ITS CONTEXT: IBERIAN DECORATED VESSELS AND PUBLIC DISPLAY IN LATE PERIOD PRE-ROMAN IBERIA (3RD-1ST CENTURIES BCE)**

Abstract author(s): Harding, Pablo (Universidad Autónoma de Madrid)

Abstract format: Oral

This paper sets out to examine the interplay of iconography and public consumption as factors in the study of value as the contextually specific concept of a given society. We will focus on a case study, the decorated ceramic vessels of Late Period Iberia (3rd-1st centuries BCE), highlighting two points:

Firstly, how the vessels themselves owe their very luxury status to iconography. From a technical standpoint, they are mostly identical in manufacture, quality, and shape to more common Iberian ware. Nonetheless, they bear traditional Iberian iconography, the long-lived medium of ideological expression and legitimation of the Iberian elites, and so these decorated vessels are elevated above other ceramic productions. They existed as specially commissioned objects tailored to the tastes of the Iberian elites and circulated exclusively within aristocratic circles, accompanied by other traditional luxury items such as imported black-glaze ware.

Secondly: the uses of these luxury products. We studied the relationship between vessel types, decoration preferences and trends, and archaeological contexts to centre on the range of activities in which the vessels were used. Identified uses were limited in number and mostly concerned with the consumption of food and drink. Identified activities included: storage, ritual and communal feasting, display in domestic and sacred spaces, consumption during ritual events, libation, and deposition as funerary objects or during ritual events. This wide array of activities coincides with many of the main avenues of display employed by Iberian elites.

Decorated vessels of the Iberian Late Period reveal the intersection of different but complementary systems of conceiving value: traditional iconography, consumption, limited circulation, and public display. These systems are tightly tied to the ways of life of Iberian elites in their specific context, who recall the images of their past and participate in traditional rites while also living under Roman rule.

13 **"RE-CRAFTING THE LUXURY OF TEXTILES": A REFLECTION ON THE DESIRABILITY OF INSTRUMENTA TEXTILIA IN ROMAN TIMES**

Abstract author(s): Morgado-Roncal, Leyre (University of Granada)

Abstract format: Oral

The Archaeology of Roman Textile Production is a fascinating and complex area of research. Textiles offer an insight into social status, identity, gender, body tales, the production process, the artisans and so much more. Consequently, at times, their archaeological vestiges portray "luxury". However, there has been a constant hope of finding archaeological textiles, but in regions such as the Iberian Peninsula, is simply extremely difficult to preserve them, hence the necessity to examine other textile remains.

In this communication we will be discussing the role of instrumenta textilia as an indicator of "luxurious" productions in Roman times. Textile tools constitute one of the most numerous and common evidence of Textile Archaeology. Despite this, the fact that they are multifunctional, "standard", plus the raw materials used, can disguise the idea of specialization, craftsmanship and even "prestige". Through several case studies of textile tools from Spain and Italy we will analyze their potential to showcase "luxury" and identify "exclusive" productions. In doing so, we expect to promote a reflection on the desirability of instrumenta textilia and explore how we perceive luxury in Roman textile productions.

Finally, we hope that our case study both helps to broaden the perception of “luxury” and to reflect on how to approximate textile handcrafts in order to approach high status material culture elements.

14 **DESIRABILITY AS A GATEWAY TOWARDS PRESTIGE. THE SPREAD OF IZALCO USULUTÁN AMONG THE COMMUNITIES OF LATE PRECLASSIC CENTRAL AMERICA**

Abstract author(s): Martinet, Adrien (Commission for Archaeology of Non-European Cultures; University of Bonn)

Abstract format: Oral

Izalco Usulután is an outlier in the highly regionalized ceramic landscape of Late Preclassic Upper Central America. It is arguably the most complex to manufacture of all the sub-types of the ubiquitous Usulután wares found throughout the region as its durability and surface decorations not only required skilled artisans to be achieved, but also access to specific resources guaranteeing the best results. These vessels – mainly used for serving – were fine-pasted, lightweight, hard-fired, polished to a glossy finish, and decorated with nearly indelible resist lines, blotches, and swirls. Given the mostly simple designs of vessel forms and surface patterns present in its typology, the quality of the ware itself and its execution must have played an important role in its early adoption as a prestige ceramic used in – mainly elite – feasting events.

Furthermore, prestige alone insufficiently explains its long-range spread from its native El Salvador, reaching into Guatemala in the north and as far south as Nicaragua, influencing multiple ceramic wares along the way and even generating local emulations in some communities.

Looking at Izalco Usulután ceramics through the lens of “luxury” allows for more flexible interpretations of the socio-political relationships between communities, departing from the often hierarchical implications proposed by “prestige”-oriented analyses. It also offers insights into the “parameters of desirability” applied to material culture and shared by the Central American cultural patchwork of the Late Preclassic period.

Given the complexity of the question of the influence and “afterlife” of the Usulután style – Izalco being the Nec plus Ultra of its execution – the study of “luxury” might open exciting new paths for future research bettering our currently hazy understanding of its influence on Maya ceramic styles.

15 **GLASS SPOON IN A PIT HOUSE - THE PECULIARITY OF EARLY ROMAN GLASS USAGE IN AQUINCUM**

Abstract author(s): Kelemen, Zsófia (Budapest History Museum; Eötvös Loránd University)

Abstract format: Oral

Even though Aquincum, the roman predecessor of the hungarian capital, has been systematically researched in the last 130 years, very little attention was directed on the glass consumption of the ancient town. Of course, some of the findings are published and most of the outstanding and significant pieces are displayed but attention was not yet directed on the wider context or socio-economic background of these. My research aims to fill this decades-old gap in the research by analysing both residual glass waste and the corresponding vitreous grave goods. This allows a far better understanding of how glass vessels was used and it's easier to determine if an item could really have been a luxury. During evaluation a very interesting trend could be seen: the earliest periods of the settlement contains many pieces of vessels that could be labeled unique. Not only from a numerical aspect, although some forms are represented only by few known example not just in Aquincum, but in Pannonia as a whole, but considering their outstanding quality. This is even more interesting with the added fact that these pieces must have arrived here by trade because local glass making is nonexistent during the period in question (second half of the 1st century AD) as the native celts did not use glass vessels. In my presentation I intend to demonstrate this phenomenon through case studies with the aim to showcase how these items, which could be considered luxury, had a very important part in the identity of Aquincum's first roman inhabitants.

16 **THE DESIRABILITY OF IRON OBJECTS IN KOFUN PERIOD JAPAN**

Abstract author(s): Stein, Britta (Martin-Luther-University Halle-Wittenberg)

Abstract format: Oral

While the introduction of lamellar armour and stirrups firmly situates Kofun-Period Japan within a long-distance trade network in Eurasia, the use of these objects differs greatly from the use in of the same or similar objects in Europe and Asia.

The middle Kofun period (5th century CE), was a time of profound changes in Kofun period society. It is characterised by a sharp increase military equipment and horse gear among the burial goods, while the importance of non-military objects decreased.

There is, however, a distinct lack of fortifications and an equal scarcity of skeletons showing signs of injury which would indicate that warfare actually took place on the Japanese islands.

Military equipment, therefore, must have served a different purpose in Kofun period society. Past and present discussions about military equipment and military activities of the Kofun people tend to omit the desirability and high value of the iron itself which is transferred to iron objects. As there is no evidence of iron smelting on the Japanese islands during the 5th and early 6th centuries, all iron had to be imported from the Eurasian mainland. Iron was thus highly valuable and accessible in large quantities only to a select few. Its desirability was further enhanced by the introduction of a new, exotic iron objects from the Eurasian mainland.

This paper will show how iron objects as well as access to specialised craftsmen were utilized by the elite in the Kinki region, the political and economic centre of the Kofun period, to form a network of allies via the distribution of prestigious objects to local chiefs. Centralised production of weapons and armour ensured a scarcity in the peripheral regions while the elite in the centre used their monopoly to strengthen and legitimize their social position and power.

17 LUXURY WARE OR COFFEE CUP? THE CONSUMPTION OF ORIENTAL DECORATIVE CERAMICS IN OTTOMAN HUNGARY BASED ON THE ARCHAEOLOGICAL RECORD

Abstract author(s): Komori, Tünde (Central European University)

Abstract format: Oral

Oriental decorative ceramics such as Chinese porcelain, Iznik ware, and Persian faience appeared in the territory of Hungary with the Ottoman occupation in the sixteenth century. These ceramics are relatively rare in the archaeological record and only appear at sites that were occupied by the Ottomans indicating that they were highly valued objects of the Ottoman material culture used only by the Ottoman-cultured population in Hungary. It is also a widely accepted paradigm that although Iznik ware in the sixteenth century was considered a luxury ceramic type, Ottomans valued blue and white Chinese porcelain even higher. By the seventeenth century Iznik production declined, and Chinese porcelain became even more important.

The archaeological record of Hungarian Ottoman-occupied sites suggests a rather more complex picture regarding the value of these objects. Since the written evidence is not sufficient for the proper study of the value of porcelain and faience in relation to each other, it is the archaeological finds that research can rely on. The proposed paper explores the indication of the distribution of the finds and contextualizes it from the perspective of trading patterns in order to reconstruct the value and prestige of these objects within the everyday Ottoman material culture of the Hungarian province. One of the main driving questions of this study is whether the term “luxury ware” is accurate in the case of these objects, or they were merely objects in everyday use, available to anyone who needed them for their daily coffee drinking routine.

18 THE BORSTÖ 1 WRECK IN FINNISH ARCHIPELAGO: SHINY PORCELAIN, GOLDEN SNUFFBOXES, TORTOISE SHELL FANS AND POCKET WATCHES

Abstract author(s): Alvik, Riikka (Finnish Heritage Agency; University of Helsinki)

Abstract format: Oral

Maritime trade and consumption went hand in hand in the 18th century. The Gulf of Finland was a highway for products like sugar, coffee, tea, dyes, metals, and textiles, but the ships carried also luxury things for the elite – court members, upper class people wealthy merchants. They had wealth, power and social status which made the consumption of luxury possible. The 18th century social order was about balance in the society and consumption by social class was part of it. Luxury things carried messages of wealth, power and high social status, and such things were not allowed for everyone.

The volume of trade increased in the 18th-century, but maritime safety was still quite poor, and shipwrecks occurred. The northern Baltic Sea is known of its rich underwater cultural heritage. In this paper, a unique material assemblage of a shipwreck site from Finnish Archipelago is presented. The unidentified wreck called Borstö 1 was found already in late 1950's. The navy divers were the first to visit the well-preserved wreck of a wooden sailing vessel, which seemed quite old. The excavation begun in the early 1960's, and things lifted during research periods between 1961 – 1998 are quite remarkable: golden snuffboxes, high - quality pocket watches, decorated fans, a horse wagon and Meissen porcelain dishes, statuettes, and flower vases. Based on finds, the shipwreck occurred around 1750 and the ship was on her way to St. Petersburg. Where did these luxury objects come from and to whom were they meant for?

THE DEVELOPMENT OF WHEELED VEHICLES IN THE EURASIAN STEPPE IN THE BRONZE AGE: A MILITARY AND SOCIAL APPROACH

Abstract author(s): Rzonca, Justyna (Institute of Archaeology Jagiellonian University)

Abstract format: Oral

Wheeled transport can be considered as a revolution in human development history, making an exchange of goods and ideas much more possible. The oldest findings of true vehicles come from the Eurasian Steppe area. Vehicles were a useful tool itself, but soon they acquired a very different role. They appeared in burial rites as a grave inventory, especially in the eastern Eurasian Steppe. Vehicles belong to the category of very rare findings and their presence in the burial rite proves their special social and religious importance. This type of rite lasted long, from the Early Bronze Age until the early Late Bronze Age all over the mentioned territory. Wagon graves required a lot of effort and material. By analysing the construction and grave inventory it is possible to recognize the application and role of these early vehicles. One of the main turning points was the invention of the spoked wheel and the adaptation of horses to draw the carts. The finds of graves from the Western Steppes, containing a vehicle combined with a significant amount of weapons from the same context, meant the beginning of a new era in human transportation. This kind of wagon actually fulfils the definition of a chariot: an invention, that improved combat and also was a very important symbol in the worldview of BA societies. Vehicles were present in the graves even though their shape and function changed and to place them in a grave required lot of effort, which means that the person buried with a chariot or wagon had a special social status. The questions here are, what does this ritual mean, why were vehicles developed in the steppe to be used in combat and what does the distribution of vehicles among cemeteries say about their role as symbol of social affiliation?

153 WEAVING NARRATIVES OF THE PAST THROUGH MEDIEVAL SMALL FINDS (AD 1000-1550)

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Lewis, Michael (British Museum) - Vargha, Maria (Charles University) - Racz, Tibor (Community Archaeology Association) - Sawicki, Jakub (Academy of Sciences of the Czech Republic)

Session format: Regular session

Archaeological finds are key to understanding the lives of past peoples, and this is especially true for the medieval period. Across Europe, our approach to understanding material culture differs, in many ways dictated by modern political boundaries, cultural differences and attitudes towards heritage protection: indeed, our lens to the past is manifestly through the present. This makes it difficult for archaeologists interested in archaeological small finds to understand them holistically, across states and areas that existed in the past but do not (necessarily) survive today. Therefore, this session's purpose is to encourage international/pan-European dialogue about the past through medieval small finds, with a particular focus (this time) on metal items.

Specifically, we are interested in contributions that: consider theoretical/digital approaches to analysing big data to understand broad trends in material culture across Europe (c. AD 1000-1550); or, look at specific object types across parts of Europe (even across regions) to understand typology, distribution, contacts and trade links etc; or, approaches to understanding the composition of finds, the sources of raw materials and (therefore) their 'life story'. It is key that papers have a pan-European focus, but they may begin weaving their narrative of the past from a local (insular) perspective.

ABSTRACTS

1 CHALLENGES TO PAN-EUROPEAN APPROACHES TO STUDYING ARCHAEOLOGICAL SMALL FINDS

Abstract author(s): Lewis, Michael (British Museum)

Abstract format: Oral

Europe's political boundaries have changed much since the Middle Ages (1050-1550) and throughout that period also. This presents challenges for those interested in studying archaeological small finds, including their development, differences in form and type, and distribution. As a result, most scholars focus on finds types in their areas, or within some traditional entity, without much consideration of them within a pan-European sphere. This is obviously problematic as it does not help to understand them within a wider context.

This paper seeks to highlight the barriers to pan-European approaches to studying archaeological small finds, specifically small metal finds, including those made by the public. This includes the fact that political boundaries have

changed over time, and these do not reflect the states of the Middle Ages. Cultural differences, such as language barriers and attitudes towards certain aspects of archaeology. Also, attitudes towards heritage protection might increase (or decrease) the number of finds available for research.

2 THE DARUFALVA (DRAUSSBURG) HOARD AND ITS CONNECTIONS

Abstract author(s): Langó, Péter (Institute of Archaeology Research Centre for the Humanities)

Abstract format: Oral

The so-called broken silver treasures are present among the 10th-11th century finds of the Carpathian Basin. These finds carry a specific North European connection – as this area was their typical source in the given period (the areas of Scandinavia, present day Poland and Russia, Northern Germany and the Baltic region). The finds are not only and exclusively silver objects or fragments as the gold hoard from Zsennye clearly demonstrates. The presentation wants to bring to the horizon of research again the assemblage unearthed in the 19th century – the treasure of Darufalva, and to highlight what types of connections the 11th century Carpathian Basin had with the regions mentioned. The hoard deserves due attention also, because its evaluation on the international level can be supported only by one single German publication that was published almost half a century ago. The recent Hungarian studies have not been translated, consequently the evaluation of the individual objects including their wider regional connections have not been accessible in English either. In the recent past archaeometallurgic studies have been involved in the research of the material culture of the given period, consequently their preliminary results will be included in the talk, and it also wishes to summarize the relationships of the individual types of artefacts, their parallels found in the Carpathian basin and in the wider Central European context.

3 WHY DID IT BECOME SO POPULAR? TWISTED JEWELLERY FROM THE FORMATIVE PERIOD OF THE HUNGARIAN STATE IN THE CARPATHIAN BASIN

Abstract author(s): Radišić, Milica (Institute of Archaeology, Belgrade)

Abstract format: Oral

The use of wire had an important place in the European crafts milieu during the Antiquity and the Middle Ages, however, jewellery made entirely by twisting wires was specific only to particular periods and geographical areas. It is well known that twisted neck-rings (torcs) and arm-rings were widespread in the north and east of Europe – a huge number of such finds come from famous Viking-age silver hoards. Similar twisted items, mainly made of bronze, were also popular in the Carpathian basin during the last decades of the 10th and the 11th century, but they are less known to a wider scientific audience. Nearly four hundred torcs and probably several hundred twisted bracelets and finger-rings originate from cemeteries of the so-called Arpad period. In previous studies, scholars from Hungary, Romania and the former Yugoslav countries emphasised different causes behind their spread, such as an atavism of the Antiquity, the Avar-period legacy and the influence of Byzantine culture. It is surprising that there has been almost no attempt to interpret these artefacts in the context of fashion influence and craft skills transfer from the Kievan Rus' and the Norse world. Even more so since historical sources hint at some contacts involving commercial and military cooperation between the Hungarian state and the aforementioned regions. This paper will discuss archaeological contexts, as well as morphological and technological characteristics of twisted jewellery in order to gain a better understanding of the nature of the relationships between East-Central Europe and the surrounding world in the beginning of the High Middle ages.

4 STAR-SHAPED BROOCHES AS FUNERARY ITEMS: SOME REMARQUES ON THEIR ORIGIN AND CHRONOLOGY

Abstract author(s): Marcu Istrate, Daniela Veronica (Romanian Academy, "Vasile Pârvan" Institute of Archaeology, Bucharest)

Abstract format: Oral

This paper aims to reopen the debate on the so called "star-shaped brooches", based on two exceptional items uncovered in 2011 in Alba Iulia (Transylvania, RO), in front of the Roman Catholic Cathedral. The today cathedral is a 13th century building. However, churches have been built on the same spot since the 10th century, and a burial site has been opened at the end of the 11th century, to be intensively used in the following centuries. Over 400 graves were uncovered in 2011, overlapping the ruin of a Byzantine style church. Very few of them had funeral items, which typically were earrings with S-shaped end, finger rings or coins. Nevertheless, several graves stand out for their very special inventory, among them being two special star-shaped brooches.

This paper will introduce the artifacts and the archaeological context of their discovery, as extremely relevant from a chronological point of view. Some new hypotheses regarding the origin of these pieces, their evolution over a wide area in Central-Eastern Europe and, last but not least, possible meanings of their fabric and usage, will be discussed.

5 PINS DISCOVERED AT CHURCHYARD CEMETERIES: VARIATIONS OF FORMS, DECORATION AND FUNCTIONS

Abstract author(s): Szocs, Peter Levente (Muzeul Judetean Satu Mare)

Abstract format: Oral

A series of new and older discoveries of pins will be presented coming from medieval and early modern Hungary and Transylvania. Their number is steadily growing due to the extensive archaeological rescue researches at church-yard cemeteries. Pins are found as grave-goods, more precisely as accessories of cloths, head-wears or shrouds, but a considerable number are found in various fills or layers, not connected directly to burials. It is of particular interest that the discovered pins present a high variation of materials (from common metals to noble ones, and their combination); dimensions; forms (from the simplest ones, to spectacular spherical heads); and decoration. All these features, and the position or the context of the discovery permit to identify the function of pins, and even the social status of their bearers. Moreover, variation of materials and decorations might help to identify techniques of production and workshops. Similar forms are present in different contexts, though, which suggests that particular objects could be used for multiple purposes.

6 SUZDAL ARCHANGELS: BETWEEN THE SYMBOLISM AND SPATIAL DISTRIBUTION

Abstract author(s): Fedorina, Anastasia (-) - Makarov, Nikolay (-)

Abstract format: Oral

Pendants in the form of figures of archangels are a well-known group of medieval items, distinguished by the unusual shape of the Christian image and the breadth of the spatial distribution of the finds. Nevertheless it is hard to clarify the importance of different aspects of Archangel' symbolism during the long Middle Ages. The observation of the Suzdal finds, their spatial distribution and co-occurrences with other categories of material culture could outline the circle of wearers of pendants in question, for example their social status.

The paper is devoted to new finds of Christian antiquities with the image of the Archangel, discovered during archaeological surveys of Suzdal settlements. The value of the presented finds lies, among other things, in the fact that it is possible to trace the context in which they existed - the general nature and dating of the settlements on which they were found have been largely clarified.

Their finds assemblage testifies to the presence among the inhabitants of representatives of the elite of the lower and middle levels. Probably, in this environment technologically simple, but few archangel pendants could circulate. Findings of this category of items on Vaigach Island testify to the possible connection of archangel pendants with the military environment. A review of finds assemblage with archangel pendants from the settlements of the Suzdal Opolye suggests the same connection, and for some settlements (Ivanovskoye 2) it can be documented through joint finds of pendants and weapons. Ivanovskoye 2 is the most short-lived settlement presented in the article. The most probable time of its life is the 12th century. The archangel pendant found here should be dated to this time, and together with it, three others, imprinted from one model.

7 FROM WALL TO TABLE- TABLEWARE FROM WALL PAINTINGS OF FINNISH MEDIEVAL STONE CHURCHES AS ARCHAEOLOGICAL FINDS

Abstract author(s): Varjo, Anu Sisko (University of Helsinki)

Abstract format: Oral

The wall paintings of Finnish medieval (1150-1523BC) stone churches have depicted religious motifs and biblical events, but the material world shown in them has been medieval. In Finland, the authors of paintings and the models of the pictures they use have been Central European, so it is interesting to examine whether Finnish churchgoers have seen the world of objects in their everyday material culture.

Finnish medieval material culture has been considered poor and scarce, but archaeological excavations in recent decades have changed perceptions of more significant objects. Tableware and cutlery, considered luxurious artefacts, are found in excavations of medieval village plots in rural areas. In my research, I have compared how the imported ceramics, glass breakers and table knives of the wall paintings of stone churches in the Uusimaa and Southwest Finland rural areas are visible in Finnish archaeological excavation findings, i.e., how familiar the objects visible in the wall of the church have been to the churchgoer.

So far, church wall paintings have been scarcely used in Finland as a source of archaeological research. The paintings need critical and careful analysis, as their original purpose has not been to document medieval material culture, and all the motifs do not necessarily correspond to medieval life. However, the wall paintings are an exciting source of archaeological research, as they provide additional information for archaeological finds on material and social culture.

8 AN INTERNATIONAL PERSPECTIVE ON MEDIEVAL SMALL FINDS IN HUNGARY

Abstract author(s): Rácz, Tibor (Ferenczy Museum Centre; Community Archaeology Association)

Abstract format: Oral

In 2015 a Community Archaeology Program has been launched boosting rescue and plan excavations as well as metal detector surveys in the central parts of Hungary. The scales and objectives of the program have been continuously expanding resulting in a huge collection of finds, comprising 10-12.000 non-coin medieval metal finds, a source base with yet barely exploited potential. The material calls for a systematic approach, a complex evaluation of the finds in the frames of a research project. The wide spectrum of objects allows us a multi-scale perspective on the material culture of medieval villages relating on several different aspects of utilization: daily routine of domestic activity, agricultural work, manufacturing, consumption habits or fashion. We can also identify production sites, trade networks and social patterns with the help of quality products.

Present paper concentrates on metal detector finds of a sample area discussing the interconnectedness of material culture on a pan-European scale. The objects were collected with the exact coordinates during controlled and well documented field surveys. The spread of finds will be highlighted with the application of geospatial methods. A plastic picture of the settlement network can be drawn at a regional level if we display the processed data on the map. With the quantitative analysis and taking into account the prestige objects, indicators of trade we can attempt to identify the central places and peripheral zones of the respective region. The hinterland of medieval towns, monasteries and forts will be clearly outlined with this methodology. The importance of the study lies in the fact that until now we had no archaeological data on the hierarchy of the medieval villages and market towns in Hungary.

9 THE SEEWINKEL IN THE EAST OF AUSTRIA - A CULTURAL LANDSCAPE AT A CROSSROADS

Abstract author(s): Perstling, Claudia (University of Innsbruck) - Özyurt, Jasmin (Austrian Academy of Sciences-Institute for Medieval Research) - Siegl, Kathrin (ÖAI Abteilung Altertumswissenschaften, Forschungsgruppe Numismatik) - Tobias, Bendeguz (Austrian Academy of Sciences-Institute for Medieval Research)

Abstract format: Oral

Recent developments in Austria show that an increasing number of historically significant sites and their information are being lost due to the intensification of agriculture and the search for archaeological finds using metal detectors. Agricultural equipment and the increased use of pesticides are destroying archaeological sites and remaining information in the form of small finds is disappearing into private collections. It is also likely that most of these finds will be lost or sold over the years. If this trend continues in the coming decades, it is expected that we will leave future generations with a cultural wasteland.

From a scientific point of view, the quality of information about archaeological sites is decisive. This means that we need accurate location information and a detailed description of an archaeological find. But what if these decisive information is missing? How can we steer uncontrolled collecting activities into scientific channels and how can we draw conclusions about archaeological finds without this information?

With the Seewinkel project in Austria, which is considered to be a particularly endangered area, an attempt is being made to work out a solution in cooperation with the Federal Office for the Protection of Monuments and the metal detector users on site to find out what small finds without archaeological context can tell us and what not.

158 DIGITAL DATA AND EARLY MEDIEVAL CARVED STONES: ACCESS, INTERPRETATION AND VISUALISATION

Session theme: 3. Heritage Narratives and Representations

Session organisers: Colbert, Kate (University of Galway) - Semple, Sarah (Durham University) - Kasten, Megan (University of Glasgow)

Session format: Regular session

The aim of this session is to both take stock and look forward. We reflect on recent advances in the recording and on-line publishing of databases/corpora of early medieval carved stones – which notably includes the Anglo-Saxon Corpus of Stone Sculpture and the database of Gotlandic Picture Stones – and look ahead to new advances with respect to these and other stone sculpture corpora, as well as additional national and international databases. These include the OG(H)AM project's digital cataloguing of all ogham inscribed stones and the Digital Atlas of Early Irish Carved Stones, as well as other projects working to establish full digital online databases/catalogues and facilitate a wide range of access and interpretation initiatives, not least in terms of digitising how stone sculptures originally looked (including the application of colour) and the nature of the historic environments they occupied. We are looking to bring together projects from across Europe that have or are working on visualisations and digital manipulations of early medieval sculpture to raise awareness of the material and encourage wider access to it and its historical, social roles. We are

interested especially in case studies where visual and digital work are setting and answering new research questions and enabling new directions in knowledge generation about early medieval sculptural outputs and artistic production. Such work is of course inter- and intra-disciplinary, and in response we are also looking to hear from collaborations involving archaeologists, museums, digital/computer specialists, art historians, anthropologists, etc. that bring data together on digital platforms and explore ways in which digital interpretations will and do enhance our understanding of that material and its users.

ABSTRACTS

1 GOTLAND'S PICTURE STONES - THE DIGITAL EDITION

Abstract author(s): Oehrl, Sigmund (Institutionen för arkeologi och antikens kultur, Stockholms universitet; Universitetet i Stavanger, Arkeologisk Museum)

Abstract format: Oral

Although much research on the Gotlandic picture stones has been carried out since the early 1940s, most of this research, by necessity, has been based on Sune Lindqvist's edition "Gotlands Bildsteine". However, 75 years after the publication of this book it is quite clear that Lindqvist's edition is outdated. Consequently, a new edition of all the Gotlandic picture stones is much needed. Secondly, all interpretations of the published picture stones and their images have been based on Lindqvist's painted pictures, that is on the fundamental perception of the shallow carved lines by a single scholar. Although Lindqvist was an excellent specialist, his perceptions of the images are sometimes doubtful and have been challenged several times. Consequently, a digital, more precise documentation of all the monuments is highly needed.

For these reasons, a new project has been started recently, financed by the Swedish Research Council, based at Stockholm University and Gotlands Fornsal, in order to create a new digital edition of the entire material. The project has three major aims: 1.) Digitization of the entire corpus of Gotland's picture stones, applying the most advanced 3D recording methods available, combining different technical approaches. 2.) Creating an interactive online edition of the picture stones, addressed to both the public and researchers, including the 3D data, digitised archival material, and detailed archaeological texts on each stone. 3.) New interpretations of the images based on the new digital documentation.

The paper will give an overview of previous research, main problems and new approaches of documenting and interpreting picture stones, clarifying the urgent need for a new, digital edition of the material, and outlining the future steps and goals of the new project.

2 THE FIRST LATIN INSCRIPTION MADE IN SWEDEN? GROOVE ANALYSIS OF THE KARLEVI RUNESTONE BY 3D-SCANNING AND MULTIVARIATE STATISTICS

Abstract author(s): Kitzler Åhfeldt, Laila (Swedish National Heritage Board)

Abstract format: Oral

The late 10th century AD Karlevi stone on the Baltic island Öland is one of the most enigmatic Viking-Age runestones in Sweden. The runic inscription tells that a Danish sea-lord has been buried on the island. It includes a long strophe formulated in the Old Norse verse meter dróttkvætt, a complicated art form aimed at an audience at the court. On the backside of the stone there is an inscription in Latin letters, interpreted as the misspelled beginning of the well-known prayer starting with "In nomine Jesus...". If this inscription is contemporary to the runes, this is the oldest known Latin inscription that with certainty has been produced within present Swedish area, as well as the oldest known Christian prayer in Scandinavia.

The problem is whether the Latin inscription is contemporary to the runic inscription, or if it has been added later. This has been investigated by groove analysis, i.e. analysis of the carving technique using 3D-scanning, the analysis tool Groove Measure and multivariate statistics.

This method has been applied in several research studies about Viking-Age rune-carvers, investigating issues concerned with mobility, contact patterns, identification of carvers, co-operation and authenticity. It shows how 3D-data can be used for sophisticated analysis of grooves and tool marks. The parameters can be adapted to other dimensions; thus the method is applicable on other artefacts and materials as well.

Results indicate that the runic inscription may have been carved by two individuals, one of whom also carved the Latin inscription. This carver might have been bilingual, e.g. a Scandinavian carver picking up some Latin or a not-so-learned priest, both options feasible in this region and time period.

3 **PICTURE THIS: 3D RECONSTRUCTIONS OF POLYCHROMED SCULPTURE IN BRITAIN**

Abstract author(s): Patrick, Jordyn (Durham University)

Abstract format: Oral

This paper will present a case study from ongoing research regarding polychromy and early medieval sculpture in Britain, CE 500-1100. Using a selection of data from the Anglo-Saxon Corpus of Stone Sculpture, the discussion will cover interdisciplinary methods used to digitise and analyse traces of pigments and other surface treatments.

From the Lichfield Angel to the Gosforth Cross, excavated finds and existing monuments in England now provide evidence that many of these monuments were painted and highly coloured. This medium has given people a way to express notions of place, memory, and identity and, in monumental form, offered a means of creating relationships between the local landscape and the people inhabiting it. Colour played a significant role in these monuments' aesthetics, composition, purpose, and visual impacts. As such, not only does this project aim to produce high-resolution 3D models of key sculptures but also to build a database of known paint traces and their composition along 3D reconstructions using these suggested pigment palettes.

4 **BUILDING A FRAMEWORK FOR RECORDING CARVED STONES IN IRELAND: STANDARDISATION AND ACCESSIBILITY**

Abstract author(s): Colbert, Kate (University of Galway)

Abstract format: Oral

The beautiful and intricate works of Insular art produced in the monasteries and churches of early medieval Ireland stand as testimony to the wealth, power and cosmopolitan nature of those ecclesiastical communities. Stone sculptures in particular reflect the artistic and technological innovations that characterised these milieux; yet despite the widespread distribution of carved stones dating to this period throughout many communities across Ireland, their full potential to shed light on key aspects of early medieval Irish society remains untapped, hindered by the absence of a systematic, island-wide survey of carved stones. The lack of such a corpus has thus far hampered our ability to draw comparisons between the Irish material and that from other regions of early medieval Europe. This not only limits our understanding of Irish carved stones in their wider context, but consequently, also impairs our capacity for knowledge generation and exchange within early medieval scholarship at a global level. Significant strides in tackling this issue are currently being made by projects such as the Digital Atlas of Early Irish Carved Stones (DAEICS), as well as the Early Medieval Irish Latinized Inscriptions (EMILI) project and the OG(H)AM project. However, due to the sheer volume of material, considerable work still remains to be done in the coverage of Irish sculpture. This paper will present ongoing work, undertaken in collaboration with key scholars across Ireland and abroad, including those associated with the aforementioned projects, in creating a guideline framework for the recording of Irish carved stones. Most importantly, this includes a comprehensive ontology that will ensure standardisation of terminology and make the data easily accessible, searchable and retrievable to researchers worldwide so that, in the medium term, the long-overdue work of building a cohesive island-wide corpus of Irish early medieval carved stones can begin.

5 **THE DIGITAL ATLAS OF EARLY IRISH CARVED STONES (DAEICS): ACCESS, VISUALISATION, INTERPRETATION**

Abstract author(s): Ó Riain, Diarmuid - Ó Carragáin, Tomás (University College Cork)

Abstract format: Oral

The Digital Atlas of Early Irish Carved Stones (DAEICS) is a new collaboration between University College Cork and Queens University Belfast funded by an Irish Research Council Coalesce INSTAR+ award. This paper will introduce the project and present some initial results. The project aims to contribute to a step-change in both the academic understanding and public appreciation of carved stone monuments of late prehistoric and early medieval date (c. AD 1-1200). Existing records by the Irish National Monuments Service (NMS) and the Northern Irish Historic Environment Division (NIHED) are being integrated and enriched, drawing on the results of recent research to add new layers of standardised data in ArcGIS. Rather than an exhaustive survey, key attributes are being recorded which will allow researchers to visualise and analyse the most important variables in form, design, resource investment, and chronology across the island for the first time. DAEICS therefore complements in-depth work on specific regions and monument types – such as the Og(h)am project – and will be a critical enabler of targeted research. This is being demonstrated by using the atlas to facilitate and inform detailed studies of outstanding collections centred on Armagh, Clonmacnoise, and Iveragh. These case studies are being undertaken in collaboration with community groups. Through training in digital recording techniques, members of the public are making an enduring contribution to the study of carved stones in their local area.

COASTAL ARCHAEOLOGY IN SMALL ISLANDS: RESEARCH PERCEPTIONS, BIASES, METHODS AND APPROACHES

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: de Waal, Maaïke (Field Research Education Centre, Faculty of Archaeology, Leiden University) - Gal, Emily - Rennell, Rebecca (Archaeology Institute, University of the Highlands and Islands)

Session format: Regular session

In many small islands, isles and islets prehistoric communities relied heavily on the exploitation of coastal resources, resulting in a coastal subsistence focus and a large number of coastal sites. This has several interesting implications. We will focus on two major topics that are largely methods and approaches based.

1) Today, small islands are often perceived as remote, isolated locations. This has caused research biases favouring less 'remote' locations, as well as site functions erroneously being interpreted. The richness of the archaeological record in small island coastal settings, however, demonstrates that our current perceptions of what is remote, marginal, isolated or uninhabitable, do not mirror prehistoric perceptions. How far-reaching are these biases, and how can we challenge or combat them?

2) Coastal processes, accelerated by climate change, also endanger site survival. Therefore, protection of exposed cultural heritage is needed, and mapping and rescue excavations are urgent, although often complicated by limited resources and limited accessibility of terrains. Another complication of this site survival issue is that we do not really know what prehistoric settlement locations and settlement patterns looked like. It is essential to establish what (and how much) information we miss when it comes to coastal prehistoric, occupation. How can we fill in the blanks?

This session crosses disciplinary, chronological and geographical boundaries (not limited to Europe) to generate synergizing discussions on the above-mentioned particularities of investigating small island coastal landscapes. We welcome contributions dealing with practical archaeology research aspects relating to above-mentioned topics, as well as experiential, reflective presentations.

ABSTRACTS

1 AT HOME IN OUR SEA OF ISLANDS: THE ARCHAEOLOGY OF BOUNDLESS OCEANS

Abstract author(s): Walker Vadillo, Veronica - Ilves, Kristin (University of Helsinki)

Abstract format: Oral

Smallness is a state of mind. With these words, the Polynesian scholar Epeli Hau'ofa challenged the widely extended notion that islands are small, remote, isolated, and peripheral. Instead, he proposed we "focus on the holistic perspective in which things are seen in the totality of their relationships" (1994: 152). This understanding of islands as connected features on a vast blanket of water has its origin in the sea and emerges as a perfect example of what Christer Westerdahl called the Maritime Cultural Landscape (1992). The biases in perceptions that islands are small, remote, and isolated likely stem from comparative associations with continental expansions, the research approach firmly grounded in terrestrial approaches. This view excludes the sea and the knowledge and technology developed by maritime communities to expand their worlds beyond land, thus perpetuating the idea of "island smallness". Where Europeans used names like Finisterre (the end of the land) for geographic features and constructed myths of "Here be dragons", the Austronesians launched the greatest human expansion by sea, navigating across two Oceans from Madagascar to Rapa Nui. Despite these well-known migrations, the field of island archaeology has yet to fruitfully incorporate concepts like the MCL and non-Western perceptions of island identities. In this presentation we review the current state-of-the-art in island archaeology and examine theoretical trends through a systematic analysis of the *Journal of Island and Coastal Archaeology*. Especial attention will be given to the way in which the journal engages with maritime archaeology theory, and to what extent non-Western perceptions of islands are incorporated into interpretations. The presentation will then explore ways to contest and combat prevalent ideas of remoteness and isolation in the study of islands by bridging the fields of maritime and island archaeology, as well as highlighting the importance of non-Western epistemologies for our research.

2 COASTAL ARCHAEOLOGY IN SMALL CARIBBEAN ISLANDS: RESEARCH PERCEPTIONS AND BIASES IN LA DÉsirADE AND PETITE TERRE (FRENCH WEST INDIES)

Abstract author(s): de Waal, Maaïke (Faculty of Archaeology, Leiden University)

Abstract format: Oral

This paper focuses on challenges related to coastal archaeology in small Caribbean islands, based on case-studies carried out in La Désirade (20 km²) and the two islands of Les îles de la Petite Terre (together ca. 1.5 km²).

Two different type of challenges will be addressed:

1) The complications in (re)constructing representative site distribution maps to allow the creation of diachronic landscape biographies, as result of coastal dynamics (often including, but not being limited to, coastal erosion) and limited accessibility of the shorelines involved. Limited accessibility can be linked to the fact that many coastal areas represent vulnerable island fringes. Often, they are also protected as such. Excavation activities that might be expected to weaken the solidness of coastal areas are never really welcomed in areas that are already susceptible to natural destruction. In addition, coastal areas may also be protected due to the presence of nesting areas (birds and turtles) and of natural reserves.

2) The presentation will also discuss difficulties encountered to provide accurate site interpretations as result of perception biases related to supposed remoteness and limited island size.

By taking archaeological fieldwork and analyses from La Désirade and Petite Terre as examples, the paper will focus on the effects of these challenges, and will discuss ways to deal with those.

3 **SMALL ISLANDS IN A SMALL GULF: EXAMINING INSULARITY BIASES IN THE CONTEXT OF THE GULF OF FONSECA (CENTRAL AMERICA)**

Abstract author(s): Kolbenstetter, Marie (Leiden University; Université Paris-Nanterre) - Thakar, Heather (Texas A&M) - Elvir, Wilmer (Universidad Nacional Autónoma de Honduras)

Abstract format: Oral

El Tigre is one of the 34 small islands within the Gulf of Fonseca, on the Pacific Coast of Central America. The Gulfs' dimensions, at its longest and widest point, do not exceed 75 km by 55 km. El Tigre is only separated from the next island over, from which the mainland can be reached, by a 2 km strait. Do conceptions of insular territories have relevance for islands and archipelagos within such close proximity to the mainland?

We propose to examine how territory is constructed among modern and precolonial island communities of the Gulf of Fonseca. Using ethnographic, archaeological, malacological and isotopic data, we investigate how daily practices shape the integration of the mainland coastlines and other small islands to the insular communities' perceived territory. We will explore how environments popularly viewed as "inhospitable", such as the mangrove swamps lining the mainland, have been integral to insular life on El Tigre from precolonial to modern times. Indeed, from fishing, to mollusk collection, to salt-making and harvesting of timber, the entanglement with these complex ecologies runs deep. Reviewing ethnographic data can then allow us to propose social nodes within the landscape of the Gulf of Fonseca, where fishermen and mollusk collectors effectively broker inter-community relations. Understanding the short-distance mobility patterns associated with subsistence practices can then provide insight into the construction of social landscapes past and present within the Gulf of Fonseca.

4 **EXPLORATION OF DIMINUTIVE SPACES: THE CONNECTED ISOLATION OF MICRONESIAN ISLANDS**

Abstract author(s): Fitzpatrick, Scott (University of Oregon)

Abstract format: Oral

On a global scale there is nowhere else in the world where islands were colonized by humans over such a remote and isolated seascape. The vastness of Remote Oceania is astonishing, covering more than 65 million square kilometers, or roughly equal to the area of Asia, Europe, and the United States combined. Yet more than 3000 years ago, peoples in the Pacific reached these islands using a combination of sophisticated watercraft, wayfinding techniques—including a celestial compass—and sailing strategies passed down orally through rote learning across generations. Over the course of 2000+ years, different groups settled islands in Melanesia, Polynesia, and Micronesia, representing the most rapid and expansive diaspora in human history. The latter region, however, stands out as exemplary in terms of how and when smaller islands were settled. The western margins of Palau and the Marianas were first colonized coeval with the famous Lapita migration ca. 3300–3000 BP while numerous high islands and atolls were later settled by around 2000 BP, centuries before those in East Polynesia such as Hawaii, Aotearoa New Zealand, and Rapa Nui. In this paper I discuss the historical contingencies that have led to cases of relative isolation on some islands in Micronesia through time while in others extensive exchange systems developed to help ensure survival, biological diversity, and the acquisition of desired or needed resources. The settlement of Micronesia represents environmental adaptation par excellence, though the irony is that years of colonial rule and globalization—coupled with climate change—have in some ways led to a greater degree of marginalization, disconnections from traditional lifeways, challenges to conducting archaeological research, and prospects of eventual island abandonment.

5 THE RELEVANCE OF 'FAR-FLUNG' ISLAND LANDSCAPES IN PREHISTORIC SCOTLAND

Abstract author(s): Mom, Vincent (Digital Preservation Projects) - Higginbottom, Gail (INCIPIT - Consejo Superior de Investigaciones Cientificas-CSIC)

Abstract format: Oral

This paper investigates some of the megalithic landscapes of the islands of western and northern Scotland as part of ongoing research into these regions. The richness and density of the archaeological records of these regions, in terms of likely ritual as well as settlement landscapes, is becoming clearer with each passing year, pushing back against the ideas of isolation and uninhabitability during the Late Neolithic at least. Thus, we see a re-assigning from the oft undeserved notion of 'lower' status, to relevant and informative. Using locational and visual 2D and 3D GIS analyses, this work shows how we can comprehend the level of relevance of island and coastal landscapes to the prehistoric people that inhabited them, as well as uncover what these perceptions might be. This new work looks at monuments around Loch Roag in the west and the isles of Rousay and Shetland in the North. Specifically, it examines the visual connections between monuments and their surroundings. This current work expands either the methods or/and data of the previous works using high resolution elevation data of the areas as well as the most recently upgraded versions of software available for the creation of 3D-landscape panoramas and the immersion technology for the investigation of cultural astronomical landscapes. This work enriches our knowledge on two levels: for instance - it cements the idea that 'far-flung' places like the west of Lewis, actually centralise and typify ritualised knowledge and that the isle of Rousay tombs were far more complex in their ideology than previously understood. Thus, to some extent, the perceptions of these tombs creators have not been interpreted correctly, nor their 'functions' fully comprehended. Ultimately, this presentation uncovers some of the complexity and critical salience these island sites had in the Neolithic of Scotland.

6 CONNECTING THE ISLANDSCAPE. COASTAL NAVIGATION DURING THE MIDDLE AND LATE BRONZE AGE ACROSS THE BALEARIC ARCHIPELAGO

Abstract author(s): Galmes Alba, Alejandra (University of Balearic Islands INCIPIT - CSIC) - Calvo Trias, Manuel (University of Balearic Islands)

Abstract format: Oral

Across the Balearic Islands, during the Middle and Late Bronze Age, there are several archaeological indicators that show a high degree of connectivity between the islands, as well as with the mainland. This phenomenon can be traced through foreign materials, but also through shared practices, habitus, and objects across the islands. However, coastal sites have not been related to maritime mobility practices until recently.

In this presentation we want to analyse the maritime mobility practices that enabled and supported such connectivity. For that, and through a range of GIS-analysis we aimed to assess the role of a group of sites located along the islands' coastline, to understand if they could be related to coastal navigation dynamics. By focusing on the visibility and prominence of these sites during navigation we wanted to understand if their location could have enabled to be used as landmarks, and to be used as infrastructures that aided coastal navigation.

All in all, we aim to challenge the idea of islands as isolated and instead understand islands and connectivity from an islander's perspective. How, by understanding connectivity we can challenge the preconceptions about islands, and how we can look beyond, to the islandscape, or even the aquapelago, to see how the sea was an integral part of their landscape, practices, and even played a role in the construction of an insular identity, not necessarily through isolation.

7 ISOLATION & ISOTOPIC ANALYSIS IN HEBRIDEAN PREHISTORY

Abstract author(s): MacLean, Mairi (SUERC)

Abstract format: Oral

The idea that the islands are remote or isolated has become entirely normalised in Western society. This is true of how much of Britain views many of its archipelagos, such as the Hebrides, found along the west coast of Scotland (Morgan 1998, 20; Wright 2008, 61; McDonald 2008, 152; McCutcheon 2008, 1). Modern Hebrideans themselves are often discussed in terms of being static, unmoving, and old-fashioned. This perception is frequently extended back through history, impacting our understanding of Hebridean prehistory - despite the surrounding waters frequently being described as a 'sea highway'. Much of this has deep roots in Scottish history, with particular connections to social perceptions of Gaels (the Gaelic speaking cultural group typically identified as Scottish Highlanders) and to later 18th and 19th century colonial attitudes towards Pacific Islanders (Hau'ofa 1994). These very modern biases have a natural influence on the way researchers approach the archaeology of island populations and consider the data for their movements.

Using isotopic analysis to determine whether Hebridean populations show evidence of mobility between island groups and/or the mainland, this paper will present the results of sulfur analysis on Neolithic and Bronze Age remains. Along

with an interpretation of prehistoric population mobility based on these results, this paper will also discuss the implications for how we understand prehistoric Hebridean populations. In particular, it will consider how this interpretation challenges the pervasive narrative that the Hebrides are remote, isolated, and culturally static.

8 PROJECT SENTINELA: MONITORING AND DOCUMENTING THE EROSION PROCESSES ON THE CULTURAL HERITAGE OF THE GALICIAN ATLANTIC ISLANDS

Abstract author(s): Valle Abad, Patricia (Universidade de Vigo; Austrian Archaeological Institute - Athens) - Fernández Fernández, Adolfo (Universidade de Vigo) - Rodríguez Novoa, Alba (Universidade de Vigo; Aarhus University) - Lago Cerviño, Marta (Universidade de Vigo)

Abstract format: Oral

The Atlantic Islands of Galicia (Spain) preserve an important natural heritage, being the reserve of some representative ecosystems of the Atlantic continental platform. Declared National Park in 2002, they also count with a remarkable but less known cultural heritage, with a considerable number of sites on the coast. Over centuries and especially in the last decade, the integrity and preservation of these sites have been compromised, due to the erosive processes of the tides and extreme climatic events.

Project SENTINELA (funded by the Ministry of Environmental Transition and the Demographic Challenge of the Government of Spain) emerges with the aim of improving the knowledge about the human occupation of the Atlantic Islands throughout history and determining the impact of the sea variations and climatic changes on the preservation of their cultural heritage. Therefore, we developed a series of protocols and procedures that will allow the identification, characterization, evaluation, measurement and prediction of the degradation agents that affect the archaeological sites. This data will help the administration of the National Park to improve the management of their cultural heritage and ease the decision-making process about the rescue actions or measures that are necessary to preserve the sites. Furthermore, a higher knowledge of the cultural heritage of the islands will add new values to the National Park, improving the understanding of its evolution.

As SENTINELA began in January of 2022 and is still in process, we will show the project, its first results, as well as a first draft of the protocols followed to gather information, the problems the project faced in the first months of implementation and the expected outcomes.

9 CARIBBEAN ARCHAEOLOGICAL SITES AND NATURAL AND HUMAN INDUCED HAZARDS FROM PAST TO PRESENT: IMPACTS, LOSS AND RESPONSES

Abstract author(s): Kelly, Harold (KITLV; Leiden University) - Richards, Andrea (Leiden University) - Hofman, Corinne - Hoogland, Menno (KITLV; Leiden University)

Abstract format: Oral

Paleo climatic research in the Caribbean has provided evidence of significant climatic variations throughout the mid to late Holocene, impacting not only the environment, but also communities and their survival since their earliest occupation of the region, 7500 years ago. Centuries-long wet conditions alternated with drier cycles contributed to a long-term trend of relative sea level rise and extreme weather events. These alternating periods of extremely wet and dry conditions, drought, tropical cyclones, extreme wave events and storm surges, flooding, and sea level rise, would have undoubtedly severely impacted the insular inhabitants of the region and their settlements, especially those located along coastal areas. Through this presentation, evidence of these environmental impacts on people and places will be highlighted through case studies from selected islands in the region. Identified examples will not only highlight the impact of climatic challenges in the past, which led to varying threats to coastal sites and attending responses, but will also illustrate the effects of natural hazards and human interference currently on coastal archaeological sites.

10 SEA-LEVEL AND SITE LOSS: PREDICTIVE MODELS OF CLIMATE CHANGE ON COASTAL CULTURAL RESOURCES

Abstract author(s): VanderVeen, James (Indiana University)

Abstract format: Oral

The worldwide historic preservation community has expressed serious concerns over the threat of global climate change to the archaeological and historic record. The damage to, or complete loss of, archaeological sites on the small islands of the Florida Keys demonstrate the story of rising seas better than most places. On these low islands, with 90% of the land mass at 1.5 meters (5 feet) above sea level or less, minor fluctuations in sea level have been shown to have significant effects on shoreline movement and human settlement in the past. The increasing frequency of destructive weather events and a growing body of evidence indicates sea levels will rise appreciably over the next several centuries. Sea level along the coast of the Gulf of Mexico and in the Caribbean Ocean is projected to rise, on average,

0.25 - 0.30 meters (10 - 12 inches) in the next 30 years (2020 - 2050), which will be as much as the rise measured over the last 100 years (1920 - 2020). Immediate actions must be taken because the damage is observable at the present. In the Keys, more than twice the documented archaeological sites have already been lost to erosion and sea level rise than to construction and development. Linked database development across large regional scales, like that done by the Digital Index of North American Archaeology, and more local-scale ground-truthing projects, such as those recently conducted by the Florida Public Archaeology Network, can be used to target areas for mitigation. Positive change can come from open-access data sharing, citizen-based programs, and regular monitoring can direct preservation actions similar to that being done to save economically valuable coastlines.

11 DRONE-BASED SURVEY TO MAP CLIMATE CHANGE IMPACTS ON ERODING ISLAND HERITAGE

Abstract author(s): Graham, Ellie (University of Aberdeen)

Abstract format: Oral

Scotland has a rich legacy of archaeological sites around its coastlines and islands. Much of this heritage is under threat from coastal processes accelerated by climate change. Previous work has shown that hundreds of sites are archaeologically significant, threatened by erosion and highly valued by the local coastal communities; many of the most vulnerable are located on island coastlines. Sites need regular monitoring, while the scale of the issue outstrips available resources, so prioritisation is required, and management strategies need to be informed by robust, up to date data. The paper will present ongoing PhD research to carry out refined-scale coastal change analysis and vulnerability assessment for a network of sites around the north isles of Scotland. A combination of drone and ground survey is used to gather high-resolution 3D data from which the current coast edge is mapped as the basis of erosion assessment. Results provide up to date records of condition for individual sites, and the high-resolution monitoring data needed by archaeologists and coastal managers. Case studies are focused on prehistoric settlement sites which are known to be urgently threatened, so the surveys will improve understanding of the patterns of prehistoric settlements in these areas. The results also transform these sites into a network of nodal observation points distributed around the islands where the impacts of erosion are closely and accurately recorded to inform understanding of climate-driven coastal change on archaeological sites and the coast more widely. The site-scale vulnerability assessment also informs planning and prioritisation for future work on threatened sites.

12 INTEGRATED ARCHAEOLOGICAL INVESTIGATION OF A MARITIME TERRITORY. HABITATION AND CONNECTIVITY IN THE SMALL CYCLADES ARCHIPELAGO, GREECE

Abstract author(s): Boyd, Michael (Science and Technology in Archaeology and Culture Research Center, The Cyprus Institute; McDonald Institute for Archaeological Research, University of Cambridge) - Hilditch, Jill (University of Amsterdam) - Wright, Joshua (University of Aberdeen) - Brodie, Neil (University of Oxford) - Gkouma, Myrsini (Malcolm H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens; The Cyprus Institute) - Margaritis, Evi (Science and Technology in Archaeology and Culture Research Center, The Cyprus Institute) - Gavalas, Giorgos - Legaki, Irini - Athanasoulis, Demetris (Ephorate of Antiquities of Cyclades, Hellenic Ministry of Culture and Sports) - Renfrew, Colin (McDonald Institute for Archaeological Research, University of Cambridge)

Abstract format: Oral

In the centre of the Aegean, the mini-archipelago of the Small Cyclades is formed of six islands and a number of smaller islets set between the much larger islands of Naxos, Amorgos and Ios. Prior to recent systematic examination, the archaeology of the area was known principally through occasional rescue or scientific work, mainly on cemeteries, and the looting of sites such as Kavos on Keros.

Large-scale investigation of the site complex at Dhaskalio and Kavos, at the western end of the today uninhabited island of Keros, revealed a third millennium BCE site of unexpected complexity, full of evidence for a high degree of connectivity. In order to understand the roles of the site in its wider seascape, surface surveys were carried out on the island of Keros, on nearby Kato Kouphonisi, and in the southeast part of the neighbouring large island of Naxos, thereby sampling the neighbouring coastal and inland settlement patterns and resource exploitation on different land-mass scales. Small scale test trenches were also opened on Keros to test survey results and to understand long-term changes in land use.

This comprehensive data set allows us to investigate changes in settlement and land use over time, especially in relation to the development and decline of the large site at Dhaskalio and Kavos; to understand the distribution of labour and investment in the landscape in relation to marginality and the role of connectivity in creating a distributed mode of settlement; and to set longer term changes against evidence for soil erosion and climate change.

This paper examines the affordances of small island groups in a prehistoric setting and challenges our notions of marginality versus the evidence for inventive and intensive inhabitation gathered by modern field survey techniques.

OF SWAMP AND SAND: COASTAL AND ISLAND ARCHAEOLOGY IN NORTH FRISIA, GERMANY

Abstract author(s): Blankenfeldt, Ruth (Zentrum für Baltische u. Skandinavische Archäologie, Schloss Gottorf) - Klooß, Stefanie (Archäologisches Landesamt Schleswig-Holstein) - Majchczack, Bente Sven (Christian-Albrechts-Universität zu Kiel; ROOTS Cluster of Excellence) - Hadler, Hanna (Johannes Gutenberg-Universität Mainz) - Unglaub, Christoph (Archäologisches Landesamt Schleswig-Holstein) - Wilken, Dennis (Christian-Albrechts-Universität zu Kiel) - Bienen-Scholt, Dirk (Archäologisches Landesamt Schleswig-Holstein)

Abstract format: Oral

The coast of North Frisia, Germany – today protected as UNESCO Wadden Sea World Heritage – was repeatedly subject to major geomorphological changes. Large parts were swampy and uninhabitable for centuries or even millennia. Other hard-won and laboriously cultivated areas sank during heavy storms. They are preserved under today's tidal flat surface and can be mapped with modern, non-invasive methods. However, low tides limit the daily accessibility of the area, which can be difficult to walk on. In addition, observations of threats to these cultural layers by coastal processes and climate change is still in an early stage.

Since the last ice age, so-called geest cores have stood out from this unsteady landscape. They were the only permanently dry areas from which today's North Frisian Islands were formed by the deposition of marine sediments. Already inhabited since the Neolithic, larger settlement groups are to be expected here from the turn of eras. Special preservation conditions provide archaeologists with an increasingly differentiated image of the island communities, which has long been regarded as isolated people in barren landscapes.

For example, on the western side of the island of Amrum, a wide belt of dunes developed in recent times, which has outstandingly preserved sites on the coast and in the immediate vicinity by covering them with sand. But if these features are blown free, they lie unprotected in the landscape. This has resulted in smaller (rescue) excavations, which have documented, among others, trading sites that were evidently used seasonally, as well as more extensive settlement features in the dune valleys.

The lecture aims to present and discuss the aspects addressed here: methodology in fieldwork, archaeological interpretation, conservation and natural challenges

BUILDING UNDER AND ABOVE GROUND DURING EUROPEAN NEOLITHIC

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Porqueddu, Marie-Elise (École des hautes études hispaniques et ibériques, Casa de Velázquez) - Le Roy, Mélie (Department of Archaeology and Anthropology, Bournemouth University) - Ard, Vincent (CNRS - UMR 5608 TRACES, Université Toulouse Jean Jaurès)

Session format: Regular session

Starting around the fifth millennium BC, the Neolithic period is marked over time by the emergence of monumental funerary structures across Europe. These burials either take place in natural environments (caves, shelters, etc.) or are artificially constructed (dolmens, hypogea, etc.). The funerary practices in use are gradually evolving from single deposits to collective burial sites, the latter becomes the main practice at the end of the Neolithic. All these structures have in common a strong impact on the landscape, whether underground or aboveground. The choice of architecture and materials may reflect specific environmental and geological contexts. Nevertheless, various geographical areas display a high density and variability of this type of tombs demonstrating that environment is only one of several explanatory factors.

At a regional scale, several questions arise on the anthropological, socio-cultural, and structural levels from the presence of this wide diversity of places to bury the dead. Do these different funerary expressions reflect an individual's different social and/or symbolic status within the same community? Alternatively, do these different types of structures illustrate distinct human communities? Other scenarios can also be formulated concerning the diversity of funerary architectures within a territory, such as the impact of architectural traditions and their evolution, or the incorporation into funerary practices of new behaviours linked to contacts with other human groups. In order to assess the evolution of these practices over time, a high-resolution chronology must be established.

This session aims to gather Neolithic case studies from across Europe and its surroundings to discuss the archaeological evidence for the world of the dead (anthropological, architectural, typo-chronological, etc.) to identify and define the determining factors, whether socio-cultural, environmental and/or technical, that had an impact on the architectural choices of human groups to establish aboveground or underground burials.

1 NEOLITHIC RONDELS AND EARTHEN LONG BARROWS. A CASE STUDY OF THE MONUMENTAL LANDSCAPE FROM THE SOUTH-WESTERN PART OF POLAND

Abstract author(s): Przybyl, Agnieszka (University of Wrocław)

Abstract format: Oral

In 2022, in the neighborhood of the Muszkowice Forest, in south-western Poland, three circular ditched enclosures were discovered. The area around the village of Muszkowice was previously known for the presence of numerous pre-historic and early medieval barrow cemeteries. Now, the early Neolithic monumental constructions have completed the picture of this sacred landscape.

The discovery was made possible thanks to the involvement of fascinators and seekers of archaeological curiosities. They used satellite images made available on the internet, taken in the exceptionally dry year of 2018. With the cropmarks visible, they noticed huge concentric circles in these images. In that rather surprising way, the discovery demonstrates still the considerable potential inherent in archaeological landscape research in Poland.

In my presentation, I focus on this particular example of the monumental landscape from Muszkowice, with different, ritual and funeral, Neolithic structures co-occurrence in one common area. It shows that even for a relatively well-studied territory, the use of modern observational methods can still provide us with surprising information to supplement our knowledge of archaeological heritage and past landscapes.

The studies presented were partially conducted with the financial support of the National Science Centre, research project No. 2017/25/B/HS3/01442.

2 FROM THE VISIBLE TO THE HIDDEN: DIVERSITY AND EVOLUTION OF FUNERARY ARCHITECTURE IN SOUTHWESTERN FRANCE DURING THE NEOLITHIC

Abstract author(s): Ard, Vincent (CNRS - DR14)

Abstract format: Oral

The south-west of France is an excellent laboratory for studying funerary practices at the end of the Neolithic period, during the 4th and 3rd millennia BC. Among the many practices that coexist, the two main ones oppose the visible and the hidden: open-air burials, symbolised by megalithic tombs, and underground burials, symbolised by sepulchral caves. Generally associated with the monumentalisation of landscapes, the history and visibility of megalithic architecture can be more complex. The evidence of dynamic phasing during recent excavations allows us to follow the evolution of the architecture from their construction to their condemnation. This communication will be the occasion to present the results of research in progress on the limestone causses of Quercy where an original process of condemnation of the monuments has been highlighted. The megalithic tombs then pass from the visible to the hidden. This process inevitably raises the question of the status of the buried and their memory among the living world.

3 LONG BARROWS AS IDENTITY LANDMARKS IN RITUAL LANDSCAPE OF BOHEMIA

Abstract author(s): Turek, Jan (Charles University) - Křišťuf, Petr (University of West Bohemia in Pilsen)

Abstract format: Oral

Late Neolithic long barrows of 5th and 4th millennia BC are found in many regions of western and central Europe, and southern Scandinavia. Despite their formal and constructional similarities, their symbolic meaning was perhaps more regionally variable. In some regions they served mainly as funerary monuments and elements of monumental landscapes. Other communities were using long barrows as ancestral sanctuaries structuring ceremonial landscapes and community areas.

Our current research project suggested that the long barrows in Bohemia are of different forms and constructions, but despite their formal variability, all served for burial of a single individual, while majority of the population was buried elsewhere. The alternative funerary sites can be found within ditch enclosures perhaps maintained funerary function for whole community or perhaps even several communities. Some people were also buried in sunken pits of habitation areas. From this point of view we need to perceive whole ritual landscape as a complex seen of funerary ritual and social interaction. The single burial long barrows of Michelsberg/Funnel Beaker Culture perhaps represent ancestral monuments reaching beyond purely familial ties. They were gaining further importance as shrines shaping regional identity and artefactual memory in landscape. Even centuries and millennia later were these sites reused for sacrificial and funerary purposes.

4 WHY CHOOSING? THE „MIXED“ ARCHITECTURES OF THE WESTERN MEDITERRANEAN

Abstract author(s): Porqueddu, Marie-Elise (École des hautes études hispaniques et ibériques, Casa de Velázquez)

Abstract format: Oral

During the Neolithic, two major architectural traditions for funerary monuments emerged: megaliths and hypogea. Both use the same material, i.e., the rock. While megalithic architecture presents the use of stones to build above ground, hypogea are cavities created by the removal of the rock. These two phenomena come into contact in different places in the Mediterranean, but also architecturally. Indeed, monuments can have both megalithic and rock-cut elements. They can be qualified as mixed or hybrid.

These monuments may have a rock-cut burial chamber and a megalithic access corridor, or a lower part carved in the rock and a cover of megalithic slabs, as is the case for the necropolis of Arles-Fontvieille in France. This combination of megalithic elements with rock-cut elements can be part of the initial architectural project of the monument as well as being the result of new interventions over time.

This paper aims to explore these original architectural proposals by offering a census of the different architectural forms known in the western Mediterranean at the end of the Neolithic, but above all by proposing a technical and architectural analysis of these structures.

5 TO BUILD OR TO UTILIZE: FUNERARY ARCHITECTURE VARIABILITY DURING THE 4TH AND 3RD MILLENNIA BCE IN TORRES VEDRAS (WESTERN PORTUGAL)

Abstract author(s): van Calker, Daniel (UNIARQ - Centre for Archaeology of the University of Lisbon)

Abstract format: Oral

The Portuguese Estremadura plays a fundamental role on the understanding of funerary Megalithism in the western-most part of the Iberian Peninsula during the 4th and 3rd millennia BCE. In this region, the Megalithic phenomenon is characterized by a significant number of sepulchers, with diverse death-related architectures, both built and natural. It presents a super-structural character (Sherrat, 1995), whose ideology and symbolism are independent from the burial space/typology in which they occur: in that sense, Megalithism is defined as a “complex set of magical-religious practices related to death (...) and not just as a type of funerary architecture” (Gonçalves, 2003), of which the cave-necropolis are an important part.

Geologically, this region is marked by the Jurassic and Cretaceous Limestone Massifs where several karst cavities with Late Prehistory funerary occupations are documented. Through the selection of a subregion as a case-study – Torres Vedras, about 50 km NW of Lisbon – we intend to discuss whether geological determinism is decisive for the choice of funerary architecture by the neolithic and chalcolithic communities of this territory. This archaeological reality is relevant for this argument, since it displays a large diversity regarding the typology of burials (such as caves, hypogea and tholoi), especially when compared to other areas of Estremadura, where natural caves are clearly predominant, revealing its “ready-to-use” character. Considering the widespread availability of these natural spaces, it is important to understand this multiplicity of funerary solutions both in time and space, assessing sociocultural aspects that can be acquired through the study of the inhumed populations and the analysis of the votive record.

GONÇALVES, V.S. (2003) – Sítios, “Horizontes” e Artefactos. Cascais. 2nd edition, 380p.

SHERRATT, A.(1995) – Instruments of Conversion? The Role of Megaliths in the Mesolithic/Neolithic Transition in Northwest Europe. Oxford Journal of Archaeology. Oxford: Blackwell Publishers Ltd. 14: 3, pp.245-260.

6 THE AVEN JANNA (SAINT-PRIVAT-DE-CHAMPCLOS, GARD, FRANCE): A COLLECTIVE BURIAL SITE FROM THE EARLY BRONZE AGE

Abstract author(s): Le Roy, melie (Bournemouth university) - Recchia Quiniou, Johanna (Paleotime) - Bertrand, Aurore (independant) - Chateauneuf, Florent (INRAP) - Chen, Agathe (Hades) - Hutinet, Kevin (independant)

Abstract format: Oral

Found in 2014, the cave “Aven Janna” presented an untouched collective burial site dated from the early Bronze Age. Since 2017, an excavation takes place, yielding the very first data on funerary practices for the region and the period.

The cave is located alongside the river Cèze, in the south of France, inside a 12km long gorges, where hundreds of cavities were found, showing for most of them archaeological occupation phases from the end of the Neolithic to the early Bronze age. Even though, numerous other burials sites are known, the “Aven Janna” is the first where data can be analysed from the field to the lab. The site presents a collective burial site welcoming a small number of individuals (n=9) with a very poor health status. Indeed, two of them present symptoms of tuberculosis. In addition to the human remains, numerous ceramic sherds and pots were found directly associated with the funerary deposit, fully taking part in the funerary practice. Finally, a collapsed dry stone construction within the cave appears to take part of the burial site management.

These first data demonstrate a more complex situation than just an occupation of the underground space. As well as in megalithic constructions, people from the early Bronze Age built and organised the space to deposit their dead. This suggests an importation of exogenous material and a planification of the building project. These new findings led to a reassessment of the previous finds in the region, revealing that the example of the “Aven Janna” is not unique and demonstrates a regional tradition for which numerous parallels can be drawn with the megalith constructions present in a close by area.

7 A MEGALITHIC PROVINCE NOT SO DIFFERENT: NORTHWESTERN IBERIA

Abstract author(s): Paulos-Bravo, Rodrigo (Complutense University of Madrid) - Ayán Vila, Xurxo (Contemporary History Institute. Universidade Nova of Lisbon)

Abstract format: Oral

Traditionally, it has been considered that the megalithic manifestations in the NW of the Iberian Peninsula were much less rich in their forms than those of other Atlantic provinces where the megalithic phenomenon reaches a remarkable polymorphism. Despite the fact that burial barrows are really numerous along the Atlantic coast of Iberia, there was little or no knowledge of the rest of the megalithic manifestations until now. However, in recent years, some structures have been documented whose morphology equals, to some extent, the prolific variety of megalithic forms in the north Atlantic, especially between the 4th and 3rd millennium BC. All this entails a change in the interpretation of the landscape that Neolithic societies loaded with meaning.

Stone and timber circles, cairns, menhirs and henges are increasingly common elements in the northwestern megalithic landscape of the Iberian Peninsula, but their interpretation has not yet reached the depth of studies carried out in other areas such as Ireland, Great Britain or the west coast of France. Including these manifestations within the studies of the Neolithic societies of southern Europe can open the way to new interpretations that allow a more precise approach to these early farmers and herders. What does seem clear is that, despite their regional differences, there is a much more homogeneous phenomenon in their forms than previously thought in northwestern Iberia, in particular during the late Neolithic period. Now it is important to analyze whether this apparent coherence in the forms also reflects a coincidence in their symbolic and functional meaning or, rather, a reinterpretation of these.

8 MEGALITHSCAPES: COMMON PATTERNS IN THE EXPERIENCE OF ARCHITECTURE. NEW RESEARCH IN THE MEGALITHIC NECROPOLIS OF BARBANZA (GALICIA, SPAIN)

Abstract author(s): Verdonkschot, Jadranka - Criado-Boado, Felipe (XSCAPE Project on “Material Minds” - ERC 2020 Synergy Grant 951631; Institute of Heritage Sciences - Incipit, Spanish National Research Council - CSIC)

Abstract format: Oral

Over the past decades, studies on the subject of the exceptional megalithic necropolis of Barbanza (Galicia, Spain) have articulated a highly significant spatial interpretation of these monuments within the landscape they occupy. The definition of these formal spatial regularities allows us to explore common patterns in architectural arrangements and experience.

Recently, this topic could be revisited thanks to the interest it holds for the X-Scape Synergy project (INCIPIT-CSIC Santiago de Compostela and partners). The X-Scape project aims to understand the relationship between the mind and the material world, implementing state-of-the-art visual neuroscience and agent-based simulations. Including Barbanza as a case study in embodied visual perception permits for further research on these megalithic monuments and the implications they and their spatial arrangements can hold for the societies they belonged to.

In this presentation the first results of this year’s field campaigns are detailed. Moreover, the potential of this archaeological line of investigation is discussed. This study brings new knowledge for the megalithic context of Barbanza and the northwestern Iberian Peninsula to the table, but also in a broader sense furthers attempts to understand societies and their perceptions throughout prehistory.

9 BUILDING COMMUNITY: TECHNOLOGY, AESTHETICS, AND COMMUNITIES OF PRACTICE IN NEOLITHIC CAITHNESS

Abstract author(s): Zaleskaya, Liudmila (University of Edinburgh)

Abstract format: Oral

Chambered cairns are still a common fixture in the Scottish landscape. They remain a vital source of evidence for the Neolithic period, especially in the regions where settlement data is scarce/lacking.

Owing to the durability of their material components, they present an image of longevity – massive, unchanging. Was this, however, the builders’ intent or mere unintended consequence? How can we investigate the impulses behind and the implications of the design of drystone chambered cairns (beyond the often-explored ideas of order, cosmology,

and ritual)? How did the tradition form? What were the modes of its perpetuation? What was its role in the negotiation of community identity and social cohesion?

The discussion is focused on several Orkney-Cromarty tombs in Caithness to understand how their architectural design/style, technological, and visual properties fit into the visual culture, aesthetics, and tradition in the Neolithic. Here, cairn architecture is conceptualised as evidence for, and instrument of, the construction of Neolithic community identities. The technological, design, visual, and aesthetic aspects of it are considered for their role in such social processes of community formation, negotiation, and perpetuation.

The existence of the aesthetic and visual traditions and concerns, alongside the technological ones, in the Neolithic Caithness is highlighted and explored. Such concerns, norms, rules-of-thumb, and dogmas are considered for their role in technological knowledge transmission, and as the mechanisms which fostered social cohesion. The notion of exercised creativity and deliberate choices in the past is explored and contrasted with the role of tradition and conformity in the establishment and perpetuation of communities/communities of practice in Neolithic north-east Scotland. A theoretical and methodological framework incorporating an aesthetic approach and communities-of-practice approach in archaeology is explored and evaluated in terms of its applicability towards the study of the material remains of the past, particularly prehistoric architecture.

169 NEOLITHIC AND CHALCOLITHIC LARGE BLADES. IDENTIFYING AND DEFINING EXCEPTIONAL LITHIC PRODUCTS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Guichet, Thomas (Université Paris 1 Panthéon Sorbonne; UMR 8215 Trajectoires) - Collin, Jean-Philippe (Université Libre de Bruxelles; CreA-Patrimoine; UMR 8215 Trajectoires)

Session format: Regular session

In Neolithic and Chalcolithic Europe, large flint and obsidian blades stood out from most of the contemporary lithic productions. In some cases these might be a few exceptional blades produced on the fringes of normal debitage by mobile knappers, whilst in others they might represent large-scale production on dedicated sites. Either way, the large blades are distinctive by their size and more broadly by the technical investment they display.

Their very uneven distribution across Europe – from Bulgaria to Portugal and from Italy to Denmark – is surprising and inevitably raises the question of the appearance of these exceptional blades: local, autonomous development and/or technical transmission from another part of Europe?

The organizers of this session wish to bring together observations from across Europe, with a particular focus on:

- the general archaeological context: culture, chronology, places of production (household, settlement, dedicated workshops...), distribution areas.
- the technical specificities of the debitage: acquisition and selection of rocks, shaping the core, removals preparation, debitage techniques. Any further information regarding the criteria used for debitage technique diagnosis would be highly appreciated.

The ultimate aim of the session is to draw up a panorama of the emergence and decline of large flint and obsidian blades across the continent.

ABSTRACTS

1 WHEN LARGE START TO BE MEANINGFUL: LONG BLADES PRODUCTION OF THE BLICQUY/VILLENEUVE-SAINT-GERMAIN CULTURE

Abstract author(s): Bostyn, Françoise (University of Paris 1; UMR 8215) - Denis, Solène (CNSR-UMR 8068 Temps)

Abstract format: Oral

Our paper will question the appearance of large blade production in North-western Europe. At the turn of the Vth millennium, the Blicquy/Villeneuve-Saint-Germain culture emerges in Northern France and Middle Belgium on an LBK substratum. An important rupture with the LBK occurs at that time within the organisation of lithic productions. A diversification of productions (flake and faceted tool versus blade productions) reveals a segmentation of tasks with the coexistence of different groups of knappers. This segmentation goes even beyond domestic needs with the emergence, in the course of the chronology, of the production of large blades. This production is exclusive to some sites of the Paris Basin and is conducted by knappers of a very high level of know-how who can be considered specialists. Furthermore, these long blades are produced to circulate within a large territory, sometimes by itinerant knappers. So, the individualisation of large blades as a proper techno-economic category starts to be meaningful at the beginning

of the Vth millennium in this part of Europe. It allows for highlighting the social segmentation of the activities among these post-LBK communities.

2 FROM THE FLINT MINES TO THE ENCLOSURES : LARGE BLADES FROM SPIENNES (BELGIUM) DURING EARLY IVTH MILLENIUM BCE

Abstract author(s): Guichet, Thomas (Université Paris 1 Panthéon Sorbonne; UMR 8215 Trajectoires)

Abstract format: Oral

Spiennes flint mines had been first described between 1842 and 1851 before proper excavations took place in 1867. One hundred years and many campaigns later, hundreds of well shafts have been discovered, displayed between two sectors, Petit-Spiennes and Camp-à-Cayaux.

Blades and cores had been already found during the 19th century researchs. Modern excavations in the 60s and 80s revealed blades production workshops within the two sectors, in addition of an intense production of flint axes.

The flint mines of Spiennes have been largely exploited during Neolithic, from the 42nd to the 23rd centuries. Blades production workshops have been dated to the early 4th millenary. Those dates are contemporary to others enclosures and domestic settlements where Spiennes blades have been found.

This contribution's purpose is to present the results of the latests studies made about blades productions within the two different sectors of Spiennes flint mines.

Flint blocks, directly excavated from the well shafts, were shaped within the workshops near by and blades were produced at the very same place.

Blades have regular breadth and thinness. They are between 15 and 20 cm long but the longest are up to 25 cm. Their edges and ridges are linear. Furthermore, some blades butts and bulbs could refer to the pressure technic. Based upon those criterias, we assume the coexistence of two major technics : indirect striking and pressure.

Such productions needed a high level of skill and raise the question of technic specialization, especially when we compare them to others productions at Spiennes. Furthermore, clues of apprenticeship have been identified within the workshops.

Majority of the blades were displayed toward northern France and Belgium enclosures, belonging to the Michelsberg culture. The proportion of Spiennes artefacts among blades is high. Spiennes workshops were significant blades displayers for communities north of Paris Basin.

3 THE NEOLITHIC SITE OF ORP/JANDRAIN-JANDRENOUILLE: NEW PERSPECTIVES ON THE LARGE BLADES OF MIDDLE BELGIUM

Abstract author(s): Collin, Jean-Philippe (Université Libre de Bruxelles)

Abstract format: Oral

Regarding flint mines and blades production, the area of Middle Belgium is well known thanks to sites such as Spiennes (Mons Basin, Belgium) and Rijckholt-Sint-Geertruid (Limburg, The Netherlands). Both sites emerged at the end of the 5th millennium, were in activity during nearly 2000 years (4200-2200 BCE) and share a lot of similarities regarding extraction strategies and products. Geographically located halfway between the two is the site of Orp/Jandrain-Jandrenouille (Hesbaye, Belgium). This Michelsberg site (4200-3600 bce) stands out by a smaller size, a shorter lifespan and by what appears to be a clear focus on the production of large blades.

The presence of those three sites in the same cultural and environmental context inevitably raises the question of their possible interrelation. In fact, the waste products from the blade production of the Orp site (cores, broken blades) present strange similarities with those of Spiennes. What if, after all, these technical specificities are indicative of knapping skills transfers between those sites? What would that mean in terms of the Michelsberg lithic economy structuration?

4 THE ORIGIN OF THE NEOLITHIC FLINT MINING IN WESTERN MAŁOPOLSKA (SOUTHERN POLAND)

Abstract author(s): Stefanski, Damian - Trela-Kieferling, Elżbieta (Archaeological Museum in Kraków)

Abstract format: Oral

The elaboration explores the issue of the origins of flint mining in western Małopolska (southern Poland). This area is known for numerous flint outcrops for which the source rock is limestone of the Oxfordian age of the Kraków-Częstochowa Upland. Remains of intensive flint processing in the Neolithic period have been documented at several sites. The investigation basing on relatively well-recognized mines and workshops in Sąpów and Bębło. Both were exploited by the late communities of the Lengyel-Polgar cycle. In the archaeological evidence, the presence of mined raw

material is related to „the metric change“. This term is defined in the literature as an increase in blade dimension which can be observed in lithic production. It also marks the presence of specialised workshops that utilised mined raw materials and were located in the vicinity of mines. This system replaced the early and middle Neolithic methods of manufacturing blades and flakes from small cores that were processed in settlement zone. The transition was thought to be a result of internal technological progress made by local Lengyel-Polgár communities under the influence of new cultural impulses reaching Małopolska from the Danube area. In our approach, the new supply model appeared as an already-defined model that was executed by experienced outsiders. It was also hypothesized that the technical caesura that was suggested was not categorical and that new patterns in a very small area might coexist with earlier ones. It is also argued that locally it emerged in the second half of the fifth millennium BC (Lesser Poland) and it is thought to be a component of the early Eneolithic set.

5 ENEOLITHIC BLADES FROM BRONOCICE, POLAND, AS AN ELEMENT OF CURATIVE FLINT ECONOMY

Abstract author(s): Oberc, Tomasz (Institute of Archaeology and Ethnology, Polish Academy of Sciences)

Abstract format: Oral

Lithic economy of south-eastern group of Funnel Beaker Culture and Funnel-Beaker-Baden horizons seem to be revolving along two main branches in SE Poland. In the settlements of these two formations, functioning between approx. 3650-3400 and 3400-3000 BC respectively, a mass production by skilled flint workers is seen with magnificent examples of axe heads and macrolithic blades, and at the same time signals of flint scarcity are observed, manifested by high quantities of repaired or reformed specimens, splintered pieces and extremely used cores, without observable regard to the raw material used. During recent re-examination of lithic assemblage from the site in Bronocice – an about 40 ha. site complex, excavated between 1969 and 1974 by Polish-American expedition, a series of blade tools was closely examined. Observed patterns of use and repairs seem to point to long “life histories” of these artefacts, as blanks for tools for multiple purposes following each other. This pattern of recycling of the flint tools points to the great economical costs of blanks requisition.

6 THE CHALCOLITHIC PHENOMENON OF LARGE BLADES IN CATALONIA: A STUDY CASE OF FUNERARY CAVES OF PRE-PYRENEES

Abstract author(s): González-Olivares, Cynthia - Mangado, Xavier (SERP - Universitat de Barcelona; Institut d'Arqueologia - IAUB - Universitat de Barcelona) - Martín, Araceli (Servei d'Arqueologia i Paleontologia, Generalitat de Catalunya)

Abstract format: Oral

The presence of the large blades phenomenon made in flint in Europe has aroused special interest among those dedicated to the study of the lithic industry during Late Prehistory. Its wide geographical –across Europe– and chronological distribution –from V to III millennium BC–, as well as the technological features that characterize it, have contributed to the specialization of analytical approaches. This technocultural phenomenon, which appeared in the northeast of Iberian Peninsula (currently Catalonia) during the third millennium BC, has been the focus of study because its functional, economic and symbolic nature. This broad territory, with great variability of local siliceous raw materials, the close distance with good quality procurement areas and the cultural differentiation of the burials –natural caves and megalithic architectonic structures–, have contributed to the development of multicultural and multi-technological expressions, which are reflected in the archaeological records as variability of shapes and techniques linked to the same social realities.

This paper focuses on the area of the Lleida Pre-Pyrenees (Solsonès), where we can locate a large number of caves and rockshelters that were used as tombs during the Chalcolithic, in which the lithic assemblages were composed of large blades and arrowheads made with silica materials of different sources. For this reason, we will present the main contextual and technological characteristics of these grave goods, as well as present the preliminary results of the macroscopic characterization of raw materials.

7 LARGE BLADES OF RECENT IBERIAN PREHISTORY: 3D TYPOMETRY, TECHNOLOGY AND EXPERIMENTATION

Abstract author(s): Vinagre, Antonio - Aguirre, Mikel (University of the Basque country) - Baena, Javier (Universidad Autónoma de Madrid) - Palomo, Antoni (Universidad Autónoma de Barcelona) - Terradas, Xavier (Inst. Milà i Fontanals - IMF-CSIC)

Abstract format: Oral

The large blades in siliceous rocks constitute a type of lithic production of high value in the recent European Prehistory, frequent in funerary contexts and scarce in domestic ones due to its intense functional consumption. It is one

of the most emblematic products in the Iberian Peninsula from the late Neolithic to the Chalcolithic, which shows the knowledge of special sources of raw material, sometimes subjected to mining, and a technology that requires high levels of mastery in knapping, in addition to revealing long-range trade networks. However, research has not yet adequately characterized its typometry (3D formats and sizes), and the characters that can differentiate the different techniques for its production, although already described, lack an experimental body of reference available to researchers. We provide a geometric classification for its precise typometric definition, both from productions from the archaeological record of the Iberian Peninsula and from experimental collections, trying to define the concept of „large blade“ dimensionally, adapted to the availability of raw materials in each region. On the other hand, we focus on the technology of its production, from the experimental programs that we are currently developing, by means of indirect percussion and pressure reinforced by a lever, and we will try to provide a little more precision to the characterization and definition of the technical diagnostic criteria, describe the necessary means and tools, with archaeological references if any, and the stigmas that may reveal the use of one technique or another.

8 LARGE NODULES, LARGE BLADES IN THE NEOLITHIC AND THE COPPER AGE IN NORTHERN PUGLIA (ITALY)

Abstract author(s): Muntoni, Italo (Soprintendenza ABAP BAT-FG, Ministry of Culture) - Mironti, Vittorio (independent researcher in Archaeology, Prehistory)

Abstract format: Oral

Northern Puglia represents one of the territories with the greatest potential for the study of the process of Neolithisation in southern Italy. Besides the numerous known inhabited settlements with their typical excavated large ditches, located predominantly on the Tavoliere plain and to a lesser extent on the Daunian Subappennine range, the geographical area of the Gargano promontory preserves the oldest flint quarries so far known on the European continent. This project aims to analyse the evolution of blade production in relation to the diffusion and circulation of the raw materials in the territory, with particular focus on the production of large blades.

In this territory, the production of lithic artifacts was closely linked to the circulation and availability of raw materials. In fact, it was only in an advanced phase of the Early Neolithic, and especially in the Middle Neolithic, that large flint nodules (extracted in the Gargano) and the objects created from them began to be circulated on the plain, giving rise to lithic assemblages characterized by the predominance of blades, including some of large size. In the earliest phases of the Neolithic, on the contrary, lithic objects were created from small-to-medium-sized cobbles found in secondary deposits on the Tavoliere.

The close connection between raw materials and lithic assemblages can also be shown, although in inverted form, for the production of obsidian items (which was very widespread throughout the Italian peninsula during the early and advanced phases of recent prehistory). In fact, it is possible that the abundant availability of high-quality flint in northern Puglia in the form of large nodules may have also negatively impacted the circulation of obsidian in large blocks and, consequently, the production of poorly documented large objects in this raw material.

9 CHALCOLITHIC LARGE CANAANEAN BLADES - EARLIER THEN THOUGHT

Abstract author(s): Abadi-Reiss, Yael - Varga, Daniel (Israel Antiquities authority)

Abstract format: Oral

The excavations of the large Chalcolithic site ‘Agamim’ in the southern coastal plain of Israel, revealed several phases in seven excavated areas, all belong to the Ghassulian culture. The variety of flint tools is typical of the period: About half of the tools are sickle blades, there are scrapers, bi-facial and ad-hoc tools. Most of the sickle blades found were from the typical Chalcolithic type: rectangular, narrow, with an abrupt or semi-abrupt backing and one or two truncations. Apart from them, the assemblage also includes sickle blades made on Canaanite Blades.

Canaanite blades exhibit two parallel ridges from previous removals, creating a trapezoidal cross-section. It was customary to associate the Canaanite blades with the Early Bronze Age, and even as fossils directors for the period. This idea arose not only from the fact that the Canaanite blades are different from the blades typical of the Chalcolithic period in dimensions and morphology, but mainly from the technological difference in their production. The assumption was that Canaanite blades were produced in centralized workshops and distributed by trade, while the Chalcolithic blades were produced in or near the settlement areas. Despite Bar and Winter’s (2010) analysis that showed the presence of a knapping technique for Canaanite blades combined with that for manufacture of non-Canaanite blades in Ghassulian sites, the opposing assumption continued.

Dozens of Canaanite blades were discovered in ‘Agamim’, with cores and debitage typical to this technology. These findings cannot be the result of layer mixing, and their large number shows that their presence on the site is not accidental. Beyond that, Canaanite blades were discovered both in residential areas and in public areas, including a 25

cm long blade. The data from 'Agamim' clearly shows that the technological tradition to produce Canaanian blades was an integral part of the Chalcolithic.

10 CHALCOLITHIC FLINT SUPERBLADES FROM BULGARIA – A BIOGRAPHICAL PERSPECTIVE

Abstract author(s): Gurova, Maria (National Institute of Archaeology and Museum, Bulgarian Academy of Sciences)

Abstract format: Oral

An impressive example of high technological skill in prehistoric knapping technology in Bulgaria is the extra-long or so-called superblades (over 25 cm long) found mainly in mortuary contexts (as burial goods) or in hoards from domestic contexts. In the first case, the blades play their votive ritual role of grave goods, in the second – they are grouped in sets of so-called caches/hoards and are kept as reserves of precious items for future use.

The superblades exhibit a peculiar artefact biography, which requires a multi-faceted study: characterisation of the raw material demands knowledge of flint resources and their technical properties; the reconstruction of technical knapping skills necessitates meticulous analysis of a spectrum of particular stigmata; while functional interpretation of the blades needs careful use-wear observations and expertise. Finally, the interpretation of these representative finds requires careful contextual analysis, bringing together empirical data and conceptual premises.

This paper focuses on the author's study of superblades from three Chalcolithic cemeteries on the Black Sea coast of Bulgaria: the Varna, Durankulak and Kozareva Tell cemeteries. Several hoards of superblades from two tell settlements are also included, thus encompassing the contextual niches of such finds.

11 LARGE BLADES EAST OF THE CARPATHIANS

Abstract author(s): Videiko, Mykhailo (Kyiv Borys Grinchenko University)

Abstract format: Oral

In the territory from the Carpathians to the Dniro they were widespread from the end of the fifth millennium, production continued until the end of the fourth millennium. The distribution of large blades here is associated with the Trypillia culture and some neighboring cultures. Raw materials from several deposits were used, located in Volhynia, Dniester, Synukha and Doneck areas. The steppe population used Donetsk flint. Flint was mined in large quantities in mines (Bila Hora on the Dniester) and natural cuts in river valleys (on the Horyn River). The mentioned raw materials made it possible to manufacture blades over 20 centimeters.

Numerous places of production have been opened. A large amount of waste was found there, as well as spent nuclei. Dniester and Cherkasy raw materials made it possible to make blades near 20 cm long. This is evidenced by finds of nuclei and finished products. These blades were used mainly to make serrated sickles, which at that time replaced sickles of the Karanovo type.

Volyn flint was suitable for creating blades longer than 20 cm. Studies have shown that they could be produced by striking and pressing. The larger sizes of the blades made it possible to use their straight parts to create high-quality tips for darts and spears. Such specialized production was investigated by N. Skakun near the village of Bodaky on Horyn river.

In addition to the utilitarian purpose, the blades probably here were prestigious products. Their treasures are known in the Trypillia culture, from a few dozen to a hundred or more products in one place. Among the steppe population, unprocessed long plates were among the burial gifts.

Thus, the territory of Ukraine can be defined as the easternmost area in Europe for the production and use of long blades in the Copper Age.

12 LOCAL PRODUCTION VERSUS THE IMPORT OF LARGE BLADES DURING THE CHALCOLITHIC PRE/CUCUTENI-TRYPILLIA (PCT) CULTURE

Abstract author(s): Vornicu, Diana-Mariuca (Institute of Archeology, Romanian Academy, Iași branch)

Abstract format: Oral

The phenomenon of large blades/superblades from the Chalcolithic of south-eastern Europe (middle of the 5th millennia BC) is associated with the Gumelnița-Kodzadermen-Karanovo VI (GKK) communities that populated the Danube valley (nowadays southern Romania and Bulgaria). At that time, north of the GKK area, in the geographic space between the Carpathian Mountains and the Bug River (nowadays eastern Romania, Republic of Moldova and Ukraine), the pre/Cucuteni -Trypillia (pCT) communities evolved. In its early phase, the pCT blade assemblage was still tributary to the microlithic technologies, with the evolution to medium and large blades becoming visible gradually.

This presentation deals with the lithic assemblage from Târgu Frumos, a pCT site that stands out through its lithic assemblage (almost 6000 artefacts coming from 13 excavated houses). The elongated products, which count for more than 3000 items range from bladelets, to medium-sized blades (the majority) to large blades (20% of the blade

assemblage). The artefacts from the latter category are made from two types of flint: 1. one that is specific for the Cretaceous deposits from the Moldavian Platform, used on a large scale by the pCT communities; 2. the other, the so-called Balkan flint, a raw material that was used on a large scale by the GKK communities (20% of the large-blades from the site) and was not available in the regions inhabited by the pCT communities. By analyzing the dimensions, technological attributes and the morphologies of the large blades of the two raw material categories, we were able to determine that the large blades from the Moldavian Platform flint were produced locally, while those made of Balkan flint are rather products of the GKK lithic technology, being thus imported artefacts in the settlement of Târgu Frumos.

ADVANCING A BIOARCHAEOLOGY OF HEALTH INEQUALITY: RECENT DEVELOPMENTS AND FUTURE DIRECTIONS

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Moles, Anna (Institute of Archaeology, University of Groningen) - Schrader, Sarah (Faculty of Archaeology, Leiden University) - Gowland, Rebecca (Department of Archaeology, Durham University)

Session format: Regular session

Socioeconomic status is one of the strongest determinants of health today. People at the bottom of the social gradient are not only more likely to die at a younger age, they will also spend more years living with ill health and disability. The COVID-19 pandemic highlighted the impact of social inequities in terms of disease risks and outcomes, especially for the very marginalised members of society. The pandemic also highlighted the way in which other aspects of identity, such as ethnicity and gender, intersect with status to create structural inequities, which lead to disparities in chronic and infectious disease risk and mortality.

Bioarchaeologists are uniquely positioned to examine health inequality in the past. Indeed, for many periods, this is the only source of evidence available for exploring the embodied impact of past structural inequities. The skeleton holds both biographical and intergenerational information concerning body/society interactions and this can be harnessed to explore past adversity and structural violence as a consequence of social inequality. The archaeology of inequality has already made significant contributions to how we conceptualise such disparities in the past, with implications for the present.

In this session we invite speakers whose bioarchaeological research pushes methodological and theoretical boundaries of health inequality research. We are interested in contributions that incorporate recent advancements that address the osteological paradox, biomolecular techniques, and multidisciplinary approaches, including the integration of historical and material evidence. We hope that papers will generate discussion and showcase how the study of inequality in the past can provide unique insights into the range of impacts on people's health and lifeways.

1

BOUNDARY CONDITIONS FOR DETECTING ANCIENT HEALTH INEQUALITY

Abstract author(s): Beck, Jess (University College Dublin) - Robb, John (University of Cambridge)

Abstract format: Oral

Health inequality is a growing problem in the modern world, as encapsulated by the United Nations Sustainable Development Goal Three “ensuring healthy lives and promoting well-being at all ages.” Understanding the duration and tempo of past health inequalities and assessing the strategies previous communities used to mitigate them thus has implications for managing health inequalities problems today. Bioarchaeology provides a unique toolkit with which to examine health and wellbeing in the human past, but insufficient work has been devoted to determining the degree to which health inequalities are detectable through skeletal analysis. Basic questions remain underexplored. What patterns of skeletal pathology will be produced by health inequalities in living populations? What analytical methods are most effective for assessing past health inequalities? How apparent are the intersecting effects of age, gender, and class on health in skeletal samples? In this paper, we address these questions with a simple simulation that draws from the clinical and archaeological literature to model the frequencies of traditional paleopathological indicators of stress and disease, including hypoplasias, cribra orbitalia, porotic hyperostosis, stature, and infectious disease prevalence. Our model explicitly investigates the parameters required to produce clear-cut, statistically identifiable differences between social groups in terms of skeletal indicators of health. Overall, we argue that explicitly grappling with issues of representation and sample bias is a fundamental step in attaining our goals of studying social inequality and health inequality bioarchaeologically.

2 POPULATION HEALTH IN THE IRISH EARLY BRONZE AGE: APPLYING THE BIOLOGICAL INDEX OF FRAILTY

Abstract author(s): Robinson, Stephanie (University College Cork)

Abstract format: Oral

Investigations of population health form a pillar of bioarchaeology, however they are plagued by one key question – how do you define health? One recent approach has suggested a reframing of this question – moving away from a nebulous concept of ‘health’ towards the more modern concept of frailty. However, a repeatable, comparable, and broadly applicable methodology for assessing frailty in skeletal collections has yet to be widely accepted. Published in 2021, the Biological Index of Frailty aimed to improve upon the 2016 Skeletal Index of Frailty, with one major development being the implementation of weighted stress markers. This has allowed for the inclusion of incomplete individuals within samples, widening applications of this methodology. The Early Bronze Age in Ireland is traditionally interpreted as a period of socio-political change, with the rise of the ‘ideology of the individual’ associated with the introduction of tin-bronze and a formal and restricted Individualised Burial Tradition. Included within a reanalysis of the inhumations of the Irish Early Bronze Age, an investigation of population health through the lens of frailty has been undertaken. Alongside an updated understanding of health in this group at the population level, the methodological approach of the Biological Index of Frailty has permitted the investigation of links between demographic and status factors (including age, sex, grave type, and grave goods) and the health status of these individuals, thus increasing our understanding of this period in Irish prehistory. The ability to explore such questions supports the ongoing push away from typological research and towards the modern problem-oriented approach. This study presents not only an updated understanding of how this period of change impacted the health of past peoples, but also comments on the application, usability, and challenges of the Biological Index of Frailty methodology to understanding health in the past.

3 HEALTH INEQUALITY IN ANCIENT GREECE: NEW APPROACHES FOR A BETTER UNDERSTANDING

Abstract author(s): Moles, Anna (University of Groningen)

Abstract format: Oral

Levels of social differentiation varied between different time periods, between urban and rural settings, and across the different regions of the Greek world. Our understanding of health inequality comes both from the written sources and from the bioarchaeological evidence. While there have been efforts towards the integration of osteological, archaeological, and textual approaches, often these studies exist in isolation without the disciplines being brought together for a more holistic approach. In the bioarchaeological record, we have looked at age-at-death and palaeopathology to assess differential health status, while factors such as biological sex, tomb types, grave goods, and burial locations are used as proxies for identifying social status or social groups.

In this paper I will look at our current understanding of the impact of social inequality on health and lifeways in the context of Classical, Hellenistic and Roman Greece through a brief overview of the work that has been done to date. I will then explore how we can advance this knowledge not only through the better integration of different lines of evidence but through the application of new approaches to understanding health and society in the past, such as the Developmental Origins of Health and Disease (DOHaD) approach, the realisation of the implications of the osteological paradox, and combined methods such as a frailty index or index of care. In considering the strengths and weaknesses of these approaches I will assess future directions for the bioarchaeology of health inequality for different types of assemblages.

4 POVERTY, LAWBREAKING, AND ENSLAVEMENT: LIVING AND DYING AS A SOCIAL OUTCAST IN ARCHAIC ATHENS (8TH-5TH CENTURY BCE)

Abstract author(s): Liedl, Hannah (Department of Archaeology, Durham University) - Rothwell, Jessica (School of Human Evolution and Social Change, Arizona State University) - Gowland, Rebecca (Department of Archaeology, Durham University) - Buikstra, Jane (School of Human Evolution and Social Change, Arizona State University)

Abstract format: Oral

During the Archaic period (8th-5th century BCE), the polis of Athens grew into an urban centre and the political system changed from oligarchy to early democratic structures. The historical sources for this period, although useful for documenting socio-political and economic change, provide an exclusively high status, male perspective. Individuals from lower socio-economic backgrounds are the silent majority, whose life experiences have been rendered invisible.

Bioarchaeological analysis has the potential to address this bias. The human remains from the cemetery at Phaleron, Athens, excavated between 2012-2017 hold potential for exploring the lives of ancient Greek people whom history has largely passed by. Analysis of these individuals provide us with a new line of evidence to investigate the impact of

these profound socio-political and economic transformations on the lives of ordinary people. Over 1700 individuals were excavated from burials in jars or shallow pit graves. The simplicity of pit graves, the lack of burial organisation, and limited amounts of grave goods, as well as the presence of several mass burials containing shackled individuals indicates people of low socio-economic status, including potential convicts and enslaved people. This investigation integrates the bioarchaeological evidence with the contextual and historical data for this period in order to reveal information about the people whose life stories currently remain untold.

5 IMPERIAL INEQUALITY? COMPARING SKELETAL AND DENTOALVEOLAR STRESS PROXIES AMONG ROMAN SENATORIAL AND IMPERIAL PROVINCIAL POPULATIONS

Abstract author(s): Bews, Elizabeth (University of South Florida) - Marklein, Kathryn (Center for Archaeology and Cultural Heritage, University of Louisville; Department of Anthropology, University of Louisville)

Abstract format: Oral

Recent bioarchaeological studies of Roman imperialism have emphasized the variability of lived experiences across the empire as embodied in the skeletons of the people who inhabited these social, economic, and political landscapes. Literary sources speak to thriving economic and political conditions under centralized, senatorial rule in Mediterranean provinces, while newly-incorporated, more geographically-peripheral (to Rome) imperial provinces are described as underregulated and subject to corruption. This meta-study considers whether differential methods of governance contributed to social inequality in the Roman period by comparing published palaeopathological data between senatorial (Nsites=25) and imperial (Nsites 23) communities across the Mediterranean.

Crude prevalence rates (CPR) for childhood (linear enamel defects, LED) and adult (antemortem fractures and degenerative joint disease, DJD) stress markers, dietary proxies (cariou lesions, calculus, abscesses, tooth loss), and specific (periodontal disease, PD) and non-specific (periosteal new bone, PNB) bone lesions were compared between senatorial and imperial groups and between male and female subgroups. Kruskal-Wallis and ANOVA results show significantly ($P < 0.05$) higher CPR in senatorial than imperial groups for all conditions except DJD, findings echoed among male and female subgroups for LED, PNB, and PD. Additionally, linear regression indicates that males experienced proportionately higher CPR for almost all conditions (excluding calculus and fractures) than females in both imperial and senatorial contexts.

Results suggest that although the dichotomous senatorial-imperial governance infrastructure was developed to favor central Mediterranean growth, geographically-peripheral imperial communities were not subjected to heightened morbidity as a by-product of their governance status. Rather, it appears that regardless of imperial or senatorial rule, being male in the Roman period was associated with significantly higher rates of almost all skeletal stress markers. Therefore, estimated sex seems to be an important factor buffering individuals living on the margins of the Roman Empire from the severe stresses that their counterparts living in the imperial heartland experienced.

6 FRAILITY AMONG NON-SURVIVORS: INVESTIGATING RURAL-URBAN HEALTH INEQUALITIES IN CHILDREN AND MOTHERS THROUGH ORAL STRESS INDICATORS

Abstract author(s): Chiappa Zugazagoitia, Oriana - Schrader, Sarah (Leiden University)

Abstract format: Oral

Substantial research has been done assessing health inequalities between rural and urban contexts; however, fewer studies have considered the effect of rural/urban living on non-adults. Because dental enamel does not remodel, analyzing the time of dental stress insult in both deciduous and permanent teeth allows for the analysis of infant-maternal stress during specific periods of time. By investigating dental stress markers, we can overcome some of the limitations of the osteological paradox, providing information about maternal and infant health inequalities between rural and urban contexts from a perspective of frailty and survivorship.

This research focuses on assessing the effects of rural/urban living in infant and maternal health during the post-medieval period (1600-1800 A.D.) in the Netherlands through the comparison of linear enamel hypoplasia from a rural (Middenbeemster) and an urban (Arnhem) collection of non-adults and adults. To do so, frequencies and age-at-formation of linear enamel hypoplasia were recorded and analyzed for permanent and deciduous teeth using age-categorical data to compare them between rural and urban individuals. The results from this research demonstrates that urban living had a negative impact on infants likely due to maternal stress in-utero, as indicated by significantly higher rates of linear enamel hypoplasia in deciduous teeth. In addition, higher prevalences of linear enamel hypoplasia in deciduous teeth are related to frailty, rather than resiliency, since individuals who died as infants were clearly more vulnerable than those who died in later stages of childhood.

7 EARLY LIFE STRESS AND FUTURE HEALTH OUTCOMES: AN ISOTOPIC MARKER FOR FRAILTY?

Abstract author(s): O'Donoghue, Ruth - Buckberry, Jo - Koon, H (University of Bradford)

Abstract format: Oral

This project sought to explore the relationship between the isotopic evidence for diet and health in the first years of life and future health outcomes, within an urban Industrial burial population.

Carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) incremental dentine analysis was performed on the first permanent molar of 22 non-adults from New Bunhill Fields (NBF) burial ground, Southwark, London (1821-53). Isotopic profiles were created spanning from birth until tooth completion/death during tooth development.

A distinct pattern of opposing covariance (elevation in $\delta^{15}\text{N}$ and decrease in $\delta^{13}\text{C}$) was observed within the first year of life in six non-adults with a younger age-at-death (4-8.5 years), who exhibited extensive evidence for metabolic disease. This data is consistent with breastfeeding through a period of physiological stress, and subsequent weaning after recovery. It is proposed that this pattern of opposing covariance represents infants who were exposed to significant stress in early life and had to adapt to this stress short-term in order to survive, but who were ultimately left frailer and more susceptible to disease in later childhood than their more robust peers who did not experience this early life stress. The NBF burial population was of low socio-economic-status (SES), and this evidence for significant early life stress amongst those who died young but not amongst those who survived is consistent with research suggesting that only the most robust low SES individuals were surviving to adulthood in Industrial era London.

This data suggests that incremental dentine analysis may provide a method to explore the relationship between early life stress and future health outcomes in archaeological populations, which does not require the retention of childhood skeletal pathology or skeletal stress markers prone to remodelling over time, and which allows the direct comparison of childhood data in both those who survived into adulthood and those who did not.

8 MAPPING CHILD HEALTH INEQUALITY ON A LOCAL SCALE: A MULTIDISCIPLINARY CASE STUDY FROM ST BRIDE'S PARISH, LONDON, UK (19TH CENTURY)

Abstract author(s): Newman, Sophie (School of History, Classics and Archaeology, University of Edinburgh) - Bekvalac, Jelena (Centre for Human Bioarchaeology, Museum of London)

Abstract format: Oral

London in the 19th century posed significant health risks associated with rapid industrialisation and population expansion. Within it also existed a highly stratified society, with Engels observing in 1844 "...poverty often dwells in hidden alleys close to the palaces of the rich..." (1950:26), and this is reflected in Charles Booth's London Poverty Maps produced in the late-19th century (1889-1903). Social inequality has a significant influence on health, with social status dictating factors such as housing quality, diet, child care, and exposure to environmental pathogens. Thus, within the localities of 19th century London the lived experiences of those residing in close proximity to one another likely differed substantially.

This study integrates historical and bioarchaeological data, and GIS, to understand patterns in child morbidity and mortality within the parish of St Bride, London, UK. The burial records for St Bride's Church provide data (sex, age-at-death, abode, and date and cause of death) for non-adults (<17 years: n=1,681) interred between 1820-1850. Crude status groups have been established from their recorded burial location based on burial fees: lower ground (lower), upper ground (mixed), vaults (higher). Using QGIS, and a georeferenced copy of Booth's map, each individual will be registered to the street recorded as their residence, enabling spatial analysis of child mortality by sex, age, cause of death, and social status. Osteological data from excavations at St Bride's churchyard will establish whether non-adults from the Lower Ground (lower status) experienced greater health stress (via analysis of growth, dental enamel hypoplasia, cribra orbitalia, periosteal new bone formation, and specific infectious disease) than those from the Crypts (higher status).

Over 120 years since Booth's inquiry into life and labour in London many areas remain zones of marked social inequality, highlighting the importance of understanding the impact of complex health inequalities within communities in the past

9 GROWING UP AND OUT: INTERPRETING STATURE OF IRISH IMMIGRANTS IN NINETEENTH-CENTURY NEW YORK CITY

Abstract author(s): Warner-Smith, Alanna (National Museum of Natural History, Smithsonian Institution)

Abstract format: Oral

Documenting evidence of health and labor, bioarchaeologists are positioned to read bodies as "archives" of inequality and structural violence experienced and embodied by past people. The "archive" I turn to is the George S. Huntington Anatomical Collection (1893-1921), currently part of the Smithsonian Institution's biological anthropology collec-

tions. The collection is comprised of both U.S.-born persons and immigrants who died in New York City at the turn of the twentieth century. Following their deaths at public institutions, their bodies were transported to a medical school, where they were dissected by students and subsequently curated by Huntington.

While the history of the collection speaks to postmortem inequality and structural violence, it has also tied persons in the collection to particular categories, as their circumstances at death mark them as “the poor.” Yet historians of the nineteenth century demonstrate that such categories were in flux, made malleable by mass migrations and movements, urbanization and industrialization, and market booms and busts. To highlight these complexities, I focus on inequality experienced by Irish immigrants in the collection. This paper responds to archaeological critiques that question the utility of “poverty” as an analytical category and promote an understanding of inequality that accounts for contingency and complexity across lived experiences and landscapes. I do so through the lens of stature, an important skeletal indicator of early health experiences that is often interpreted as a marker of status or class. By integrating archival research with skeletal data, I analyze stature in relation to experiences of the Irish Famine and immigration experiences. Far from a singular experience of “poverty,” I argue that stature data shed light on experiences of the Famine and the ways health was shaped by immigration, gendered labor, and the environments of Ireland and New York City across the life course.

10 INVESTIGATING HETEROGENEOUS FRAILTY UNDER THE PRISM OF MULTIPLE SOCIO-POLITICAL TRANSITIONS, IN ANCIENT AMPHIPOLIS, MACEDONIA, GREECE

Abstract author(s): Michael, Dimitra (School of History and Archaeology, Faculty of Philosophy, Aristotle University of Thessaloniki) - Snoeck, Christophe (Analytical, Environmental and Geo-Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB; Multidisciplinary Archaeology Research Institute, Department of Art Studies and Archaeology, Vrije Universiteit Brussel, MARI- LW-VUB) - Tselekas, Panagiotis - Sverkos, Ilias (School of History and Archaeology, Faculty of Philosophy, Aristotle University of Thessaloniki) - Malamidou, Dimitra (Ephorate of Antiquities of Serres) - Triantaphyllou, Sevi (School of History and Archaeology, Faculty of Philosophy, Aristotle University of Thessaloniki)

Abstract format: Oral

Heterogeneous frailty lies on the fact that every individual alive at a particular age is not at the same risk of dying at that age, due to biological (e.g. genetic predisposition) and cultural (e.g. access to food) reasons. Exploring heterogeneity in frailty and introducing a likely family-centered approach provides a powerful glimpse into past social dynamics. Nonetheless, the concept of frailty has been widely overlooked, as few papers have directly investigated it as a subject worthy of inquiry in and of itself. Neglecting to properly address predisposing factors for stress and disease can create serious biases and misinterpretations when attempting to reconstruct the health profile of a past society. It is essential, therefore, to provide a high-resolution on how cultural and biological factors may lead to stress and disease, through investigating population mobility and biodistance combined with people’s health, lifestyle and foodpaths. This approach lies at the heart of the recently funded project BIOSOCIOPOLIS (Marie Skłodowska-Curie individual postdoctoral fellowship-Grant agreement 101065089), which aim to develop a new interpretive model to reveal the extent to which multiple socio-political transitions, affect human lifeways and deathways, in a diachronic perspective. Amphipolis which belongs to the modern regional unit of Serres in Macedonia, in the north of Greece, experienced many different political models between the Late Archaic/Classical and Roman periods and was thus chosen as an ideal case study. Bioarchaeological evidence will be drawn from various mortuary burial contexts linked to “elaborate” and “modest” burial features dating from the Late Archaic/Classical and Roman periods. The multi-leveled approach which will combine macroscopic and analytical isotopic tools with mortuary data is expected to investigate the sources of frailty and make a true methodological advancement for the field of historical bioarchaeology.

11 DENTAL DISEASES AS AN INDICATOR OF MULTICULTURALISM (ACCORDING TO MATERIALS OF CHERVONY MAYAK NECROPOLIS)

Abstract author(s): Kotova, Nadiia - Kozak, Oleksandra - Symonenko, Oleksandr (Institute of Archaeology of Ukrainian National Academy of Sciences, Kyiv)

Abstract format: Oral

After the decline of Scythia in the 3rd century BC the political and ethnic situation in the Northern Pontic region was changed. In the steppe zone Scythian culture was replaced by Sarmatian and Late Scythian ones. The core of the latter, according to O. Symonenko, consisted of the Scythians of Dniester region who moved to the Lower Dnieper under pressure of the Getae or Bastarnae. The Late Scythian culture contains foreign cultural elements (La Tène, Sarmatian, Antique). Multiculturalism can be traced, in particular, in the funeral rites. The main type of Late Scythian burial structure is the catacomb while other types of structures (simple pits and niche graves) were accompanied by poor grave goods.

One of the best-studied Late Scythian sites is the Chervony Mayak necropolis. It is located behind the Chervony Mayak village, next to the hill-fort, on the high right bank of the Dnieper River. During the excavations of 1976-1977, 1986-1988, 2011-2021 in total 177 graves have been discovered.

Preliminary studies of bone remains have shown the differences in the morphology and health of people buried in crypts and pits. It was assumed that the richer burials belonged to representatives of the dominant people (Late Scythians). Representatives of another ethnic group (Sarmatians?) are buried in pits without grave goods.

Diets and the body's reaction to stressors are indicators of population welfare. Among the indicators of stress, tooth enamel hypoplasia is the most indicative. Dietary patterns are reflected in the intensity and frequency of caries, the quality of calculus, and the characteristics of tooth abrasion. There is a significant difference in these indicators among people buried in the graves of different types. It is one of the possible indicators of the multiculturalism in the necropolis.

12 IMPAIRMENT AT MEDIEVAL ESTREMOZ, PORTUGAL

Abstract author(s): Curto, Ana - Maurer, Anne-France (HERCULES Laboratory, University of Évora) - Fernandes, Teresa (Biology Department, University of Évora)

Abstract format: Oral

Most of the attention given to impairment in bioarchaeology has been in the form of reporting case studies and estimating how much care could have been provided to that individual for their survival. We aim to take a step forward by comparing diet, estimated from stable isotope ratios (carbon and nitrogen), and various skeletal indicators of health between individuals with variable degrees of physical impairment (n=8) and those representative of the adult general population (n=33) in medieval Estremoz, Portugal. This way, we inferred the health status of these individuals besides evaluating their survival.

Sex and age at death were estimated, and morphometric characteristics, skeletal lesions and indicators of physiological stress were recorded. The number of linear enamel hypoplasias (LEH) was counted for each tooth, the age of the LEH formation was estimated for each line of the canines (Cares Henriquez and Oxenham 2019). The Biological Frailty Index (Zedda et al. 2021) was calculated and the guidelines of the Index of Care (Tilley & Cameron 2014) were considered.

The individuals with physical impairment do not have more frequent or more severe skeletal signs of physiological stress or traumas than the rest of the population recovered from Estremoz. The survival into adulthood with apparent good health of individuals with deforming and limiting congenital diseases provides direct evidence for childcare towards disabled children. It appears that at medieval Estremoz people with physical impairments or physically distinctive were being taken care of in their childhood and when their health status required so.

13 NARRATIVES OF MARGINALISATION: SOCIAL INEQUALITY AND STRUCTURAL VIOLENCE IN VIKING-AGE SCANDINAVIA

Abstract author(s): Raffield, Ben (Uppsala University)

Abstract format: Oral

Current archaeological paradigms for the discussion of the Viking-Age (c. 750-1050 CE) are framed almost exclusively by the study of elites. These were martial rulers, their kinship groups and retinues, and the aristocratic landholders who occupied the upper strata of Scandinavian society. The emphasis ascribed to these groups in both scholarly and popular literature reflects cultural historical perspectives dating from the 19th- and early-20th century, when antiquarians and early archaeologists sought to anchor the developmental trajectory of the Scandinavian nations within the prehistoric past. Today, the focus of research on high-status social groups continues to cast a shadow over the lives of the wider population, including members of the lower-status freeborn classes and semi-free, unfree, or enslaved peoples. To date, there have been few attempts to identify and study the lives of subaltern groups, nor to examine the conditions that allowed hierarchical social structures to be established and upheld across generations.

This paper will introduce a project that has been designed to address these issues through a critical study of social inequality and marginalisation in the burial record. Focusing on cemeteries located in modern-day Sweden, the project will mobilise a novel framework that combines bioarchaeological, material, and textual analyses in order to examine the ways in which systemic inequality impacted the health and lifeways of different social groups. This will provide a new and crucially overlooked perspective on Viking-Age communities that ascribes primary to those occupying the bottom of the social ladder.

DISPLACED AND SCATTERED: IDENTIFYING AND ADDRESSING SYSTEMIC INEQUALITY IN AN OSTEOLOGICAL TEACHING COLLECTION

Abstract author(s): Marklein, Kathryn (Department of Anthropology, University of Louisville; Center for Archaeology and Cultural Heritage, University of Louisville) - Davis, Mekenzie (Department of Anthropology, University of Louisville)

Abstract format: Oral

Bioarchaeology provides robust methods and avenues for identifying and addressing inequality in archaeological contexts. Recent global ethics movements in biological anthropology, however, illuminate issues of social injustice, racial inequity, and structural violence imbedded in the foundations of bioarchaeology and perpetuated in human skeletal research, curation, and pedagogy. The tendency to essentialize historic documented human skeletal collections to their anonymized metadata and research utility has rendered skeletonized individuals in human osteology and methods courses as educational objects, subjected to postmortem dehumanization in the classroom context. In this paper, we apply a multi-phase approach to the analysis, interpretation, and long-term memorialization of over ten commingled and partially represented adult individuals relocated to the University of Louisville's Department of Anthropology after their discovery in the Department of Biology. Thusly, we aim to 1) demonstrate how skeletal teaching collections represent legacies of inequality and systemic violence, and 2) present collection care and engagement options that emphasize respect and mitigate inequality. We employed preliminary assessments of morphological, metric, taphonomic, demographic and pathological variables to resolve commingling of over 240 human bones. Subsequently, we integrated these skeletal data, textual and oral UofL records, and trend analyses of 20th century international trade in human skeletons to reconstruct the likely history of these individuals. Our findings of internationally condoned human body sales, postmortem damage, and unresolvable commingling embodied in these individuals evoke an acquisition narrative similar to many U.S. anthropological and anatomical teaching collections, wherein minority, disenfranchised, and marginalized peoples were exploited in death. We shared these results locally to solicit public opinion, which will further inform how to best memorialize these individuals. Ultimately, this exercise has provided an opportunity to uplift past human narratives and experiences and offered a way to recognize and disrupt the inequality and violence within our own teaching collections.

A. SOCIOECONOMICAL DETERMINANTS AS RISK FACTORS FOR TUBERCULOSIS INFECTION IN THE PAST: HISTORICAL AND SKELETAL EVIDENCE

Abstract author(s): Ribeiro, Fabiana (CIAS - Research Centre for Anthropology and Health, Department of Life Sciences, University of Coimbra; CBMA - Centre of Molecular and Environmental Biology, Department of Biology, University of Minho) - Rito, Teresa - Soares, Pedro (CBMA - Centre of Molecular and Environmental Biology, Department of Biology, University of Minho) - Silva, Ana Maria (CIAS - Research Centre for Anthropology and Health, Department of Life Sciences, University of Coimbra; UNIARQ - University of Lisbon; Centre for Functional Ecology, Department of Life Sciences, University of Coimbra)

Abstract format: Poster

Environmental factors, such as human behaviour, can influence the emergence, spread and maintenance of infectious diseases of human populations. Their influence can be addressed by anthropological and historical studies. Skeletal tuberculosis (TB) occurs in only 3-5% of the untreated cases yet lesions suggestive of TB in skeletons are often found in archaeological and paleontological contexts. It is known that the risk of infection following TB exposure is primarily controlled by exogenous factors and concomitant diseases. Also, some socioeconomic determinants are considered a risk factor to TB, as alcohol and drug abuse, bad nutrition, smoking and indoor air pollution. People with low socioeconomic status have a higher likelihood of being exposed to crowded, less ventilated places and have limited access to safe cooking practicing facilities.

Studying how diseases develop alongside humans, can provide a more accurate picture of its evolution and how that process was affected by the huge cultural changes and public health policies that human populations have undergone through time. The aim of this work is to increase the knowledge about tuberculosis in Portugal in the past. This can be addressed by the study of skeletal evidence and biomolecular analysis in individuals from Portuguese archaeological sites, with TB compatible lesions. Also, documentary resources are a valuable source of information. Their analysis allows to map a chronology of events related with TB, that can provide a more accurate idea of what happened in terms of health measures and reports of a respiratory disease. The goal is to realize how mortality crises conditioned the growth of the different populations at different times and geographics, and whether they differ in intensity and frequency. Lastly, it will be addressed how the different social-economic status, and consequent differentiated exposure to risk factors, could have influenced the disease outcome in Portuguese past populations.

B. A LIFE COURSE APPROACH TO DIFFERENTIAL HEALTH AT MEDIEVAL TZUMMARUM (FRIESLAND, NETHERLANDS)

Abstract author(s): Iodice, Federica - Moles, Anna (Groningen Institute of Archaeology; University of Groningen)

Abstract format: Poster

Using enamel hypoplasia as an indicator of childhood developmental health, this study seeks to take a life course approach to understand health inequality at Tzummarum (Northern Friesland, Netherlands). These enamel defects are caused when an individual experiences physiological stresses during the formation of the tooth crown. These stress factors can be malnutrition, infectious diseases, or physiological stress associated with weaning or hereditary factors. In a life course theoretical framework, the identification of enamel hypoplasia in individuals can be used to identify developmental interruptions. Osteoarchaeological analysis was conducted on an assemblage from two cemeteries at Zwaarderburen and Kapelleterp in Tzummarum associated with the 12th-13th century monastery and settlement. The individuals with largely complete dentitions were analysed to assess the sex, estimate the age, and identify the prevalence of enamel hypoplasia. This research aims to contribute to understanding the different life course conditions between males and females in medieval Tzummarum. This distinction is intended to assess whether there were differential developmental conditions and health between males and females. This research contributes to a reconstruction of the quality of life of the individuals, to open up a broader discussion about the limitations of having enamel hypoplasia as the sole indicator of developmental conditions, and the gender gap in living conditions.

176 TERRACES AS SUSTAINABLE HISTORIC LANDSCAPES

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Turner, Sam (Newcastle University) - Civantos, Jose Maria (University of Granada) - Kinnaird, Tim (University of St Andrews) - Shillito, Lisa-Marie (Newcastle University)

Session format: Regular session

Terraced landscapes of the Mediterranean produce diverse crops, and contribute significantly to soil and water management. Despite their widespread occurrence, the history and archaeology of Mediterranean terraces has been obscure, largely due to problems in dating their construction and use. Current research is showing that terraces were built all around the Mediterranean in the Middle Ages and before. However, the assumption that terraces are generally young means their importance over the longer term is not appreciated. This has many implications for our understanding of historic Mediterranean landscapes, from past soil development and ecologies to economic strategies and social organisation.

Terraces provide a unique window for understanding long-term environmental impacts of land-use and for evaluating long-term sustainability in agricultural practice and policy. Contributions to this session will consider whether terraces enabled greater resilience to economic or ecological instability in the past, and whether they played a role in mitigating the impacts of past climate change. The session will also reflect on the potential of terrace history to inform future land use, considering both increasing climatic instability and changing needs for food production.

ABSTRACTS

1 TERRACES AS SUSTAINABLE AGRICULTURAL ENVIRONMENTS: LONG-TERM PERSPECTIVES FROM THE MEDITERRANEAN

Abstract author(s): Shillito, Lisa-Marie - Brandolini, Filippo (Newcastle University) - Kinnaird, Tim (St Andrews University) - Sevara, Chris (Newcastle University) - Srivastava, Aayush (St Andrews University) - Turner, Sam (Newcastle University)

Abstract format: Oral

Agricultural terraces support many crops and farming regimes around the world, help to retain and improve soils, and enable effective management of water. In the past, archaeologists have struggled to date the construction, modification and use of terraces. This problem has limited research on their broader historic significance, including for example knowledge of past agricultural practices, organisation and division of land in different periods, and the long-term investment choices made by rural communities. The TerraSAgE project has used Optically-Stimulated Luminescence Profiling and Dating (OSL-PD) to date construction and use of terraces in case-studies across the Mediterranean region (Spain, Italy, Croatia, Greece, Turkey). The results have shown regional patterns of terrace and construction and use, with intensive episodes of terrace-building occurring at different times in different areas. This new knowledge has significant implications for future landscape management and the role of terraces in mitigating climate change impacts such as flooding and soil erosion.

2 CHARACTERISING TERRACE SYSTEMS: USING REMOTE SENSING DATA TO HELP UNDERSTAND THE ROLE OF TERRACES IN LANDSCAPE DEVELOPMENT

Abstract author(s): Sevara, Christopher (Newcastle University) - Salazar Ortiz, Natalia (Universitat de Lleida)

Abstract format: Oral

Terrace systems are striking manifestations of the choices people have made in the past as they confronted social and environmental issues and sought short- and long-term agricultural solutions to improve their own lives and/or those of their communities. However, due to a lack of sufficient understanding about the origins, construction, maintenance, and use of terrace systems the reasons for their development largely remain presumptive. A better understanding of terrace development and use is a key to understanding their role within the framework of wider landscape development, and the goal of the project Terraces as Sustainable Agricultural Environments (TerraSAgE). This paper concentrates on the contributions that over 80 years of remote sensing data, including historic aerial and spaceborne imagery, LiDAR and Synthetic Aperture Radar (SAR) data provide for understanding such events. This information forms the basis of TerraSAgE's Historic Landscape Characterisation (HLC), a geospatial dataset created from a variety of historic and modern information to document the historical transformation of the landscape. We present ongoing research in Catalonia, Spain, discussing how HLC approaches, geospatial analysis and modelling can be used to produce broad-scale narratives of terrace development, document and analyse the impact of modern mechanization on terraced environments, assess the impact of terracing on soil loss, and understand how terraces may contribute to ecosystem sustainability on local and regional levels. Together with data from detailed geoarchaeological and environmental analyses being carried out in other components of the project, this information will be used to better understand the origins and development of terraced landscapes as well as to inform development of sustainable strategies for management, monitoring and their future use.

3 ORIGIN, DEVELOPMENT AND LAND DEGRADATION OF THE NORTHERN APENNINES RURAL LANDSCAPE (ITALY)

Abstract author(s): Brandolini, Filippo (Newcastle University)

Abstract format: Oral

Land degradation is a critical environmental issue worldwide. The latest projections on climate change indicate that increasingly severe storm intensity and runoff will induce greater soil losses by water erosion in the future than in the past decades. Recent environmental studies and policies have recommended maintaining archaeological landscape features such as intercropping, agroforestry and cross-slope barriers (e.g. hedgerows, stone walls, earth banks) for their potential benefits to ecosystems.

This study focuses on a portion of the Tuscan-Emilian Apennines coinciding with the municipality of Vetto d'Enza (commonly referred as Vetto), located on the right bank of the Enza River in the Man and the Biosphere UNESCO reserve (Emilia-Romagna region, Northern Italy). The main characteristics of this historic rural landscape trace their origin back to the Middle Ages at the period of the Great Countess Matilda of Canossa (10-11th century CE) and the area's land management system appears to have remained largely unaltered until the end of the 19th-century CE. Among the most distinctive characteristics of this historic landscape are relicts of agroforestry practices (known as 'alberata emiliana') and well-preserved stone walls and earth banks that have been used extensively between steeply-sloping fields to delimit tenurial boundaries and to face agricultural terraces. This study develops a new interdisciplinary approach with particular reference to soil loss and degradation over the long term. It presents innovative methods for assessing and modelling how pre-industrial agricultural features can mitigate soil erosion risk in response to current environmental conditions. Landscape archaeology data presented through Historic Landscape Characterisation (HLC) are integrated in a GIS-RUSLE model to illustrate the impact of varying historic land-uses on soil erosion. The study offers a new protocol that could be used by policymakers and stakeholders who need to develop strategies which encompass both natural and cultural values for landscape planning and management.

4 SCULPTING AN ISLAND: A DIACHRONIC PERSPECTIVE ON TRADITIONAL TERRACE - DRYSTONE SYSTEM AND ITS ENVIRONMENT ON THERASIA ISLAND, GREECE (ARCH2PLANT)

Abstract author(s): Athanasiou, Konstantinos (Department of Architecture, Polytechnic School, Aristotle University of Thessaloniki) - Stavridou, Evangelia (Institute of Applied Biosciences, Centre for Research and Technology - Hellas) - Gkatzogia, Eugenia (Dept of Archaeology, School of History and Archaeology, Aristotle University of Thessaloniki)

Abstract format: Oral

The Arch2Plant project studies the rural, residential and natural environment of Therasia island. Therasia, part of the larger Santorini island group, has a unique volcanic environment with particular environmental and architectonic features. Recent studies have shown that 75% of the island is covered with terraces, except for the steep cliffs of the

caldera; thus, creating a unique man-made environment. Today, the landscape of Therasia is covered by uncultivated terraces, semi-destroyed paths and ruined dry-stone walls. Herein we will focus on three topics regarding the terrace dominating rural environment of Therasia: i) The art of terrace and drystone wall-making. Exploring the significance of the terraces and drystone walls. Measured drawings of more than a hundred well preserved examples of drystone walls, all part of terraces and most of them over a century old revealed the unexplored architectural typologies and constructional details. ii) Reclaiming nature. Studies on vegetation and flora of abandoned terraces and specifically on and near the drystone constructions. The abandonment of the rural landscape has led to the creation of a new micro-ecosystem with characteristic plant species and communities. iii) The tales of the people. Ethnographic study regarding the corps and the cultivation practices on Therasia's terraces. The utter goal of this work is to reconstruct a comprehensive picture of the island's terraced landscape and plant diversity in relation to rural activity, ultimately shedding light on the emergence of Therasia's uniqueness.

5 UPSETTING HERITAGE GIVENS: THE CASE OF RURAL HERITAGE ON THE ISLAND OF NAXOS, GREECE

Abstract author(s): Lekakis, Stelios (Newcastle University)

Abstract format: Oral

Cultural heritage is commonly related to iconic and monumental remains of the past, carefully selected and curated by nation-states to reflect the collective identity of their citizens and serve as a touristic impetus for all incoming others. Even though the emphasis on the material authenticity and the overpowering national stewardship of heritage has been contested, following the 1990s 'opening up' trend to involve plural publics in heritage interpretation and management and the 2000s 'broadening' heritage identification to include new categories (e.g. landscape, intangible, contested, dark heritage), criticism might still be considered unfulfilled. Commenting on the first survey results of the TerraSAgE project on the rural heritage of Naxos Island and our relevant community engagement work, we will be discussing a further upsetting of these heritage givens, i.e. concepts of monumentality, age, authenticity, community participation and will be proposing a new management system of a developing 'ubiquitous heritage' category based on the commons.

6 NEW LIGHT ON THE DATING OF CULTIVATION TERRACES ON PELJEŠAC PENINSULA, CROATIA

Abstract author(s): Carlton, Richard - Turner, Sam (University of Newcastle) - Kinnaird, Tim - Srivastava, Aayush (University of St Andrew's) - Shillito, Lisa-Marie - Sevara, Chris - Germanidou, Sophia (University of Newcastle)

Abstract format: Oral

Agricultural terrace systems extend over large parts of the Mediterranean region and, as focal points of agricultural production systems, offer a window into past socio-economic systems. This potential has remained largely untapped, however, because archaeologists have hitherto lacked the means to interrogate these historic landscapes with respect to their origins and development. This has severely hampered efforts to understand the effects of terracing on landscape and, in turn, strategies for mitigating the impacts of past climate change and informing sustainable strategies for future land-management.

Here we focus on terrace systems on the peninsula of Pelješac in southern Dalmatia, Croatia, where secure chronological information on terraces is entirely lacking. At 25 terrace sites across four coastal and inland locations, trenches were hand-dug and placed in a relative chronological sequence using a portable optically stimulated luminescence (OSL) dating reader and gamma spectrometer. Samples were then collected for absolute OSL dating and additional micromorphology and x-ray fluorescence (XRF) analyses. The results of this multidisciplinary approach, which also includes documentary and ethnographic contributions, suggest large-scale land-use in periods for which little or no other evidence indicative of intensive landscape exploitation survives. Preliminary data show evidence of terrace construction and use between the 1st millennium BC and the 17th century AD, with intensification apparent during the Medieval period. When combined with micromorphological and XRF data and modelled, the findings indicate the value of terraces as long-term resilient, adaptable agricultural and environmental features. The study concludes that this novel multidisciplinary approach leading to a robust chronology has important implications for unravelling the history of agricultural terraces within wider socio-economic systems and the future sustainability of terraced landscapes in Croatia and beyond.

7

RECONSTRUCTING PAST AGRICULTURAL TERRACED LANDSCAPES IN GRANADA, SPAIN

Abstract author(s): Srivastava, Aayush - Kinnaird, Tim (University of St Andrews) - Sevara, Chris - Brandolini, Filippo (Newcastle University) - Martín Civantos, José María - Santisteban, José Abellán - Rodríguez, Blas Ramos (University of Granada) - Turner, Sam (Newcastle University)

Abstract format: Oral

The practice and benefits of terracing is attested globally in agriculture, with agricultural terrace systems being prevalent in the Mediterranean region. Despite this, the historical background and social-economic impact of these systems is not well understood due to lack of reliable dating methods. This makes it challenging to fully comprehend the effects of terracing on the landscape, including its role in mitigating the effects of past climate change and developing sustainable land-management strategies for the future. In recent times, owing to the developments in the applications of sophisticated luminescence field and laboratory profiling and dating techniques, research on historical agricultural landscapes in Southern Europe has seen significant growth (1).

In this study, we focus on terraced landscape in Granada, Spain where an examination of 24 terrace sites was conducted in four areas using remote sensing data. Trenches were manually dug and ordered chronologically using a portable optically stimulated luminescence (OSL) reader and a gamma spectrometer. Subsequently, samples were taken for absolute OSL dating and further sedimentological analysis. The data suggest that the construction and utilisation of terraces took place between ~5.5 ka and 18th century in multiple episodes. The chronological findings from this study demonstrates the existence of widespread land-use in the absence of any other surviving evidence of landscape exploitation. As the demand for sustainable land use practices continues to grow in the Mediterranean, such chronological studies of historic terrace systems are important for understanding the complexities of human-environment interactions and for preserving the land for future generations.

8

RETHINKING THE ARCHAEOLOGY OF AGRICULTURAL LANDSCAPES IN THE NORTHEAST OF THE IBERIAN PENINSULA THROUGH A MULTIDISCIPLINARY APPROACH TO CATALONIAN TERRACES

Abstract author(s): Salazar Ortiz, Natalia (Universitat de Lleida) - Turner, Sam (Newcastle University) - Kinnaird, Tim (University of St Andrews) - Sevara, Christopher - Brandolini, Filippo (Newcastle University) - Srivastava, Aayush (University of St Andrews)

Abstract format: Oral

Terraces have defined a greater part of the mountainous landscapes of Catalonia for centuries, as in the rest of the Mediterranean regions of the Iberian Peninsula. Their relevance as cultural and ecological heritage has been valued since the 2000s from different perspectives in sectoral studies, either from the social sciences or from the environmental sciences, highlighting a lack of multidisciplinary approaches. A retrospective analysis shows that, in the context of Catalan archaeology, most of the research on terraces has pursued chronological microdata to insert it into the interpretation of a specific and individualized productive settlement, generally from medieval times and/or later. Few studies have addressed a geo-archaeological perspective and some have adopted an approach from landscape archaeology that is highly dependent on HLC (Historic Landscape Characterisation) and on the security of documentary data, both historical and cartographic. Archaeological investigations of agricultural landscapes in the northeast of the Iberian Peninsula, despite the documentation of the progressive intensification of the occupation and exploitation of rural areas during the Iron Age, Roman times and Late Antiquity have not yet provided chronologies that can trace the use of terraces in Catalonia to pre-feudal times, as it has been possible to verify in other regions of Spain, such as Galicia or Valencia. In this context, the results of the multi-scale analysis of terraces carried out in central Catalonia through the TerraSAgE project (Terraces as Sustainable Agricultural Environments) not only represents a turning point in the diachronic investigation of terraces. It offers, in addition, the decisive opportunity to rethink the approaches and methodologies to be implemented in the study of other Catalan agricultural landscapes that could respond to the need that we archaeologists have to understand them in relation to their regional and translocal historical context and within the framework of Mediterranean culture.

THE TERRACES OF THE MONKS? DATING AND CHARACTERISING THE AGRARIAN SPACES AROUND THE MONASTERY OF SAMOS (LUGO, NW SPAIN)

Abstract author(s): Sanchez-Pardo, Jose Carlos (University of Santiago de Compostela) - Turner, Sam (Newcastle University) - Kinnaird, Tim (University of St Andrews) - Brandolini, Filippo - Carrer, Francesco (Newcastle University) - Silva-Sánchez, Noemi (CSIC) - López-Salas, Estefanía (University of Coruña) - Otero-Vilariño, Carlos (CSIC) - Srivastava, Aayush (University of St Andrews)

Abstract format: Oral

This presentation discusses the results of a multidisciplinary approach to understanding landscape evolution around an important monastic centre in Northwest Iberia: Samos abbey, which was founded in the 6th-7th centuries AD, and has played a permanent role of territorial marker until the present days. As part of the ARPAMED and ECOLOC projects (funded by the Spanish Ministry of Science), our objective is to test whether or not landscape transformations here – in particular terracing related to agriculture – can be linked to the agency of the monks in the last 1400 years. Our landscape study combined analysis of written sources with archaeological survey and test-pitting, including OSL profiling and dating of seven earthworks, with pollen and geochemical analysis of three of them. The results obtained suggest at least four main phases of landscape transformation in the immediate surroundings of Samos abbey. The mid-17th century saw the most recent and visible transformations, but the impact of earlier changes from the Iron Age, 8th-9th and 13th centuries AD were also detected. The data suggest that landscape transformation had already begun in this area centuries before the abbey was created, but the presence of this power centre from the early Middle Ages resulted in intensive use of the territory over the last 12 centuries.

180 THE STORY SESSION

Session theme: 3. Heritage Narratives and Representations

Session organisers: Reiter, Samantha - Walsh, Matthew (National Museum of Denmark) - Bača, Martin (Comenius University Bratislava) - Schelvis, Morgan (University of Amsterdam)

Session format: Regular session

As archaeologists, we are often the most popular attendees at the cocktail party. Tell your occupation and (as long as people don't ask you about your favourite dinosaur or the latest building you designed), the other guests enthusiastically gush about "every time there is an archaeology special on, I always watch it!". Nevertheless, it is quite rare that archaeologists themselves write stories about their discoveries, research or even their quite adventurous lives. Archaeologists do write, but we often do not share these works outside of our professional bubble. We rely mostly on interviews with the press and/or specialized communicators to tell the stories for us. We let others decide how archaeology and archaeologists are presented to the public, whilst we could be our own spokespersons.

This session invites papers which explore the connection between the public fascination for archaeology and the means to encourage archaeologists themselves to capitalize on it. We invite papers from writers of popular science, archaeologically-oriented fiction and museum exhibition designers which address the balance between entertainment and education as well as the importance of narrative. Written, illustrated or otherwise acted case studies of single individuals (either real or imagined) are also welcome and encouraged, as are short vignettes and thought experiments humanizing our shared past. You may consider exercising your archaeological imagination by reading a narrative document addressing either a pre/historic theme or a larger metadata-style discourse on living as an archaeologist in order to tell the story behind the story accompanied by an image collage.

ABSTRACTS

1 THE STORIES WE TELL (AND SOME MAYBE WE SHOULDN'T)

Abstract author(s): Walsh, Matthew (National Museum of Denmark)

Abstract format: Oral

As archaeologists, we often live pretty exciting lives. Many of us travel a lot. Some of us do so to quite remarkable, isolated and even exotic – sometimes dangerous – places. We navigate diverse cultures, we meet unique and interesting people. We contend with the stingy-bitey-crawly kinds of animals, and we get very, very dirty. While this is all true, these moments of excitement are often mere punctuation marks in otherwise mundane, academic, and even boring lives. As exciting as things get for some of us, we more often than not find ourselves with our noses in books or paperwork than we do discovering lost cities or unearthing forgotten treasures. But, let's keep that our little secret, shall we? This presentation will discuss the author's own experience learning the value (and the perils) of keeping a field journal. It illuminates the insights to be gained from taking an explicitly personal and non-academic perspective on our experiences of archaeological fieldwork. It highlights the introspective power that can come from revisiting and remem-

bering – sometimes even regretting, but hopefully learning-from – our times spent in and out of the one-by-one. Ultimately, in the author's view, preserving, confronting and thinking with these moments and memories and the ways in which we record them makes us not just better archaeologists but with any luck better people. That said, maybe don't share that part on page 72?

2 FROM BARROW WITH LOVE: STORIES OF KURGANS DURING EXCAVATIONS

Abstract author(s): Teslenko, Dmytro (State intertainment)

Abstract format: Oral

Over the last 5 years the team of the Dnieper archaeological expedition of the Protective Archaeological Service of Ukraine has been constantly faced with the need to communicate with people interested in archaeology. This happened directly during excavations, during the display of artefacts at exhibitions or during participation in historical festivals. For example, during the 2021 survey of the Novoalexandrovka mound, around 2,000 people visited the excavation site every weekend. As a result, one of the team members had to work as a guide.

I would like to share this experience. Firstly, most people perceive the work of archaeologists as a treasure hunt, and in addition to questions about dinosaurs and engineered buildings, they ask: "how much gold did you dig up?", or "do you keep something for yourself?" Secondly, the attendees have little or no knowledge of ancient history and archaeology. Finally, there is even less understanding of the work of an archaeologist and the question "how do you discover artefacts or burials in kurgans?" remain among the most topical.

For successful communication with listeners, the style of an archaeological publication proved totally useless. The stories at the onset were based on an interpretation of the archaeological records. The use of absolute dating also proved ineffective. Much clearer were the maxims like: "when no pyramids were yet built in Egypt", or "two thousand years before the Scythians". The final narrative was more akin to History of Spain by Arturo Perez-Reverte, rather than an archaeological text.

This communication led to several projects, the first of which was the creation of social media and YouTube channels. The second initiative was the development of project documentation for the creation of archaeological landscape parks with the museumification of part of the archaeological sites.

Unfortunately, these projects were halted because of the war.

3 READING FROM GRAPHIC NOVEL „PFOSTENLOCH" ("POST HOLE")

Abstract author(s): Heller, Daniela (none)

Abstract format: Oral

Summer, somewhere in southern Germany: Two young women are working on an archaeological excavation during the semester break. Between tarps, barrows and curious onlookers, they uncover the remains of an Iron Age settlement: post holes, the last traces of long-gone wooden houses in the earth. While the two friends dig through layer after layer of human pasts, their thoughts revolve around their uncertain professional future. When a position suddenly becomes vacant on the excavation, an unwanted rivalry arises between them, which puts their friendship to the test. And it's not just remains of Iron Age houses that are being unearthed - buried memories and repressed grief also come to light.

Post hole" (original German title: "Pfostenloch") is a story about friendship, archeology and people's remains - in the earth and in memory. It also asks the question of what it actually is that archaeologists are searching for and what it is they find.

I developed this graphic novel as my graduation project at the Art Academy of Kassel (Germany) where I studied visual communication with a focus on comics and illustration after studying and graduating in prehistoric archeology and spending some time on excavations. The book was released in 2022 by the Berlin comic publisher avant-verlag. In the same year, it won a prize for the best comic debut at the International Comic Salon in Erlangen, which is considered the most important German festival for comics and graphic literature.

I wanted my comic to deal with the less glamorous aspects of field archaeology while also working with humour and targeting archaeologists and non-archaeologists alike.

I propose to do a reading of a translated extract from the graphic novel with sound effects and an overhead projection.

4 THE MYSTERIOUS AFFAIR IN ARCHAEOLOGY OR WHAT IF POIROT WAS AN ARCHAEOLOGIST

Abstract author(s): Baca, Martin (Department of Archaeology, Faculty of Arts, Comenius University in Bratislava)

Abstract format: Oral

„You would have made a good archaeologist, Mr. Poirot. You have the gift of re-creating the past“ (A. Christie - Murder in Mesopotamia, 1936)

Since I was a kid I loved stories in which the famous Belgian detective Hercule Poirot solves numerous sophisticated murders, whether it was in a movie or in a novel. Of course, I know that I am not the only fan – Poirot became an iconic detective figure since Agatha Christie introduced him to popular culture more than a century ago, and his popularity certainly did not wane. When I started my profession as an archaeologist, I began to wonder whether we (archaeologists) could learn something from the perspective of A. Christie writing. Most of us know, that Christie was engaged in archaeology to some extent and undoubtedly helped to popularise it in her famous novels such as *Death on the Nile* or *Murder in Mesopotamia*. The most interesting thing for me is, however, the way in which Poirot at the end of every novel/movie always presents his final thoughts to a small crowd of rather nervous suspects. The detective-like evaluation of facts is something that was often compared with the archaeological methodology. But equally interesting is that Poirot's evaluation of the chain of evidence is at the end always assisted by very engaging narration. This is probably the most crucial part of each novel/movie where Poirot is the leading character because it enables the reader/viewer to finally understand the very complex background of every investigated crime. In this paper, I will discuss whether archaeologists could learn something from this, respectively from A. Christie and especially from the works starring her most famous detective.

5 BEING SOMEONE ELSE: SELFHOOD AND THE PREHISTORIC IMAGINATION

Abstract author(s): Taylor, Timothy (Comenius University in Bratislava; *Journal of World Prehistory*)

Abstract format: Oral

This presentation is designed to amplify the insight of Alexander von Humboldt that facts are valueless without an imaginative conception, and that any imaginative concept only becomes valuable once it can be dignified by facts. How we imagine depends on how we have experienced the world. In 'Oneself as Another', Paul Ricoeur argued that being able to self-critically reflect on ourselves (as seen somehow from an outside perspective) was a foundation of deepening ethical commitment. The ability to put oneself in another person's position in no sense signals a susceptibility to relativism; it may offer a contrary opportunity: to increase objectivity (even if that objectivity is complexified – as viewpoint theory suggests it must be). Archaeology does not simply demand a Giddens-style double hermeneutic, where the society of the self is under review, and data is gathered to describe and also change what is described. It is clearly more ambitious than the Malinowskian–Geertzian thick description, as (mostly) its actual subjects are a priori no longer extant (and, in prehistoric contexts, beyond any direct record of thoughts expressed through language). Assessing how far we can undertake any praxeology for such past contexts is thus a major challenge. One possible approach is through materiality theory, and the apprehension of our artefact data as having potential to retain many original affordances. Through playing out the past, in concrete physical reconstructions, in our heads, or in virtual environments, we can better invent and imagine scenarios with points of possible consilience (equifinalities at least) with archaeological materials. Following Alison Wylie's recommendations for source- and subject-side analytical work, it has to be possible to convincingly transform one type of data into another, and replace earlier and less tethered conceptions with more objective kinds of imagination. This has significant implications for museum display interpretation and public outreach.

6 IF I WERE TO VISIT A TAVERN IN 1650 HOLLAND, WOULD I BE ALLOWED TO ENTER?

Abstract author(s): Schelvis, Morgan (University of Amsterdam)

Abstract format: Oral

The consensus is 'probably not', because I am a woman (and because I am not a time traveller).

Seventeenth-century Holland taverns were (semi)public spaces where people could sit and drink whenever the hosts were awake. Due to the public nature of these drinking houses, they became centres of social, political, and business activities from medieval times onwards. The day-to-day social structure in seventeenth-century Holland was in part shaped around its taverns. In Dutch historical archaeology it is generally accepted that the tavern was an exclusively male space with few exceptions. I challenge this notion: I see the seventeenth-century Holland tavern as a mixed gendered space with few exceptions.

When it comes to women's participation in the tavern's social structure, there is a lack of focus in the available literature. Important Dutch historical works about taverns do not explore the possibility of women as patrons, but predominantly explore women as workers and wives and make it clear that the tavern was a male space in which women sometimes existed.

In this presentation, I take you through a figurative journey back in time to showcase how our understanding of the tavern changes by creatively exploring them from a woman's perspective. Intentionally looking at the past through the lens of imagination and storytelling is an important exercise we, as archaeologists, should be doing more of. It helps us think critically about the past and who we include and exclude in our understandings of the past.

I wrote a story about two women who lived approximately 370 years ago. We get to know Jannetje, a farmer in a village, and Geertje, a housewife living in a city. By looking at their day-to-day lives, we gain a better understanding of the inner workings of the tavern as a mixed gendered space.

7 INTERACTIVE STORYTELLING - INTERPRETATION OF CULTURAL HERITAGE

Abstract author(s): Abonyi, Zsanett (Budapesti Történeti Múzeum/ Budapest History Museum)

Abstract format: Oral

The role of museums has become more diversified than ever before. Museums must be places for the transferring of knowledge and must respond to the expectations of the modern world. In addition to their professional responsibilities, the archaeologist must also help to create value from both the tangible and intangible assets of the past. While it is acknowledged that museums are forums for public education, they are also venues for entertainment and must strive to bring a level of engagement that motivates learning, while also providing an enjoyable experience. This 'edu-tainment' should up new perspectives the museum to engage with fantasies, new narratives, and step out from the comfort zone to find new solutions for engagement.

Regular archaeological excavations have been carried out in the territory of Budapest for almost 150 years. It is high time that our museum focus on better communicating the preserved heritage of the past in creative and more engaging ways. Since 2018, we have been endeavoring to develop more informal ways of presenting archaeological news and stories through, e.g. the use of short videos and live-streaming through social media platforms. But, even beyond this, the Living Aquincum Project is a remarkable undertaking in these regards. The project revives the ancient city of Aquincum as an alternative parallel world during the main museum's events. This world is represented by reenactors and based on historical and archaeological sources. It works with the method of living history on site as well as online and as a new initiative aims to bring an authentic interpretation of the past. As such, it must straddle the fine line between accuracy and amusement. This exceptional project keeps things fun and fresh while striving to provide an experience at the intersection of connection, learning and enjoyment for anyone who walks through the museum doors.

8 THE PYLOS COMBAT AGATE

Abstract author(s): Wood, Florence (-)

Abstract format: Oral

In 2015, archaeologists Jack Davis and Sharon Stocker were working on the site of Nestor's Palace in Crete when they discovered the shaft tomb of a Mycenaean warrior. The tomb, dated to 1450 BC, is now known as the 'Griffin Warrior Tomb'. Without doubt the Griffin Warrior was wealthy and of great social standing for not only was he buried in a single grave, unusual for that time, but he was surrounded with more than 3000 artefacts. These included a sword, a sword pommel, gold rings, silver cups, beads and ivory combs. Also amongst them was a small carved agate, 3.6 cm long and some 2 cm high, which became known as the Pylos Combat Agate because of the three warriors delicately carved upon it. There are two scenes carved on the Agate. At bottom left, there is a dead warrior lying on his back, knee raised, and large shield beneath him. A breastplate floats above his body. Two warriors dominating the scenario are engaged in mortal combat. The attacking warrior is poised on a muscular leg, his face contorted with rage. The other is protected by a large, bossed shield, his throat exposed, and his face turned away from the fatal blow of his assailant's two-edged sword. The two scenes faithfully reconstruct the death of Achilles' friend Patroclus by Hector and the subsequent death of Hector by the vengeful Achilles, as graphically told in Homer's Iliad some 700 years later.

Did the Griffin Warrior know of these ancient stories and, if so, did he see himself as the mighty conquering Achilles? The riches of this carefully constructed shaft grave suggest that his followers certainly did, for the Combat Warrior Seal along with other precious artefacts was placed carefully about his rib cage.

9 THE NARRATIVE AND THE INDIGENOUS WORLD IN THE EDUCATIONAL CONTEXT: THE GUANCHE MEMORIES FROM TENERIFE AS A CASE STUDY

Abstract author(s): Farrujia de la Rosa, Jose (Universidad de La Laguna)

Abstract format: Oral

In this paper we present a didactic project for compulsory education in Spain, focused on the indigenous or Guanche world of Tenerife, in the Canary Islands.

The Canary Islands archipelago was conquered and colonised by Europeans during the 15th century and, as a consequence of cultural ethnocide, the indigenous world gradually disappeared. Unlike to what happened in the American context, the indigenous communities of the Canary Islands did not bequeath us the so-called "visions of the vanquished", as the oral and unwritten tradition predominated among them.

This project, based on illustrated historical narrative, recovers the knowledge about the indigenous world of the Canary Islands. Based on texts written within this project in the form of first-person testimonies, a series of indigenous

characters, both male and female, who existed in the 16th century, enable us to recreate their world, the effects of colonisation and their evolution in the early years of the colonial period. The stories have been written on the basis of archaeological research and documentation generated by the European conquerors in the 16th century. The educational project, in this sense, is based on literary recreation to bring students closer to the reality of the indigenous heritage of the island of Tenerife, and to address aspects such as equality, multiculturalism and the development of skills in cultural expressions. The project also aims to incorporate this theme in order to fill the gaps that exist in the official curriculum at this educational stage.

10 EDUBBA'A – THE THEATRICAL STAGING OF SUMERIAN LITERATURE

Abstract author(s): Borkowski, Sebastian - Marti, Cynthia (University of Bern)

Abstract format: Oral

The play *Edubbā'a* ('At School') was first performed in 2022 at the 75th anniversary of the Swiss Academy for Humanities and Social Sciences in Bern, Switzerland. The literary source of the play is a nearly 4000-year-old Sumerian narrative from Mesopotamia copied by apprentice scribes in the Old Babylonian period. The story revolves around everyday life in the *Edubbā'a*, the Mesopotamian school. Protagonist and first-person narrator is a pupil who is bullied by his teachers and finally persuades his father to use bribery to convince the headmaster of his talent in writing.

Staging the play was an interdisciplinary project, involving students and doctoral students from the Institute of Archaeological Sciences of the University of Bern and hobby actors. The play was preceded by a short film adaptation of the same literary source in 2018. Since then, a seminar on ancient textiles and fashion taught in collaboration with the Institute of Art History of the University of Bern discussed and designed costumes according to ancient visual and textual sources. A second seminar critically reviewed the reception of ancient West Asian history and material culture in theatre and film productions.

The project had the aim to teach students about the processes and relevance of public outreach and to educate a broad public audience about Sumerian language as well as Old Babylonian literature and material culture in a creative and entertaining way. Through the performative reconstruction of everyday school life in ancient Mesopotamia, furthermore, we intended to stimulate an intercultural dialogue about childhood and education in ancient and modern times.

Edubbā'a is a playful approach to philological and archaeological sources that loosens up the otherwise very academic discussion. A film adaptation of the play is currently under development in order to reach a larger public audience and to document the project for future teaching.

181 SCIENCE, NOT SCIENTISM, IN EXPERIMENTAL ARCHAEOLOGY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Schenck, Tine (Mesolithic Resource Group; ArchaeologistsEngage) - Lundström, Fredrik (Department of Archaeology and Classical Studies, Stockholm University)

Session format: Regular session

Experimental archaeology has long relied on methodological ideals of the natural sciences. Some have gone as far as to state that the ideal experimental methodology should be based on experimental physics (P. Reynolds "The nature of experiment in archaeology" 1999). As scientific techniques have exploded onto the archaeological scene, experimental archaeologists seem to increasingly strive for variable control and quantified results. But how does this trend affect experimental results in a larger, archaeological context?

Natural sciences founded on positivist ideals opens a vast tool box for experimental archaeologists. However, those sciences do not necessarily mesh with current archaeological epistemologies. This leads to a dichotomy of ideals, and how we connect positivist results to the actual people of the past is crucial. For scientific results to have any validity in the archaeological discourse, results have to comply both with the archaeological record and link to what it is to be an embodied human. Still, many controlled experimental studies stop at their results without further contextualisation, thus falling into the trap of scientism. Additionally, experimenters look less to other forms of scientific experimentation that have humans at the centre, such as psychological experiments, as an alternative way to conduct an experimental protocol.

We suggest that all these scientific techniques are invaluable tools for experimental archaeology that can be taken into a human context, providing a synergy effect that can give innovative new results. This session seeks to explore how experimental archaeologists can apply science in a thoughtful way, without sacrificing the connection to people who lived, their bodies, minds, and knowledge of the world.

We invite speakers to present:

- Experimental studies that display thoughtful application of scientific results to a human context
- Theoretical/methodological approaches to the application of science in experimental archaeology

- The use of alternative, scientific experiment protocols

ABSTRACTS

1 USING EXPERIMENTAL ARCHAEOLOGY ALONGSIDE POST-HUMANIST-ONTOLOGY WHEN AIMING TO UNDERSTAND MATERIAL PROPERTIES, THEIR EFFECT AND AFFECT, AND THE PROCESS OF MAKING

Abstract author(s): Roy, Amber (Stockholm University)

Abstract format: Oral

Experimental archaeology has been used to assess a multitude of hypothesis and research questions and spans a broad range of applications, from quantitative lab-based approaches to those which are “real world” based.

Material properties will always affect the way an artefact was manufactured and used since aspects such as hardness, friability, and strength will influence the *Chaîne opératoire* and set boundaries for functional possibilities. Experimental archaeology and use-wear analysis, particularly when applied together, are valuable methods to assess events in the life history or itineraries of artefacts, such as episodes of manufacture, treatment, repair and use. Yet, we can go further, building upon such methods to add additional data on material properties which will contribute new strands of evidence. Such as, by carrying out experiments to test the effect of mechanical and material properties on the manufacture and use of artefacts.

Furthermore, the affect of material can also be understood experientially and theoretically, using practical experiments, such as when manufacturing an artefact. For instance, the application of experiential and ontological approaches, drawing on post-humanistic thought, has the potential to reveal the processes associated with the manufacture or use of artefacts as well as information about those people who interacted with them which is not easily available when applying traditional experimental archaeological methods and can be combined with data from the latter to gain a broader insight into the past.

This paper will use research on British Early Bronze Age stone battle-axes and axe-hammers and an ongoing project looking at Swedish Middle Neolithic B stone battle-axes to discuss a mechanical, experimental, experiential and ontological theoretical approach/es which combines both the major and minor sciences and aims to introduce new understandings of the effect and affect of certain artefacts through their material.

2 CONNECTING PAST AND PRESENT ACTORS THROUGH EXPERIMENTS AND SCIENTIFIC ANALYSIS: THE LATE NEOLITHIC WETLAND PEOPLE OF THE RHINE MEUSE DELTA

Abstract author(s): van Gijn, Annelou (Faculty of Archaeology, Leiden University)

Abstract format: Oral

Experimental archaeology is crucial to bring people of the past and the present together. This is especially so when we focus on the details of daily life, something that everyone can relate to: what kind of recipes did people cook, where could they have slept, what kind of things did they make and with which tools, and how did they move about the surrounding landscape to obtain food and raw materials? In the context of an interdisciplinary project we organize workshops in which both archaeological scientists, craftspeople and volunteers of the educational archaeological center of Masamuda near Rotterdam (Netherlands) are partaking and interacting (www.puttinglife.com and <https://exarc.net/cooperation/late-neolithic-houses>) (NWO AIB.19.020). During these experimental sessions we obtain ever more detailed and intimate knowledge about materials, technological processes and tools that could have been relevant in the past. By combining these experiences and insights with scientific approaches like microwear analysis of toolkits (flint, bone, pottery etc.), palaeobotanical research and organic residue analysis, we can come closer to how people lived in the past. This continuous dialogue between experiments (both quantitative and explorative) and laboratory analyses have led to detailed visualizations of past life in the Dutch Rhine Meuse delta during the Late Neolithic Vlaardingingen period, made by the team's artist. These visualizations are in turn inviting a continuing dialogue, both between present-day participants, but also with the people in the past, leading to a connectedness and empathy between past and present actors.

3 PROJECTILE AS PROBE -AN EXPERIMENTAL ARCHAEOLOGICAL PILOT STUDY ON THE ROLE OF PERCEPTION AND JUDGEMENT IN PROJECTILE POINT PERFORMANCE

Abstract author(s): Lundström, Fredrik (Stockholm University)

Abstract format: Oral

Projectile points are popular objects in experimental archaeological studies. Because of these studies, we have gained useful knowledge, especially on how function is constrained by point type. Yet, by their ability to capture subtle functional variables, new scientific techniques seem to make projectile experiments redundant. As a result of these techniques, digitized archaeological artefacts can be quantified and abstracted by various analytical procedures or simulated under controlled conditions. This data revolution appears to make archaeological experiments with idealised replicas redundant. However, for at least two reasons, the usefulness of data gained exclusively by digital techniques is very limited. Firstly, it is difficult to determine what minute point size and shape differences could have been meaningful in the situations where a projectile once was employed. Secondly, no simulation captures the almost unlimited number of variables that originally affected the point form. In common for both these problems is determining the role of environmental information processed by the persons that crafted and used the points in question. This paper addresses these problems through a pilot experimental archaeology study that combines, projectile delivery with psychophysics and cognitive psychology.

4 NEW APPROACHES IN EXPERIMENTAL AND COGNITIVE ARCHAEOLOGY

Abstract author(s): Lima-Olivera, Elena - Silva-Gago, María - Fernandez-Pestonit, Alba - Zaghi-Lara, Regina (INCIPIT, CSIC) - Blanco Rial, Manuel (University of Santiago de Compostela)

Abstract format: Oral

As the more traditional approaches to the study of human beings over time seem to be exhausted, new ways of exploring human behaviour are being developed, based on methodologies and techniques from disciplines such as neuroscience and psychology. For instance, eye tracking is applied in archaeology to investigate how material culture influences the way humans perceive the surrounded world. This method detects and measures eye positions, identifying the underlying patterns of visual behaviour based on the eye movement events, namely fixation and saccade system. Other applied techniques can be electroencephalography, which measures brain activity, and biometric sensing such as heartbeat or electrodermal activity. Therefore, the engagement of people to participate in experimental studies is needed in order to make inferences into the past. These experiments can reveal how humans construct inferences based on materiality that shape, and are shaped by, human cognition and action. In this sense, the behavioural response can be quantified and it can show changes that need to be contextualized according to the archaeological record. The XSCAPE project and the Material Minds Lab, funded by the European Research Council, constitute an example of this perspective. Through this combination of archaeological material and neuroscience, this project will provide the first fully integrated framework for understanding the cycles by which humans create and transform the landscapes, practices and artefacts that create and transform the human minds.

5 PAST AND PRESENT THROUGH THE LENS OF ACTIVE INFERENCE AND COMPUTATIONAL BIOLOGY

Abstract author(s): Valiño, Arturo (Instituto de Ciencias del Patrimonio - INCIPIT-CSIC, Santiago de Compostela) - Constant, Axel (Department of Engineering and Informatics, The University of Sussex) - Clark, Andy (Department of Engineering and Informatics, The University of Sussex; Department of Philosophy, The University of Sussex; Department of Philosophy, Macquarie University) - Criado-Boado, Felipe (Instituto de Ciencias del Patrimonio - INCIPIT-CSIC, Santiago de Compostela) - Martínez Otero, Luis (Instituto de Neurociencias de Alicante - CSIC-UMH)

Abstract format: Oral

Through the lens of active inference anything that opposes a resistance to the environment can be considered an adaptive system that reaches an equilibrium state with the environment by self-evidencing. This approach entails a formal approach to mathematically model cultural changes through time, where societies and material culture are, in essence, a reflection of each other.

We propose a theoretical framework that first models individuals, groups and societies as nested Markov chains that reach a dynamic equilibrium following active inference. And second, an experimental and simulated agent approach to understand what drives these changes. For this, a comparative cultural and biology approach becomes completely necessary. In short timescales, where functional brain dynamics adapt to the environment and can be measured using experimental techniques, an inter cultural approach is the way to understand the main parameters that drive changes through time. Therefore, to measure and understand physiologically what drives cultural changes, we propose the use of a combination electrophysiological measurements; EEG recordings, eye tracking and data from wearable

sensor modules under subjects interacting with past and present materiality. In long timescales, in analogy with the visual nervous system, a comparative biology approach enables to detect biological constraints that clearly relate the dependency of the context and genetic background in how and what operations the cortex performs across different species, and thus enables to infer how this neuronal circuits were biologically realized through time.

In conclusion, the comparison of the landscape and material culture (pottery, buildings and other materials found in archeological record) of past and modern humans, combined with our genetic background, is a perfectly valid framework to use an inter cultural and comparative biology approach to decipher what drives culture changes through time.

6 RIDING A HORSE - EXPERIMENTAL STUDIES PROVIDE NEW DATA ABOUT HORSE TACK IN THE VIKING AGE

Abstract author(s): Bagge, Merethe Schifter (Museum Skanderborg) - Nørgaard, Maria (Juelsminde Hestepraksis) - Pedersen, Anne (National Museum of Denmark)

Abstract format: Oral

A rare equestrian burial from the mid tenth century, Fregerslev II, was excavated in 2017 in eastern Jutland, Denmark. An impressive horse harness with hundreds of decorating fittings was found in the grave; in addition, the following laboratory micro-excavations revealed fragments of leather straps, fur and wood. The elaborate harness included a highly specialized bit, suggesting that the harness had not only been for display of wealth and status, but might also have had specific functional use enabling precise control of the horse.

To fully understand both the appearance and functionality of the harness, a project team including a researcher of Viking-age horse harness, the head of excavation and an equestrian veterinarian with both riding and experimental experience collaborated to reconstruct and test the harness.

Meticulous analyses of the preserved harness details and studies of contemporary depictions formed the basis of the reconstruction of the horse harness.

Using former research results of functional analyses and pressure tests of different types of modern horse bits, the function of the reconstructed bit was evaluated on a horse cranium and on a living horse, performing selected maneuvers with two different modern bits as reference. The maneuverability as well as the physical and behavioral reactions of the horse when ridden with the modern reference bits and the reconstructed bit, was closely evaluated and compared both by the veterinarian and an external professional rider.

This method of testing the functionality of specialized historical riding equipment has proved valuable on pilot study level in providing insights to the possible riding style and use of riding horses by the social elite in the Scandinavian Viking Age.

183 THE WHEEL HAS COME FULL CIRCLE: TECHNOLOGICAL CHOICE IN POTTERY PRODUCING COMMUNITIES OF CENTRAL AND NORTHERN EUROPE (100BC-800 AD)

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Borgers, Barbara (University of Vienna) - Willems, Sonja (Catholic University of Louvain; Museums for Art & History of Brussels) - Hawkins, Kayt (UCL Institute of Archaeology - ASE)

Session format: Regular session

This session aims to identify and assess the (dis)appearance of the pottery wheel as a technological innovation within central and northern Europe between 100 BC and 800 AD. As an important hub for trade networks, central and northern Europe is an interesting study region to assess how a technological invention, such as the pottery wheel, can alter society; why and how pottery wheel-throwing can be adopted by various craft communities and how important social interactions are in the assimilation of the new technique. In the case of central and northern Europe, the earliest as well as the latest stratigraphic contexts comprise both handmade and wheel-thrown pottery, yet the implications of such co-existing divergent technological traditions remain poorly understood. Why did some craft communities adopt the wheel-throwing technique, and why did others reject it?

While central and northern Europe is a valuable study region, a key objective of this session is to better understand the social interactions that facilitated technological knowledge transmission of pottery wheel-throwing within complex societies. Consequently, cross-cultural and cross-regional case studies outside the study region, which tackle the issue of how a technological innovation is assimilated in craft communities and assess the underlying dynamics and social networks, are invited. Research papers integrating theoretical perspectives on social interactions with compositional and technological studies, experimental archaeology or digital analytical tools are welcome. A comprehensive

reconstruction of pottery manufacturing processes combined with theory will permit to identify previously hidden social and dynamic networks of craft communities and highlight the connection between craft communities and society.

ABSTRACTS

1 USE OF THE POTTER'S WHEEL IN CHANGING SOCIO-ECONOMIC CONDITIONS OF THE LATE IRON AGE IN CENTRAL EUROPE

Abstract author(s): Ther, Richard - Mangel, Tomáš (University of Hradec Kralove)

Abstract format: Oral

The Late Iron Age covers the period from the beginning of the use of the potter's wheel in Central Europe to its temporary abandonment. During the period, technological novelties were evolving in the context of significant societal changes. The presented study compares the production of wheel-made pottery in three regions (central, western, and northwestern Bohemia, Czech Republic) with different settlement histories and changing socio-economic conditions. The analysis is focused on estimating the extent of application of the potter's wheel in the pottery forming sequence. It is based on a novel combination of the quantification of microstructure orientation in section analysis, computed tomography visualisation, and quantitative topographic analysis of the pottery surfaces. The discovered variability of pottery-forming methods is discussed in the context of the socio-economic development in the studied regions. The results indicate various mechanisms of cultural transmission which were at play in the evolution of technology in the Late Iron Age society.

2 OF POTS AND PEOPLE: APPROACHING SKILL, SETTLEMENT, AND EARLY ROMAN RURAL SOCIETY IN THE LOWER OUSE VALLEY, CAMBRIDGESHIRE, UK

Abstract author(s): Hudak, Eniko (Pre-Construct Archaeology Ltd; Newcastle University) - Sutton, Adam (MOLA Northampton)

Abstract format: Oral

A long and highly complex series of technological interactions characterises pottery-making in later Iron Age and early Roman southern Britain. Following its introduction in the later second or earlier first centuries BC, potter's wheel technology was used in diverse and highly socialised ways. Among communities who embraced it, the new technology became entangled with various novel styles of potting, some highly regionalised, as well as with other emerging technologies. In the decades after the Roman conquest of AD 43 these technologies began to manifest into archaeologically visible production sites, some of which were concerned with the production of specialised vessel types.

Conventional narratives of this period have tended to lean on economic factors and the direct impact of Roman conquest as interpretative frameworks, neglecting the study of social agency. This paper argues that we can do better. The authors will present analysis of the newly-discovered 'Lower Ouse Valley' potting complex (Cambridgeshire, UK), characterising pottery-making here as revealed through typological and archaeometric (petrographic, x-radiographic, and environmental) analyses. We will then contextualise the ceramic chaîne opératoire revealed by these analyses through a study of the structural remains of these first- and second-century AD pottery production sites, which were excavated as part of a single landscape-scale scheme of works. The result, we argue, is a rich understanding of how potting technology and technique continued to change several generations after the initial introduction of wheel technology, and even within communities who enthusiastically engaged with technological novelty. Key outcomes include the revelation of the heterogeneous ways in which wheel technology was used even in the production of a 'standardised' repertoire; the identification of different forms of technical knowledge, exchanged on multiple scales; and a consideration of how social and economic narratives may be more fruitfully interwoven in the study of ancient technology.

3 NON-DESTRUCTIVE SMALL-ANGLE NEUTRON SCATTERING (SANS) FOR THE DIFFERENTIATION OF WHEEL-BASED POTTERY FORMING TECHNIQUES: A CASE STUDY FROM 4TH-6TH C. PANNONIA

Abstract author(s): Gait, John - Bajnok, Katalin - Len, Adel (Centre for Energy Research, ELKH)

Abstract format: Oral

Differentiating wheel-throwing from other wheel-based forming techniques employed in pottery manufacture represents a significant technical challenge within archaeology. Composite techniques (e.g. 'wheel-coiling' / 'wheel-shaping'), in which a wheel is used to modify the shape or surface of initially hand-built forms, pose particular difficulties, as many of the physical characteristics of such forming (e.g. surface traces, vessel profiles) are difficult to differentiate from those produced by wheel-throwing alone. Attempts to utilise the orientation of objects (i.e. particles/voids)

within the fabric of vessels to differentiate wheel-based techniques (e.g. by thin section petrography or tomographic imaging) are also often hampered by the fine-texture of fabrics commonly used with such forming techniques, and/or by the desire to avoid destructive sampling.

To redress some of these difficulties, we introduce small-angle neutron scattering (SANS) as a non-destructive means of measuring the preferential orientation of micro- to nano-scale objects. Through extensive experimental studies we demonstrate that SANS may be used to differentiate a variety of forming techniques, including wheel-throwing, wheel-shaping (coiling+wheel), coil-building, and percussion-building/moulding.

The practical application of SANS is demonstrated with a case study of 4th-6th c. AD pottery from three archaeological sites located in the former province of Pannonia (Hungary). In the wider context of the disintegration of centralised Roman administration, the extent of social and economic continuity versus disruption and immigration, has often been measured in terms of the relative proportions of wheel-thrown (i.e. industrial, "Romanised") versus 'hand-made' (i.e. non-industrial, "Barbarian") pottery. However, such material dichotomies, may disguise more subtle changes occurring at this time, in which technological knowledge may have been transferred across apparent cultural/ethnic boundaries. Therefore, the ability to identify potential technological developments, such as composite forming techniques in particular, may in turn offer new insights into the nature of economic, social and cultural relations in late Roman / early Medieval Pannonia.

4 RECONSTRUCTING POTTERY FORMING PRACTICES AT THE MEDIEVAL TOWN OF UTRECHT, THE NETHERLANDS

Abstract author(s): Borgers, Barbara - Dockner, Martin (University of Vienna) - Griffioen, Arthur (Archeologisch Bureau Griffioen)

Abstract format: Oral

At the Medieval town of Utrecht, the Netherlands, potters manufactured ceramics between the 12th and the 15th centuries AD. Several workshops were located in the suburbs north and south of the Medieval town walls, along the Vecht and Vaartse Rijn Rivers. Potters used a fluvial clay for the manufacture of greyware and redware and seemed to have adopted different forming techniques through time: During the first production phase, they made greyware cooking jars by hand. Surface finishing applied at the leather-hard stage, however, obliterates the primary forming techniques of these jars. During later production phases, potters mainly manufactured wheel-thrown redware.

With the aim to reconstruct forming practices, this research combines observation of greyware and redware cooking jars at the macroscopic scale (e.g., visual inspection of surface features, X-ray microtomography) with examination at the microscopic and mesoscopic scales (e.g., grain and void orientation patterns in the cross-section of ceramic thin sections and scans of fresh breaks respectively). While the literature suggests that the change in forming techniques coincided with changes in users' households/domestic buildings, the results also permit to infer aspects of the organisation of pottery production at Utrecht during the Medieval era.

5 TECHNOLOGICAL CHANGE AND CONTINUITY IN POST-MEDIEVAL AND MODERN NUBIAN POTTERY FROM OLD DONGOLA

Abstract author(s): Franczyk, Boguslaw (Warsaw University, Department of Archaeology)

Abstract format: Oral

Quite a unique feature of post-medieval Nubian pottery is the disappearance of wheel made technology in favour of handmade pots on the one hand, and an increasing number of vessels forms and their multifunctionality on the other. Those technological changes correspond with political, cultural and economic changes in the region of Old Dongola. Nevertheless, some technological features and forms remain to modern times, indicating that knowledge transmission patterns have changed only partially. The major part of handmade pottery has been obtained during archaeological excavations in the Old Dongola citadel, within the ERC Starting Grant project "UMMA – Urban Metamorphosis of the community of a Medieval African capital city". The second part of the pottery has been collected during ethnographic research in the vicinity of the archaeological site.

For a better understanding of technological choices, the author decided to use a set of particular methods and analytical tools. Using thin-section petrography, traceological observations and thick-section analysis, diagnostic technological traces observed in macro-, mezo- and microscopical scale will be presented. The importance of thick-sections will be emphasized as a handy field method, which can provide a set of data for components orientation analysis in the vessels profile.

The author will also discuss the problem of asynchronous changes within the pottery assemblage, as observed in the disappearance of wheel made pottery and preservation of handmade pottery traditions – i.e., continuity and discontinuity of knowledge transmission. Technological changes, which are observed in ceramic materials, can be also perceived as a change in knowledge transmission, which corresponds to changes in society. Therefore, the constant

need for new tools and methods of analysis can improve our understanding of technological operations from the past, and following from this, the inference of a change or continuity within a society.

6 THE WHEEL-THROWING POTTERY AT THE BURIAL SITE IN OČKOV

Abstract author(s): Kalapáčová, Anna (Slovak Academy of Sciences)

Abstract format: Oral

In the village of Očkov located in South-Western Slovakia, a Germanic Urn burial site was excavated in the 50th. A large number of graves were destroyed in earlier periods, but the 245 graves were rescued (from stages B2/C1 to C3 of Eggers' Relative Chronology). It is assumed that more than 1,000 Urn graves may have been deposited in the burial site, making the Očkov burial site the largest Germanic necropolis from the Younger Roman period in Slovakia. Together with the nearby princely graves discovered at Krakovany-Stráže and the extensive settlement at Pobedim, it is evidence of the existence of an important Quadi economic and political center in the western part of Slovakia in this period.

In terms of the urn burial site is interesting to focus on the question of when the wheel-made pottery appeared as the urn in the Roman period in South-West Slovakia. Some of the graves show hand-made pottery as urns, others show wheel-made pottery. The main aim is to find the horizon of the beginning of the predominant use of wheel-made pottery as an urn. The main problem is the distinction between Roman-provincial pottery and domestic wheel-made pottery and the state of research with documentation of pottery workshops. The main arguments for a domestic origin are the common shape and ornamental features of plain Germanic pottery.

The paper summarized the problem of the wheel-throwing urns in Slovakia and point out some nuances with artifacts in particular graves and what role influences from the Roman provinces and Przeworsk culture played in this.

7 EXAMINING THE TRANSMISSION AND ADOPTION OF CERAMIC INNOVATIONS IN WESTERN ANATOLIA AND THE AEGEAN USING A CULTURAL EVOLUTIONARY FRAMEWORK

Abstract author(s): Alam, Christina (University College London)

Abstract format: Oral

During the Bronze Age, novel cultural traits were transmitted between potters in the Aegean, including pottery-making techniques that ethnographic research suggests were taught from parents to offspring. Following a phase of slow adoption, they were rapidly adopted in the context of palace/elite-consumed pottery. I investigate how geography, population size, and elite demand affected innovation adoption using cultural evolutionary theory and simulation models.

I simulate trait transmission through a network and explore 'toy' and 'realistic' models. Using toy models, I describe the dynamics emerging from the assumptions of the model, which incorporates the effects of travel costs, the local rate of innovation adoption (LRA, which serves as a measure of elite control over local adoption), population size, and random trait loss. Their outputs suggest that relative population clustering affects the shape of the adoption curve and that different combinations of travel costs, LRA, and population density result in spatial diffusion propagating along different types of wavefronts.

'Realistic' models are run on networks reflecting the Aegean's interesting geography, consisting of two land masses connected by an archipelago, with natural boundaries that create relatively isolated sub-populations; they additionally incorporate the effects of different landscape types and the location of the innovation's origin. Their outcomes are quantitatively compared to empirical adoption curves for the potter's wheel innovation and suggest that the location of origin can determine the shape of the curve, especially its position on the East – West axis defined by the land-masses of Greece and Anatolia.

The study showcases the potential of simulation modeling for addressing questions about cultural transmission using archaeological data. It shows that abstract models with empirically supported assumptions can be informative, even when the empirical data are recorded at varying levels of granularity and originate from a scholarly tradition resisting large-scale quantitative approaches.

MATERIAL WEALTH? NEW APPROACHES TO THE ARCHAEOLOGY OF SOCIAL INEQUALITY AND COMPLEXITY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Lawrence, Dan (Durham University) - Ortman, Scott (University of Colorado Boulder; Center for Collaborative Synthesis in Archaeology; Santa Fe Institute)

Session format: Regular session

Over the last decade, social inequality has emerged as a major research area in the historical sciences. New methods for assessing wealth and living standards from the archaeological record have been developed, from the use of Gini coefficients on artefactual and architectural data to bioarchaeological approaches to health and wellbeing. These have been marshalled to make comparisons at a variety of geographical and temporal scales, and to discuss the causes and consequences of inequality in a wide range of societies. Through this work, a series of tensions have emerged. Broad scale studies covering long periods and large areas have recognised a general trend towards increasing inequality over time, often correlated with societal scale and levels of social development (broadly conceived), leading some to argue that complexity and inequality are functionally linked. However, more detailed studies have identified significant variability within this general trajectory, including cases where inequality is low despite high levels of material wealth, population and/or population density, and periods where inequality has decreased.

In this session we seek to deepen understanding of relationships between inequality, scale, living standards, and institutions. All of these are contested concepts, and data relating to them are not straightforward to extract from the archaeological record. As a result, we also focus on methodological innovation. We seek papers which address one or more of the following questions:

- What are the strengths and weaknesses of quantitative approaches to inequality, such as Gini coefficients or cumulative distributions based on specific measures?
- What are good proxies for measuring living standards within and between societies?
- What social mechanisms have been responsible for increasing or reducing inequality in past societies?
- Are there general relationships between societal scale, social development, and levels of inequality? How strong are these relationships?
- What are the long-term consequences of social inequality for human societies?

ABSTRACTS

1 THE FARMING-INEQUALITY NEXUS, REVISITED: NEW INSIGHTS FROM THE GINI PROJECT

Abstract author(s): Bogaard, Amy (School of Archaeology, University of Oxford; Santa Fe Institute) - Cruz, Pablo (UE CISOR, CONICET-UNJu)

Abstract format: Oral

In this talk we revisit the hypothesis that farming systems where production is limited by heritable material wealth (such as land) are associated with higher persistent levels of wealth inequality than systems where production is limited by (free) human labour. In previous work on western Eurasia, expansive 'land-limited' farming systems facilitated by animal traction were found to be associated with higher sustained levels of household inequality than smaller scale farming systems reliant on human labour ('labour-limited'). New results from the ongoing GINI project (The Global Dynamics of INequality) expand the dataset on past household inequality in western Eurasia and in other world regions with very different agroecologies. We focus on case studies where archaeobotanical and/or preserved landscape features offer unusually clear insights into the nature of farming practice. These include remarkably intact agricultural landscapes in the southern Andes. In this cold and arid high-altitude setting, pre-Inka societies developed a form of labour-limited agriculture. This regime changed abruptly with Inka colonization in the 15th century to a form of land-limited agriculture through forced labour. This agricultural trajectory continued under Spanish colonial rule, introducing use of animal traction along with new crops and domestic animals.

2 SOCIAL PRACTICES AND INEQUALITY MEASUREMENT IN PRE-HISPANIC POLITIES: DIACHRONIC NOTES FROM SOUTHERN ANDES

Abstract author(s): López Lillo, Jordi A. (INCIPIIT-CSIC; Universitat d'Alacant) - Franco Salvi, Valeria L. (IDH-CONICET; Universidad Nacional de Córdoba) - Salazar, Julián (IEH-CONICET; Universidad Nacional de Córdoba) - Cruz, Pablo José (UE CISOR-CONICET; Universidad Nacional de Jujuy)

Abstract format: Oral

This communication seeks to explore political organization and dynamics from a comparative perspective over time, relying on three case studies which cover the so-called Formative (500 BC-AD 600), Regional Development (AD

1200-1450) and Late or Inca Periods (AD 1450-1550) in Northwest Argentina and South Bolivia. In each case, samples of several hundreds of residential units were used to calculate Gini coefficients; disaggregating them, additionally, by the different types of roofed and open surfaces within households. These analyses were then densified and put in perspective taking into account further archaeological records, as their crop fields, burials and other material indicators sensible to social inequality, in order to get a better understanding of each political configuration. As a result, it seems not only that, unlike those in Central Andes, the social processes that took place in this southern part led to the formation of agropastoral societies with low levels of centralization and wealth inequality during the Second Millennium BC, but also that the egalitarian polities of the First Millennium were far more complex and perhaps even internally competitive than assumed.

3 **SITES, SYSTEMS AND STATES: EXPLORING LONG TERM TRENDS IN WEALTH INEQUALITY AND SOCIAL COMPLEXITY IN ANCIENT SOUTHWEST ASIA**

Abstract author(s): Lawrence, Dan (Durham University) - Tumolo, Valentina (Università degli Studi della Tuscia, Viterbo; University of California, Berkely; Durham University) - Basri, Pertev - Chelazzi, Francesca (Durham University)

Abstract format: Oral

In this paper we seek to understand the relationship between wealth inequality and social complexity over the long-term in Southwest Asia. We apply Gini coefficients to house size and storage volume data to investigate trends in wealth inequality at a variety of temporal and spatial scales. We then compare these trends with those for a range of proxies commonly related to social complexity, including overall population, levels of settlement hierarchy and evidence for political centralisation and landscape modification. Our results show that inequality increased from the Neolithic to the Iron Age, with distinct regional trajectories. We see a step change in levels of inequality around the time of the emergence of urban sites in each region, but initially urban and rural sites were similarly unequal, suggesting that, outside the elite, the inhabitants of each enjoyed a similar range of wealth. The situation changes during the Iron Age, when inequality in urban environments increases and rural sites become both poorer in absolute terms and more equal. This coincides with a new level of landscape coordination and management, including an unprecedented phase of settlement dispersal and the construction of large-scale irrigation schemes. We therefore argue that the shift from inequality operating at a site scale to a settlement system scale may be related to the operational and integrative capacities of ancient polities.

4 **MONEY, MASS AND MEASUREMENT: OR, HOW CAN AN ARCHAEOLOGY OF QUANTIFICATION CLARIFY THE LONG-TERM DYNAMICS OF INEQUALITY?**

Abstract author(s): Green, Adam (University of York) - Wilkinson, Toby (University of Cambridge) - Wilkinson, Darryl (Dartmouth College)

Abstract format: Oral

Inequality is, fundamentally, control over other peoples' labour. It is much easier to control someone else's labour if you can monopolise the means of measuring it. This is why, in 1972's *Stone Age Economics*, the anthropologist Marshall Sahlins argued that it was the "instrumentalisation" of exchange that separated economies based on reciprocity from those based on trade. Or, in the neo-evolutionary typologies, quantification of exchange separated egalitarian economies from inegalitarian ones. It is ironic that at the same time as Sahlins argued that quantification created inequalities, "monetarist" economists argued that their governments should only use money to quantify an economy's supply. Their proposal was a dramatic break from Keynes' suggestion that sufficient money should be produced to quantify an economy's demand. A half century on, with inflation raging and inequality spiking, it is clear that the macro-effects of economic quantification remain only half-grasped (or conveniently forgotten). In the space between anthropology and economics we find a centuries-old debate about the source of money's value—is it the mass of material it represents, as believed by advocates of the gold standard? Or is it something else money quantifies? Is money a neutral entity or politically loaded? How far into the past does monetary behaviour go? Here, archaeology has an important role to play. The half century that has passed since Sahlins first published his typology has been marked by a substantial increase in archaeological data about how past human economies measured their material worlds. In discussing the origins of money and measurement, we theorise how different regimes of quantification have increased (and decreased) inequality over the millennia.

5 SIGNIFICANT CHANGES? THE DEVELOPMENT OF SOCIAL INEQUALITY DURING THE PREHISTORY IN THE CARPATHIAN BASIN

Abstract author(s): Wilkes, Fynn (ROOTS Cluster of Excellence; Christian-Albrechts-Universität zu Kiel)

Abstract format: Oral

Social inequality is often studied either on households or on graves. For Europe, there is a lack of quantitative studies that analyse the development of prehistoric social inequality on a larger scale with the help of established methods (Gini index). The Carpathian Basin offers the opportunity to study the development of social inequality between the Neolithic and the Bronze Age on a larger scale and on household and graves. The work presented here is an ongoing dissertation project that aims to examine the development of social inequality from the site to the local and regional levels and to discuss this development in relation to contemporary processes (settlement development, environmental changes, migration). The talk presents an analysis of two different types of wealth inequality, showing the development of material wealth inequality based on households and relational wealth inequality based on burials. In addition to a discussion of the changes in inequality and influencing processes over time, the talk will address the quantitative approach, its results and the consequences in dealing with often weak archaeological data sets.

6 ON THE MOUNDS OF INEQUALITY: WHAT BURIAL MOUNDS REVEAL ABOUT THE WEALTHY IN PREHISTORICAL CENTRAL EUROPE

Abstract author(s): Laabs, Julian (Kiel University; CRC1266) - Marzian, Johannes (Kiel Institute for the World Economy) - Müller, Johannes (Kiel University; CRC1266; ROOTS) - Requate, Till (Kiel University; ROOTS)

Abstract format: Oral

There is a growing literature on the development of inequality in prehistory. However, the overall picture is still fuzzy, as detailed evidence from many regions and periods around the world is still lacking. To help complete the picture, we created a dataset by coding rich information from archaeological records on single-funeral burial mounds in prehistoric Central Europe. The dataset contains about 5,000 observations and covers the period from 4000-0 BCE, with a possible temporal resolution of 200 years. Our analyses focus on a particular segment of the population – namely, the segment of those individuals who were buried in burial mounds. This societal segment, we argue, represents an upper part of the social wealth distribution, since the act of building a burial mounds shows the relational wealth and social capital of the deceased and its associated group necessary to mobilize labor and economic goods for such an endeavor.

Employing the volume of a burial mound as a proxy for the social wealth of a buried individual, we find an increasing trend in social inequality over time. The increase, however, is not linear and shows phases of significant increase, stagnation and decrease. Our results show that there is no clear relationship between social inequality among the upper societal segment and other trends in the population, except a general increase. For certain periods, changes in social inequality and changes in other proxy time series, representing population size (e.g. abundance of graves), climate events or sociopolitical organization (e.g. size of collective acting group, conflict), are identical, but there is no consistent pattern, yet.

With providing a time granular, big-picture overview of social inequality in the upper societal segment in prehistoric Central Europe, we could show that inequality among this segment seems to be decoupled from other trends in society.

7 BURIALS, LAKE DWELLINGS AND TRADE ROUTES. THE DEVELOPMENT OF SOCIAL STRUCTURES DURING EARLY BRONZE AGE AT THE CENTRAL ALPS

Abstract author(s): Brunner, Mirco (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research - OCCR, University of Bern)

Abstract format: Oral

This paper offers a detailed summary of the state of Early Bronze Age research in Switzerland between the Swiss Plateau and the alpine region and introduces important grave, hoard and settlement finds. During the Early Bronze Age a large number of rich Bronze Age burials appear in Western Switzerland often connected to the emergence of bronze metallurgy and the exploitation of local ore deposits. Those graves display burial costumes and include material culture, especially bronze artefacts, which shows close relations to trans-European way of expressing prestige and status. The development of bronze consumption during the three phases of the Bronze Age at the central Alpine Area will be discussed.

In the Pre-phase (BzA1), 2200 to 2000 BC, metal finds like oar-headed pins and daggers remain scarce. Only during the classic phase (BzA2) between 1900 to 1750 BC outstandingly wealthy graves can be recognized, like Thun-Renzenbühl. Considerably more graves occur; the first hoard finds are deposited at this time. Additionally,

gender distinctions in the burial rite become more regular and is visible in the burial equipment. The spatial extension and increasing density of settlements in prealpine areas and alpine valleys indicate the importance of the access to trade routes and resources. This development is backed by dendro and 14C dates from lakeshore and hilltop settlements. Between 1750 and 1550 BC gender-specific grave assemblages show strong contacts to Central Europe. The phenomenon of exceptionally well-equipped male graves is striking. It is discussed whether these are »young leaders« or assemblages of prosperous families.

Although we see an increasing rise in inequality in the realm of burial costumes the development of Alpine settlement dynamics, subsistence and metallurgy is a complex process that must not be subsumed to social evolutionist models of the evolution of hierarchical society.

8 QUANTIFYING HOUSEHOLD INEQUALITY IN MIDDLE HELLADIC GREECE

Abstract author(s): de Raaff, Yannick (Gothenburg University)

Abstract format: Oral

The Middle Helladic period (ca. 2000-1700 BCE) on the southern Greek mainland is generally considered a static period of relative poverty and isolation. It was kinship-based and egalitarian, with no monumental architecture or other expressions of wealth, until these societies rapidly transformed into ranked and competitive early Mycenaean polities (ca. 1800-1600 BCE). Recent studies have argued that this interpretation of Middle Helladic Greece is overly simplistic: change did take place, local communities were not disconnected from wider Aegean networks, and, although not visually impressive, a general increase in the durability, quality and complexity of construction of houses has been discerned. In this paper, I explore the notion of household inequality within these pre-Mycenaean communities.

My discussion is based on the comparison of Gini coefficient of a sample of ca. 100 domestic structures from the so-called Early Helladic III – LH I period (ca. 2200-1600 BCE) excavated across the Greek mainland. In particular, I explore the logic that governed the construction of the generally small dwellings that may explain the limited variation among them: is this a reflection of general poverty, the result of social rules that prevent ostentatious gestures, little community cooperation, small households, landscape limitations, or economic activities outside instead of inside the dwelling? Can house sizes in this time and place be taken as a solid indicator of household wealth?

9 SCYTHIAN BURIAL COMPLEXITY AND THE DYNAMICS OF CHANGE IN THE CLASSICAL PERIOD

Abstract author(s): Demina, Alisa (National University of Kyiv-Mohyla academy)

Abstract format: Oral

Though funerary customs are considered to be a rather conservative aspect of culture, the dynamics of their change often correlate with the agency the burials possess. The political significance of Scythian kurgans and their “ancestors” is well-illustrated in Herodotus’ description of the Persian invasion, but most importantly, has been explored archaeologically through the complexity of the mortuary practice. A particular example is the series of major events in the Scythian burial rite between 500 and 300 BC that are mainly associated with the emergence of “Princely” barrows in the Pontic Steppe region. This research aims to contribute to the question of whether their funerary display of power reflected the corresponding change in wealth distribution.

It primarily focuses on the two neighboring groups of kurgans in the Northern Azov sea region: the basins of Molochna and Kalmius rivers, where several necropoleis functioned during the entire Classical period. To examine the interaction between the sites and measure the impact of centralization on the regional kinship difference the social network analysis along with the traditional grave wealth indices are used.

The dataset for the study consists of funerary assemblages that contributed to the organization of the burial space, with the body of the deceased as its literal and metaphorical center.

Grounded in decades of field research, this study suggests a relatively small-scale perspective on the Scythian burial rite before its eventual downfall.

10 DYNAMICS OF INEQUALITY, PAST AND PRESENT: HOUSING IN ROMAN BRITAIN AND THE CONTEMPORARY UNITED STATES

Abstract author(s): Ortman, Scott (University of Colorado)

Abstract format: Oral

There is a rich and growing literature that uses the archaeological record of housing to investigate the emergence and consequences of inequality in past societies. Two issues that have not been addressed thus far are: 1) the degree to which variation in housing mirrors patterns of inequality in asset values and incomes in present-day societies, and 2) whether notions of trade-offs between inequality and growth in contemporary economics reflect general dynamics that characterized pre-capitalist societies as well. In this paper I address both issues. I first examine relationships be-

tween house areas, house values, and household incomes in the contemporary US using real estate and census data. Then, I examine a database of housing information for Roman Britain to examine the relationship between inequality and development over time. Results show: 1) that inequality is a system-level property that can be estimated using data from a simple random sample of settlements; 2) that house areas generally under-represent levels of inequality based on asset values and incomes; and 3) that increasing inequality in Roman Britain was associated with substantial improvement in the material conditions of life for most households. Together, these results suggest archaeological data can in fact capture the dynamics of inequality in ways that are potentially helpful for the present and future.

11 SOCIAL NETWORKS, INEQUALITY, AND THE HOUSING STOCK OF POMPEII

Abstract author(s): Hanson, John (University of Oxford)

Abstract format: Oral

Over the last few years, there has been significant interest in using the architectural characteristics of domestic structures, such as the total footprints, the numbers and diversities of rooms, and the interior decoration of residential units within Pompeii and Herculaneum as a proxy for social and economic inequality, revealing a much larger group of middling consumers than has usually been acknowledged. One of the problems with this approach, however, is that it has tended to ignore the wider social networks of the inhabitants of these structures. In this talk, I will use a combination of recent theoretical work on urban systems and existing empirical data to re-evaluate the evidence for the housing stock of Pompeii. This reveals previously unrecognized patterns, which not only raise interesting questions about the interrelationship between social networks, systems of patronage, and domestic architecture, but also complicate the latter's use as a proxy for living standards and inequality.

12 THE LIFESTYLE OF THE MEDIEVAL NOBILITY FROM 800 TO 1500 IN EASTERN SWITZERLAND

Abstract author(s): Hutter, Iris (Amt für Archäologie Thurgau; University of Zurich)

Abstract format: Oral

The standards we use today to measure comfortable living or housing are most likely not the ones that medieval society used. It is difficult to guess what is appropriate to one's social rank in a certain time period, because we tend to judge categories such as comfort, defensive use, representation or remarkable construction solutions by different standards than contemporary witnesses. In addition, the indicators for wealth or nobility in society varied regionally.

To find out more about the needs and associated standards of living of nobility in specific periods, an analysis of three castles was conducted: Altenburg, Castle Klingen and Castle Altenklingen (Switzerland). They stand or stood in short distance of each other and, as the research revealed, were built in successive periods during the Middle Ages. An old castle was abandoned in order to live in a newer or to build the newer castle.

This base offers a good ground to evaluate standards for nobility, in best-case measure wealth of the owner of each castle in a similar setting but different time. The results indicate that nobility showed their wealth and power in many different ways throughout time. Even though the requirement to have a residence befitting one's rank remains the same and the period under investigation is relatively narrow, the changes in the understanding of comfortable living and representation are remarkable. Some symbols of nobility developed early on out of need (like the tower of a castle) were reproduced as the standard for a castle for many hundred years, even if their actual purpose of use was completely lost. Many more results of the research show that wealth and nobility showed themselves in many more facets and make it clear that individuals but also communities of a larger region, valued and understood same or similar symbols as wealth.

13 ARCHITECTURAL INEQUALITIES - SPATIAL DISTRIBUTION OF WEALTH IN PREINDUSTRIAL CITIES IN CENTRAL EUROPE

Abstract author(s): Legut-Pintal, Maria (University of Wrocław) - Grosel, Mikołaj (Faculty of Architecture - Wrocław University of Technology)

Abstract format: Oral

In Central Europe traditional studies of urban architecture were focusing on artistic quality and functional changes of the house layout. Synthesis are usually limited to the most interesting buildings. Very rarely it is possible to characterise urban housing as a whole phenomenon. Most studies about inequality in pre-industrial society are based on written sources - mainly tax records. We would like to discuss some limitations of methods of evaluating inequalities, such as the Gini coefficient based on tax records and analysis of living space area in the case of preindustrial cities in Central Europe.

In our studies we test a model of wealth distributions based on analysis of houses based on written, architectural and archaeological sources and iconography. We developed a method of evaluating the city's residential space, in which location (quality of neighbourhood), architectural quality of the building (elements of art, building material, structural

complexity) and access to the facilities were identified as the main factors of the utility value of the real estate. We verify the accuracy of the proposed model against tax records. The result suggests that it is possible to simulate distribution of wealth in the cityscape based on other indicators. Taking a problem of comparing wealth distribution in different towns, we assume that the scale of inequality may depend on the size of the city. The ways in which luxury is spread is correlated with urban morphology and cultural and political context.

14 TRACING INEQUALITIES THROUGH MATERIAL CULTURE. POST-MEDIEVAL AND CONTEMPORARY ARCHAEOLOGY FROM "SCATTERED FINDS" TO "TOTAL CONTEXT"

Abstract author(s): Sawicki, Jakub (Institute of Archaeology of the Czech Academy of Sciences in Prague)

Abstract format: Oral

The subject of social inequality is very closely related to issues such as quality of life, material wealth or differences between the "standard" and "luxury" of archaeologically recorded material culture. The terms mentioned are of course not the same and cannot be used interchangeably, but they have many points in common and the research questions which can address them are also quite similar.

The experience provided by the archaeology of large urban centres, rich in complex contexts dating back to the Middle Ages, and the abundance of historical sources, sometimes difficult to correlate, shows the need for developing new methods in understanding and dealing with material culture from a very dynamic environment.

This paper aims to discuss some observations concerning the possibilities of analysing large assemblages of material culture to study the changes and complexities of social relations regarding luxury, standard and poverty leading to further understanding of the quality of life as well as tracing the inequalities. It focuses on two case studies. The first one concerns the interpretation of "scattered finds" from urban excavations of medieval and early modern Prague (Czech Republic) and Wroclaw (Poland), large urban centres of historical significance. The second is a test of these concepts which aims to analyse the material culture acquired during surveys at the contemporary, "living" flea market while the entire "total" context of those items is theoretically known.

15 INEQUALITY WHERE, MARGINALITY WHERE. METHODOLOGICAL REFLECTIONS ON CONCEPTS AND SOCIAL RELATIONSHIPS FROM THE MEDITERRANEAN MOUNTAIN (17TH-21ST C.)

Abstract author(s): Stagno, Anna Maria - Tacca, Matteo (University of Genova - Laboratory of Environmental Archaeology and History) - Di Tullio, Matteo (University of Pavia) - Bizzarri, Giulia (University of Genova - Laboratory of Environmental Archaeology and History)

Abstract format: Oral

In 1972, with his "Stone age economics", with the idea of "original affluent society" Marshall Sahlins allowed to develop a first complex discussion around the meaning of complexity, inequality and wealth. What after more than 50 years still remains effective is the possibility to avoid deterministic and mechanistic explanation, when considering that each one (as many others) of these concepts needs to be contextualised to be used and, thus, to become helpful in our historical enquiries. While this statement seems quite obvious, less obvious could become in the dialogue between disciplines and analytical perspective. Inequality is not a concept univocal, but depends from the comparison we make and the relationship we explore in our investigation, and depends also by the different documentary series we take into account.

By comparing investigation carried out in the mountains of southern Europe which made it possible to analyse, with a micro-analytical perspective, the transformations of different rural hamlets between the 17th and 21st centuries, this paper aims to reflect on some possible key issues. Inequality as a concept becomes intelligible when social groups and collectivities are considered in relation to each other, so which are the relationship and the distance we take in account? If objects create social relationships, and there are no relationships without objects, the different uses of objects is enough to explore the complexity of the "inequality"?

16 EXPLAINING VARIABILITY IN WEALTH INEQUALITY: REFLECTIONS FROM THE GLOBAL DYNAMICS OF WEALTH INEQUALITY (GINI) PROJECT

Abstract author(s): Kohler, Tim (Department of Anthropology, Washington State University; Santa Fe Institute; Crow Canyon Archaeological Center; Department of Archaeology, Durham University) - Bogaard, Amy (School of Archaeology, University of Oxford; Santa Fe Institute)

Abstract format: Oral

One of the methods for assessing the causes of change in any particular cultural-historical sequence is to see if the factors purporting to drive change in one sequence are equally potent in other sequences where their contexts (the other salient variables) may be quite different. Such cross-cultural approaches were quite common in the mid-twen-

tieth century, though applied more typically to ethnographically known societies than to the long-term sequences of change available to archaeology. Here we apply this logic to understanding the causes for variability in rates of change in wealth inequality through time using Gini coefficients calculated across size distributions of contemporaneous houses from a dozen world regions as our main measure of inequality. These data have been assembled by the members and partners in the GINI (Global Dynamics of INequality) project, sponsored by the Coalition for Archaeological Synthesis, managed through the Center for Collaborative Synthesis, and funded by the US NSF.

185 THE AGENCY OF VALUE IN ARCHAEOLOGICAL HERITAGE

Session theme: 3. Heritage Narratives and Representations

Session organisers: Barreiro, David (Institute of Heritage Sciences - Spanish National Research Council) - Díaz de Liaño, Guillermo (MOLA - Museum of London Archaeology) - Pastor Pérez, Ana (Norwegian Institute for Cultural Heritage Research - NIKU; University of Barcelona) - Robson, Elizabeth (University of Glasgow) - Watson, Sadie (MOLA - Museum of London Archaeology)

Session format: Regular session

Ideas of value have become key elements in debates within heritage-related disciplines, and particularly archaeology. There is an abundant and diverse literature on how social value, as opposed to supposedly non-social value, can be created, circulated, or challenged. Similarly, there is growing consensus on the need to not only understand how people engage with archaeological heritage, but also to reflect a far greater diversity of experiences and values in place-based policymaking and heritage management processes. These debates have profound consequences for the nature of archaeology in practice (e.g., the development of fields such as public archaeology) and theory (e.g., how we conceptualise archaeological heritage and value, as well as their agency).

This session will explore a diverse range of archaeological projects and the different ways in which they (re)produce and circulate value. We are particularly interested in contexts where different actors are working collaboratively in archaeological heritage-making processes (from planners and those in the construction industry, to policy makers, residents, landowners, and interest groups, to academic and commercial archaeologists, conservators and heritage managers) and how these actors express and negotiate their potentially differing values in practice. Is value itself an actant in these networks, with the capacity to catalyse or direct management processes? Are all values considered equally, and how might analysing discourses on the value of archaeological heritage help move us towards more open, participatory, sustainable, and socially transformative practices?

The aim of this interdisciplinary session is to provide a space for dialogue on how we understand the networks of value created through archaeological heritage-making processes. Papers are invited that explore theoretical, strategic, and/or methodological approaches to the concept of value. Case studies may be drawn from, but are not limited to, community projects, citizen science, community museology, public archaeology, heritage management, research projects, commercial archaeology, and conservation.

ABSTRACTS

1 AGAINST A DISCOURSE BASED ON VALUES. DISPUTES AND ARCHAEOLOGICAL HERITAGE

Abstract author(s): Corpas, Nekbet (Universidad Complutense de Madrid; Instituto de Historia-CSIC)

Abstract format: Oral

Discourses based on the values of archaeological heritage are key to justify legal protection, public spending and management of heritage. Academic works list multiple values of archaeological heritage: historical, scientific, aesthetic, economic, symbolic ... Values may be understood twofold (Mason and Avrami 2000; Avrami and Mason 2019): on the one hand, they are positive qualities attributed to archaeological sites and objects by heritage law, administrations and some agents (traditionally scientific/material/aesthetic); on the other hand, they refer to principles or ideas that help in guiding the actions of people/institutions. Understood as general principles, they open the chance to approach archaeological heritage beyond traditional views, yet, as those authors have observed, they are normally viewed as qualities. An incompatibility of opinions between groups on the value of archaeological heritage is recurrently identified in international documents on cultural heritage as the main cause of disputes in the field. However, a research into the disputes in different cultural landscapes suggests that the discourse on the values of archaeological heritage management frames these conflicts in a way that excludes non-archaeological issues from the debate (e.g. environmental concerns, the economic merit of a proposed project, social attachment to a site or challenges between different governmental departments). A focus on the values of archaeological heritage prevents discussing and addressing the motives of the parties involved in archaeological disputes and may narrow these conflicts to pure technical issues (e.g. how to excavate an archaeological site). Drawing on the research of several cases of collaboration between heritage

authorities and civil society organizations/individuals, the appropriateness of the concept of heritage values is put into question for contexts of archaeological disputes.

2 DISCUSSING THE VALUES OF ARCHAEOLOGICAL HERITAGE WITHIN THE FRAME OF PUBLIC ARCHAEOLOGY

Abstract author(s): Pastor Pérez, Ana (Norwegian Institute for Cultural Heritage Research - NIKU; Institute of Archaeology, University of Barcelona - IAUB; Universitat Autònoma de Barcelona - UAB) - Frascella, Selene (Universitat de Barcelona - UB; Institute of Archaeology, University of Barcelona - IAUB)

Abstract format: Oral

This paper aims to discuss how heritage values linked to archaeological practice, and more specifically to a more public or community-based approach, are conceptualised and used in decision-making strategies. These values have mutated and evolved along with the ontological shifts that archaeology has gone through, moving from monolithic, elitist, and positivist categories to others that are more dynamic, social, and interpretative. In this sense, archaeology has become an active agent that collaborates to respond to current societal challenges and social sustainability. This is especially visible in public and community archaeology projects.

In this paper, we will relate these thoughts to two case studies, one urban and one rural: the Fabra i Coats Recint (Barcelona) and the Cardboard Hospital of Capdella (Lleida). Two non-archaeological sites related to industrial heritage that have been analysed through participatory archaeological ethnography. This results in the emergence of a series of multi-temporal values that confer on the same place or object multiple meanings and significance. The otherness connected with these new inclusive heritage values developed through participatory strategies, which represent peripheral discourses through multivocal narratives, will inspire new connections with present-day voices, disrupting the hegemonic paradigm of traditional values. The risk, as always, is that we do not revert to the authoritarian nature of our expert vision, thereby breaking the chain of agency at its source.

Therefore, the goal of this research is, on the one hand, to talk about how ideas about archaeological value and heritage have changed over time and what those changes mean for community archaeology. On the other hand, it pretends to look at what strategies we are using to improve a grassroots social value in which all community voices will be heard in decision-making.

3 BEYOND THE HERITAGE VALUE CHAIN

Abstract author(s): Barreiro, David (Incipit - Institute of Heritage Sciences)

Abstract format: Oral

The value-chain model has long guided the research, management and dissemination processes of cultural heritage, both explicitly and implicitly. This model was defined in Spain during the mid-1990s, when heritage became a significant element for a sector of post-processual archaeology.

The original value chain model proposed combining the production of knowledge and its transfer to the environment, in the form of heritage, thus expressing a one-way concept. It contained different evaluative instances regarding heritage entities: their informative value, their heritage value and their social value. In such a way, it was adjusted to the means of knowledge production and innovation of those days.

Over the last thirty years, the emergence of a new heritage paradigm, oriented towards participation and social value, has led, on the one hand, to the generation of new heritage realities. On the other hand, this new paradigm is in line with the emergence of citizen science and community archaeology and the involvement of social agents in processes of knowledge production.

Furthermore, research continues to generate different axiological models, all of which point towards a complexification of the value systems which come into play in heritage activations. In addition, the growing need to integrate heritage management with landscape management as a biocultural environment generates even more complex axiological models.

These changes imply the necessity to update the value chain model in the ontological, epistemological and axiological planes. In this presentation, we shall seek to exemplify this process by way of a case study situated in Uruguay.

4 EXPLORING A LINK BETWEEN LOCAL AND ARCHAEOLOGICAL VALUES: A CASE STUDY FROM OLD DONGOLA, SUDAN

Abstract author(s): Fushiya, Tomomi (University of Warsaw)

Abstract format: Oral

Social values are often discussed as opposed to other non-social values such as archaeological value(s). Placing these two as opposition may risk missing an opportunity to explore relations between different values, or a possibility of in-

teraction between them in a heritage-making process. Efforts in participatory archaeological heritage projects at Old Dongola, Sudan, has developed a path way to explore how different values of an archaeological site could be brought together and gradually shift the narrative of a place.

Old Dongola archaeological site has been known as the capital of the Medieval Nubian kingdom, Makuria. Archaeological investigations at the site in the past fifty years have largely dedicated to the Medieval period (6th to 14th century CE), especially Christian remains (e.g. churches, monasteries). Yet, the history of the site goes further into the post-Medieval Islamic period and continues on up to today. Local communities who are all Muslims are direct descendent of the former residents of Tungul (Old Dongola) and the cemetery is still in use as a burial ground and a place of ceremony. Nevertheless, these links between the past and present, archaeology and communities, did not draw scholarly attentions and unexplored for a long time. Archaeology and communities were separated in the narrative-production and the knowledges of each other until recently.

Two new research projects; one focused on archaeological investigation of the Islamic period and the other carried out community engagement and ethnographic studies that were instigated in 2018 and 2019, brought more conversation opportunities about the lands, ancestry, archaeology and heritage between archaeologists and local communities. This paper discusses the ongoing collaborative heritage-making process with focuses on what has been learnt so far, and what changes and challenges it brought to the values of the place and human relationships.

5 LEVELS OF SIGNIFICANCE: PROMOTING VALUE AT THE PREHISTORIC TELL OF VÉSZTŐ-MÁGOR

Abstract author(s): Seifert, Jerrod (Cardiff University) - Lingle, Ashley (University of York) - Gyucha, Attila (University of Georgia) - Duffy, Paul (Kiel University) - Parkinson, William (Field Museum; University of Illinois - Chicago)

Abstract format: Oral

Values shift over time. To be sustainable, values need to be adaptable, which creates a challenging paradox for site managers who need to preserve the past, serve the present, and safeguard for the future. The team working to re-invigorate the archaeological site of Vésztő-Mágor, Hungary, is attempting to recognise the benefit of blending interdisciplinary perceptions of value in their approach of safeguarding the site. This multi-year program aims to stabilize, preserve, and rejuvenate the exhibition of a unique, in situ trench excavated into the largest tell on the Great Hungarian Plain. Drawing insight from archaeologists, conservators, engineers, site managers, and working with the local community, the project looks to create a dialogue of meaningful presentation strategies for the site. Project phases include conservation and stabilization throughout the trench and the built shelter, climate control with environmental monitoring, and finally a visitor interpretation program to rejuvenate the exhibition. The key aim of the project is to help ensure the site is preserved as a thriving center for local identity and regional congregation. The team looks to achieve this through collaborative approaches to enhancing visitor experience and attracting more visitors. This paper discusses the successes and challenges of the initial foundations of the project and stabilization program. While it is recognised that despite having different and often conflicting purposes, archaeological research and conservation are deeply intermingled in the preservation of future knowledge, and this project looks to take a further step in inclusive practice through understanding value in a broader perspective. In this context, focus on communal and evidential values in initial project phases is used to support later stages of engagement focusing on evidential and historical values of this incredible piece of heritage.

6 RETHINKING THE ROLE OF SOCIAL VALUE IN HERITAGE CONSERVATION: PERSPECTIVES FROM CHINA

Abstract author(s): Gao, Qian (Durham University)

Abstract format: Oral

This paper addresses the lack of understanding of the interaction between social value and conservation interventions. Value-based approaches, primarily promoted by nation-states in the global north, have become an internationally accepted heritage conservation paradigm. The recognition and growing emphasis on social value have been a major development of the paradigm over the last three decades. Social value refers to the associations and meanings that a place of heritage holds for a specific community. Through the 2015 revision of the China Principles, China is one of the global south nation-states that has recently embraced 'social value' in its heritage conservation practices.

Although social value is given equal weight in heritage conservation to the 'three major values (historic, scientific, and aesthetic)', we know surprisingly little about the relationship between social value and the agents that physically interfere with heritage objects. The core premise is that the material constituting a heritage object, as well as the transformations it undergoes over time, is essential to the social values associated with the object. Material durability, ageing signs, and the resulting patina all contribute to the perceived qualities that underpin social values. Changes in

the physical sphere can thus alter people's understanding and experience of the object, enhancing or diminishing the meanings that they project onto it.

Using the Dazu rock carvings, a UNESCO World Heritage site managed as a museum in southwest China, as a case study, this paper aims to understand how conservation practices have influenced, and been influenced by, the social values attributed to heritage objects and sites. It focuses on the recent renovation of Dazu's 800-year-old thousand-hand bodhisattva rock statue, a national project that has sparked controversy due to the conservation methods used to preserve its social values.

7 AN ETHNOGRAPHIC VIEW ON HOW 'VALUE(S)' ARE CONCEPTUALISED, PRODUCED AND CHALLENGED IN DEVELOPER-LED ARCHAEOLOGY

Abstract author(s): Díaz de Liaño, Guillermo (MOLA (Museum of London Archaeology))

Abstract format: Oral

This talk will explore, from an ethnographic perspective, the production and conceptualisation of 'value(s)' in the context of developer-led commercial archaeology in the United Kingdom.

It will analyse the different ways in which value is produced within the network of relationships, stakeholders and processes that constitutes developer-led archaeology. It will also reflect, from the situated perspective of archaeology, on how we can navigate, influence and challenge those networks to produce 'better value(s)', or value(s) that align with our goals.

Among the key elements contributing to this networks of 'value(s)', some of the central ones that will be analysed in this talk are 1) the structural conditions of the networks, paying particular attention to the agency of the stakeholders involved, and 2) the communicative process between the stakeholders, which includes not only the interactions between archaeologists and developers, but also the interactions within each discipline during the different stages of the process, and the channels and styles of communication.

8 ANTI-SOCIAL BEHAVIOURS: THE STRUGGLE TO CREATE SOCIAL VALUE THROUGH DEVELOPMENT-LED ARCHAEOLOGY

Abstract author(s): Watson, Sadie (MOLA)

Abstract format: Oral

The development-led, or preventive, system of archaeology is the structural enabler of archaeological work across Europe and beyond. We have often discussed the problems inherent with taking economic value as a primary focus for decision making, and how the onus on cost-driven work can reduce the capacity for research and public participation. Recent advances in policy and practice are helping to steer some projects away from this as the main consideration, but it persists, and realistically we observe movement away from the lowest price being chosen only at glacial pace. The primary aim of many archaeological contractors still appears to be satisfying commercial customers, so how can we square that with the need to embed sustainability for communities or encouraging the inclusion of social value into project design and implementation. This paper will take a critical look at some examples from the UK, consider whether the social value argument is too radical for the sectors that we work within, provide a theoretical underpinning for the addition of values into the process, and suggest how we could enforce our beliefs in social value in situations where the opposite (antisocial value) is being produced.

9 SHARING THE KNOWLEDGE TO PROMOTE THE VALUE OF UNLISTED ARCHAEOLOGICAL HERITAGE IN ESTONIA

Abstract author(s): Kaldre, Helena - Lillak, Anu (Estonian National Heritage Board)

Abstract format: Oral

In recent years, several successful cooperation projects have been initiated by the Estonian National Heritage Board to acknowledge and consider the value of unlisted archaeological heritage. This paper aims to explore the relationships among different local and national management bodies and their joint work in the protection of different archaeological sites and how the exchange of information shapes new values about archaeological heritage.

In the process of renewing the comprehensive plans by the local municipalities, the collaboration with the National Heritage Board has resulted in the latter to giving information and input about the archaeologically sensitive areas where sites are not listed but known. The municipalities are encouraged to take these areas into account in spatial development projects, although they are not legally obliged to do so. Although there has been some resistance from the municipalities, more and more of them have started using the information to enhance the planning process and to know better when archaeologists should be involved.

Cooperation between the National Heritage Board and Transport Administration is a good example of successful intergovernmental information exchange. Due to several unexpected archaeological discoveries during road construction projects, the Transport Administration has decided to include an archaeological survey in the planning process for major motorways. The goal is to be able to minimise “archaeological surprises”, but also to plan the construction process with archaeologists for a smoother journey.

These examples demonstrate that the value of archaeological heritage and its recognition are heavily reliant on information sharing. The information about unlisted heritage sites is not made public in Estonia because of the potential threat of looting. However, in the situation where legal protection of the sites is a slow process, the choice to strategically share some of the information can be an effective measure of protection.

10 TANGIBLE PUBLIC BENEFITS OF DEVELOPMENT-LED ARCHAEOLOGY: A FRAMEWORK FOR COLLABORATION?

Abstract author(s): Sloane, Barney (HE - Historic England)

Abstract format: Oral

The relationship between public value and public benefits of archaeology is significant when considering the management of our archaeological resource. One way of looking at this relationship is that tangible benefits of archaeology combine to create the value which society recognises, and thus continues to support through its legislation and policies. The European Archaeological Council (the organisation of state archaeological heritage managers in Europe) are developing a basis for promoting a wide range of public benefits which development-led archaeology can bring. Some are well-known – creating knowledge of the past, recovering cultural treasures for display and research. Others are less well developed (the contribution archaeology makes to other scientific disciplines). This paper will outline these benefits, and set out why EAC believes realising them helps to demonstrate that archaeology should not be seen as a costly burden but as a net gain for the state in which it operates. It will underscore the importance of clear recognition of the value derived from these benefits by decision-makers, developers/investors, archaeologists and the wider public. We hope this will sustain Valletta principles and maintain strategic support for development-led archaeology, avoiding legislative and policy shifts which could have unintended, significant consequences. It will also offer and invite some general thoughts about how to embed their consideration into early planning for excavations.

11 BEYOND ‘HARVESTING’: UNDERSTANDING BIAS IN SOCIAL MEDIA RESEARCH ABOUT HERITAGE VALUES

Abstract author(s): Bonacchi, Chiara (University of Edinburgh)

Abstract format: Oral

This paper discusses differences and bias in assessments of heritage values that are based on social media research. In the last few years, there has been increasing consideration of social media websites as fields where interactions with the past can occur and be examined, qualitatively or in automated ways. Existing literature has analysed cultural, social and political values associated with tangible and intangible dimensions of the past on sites ranging from Twitter, Flickr, Facebook, and Instagram to eBay and YouTube. However, there has not been, so far, a focused and empirically evidenced reflection on how heritage values relating to the same heritage ‘thing’ emerge from different social media environments. Such a study is of essential importance to account more effectively for the variabilities and injustice that can derive from research approaches that a-critically analyse heritage values by harvesting data from specific social media sites. This important issue will be addressed by reflecting on the multi-platform social media research undertaken on the social values associated with a specific heritage place, the area once occupied by the Old Gas Works in North Canongate, in the city centre of Edinburgh, UK. The study was conducted as part of the Deep Cities project (2020-22), which aimed to develop value-based methodologies to guide the curation of urban heritage transformations across Europe. Examining how injustice is embedded in knowledge production about heritage is of particular importance when it informs decisions on themes of public interest such as conservation and urban planning.

12 VALUED AND VALUES: AN EXPERIMENTAL RE-EXAMINATION OF LOCAL TRANSFORMATIONAL HERITAGE DATASETS

Abstract author(s): Boardman, Claire (University of York)

Abstract format: Oral

Between 2018 and 2020 designed ethnographic interventions (Mounajjed & Walker, 2007) were completed in two inner-urban neighbourhoods; areas characterised by the repetitive utilitarian architecture of late 19th century/early 20th century worker housing and diverse, often highly mobile populations and other place based stakeholders.

Encompassing multiple communities and phases of local, transformational heritage engagement, several local participant events ran over a 9 month period followed by an additional 6 months of remote monitoring to evaluate longer term impact and legacies. These longitudinal studies generated a large amount of qualitative data in multiple output formats including: hand-drawn cognitive maps, heritage-led digital stories and workshop and interview transcripts.

This paper presents an initial, experimental step in a re-examining of this existing rich and comparative data resource through a 'value lens'. Through the application of the 'Pen Portrait' analytical technique (Sheard & Marsh, 2019) to create a chronological view of individual participant interactions before applying a close reading narrative analysis to ask the core question: what elements are valued here and what values are being invoked? and further, how/if these differ between stakeholder groups and/or change over time.

Key findings and insights from both the data analysis and the overall approach will be discussed along with potential avenues for future research including its application at scale and intelligent machine support.

13 THE CONTEMPORARY VALUES OF LANDSCAPES OF DIFFICULT HERITAGE: THE CASE STUDY OF THE SITE OF NATIONAL REMEMBRANCE IN ŁAMBINOWICE, POLAND

Abstract author(s): Pawleta, Michał (Adam Mickiewicz University in Poznań) - Kobiąłka, Dawid (University of Łódź)

Abstract format: Oral

Since June 2022, the Central Museum of Prisoners-of-War (Poland) has been carrying out a multidisciplinary research project entitled Science for the Society, Society for the Science at the National Memorial in Łambinowice (former Lamsdorf). From the second half of the ninetieth century, various types of PoW, displacement and forced labor camps functioned in the village of Lamsdorf and on its outskirts. The applied methodology combines historical, archaeological and ethnographic methods to map material remains of the camps that have preserved until the present as well as their contemporary values for the local communities.

The archaeological fieldwork has also important social, cultural and community-oriented aspects. It has been carried out in accordance with the tenets of community archaeology and consequently assumed an active engagement of local communities in archaeological works and activities undertaken around heritage of Lamsdorf's camps. A pivotal element assumes interviews with local people and various heritage stakeholders to assess the ways of how they perceive archaeological fieldwork and how it connects to their traditional ideas about the discipline and determines their attitudes and values toward heritage and the painful past.

The aim of our presentation is to discuss the preliminary results of the ethnographic research conducted during the project so far. We focus on two aspects: (1) recognition of the contemporary significance and values of post-camp sites in Łambinowice for local communities, and (2) examination of the attitudes and values of volunteers participating in archaeological research conducted at post-camp sites toward heritage and archaeology. The undertaken research enabled to identify contemporary social values of heritage – the relics of the camps. Additionally, they prove the value of so-called community archaeology in which the participation of local communities in field research is an important element of applied methodology.

14 DIVERSE VALUES AND MULTIPLE NARRATIVES: ASSESSING AND WRITING THE CONTEMPORARY SIGNIFICANCE OF THE CATERTHUNS HILLFORTS IN ANGUS, SCOTLAND

Abstract author(s): Robson, Elizabeth (University of Glasgow)

Abstract format: Oral

Archaeological heritage can bring a unique understanding and character to a place. However, studies have shown that the social values associated with such places (how they contribute to people's sense of identity, belonging, attachment, and memories) can differ significantly from assessments of scientific and historical value. Indeed, contemporary narratives and practices, including those that respond directly to the presence of archaeological remains, may diverge from, or even conflict with, professional understandings and conservation priorities. How can heritage management practices identify and respond to these diverse values and multiple narratives? And what role do values themselves play, actively or unconsciously, in these discourses?

This paper examines the role of values in assessing and writing about the contemporary significance of the Brown and White Caterthuns. The Caterthuns are a pair of Iron Age hillforts (located about 1 km apart) in Angus, Scotland. The forts, which are visible as earthworks and collapsed stone walls, were designated as nationally significant monuments in the 1880s. The hills are popular destinations, used by locals and visitors to the area. In recent years, site managers have expressed concern that some visitor activities are damaging the archaeological remains and jeopardising the scientific value of the site.

Drawing on the experiences of conducting a social values assessment for the Caterthuns, and the subsequent incorporation of the findings into the site's Statement of Significance, the paper shows how different values are mobilised – shaping who participates, how, and which knowledges are amplified (or elided) in discussions on archaeological

heritage. It argues that greater reflexivity and recognition of situated expertise is needed to surface these processes and contextualise the multiple values that are active within heritage management.

15 WE CREATE HISTORY - ARCHAEOLOGY IN KINDERGARTEN AS A STRATEGIC TOOL IN SETTLEMENT STRATEGY AND CULTURAL HERITAGE POLICY MAKING

Abstract author(s): Paulsen, Charlotte - Mørk, Stine (Museum Skanderborg)

Abstract format: Oral

Museum Skanderborg is a cultural history museum with an archaeological service that covers the heritage of Skanderborg municipality from stone age to modern times. Museum learning is a primary aim of the museum's public obligation. In cooperation with kindergarten institutions from the municipality of Skanderborg, Museum Skanderborg has developed a learning program, "We create history" for children aged 4-5 years. The aim is to use history and archaeological artefacts to support and develop shared identity of the children and the adults in the kindergartens. The municipality of Skanderborg is a newcomer's settlement area, with new citizens with no historical connection to the location, where they are going to live.

The course includes six themes: Stone Age, Bronze Age, Iron Age/Viking Age, Middle Age, My Town and My Kindergarten. The journey through time supports their affiliation to their local area – what happened before me? The program has now been running for six years. App. 20 kindergarten institutions are participating yearly, each with groups of up to 25 children.

The children pass on their newfound historical knowledge to their families - thus, creating a shared identity that helps them all to grow attached to their new neighborhood.

Attending the program is now a strategic goal in the development contracts, between the kindergartens and the municipality. On governance and political level, the learning program is part of the revision of the cultural heritage policy by the city council.

This paper will present the political as well as pedagogic motives that lies behind developing the project and what values it has created for the institutions, the children and their families, the museum and for the policy makers. It will also show examples of the activities and interactions with the children and their immediate and often funny responses to the subjects.

16 DEVELOPING A NEW RUBBISH THEORY AT THE MUSEUM OF TAT

Abstract author(s): Fredheim, Harald (University of York)

Abstract format: Oral

In his book *Rubbish Theory*, Michael Thompson argues that the value of objects in use is 'transitory' and that after falling out of use and becoming 'rubbish' they may subsequently acquire 'durable' value as heritage objects. This fits well with how we often conceptualise value as archaeologists. However, more recent research on the transitory and subjective/situated values of heritage calls Thompson's value categories and their relationships into question. This presentation draws on the findings of the Profusion theme of the Heritage Futures research programme (heritage-futures.org) to show that the values of everyday objects in social history collections cannot be considered 'durable' and may in some cases once again be becoming rubbish. This raises questions about the sustainability of heritage value and how we might more accurately and creatively understand and manage heritage.

As a response to these reflections, this presentation will also outline a pilot project for establishing a Museum of TAT that specialises in transforming unwanted museum objects through collaborations with creative practitioners, sometimes referred to as practices of 'creative disposal'. It will consider whether such material transformations can be considered acts of conservation - and how the values of the original objects and new artworks are valued differently by museum staff, artists, visitors and other stakeholders.

17 AWAKENING THE SLEEPING BEAUTY! THE ROLE OF ARCHAEOLOGY AND CULTURAL HERITAGE IN THE REVIVAL OF BADEN'S THERMAL BATHS

Abstract author(s): Schaer, Andrea (Archaeokontor GmbH/University of Berne)

Abstract format: Oral

Baden in the Swiss canton of Aargau looks back on 2000 years of tradition as a thermal spa. The Romans were the first to use the local sulphur springs. In the Middle Ages and until the 17th century, Baden was the most important spa resort in German-speaking Europe. During the spa boom of the 19th and early 20th centuries, Baden was an internationally important spa town, but always in the shadow of even more famous spa towns such as Baden-Baden or Vichy. In the 20th century Baden turned into an industrial town and lost its identity as a spa town.

In the first two decades of the 21st century, the revitalisation of the baths was undertaken.

Preceding and accompanying the building projects extensive archaeological excavations were carried out in several stages between 2009 and 2022. This not only yielded a wealth of scientific findings on the history of the Baden baths. Rather, the visible excavations made the rich cultural heritage of the Baden baths manifest again and most of all made it a public issue.

The presence of the rich tangible and intangible cultural heritage, as well as the connections between the past and the future that were shown, laid the foundation for a reawakening of an increased awareness of the baths' history, and the cultural heritage was newly understood as – besides of the healing waters – the USP and main asset for the city and the baths.

The paper shows the understanding of the value of cultural heritage of the spa town has changed due to the archaeological work. It further presents some of the initiatives and valorisation projects that base on or include archaeological heritage. Finally it also points out where it has not been possible to sustainably use the cultural heritage to shape the future.

A. TRACES OF ANTIQUITY IN THE COLLECTIONS OF STATE CASTLES AND CHATEAUX IN THE CZECH REPUBLIC

Abstract author(s): Kucova, Stanislava (National Heritage Institute, Czech Republic)

Abstract format: Poster

Classical archaeology has its place even in countries that were only marginally involved in the ancient world. Since the time of Emperor Rudolph II, aristocracy, nobles, and various collectors in the Czech lands have been inspired by classical antiquity and have collected and often displayed ancient artefacts in their residences. Due to dramatic political changes, the ownership of these imports changed, and even today we can still encounter often fragmentary collections (apart from museums and universities) in publicly accessible castles and chateaux throughout the Czech Republic on touring circuits or in depositories; 106 of these objects are currently state-owned and are under the administration of the National Heritage Institute. The poster will summarize the issue of ancient collections in state castles and chateaux today and will present the most interesting pieces and their finding circumstances, placing them in the context of the ancient world. Attention will be paid in particular to the collection of Chancellor K. W. N. L. Metternich at Kynžvart Castle in western Bohemia and the question of what value a collection of archaeological artefacts that is only fragmentary and that fulfils a different purpose than at the time of its creation can have and what contribution such a collection can make to contemporary classical archaeology.

195 FAR AWAY, SO CLOSE - THE CURRENT DEBATES ABOUT POST-MEDIEVAL CEMETERIES IN ANTHROPOLOGICAL AND ARCHAEOLOGICAL STUDIES

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Líbor, Csilla (Hungarian National Museum; Eötvös Loránd University) - Mateovics-László, Orsolya (Hungarian National Museum) - Piombino-Mascali, Dario (Institute of Biomedical Sciences, Vilnius University) - Lepionka, Hubert (Podlaskie Museum in Białystok)

Session format: Regular session

The archaeology of death and the bioarchaeological analysis of cemeteries have now undergone significant developments and account for a large proportion of research. The growing number of rescue excavations resulted in significant human remains covering all periods, including late medieval and early modern times which were not the main focus of the archaeological studies. The recovery, analysis, and different storage standards and ethical issues emerging with the study of these materials make them undoubtedly special in the field.

The research of cemeteries of the post-medieval/early modern period has no less information for us than the burials from earlier times. Bioarchaeological Research of these human remains and their archaeological contexts enriches our knowledge in the same way: we can learn about the social structure, burial customs, migrations, population changes, disease, and health. But opposite to earlier periods, bioarchaeological data often can be testified by a written source about the individual or a community, or even by documented larger historical events. For example, in the case of the study of epidemic periods, the cemeteries of the past 500 years can provide the best opportunity to examine these distressing environmental impacts on human populations in the past. Also, these populations genetically are the most closely related to modern people which is not only important from a biological perspective but also raises important Ethical questions especially if relatives of the buried are still alive.

This session represents a developing but very important field of bioarchaeology. This session aims to bring together researchers who share a similar interest in cemeteries of the post-medieval/early modern period.

Expected papers may include but are not limited to:

- Presentation of excavations and findings.

- Bioarchaeological analysis of the cemeteries
- Paleopathological analysis of the individuals
- Ethical questions

ABSTRACTS

1 IMAGING THE RADZIWIŁŁ FAMILY (KÉDAINIAI, LITHUANIA): RADIOLOGICAL APPROACHES IN CRYPT ARCHAEOLOGY

Abstract author(s): Piombino-Mascoli, Dario - Jankauskas, Rimantas (Faculty of Medicine, Vilnius University) - Kozakaitė, Justina (Faculty of History, Vilnius University) - Tamošiūnas, Algirdas - Girčius, Rokas (Vilnius University Hospital Santaros Clinics)

Abstract format: Oral

The nine individuals discussed in this paper were recovered during a project aimed at investigating the mortal remains of members of the Radziwiłł family, a powerful dynasty of the former Grand Duchy of Lithuania and the Crown of the Kingdom of Poland, who died between 1666 and 1674. The remains had been contained in a crypt of the evangelical reformed church of Kėdainiai, a historic town in central Lithuania. An additional crypt of the same church was utilized as a resting place for other dignitaries unrelated to the family. Both rooms have been opened, resulting in disturbance and possible mixing of their contents over time, and loss of the identities of the deceased. Therefore, in July of 2019, members of the Kėdainiai Regional Museum and the Faculty of History of Vilnius University, began a project aimed at recovering the remains from both crypts, identifying the subjects as far as possible, and eventually providing them with new coffins to be located within the same burial place. Through this, the research group in charge have recovered a number of mummies and skeletons that were brought to the Faculty of Medicine of the same institution for a thorough bioarchaeological assessment. Out of the 37 individuals investigated, nine were submitted to computed tomographic (CT) analysis due to their remarkable preservation status. This presentation aims to present the results of these investigations, including age, sex, and other identifying features of the individuals, and interpretation of the pathological changes seen on the bone and soft tissues during radiological evaluation.

2 PERSONS BEHIND THE BONES – BIOARCHAEOLOGICAL RESULTS OF AN EARLY MODERN CEMETERY (SZÉCSÉNY, HUNGARY)

Abstract author(s): Líbor, Csilla (Hungarian National Museum; Eötvös Loránd University) - Balogh Bodor, Tekla - Szénásy-Laczkó, Virág - Mateovics-László Orsolya, Orsolya (Hungarian National Museum)

Abstract format: Oral

In 2019, we had the opportunity to excavate a late medieval- early modern cemetery (17-18. c) in Szécsény, Hungary. The excavation area has covered the middle and northeast segments of the cemetery. The cemetery is rich in finds and artifacts, including remains of contemporary clothing, representing a typical archaeological assemblage for this period. Many of the 298 graves contained coffin remains. Despite their relatively good preservation of them, the bones were poorly preserved. Only in the case of some coffin burials were the skeletons complete and well-preserved, including newborn infants. That has raised the question of whether the wooden coffins, the interior coating of the coffins, the geochemical character of the soil, the urban conditions, or individual factors of the skeletons explain the generally poor preservation of the bones. Despite the overall poor condition of the bones, we were able to do a bioarchaeological investigation.

The skeletal sample showed the presence of infectious diseases, malnutrition, and traumas in the population, reflecting the life and death circumstances that once existed in Szécsény in the 17-18th centuries. The abundance of grave finds has allowed us to examine social, sex, and age differences in this community. This research is part of a more comprehensive project that explores early modern/modern Hungarian populations by applying bioarchaeological methods and tools.

3 WHAT YOUR DIARIES DIDN'T TELL ME... PRELIMINARY DESCRIPTION OF POPULATION HEALTH OF EARLY MODERN CHEŁM

Abstract author(s): Grzegorska, Aleksandra (University of Warsaw)

Abstract format: Oral

Health is an important aspect of everyday life which has an undeniable impact on all parts of life, especially highlighted by many epidemics like the recent Covid-19 pandemic. Osteological research of the human remains found during archeological excavations is an important source of information in regard to this topic. In contrast to written sources, osteological analysis provides information regarding people derived from all the social classes, of different ages and

genders. While analyzing human remains, research emphasis can be put on different aspects of health in the past. However, one of the most important results which may later be used by archeologists and historians is the general description of the level of health of the population.

This presentation aims to share preliminary results of a bioarchaeological study of the population from a cemetery in town Chełm (south-eastern Poland, in Lubelskie voivodeship) dated approximately from the 16th to late 19th century. I will present and discuss data from a random sample of 100 individuals (which is approximately 1/4 of all the burials from the cemetery). The assessment of their level of health will be based on indicators such as stature, linear enamel hypoplasias, porotic hyperostosis and infection diseases. The reconstructed population health will be used to create a more comprehensive description of life in the past.

4 TO STUDY OR DISCARD?: RESEARCH POSSIBILITIES, LIMITATIONS, AND ETHICAL QUESTIONS REGARDING COMMINGLED AND FRAGMENTED HUMAN REMAINS

Abstract author(s): Dec, Olga (Doctoral School of Humanities, Adam Mickiewicz University, Poznań)

Abstract format: Oral

Commingled and fragmentary human skeletal remains are a particular type of osteological material – rather specific and often problematic from the point of view of bioarchaeological and anthropological analyses. They can be retrieved from a variety of contexts: from mass graves and ossuaries, to loose assemblages devoid of any clear spatial, chronological or anatomical arrangement. Due to that, the scope of potential research can be significantly reduced – and, therefore, as well the data acquisition and its further interpretation. Such somewhat limited scientific value may therefore bring to mind questions of ethical nature: How one should proceed with commingled and fragmentary human remains? Is it in interest of science, or a matter of ethics and little more?

Based on the example of osteological material from rescue excavations at the former Saint Gothard settlement in Poznań, Poland, the purpose of this paper is to attempt answering these and more questions – highlighting methodological considerations derived from author's own observations, and including a list of recommendations for both the analyses, as well as for ethical treatment of the remains.

5 THE EXPERIENCE OF THE BIOARCHAEOLOGICAL RESEARCH OF THE 19TH CENTURY CEMETERY IN LVIV, UKRAINE

Abstract author(s): Unhurian, Veronika (Institute of Archaeology, National Academy of Sciences of Ukraine) - Zlatohorski, Oleksi (Specialized Institution „Volyn Antiquities“) - Osaulchuk, Oleh (Scientific and Research Centre «Rescue Archaeological Service» of the Institute of Archaeology, National Academy of Sciences of Ukraine)

Abstract format: Oral

In the autumn of 2022, an expedition of the Research Center “Rescue Archaeological Service” of the Institute of Archaeology, National Academy of Sciences of Ukraine (Lviv, Ukraine) explored a part of the 19th century Stryi cemetery covering the area of 5501 m². Despite the extensive experience in rescue archaeological research of cemeteries, archaeologists first encountered with such a density of archaeological objects - over 1,700 graves were discovered and over 1,400 burials were explored. Taking this into account, we can state about unique archaeological research for Ukraine.

Since the preventive nature of the studies, the specifics of the project were extremely short deadlines for identifying, fixing and processing of the materials. Therefore, the excavations of the Stryi cemetery also posed many challenges for bioarchaeologists: how to plan your work in such a way as to collect as much information as possible in the shortest time?

Our paper deals with the experience of working with a large skeletal collection of the Stryi cemetery and the research issues of modern funerary sites in Ukraine.

6 PERCEIVING DEATH, BETWEEN THE 16TH AND 19TH CENTURIES, IN A BORDER FORTRESS OF THE NORTHWEST OF PORTUGAL, VALENÇA

Abstract author(s): Alves, Alexandrina (Lab2PT - Minho University; CIAS - Coimbra University) - Fontes, Luís (Lab2PT - Minho University) - Silva, Ana Maria (Department of Life Sciences, University of Coimbra; CEF - University of Coimbra; UNIARQ - University of Lisbon)

Abstract format: Oral

The main goal of this work is to analyse and understand, through archaeological, anthropological, and historical data, how cemeteries evolved in a modern fortress, located in the northwest border of Portugal, called Valença.

This small city, on the top of a hill, south of the river Minho, has a privileged localization on the Portuguese northwest border with Galicia, Spain, and was a bastion of the border defence, along the centuries.

Despite the city being surrounded by defensive walls, and so limited to expand, it has two medieval churches, two modern churches, a chantry and a nuns convent, each one with their own burial grounds, until 1850, when the public cemetery was consecrated outside the fortress.

The historical data, through military cartography and parish records, bring some light into the burial ground organization between 16th and 19th centuries, and all the pressures that those spaces suffered from the military occupation and the several death crises identified between the 16th and 19th centuries.

The archaeological and anthropological data, from the excavations, allow us to question the spatial and rituals adaptations to the military needs and civilians' beliefs along those centuries. Moreover it seems that the military environment has deeply influenced the burial grounds management and dedicated area to the dead.

7 ON TOP OF THE HILL - THE STONE, THE BROKEN CROSS, AND THE BABA. POSTMEDIÉVAL STELAE CEMETERIES IN NORTH-EASTERN POLAND

Abstract author(s): Lepionka, Hubert (Podlasie Museum in Białystok)

Abstract format: Oral

Old necropolises of various religions and nationalities that for generations have lived along the border are typical features of the Podlasie Voivodeship landscape. The "mogilki" cemeteries stand out among the widely known Christian, Jewish and Muslim burial grounds. In the Podlasie dialect, "mogilka mahilnik", "mohilnik," and "mohilki" refer to an old rural cemetery or a location where graves are marked with stones. These unusual sites are usually located in Podlasie, near to early modern villages, on natural slopes. Despite the prevalence of traditional tales regarding the origins of the cemeteries, two issues remained unresolved: Who was buried there, and when did these cemeteries continue to function?

Presented study exposed the complex organization of the Polish-Lithuanian Commonwealth's lowest social strata burial ceremonies. Survey research verified non-invasive investigations' results that cemeteries are spatially organized and contain more complicated stone constructions than previously believed. Cemeteries from the second half of the 17th to the middle of the 18th century might be dated by coins found in tombs that had been excavated. Finally, the project also verified old legends and restored the stele cemeteries in the memory of local inhabitants.

8 DIACHRONIC TRENDS AND SOCIAL STRATIFICATION IN A LATE-MEDIÉVAL AND POSTMEDIÉVAL CEMETERY FROM LUXEMBOURG CITY

Abstract author(s): Kremmer, Anne (Department of Geosciences, AG Biogeology, University of Tübingen) - Bocherens, Hervé (Department of Geosciences, Palaeobiology, University of Tübingen; Senckenberg Center for Human Evolution and Palaeoecology - HEP, University of Tübingen)

Abstract format: Oral

Since its first mention in 963AD, the fortress of Luxembourg City had been expanding steadily throughout the medieval times. However, it is only in 1443AD, after the conquest by Philip the Good, duke of Burgundy, that the city of Luxembourg, which by then had become one of the strongest fortresses in western Europe, got caught between the fronts of the major political forces of the time. From then on until the dismantling of the fortress in the mid-19th century, life in Luxembourg City had been dominated by foreign occupations, sieges and wars. In order to assess the impact these times of political unrest had on the population of the city, 391 individuals buried inside the cloister and on the cemetery grounds of a Franciscan friary were analysed. 14C analyses and evaluation of archaeological data allowed to identify two main burial phases: an older one dating from the mid-14th to the mid-16th century and a younger one dating from the mid-16th century to the cemetery's dissolution. The aim of this study is to investigate whether there are detectable changes in physical activity, health, and diet, and thus in living conditions over time and amongst different socioeconomic groups, represented by the cloister and cemetery burials. These questions were addressed by examining palaeodemographic parameters, stature and growth, markers of physical activity, diseases as well as indicators of diet and nutritional status, using a combination of osteological and bioarchaeological methods such as stable isotope analysis (Nitrogen-15 and Carbon-13). A comparison to contemporaneous rural, urban and monastic sites as well as to other cemeteries in the city revealed an overall high standard of living conditions for the people interred in this burial ground and revealed further differences between cloister and cemetery burials, pointing towards a clear social stratification within the same burial complex.

9 **ADRO VELLO (O GROVE, PONTEVEDRA, SPAIN): AN APPROACH TO FUNERARY PRACTICES AND CHILDHOOD OF A LATE MEDIEVAL/POSTMEDIEVAL NECROPOLIS**

Abstract author(s): Colmenares Prado, Marta - Mangas Carrasco, Elvira (CRETUS, EcoPast, Area of Archaeology Department of History, Universidade de Santiago de Compostela) - Fernández Fernández, Adolfo (Department of History, Universidade de Vigo) - López Costas, Olalla (CRETUS, EcoPast, Area of Archaeology Department of History, Universidade de Santiago de Compostela; Department of Archaeology and Classical Studies, Stockholm University)

Abstract format: Oral

Childhood is a topic of great interest in the past societies research, but of great complexity when approaching it from archaeology. The study of funerary practices as well as the human osteoarchaeological remains from a given necropolis provide an excellent opportunity to deepen into the concept of childhood, in this case, of a medieval and postmedieval community. We present here the main results of the study carried out on the osteological remains obtained during the 2017 mission at Adro Vello site. Adro Vello (O Grove, Pontevedra, Spain) is a coastal rural necropolis, considered highly representative and iconic for the medieval and postmedieval Galicia (NW Iberia). The campaign comprised the excavation of a large balk (named1.2017; 2 x 1 x 0.8m) left by the old missions. Minimum Number of Individuals (MNI) of fourteen skeletons were documented - seven articulated and seven disarticulated. Eight were non-adult individuals, six under one year-old. The burial practice is consistent with the Christian norma - supine position, W-E orientation and without grave goods. The pathological features are among those common in archaeological populations - osteoarthritis, cribra femoralis, fractures, etc. These results were compared with those from earlier excavations. We discussed the management of cemetery space and the relationship of burials with other structures. We focused especially on the high presence of very young individuals, including newborns and perinatal skeletons, buried alongside adult individuals in this Christian cemetery - an area where burials were supposed to be reserved for baptized members of the community.

10 **FORGOTTEN UNTIL THE JUDGEMENT DAY. SOME INSIGHTS INTO AN EARLY MODERN CEMETERY IN DRAWSKO, POLAND**

Abstract author(s): Gembicki, Maciej (The Faculty of Archaeology University of Adam Mickiewicz) - Polcyn, Marek (Lakehead University)

Abstract format: Oral

During the years 2008-2019, the Slavia Foundation conducted excavations in an early modern cemetery in Drawsko, Poland. According to our latest findings, the cemetery, which had been used for almost 250 years, was not a conventional cemetery, used mainly during the great epidemics that hit the surrounding lands in the 17th and 18th centuries. The deceased buried there meant to be a real threat in the eyes of the living, and as such required special treatment. The inhabitants of Drawsko developed several apotropaic practices that prevented the dead from coming back to life, such as decapitations, crushing bodies with stones, placing sickles around the neck or putting coins or flints in the mouth. So far, out of over 500 examined burials, almost 17% bear clear traces of apotropaic practices, which is the highest percentage among the examined cemeteries in Poland. This phenomenon may be explained by the combination of two factors: the common belief in the so-called „upióry“, that refers to dangerous creatures that return to life unless appropriate apotropaic treatments have been performed, and the belief that the plague is the effect of evil powers whose victims also pose a threat to the living. As a result, the cemetery in Drawsko shatters the dualistic discussion on typical and atypical burials, giving an extraordinary example of the burial rituals of Polish peasants.

11 **„HOLD ON TIGHT” – BIOARCHAEOLOGICAL INTERPRETATION OF A FEMALE SKELETON WITH SIGNS OF CORSET WEARING FROM 17-18TH CENTURY, HUNGARY**

Abstract author(s): László-Mateovics, Orsolya (Hungarian National Museum - Magyar Nemzeti Múzeum) - Perger, Andrea (Textile and Costume Collection Department, Museum of Applied Arts, Budapest) - Csiki-Deminger, Csilla (Museum of Kuny Domokos, Tata) - Libor, Csilla (Hungarian National Museum) - Molnár, István (Rippl-Rónai Museum) - Schmidt Mayer, Richárd (Museum of Kuny Domokos) - Zay, Orsolya (István Dobó Castle Museum)

Abstract format: Oral

Skeletal evidence of corsets is mainly attributed to cemeteries from the Victorian Era, though it is known from written sources that have been used widely in Europe. Only a few examples have been known in the bioarchaeological record, however, tightlacing just like other body modifications, is also a remarkable source of past human behaviour. The spatial and temporal distribution of this fashion still needs more examples to refer to other evidence than skeletons show. Though recognizing such change is not always straightforward. The skeletal changes of the rib cage and the pelvis are named as typical signs that can be confounded with other pathologies which can also lead to the compression of the rib cage. Another restrictive factor is that the amount of extensive bioarchaeological research on post-medieval and

early modern cemeteries is scarce compared to earlier centuries. This paper will provide the first case of corset wear from Hungary and discuss this further data on the usage, effect and history of this unique clothing.

12 A GOLDEN COIF FROM SZTÁNA - FROM ARCHAEOLOGICAL FINDING TO THE REPRESENTATION OF SOCIAL STATUS

Abstract author(s): Zay, Orsolya (Dobó István Vármúzeum)

Abstract format: Oral

A rare renaissance hairnet was found in Sztána (RO), in the protestant church under renovation in 2021.

Archaeologists excavated in situ the finding, found in the last hours of the excavation, most of whose metal thread parts were preserved. It was safely stored in a room of the reformed community center next to the church, until restoration work began. It was a piece of rare and outstanding value, so we considered it especially important that it be accurately documented from the excavation through the restoration to the publication.

The morphology of the metal threads and the embellishment was examined with an electron-microscope, and the material composition with spectroscopic elemental analysis (EDX, SEM). According to our assumption, they were made of precious metals, gold and silver could be identified.

For finds with such complex materials, such as pieces of clothing, where organic and inorganic materials are present at the same time, the joint work of the textile- and metal conservator and the archaeologist is important.

Next to the material analysis the researchers wanted to interpret the identity of the owner. As benefactors of the ecclesiastical place, the Gyerőffy family, who played an important role in the history of early modern Transylvania and reached the rank of nobility, could use the church of the hidden village as a burial place, in the period of inadequate public security, between 1530-1550. The presentation will show the process when an archaeological finding, compared with historical sources and ethnographical parallels, reveals the rank and social status of a person. Through an item we can discover gender related garments, social law for women and regulations for married and unmarried women in the 16th century. Furthermore the coif points to the background of the professional craftsmanship which related to the fashion industry of the late renaissance Hungary.

13 POST-MEDIEVAL CEMETERY OF SZÉCSÉNY, HUNGARY

Abstract author(s): Balogh Bodor, Tekla - Szénásy-Laczkó, Virág - Zsiga-Csoltkó, Emese (Hungarian National Museum) - Szolnoki-Anderko, Anna (Kubinyi Ferenc Museum) - Reich, Szabina (Szent István Király Museum) - Libor, Csilla (Hungarian National Museum)

Abstract format: Oral

Back in 2019, we conducted a preventive archaeological excavation near the city center of Szécsény (Nógrád county, Hungary). The archaeological site is located a few meters from the medieval old town. Although the direct area of the site has been populated over the years, there was a parking lot on the territory of our excavation. Several excavations were carried out in the neighborhood earlier, when the post-medieval cemetery of Szécsény was successfully identified. Our excavation probably concerned the center and north-eastern part of the cemetery. We excavated around 286 graves. Despite the fact that 80 percent of the skeletons were poorly preserved, in some cases we found whole skeletons in good condition. In most of the graves, we excavated several elements of the wooden coffins, where we could even observe the decoration elements of the coffins. One question for future investigations is, how the different conditions of the skeletons can be explained (possible explanations are the material of the wooden coffin or the inner lining of the coffin, the chemical composition of the soil, or the urban environment).

Regarding the archaeological artifacts, the cemetery was rich, and corresponded to post-medieval trends (among the artifacts there were jewelry, hairpins, elements of religious belief: rosaries, crosses, devotion medals). Most often, we excavated various elements of women's wear: corollas, which were mainly decorated with beads, sequins and sometimes with garnet-shaped flowers. Another significant element of the artifacts were the upper wears, which we observed in three graves, where the textile remains and metal threads of the clothing were well preserved. The procession of the cemetery and artefacts is in progress, but based on our preliminary observation, the cemetery can be dated to the end of the 17th century and the first half of the 18th century.

14 **EMPTY PLACES? SITES OF MASS EXTERMINATION FROM 1939 IN THE POMERANIAN PROVINCE, POLAND, AS A FORM OF CEMETERIES**

Abstract author(s): Kobialka, Dawid (Institute of Archaeology, University of Łódź) - Rennwanz, Joanna (Institute of Archaeology and Ethnology, Polish Academy of Science)

Abstract format: Oral

Nowadays, it is estimated that between September and December of 1939, about 20-30 thousand Polish citizens of the pre-war Pomeranian province were murdered by Germans. One can propose that sites of mass extermination from 1939 in the Pomeranian province can be understood as a unique category of war graves and cemeteries. Many of them were exhumed in the first post-war years. Similarly, burial pits, shooting ditches, sand pits, etc., in which the victims' bodies were hidden by the perpetrators, have been levelled during the last few decades. Hence, a somewhat common belief is the statement of one of our informants: "Sir, there's nothing there, everything was dug up after the war".

The presentation intends to sketch the context, goals, methods, cognitive and social potential that guide the international and multidisciplinary research project entitled "An Archeology of the Pomeranian Crime of 1939". The idea behind it is a deep conviction that the German mass crimes of the first months of 1939 in the Pomeranian province within the so-called Intelligenzaktion and T-4 (which are now referred to as the "Pomeranian Crime of 1939") are associated with leaving a huge amount of traces. My thesis is that contemporary archaeology has the appropriate experience, tools and methods to discover them. The use of a multidisciplinary approach (e.g. archaeology, history, ethnography, forensic medicine, genetics) allows for a holistic research into the past of selected sites of mass extermination as well as their contemporary role and significance for local communities. Chojnice's Death Valley, from which, in 2021, almost a ton of burnt human remains of the victims was excavated will be used as a case study.

15 **« MY NAME IS NOBODY » - THE SOLDIERS OF THE BATTLE OF ORTHEZ (FRANCE)**

Abstract author(s): Calmettes, Philippe (Inrap; UMR 5607 Ausonius) - Nichols, Alistair (Society for Army Historical Research) - Souquet, Isabelle (Inrap; UMR 5199 Pacea)

Abstract format: Oral

In 2016 an archaeological dig at Orthez (France) revealed the presence of a hospital, a communal cemetery and above all that of a vast and remarkable grave of 26 soldiers killed during the battle of 27 February 1814. This was fought between Napoleon's army and that of the allies, made up of British and Iberian troops. Study of uniform buttons and other objects found with the soldiers confirm that they belonged to both sides. Such a deposit is unprecedented in France and among the many lines of research that are presented is the opportunity to identify soldiers, both French and allied, by combining historical, archaeo-anthropological, genetic, isotopic and biochemical data. The investigation involves gathering the available data from each individual skeleton (age, sex, physical information, geographical origin, environment and identification of the environment in which they grew up) by study and analysis.

This interdisciplinary research is essential in understanding this deposit on several counts. This includes investigation of the composition of the different armies, such as the recruitment criteria at the end of the First French Empire and the geographical origin of the individuals, as well as the care and treatment of the deceased according to the nationality of the armies in which they served. One of the unacknowledged objectives is to try to give them a name.

If the 19th Century is so close and our knowledge of the subject seems well established, the study of the pit of the battle of Orthez shows that our understanding of the reality of the Napoleonic period is fragmented and far from complete.

We propose to present the exploitation of the different lines of research and the first results.

16 **MASS GRAVES FROM A MILITARY HOSPITAL FROM LISBON (16TH-18TH CENTURIES): ANALYSIS OF THE SKELETAL REMAINS**

Abstract author(s): Leirião, Carina - Carvalho, Liliana - Amarante, Ana (University of Coimbra, Research Centre for Anthropology and Health, Department of Life Sciences) - Henriques, Susana (EON - Indústrias Criativas) - Wastlerlain, Sofia (University of Coimbra, Research Centre for Anthropology and Health, Department of Life Sciences)

Abstract format: Oral

Between the 16th and 18th centuries, a military hospital operated in Lisbon, near the Castle of São Jorge. Associated with the hospital, a burial ground with six phases of use was identified, being the third characterized by mass graves. This work aims to analyse the 56 skeletons recovered from this phase, at both palaeodemographic and palaeopathological levels. Age-at-death estimation was performed with standard methods based on skeletal development and degenerative alterations for non-adults and adults, respectively. In all, 57.1% were non-adults and 32.1% adults. In 10.8% of the individuals the poor state of preservation precluded any age estimation. The lower age range for the non-

adults was 12-14 years (3.6%). For adults, sex estimation was based on metric and morphological analyses. In 22.2% of the cases, sex estimation was not possible due to preservation issues. All the other adult individuals (77.8%) were males. All bone lesions were analysed, being enthesal changes and osteoarthritis classified according to their degree. The most common pathological lesions were the physiological stress indicators (60.7%), supporting the literature which claims poor life conditions, epidemics, and famines in the studied era. Equally frequent were the traumatic and enthesal changes (37.5%). Also, periosteal lesions were identified in 12.5% of the individuals, probably of various aetiologies. The biological profile of the individuals, together with the pathological conditions observed, seem to reflect a military background, with men recruited since young age, submitted to great physical effort and possibly interpersonal violence. These individuals may have been victims of an epidemic outbreak once these were frequent at the time, and they were inhumed in mass graves.

17 THE WINDS OF WINTER: THE 1710 PLAGUE CEMETERY IN TALLINN, ESTONIA

Abstract author(s): Malve, Martin (University of Tartu, Faculty of Science and Technology, Institute of Genomics; University of Tartu, Faculty of Arts and Humanities, Institute of History and Archaeology) - Keller, Marcel (University of Tartu, Faculty of Science and Technology, Institute of Genomics) - Aguraiuja-Lätti, Ülle (Tallinn University, Archaeological Research Collection)

Abstract format: Oral

In 1710 Tallinn suffered from the most prominent outbreak of plague, which caused more deaths than any previous epidemic in the town. Cemetery reflecting the victims of this outbreak was archaeologically excavated in 2018–2021 and the burial ground remains the largest of its kind so far discovered in Estonia.

Rescue excavations revealed a total of 117 burials from the site, with the graves situated irregularly over a large area. The burial ground was used for a very limited time. The deceased were buried mostly in double and triple graves, but also in single and mass graves. Based on artefacts collected from the burials, both urban and suburban commoners, peasants, also Swedish and Russian soldiers and potentially their family members, were interred to this cemetery.

Out of 117 individuals 38 were males, 55 were females and 20 were non-adults. The high prevalence of female burials was surprising, as such a large percentage of female skeletons has not been observed from any other Estonian cemetery that has been osteologically analysed. Most of the buried were young adults (17–25 years), whereas the number of non-adults and older individuals was remarkably low. The analysis of the skeletons shed more light on the lifestyles and habits of the individuals. Irregular wear of the front teeth due to long-term pipe smoking was observed for both sexes. Healed blunt force and sharp force injuries were also documented. Furthermore, numerous dental pathologies (e.g. dental calculus and caries), degenerative diseases (e.g. osteoarthritis of the limb joints and spondylosis of the spine) and few cases of healed fractures were detected on the skeletons. Initial results gathered from aDNA and stable isotope analysis further support osteoarchaeological results and written data.

18 TWO SITES, TWO MASS GRAVES, TWO STORIES

Abstract author(s): Kozakaite, Justina (Association of Lithuanian Archaeology; Vilnius University, Faculty of Medicine) - Konovalovas, Aleksandras (Vilnius University, Life Sciences Center)

Abstract format: Oral

Uncovering the mysteries of the past is a timeless quest that continues to captivate us. In Lithuania, 17th-19th century cemeteries and their bioarchaeological materials hold a wealth of information waiting to be explored. Despite previous paleopathological case studies that have shed light on these populations' lifestyles, diets, and medical practices, the use of cutting-edge techniques like paleogenomics to understand the prevalence of diseases, the vulnerability of certain people, and the impact of historical events has been limited. Until recently, the answers to questions concerning these topics have relied on foreign institutions' goals and ongoing projects.

This presentation focuses on two mass graves in present-day Lithuania, each with a unique story to tell. The first site, located in Panerių street 12 in Vilnius, dates to the 17th-18th centuries, while the second, in Skongalio street at Kėdainiai, is from the 17th century. Despite the absence of any apparent traumatic injuries, the presence of mass graves raises questions about the causes of death, which were most likely swift and devastating.

We employed the latest long-read DNA sequencing technologies in this research and validated our results using a standard next-generation sequencing platform. Our findings affirm the suitability of these methods for analyzing ancient DNA and provide critical insights into our past.

THE DARK SATANIC MILLS: THE BIOARCHAEOLOGY OF HEALTH IN ENGLAND DURING THE INDUSTRIAL REVOLUTION

Abstract author(s): Buckberry, Jo (University of Bradford) - Crane-Kramer, Gillian (SUNY Plattsburgh)

Abstract format: Oral

The Industrial Revolution represented one of the greatest economic, social and biological transitions in the history of humanity. Increased excavation and analysis of post-medieval cemeteries in England allows us to investigate how this transition altered the patterns and experience of disease, and to directly compare the skeletal evidence with historical data.

Documentary data speaks of high infant mortality and deaths due to infectious, nervous and respiratory diseases. We compared age-at- and cause-of-death for 335,055 individuals from the annual report of the Registrar General for 1837-8. This revealed stark contrasts in life expectancy and disease experience in rural and urban areas, with London comparing favourably to the newly developed urban centres of the midlands and north. While infectious diseases were rife in towns and cities, more deaths attributed to TB were reported in rural areas, indicating that while migration to urban areas was a risk to health, urban to rural migration by those with long-term conditions might have permitted family support during chronic illness.

We collated published demographic and pathological data for 4151 skeletal individuals dated c.1700AD (industrial) and 1260 individuals dated to between c.1100 and c.1750AD (pre-industrial). Statistically significant differences were observed for age-at-death but not sex. Cribra orbitalia, periosteal reactions, rib lesions, rickets, scurvy, osteoarthritis, fractures and dental diseases were all more prevalent in the Industrial period ($P < 0.01$). Unexpectedly, the prevalence of osteomyelitis declined while TB, treponemal disease, maxillary sinusitis, osteomalacia, osteoporosis, DISH, and gout did not change. Overall, our data support the hypotheses that the Rise of Industry correlated to significant decline in general health, but not an increase in all pathologies. This paper will compare and contrast the documentary and skeletal data for England to build a more holistic view of population health than either one could produce alone.

Funded by the Royal Society (IES\R1\180138).

A. EVALUATING NON-METRIC TRAITS OF HUMAN TEETH TO IDENTIFY BIOLOGICAL RELATEDNESS IN MEDIEVAL POPULATIONS FROM EASTERN ROMANIA

Abstract author(s): Popovici, Mariana - Ciorpac-Petraru, Ozana-Maria - Groza, Vasilica-Monica (Romanian Academy – Iasi Branch, “O. Necrasov” Center of Anthropological Research; Alexandru Ioan Cuza University of Iasi, Faculty of Biology) - Bacumenco-Pirna, Ludmila (Romanian Academy – Iasi Branch, Institute of Archaeology; Alexandru Ioan Cuza University of Iasi, Faculty of Biology) - Bejenaru, Luminita (Romanian Academy – Iasi Branch, “O. Necrasov” Center of Anthropological Research; Alexandru Ioan Cuza University of Iasi, Faculty of Biology)

Abstract format: Poster

During archaeological research in 2021, at Vovidenia Church from Iași (Romania), 114 human skeletons of 16th-17th centuries were discovered.

The present study is focused on the dental morphology and identifying relationships between individuals based on non-metric traits. There are analyzed the frequencies and variability of non-metric dental traits, such as cusps, roots, tubercles, grooves, and ridges of teeth. The traits were scored using the ASUDAS System. Descriptive analysis was performed for each of the observed morphological features, including the frequency of occurrence, and its degree of expression.

Out of the 17 of non-metric dental traits which were followed in the sample, only 10 of them have been identified. The most common morphological feature identified on the occlusal surface of mandibular second molars was the pattern with four cusps and “x” groove (90% of molars). The fifth cusp, represented by large size hypoconulid was identified in 20% of the lower second molars (M2), while Carabelli trait expression had a frequency of 33% in the upper first molars (M1), and 11% in the upper second molars (M2). Also, enamel extension and deflecting winkle were observed in the first molars (M1).

The Correspondence Analysis, based on the measure of the inertia, underlines affinities but also divergences inside the sample and between different local medieval populations. Some features highlight the particularities of this sample, in which potential biological relatedness, based on non-metric traits, are discussed in the work.

This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-III-P4-PCE-2021-1180, within PNCDI III.

LANDSCAPES AND ARCHAEOLOGIES OF PRESENT COMMUNITIES: NOVEL ENGAGEMENTS TOWARDS ENRICHING GLOBAL AND LOCAL HISTORIES

Session theme: 6. Contested Pasts & Presents

Session organisers: Petek-Sargeant, Nik (University of Cambridge; British Museum) - Cruz, M. Dores (University of Cologne) - Seitsonen, Oula (Lakehead University; University of Oulu)

Session format: Regular session

There has been a significant push towards making archaeology more accessible, inclusive, and approachable and to engage local and indigenous communities. This has resulted in enriched narratives, strengthened connections to local landscapes, and sometimes alternative forms of perceiving temporal and geographical pasts. For example, Afro-descendant communities are weaving new stories in partnership with heritage specialists and archaeologists, using ethnographic and archival collections to link their memories to ancestral lands; the geographically distant Sami, First Nations, and Aboriginal communities are sharing experiences of archaeological research with each other and developing frameworks of engagement. It is this context of global exchanges and theories that highlights a decolonisation of archaeology, but also Europe's slower uptake of community engagement compared to Africa, where local involvement and contributions have a longer history.

This session explores new approaches and theories of decolonisation of archaeological research and community engagement, of ways to bridge the gap between (historical) archaeology and present communities, as well as the role of archaeology and cognate disciplines in the construction of identity in time and place. Papers will examine how theory and methods from around the world can inform and reshape European archaeological approaches and local histories, as well as compare European archaeologies to global ones. Archaeology is fertile ground for creating local social and cultural capital, and by tapping into themes of displacement, colonialism, digital preservation, and environmental change, we can see how dialogues and exchanges on community engagement and decolonisation benefit European archaeology.

ABSTRACTS

1 ENGAGING COMMUNITIES IN HISTORICAL ARCHAEOLOGY: REFLECTIONS FROM KENYA

Abstract author(s): Petek-Sargeant, Nik (University of Cambridge)

Abstract format: Oral

Archaeology in Kenya and elsewhere in East Africa has a long history of engagement with and contributions from local communities. Since post-independence in the 1960s and 70s, archaeologists have approached communities and vice-versa to seek information on the histories of landscapes, settlements, and their ancestors, although many communities were treated as analogues for archaeological cultures, portraying them as unchanging, and details from their oral history dismissed. Since the 90s there have been calls to historicise communities and address the disjuncture between the communities, their history, and the archaeology. Through these calls came a focus on the historical period and the last few centuries, although the archaeology has been drawn into Eurocentric discussions about colonial disruption. However, today's postcolonial historical archaeologies in Africa envision history as community memory and they are moving away from correlations between history and colonial encounters. Instead it is becoming about collaboration and engagement with the aim of co-creating narratives that are usable and connected to past and present political and socio-ecological issues.

In this paper, I will discuss how a recent multi-year collaboration with Kenya's Ilchamus community is bringing value to archaeology and helping reinterpret the record as well as ethnographic museum and archive collections. By interacting with the archaeological assemblage and museum collections at exhibitions, workshops and crafting sessions, the community entangled them in the assertion of identity. The paper will use this case study as an example of new approaches to a historical archaeology that moves away from disruptive encounters and privileges internal dynamics of East African communities. It will compare it to Anglo-American and European approaches to see how dialogues with communities can benefit archaeology and theory globally.

2 EXCAVATING EMPIRE: (RE)FRAMING COMMUNITY-BASED ARCHAEOLOGY IN SÃO TOMÉ

Abstract author(s): Cruz, M Dores (University of Cologne)

Abstract format: Oral

A growing attention to historical archaeology has shifted the field into practices that involve local communities, making the discipline more inclusive and relevant, while also becoming a source of empowerment by stressing different ways of knowing and doing. Africanist historical archaeology has been particularly effective in approaching these issues from a decolonizing, interdisciplinary lens that challenges authorized metanarratives to enable alternatives that

build upon local heritage and its impact on contemporary communities. My paper aims to introduce a project endeavoring to decolonize landscapes of power and engage local communities by implementing sustainable and participatory archaeological research in the island of São Tomé (São Tomé e Príncipe). The contribution discusses how the objectives of an action-driven, critical and decolonizing archaeology are often ambitious enterprises, fraught with obstacles, which must take into account local historical and socio-political conditions. The second smallest country in Africa, São Tomé e Príncipe has a heterogeneous population that has been affected by colonialism in different ways (e.g., slavery, indentured labor, contract work, maroon resistance). Despite its pioneering role in the construction of the Atlantic world and the development of plantations systems, archaeological research is completely absent in the country. Thus, it ideally places the project for promoting community engagement since the inception of the research, and experiment with different ways of incorporating and negotiating diverse interests. The project strives to reconcile different forms of knowledge for a better understanding of the past and to achieve the potential for social intervention. Ultimately, the goal is to decenter historical archaeology in São Tomé from empire to focus on marginalized communities, past and present.

3 IDENTITIES, ONTOLOGIES AND CULTURAL REVITALIZATION: NEW PERSPECTIVES IN HISTORICAL ARCHAEOLOGY OF ROZVI LANDSCAPES IN ZIMBABWE

Abstract author(s): Machiridza, Lesley (Institute of African Studies and Egyptology, University of Cologne; Department of Development Studies, History and Archaeology, Simon Muzenda School of Arts, Culture and Heritage Great Zimbabwe University)

Abstract format: Oral

Indigenous communities and their past(s) have always attracted scholarly attention, albeit through a Western lens compromised by colonialism. The 2000s have however, ushered in a new era of academic decolonization, where indigenous narratives are slowly reclaiming their position in archaeology and heritage management practices. In Africa, the immaterial and material help inform/define each other, so it is crucial to understand both dimensions of memory and knowledge production in archaeological interpretations. Since the interpretation of Rozvi archaeology has partly suffered from this conceptual and methodological error, the recent surge in diverse Rozvi groups frequenting Zimbabwe Culture sites as their heritage-sacred places offers new opportunities for in-depth reflections aimed at redressing this anomaly. These ongoing living heritage practices signify crucial intergenerational dialogues in the form of narratives, oral traditions, memories and heritage that has always been silenced, sidelined and despised as “unscientific” knowledge in most related archaeological enquiries. Therefore, this study taps into multiple archival and ethno-historical sources in attempts to pin-point Rozvi ontologies and epistemologies that may advance knowledge frontiers or better still help inform their proper archaeological diagnosis.

4 VAAKUNAKYLÄ: COMMUNITY HERITAGE AND MEMORIES ON THE EDGES OF A NORDIC WELFARE STATE

Abstract author(s): Seitsonen, Oula - Hyttinen, Marika - Matila, Tuuli (University of Oulu)

Abstract format: Oral

Vaakunakylä was until the 1980s a residential area near the center of the town of Oulu, northern Finland. It was established during the Second World War as a German military camp, and after the war became a working-class neighborhood when homeless evacuee Finns moved into the barracks left by the Germans. Through the decades it gained a bad reputation in the outsiders eyes, and finally in the 1980s the city forced people to move out from Vaakunakylä. Their houses were torn down and the area was levelled and became an idle forest for decades. The decision to remove this community was influenced by the Finnish State's ideal commitment to a seemingly classless welfare society living in harmony, and also to the area's complex Second World War history related to siding with the Nazis. However, the former inhabitants of Vaakunakylä did not recognize or approve with the outsiders' and officials view of their home as an ill-reputed slum that needed to be cleaned out.

During our archaeological excavations in Vaakunakylä, preceding the development of the area for a grand housing exhibition in 2025, many of the old inhabitants were enthusiastic that their past and heritage was finally remembered after decades of silence. Many of them were eager to share their personal memories and recollections of the life and times in Vaakunakylä. These were collected in co-operation with the city of Oulu which has finally decided to acknowledge their pasts. Archaeological and ethnographic inquiries can in some ways counter the dominant narrative of the social problems and quality of life in the area. In this presentation we discuss the community work with the former residents, the differences between the official perspective and the local narratives of lives in Vaakunakylä, and how the former inhabitants' perceived archaeologists digging into their own pasts.

5 **DISMANTLING EUROCENTRICISM IN INDIGENOUS HISTORY: THE ARCHAEOLOGY OF FOREST COMMUNITIES IN THE NILGIRI MOUNTAINS, SOUTHERN INDIA**

Abstract author(s): De Simone, Daniela (Ghent University)

Abstract format: Oral

The colonial misrepresentation of Indian forest-dwelling communities or “tribes” as primitive, hence a-historical, viewed them as the subject of ethnographic studies rather than archaeological research. As a result of this biased perspective rooted in racial theory and colonial governance, which is still dominant today in the study of the ancient world, archaeological investigations in Indian forests are rare, and museum collections of archaeological artefacts from forested areas are instead held by ethnography departments. The Nilgiri Archaeological Project, a 5-year research programme based at Ghent University, aims to move beyond this Eurocentric approach by developing a new trans-disciplinary framework to study the pre-colonial history of Indian forest communities. Our research focuses on the Nilgiri Mountains of southern India, a region of montane subtropical forests, and the homeland of several indigenous communities. This paper will discuss three common colonial misconceptions on the history of forest-dwelling communities still guiding research, and deconstruct them based on the preliminary results of our project: 1. ‘Forests are (nearly) empty spaces inhabited by “tribes”’: the mountaintops and ridges of the Nilgiri Mountains are dotted with megalithic tombs, while dolmens and carved memorial stones are found throughout the region; 2. ‘Forest communities are remote and isolated’: grave goods from the Nilgiri burials, dating between the 1st and 16th century CE, include artefacts imported from the lowlands, while oral histories reveal the presence of an indigenous royalty having relations with the polities of the plains; 3. ‘Forest communities practice a subsistence economy’: the region of Coimbatore, at the feet of the Nilgiri Mountains, yielded the largest number of Roman coins found in India. Indian forest-dwellers were first-tier suppliers of timber and non-timber forest products to the “spice trade” in the Indian Ocean but, with the establishment of the colonial enterprise, they were relegated to a subaltern role.

A. **BRIDGING BOUNDARIES OF PRACTICE: INDIGENOUS HERITAGE AND IDENTITY IN THE SOUTHEASTERN CARIBBEAN**

Abstract author(s): Antczak, Oliver (University of Cambridge)

Abstract format: Poster

The Southeastern Caribbean faced intense European colonialism starting in the late 15th century. Over the next 500 years, the islands that make up the region have taken diverted paths that, despite their geographical proximity, today keep the islands separated by thick socio-economic, political, cultural and linguistic barriers. Consequently, archaeological, historical, and heritage narratives have struggled to tell an integrated story of the region’s past. For present-day Indigenous communities of these islands—who have resisted through colonial enslavement, erasure, and transculturation—these narratives have mostly failed to meaningfully link them with the pre-colonial past. Through the study of the different colonial histories of Bonaire, Margarita, and Trinidad, this poster aims to better understand how Indigenous identity and heritage processes have been impacted differently on the three islands. Results put into question archaeological interpretations in the region and suggest a move away from European models of heritage management to make archaeology more relevant for present-day communities and facilitate linkages with the past.

199 **ARCHAEOLOGICAL NARRATIVES, SCALES AND THE ISSUE OF SOCIAL COMPLEXITY**

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Souvatzi, Stella (University of Thessaly) - Mina, Maria (University of the Aegean) - Daems, Dries (Middle East Technical University)

Session format: Regular session

The recent epistemological shift in archaeology from the traditional focus on large scales of analysis towards the inclusion of smaller scales has not always resulted in a congruous historical perspective or in the recognition of the necessity of multi-scalarity. A major obstacle is the maintenance of the Eurocentric view of history, deriving from the grand models of social evolution, as a teleological, linear, cumulative, and inevitable ‘progress’ towards hierarchisation. Consequently, many archaeological narratives equate complexity with hierarchy, take hierarchy as the chief mechanism driving social advances, and contrast complexity with simplicity. Yet, archaeology is continually confronted by processes, trajectories and social choices that do not fit into neat preconceived models.

This session seeks to explore alternative models of social complexity in archaeology in relation to archaeological theories and analytical frames for a historical outlook on past societies. It aims to question top-down approaches and to emphasise that a theoretically informed understanding of complexity needs to address a wider range of issues and scales than those conventionally considered and to embrace perspectives more open and dynamic than the brands of evolutionism which often underlie our interpretations.

Papers focus on one or more of the following issues and draw on case-studies across the world:

- How do we problematise historical process(es) in archaeology? Can a multi-scalar approach be key?
- How do we define social complexity? Can relevant discussions in the social sciences inform us? Can theoretical and computational models help us understand the multi-causal drivers of social complexity?
- Does the classification of societies either as simple (i.e., egalitarian) or complex (i.e., unequal) stand up to the test of contemporary social theory?
- Are social hierarchy, technological advances and gender imbalances concomitant with social complexity?
- How can a new understanding of social complexity inform the construction of archaeological narratives?

ABSTRACTS

1 CONCEPTUALISING LONG-TERM TRAJECTORIES OF SOCIAL COMPLEXITY: CAUSAL MECHANISMS, UNCERTAINTY REDUCTION AND PATHWAYS OF DEVELOPMENT

Abstract author(s): Daems, Dries (KU Leuven)

Abstract format: Oral

Human societies have changed dramatically over the last 12,000 years, from small hunter-gatherer bands to highly urbanized, industrialized, and globally connected societies. These changes are often interpreted as increasing social complexity. Yet, what exactly constitutes social complexity and how it changes over time is not always specified. It is all too easy to perceive this change as an almost teleological sequence of progress and advancement towards a better society. No doubt modern societies have produced many benefits worthy of being characterized as progress. However, by recasting all of history in this light, we run the risk of discarding the past as an inherently inferior and altogether different world. In doing so, we lose out on the benefits of understanding long-term patterns of change (and stability) to inform our present and future.

In this paper, I present a novel conceptual framework of social complexity formation from the perspective of complex systems thinking (Daems 2021). The model is based on the core interrelationship of flows of energy, resources and information, shaped by causal mechanisms of decision-making, uncertainty reduction strategies, and pathways of development. This framework provides a bottom-up approach to social complexity as an emergent property in human societies. I apply this framework in a case study of Anatolia (modern-day Turkey) from Bronze Age to early Roman Imperial times (3000 BCE - 200 CE). It is shown that strong trade-offs exist between multiple mechanisms of decision-making that can help understand causal dynamics in social complexity trajectories. This work will not only improve our knowledge of the past *sui generis*, but also elucidate how understanding long-term trajectories of social complexity can inform trade-offs in decision-making and pathways of development in the present.

2 SOCIAL COMPLEXITY AND EGALITARIANISM: THE CASE OF THE NEOLITHIC SOCIETIES IN GREECE AND TURKEY

Abstract author(s): Souvatzi, Stella (University of Thessaly)

Abstract format: Oral

Mainstream archaeological theory has persistently tended to equate social complexity with inequality and hierarchy, and social dynamics with economic competition. From this often follows the belief that social dynamics and history are primarily driven by self-interest, divisions and antagonism, privileging social asymmetry. At the same time, for reasons difficult to explain, there is an increasing interest in religion or religious ideals over recent years as a prerequisite for building reciprocity or in order to explain co-operative behaviour. This paper argues for a separation of these concepts and explores alternative models of complexity, bringing insights from social theory and using data from the early farming societies in Greece and Turkey. It focuses in particular on the dialectical interweaving between the political and the moral economy and argues that a theoretically informed understanding of complexity and a multi-scalar approach are necessary both to counter the ego-centred nature of many of the archaeological narratives and to understand better historical process without resorting either to modern Western notions or to the brands of evolutionism which often underlie our interpretations.

3 THE EARLY BRONZE AGE OF ANATOLIA: THE ISSUE OF SOCIAL COMPLEXITY

Abstract author(s): Alpay, Ayse (Middle East Technical University)

Abstract format: Oral

One of the major issues in the EBA archaeology of Anatolia is the lack of consensus among scholars on how to define the concept of social complexity and measure it in an archaeological context. The social complexity is often addressed through and in correlation with the development toward urbanisation. Moreover, places, where surpluses were maintained, are interpreted as an indicator of centralised authority. This rather vague and restrictive perspective ignores different possible social systems. This study acknowledges the diversity of social systems. Following Bergman and Beehner's argument, it proposes that the degree of social complexity of a given society should be measured based on the number of differentiated, horizontally and/or vertically, relationships individuals maintain in a society. Following McGuire's argument, the concept is broken down into variables: inequality and heterogeneity to investigate the "differentiated relationship". By doing it, it aims to measure vertical and horizontal stratification and define the nature of the social organisation of the given sites. In this respect, archaeological footprints are categorised into four primary groups: architecture, spatial location and boundary control, artefacts implying different economic activities, and greater access to exotic goods. In this study, examining the EBA settlement of Bademağacı Höyük as a case study, the issue is addressed using an integrated approach combining Space Syntax with investigating artefact distribution and architecture, estimating population and archaeoastronomical analysis. The result reveals that some identifications and definitions made by the excavators need to be re-evaluated. Instead of centralized authority control over the surplus, it asserts here that there are horizontal and vertical social stratifications with lower degrees of heterogeneity and inequality and social leadership-like authority, and the existence of communal storage facilities.

4 POLITICAL ORGANISATION AT THE EARLIEST LOW-DENSITY, EGALITARIAN CITES IN EURASIA: A TRYPILLIA MEGASITE NARRATIVE

Abstract author(s): Chapman, John (independent scholar) - Gaydarska, Bisserka (Durham University)

Abstract format: Oral

After a prolonged archaeological debate over social complexity and social hierarchy, we seem to have made little progress in understanding Holocene societies. Perhaps the time has come to abandon these terms and look at past communities in different ways. A great starting-point for this urgent task is David Graeber and David Wengrow's (2021) book "The dawn of everything", in which the Western model of social evolution is consistently challenged. One of the case studies on which Graeber and Wengrow have based their critique was the Trypillia megasites (or TMS) of Ukraine – sites which constituted the largest sites in 4th millennium BC Europe and were, in our view, the earliest, low-density cities in the world. Here, we build upon our research at the Ukrainian TMS of Nebelivka to discuss the political organisation which enabled the TMS as a phenomenon to survive for over six centuries.

Our over-arching model of Trypillia political economy is developed from the insights published in David Graeber and David Wengrow's (2021) book "The dawn of everything". We start by relating the term 'cultural schismogenesis' to the size and longevity of the Cucuteni – Trypillia group by re-conceptualising the "Big Other" as an extended moral community. We place in the TMS context Graeber and Wengrow's discussion of the three freedoms – mobility, disobedience and imagined worlds – as well as their three forms of domination – military, esoteric knowledge and charismatic leadership. The combination of the presence of these freedoms and the absence of these forms of domination enables the development of egalitarian relations on a hitherto unimagined scale. We close by considering the key questions raised in this session with reference to the TMS.

5 THE 'ORIGINS' OF 'ANCIENT SOCIETY': GENDER AS A GAUGE OF SOCIAL COMPLEXITY

Abstract author(s): Mina, Maria (University of the Aegean)

Abstract format: Oral

The paper aims to explore the validity of evolutionary models that explain gender asymmetries as an effect of growing social hierarchy and thus complexity. In particular, models of social complexity in Aegean prehistory have by and large proposed a progressive evolution towards "civilisation" with signs of growing social hierarchy and, naturally assumed, gender asymmetry. In order to refute the hypothesis that gender inequality is an inescapable condition of social complexity, we need to deconstruct and assess the models that conflate the two phenomena. If hierarchy proves to be an inadequate measure by which social complexity can be detected archaeologically, or if it can be demonstrated that social hierarchy does not presuppose gender asymmetry, it is proposed that we need to seek alternative ways of approaching the evidence. Studying the archaeological record in terms of heterarchical and/or homoarchical social organisation allows us to negate an a priori equation of social complexity with gender inequality and to identify complexity in non-hierarchical formations.

6 ON THE QUESTION OF REGIONAL VARIABILITY - MULTI-SCALAR ANALYSIS OF BRONZE AGE CERAMIC ASSEMBLAGES IN THE EASTERN CARPATHIAN BASIN

Abstract author(s): Parditka, Györgyi (University of Michigan) - Duffy, Paul (Cluster of Excellence Roots, Christian-Albrechts-Universität zu Kiel)

Abstract format: Oral

During the Middle Bronze Age (ca. 2000-1500/1450 BC) the Eastern Carpathian Basin was populated with tell societies of various cultural traditions. Large-scale narratives of Bronze Age Europe assume regional political hierarchies in this region, but an increasing number of micro-regional studies suggests more variability in the social landscape. While the specific organizational forms that these societies represented are still murky, some non-state level societies in the region present more evidence for institutionalized inequality than others.

This presentation focuses on settlements (both tell and shorter-lived sites) in the territory of the Otomani-Gyulavarsánd cultural tradition. The paper compares the use of decorative techniques and stylistic motifs along with investment in ceramic display at multiple scales: within sites, along river valleys, and across the broader Lower-Körös area.

In most narratives, tells are described as socioeconomic centers, the residence of the social elite, and the focus of trade and redistribution. Through the different measures, we aim to evaluate the potential asymmetrical relationships between settlement types and the extent of consistency in cultural traditions across the landscape. This paper aims to demonstrate that a multi-scalar and less tell-centered approach is advantageous in further unpacking the degree of, and variation in, social complexity found in these societies.

7 DISENTANGLING GEORESOURCESCAPES WITH AGENT-BASED MODELLING: THE CASE OF PREHISTORIC SALT MINING AT DÜRRNBERG, AUSTRIA

Abstract author(s): Angourakis, Andreas (Ruhr-University Bochum; University of Cologne) - Boenke, Nicole (Ruhr-University Bochum) - Stöllner, Thomas (Ruhr-University Bochum; German Mining Museum Bochum)

Abstract format: Oral

Georesourcescapes are systems where social practices, carrying material and immaterial culture elements, are intertwined with the environment to appropriate mineral deposits as georesources. However, can we identify mechanisms explaining the formation of a georesourcescape?

We address this question by developing a middle-range theory on a well-studied case, the trajectory of Iron Age rock salt mining at Dürrnberg, Austria (6th-1st century BC). In contrast with Hallstatt, the earlier salt mining site in its proximity with a mining tradition already dating to the Late Bronze Age, Dürrnberg's evidence shows a planned endeavour, where salt played an essential role in most spheres of social and economic interactions. There, salt extraction seems to have fuelled unprecedented intensification, mainly through the multiplication of activities and specialisation, making the settlement a regional hub for exchange and crafts.

The perception of Iron Age mining and central locations, thus the current understanding of the Dürrnberg case, is characterised by recurring narratives of social complexity formulated from top-down perspectives (for example, a functional role of local elites). To test, revisit and improve such narratives, we are developing an agent-based simulation model formulated as a Socio-Ecological Systems (ABM-SES). ABM-SES can shift social complexity narratives towards a bottom-up approach by representing explicit micro-level behaviour (individuals and households) and relating these with higher-level dynamics. Furthermore, ABM-SES enables the breakdown of the overarching concepts into heuristically separable parts, both environmental and social, and articulates the uncertainties about social organisation into a formal exploration of hypotheses and scenarios. What micro-level factors, possibly not yet considered in the archaeological research, could be involved in forming the Dürrnberg georesourcescape? In this paper, we present our preliminary answer to this question, a schema representing salt mining as it is entangled with other activities and aspects in transversal domains, such as demography, food economy, and social structure.

8 DECONSTRUCTING CULTURAL ESSENTIALIST NARRATIVES: TRANSLOCALITY AS AN ANALYTICAL TOOL FOR CAPTURING ECLECTIC COMPLEXITY IN ARCHAEOLOGICAL MATERIALS

Abstract author(s): Zhao, Chunrong (Utrecht University)

Abstract format: Oral

Cultural essentialism, as a colonial legacy, often serves as a ground for evolutionary perspectives in archaeological narratives. It reductively assumes the fundamental differences and distinct delimitations between Western culture and non-Western cultures, ignoring and obscuring the complexity within both the essentialized categories of "the West" and "the non-West." In the context of colonialism, cultural essentialism has become a theoretical basis of the Eurocentric evolutionary view of history, elevating Western culture and devaluing non-Western cultures, empha-

sizing that culturally backward non-Western cultures are destined to evolve towards culturally progressive Western culture, thereby exculpating colonialism. However, cultural essentialist narratives with overtones of evolutionary value judgments still persist today. Such persistence of the essentialist narratives highlights the urgency of adopting new conceptual tools, not only to decolonize our mindsets but also to reconstruct a more productive and unbiased theoretical framework for analyzing archaeological materials and re-evaluating social/cultural complexity. This paper aims to challenge traditional evolutionary views of history and cultural essentialist narratives. Meanwhile, it also suggests that the concept of 'translocality' might be a promising analytical tool for us to capture cultural eclecticism, which can be one of the criteria worth adopting for measuring social/cultural complexity in archaeological material cultures. Based on the reflections on transcultural theory and the case study of Vajrapāni's images in Gandhāra archaeological materials, the author argues that the concept of translocality can encourage us to attend to the complexity of cultural exchanges and to resume the subjectivities and agencies of local cultures.

9 A 'LIVING MOUNTAIN' LANDSCAPE - SIMULATING BEHAVIOURS AND ADAPTATIONS TO AN EARLY HOLOCENE MONTANE ENVIRONMENT IN THE CAIRNGORMS, SCOTLAND

Abstract author(s): Butler, Micheál (University College Dublin) - Doughty, Alice (University of Maine) - Kelley, Sam - Warren, Graeme (University College Dublin)

Abstract format: Oral

The ephemerality of hunter-gatherer archaeology is well established, with the means to identify sites and evidence often restricted as a result. This difficulty is compounded by the range of environments which prehistoric hunter-gatherers inhabited and interacted with, meaning that survey work has different potentials and problems in different landscape types. This is especially true for locating hunter-gatherer archaeology in mountain landscapes. A small number of sites have been identified by chance finds and small scale survey work in the Cairngorms, Scotland. Conventional archaeological investigations have been conducted at these sites (see Warren et al, 2018), but further work is needed at a landscape scale in order to identify the extent at which these environments were used during the Mesolithic. Given the challenges of archaeological survey in these landscapes we have developed an innovative and interdisciplinary predictive model of archaeological potential.

The Irish Research Council funded 'Looking Up' project (2022-2023) uses a coupled, GIS predictive modelling and agent-based modelling (ABM) framework which allows us to engage with the dynamic post-glacial environment. Changes in glacial cover and extent established by a new programme of dating and modelling of deglaciation further dictates movement and interaction across these landscapes, simulating these at human time-scales. Furthermore the construction of these coupled predictive ABM models will be used to facilitate the development of recommendations for the management and conservation of these mountain landscapes. This exemplifies well the utility of agent-based models, as not just an explorative tool, but also its place in policy making efforts - much the same as GIS predictive modelling has for the last several decades.

10 AGENT-BASED SIMULATIONS OF FORAGING BEHAVIOUR IN ARID ECOSYSTEMS: AN EMPIRICAL APPROACH

Abstract author(s): Paliou, Eleftheria (University of Cologne) - Angourakis, Andreas (University of Cologne; Ruhr-Universität Bochum)

Abstract format: Oral

Simulations of hunter-gatherer mobility and behaviour are frequently used in archaeology to shed light onto the subsistence strategies, survival resilience and social development of early human societies. Integral to these models are foraging practices that would have been determined by socio-ecological dynamics. Nonetheless, the archaeological record offers only sparse and indirect evidence of such practices, which makes theory and model building on foraging behaviour particularly challenging for archaeologists. Despite some valuable insights gained from ethnographic research, several aspects of human-environment and human-animal interactions in the context of traditional hunting practices (i.e. hunting on foot, with a bow and arrow as opposed to firearms, and without orientation instruments) are still poorly understood. This paper will discuss how empirical datasets on traditional hunting practices, obtained in the framework of an interdisciplinary and collaborative project that brings together archaeologists and indigenous hunting experts, can support archaeological simulation modelling. The project offers a rare opportunity to capture using geospatial technologies the movements of Ju/'hoansi and Hai//kom San game tracking experts during hunting bouts in arid landscapes in Namibia. During four field seasons, which took place between 2019 and 2022, a variety of georeferenced quantitative data (including movement trajectories, heart rate, caloric expenditure, and wind data), as well as qualitative information on decision-making during hunting were collected. This paper will discuss how these datasets

can be used to support the conceptualisation, calibration and validation of agent-based simulations of hunter-gatherer behaviour in arid ecosystems. More specifically, we develop models that aim to explore the interplay between ecological changes and foraging decisions and test different scenarios of human-animal and human-environment interactions in varying environmental conditions. Our work seeks to examine aspects of environmental sustainability and biodiversity that are relevant to past hunter-gatherer societies, as well as modern populations in our study area.

202 USING EARTHEN ARCHITECTURE AS AN EXCUSE: PRODUCTIVE AND SOCIAL PRACTICES IN PREHISTORIC AND PROTOHISTORIC BUILDING

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Pastor Quiles, María (Universidad de Alicante) - Ruano Posada, Lucía (Universidad Complutense de Madrid) - Sánchez Polo, Alejandra (Universidad de Salamanca) - Mateu Sagués, Marta (Institut Català d'Arqueologia Clàssica) - Péfau, Pierre (Université Toulouse Jean Jaurès)

Session format: Regular session

This session aims to tackle the archaeological detection and study of productive and social activities and practices involved in building processes during prehistoric and protohistoric times. For this we acknowledge the central role of studying earthen architectural remains and structures and all the information they may contain, also about other building components. At the same time, we intend to use earthen architecture as an excuse to explore the whole range of building materials available, such as wood, wattle, grass, stone, etc.

We seek case studies that address the chaîne opératoire of pre- and protohistoric building processes, from obtaining, selecting, preparing, transforming, and producing construction materials (including recipes), to their storage, protection, reuse, transport, and exchange. Also the steps and gestures involved in the construction itself, decoration of the built spaces and structures, use and maintenance. Finally, the abandonment of buildings and related practices can also be part of the discussion.

Multidisciplinary contributions coming from different methodological approaches are welcome, especially those focused on social practices of building activities, from macro to microscopic analyses, like geochemistry, archaeobotany, or archaeometry. We are also looking for presentations from experimental archaeology or ethnoarchaeology, which can provide insight in aspects such as choosing and preparing the space for a new building, on foundation, inauguration or “coronation” practices (a less known part of the building processes that can also leave a material trace, through offerings and additions, and be detected in archaeological contexts).

We seek to bring together diverse research around these topics, from case studies to comparative analyses and synthesis with a wider scope, trying to shed light also on the environmental, material as well as cultural and identity factors behind specific building practices.

This session will be complemented with the Workshop “Unsolved case studies of earthen architectural remains: a workshop to share experiences”.

ABSTRACTS

1 BUILDING A MESOLITHIC HUT: A SOCIAL INTERACTION ANALYSIS OF COORDINATED ENGAGEMENT WITH THE MATERIAL ENVIRONMENT

Abstract author(s): Wilton, Antje (Free University of Berlin) - Hochuli, Kenan (University of Zürich)

Abstract format: Oral

This contribution addresses the interactional and collaborative processes occurring during the construction of a prehistoric building. The project is part of a larger study using space-based multimodal interaction analysis (Hausendorf, Schmitt & Kesselheim 2016) to study the interactional appropriation of past architectural spaces. In interaction analytical work, the structure of architecture and landscape is considered a resource that participants can draw upon in organizing their activities (McIlvenny et al. 2009). However, participants are not entirely free in adapting their activities to the ecology: architecture as well as the structures of natural habitats (Uexküll & Kriszat 1934) make some forms of perception, locomotion and coordination more likely than others, thereby influencing interactions between humans within a material environment. The project is based on audiovisual recordings of the building of a Mesolithic hut (Cziesla 2019) by a group of experts (experimental archaeologists) and laypeople (students and visitors) during a citizen science event at the Freie Universität Berlin. The recordings document three perspectives: the external observer's perspective (static camera), the internal observer's perspective (mobile camera) and the internal participant's perspective (bodycams). This allows for the analysis of all interactional activities that participants employ during the building process, including decision-making (e.g. through visual and haptic exploration of materials accompanying verbal interactions), giving instructions (e.g. by directives and/or gestural means) and coordinating actions (e.g. by

aligning verbal and embodied actions). The analysis reveals the sequential integration of semiotic, interactional, material and spatial resources in the building process, shedding light on the social and communal aspects of such activities as a way of place-making (McFayden 2008). One aim of the project is to explore possibilities for inferring past building practices and space usage through the analysis of present-day interactions. Thus, we seek the interdisciplinary exchange to explore common theoretical ground and to refine our methodology.

2 EARTH MORTAR USE ON EARLY NEOLITHIC DOMESTIC STRUCTURES IN THE IBERIAN PENINSULA: EMPIRICAL CHALLENGES AND EVOLUTIONARY PROSPECTS

Abstract author(s): Gómez-Puche, Magdalena (Universidad de Alicante, I.U.I. Arqueología y Patrimonio Histórico - INAPH) - Polo-Díaz, Ana (Maria Zambrano Fellow at Universidad del País Vasco / Euskal Herriko Unibertsitatea)

Abstract format: Oral

Prehistoric daub remains have attracted increasing attention from scientific community in the last decade. Innovative lines of research have been carried out studying earthen architecture at different analytical scales. Despite this promising rise, many aspects regarding identification, interpretation and conservation of daub fragments still are on its infancy and require specific and standardized protocols for addressing a holistic interpretation of this particular type of archaeological material.

Precisely, the discovery of an Early Neolithic earthen domestic architecture that had remained invisible until recent times, has taken on a new prominence. Debris of hardened earth have provided the first direct evidence houses and other domestic furniture.

In this contribution we aim to characterize the Early Neolithic architecture techniques in the Western Mediterranean basin, with special focus on earth mortar remains. The data sets come from the Early Neolithic sites of El Barranquet (Valencia, Spain), Mas d'Is (Alicante, Spain) and Los Cascajos (Navarra, Spain). These are key sites in the research agenda: first, because they refer to different Early Neolithic ceramic groups (Sillon d'Impressions for Barranquet; Sillon d'Impressions and Cardial for Mas d'Is; Cardial and Epicardial for Los Cascajos) and second, because they represent the oldest Neolithic villages in each one of the regions (Barranquet and Mas d'Is for the Valencian region and Cascajos for the Upper Ebro river valley).

Using a multidisciplinary and multiscale approach, combining micromorphological and macroscopic analysis, we will specifically investigate the building materials and constructive techniques of Early Neolithic houses and we will explore their evolutionary implications in the field of demography and social organization of Early Neolithic farming groups.

3 RONDELS: LABOUR AND DESIGN

Abstract author(s): Dickie, Caitriona (Kiel University)

Abstract format: Oral

The neolithic rondel or circular ditched enclosure building phenomenon spread across central Europe during the fifth millennium BC. The rondels range in size and design complexity but all feature a concentric pattern of single or multiple ring-shaped ditches with a variety of entrance/exit style types, often featuring wooden palisade structures.

Utilising two rondel databases (Ridky et al. 2019, Literski & Nebelsick 2012) and neolithic labour cost calculations (Kerig, 2008) the estimated required hours of labour involved in the construction of 44 of these monumental earth-work features has been calculated. In addition, the caloric input required for these construction projects has been calculated. These calculations contribute to a demographic understanding of neolithic labour forces. Additionally the design elements such as the shape, size, and complexity of the rondels further provide insight into transmission of knowledge with regard to both building practices and likely to the intended function of these features across a wide study area.

4 COB BALLS OF THE BRONZE AGE: A COMBINED STUDY OF THEIR PRODUCTION AND USE IN THE SOUTH-EASTERN IBERIAN PENINSULA

Abstract author(s): Pastor Quiles, María (University of Alicante; Catalan Institute for Classical Archaeology) - Mateu, Marta (Catalan Institute for Classical Archaeology)

Abstract format: Oral

Among the study of earth building techniques in archaeological contexts, the implementation of puddled and/or stacked mud units or modules is quite an invisible one. This contribution presents a multi-approach comparative study of a selection of these remains coming from different settlements dated back to the first centuries of the 2nd millennium BC in the south-eastern area of the Iberian Peninsula. Macrovisual observations reveal differences and similarities between sites in how these building elements were prepared, put in place, and put together with other construction materials. Of different forms and sizes, these cob balls were in some cases made of sediment that con-

tained reused materials, such as bone and ceramic remains. In other instances, these modules were applied on reed panels or were covered with coatings. They would have been used to erect Bronze Age buildings, in walls, roofs, or in non-portable structures that fitted out these spaces. Combining different perspectives of analysis, with micromorphological observations, experimental tests and ethnoarchaeological data, this study aims to deepen our knowledge on the technical and productive aspects of this earthen technique and how it was applied. In addition, it also wants to reflect and raise hypothesis on how this way of building developed among those prehistoric communities.

5 CONSTRUCTIONS IN RAW EARTH IN THE BRONZE AGE NAVETIFORMS IN MALLORCA: NAVETA 1 OF CLOSOS DE CA'N GAIÀ

Abstract author(s): Bergadà, M. Mercè - Carbonell, Joan (SERP. Dept. Història i Arqueologia. Universitat de Barcelona; IAUB. Institut d'Arqueologia de la Universitat de Barcelona) - Mateu, Marta (ICAC. Institut Català d'Arqueologia Clàssica; IAUB. Institut d'Arqueologia de la Universitat de Barcelona) - Servera, Gabriel - Javaloyas, David (ArqueoUIB. Dept. Ciències Històriques i Teoria de les Arts. Universitat de les Illes Balears)

Abstract format: Oral

In this study we present the micromorphological analysis of the stratigraphic sequence of naveta 1 of Closos de Ca'n Gaià (Felanitx, Mallorca). This archaeological site is a settlement whose domestic buildings – the navetiforms- were constructed by a cyclopean technique and arranged in a dispersed manner with similar orientations from S to SE. Naveta 1 is an elongated, U-shaped structure, 16 m long and 7 m wide at the façade, with walls 2 and 3 m thick, while its height does not exceed 1.5 metres.

A sequence of 4 phases has been identified: a) before the construction of the monumental structure (ca. 1700 - 1500 BC); b) phase 1 (ca. 1500 - 1000 BC); c) phase 2 (ca.1000-850 BC) and d) post-abandonment (after ca.850 BC).

The microstratigraphic study carried out covers the entire sequence of the naveta and we can deduce, especially from phases 1 and 2, that these communities used different hand-shaped earth construction techniques in situ, applying two systems: the stacking or overlapping of layers in the form of earth lumps, cob balls, and the wattle and daub. The cob balls are the most dominant in the sequence analysed, probably used as render for the stone floors or simply as floors. Remains of domestic activity are also found, specifically in unit SU9s in phase 2.

The materials used come from the same environment as the site, and it is possible that in the wattle and daub there was a greater selection of clayey material.

Post-depositional processes, such as bioturbation, mainly the biological activity of the soil fauna, have accentuated the degradation of these earth raw materials, which makes their characterisation difficult, as is the case in other archaeological sites from temperate environments.

6 THE BRONZE AGE SETTLEMENT AT BRECCIARA (SERRACAPRIOLA-FOGGIA, ITALY). BUILDING STRATEGIES, TRADITION, REUSE AND RENOVATION

Abstract author(s): Bianchi, Paola Anna Elena (Freelance Archaeologist) - Oione, Domenico - Muntoni, Italo M. (Soprintendenza Archeologia, Belle Arti e Paesaggio per le Province di Barletta-Andria-Trani e Foggia) - Liseno, Maria Grazia (Nostoi s.r.l.) - De Giovanni, Davide - Giuliani, Biagio - Pedico, Luisa - Ruggeri, Daria - Torre, Martina (Freelance Archaeologist)

Abstract format: Oral

Dating back to the Bronze Age, the multi-layered site of Brecciara is an important settlement at the centre of the lower valley of River Fortore, close to the coastal line in Puglia (Southern Italy).

Discovered thanks to preventive archaeology for the construction of the Termoli -Lesina Railway, the site has been the subject of large - scale excavation in 2020-2021.

The abandonment in situ of buildings or structured areas is exceptional due to catastrophic events as fire or sudden obliteration: earthen floors, timber / earthen walls, foundations / load - bearing elements with part of the elevation, internal divisions, and hearths.

Around the middle of the 2nd millennium BC, distinct phases of dwelling, craft activities or areas of domestic activities are observed: different plans and use of building materials, gullies, post- holes, and stone or timber foundation. Raw earthen remains identify the perimeter of the houses.

Remains of walls, such as burnt earthen or raw material, can be associated with internal divisions. Later houses, connected to outdoor areas with furnaces and stone structures, have apsidal plans and well explain the dynamics of reuse of space, building materials and choices in the construction and demolition. Large and articulated overlapping system of fire features are another characteristic of the settlement. Space organization focuses on a large sub-circular fire

platform, with multiple preparation levels, and other related combustion features. A crawl space, made of thousands ceramic fragments, refers to the preparation and levelling layers.

This paper presents preliminary archaeological considerations, aspects of technical and conservation characteristic, composition and gesture and intentionality in building dynamics, about selected example of earthen raw material, timber / daub, stone use (selection, re-use, and stone / features), discarded material as building material (pottery, metals, other materials).

7 INTERACTIONS AND CONTINUITY: CHARACTERISING EARTHEN BUILDING TECHNIQUES OF THE IBERIAN NORTHERN PLATEAU IN A TRANSITIONAL PERIOD (LBA-EIA)

Abstract author(s): Ruano, Lucía (Universidad Complutense de Madrid) - Sánchez Polo, Alejandra (Universidad de Valladolid)

Abstract format: Oral

The transition between the Late Bronze Age (LBA) and the Early Iron Age (EIA) in the Northern Plateau of the Iberian Peninsula (ca. 1100-800 BC) is a period of great change, marked by a shift in the socio-economic structure of the local human groups, promoted by meridional and easter contacts. This process is reflected in the farming practices, as well as the emerge of a renovated ceramic repertoire and new kinds of settlements and building techniques: while LBA sites are characterised by isolated wattle-and-daub huts, EIA villages are dominated by mudbricks buildings. However, this is not a radical change, because for three centuries, villagers experimented with the new building techniques, an idea supported by the presence of both systems in the same settlements, as well as mixed techniques.

Although much has been written about these changes, earthen architecture has been dramatically understudied in this context, which leads to a conceptual confusion that overlooks the socio-economic practices involved in the different construction processes. Through a multidisciplinary study of a selection of earthen remains from several settlements, this contribution aims to characterise the building traditions used in the Northern Plateau during Late Prehistory. Discerning the operational construction chains and their implementation can help us to better understand these social and demographic changes, which seem to indicate a progressive adaptation of local traditions to outside innovations.

8 PRODUCTION, STORAGE AND ABANDONMENT PRACTICES AT LATE BRONZE AGE ERIMI PITHARKA, CYPRUS

Abstract author(s): Recht, Laerke (University of Graz) - Zeman-Wisniewska, Katarzyna (Cardinal Stefan Wyszynski University, Warsaw) - Mazzotta, Lorenzo (University of Salento)

Abstract format: Oral

The Late Bronze Age site of Erimi Pitharka presents a range of architectural practices and strategies related to production, storage and abandonment. While walls have foundations and lower parts made of drystone, structures are created by levelling, shaping or digging into the natural limestone bedrock. In some places, deteriorated mudbrick was used to make a level surface on which to align walls. Elsewhere, subterranean and semi-subterranean installations were carved out of the bedrock - including a range of sizes and shapes, from bathtub-sized features to fully subterranean caves several metres deep and with separate carved chambers. These features appear to be a means of taking advantage of the local environment for production and storage purposes: the bedrock is also carved into as a direct setting for facilities such as pithoi (for which the site also receives its name). Finally, the site was abandoned and almost entirely cleaned out, with mainly heavy and large material culture left behind. Some rooms appear to have doorways deliberately blocked with stones, and the interior filled with deteriorated mudbrick material. We would be particularly interested in discussing with colleagues and comparing these practices to those at other sites, in particular in terms of the strategies employed in relation to the environment, storage and production.

9 EARTHEN REMAINS WITHOUT HABITAT CONTEXT RECOVERED IN IRON AGE SILOS IN COASTAL CATALONIA: AN INTERPRETATIVE CHALLENGE

Abstract author(s): Canela-Gracia, Joan - Belarte-Franco, Maria Carme - Corrales Soberino, Antoni - Mateu, Marta (Catalan Institute of Classical Archaeology) - Pastor Quiles, María (Universitat d'Alacant; Catalan Institute of Classical Archaeology)

Abstract format: Oral

Silos are an underground storage system attested in north-eastern Iberian Peninsula since the Bronze Age to the romanization. They served mostly to storage cereals for several years, and then were abandoned and filled with debris from the habitat located in their vicinity, or reused for other purposes. This storage structures were often arranged in important extensions named silo fields, mostly located in plain areas with sedimentary soft rocks. These areas have

been for long cultivated; as a result, settlement remains have been largely flattened. The inferior part of silos are thus the only remains for most of these sites, for which domestic buildings are rarely preserved. Nevertheless, silos are an important source of information, as they were filled with any sorts of materials: consumption remains, domestic pottery and utensils, building materials, etc. Some of them also served as pits for ritual depots.

The excavation of a group of Early Iron Age silos at Mas Cap de Ferro (Nulles, Tarragona, Spain) archaeological site allowed to recover a set of earthen materials of different kinds and functions: an adobe block, fragments of wattle and daub, floorings or wall finishing (some of them decorated), and several objects of an unknown use. We aim to reconstruct the functions of these materials by comparing them with those recovered in other contemporaneous sites. However, many questions on their use remain unsolved.

10 INVESTIGATING THE SOCIAL ORGANISATION OF NURAGIC COMMUNITIES THROUGH THE ARCHITECTURAL REMAINS: THE CASE OF SOUTH MONTIFERRU AND NORTH CAMPIDANO REGIONS

Abstract author(s): Pisanu, Laura (University of Melbourne)

Abstract format: Oral

Over the Middle Bronze and Early Iron Age (16th – 10th century BC), the human occupation of Sardinia (Italy) is known as having been part of the Nuragic civilization, whose name comes from the nuraghes, which were towers. The abundance of building materials and the use of a dry-stone construction technique enabled Nuragic groups to construct simple towers, complex systems of nuraghes, settlements and collective monumental tombs across the whole Island. All these monuments resulted in the organisation of a specific geographic, social, and cultural milieu whose architectural expression and symbolic value might have been at the basis of the creation of a monument-oriented islands, such as supposed by previous scholarship.

In this scenario, a large number of complex nuraghes and a monumental burial area were built at the southern Montiferru and northern Campidano regions (central-western Sardinia). It is assumed that this phenomenon is related to a hierarchical organisation of groups living around the towers and exploiting local natural resources. However, architectural remains and geographical locations of these ancient buildings, as well as the shared management of construction materials, could suggest hypotheses different from the one based on nuraghes as reflection of authority among individuals belonging to the same group. Hence, using data collected during fieldwork activities and spatial analysis, this paper aims at illustrating social factors and communities' decision-making that might have been behind the buildings of monuments at the above-mentioned regions.

11 FOLLOWING THE PHOENICIANS: THE #BUILDINGINNEWLANDS PROJECT AND THE STUDY OF EARTHEN ARCHITECTURE THROUGH THE MEDITERRANEAN SEA

Abstract author(s): Lorenzon, Marta (University of Helsinki) - Cutillas-Victoria, Benjamín (University of Murcia; NCSR Demokritos)

Abstract format: Oral

Phoenician colonization of the Mediterranean is a complex phenomenon that involved migration, circular economy, and environmental adaptation, which characterized the first half of the 1st millennium BC. Groups of displaced Phoenician communities settled and prospered in the Central Mediterranean and the Atlantic coast, adapting their knowledge and experience to unfamiliar landscapes and resources. In these settlements, earthen architecture buildings and fortifications stand out as one of the most significant archaic Phoenician remains, following vernacular Levantine practices and showing the environmental challenge of thriving in new territories. However, earthen architecture has been traditionally understudied, preventing the analysis of the enormous cultural, economic, and ecological source of information that may shed light on the challenges and opportunities faced by local and migrant communities.

The project "Building in new lands: Sustainable Phoenician architecture and environmental adaptation along the Mediterranean" focuses on analyzing Punic and Phoenicians earthen remains in the Central and Western Mediterranean. Our research aims to study the modes of cultural relationship, identity development, and environmental interaction between the displaced Phoenician communities through the analysis of earthen building materials. Our interdisciplinary methodology combines traditional archaeological techniques and geoarchaeology (e.g. XRF, pXRF, XRD, SEM-EDS, OM, GS, CHN, TG, eDNA, phytoliths, etc.). To conduct this research from a multi-scale perspective, several archaic Phoenician and Punic sites from Tunisia, Italy, Spain, and Portugal have been selected, providing new data about raw material procurement, manufacturing choices, technology, labor organization, and architectural evolution from different Mediterranean scenarios connected by the same link. Our presentation in the sessions will address the objectives and perspectives of the project, as well as present the preliminary data and its archaeological implications.

12

CONSTRUCTION TECHNIQUES AND CULTURAL PATTERNS IN THE EARLY IRON AGE SETTLEMENT OF SANT JAUME D'ALCANAR (CATALONIA)

Abstract author(s): Garcia i Rubert, David (GRAP-University of Barcelona / Institut d'Arqueologia - IAUB) - Mateu, Marta (ICAC; GRAP-University of Barcelona / Institut d'Arqueologia - IAUB) - Saorin, Carme (GRAP-University of Barcelona / Institut d'Arqueologia - IAUB) - Carbonell Pastor, Sonia (University of Alicante; GRAP-University of Barcelona / Institut d'Arqueologia - IAUB)

Abstract format: Oral

This communication presents a comprehensive study of the construction techniques used in the Early Iron Age building of Sant Jaume (Alcanar, Catalonia) (ca. 800-500 BC), a fortified settlement with an unusually pseudo-circular ground plan, stone walls and a foundation system that gives the whole complex robustness. The different rooms that structure the internal space of the building had a first floor or storey (wattle and daub technique), and the roofs, which are currently being studied, may have had a primarily vegetal character.

The building was destroyed by fire, after the inhabitants themselves or the attackers had taken the most valuable objects. This fire caused a destruction and sedimentation that is very characteristic of this site, as well as the preservation of many structural remains that, due to their nature, would not have been preserved otherwise: earthen coatings (some painted), roofs, beams, stored building materials, floors, etc.

The study carried out involved the use of various analytical techniques (stratigraphy, micromorphology, photogrammetry, etc.). We have also presented preliminary results on the chaîne opératoire of architecture: questions relating to the provenance of raw materials and the construction techniques used, as well as their cultural characterisation. The way in which architecture and landscape are conceived is inextricably linked to the traditional knowledge and practices of social groups. We have also defined the cultural significance of the use of certain construction techniques and forms in Sant Jaume, understanding that culture is nothing more than a set of phenomenal features that, like other archaeological objects, reflect the changes that occur in the social and economic spheres of human groups. Whether it is earth, stone, or other raw materials, it is the way in which the materials have been modified and used that shows the persistence or change in the communal activities of a human group.

13

SHAPING THE BUILT ENVIRONMENT OF BRONZE AGE CYPRUS. MULTI-SCALAR ANALYSIS OF TECHNOLOGICAL CHOICES AND SOCIAL PRACTICES IN EARTHEN BUILDING CONSTRUCTION

Abstract author(s): Amadio, Marialucia (Ghent University)

Abstract format: Oral

Current studies of the built environment in Bronze Age Cyprus are largely based on the classification and description of architectural components, building structures and settlement layouts, with little consideration of the complex interplay between space and society. In particular, studies of Late Bronze Age Cypriot architecture (ca. 1700-1100/1050 BC) often focus on the monumental structures of urban settlements as stage backgrounds for socio-political events, paying less attention to the creation of social relations through the activities and interactions that took place during the process of construction. As a result, Late Cypriot monumental architecture is often considered as a product of external influences, underestimating the input of local technological expertise. In this paper, I propose to reassess the architectural evidence of Late Bronze Age Cypriot contexts by analysing new data on earthen building structures of the previous, pre-urban period on the island and to provide new evidence pertaining to social and technological practices associated with building construction activities. I want to demonstrate how technological know-how was progressively established in local communities through the sharing of technical knowledge and ongoing experimentation. The research presented here is based on a multi-scalar analysis of mudbricks and plaster materials collected at the Middle Bronze Age settlement of Erimi (ca.1950-1650 BC) that integrates macro-scale examinations with microscopic applications (i.e., micromorphology, XRF and FTIR). The results suggest that supra-household forms of labour were emerging in construction activities in Middle Bronze Age Cyprus, leading to a progressive specialisation in building techniques. This acquired technological know-how would constitute a premise for the construction of the Late Bronze Age urban centres on the island.

14

FIRE/EARTH/PEOPLE. AN ARCHITECTURAL AND GEOARCHAEOLOGICAL STUDY OF THE MALIA PALACE EARTHEN BUILDING MATERIALS

Abstract author(s): Devolder, Maud (Ghent University) - Lorenzon, Marta (University of Helsinki)

Abstract format: Oral

In Bronze Age Crete the Palace at Malia is a rare example of Minoan architecture where sun-dried mudbricks are preserved on such an extensive scale. This is mainly due to the conflagration events that the building endured throughout its long life. These events 'froze' the earthen walls and their mud coating, thus providing us with a wealth of informa-

tion on Minoan building materials and techniques. In this paper, we want to present the results of our study of the macro- and microscopic features of the Palace mudbrick walls. Macroscopic observation of the individual mudbricks and their bricklaying techniques is combined with geochemical analyses (pXRF, XRD, SEM-EDS and FT-IR) and the petrographic study of mudbrick samples. These indicate a general diachronic consistency in soil procurement and building practices. But they also show strong variability within the processing of the raw materials mixing, the selection of vegetal temper, and the production chain that affects the quality of individual mudbricks and walls forming the early Late Bronze Age Palace. The clustering of such variations in separate architectural units suggests that the late 17th c. BC Palace at Malia was erected by different building teams, with no mass-production of mudbricks to be used indifferently in the various parts of the edifice. Considered against the architectural sequence of the Palace and set in perspective with other masonry types, our multi-scale approach provides meaningful insights regarding the craft-people and labourers who participated to this monumental building project and its compartmentation in separate architectural units.

15 WHERE WAS THE RAW EARTH TRANSFORMED? MICROMORPHOLOGICAL ANALYSIS OF THE FT-1625 STRUCTURE OF THE FORTRESS OF ELS VILARS (ARBECA, SPAIN)

Abstract author(s): Carbonell Roca, Joan (Seminari d'Estudis i Recerques Prehistòriques - SERP, Universitat de Barcelona; Institut d'Arqueologia de la Universitat de Barcelona - IAUB) - Alonso Martínez, Natàlia (GIP, 3DPatrimoni, Departament d'Història, Fac. de Lletres, INDEST, Universitat de Lleida) - Bergadà Zapata, M. Mercè (Seminari d'Estudis i Recerques Prehistòriques - SERP, Universitat de Barcelona)

Abstract format: Oral

This paper shows the results of a micromorphological study carried out in a moat (FT-1625) of the Iron Age at La Fortalesa dels Vilars d'Arbeca (Arbeca, Lleida, Spain). Located in front of the East Gate, during its excavation it was interpreted as a defensive moat. Its stratigraphy showed a succession of brown and grey layers, as well as signs of having contained water.

The micromorphological study allowed us to characterize the stratigraphic sequence, which is made up of debris layers, water circulation levels, and raw earth layers. We have determined six types of microfacies, which have been put in their temporal and stratigraphic context. The results show that the structure was first used to store water, most probably channeling rainwater from inside the site. Later, and in relation to an urban reform of Vilars, the structure was used to process raw earth.

Although much progress has been made in the identification and understanding of earthen buildings and structures, as well as the different steps that make up its chaîne opératoire, there are few archaeological cases of storage and processing raw earth. The FT-1625 moat shows an archaeological case with clear evidence of a space dedicated to the elaboration of raw earth.

With the presentation of this work, we want to improve the understanding of the chaîne opératoire of raw earth during the protohistory, but also to provide information to understand the daily life in the Iron Age.

16 EVOLUTION OF SELF-SUPPORTING VAULTS IN MEDITERRANEAN PROTOHISTORY: A GEOMETRIC AND CONSTRUCTIONAL ANALYSIS OF VAULTS WITHOUT WOOD FORMWORKS

Abstract author(s): Carranza Peco, Luis Miguel (CSIC) - Fortéa Luna, Manuel (Universidad de Extremadura) - Rodríguez González, Esther - Celestino Pérez, Sebastián (CSIC)

Abstract format: Oral

Among the alternatives for covering earthen buildings, some types of domes and vaults are the most economical and simplest in their execution. Of all these, vaults executed without wood formworks were the most deeply rooted in the ancient Near East, with some examples, such as the one at Tell al-Rimah (Iraq), showing the transition from round to square and rectangular plans. This type of vaulting spread throughout the Mediterranean has been attributed to the Byzantine period. However, the Phoenician expansion spread architectural typologies from the Levant as early as the 1st millennium BC. In fact, in the Southwest of the Iberian Peninsula, evidence of vaults has been found as a resource used by the societies of the Early Iron Age, the case of the site of Casas del Turuñuelo (Guareña, Badajoz) is the earliest example. Consequently, here we raise the possibility that, like other elements of material culture and architectural solutions, vaults without shoring reached the far west in the protohistoric period.

This paper invites a re-evaluation of the architectural evidence for the existence of vaults in the protohistory of the Mediterranean. Furthermore, we also warn about the confusion that exists between the process of elaboration, the mechanical characteristics, the geometric study and the constructive complexity of the vaults. It is precisely the combination of the geometry with the materials found in archaeological contexts, mortars and rigging, indicating which solutions would make sense and which should be discarded. From there, the different situations must be studied to see which one is relevant regarding the recovered archaeological remains.

17 **ADOBES, ADOBES AND MORE ADOBES: SOCIAL PROCESSES OF CONSTRUCTION AND DESTRUCTION DURING EIA AT CERRO DE SAN VICENTE (SPAIN)**

Abstract author(s): Sánchez Polo, Alejandra (Universidad de Valladolid) - Padilla-Fernández, Juan Jesús - Blanco-González, Antonio (Universidad de Salamanca)

Abstract format: Oral

Early Iron Age (EIA) (7th-4th centuries cal BC) domestic architecture of northern inland Iberia is well known from its villages, made up mostly of circular adobe structures. The outstanding tells created by centuries of rebuilt houses and the early urbanism revealed by the settlements may be some of the reasons for not paying attention to other aspects of the construction details. So, productive processes involved in the building of houses and the symbolic gestures of their final dismantling are understudied topics.

This contribution is focused on the productive and social organizations involved in the construction and -intentional- destruction of House 1 located in the site of Cerro de San Vicente (Salamanca, Spain). For this purpose, more than 200 adobes extracted from its amortization have been examined macroscopically and archaeometrically. Their production process has been analysed from the clay supply to the composition of the mud recipes and the different sizes of the moulds. The marks or fingerprints left by the producers on the clay still fresh -whether to increase the adhesion between adobes, to distinguish the individual and family identities of the producers, or without motivation-, get us closer to the people that participated in those processes. Other traces inform about the spaces in which these adobes were kneaded and left drying as unique places full of intergenerational and social interaction.

Finally, at the end of its biography, House 1 was burned, dismantled, and filled up with its own mudbricks, but how did that process occur? This last stage in the social life of the adobes will also be re-evaluated to understand the agencies involved in these complex processes.

18 **A PROPOSITION OF MUDBRICK CHAÎNE OPÉRATOIRE AT THE HEUNEURG IN 600 BC**

Abstract author(s): Remise, François (Independent researcher)

Abstract format: Oral

Production time of mudbricks in the antiquity has been so far poorly studied, despite the fact that over thirty Architectural Energetics studies using mudbricks production labour rates have already been carried out. In 2016, for my Master thesis, I made a first attempt to analyse all the labour rates drawn from the literature and I proposed a model to estimate the mudbrick production rate when taking into account the working site conditions.

In this paper, I propose a new model to estimate the total mudbrick production time, logically adding the successive stages times of the mudbrick production process.

Then I use this model to estimate the mudbrick production and installation times of the Heuneurg fortification built around 600 BC in southwestern Germany. I propose a model of organisation the Heuneurg community had to establish for the whole chaîne opératoire, from preparing the mud to installing the mudbricks in the fortification.

19 **BURNING WATTLE-AND-DAUB DWELLINGS TO THE EAST OF CARPATHIANS: A MACRO-ARCHAEOLOGICAL PERSPECTIVE**

Abstract author(s): Grechko, Denys - Diachenko, Aleksandr (Institute of Archaeology, National Academy of Sciences of Ukraine)

Abstract format: Oral

This paper discusses macro-archaeological patterns of burning the prehistoric wattle-and-daub houses to the east of the Eastern Carpathians. The studies dealing with the abandonment of dwellings in this area are mostly focused on the Chalcolithic Cucuteni-Tripolye cultural complex, for which the long-term tradition of deliberate house burning is confirmed by field observations and experimental research. However, construction and abandonment of wattle-and-daub dwellings in other periods remains a generally underrepresented topic, even despite the available evidence (mostly, burnt daub). Therefore, we integrate and systematize data on house burning from the Neolithic, Chalcolithic, Bronze and Iron Age sites in the analyzed region, also addressing a wider spatial framework when it is necessary due to the archaeological ('cultural') taxonomies. Our study questions the similarities and differences in dwelling construction techniques and abandonment practices. Identification of macro-archaeological patterns is considered as an integration of spatio-temporal distribution the high-resolution data, while a capacity to explain these patterns is framed by discontinuity, continuity and change.

THE TRACE OF THE BRICKS FROM CLAY TO THE BURNT: ROMAN CITY OF ROMULA

Abstract author(s): Artene, Ilinca („Ion Creanga“ National College) - Basasteanu, Exter (University of Craiova) - Dinu, Andrei - Badica, Petre (National Institute of Materials Physics) - Batalu, Dan (Politehnica University of Bucharest) - Savulescu, Ionut (University of Bucharest) - Negru, Mircea (University of Craiova; „Spiru Haret“ University) - Bohâlțea-Mihuț, Florica (University of Bucharest)

Abstract format: Oral

The bricks were the most prevalent building material in the Roman provinces from Europe since the 1st century AD. Romans used them in constructing civilian, administrative, religious, or military buildings, infrastructure channels, paved roads, and markets. The Roman Empire became a world of bricks.

The bricks' story started with the identification of the plastic argyle clay. The excavated raw clay was then placed under the weather effects. We modeled it into the bricks that dried in the shadow zones. Finally, the dried bricks were burnt in kilns.

The trace of the bricks made in Romula Roman city was drawn from the clay resources to the unearthed bricks and the burnt bricks. Five kilns discovered in the northern ceramic quarter of Romula were used for bricks burn.

Some XRF, XRD, FTIR, and other investigations were made on all these phases, which provided valuable information about this trace and the material properties (thermic, mechanics, magnetism and so on).

The case of Roman bricks in Romula contains relevant images of all these three phases of technological trace from the raw clay to the mud, burnt bricks, and also the tables and pictures of lab investigations results.

THE HUMAN CONTRIBUTION IN THE SEDIMENT/SOIL FORMATION AT THE BRAZILIAN GEOGLYPHS OF ACRE

Abstract author(s): López Melón, Sonia - Díez Castillo, Agustín - Gallelo, Gianni (Universitat de València) - Rampanelli, Ivandra (Chapeco Arqueologia)

Abstract format: Oral

Earthen structures were built by ancient populations in very different contexts and chronologies. In the western Brazilian Amazon region, in the state of Acre several earthen structures called “geoglyphs” have been found. The questions involving the use, extension and geographic distribution of these earthen structures are still completely open. Some hypotheses about their function are associated to settlements, ceremonial centres, social power management; or simply for drainage, channels of irrigation or animal farming. The first excavation carried out by our team in the Reserva Extrativista Chico Mendes (RESEX), in the area of Santa Rosa geoglyph (2022) showed that the archaeological materials is limited to some few ceramic shreds, lithic materials and paleo-biological remains. Several sediments/soils samples were collected and geochemical sediment analyses carried out. The chemical elements data obtained were cross-referenced with the archaeological record to better understand the human contribution to the development of the soils/sediments found in the earthen structures. Trace elements concentrations together with major elements such as Ca and P when cross-referenced with the archaeological record show that the geochemical information can potentially become a complementary tool to better understand the human contribution to sediments/soils stratigraphic formation in the studied RESEX geoglyphs.

BUILDING AS TIMEWORK: ADOBE OBJECT BIOGRAPHIES AND THE RECONSTRUCTION OF TEMPORALITY AT THE MOCHICA SITE OF HUACA COLORADA, PERU

Abstract author(s): Morrow, Giles (Vanderbilt University)

Abstract format: Oral

The arid Pacific coastal deserts of Peru preserve a rich history of earthen construction techniques that persist from the Initial Period (ca 5000 BCE) through the Colonial Period, and extends into vibrant contemporary building practices. Within the Moche Period (ca 250-950 CE), monumental adobe brick edifices, known as huacas, remain the largest mud brick structures built across the Americas. Ceremonial activities at these huacas were often oriented towards platforms used to enact various community-building rites. Excavations across the north coast also show that most huacas are the culmination of a palimpsest of renovations – a testament to their enduring importance on the landscape. Renovation phases were decision making processes which both encapsulated previous iterations of a community's sacred spaces and religious activities, and marked time through renewal and re-orientation of ritual practice. This paper focuses upon the architectural history of the Late Moche Period (ca 650-950 BCE) site of Huaca Colorada in the Jequetepeque Valley, where excavations have revealed the repeated use of cylindrical adobe

lined features that acted as sockets for vertical wooden posts. Often over 2m deep, these adobe structures were built between architectural phases to allow for the careful curation and reuse of wooden structural members throughout occupation. Spatial and stratigraphic analyses of these persistent adobe features clarify how changing access patterns within this ceremonial space relates to broader cultural shifts during the terminal phase of Moche influence in the region. This paper approaches the use of these intergenerational adobe post emplacements as not only markers of a regional building technique, but as meaningful acts of persistence that reflect aspects of social memory and shed light on Andean ontologies of temporality, kinship and personhood.

23 BUILDING THE FUTURE FROM THE PAST: THE INTANGIBLE HERITAGE OF TURF

Abstract author(s): Romankiewicz, Tanja (University of Edinburgh, School of History, Classics and Archaeology) - Postma, Daniel (Archaeo Build)

Abstract format: Oral

The Grassroots Hutting project is a fieldwork initiative, organised by Tanja Romankiewicz from the University of Edinburgh, which operates as a co-productive partnership in Perthshire, Scotland. Together with Archaeo Build traditional builders and archaeologists, permaculture and eco-tourism venue Comrie Croft, and public heritage agency Historic Environment Scotland, we have designed two turf-walled structures: a bench as a piece of landscape art and look-out, and a full-scale hut. We built these together with local volunteers and professional practitioners, supported by ecologists, agricultural scientists, and social science researchers.

Our contribution to this workshop session proposes to add turf as a raw earthen material to the debate and discuss the chances and challenges we faced in our projects.

Our aims were to protect the intangible heritage side of building with turf in Scotland, documented from Neolithic to early modern times, and to embed this into positive climate action. By training local communities and professional practitioners through immersive experiences, we not only build structures, but also resilience and new capacities. We hope to have empowered them to become positive multipliers of turf building and turf buildings.

The project is designed as a process of doing, not to produce finished products, and we are not replicating prehistoric buildings, but constructing distinctively modern structures inspired by ancient concepts of circular economies that demonstrate the viability of local, natural, zero-carbon, circular architecture - then and now.

We propose to introduce our project design based on Romankiewicz's research into prehistoric circular architectures and economies, to discuss our progress in turning intangible heritage into tangible structure, and to stimulate debate on how archaeology can provide new ways of constructing the past, presence and future.

220 PLACES OF IMAGINATION: AN APPROACH TO FICTIONAL LANDSCAPES

Session theme: 3. Heritage Narratives and Representations

Session organisers: Martin, Jesus (Universiteit van Amsterdam. Faculty of Humanities. Amsterdam Centre for Ancient Studies and Archaeology - ACASA) - Äikäs, Tiina (Archaeology, Faculty of Humanities. University of Oulu) - Barreiro, David (Institute of Heritage Sciences, Spanish National Research Council)

Session format: Regular session

In places of imagination, fiction and reality overlap. Visitors simultaneously perceive a real and an imaginary world. They are real because they occupy a place and possess material remains. However, they are also imaginary because a visitor is aware of living in a simulated and/or recreated place. These places appear real because they occupy a place and possess material remains. Nevertheless, imaginary because the visitor becomes aware that they represent a simulated and recreated place.

Places of imagination exist worldwide since fiction has always been part of human history. They often take the form of displays in the landscape or architectural constructions. Often such places serve to project real or imagined power, and in so doing, they can stimulate collective imagination. Nevertheless, archaeologists and heritage scientists have considered places of imagination as unimportant, not even deserving of protection or management.

In recent years, the global demand to visit and experience imaginary places has increased, from architectural and urban follies (Parque "El Pasatiempo", Betanzos) to film sets (Lord of the Rings, Harry Potter) and theme parks (Sagolandet Lejre or Paleolítico Vivo, Burgos); from literary routes (Ruta del Quijote or Whitby of Dracula) to "trompe l'oeil" (Romangordo, Cáceres) and even some historicist reconstructions in real places (Makronisos island in Greece).

The session will explore the ontological characteristics of places of imagination, where concepts of authenticity or veracity and their social effects interact. Understanding such places as multifaceted, we welcome approaches from archaeology, heritage studies, and related scientific disciplines with diverse theoretical and methodological perspectives focused on exploring places of imagination to create insights into social landscapes and social life.

1 MYTHICAL GEOGRAPHIES AND ARCHAEOLOGICAL LANDSCAPES: THE CASE OF THE SUNJATA EPIC

Abstract author(s): Canós-Donnay, Sirio (Incipit-CSIC)

Abstract format: Oral

The Sunjata epic narrates the origin of the Mali Empire (13th-16th C) and its hero founder Sunjata Keita. It is performed across the area of the former Empire (from Senegal in the west to Burkina Faso in the east) by specialist bards known as griots or jeli, traditionally attached to noble families. It is a story of sorcerers, secret knowledge, and quests for power, not unlike the King Arthur myth, with which it is almost contemporary. It is also an imagined map of the Empire itself, as in their travels, its heroes and antiheroes trace the outline of the land, its people and rulers, and its sources of power. This map, however, does not correspond to Cartesian space or easily identifiable locations; in fact, most places in the epic do not correspond to known geographical points. As a result, all attempts at integrating the Sunjata epic with archaeological research have been unfruitful so far. In this paper, I propose a different approach, one that considers the dynamic, situated, and politicised nature of the epic as a performance as well as the imagined nature of its landscapes, and proposes ways in which these can be informative to archaeologists.

2 CONTEMPORARY NATURAL „SACRED PLACES“ AND THE INVENTION OF THE PAST

Abstract author(s): Ballmer, Ariane (-)

Abstract format: Oral

So-called natural „sacred places“ are widespread artefacts of contemporary imagination, interpretation and practice. These are largely unaltered natural sites, often in impressive topographical settings, frequently accompanied by anthropogenic markers, on the one hand by archaeological remains such as, for instance, menhirs, but also by pseudoarchaeological remains on the other. These places do not simply serve as sites of commemoration or spectacle but, by definition, are also said to bear transcendental potential. This alleged potential is “evidenced” not only by utilizing technical measurements of energy flows or astronomical references etc., but also legitimized through on site-experiences and, most importantly, through an (invented) temporal continuity. As products of the imaginary, natural „sacred places“ enjoy great popularity with a large, diverse audience. However, the narratives around these places are strongly determined by individuals and groups outside the field. The paper aims to discuss how these places conceptually “work”, i.e., how they are identified, how their meaning is created and maintained, how they are advertised, and which stakeholders are involved. As a matter of fact, archaeology tends to turn away from further engagement due to the matter’s proximity to parascientific and esoteric contexts. By doing so, the author postulates important responsibilities are being missed. Eventually, the question arises about how archaeologists can deal with the challenge.

3 HAMEL’S STORY IN SOUTH KOREA AND THE NETHERLANDS: MUSEUMS’ IMAGINATION OF A FOREIGN LAND

Abstract author(s): Kim, Geonyoung (University of Cambridge; Cambridge Heritage Research Centre)

Abstract format: Oral

A Dutch East India Company ship from Batavia to Japan was shipwrecked in Jeju, near the Korean Peninsula, in 1653. Because of this accident, Hendrick Hamel (1630- 1692) and his colleagues were forced to stay in Joseon (the last dynastic kingdom in the Korean peninsula) until 1666, when they successfully escaped to Japan. Hamel published his journal on his journey in Joseon in 1668. After a short period of popularity, his story was gradually forgotten. In 2002, Hamel’s story revived with enormous popularity thanks to South Koreans’ spotlight on Guus Hiddink, the Dutch football manager who led the South Korean football team in the 2002 FIFA World Cup. Since then, Jeju, Gangjin county and Yeosu city, which were mentioned in Hamel’s journal, actively claimed their association with Hamel. Three Hamel museums were opened in these locations in 2003, 2006 and 2013 to celebrate their newly discovered heritage. In the Netherlands, Gorinchem opened the Hamel House Museum in 2007 in the birthplace of Hamel. Both museums in Gangjin and Gorinchem organised a section imagining the scenery of the foreign land of the 17th century through the presentation of material culture and landscapes. How are the Netherlands and Joseon of the 17th century imagined by the Hamel Museum in Gangjin and Gorinchem? What does the imagined foreign land play a role in making Hamel a part of the local heritage in the Netherlands and South Korea? This paper analyses the visual (re)presentations of Joseon and the Netherlands displayed in the Hamel Museums. The analysis looks at the images, material culture and installations used in the permanent exhibition through visual analysis methods. This paper concludes with how the imagination of foreign land of a relatively distant past is appreciated differently in contemporary Korea and the Netherlands.

4 GNOMES AND TOURISTS IN MINES - EXTRAORDINARY UNDERGROUND AS PLACE FOR HERITAGE TOURISM

Abstract author(s): Äikäs, Tiina (Archaeology, University of Oulu)

Abstract format: Oral

In old mythology as well as in contemporary popular culture, e.g., movies and fantasy books, the underground is seen as a place of supernatural beings. Gnomes and goblins can snatch children, take part in mining activities and act as guardians of the underground treasures. These legends are also used to attract tourists when old mines are turned into heritage sites. In this paper, I use cases of Tytyri and Outokumpu mines in Finland to explore how stories of mythical beings are interwoven into the history of the mine and how they are presented to tourists. In Outokumpu a gnome doll welcomes visitors to the underground parts of the mine and in Tytyri one can read the story of a gnome from a children's book already before the visit. This story is then re-told as a drama in the mine. I ask, what is the role of these mythologies for the heritage sites and how the fictional landscape meets the real. What kind of stories are told and how do they add to experiencing the sites?

5 WALKING IN AN IMAGINARY BUT REAL CITYSCAPE: CHILDREN'S DETECTIVE STORIES IN THE SUBURBAN LAHTI

Abstract author(s): Malinen, Anssi (Lahti City Museums) - Äikäs, Tiina (Archaeology, University of Oulu)

Abstract format: Oral

Lahti is Finland's ninth biggest city. Besides being famous for cross-country skiing and ski jumping, the city has also suffered from a bad reputation as "the Chicago of Finland", known for drugs and violence. The ski jumping towers and old radio masts are the most prominent landmarks also spotted by tourists. But for those familiar with the children's detective stories Henkka & Kivimutka Lahti can be a place of adventures in otherwise peaceful suburbs. The author Kalle Veirto wrote the first Detective agency Henkka & Kivimutka book in 2008 and so far there have been 20 books in the series. The friends Henkka and Kivimutka live in an imaginary Pumpputie street, but otherwise, their surroundings in the suburb of Laune are based on real topography of Lahti. In this paper, we map these places mentioned in the books and explore them on a walking trip with two keen readers of the series. We also do a netnographic survey on how the city of Lahti has or has not utilized the books in tourism. The aim is to demonstrate how a mundane, suburban landscape can be transformed into a touristic experience by imaginary layers and how these experiences bring forth new dimensions in the cityscape.

6 FROM LLANDOUGH TO LOTHLÓRIEN: LEARNING FROM HIGH FANTASY FOR PUBLIC ENGAGEMENT

Abstract author(s): Pageau, Hanna (Cardiff University)

Abstract format: Oral

High Fantasy proves time and time again to be one of the most popular genres of fiction on both page and screen. Its early roots of popularity solidified by Peter Jackson's Lord of the Rings trilogy - which we now see carried over into the show Rings of Power. Alongside other shows like House of the Dragon, Wheel of Time, and Shadow and Bone - worlds full of magic and mystery are enticing and popular with the public, much in the same way historical and archaeological sites are. These sites, fictional and real, are not only tied by the way the public interacts with them - but they often physically use the same spaces. Either modified or not, shows like The Witcher have famously used well known heritage sites for many of their sets. This paper will explore the relationship between High Fantasy and other magical settings, heritage in the extant world, and what the public's interactions with each can do to help each other not only better use the worldbuilding available to them, but also how it can affect how they are viewed in their respective landscapes in real time.

7 FINDING SUMMERISLE: AUTHENTICITY AND SENSORY EXPERIENCES OF THE WICKER MAN (1973) 'PILGRIMAGES'

Abstract author(s): McLean, Hannah (University of Glasgow)

Abstract format: Oral

Among archaeologists, particularly those interested in folk horror and the occult, The Wicker Man (1973) has been a continuing subject of fascination. Even a cursory online search brings up several websites devotedly maintained by film fans, with a particular emphasis on 'pilgrimages' to the filming locations around the southwest of Scotland. This paper will explore not only the contemporary archaeology of The Wicker Man and the traces left behind by its production but furthermore the ways in which such 'pilgrims' undertake tours of these sites.

By conducting research into visitor accounts of the pilgrimages, as well as undertaking a personal tour of the sites, this paper will explore interactions with the fictional landscape of *The Wicker Man* and the search for an ‘authentic’ experience of both the film and the Scottish landscape. This will involve an exploration of the conflict between expectations of a wild, haunted, and isolated island landscape with the reality of ‘Summerisle’ – that is, an amalgamation of Scottish tropes filmed in mainland locations now a stone’s throw from car parks, motorways, and holiday camps, the film’s stone circle constructed with polystyrene props. How do *The Wicker Man* ‘pilgrims’ experience and negotiate these conflicts? Within this context, I will also explore the sensory experiences of the fictional landscape of Summerisle and the relation to the film’s theme of pagan-Christian interactions. Music and soundscapes, the consumption of food and drink, and emotional encounters with the landscape are integral to religious and spiritual experiences, narratives of the Scottish landscape, and the film’s worldbuilding itself. The language used (‘pilgrimage’) and visitors’ behaviours (chipping wood from the titular structure for use as a relic or memento) further constitute a continuation of this spiritual theme, which will be explored in this paper.

8 BACK WHEN RURAL SPAIN BECAME THE FAR WEST: STUDYING THE LANDSCAPE OF THE SPAGHETTI WESTERN AROUND MADRID

Abstract author(s): Martin, Jesus (Universiteit van Amsterdam) - Barreiro, David (Institute of Heritage Sciences, Spanish National Research Council)

Abstract format: Oral

The film industry shapes the collective imaginary in many aspects. For example, regarding places of imagination related to the film industry, geographical stereotypes contribute to modelling the collective imaginary about a specific landscape through the impersonation of places. Since the end of the fifties, the film industry has chosen the Spanish rural landscape to recreate various geographies worldwide.

In 1960, as a political decision to break international isolation, Franco’s administration substantially decreased the costs associated with filming in Spain, fostering the emergence of a new film industry as directors chose rural sites near large cities. The rise of major Hollywood films such as *Spartacus* (Kubrick, 1960) and *55 Days at Peking* (Ray, 1963) led to the development of enormous film sets. As hundreds of Spanish technicians and professional performers gained experience working on such mega-productions, this first wave of Hollywood films influenced the later development of European Westerns and peplum.

As a subgenre, the Spaghetti Western was born at this time. It received its name due to the Italian adaptation of western cinema. However, these productions soon relocated to Spain, which offered better economic conditions and a greater variety of western-themed landscapes.

Indeed, for a large portion of Spanish society, which has watched many Western films, the Wild West is actually Almería (SE Spain). However, other places, like the landscapes close to Madrid, were also relevant. Many authors have conducted significant research to find the specific locations used to film spaghetti western movies. This paper will explore the multiple geographical layers of various spaghetti western film locations in Madrid by capturing the filmic gaze that compares a movie frame with photos taken from the same angle at the same place.

9 ARCHAEOLOGIES OF A FUTURE THAT NEVER HAPPENED (IN FILMS)

Abstract author(s): Almansa-Sanchez, Jaime (INCIPIT-CSIC)

Abstract format: Oral

Archaeology and popular culture are deeply embedded, feeding the archaeological imagination both ways. In the process, the representation of the past is full of presentisms that allow to understand our current selves better. What if we could do that looking into the future?

Humans have imagined the future in very different ways, but always with two main approaches: one, a representation of what we want to be. The other, a usual apocalyptic future that results from our unruly present. We normally assign these works into the category of science fiction, and they truly are, but they offer the possibility of a very interesting analysis.

At TAG 2017 I explored the theoretical possibilities of this idea. Today, in 2023, many fictional works of the 19th and 20th centuries fall into what we could call “fictional pasts”, although they were intended as imaginations of the future. Can an archaeological analysis of these futures that never happened help to understand who we are, what we want to be and, more interestingly for our professional development, how do we think change and time?

This paper will focus on some examples from films that can help to understand our current selves from an archaeological perspective, focusing on the material culture displayed.

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Austvoll, Knut Ivar (University of Oslo) - Burlot, Aurélien - Bengtsson, Boel (University of Gothenburg) - Howle Outlaw, Carolyn (University College Cork)

Session format: Regular session

Recent advances with DNA and isotopes have brought mobility back into archaeological explanation, but little attention has been paid to maritime aspects of these movements. The great prehistoric migrations, or phases of mobility, are far too often represented as large arrows spanning vast seas or rivers with no further explanation of how these groups negotiated large bodies of water. There is also a tendency to view maritime regions as passive targets of migrations and movements.

We believe that this is insufficient when studying various developments along the Atlantic façade, including contacts between agricultural societies and hunter-gatherers in Scandinavia, Bell Beaker complexes in Atlantic Europe, or Bronze Age long-distance trade. With regards to these processes, we argue that maritime interactions must have been at the centre of both social and political organizations.

Therefore, the gap lies in the actual undertaking of these travels. How did people interact and what technological innovations were a prerequisite for travels along the Atlantic façade? How was maritime crossing organized along the Atlantic façade during prehistory, and in which places in the landscape/seascape did these actions take place? Moreover, what boats were used; how were these boats built; how far did people travel; and what social and political organizations were in place to complete such voyages?

The session welcomes papers exploring methodological innovations to discuss maritime mobility, but also theoretical concepts to help us think about maritime connections in European prehistory.

ABSTRACTS

1 BRONZE AGE WAR CANOES, BOATS AND SAILING SHIPS IN SCANDINAVIA 2000-500 BC

Abstract author(s): Artursson, Magnus (Institute of Historical Studies, Gothenburg University) - Bengtsson, Boel (Gothenburg University)

Abstract format: Oral

In view of recent studies on the origin and volumes of copper and tin arriving in Scandinavia during the Bronze Age (c. 1700 – 500 BC) along the European Atlantic façade, probably from sources in Britain during the Early Bronze Age, and from c. 1300/1400 BC, the Iberian peninsula, it is clear that seafaring abilities and marine technologies in Scandinavia enabling such journeys must have been well developed. The trade in tin and copper would have provided the incentive and drive to push boat building technologies towards the construction of larger and more seaworthy plank-built war canoes, boats and ships. In Scandinavia, the evidence of watercrafts is mainly restricted to ship depictions in rock art and on metal objects, and also represented in the construction of stone ship settings used for marking graves. This paper has as one of its main aims to deepen the knowledge concerning the development of more advanced sea craft constructions during the Bronze Age in northern Europe, taking into account both direct and indirect evidence. Also, different methods of possible propulsion of seacrafts, paddling, rowing and sailing, will be discussed.

2 THE INTENTION CRAFT: PADDLES AND PROPULSION IN POST-GLACIAL EUROPE

Abstract author(s): Piper, Stephanie (University of York)

Abstract format: Oral

The role of watercraft in the post-glacial colonisation of the Atlantic façade has been key to debates around how rapidly this occurred, and from where. Globally, the successful habitation of islands by hominins is indisputable, although how this happened is not yet fully understood. The scarcity of archaeologically preserved watercraft from the late Pleistocene and early Holocene in determining technological capabilities is a challenge in this regard.

Research on the global development of seafaring and boat technology primarily focuses on the watercraft, whereas little investigation has been undertaken of paddles themselves. This is despite a clear diversity in the range of shapes and styles on global, regional, and temporal scales.

A paddle is the mechanism by which a person becomes meaningfully connected to the water; it becomes an extension of the body by which to propel oneself. This technology unequivocally demonstrates intentionality, without this the watercraft and its passengers are solely at the whim of the current. Numerous examples exist of decorated archaeological paddles, and many Indigenous peoples have exceptionally complex relationships with these components of the

watercraft that are so integral to their society. As such, paddles provide not only the means to movement, but also in wider social communication and expression of identity that may be traced along the Atlantic façade.

3 ACROSS THE SEAS. REMARKS ON NAVIGATION WITHOUT INSTRUMENTS

Abstract author(s): Weski, Timm (Retired)

Abstract format: Oral

From the distribution of similar artefacts, the occurrence of natural resources like tin ore or the evidence of related DNA and isotopes, it is known that even during Prehistoric and Early Medieval times man was already able to sail long distances across open waters. But how did he know his way without instruments? Archaeological finds of navigational aids are still missing, but by analysing ethnographic and historic sources, even if they were recorded in different areas and periods, certain techniques can be detected which may have already been used in former periods. If one compares Polynesian navigational knowledge with that what is written down in Nordic sagas, one can observe several similarities. For example, apart from the use of sun and stars, there are wave patterns and “Seeorte” as means for steering. Some of them can be observed by eye, others can only be detected by feeling the boat’s movements. All have in common that the navigator has to observe constantly wind, weather, visibility, motion of the boats etc., because it is the combination of all phenomena which enables him to decide about the course to be steered.

4 THY TO LISTA IN 1500 BC: COMPARING DIRECT OPEN WATER CROSSINGS AND COASTAL ROUTES USING AN OCEAN VOYAGE SIMULATION TOOL

Abstract author(s): Bengtsson, Boel (University of Gothenburg) - Austvoll, Knut Ivar (University of Gothenburg; University of Oslo) - Montenegro, Alvaro (Ohio State University) - Ling, Johan - Tomasini, Matteo - Green, Ashely (University of Gothenburg) - Prince, Martyn (University of Southampton; Wolfson Unit) - Lindhé, Cecilia (University of Gothenburg)

Abstract format: Oral

The aim of this paper is to evaluate and compare different sea journeys between Thy in northern Jutland, Denmark, and Lista, southwest Norway, in the Early Bronze Age. Archaeological evidence suggests direct contact between the two areas already in the Late Neolithic but remains intense throughout the Bronze Age. Using vessel performance data based on the 350 BC Hjortspring boat as valid parameters for a Scandinavian Bronze Age (BA) type boat, and present-day (the 1990s onwards) environmental data of winds and currents, we simulate and analyze different sea routes this vessel could safely have taken when traveling between the two regions. This paper will discuss the background for the contacts, and compare navigational considerations for both direct open water crossings and inland/coastal routes, including likely points of departure, weather prediction abilities, navigation in a south-to-north direction across the Skagerrak (over 110 kilometers at its shortest distance) without any navigational instruments, safety aspects, and the impact of waves (on small open boats). The results of the ocean-voyage simulations tool for these sea journeys will be briefly presented and the result discussed and evaluated.

5 UNUSUAL HEATHERS IN WESTERN IRELAND AND BRITAIN INDICATE AN ANCIENT MARITIME TRADE ROUTE FROM THE IBERIAN PENINSULA

Abstract author(s): Scott, Nick (Teach na Tuisceana) - Sheehy Skeffington, Micheline (University of Galway) - Fagúndez Díaz, Jaime (Universidad de A Coruña)

Abstract format: Oral

Five heather species have disjunct ‘Lusitanian’ type distributions in Europe.

They occur as discrete populations along Ireland’s west coast, and two also occur along Britain’s south-west coast. They are found elsewhere only, or principally, in the Iberian Peninsula. None could have survived the last ice age in Ireland or Britain, and migration northwards, leaving 100s of kilometre gaps en route, appears impossible. A genetic study of *Erica mackayana* (Mackay’s Heath) indicates that each of its six Irish populations has been introduced from a different place in north Spain, most probably as packing for smuggled goods, but the largest population, on Roundstone Bog in Connemara, is probably much older. Other heather species may be historical introductions, but not *Daboecia cantabrica* (St Dabeoc’s Heath), now throughout Connemara, while a palynological study suggests that *Erica ciliaris* (Dorset Heath) had arrived at Poole Harbour, south-west Britain, by 3600BP. Eleven other Lusitanian plant species occur in western Ireland including *Arbutus unedo* (Strawberry Tree), probably introduced 4,300 BP by the first copper miners. We present preliminary botanical evidence for an ancient maritime trade route along the Atlantic seaboard which may include a direct crossing due north from Galicia to western Ireland.

6 TRAVELLING BOATS, TRAVELLING IDEAS – EMERGING EVIDENCE FOR PLANK BUILT BOAT TECHNOLOGY IN BRONZE AGE IRELAND

Abstract author(s): Brady, Karl (National Monuments Service; Department of Housing, Local Government & Heritage)

Abstract format: Oral

The publication of the Dover Boat book and related works were landmark publications in relation to our understanding of the development of early watercraft in prehistory and Peter Clark's works continue to inspire archaeologists to this day. While it is generally considered that plank boat technology was confined to Britain in the Bronze Age, evidence is now emerging that knowledge of this method of boat building was more widespread than previously thought. Work carried out by the Underwater Archaeology Unit has revealed that a logboat found off Lee's Island in Lough Corrib, Co. Galway was repaired using the same methods used to build the Dover Boat and other sewn plank boats of the period. The Lee's Island oak built logboat had developed a central longitudinal split for most of the length of its floor, which was stitched back together with yew withies, longitudinal soft wood laths and moss caulking. Other repair features include the use of wooden cleats and transverse timbers to help provide structural strength to the floor of the vessel. The presence of these features clearly illustrates that the sewn plank boat technology which was previously thought to be confined to England and Wales during the Bronze Age had spread further afield. How this technology had spread to the west coast of Ireland by the 14th/13th centuries BC is yet to be confirmed but may indicate direct maritime links between the Western Atlantic Fringes and southern coast of Britain during this period.

7 FIMBULWINTERN ON THE "MARGINAL" ÅLAND ISLANDS – NEW INSIGHTS FROM PALYNOLOGICAL RESEARCH

Abstract author(s): Larsson, Petter Ingolf - Ilves, Kristin (University of Helsinki)

Abstract format: Oral

The Åland Islands, in-between the mainlands of Sweden and Finland, have been long understood as marginal and to a large degree separated from the societal processes that took place during the Iron Age (500 BCE–1050 CE). The islands are reduced to a geographical space, and a cultural outpost at best. Nonetheless, the archaeological record does indicate a considerable growth of population during the Late Iron Age (c. 550–1050 CE), and investigations point towards extensive networks as well as economic affluence of the islands at that time. In addition, recent palynological investigation have now provided new and valuable knowledge on land use and subsistence strategies during the Late Iron Age on Åland. Not only do the pollen signal match the archaeological record and strengthens the interpretation of a sudden growth in population during the Late Iron Age, but the pollen signal also indicate a relatively large scale and fortunate agrarian activities combining both animal husbandry and cultivation of cereals. In other areas, not least in the Mälär-valley of eastern Sweden, there is evidence of demographic changes in relation with the mid-6th to 7th centuries CE Late Antique Little Ice Age. Whether or not the increased population on Åland from the mid-6th century CE is a result of climate refugees from the closest neighbouring areas, our studies show that the subsistence strategy of the suddenly grown Åland population appears to have been more successful compared to mainland regions in this period of climatic challenges. We argue that a mixed economy of animal husbandry, cereal cultivation, maritime resource utilisation, as well as long distance trade provided a flexible economy – with opportunities to alter the economy to meet external circumstances.

8 MOLECULAR ISLAND HISTORIES: DNA FROM LAKES AND SOILS REVEALS DIVERGENT AND CONVERGENT ISLAND HISTORIES AROUND THE SEA OF MOYLE, UK

Abstract author(s): Brown, Antony (Palaeo Lab, University of Southampton) - Fonville, Thierry - Pears, Ben (University of Southampton) - Van Hardenbroek, Maarten (University of Newcastle) - Mackay, Helen (University of Durham) - Henderson, Andrew (University of Newcastle) - Gleeson, Patrick - Plunkett, Gill (Queens University Belfast) - Alsos, Inger (Arctic University of Norway)

Abstract format: Oral

The Sea of Moyle (Sruth na Maoile) project has focussed on the socioecological resilience of island communities around the narrow sea between Scotland and Ireland. Although ownership has changed since 'The Kingdom of the Isles' and the 'Vikings period', the islands are still closely inter-connected, but also have diverged in many ways. These islands provide a unique opportunity to reconstruct cultural and ecological change over long periods of time.

Due in part to the problems and limitations of traditional land use proxies we are using sedimentary ancient DNA (sedaDNA) for both plants and animals. This is the analysis of short DNA fragments archived within sediments. By sequencing these DNA fragments and comparing these to databases of known plant DNA and animal sequences, it is possible to reconstruct long term vegetation patterns and grazing history. In combination with radiocarbon dating, lipi analyses and more traditional palaeoenvironmental techniques such as geochemical, pollen and diatom analysis

we are able to reconstruct past land use changes, such as the creation of meadows, heathlands or crop cultivation. By applying these techniques to island lake sediments and soils we can disentangle how land use has changed over time due to population dynamics and socio-cultural factors.

A key site, Loch Finlaggan, seat of the Lords of the Isles on Islay, reveals a detailed occupation history, with evidence of prehistoric crannogs, medieval and later royal and ecclesiastical occupation and the turbulent post-Medieval agricultural economy. Plant community shifts over time have been sequenced from the sedaDNA records, tracking many of these settlement phases into modern times, where surrounding farmsteads currently lie abandoned. The evidence from Finlaggan and other sites can be compared to other records such as census and historical data to track long term environmental change and the impact of population, culture and economics on these island landscapes.

9 **WOODLAND AT THE EDGE: EARLY TO MID-HOLOCENE WOOD PEAT SEQUENCES AT THE LAGGAN-TORMORE SHETLAND GAS PLANT, SULLOM VOE, SHETLAND**

Abstract author(s): Mighall, Tim (University of Aberdeen) - Timpany, Scott (Archaeology Institute, Orkney College UHI) - Ramsey, Susan (Freelance)

Abstract format: Oral

This presentation summarizes the results of the palaeoenvironmental investigation of three peat horizons containing macrofossil wood remains uncovered during the construction of the Laggan-Tormore Shetland Gas Plant adjacent to the Sullom Voe Terminal, Shetland. Multi-proxy analysis of pollen, non-pollen palynomorphs (NPPS), microscopic charcoal, wood identification and waterlogged plant remains analysis was undertaken taken from multiple locations across the development area to examine early- to mid-Holocene woodland dynamics including human impact given the likelihood of a material Mesolithic presence. Radiocarbon dating of the peat profiles combined with the palaeoenvironmental data indicate that willow-birch carr-woodland formed locally at approximately 6400 cal BC and lasted until around 3395 cal BC when a possible combination of deliberate woodland clearance and increased mire wetness caused its demise. Intense fires are recorded in the microscopic charcoal record during the Mesolithic and Early Neolithic periods accompanied by falls in tree and shrub pollen and increases in disturbance pollen indicators and coprophilous fungi suggestive of anthropogenic activity. Phases of probable human-environmental interaction were also found to positively correspond with archaeological and archaeobotanical evidence for an Early Neolithic settlement at the Hill of Crooksetter dating to 3600-3400 cal BC.

10 **NEOLITHIC POPULATION DYNAMICS BASED ON SPDS AND SITE COUNTS IN THE SCHELDT BASIN (WESTERN BELGIUM AND NORTHERN FRANCE)**

Abstract author(s): Van Maldegem, Elliot - Crombé, Philippe (Ghent University)

Abstract format: Oral

During the Mesolithic hunter-gatherers were faced with a multitude of adversities, which included changing landscapes, climate upheavals and rising sea levels. In the following Neolithic period this only partially stabilized. The first farming communities entering Belgium encountered poor soils and more climatic downturns, which put a limit and strain on the size and the spread of populations.

We studied this in the western half of the Scheldt drainage basin in western Belgium and northern France. The area has been extensively studied during the preceding decades, mainly through developer-led archaeology, which led to the discovery of hundreds of sites, both through intensive prospection campaigns and through excavations. A large number of these sites have been subject to extensive dating efforts. Through the use of summed radiocarbon probability distributions and site counts, the paleo-demographic dynamics can be reconstructed in order to better understand if the first farming communities were able to weather short-term climate events and other difficulties. Both popular methods have proven to be successful in gaining more insight into population dynamics, yet both have their drawbacks. By comparing and contrasting the results, the validity of both models can be tested, together with the impact of site taphonomy and changing building traditions.

Following careful critical selection of the data we fit MCMC- and KDE-models on the summed probability distributions, and utilize raw count and aoristic weighing of the settlement data to form a preliminary model of demographic evolutions within the study area for the Neolithic period and the beginning of the Bronze Age against the background of climate and environmental changes.

WHAT MAKES A SETTLEMENT? COMPARATIVE PERSPECTIVES ON SETTLEMENT STRUCTURES AND PATTERNS FROM NEOLITHIC TO IRON AGE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Wunderlich, Maria (Institute for Pre- and Protohistoric Archaeology, Kiel University) - Tkáč, Peter (Department of Archaeology and Museology, Masaryk University; Department of Vegetation Ecology, Institute of Botany of the Czech Academy of Sciences) - Palmisano, Alessio (Department of Historical Studies, University of Turin)

Session format: Regular session

In the broader context of prehistoric archaeology, settlement archaeology represents one of the most pivotal fields of research. The investigation of settlement structures, patterns and organization has developed into a field in which multiscale approaches are widely applied. Settlement structures, on the intra-site scale, and patterns, on the inter-site scale, are investigated at local, regional and supra-regional levels, with qualitative approaches playing an important role alongside statistical approaches. In this context, perspectives on and approaches to settlement archaeology have constantly changed and reflect the orientation of archaeological research.

Nevertheless, the question remains how to bring together the different levels of inquiry and how to describe and interpret the socio-political dimensions of settlement patterns and organization. The aim of the session is to lead discussions about the linkage of different scales of research, the importance of different methodological approaches, and the significance of theoretical approaches.

Within the session we want to address different questions with a focus on the cultural contexts from the Neolithic to the Iron Age in a comparative perspective:

- How do we perceive settlement structures and patterns and how can we describe and analyze the underlying functional, social, political and economic aspects?
- How can we integrate those aspects into a holistic view on settlement organization and systems?
- Can the analysis of settlement patterns and structures be seen as a tool that allows the study and interpretation of past social structures?
- How can we connect different scales of inquiry and research? Which theoretical frameworks and methodologies seem appropriate?

We invite contributions that focus on the aforementioned topics and which might focus on the different levels of inquiry cited above. We also encourage papers focusing on socio-cultural anthropological perspectives, as well as the theoretical frameworks connected to the study of settlement structures, patterns and organization.

ABSTRACTS

1 BETWEEN DESCRIPTION AND INTERPRETATION. SETTLEMENT PATTERNS STUDIES ON AN EXAMPLE OF CZECH ARCHAEOLOGY

Abstract author(s): Tkáč, Peter (Masaryk University; Institute of Botany of the Czech Academy of Science)

Abstract format: Oral

The study of settlement patterns is one of the established methods of investigating prehistoric societies. It is based on the assumption that the distribution of archaeological sites in the landscape reflects the character of prehistoric societies. Additionally, landscape archaeology brought into discourse concepts of subjective perception and more holistic approaches. But is the potential of these “spatial studies” fully exploited? Aren’t we sometimes using them only as another way of describing the archaeological evidence?

I will address these questions on the example of Czechia, whose archaeological tradition still, to a certain degree, bears the legacy of post-WW2 development. This is mostly manifested in a distant attitude towards theory in general, and in main focus on typology and relative chronology. On the other hand, from the 1990s at the latest, Czech archaeologists were successful in development of detailed methods of non-destructive surveys, intensive studies of micro-regions and creation of large archaeological databases.

My research is based on text analysis of Czech archaeological journal articles and monographs dealing with inter-site spatial relations, ranging from Mesolithic period to High Middle Ages (10 000 BCE - 1250 CE). The greatest attention was devoted to exploring how Czech archaeologists worked with spatiality - did they use it as another tool for description, or as an analytic tool in order to interpret life of the past people? I was also interested in spatial and temporal distribution of these studies: are some regions and periods under-represented or over-represented in comparison to “general” interest of the majority of archaeologists? If so, what is the cause? Is it a different nature of archaeological evidence in different periods, or is it a different school of thought?

This paper aims not only to reflect on our perception of spatial studies, but also to discuss their testimonial potential.

2 **FACTS, THEORIES, MODELS: 50 YEARS OF PERCEPTION OF TRYPILLIA MEGA-SITES**

Abstract author(s): Burdo, Nataliia (Kyiv Domain Archaeological Museum) - Videiko, Mykhailo (Kyiv Borys Grinchenko University)

Abstract format: Oral

The structures of large settlements of the Trypillia culture (about 4200-3300) on the territory of Ukraine became available for perception through archeometric and archaeological research. Their research has continued intermittently since 1971. The last ten years have been international projects with the participation of archaeologists from many European countries. A certain research methodology has been developed, which has found recognition among specialists. Around the results of research and their interpretation of the discussion. Using their example, it is interesting to see exactly how and why we perceive certain information in a certain way and what comes out of it during the reconstruction of various aspects.

It should be noted that the same information is the basis of different models and conclusions, versions that contradict each other and cannot be reconciled. The first group of archaeologists sees in them manifestations of urbanization, the second - the “phenomenal” evolution of agrarian settlements. Within the first group, some propose the theory of “low density urbanism” combining it with idea of seasonal ritual centers. In this example we see the adaptation of facts to the theory. This is a case where additional facts are unlikely to change the position of the interpreters. On the other hand, the position of the second group began to evolve towards the recognition of the process of urbanization. The basis was the discovery of ceramic crafts, confirmation of the simultaneous existence of different parts of the settlement. That is, the appearance of new factual material.

As we can see, the significant impact on the interpretation of the source base is not the increase in the volume and even the quality of information, but the researchers’ theoretical foundations. And in this case, the progress of further research will determine an unbiased approach to the array of information.

3 **WHAT’S IN A SETTLEMENT? ARCHAEOLOGICAL AND ANTHROPOLOGICAL PERSPECTIVES ON SOCIO-POLITICAL ORGANIZATION IN NEOLITHIC SETTLEMENTS**

Abstract author(s): Wunderlich, Maria (Institute of Pre- and Protohistoric Archaeology, University Kiel)

Abstract format: Oral

As a central place of social and political interaction of communities in the past, settlements and settlement structures can be considered of outstanding importance. Settlements are not only a place of everyday interaction and encounter, but also potential places where regional and transregional networks meet. Therefore, an evaluation and understanding of potentially acting social and political entities is essential. These actors have certainly included collective and communal units, such as neighborhoods, as well as more individual units, such as households. On a more structural level, institutional locations such as places of assembly or communal houses are relevant. In this regard, political and social anthropology in particular offers a wealth of data and models of the extent to which social and political units may act in settlements and how these may be materialized.

The paper will therefore trace potential archaeological parameters of social and political actors and structures in the context of the internal organization of settlements, as well as settlement structures within local regional contexts. Using selected case studies of the Neolithic and Chalcolithic phases and with the help of ethnoarchaeological and anthropological data and models, perspectives on social coexistence in settlements will be opened up.

4 **LOOKING OUTDOORS AND BEYOND: SOCIAL PRACTICES, SETTLEMENT SPACES AND COMMUNITY STRUCTURES IN THE GREEK NEOLITHIC**

Abstract author(s): Kalogiropoulou, Evanthia (University of Crete)

Abstract format: Oral

The Neolithic period in Europe is characterised by prominent transformations in social organisation, everyday practices and community lifeways that were expressed in variable settlement arrangements, diverse architecture constructions, and numerous spatial formations. During the last few decades, the increasing volume of data and the application of multiscale scientific approaches in the archaeological discipline stresses the need for the re-assessment of the various social expressions of settlement spaces in both local and intertwined regional scale.

This paper explores the organisation, use, and dynamic involvement of outdoor spaces for the overall formation of the settlement arrangements, focusing on Neolithic communities in Northern Greece, including Macedonia and Thessaly. Although their effect in settlement formations is essential, outdoor spaces remain considerably under-theorised and under-studied. Here, open-air spaces are considered as dynamic agents of community developments, as

arenas of subsistence practices, and multi-task venues to the production of communities, reflecting diverse Neolithic lifeways. The paper attempts a broad synthesis of published and unpublished data and discusses examples of various community practices that define settlement spaces, such as daily or exceptional, domestic or social and collective, subsistence and workshop practices. The paper tackles questions of how communities were organised and how different forms of habitus or different kinds of entanglements shaped Neolithic settlement forms and reproduced spatial patterns. This research is conducted in the framework of BONDS - 'Beyond Oikos: Outdoor spaces, daily life and sociality in Neolithic Greece' Project (Number: 00229), funded by H.F.R.I.

5 „EMPTY SPACES....?“ INVESTIGATING THE LOCATIONS OF EVERYDAY AND SYMBOLIC ACTIVITIES THROUGH A MULTI-LEVEL ANALYSIS

Abstract author(s): Fábrián, Szilvia (Hungarian National Museum) - Marton, Tibor (Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Network) - Czifra, Szabolcs (Hungarian National Museum) - Csippán, Péter (Institute of Archaeological Sciences, Eötvös Loránd University) - Rajna, András (Ferenczy Museum Centre, Szentendre) - Klinga, Flóra (Hungarian National Museum) - Priskin, Anna (Déri Museum, Debrecen) - Daróczi-Szabó, Márta (Budapest History Museum) - Balogh, Árpád (Hungarian National Museum)

Abstract format: Oral

Our research focuses on exploring activity zones and household units within the settlements, investigating the relationships among them, and the role of household units within the community and the settlement's life. One of the aims of our project is to develop a methodology to identify activity zones and household units at Late Copper Age settlements.

In the second half of the 4th millennium BC, decisive social changes took place in the Carpathian Basin. Despite the fact that more than two thousand Late Copper Age sites are known in the region we still lack the necessary knowledge about the internal structure of the settlements, including the absence of traces of buildings, the locations of different activities, and the social organization of human communities that lived there.

Creating a multi-level (SQL) database we examined the archaeological data through explorative statistical methods increasingly widespread in archaeological science (CA, MCA, PCA). With the help of the statistical and spatial analysis of the finds, we carried out a joint quantitative and qualitative analysis of the various find categories. By the different types of classifications and analyses of the records of the created database, we can detect and visualize the finer patterns in the distribution of the archaeological finds that are hidden behind the huge amount of data. To understand the formation of archaeological contexts, it is essential to use theoretical and methodological tools, which reveal the relationship between human behavior and object and material remains.

The data collection and analysis carried out in a uniform manner for each site, compared to the possibilities, provide an opportunity to embed the given settlement structures at the micro-regional and regional levels, and comparing them with each other we can have a chance to describe and interpret the socio-political dimensions of settlement patterns and organization.

6 ANALYSING HOUSES. A DIACHRONIC STUDY OF BRONZE AGE HOUSES IN THE PANNONIAN PLAIN AND ITS POTENTIAL FOR WIDESPREAD ARCHAEOLOGICAL INVESTIGATIONS

Abstract author(s): Wehrheim, Ruben (Freie Universität Berlin)

Abstract format: Oral

The study of houses and their integration into larger archaeological interpretation models is an underestimated and rarely used tool for understanding prehistoric civilizations. Predominantly house constructions, if they even were included, are only used to interpret settlement patterns or the settlements themselves. Furthermore, the intention of building different house types was often brushed aside as related to cultural groups instead of looking at the relationship to other reasons for their development.

In this study, I did use Bronze Age house constructions of the Pannonian Plain, excavated in the last decades, to analyse and show what those houses and their research can tell about such civilizations. To understand their behaviour, I focused on the research questions of how the building types evolved diachronically and why different building types and materials, like clay, wood, stone, or reed, were used. To do so, over 500 buildings have been recorded, with more than 40 attributes each. Those pieces of information, such as building types, measurements, or construction phases, have been statistically collated with each other, general archaeological and geographical information.

This approach led to a high number of reliable information about the genesis of house constructions and their usage as well as the intention of their builders of the chosen materials, positions or sizes, and use of space.

Contrary to what previous research assumed, this investigation brought to light that the analysis of house construction contains not only much information about cultural processes and developments but also shows clearly, that the choice of building types is not necessarily culturally determined.

7 TAVŞANLI HÖYÜK: A LARGE BRONZE AGE TOWN IN INLAND WESTERN ANATOLIA

Abstract author(s): Naiboglu, Nihan (İstanbul Nişantaşı University) - Fidan, Mustafa (Bilecik Şeyh Edebali University)

Abstract format: Oral

Since 2017, we have been carrying out an archaeological survey project in Inland Western Anatolia. The project is characterized by the employment of recent geoarchaeological techniques including remote sensing, GIS, GPR, geoarchaeological corings, as well as radiocarbon dating. The research is concentrated on Bronze Age settlements, with a special focus on the large settlement mound of Tavşanlı Höyük. Indeed, the intensive survey conducted around the mound revealed that the archaeological settlement of Tavşanlı Höyük was covering a much larger area than previously assumed, reaching a size of nearly 45 ha which makes the mound one of the largest settlements of Western Anatolia throughout the Bronze Age. As part of the intensive survey, not only GPR measurements have been performed, but also geoarchaeological corings have been implemented, enabling us to collect charcoal samples for radiocarbon dating. With these samples, it was possible to determine the chronology of Tavşanlı Höyük prior to the excavation. The collected data provides a stratigraphy, beginning at approximately 6000 BC, and reveals that the earliest settlement in the area, namely a Neolithic village, submerged in a swamp in the following periods. However, at the beginning of the Bronze Age in around 3200 BC, a new settlement was built on top of this layer, suggesting that the swamp was drained at that time. Continuous layers from 3200 BC to 1200 BC spanned the whole period of the Bronze Age. Linking the GPR data with radiocarbon dates resulted in a reconstruction of a large mid-3rd millennium BC settlement consisting of housing blocks surprisingly similar to the Aegean insulae from the same period.

To verify our survey results, we started an archaeological excavation at Tavşanlı Höyük. This paper aims to present our results while highlighting the potential of recent technologies for providing knowledge in archaeological research.

8 I EXERCISED AUTHORITY...I ERADICATED THE LANDS: COMPARING PERCEPTIONS OF SOUTHERN BABYLONIA IN NEO-ASSYRIAN AND NEO-BABYLONIAN SOURCES

Abstract author(s): Clark, Shmuel (Digital Pasts Lab, Ariel University) - Gordin, Shai (Department of Archaeology & Land of Israel Studies, Ariel University; Digital Pasts Lab, Ariel University)

Abstract format: Oral

Southern Babylonian, and specifically the urbanscape around the city of Uruk, has played a major role in Mesopotamian history for thousands of years. It is the source of a deep, wide-ranging corpus of everyday texts which deal with all manner of intra- and inter-community connections. These texts form the basis of The Mesopotamian Ancient Place-names Almanac (MAPA) Project, which has published a gazetteer of place-names and related citations from Neo-Babylonian and Achaemenid Uruk. Preliminary analyses of this data has revealed the complex settlement patterns and structures, as they were understood and described by the inhabitants.

Previous to the Neo-Babylonian period, however, this same region was the target of repeated incursions, occupations and invasions by the Neo-Assyrian empire, which was attempting to strengthen their control of the region. These actions were recorded in detail in each relevant king's chronicles, from Tiglath-Pileser II to Sennacherib and Esarhaddon. These chronicles describe the same region, but with a focus on settlement patterns in service of the king in question, to aggrandise his conquests or minimise his defeats.

We propose a close comparison of Uruk, its urbanscape, and the surrounding regions as portrayed by the textual corpus collected in MAPA, and by the Neo-Assyrian Royal Chronicles. By contrasting these two viewpoints to each other, we will obtain a more holistic view of the settlement patterns of Southern Babylonia in the 1st Millennium BCE, which sheds light on the functional, political, and economic changes throughout this period.

9 SETTLEMENTS IN THE FLUID LANDSCAPE OF THE IRON AGE IN NORTHERN GREECE: THE CASE OF NEO RYSIO IN CENTRAL MACEDONIA

Abstract author(s): Plika, Peli - Manoledakis, Manolis - Mentessidou, Eleni (International Hellenic University) - Papadakou, Trisevgeni (International Hellenic University; Aristotle University of Thessaloniki)

Abstract format: Oral

Northern Greece during the transition from prehistoric to historic times presents an interesting landscape of rather self-sufficient and self-contained communities, while at the same time trade networks flourish and the process of colonization from southern Greece begins to unravel. Within this context, the new and still ongoing excavation at 'Trapeza of Neo Rysio-Kardia', near the city of Thessaloniki, offers valuable insights on how these realities were expressed in the built environment of a settlement. Taking into consideration various lines of evidence, such as the location of the settlement, the architecture and the spatial distribution of storage facilities, the local character of crafts - most notably weaving and pottery making - as well as the presence of imports, we discuss the internal structure of the settlement, both physical and social. Moreover, recently published data from other contemporaneous sites in

the area of the Thermaic Gulf serve to place 'Trapeza of Neo Rysio-Kardia' within the wider regional context and to explore the emerging urbanization in the landscape of central Macedonia.

10 WHAT MAKES A SITE UNITARY? THE CASE STUDY OF COMO-SPINA VERDE IN THE IRON AGE

Abstract author(s): Di Maria, Francesca (Sapienza - Università di Roma) - Grassi, Barbara (Soprintendenza Archeologia, Belle Arti e Paesaggio per le province di Como, Lecco, Monza-Brianza, Pavia, Sondrio e Varese - Funzionario archeologico) - Vanzetti, Alessandro (Sapienza - Università di Roma)

Abstract format: Oral

This contribution aims to underline the dynamics that led to the development of the wide settlement of Spina Verde, near present day Como, during the Final Bronze and the Early Iron Age (X-beginning of IV century BC).

Settlement traces occupy a vast area (from the southwestern slopes of the Spina Verde height to the plateau of the municipality of San Fermo della Battaglia). In the period of its first maximum expansion, the settled area reached 60 ha, and later expanded to 150 ha: it is commonly defined as a proto-urban centre. The evidence is anyway not continuous, due to the research history and to the impact of modern constructions.

Based on archaeological data, how can we judge whether this area is occupied by a single political unit or by multiple realities that are extremely close to each other?

Through the study of the structural evidence that characterizes the mentioned landscape (e.g. dwellings, terraces, channels for water management, roads) along with the study of the structures' orientation, it can be possible to define some characteristics that are coherent with a unitary site.

The interpretation of the different entities as a wide and single site is rooted in a comparative study and a multidisciplinary approach: both archaeological and ethnographic comparisons have been used. This procedure has helped to generate an archaeological map of the settlement of Spina Verde, Como, starting from the systematic review of the excavation reports and bibliographic sources, with the contribution of lidar surveys and geophysical prospections, in OA GIS environment (Qgis). The coherence of data has in this way been critically validated.

11 MOUNTAINS, DALES, ESTUARIES AND WETLANDS: LIVING ACROSS THE NEOLITHIC LANDSCAPES OF CUMBRIA AND NORTH LANCASHIRE

Abstract author(s): Evans, Helen - Dickson, Antony - Brown, Fraser (Oxford Archaeology)

Abstract format: Oral

People live and work across local and wider landscapes at different scales, coming together and separating in different times and places, sometimes for local and everyday tasks, and sometimes journeying to gatherings in significant locations.

Based on what we've learned from digging Neolithic (and Mesolithic) archaeology on the east side of the Irish Sea, we explore a region less-visited by academics. Whilst the northern English counties of Cumbria and Lancashire are well-known for Neolithic stone axe quarries and stone circles in the Lakeland fells, the occupation record is poorly understood. Recent large scale excavations on major infrastructure projects have revealed lowland landscapes sealed by peat, allowing analysis and interpretation of the social scales of landscape exploitation. Sites range from small campfires and tree-throws along the wetland edge to aggregation sites on confluences and islands, some marked by structured deposition and others by large-scale monuments. Lithic analysis tells of the exploitation of local raw material sources within small valley systems and wider exchange networks stretching along and across the Irish Seaboard.

The uplands, river valleys and estuaries of Cumbria and Lancashire provided the main arteries of seasonal and social life. If we are to generate a holistic view of how people organised themselves at the different social scales indicated by our sites, material culture and ecofacts, the basic unit of analysis should be the landscape itself. We need to zoom into the micro-topographies and environments of the wetland edge, take a close look at the settings and scales of monuments, then zoom back out to drainage patterns and their relationship with the wider world. Tacking back and forth between these scales of analysis has many challenges. However, multi-skilled project teams and digital technologies allow for the fine-grained analyses and wider collaborations that make this approach both possible and successful.

12

RECONSTRUCTION OF THE KUYAVIAN SETTLEMENT NETWORK IN THE SECOND HALF OF V MILLENNIUM CAL. BC

Abstract author(s): Zon, Filip - Jakubczak, Michal (Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Czerniak, Lech (Institute of Archaeology and Ethnology, University of Gdansk) - Leloch, Michal (Institute of Archeology, University of Warsaw) - Woreta, Jakub (Institute of Archaeology and Ethnology, Polish Academy of Sciences) - Pisz, Michal (University of Bradford)

Abstract format: Oral

Settlements of the Brześć Kujawski culture (4350 – 4000 cal. BC) are very characteristic due to the way of buildings construction. These are the long houses, with their characteristic trapezoidal shape of foundation trenches and the orientation on the NW-SE axis. Thanks to this, it is possible to easily identify them on aerial photographs. In 2020, we started a project aimed at reconstructing and analysing the settlement network of the central part of the Kujavia region. The total area of research can be estimated at about 300 km². The reason for choosing this area is the diversity of environmental conditions that allow for testing the remote sensing methodology on almost all types of landscape.

It is clear that there is much more than just a utilitarian function behind the large BKC settlements. For example strong ritual significance is confirmed by the location of burials within them. There is also a correlation between the number of graves and the rank of the settlement. Burials occurred both: inside and outside the houses, as well as in the foundation trenches.

During the research, we used various types of remote sensing methods (aerial photos from a drone, an airplane, satellites and LiDAR data), but also geophysical surveys and classic fieldwalking. We also built a predictive model based on the results of our work and archival data.

We want to present the settlement model we have created, but also consider how the information obtained during non-invasive research (micro and macro scale) allows us to extend our interpretation of past social structures.

13

TOWARDS IDENTIFYING A SETTLEMENTS PATTERN IN THE SOUTHEASTERN ENEOLITHIC BLOCK FROM NORTHERN BALKANS

Abstract author(s): Lazar, Catalin Alexandru (ArchaeoScience#RO, ICUB, University of Bucharest) - Stal, Cornelis (HoGent) - Ignat, Theodor (Museum of Bucharest) - Covătaru, Cristina (ArchaeoScience#RO, ICUB, University of Bucharest)

Abstract format: Oral

Southeastern Eneolithic Block (SEB) represent a series of ceramic styles produced by some human groups related to the second migration wave of farmers from Southwestern Anatolia, denominated by archaeologist as “culture” despite their limitative character to reflect the human group’s evolution and development. The SEB communities cover the 5th millennium BC in the Northern Balkans area (SE Romania and NE Bulgaria) and comprise the Hamangia, Boian-Polyanitsa-Karanovo V and Kodjadermen-Gumelnita-Karanovo VI “culture”. The tell-type settlements in the northern part of the Balkans emerged in the Eneolithic (aka Chalcolithic or Copper Age). This transformation of settlement type reflects a sedentary population and demographic growth, along with some techno-economic progress and the rise of the elites, as proven Varna I cemetery.

The current paper explores the tell settlements created by the SEB human groups in terms of location, size, structure, buildings distribution and organization patterns. Following the available data, it becomes evident that the way of organizing the internal habitation area varies from one settlement to another, but specific patterns can be identified. For this analysis, we focus on a comparative study between previously investigated tell settlements from the targeted time period and study area. Our research is supported by GIS.

This work was supported by two grants of the Romanian Ministry of Research, Innovation, and Digitisation and CNCS - UEFISCDI, project number PN-III-P4-ID-PCE-2020-2369, and contract number 41PFE/30.12.2021, within PNCDI III.

14

REVALUATING THE LATE CHALCOLITHIC AND EARLY BRONZE AGE SETTLEMENT PATTERN IN THE ANATOLIAN CENTRAL BLACK SEA REGION (5TH-3RD MILLENNIUM B.C.)

Abstract author(s): Valsecchi Gillmeister, Margherita (Freie Universität Berlin)

Abstract format: Oral

The interpretation of the archaeological landscape of the Anatolian Central Black Sea region between the late 5th and the 3rd millennium B.C. mainly relies on the finds from a few excavated sites on the Black Sea coast and the information from North Central Anatolia. Yet very little data is available for this area. The site of Oymaağaç Höyük (Vezirköprü, Samsun), with its long-term multidisciplinary investigation, offers the starting point for a reevaluation of

the settlement pattern of this region at the crossroad between the coast and the inland. The cross-check of the Late Chalcolithic and Early Bronze Age surface pottery record against the subsurface evidence at an intra-site level is fundamental for a critical evaluation of the part played by Oymaağaç in the local geographical and cultural landscape. The results gained will be combined with the dataset already available for the Central Black Sea region, leading to the reassessment of the settlement system of this region and its role in the late 5th and 3rd millennium B.C. archaeological landscape.

15 “MEGA-FORTS” AND SETTLEMENT PATTERNS IN THE LATE BRONZE AGE OF THE SOUTHERN GREAT PANNONIAN PLAIN

Abstract author(s): Priskin, Annamaria - Szeverényi, Vajk (Deri Múzeum) - Czúkor, Péter (Móra Ferenc Múzeum)

Abstract format: Oral

Recent research has shown that the southern part of the Great Pannonian Plain is characterized by the emergence of a series of smaller and larger fortified settlements during the Late Bronze Age, ca. 1350-1100 BC. The size and character of these sites seem to vary considerably throughout the region concerned, with settlement sizes ranging from 1700 hectares to 1, and fortifications ranging from a simple single ditch to a system of multiple ditches and ramparts enclosing huge areas. The “function” of these sites is often controversial. Since 2020, we have been working on a project studying such sites and the settlement patterns in their “hinterlands” in southeastern Hungary. The aim of our paper is to present the preliminary results of our project, and – from that starting point – to re-investigate the varied character and possible “function(s)” of such mega-forts in Hungary, Romania, and Serbia. We investigate their internal layout, observed and excavated features and structures, and their relationship to other fortified and non-fortified sites and to other mega-forts. We compare opinions identifying them either as defensive structures and special places of collective rituals. We suggest that beyond the possible defensive function of the central enclosures of these sites, much evidence suggests that the area provided space for various ritual activities identifiable through structured depositions and that the role of the enclosures was at least partly the invention of tradition through monumentality.

16 MONUMENTAL SETTLEMENTS: A SPATIAL APPROACH TO THE SOCIAL AGENCY OF THE DEFENSIVE STRUCTURES IN THE BAROÑA HILLFORT (A CORUÑA, SPAIN)

Abstract author(s): González Camino, Rodrigo - González Álvarez, David (Incipit - Institute of Heritage Sciences)

Abstract format: Oral

The Iron Age hillforts of NW Iberia are excellent study cases for exploring the acculturation of landscapes through the monumentalization of settlements. These sites are the unique format of settlement recognised so far in the region, and they are abundant throughout the territory. The prominence of fortified settlements contrasts with the absence of warfare evidence in the archaeological record, prompting the debate about the social role of their ‘defensive’ constructions. This paper presents the research developed in the Baroña hillfort (Porto do Son, A Coruña, Spain), where we applied digital methods and spatial analysis. These methods aimed to explore the experiential effects of the ‘defensive’ structures of the site in the way its inhabitants or visitors perceived the Iron Age village while moving around it, walking through its inner spaces or contemplating it from the distance. We argue that the structural patterns of Iron Age settlements respond to a social staging established in a dwelling tradition, in addition to any possible defensive or productive planning. Therefore, we suggest defensive structures within this region might be interpreted as active devices bounding Iron Age communities to their land.

17 THE SPATIAL SCALE OF ANALYSIS MATTERS: AN EXAMPLE FROM PRE-ROMAN ETRURIA

Abstract author(s): Palmisano, Alessio (University of Turin)

Abstract format: Oral

In this paper, I adopt a long-established method known as rank-size analysis to detect particular settlement patterns in pre-Roman Etruria in the first millennium BC. Archaeologists must be particularly careful when applying rank-size analysis to a given study area as the results can change according to a specific spatial scale of analysis. With this premise in mind, in this work, I firstly show the results produced by performing rank-size analysis on Etruria as a whole during the Iron Age/Orientalizing (ca. 1,020/1,000–580 BC), Archaic (ca. 580–480 BC) and Post-Archaic (ca. 480–350 BC) periods.

Secondly, I break down each study area into XTENT model-defined territories to investigate how settlement size distributions changed at a local scale. The results show that at a larger regional scale, pre-Roman Etruria is characterized by fragmented political landscapes of competing independent polities loosely integrated. By contrast, at a smaller local scale of analysis, settlement systems appear more nucleated in those large centres dominating their surrounding rural hinterlands by exerting a strong political and economic centralisation.

Finally, this paper demonstrates the advantage of using rank-size analysis at different spatial scales to detect regional variation in landscape organisation within the predicted territorial boundaries of the major urban centres and the more transitory centres, as well as the buffer zones in between.

18 WANDERING FARMSTEADS OR A SETTLED SETTLEMENT? IRON AGE OCCUPATION AND SOCIO-CULTURAL STRUCTURE IN THE SOUTHERN PART OF THE NETHERLANDS

Abstract author(s): Jansen, Richard (Faculty of Archaeology Leiden University)

Abstract format: Oral

Large-scale settlement archaeology is a characteristic and pivotal research area in Dutch archaeology. Since the introduction of Malta-legislation dozens of Iron Age settlements have been extensively excavated, especially in the southern Netherlands. This gives ample opportunities for investigating settlement structures and patterns at a local, regional and supra-regional level as well as intra-site and inter-site comparisons.

The dominant theories concerning these settlements assume a dynamic settlement structure in which farmhouses are abandoned after one generation and rebuilt at some distance. This has led to a model of farmsteads 'wandering' around a monumental and fixed cemetery, the so-called wandering farmsteads-model.

This model is however based on a out-dated dataset. A comparative inquiry of the present dataset leads to a new perspective towards settlement structure and pattern including their placement in the landscape. A comparison of different sites within a region and of different regions suggests a much less dynamic system consisting of settled settlements that have been in a specific place in the landscape for generations together with cemeteries and fields. This new perspectives not only changes our idea about the socio-cultural/-political structure of Iron Age societies but also our approaches to settlement archaeology in practice.

In this contribution I want, based on the unique dataset of extensively excavated Iron Age settlement in southern Netherlands, to address the questions: how do we perceive settlement structures and patterns and how can we describe and analyse the underlying functional, social, political and economic aspects and can the analysis of settlement patterns and structures be seen as a tool that allows the study and interpretation of past social structures?

234 ARTEFACTS' RESIDUE ANALYSES AS A TOOL FOR DECODING PAST DAILY LIFE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Tsiritsi, Kyriaki (The Cyprus Institute - STARC) - Tsafou, Evgenia (Université Catholique de Louvain Collège Erasme)

Session format: Regular session

The present session aims to address topics related to the residue analyses conducted in archaeological sites, dated to the 2nd and 1st millennium BCE, located in the southern Europe and the eastern Mediterranean. Residue analysis, including lipids, proteins, starches as well as phytoliths, have the potential to provide insights not only about past diet, food preparation and consumption, vessel's functionality, but also to unfold subsistence practices, economical, and sociopolitical developments, and shifts. This session will underline the significance of such analyses for the better understanding of archaeological artefacts, contexts, structures, sites, and the socioeconomical developments of the related societies. Furthermore, this session aims to highlight the need for cohesion and consistency on the methodological strategies applied. Given that there are specific protocols for various types of residue analysis, from the sampling in the field, the sampling of the artefacts to the lab work processing, this session will invite the attendees to exchange ideas, through the presentation of case studies, about the need of the integration of different techniques of analyses, which will allow the sustainability of sampling strategies in a holistic way.

ABSTRACTS

1 GC-HRMS OF FRESH AND AGED DI- AND TRI-TERPENIC RESINS

Abstract author(s): Germinario, Giulia - Babbi, Andrea (CNR-ISPC) - De Benedetto, Giuseppe (Laboratorio di Spettrometria di Massa Analitica e Isotopica, Università del Salento, Dipartimento di Beni Culturali)

Abstract format: Oral

Natural resins are organic materials that have been used as environmental fragrances, water repellents, adhesives, sealants, or paints, and in ancient Egypt for mummification. Their chemical characterization in archaeological finds can provide important information on craft techniques, daily activities, and trade. The composition of natural resins is complex and not known in detail, and it changes considerably with age due to polymerization and oxidation processes. In this work, six triterpenoid (myrrh, frankincense, benzoin, aloe, dammar, and mastic) and five diterpenoid (colophony, burgundy, copal, elemi, and sandarac) resins were selected. The resins were subjected to natural and artificial

aging and analyzed with GC-HRMS before and after aging. In addition, some sherd samples from Bisenzio (Capodimonte, VT - Italy), a settlement that flourished between the 9th and 5th centuries BC, were subjected to total lipid extraction. All resins analyzed showed a different profile between fresh and aged samples. Some results are reported as an example: the resins of conifers show the same stable biomarker, dehydroabietic acid, which increases with aging together with 7-oxo-dehydroabietic acid, abieta-8,11,13-triene, and abieta-8,11,13-trien-3-one. Thank to HR-MS it was possible to detect and identify different degradation products. Conversely, abietic acid is most abundant in fresh colophony resin and tends to disappear with aging. Six compounds with labdane and pimarane skeletons were identified in sandarac resin. Diterpenoids with conjugated double bonds in the side chain, such as communic acid, are known to polymerize to a cross-linked structure, so their decrease with aging and more with artificial aging than natural has been observed. The samples from the archaeological site of Bisenzio show di- and mono-acylglycerols, fatty acids, cholesterol, and its degradation products. Moreover, dehydroabietic acid, isopimaric acid, pimaric acid, sandaracopimaric acid, and communic acid, and their relative degradation compounds suggest the presence of Pinus and Cupressaceae resins.

2 INSIGHTS INTO CERAMIC USE IN PROTOHISTORIC NORTHEAST BELGIUM OBTAINED FROM RESIDUE ANALYSIS OF THE CERAMIC MATRIX

Abstract author(s): Heller, Frederic (AWaP) - Garnier, Nicolas (Laboratoire Nicolas Garnier)

Abstract format: Oral

Interest in paleo-diets has grown in parallel with the development of technologies and analytical tools that have now made it possible to identify organic residues more precisely.

In this paper, we present the first analytical results of a first batch of eight potsherds recovered from the Late Bronze/Early Iron Age site (Hallstatt B-C-D) of Linsmeau in Belgium. The study of pottery for this period has traditionally served to define cultural groups and to provide dates, the function of pots was deduced from their shape and sometimes from cooking caramels preserved inside.

New methods such as lipodomics and metabolomics are now available to extract a wider range of information from these same vases without having to rely on visual clues, but they also have to be planned for upstream. These new methods and instruments were used in our case. After a thorough dry cleaning, twin samples of powdered pottery wall were taken from each fragment using a clean dentist drill and sealed in aluminum foil. In the laboratory a first extraction and analysis of the extract by gas chromatography coupled with high resolution mass spectrometry (GC-HRMS) was performed, thus allowing the identification of soluble markers, then a second acid-catalyzed extraction of the residue already extracted was done, the analysis of this extract by GC-HRMS gave access to the insoluble and/or polymerized markers.

The analyses of organic residues from Linsmeau's 'La Closiere' abundant pottery will provide insight into food, culinary and funerary practices encompassing a period between the Late Bronze Age and the end of the Early Iron Age. Sadly, this method of research remains rarely explored, a gap that this study attempts to begin to address.

3 CHEMICAL MARKERS AND THE FUNCTION OF DOLIA IN THE ROMAN FOUNDRY OF VALDERREPISA (CIUDAD REAL, SPAIN)

Abstract author(s): Pina Buron, Maria Rosa - Zarzalejos Prieto, Mar (Universidad Nacional de Educacion a Distancia) - Oliveira, César (Universidade de Evora)

Abstract format: Oral

The aim of this work is to discuss the results of chemical analysis of residues conducted by means of Gas chromatography-mass spectrometry (GC-MS) in an assemblage of roman dolia coming from the site of Valderrepisa (Ciudad Real, Spain). The site, excavated between 1990 and 1991, holds an ancient foundry dating back to the Late Republican period (II-I centuries B.C.) and related to the mining exploitation of silver and plumb of Sierra Morena at its time of highest activity. The interest of this case study is that the pottery containers were found in their primary context of use inside a storage room, thus providing major evidence about diet and subsistence practices of the foundry workers, who might have been of Italian origin, at least in part. A variety of chemical markers retrieved from the pottery samples analysed points out to vegetable oil as the only content of the whole assemblage. A dataset we will confront with literary sources to ascertain the function of these vessels in the site.

4 THE APPLICATION OF THE ORGANIC RESIDUE ANALYSES ON THE STUDY OF MINOAN CERAMIC VESSELS FROM THE 2ND MILLENIUM BCE CRETE

Abstract author(s): TSAFOU, EVGENIA (Université Catholique de Louvain)

Abstract format: Oral

This paper discusses the application of the organic residue analyses on ceramic cooking vessels dated in the Middle and Late Bronze age (1750-1200 BC) which are coming from two neighbouring Minoan settlements of the island of Crete in the Aegean. The organic residue analyses programme was part of a holistic approach and an interdisciplinary methodology adopted on the examination of the function and use of different shapes and types of domestic vessels related to food preparation, which was aiming to understand better the Minoan culinary practices.

The implementation of the programme contained two different techniques of analysis, the microbotanical and the molecular analysis, and different kinds of shapes and types of utilitarian vessels, which enabled the study to detect a large range of organic substances used in the ceramic vessels. Through this paper, the results obtained from the two methods of analysis and the new information added in the function and use of the cooking vessels, as well as in the Minoan cooking practices, will be pinpointed. Furthermore, the methodological strategy followed in the implementation of two different techniques of analyses and the methodological challenges will also be discussed.

5 STARCH GRANULE ANALYSIS UNDER DISCUSSION: THE CASE OF 2ND MILLENNIUM BCE CYPRUS

Abstract author(s): Tsirtsis, Kyriaki - Margaritis, Evi (The Cyprus Institute - STARC)

Abstract format: Oral

Archaeobotanical studies in the Eastern Mediterranean have shown that the integrated analysis of macro botanical remains and starch granules from food-related artefacts (e.g., pottery used to store, process or consume food) has the potential to result in a better understanding of plant-based food processing and culinary practices; insights that allow a better and holistic reconstruction of the interaction of past humans and plants at regional and interregional level. The present paper aims to address topics related to the starch granule analyses conducted in archaeological sites, dated to the 2nd millennium BCE and located on the island of Cyprus in the Eastern Mediterranean. The starch granule analysis which was conducted on artefacts that derived from various contexts linked to domestic, storage, funerary, and workshop activities aims to provide important information on the significance of starch granule's presence in -not necessarily related to domestic activities- archaeological units but also to open a new discussion on the design of sampling strategies.

236 EARLY MEDIEVAL TOWNS IN EUROPE: BETWEEN LEGACY OF THE ROMAN EMPIRE AND „BARBARIAN“ CULTURE?

Session theme: 6. Contested Pasts & Presents

Session organisers: Lorans, Elisabeth (University of Tours) - Crabtree, Pamela (New-York University) - Lefebvre, Bastien (University of Toulouse)

Session format: Regular session

As a result of excavations that have been conducted throughout Europe during the past 40 to 50 years, urban archaeology has increasingly revealed the transformation of urban space between the 4th and 11th centuries CE. In the territory of the Western Empire where classic Roman towns predominated, archaeologists have observed important changes that took place more or less rapidly, principally during the 4th and 5th centuries CE. They include: the progressive abandonment of construction in stone in favor of building with wood and turf which can be more difficult to interpret, the reuse of construction materials, public spaces and amenities that are poorly maintained or abandoned (such as roads, squares, and aqueducts), the development of episcopal centers or new settlements around certain suburban basilicas, the replacement of habitation or industrial areas with cemeteries, and the adoption of new ways of life that can be difficult to identify in the thick deposits of the "dark earth", etc. Although these issues are well known and have been treated in many publications, comparisons between different countries and regions are needed in order for them to be better understood. The goal of this session will be to compare territories within and outside the Roman Empire from the same period in order to identify their similarities and differences. Identifying these similarities and differences will allow us to distinguish antique survivals from the contributions of Germanic or "barbarian" societies to the development of early medieval towns.

Synthetic contributions, on a regional or national scale, are requested, rather than reports on individual sites. These contributions could focus on general characteristics of urban spaces or on certain aspects of urban organization and

topography (such as roads, houses, cemeteries, etc.) or on the archaeological evidence that can reveal new ways of life.

ABSTRACTS

1 WHAT IS THE NATURE OF URBAN LIFE IN 5TH-8TH CENTURY BRITAIN?--EVIDENCE FROM SOUTH-EAST ENGLAND

Abstract author(s): Crabtree, Pam (New York University)

Abstract format: Oral

The question of the transition from the Roman to the post-Roman world has been of interest to historians for centuries, and archaeology has also played an important role in attempts to answer this question since the middle of the last century. While scholars working on the European continent have made a strong case for some degree of continuity in settlement in post-Roman towns and cities, some scholars working in Britain have argued for a significant decline or disappearance in urban life in the 5th century CE. This presentation will examine both settlement data and zooarchaeological evidence from late Roman towns and cities in southern Britain to examine the extent of urban life in former Roman towns from the 5th through the 8th century. To what extent can we talk about urban life in post-Roman towns in Britain, or do these towns simply survive as features in the early medieval landscape? In addition, what is the relationship between these Roman towns and the establishment of the so-called 'wics' in the 7th and 8th centuries CE?

2 BECOMING URBAN IN THE KINGDOM OF EAST ANGLIA

Abstract author(s): Fathy, Brandon (University of Leicester)

Abstract format: Oral

The question of how towns (re)emerged in the early Middle Ages continues to vex archaeologists. This research has been particularly hindered by a framework which sees towns as stable categories of being, rather than as articulated through a process of becoming. Accordingly, this research critically examines the early history of Ipswich, AD 600-900, in an effort to understand how and when it emerged as a town. To do this, I explore Ipswich in context with neighbouring contemporaneous East Anglian settlements - Brandon (Suffolk), Carlton Colville, Kilverstone, Rendlesham, and West Stow - to identify how early archaeological evidence can begin to detect a new species of settlement (i.e. a town) at Ipswich. For this research, an individual settlement does not belong to the category "town" by a list of common characteristics, but rather by historical processes.

I collated over 50 separate excavation reports around Ipswich and a further six from surrounding settlements and mapped their features and artefacts in a GIS, including quantitative and qualitative data. I examined and contrasted the following four characteristics from each settlement: boundary plots, settlement scale, building clustering, and quantity of imports. Key results included that Ipswich was, as early as the 7th century, distinct from neighbouring sites from a) the presence of smaller enclosures, b) the high frequency of pit/well features per plot, c) later continuity of earlier construction traditions, d) a more extended territory, and, perhaps most interestingly, e) the replacement of roads in favour of "halls" as the spatial focus of construction. Furthermore, f) a higher absolute and relative quantity of imports were deposited in Ipswich than at most sites. I conclude that Ipswich did not begin its life as a village and then grew into a town, but was instead qualitatively different from East Anglian settlements from the start.

3 TRANSFORMATION OF ROMAN CAPITAL CITIES IN GAUL BETWEEN THE 4TH AND THE 10TH CENTURIES: AN OVERVIEW

Abstract author(s): Lorans, Elisabeth (Université de Tours)

Abstract format: Oral

Urban occupations from the 4th to the 10th centuries in the former territories of the Roman Empire, known as "l'entre-deux" following the work of Henri Galinié, remain difficult to understand despite the many archaeological discoveries of the past fifty years. This presentation focuses on France and highlights the major transformations of the urban landscape in the major ancient urban centers of Gaul: what became of civil or religious public buildings; changes in construction practices (the transition from stone to earth and wood, but also the intensive recycling of building materials); a new religious topography based on the pairing of the basilica and the episcopal see, but also funerary rites characterized by a diversity of practices (from individual tombs to vast necropoli associated with a basilica); or even agropastoral or artisanal activities identified during excavation, sometimes connected with dark earth deposits. The objective of this presentation is to evaluate the roles of continuity and change in the transformation of the principal Roman cities in Gaul, privileging a qualitative rather than a quantitative approach.

4 WELCOME TO THE DARK SIDE: DISCLOSING INVISIBLE STAGES OF MEDIEVAL URBANIZATION THROUGH THE INTEGRATED STUDY OF EUROPEAN DARK EARTH

Abstract author(s): Lo Russo, Sarah (Vrije Universiteit Brussel; University of Basel) - Devos, Yannick (Vrije Universiteit Brussel) - Pümpin, Christine - Brönnimann, David - Kübler, Simon (University of Basel) - Nys, Karin (Vrije Universiteit Brussel) - Ismail-Meyer, Kristin (University of Basel)

Abstract format: Oral

Thick, dark-colored homogeneous deposits, also known as Dark Earths, are a common phenomenon in European towns. Their seeming absence of stratigraphy has in the past resulted in a lack of research or their discarding or generalizing interpretations, for instance as abandonment deposits linked to towns' supposed decline. Meanwhile, geoarchaeological research has convincingly demonstrated that they contain highly valuable information impossible to access with traditional methods. For the Early and High Medieval Period, these Dark Earths represent some of the least known aspects of town development.

The WEAVE-project "Welcome to the Dark side" will re-evaluate micromorphological data from numerous case studies, primarily in Belgium and Switzerland, in an integrated study. The main goal of this project is to perform a first, large-scale, integrated Europe-wide synthesis of all results, important themes and major trends of past and current geoarchaeological Dark Earth research on early and high medieval towns. This will complement and challenge past historical-archaeological debates on the emergence and development of towns, and to write a novel, geoarchaeology-informed narrative on this subject. All data are entered into a novel two-pillar database system (GEOARCHrec and GEOARCHive). Thanks to this unique open access system and image reference collection, the project will have a significant and lasting impact on how Dark Earths are studied in the future, preventing further loss of irreplaceable information.

5 WALLS, STREETS, SEWERS, AND AQUEDUCTS. GENERAL TRENDS IN HISPANIA BETWEEN 4TH AND 7TH CENTURIES AD

Abstract author(s): Ruiz-Bueno, Manuel D. (Universidad de Córdoba)

Abstract format: Oral

The Romanization of the Iberian Peninsula led to the foundation of new cities across the territory or the transformation of the previous ones. Regardless of their origin and status, most of the urban centres in Hispania shared some basic infrastructure that include walled enclosures, a network of stone-paved streets with a sewage system and a water supply system where aqueducts had a key role.

This varied infrastructure had a different evolution from the 2nd century AD onwards, but mainly in the period comprised between the 4th and 7th centuries. In those cities that remained inhabited, the continuous maintenance and repair of the walled enclosures contrasts with the progressive abandonment of almost all the aqueducts, and therefore, the proliferation of wells and cisterns. Meanwhile most of the streets were still in use, but with a different appearance due to several changes that include the partial or total occupation of porticoes and roads, the replacement of stone pavements by beaten earth floors over the time and the progressive disuse of most of the sewers.

These general trends are shared with other cities of the former Western Roman Empire and reveal the disappearance of the classical city and the emergence of the late antique town. However, they did not happen at the same time, and even in the Iberian Peninsula there are important differences not only between the cities but also inside the same town. Through this contribution our aim is to provide a broad view of these changes paying special attention to when it happened.

6 TOPOGRAPHY OF POWER AND TOWNS. THE CASE-STUDY OF MILAN AND NORTHERN ITALY BETWEEN LATE ANTIQUITY AND THE EARLY MIDDLE AGES

Abstract author(s): Vassena, Mauro (Università Cattolica del Sacro Cuore - Milano)

Abstract format: Oral

Topography of power is widely recognized as a privileged approach to investigate features and transformations of towns between Late Antiquity and the Early Middle Ages, because it profoundly determined the development of urban settlement fabrics. Analyzing selected data from both written sources and archaeological evidences regarding ecclesiastical and civil seats of power (bishops' palaces, royal and ducal buildings), this presentation aims to describe how Milan and other urban settlements in Northern Italy (especially in Lombardy) developed from roman to early medieval towns. We will be able to notice how the typical architectural language of the authorities in Late Antiquity, well rooted in the Roman past, underwent significant transformations probably following contacts with new forms of monumentality imported from barbarian populations. In particular, we will see how the multicentric extension of the grandiose late antique palaces (often corresponding to entire urban districts) evolved towards much smaller and com-

pact structural forms, and how the implementation of palaces' defensive systems became a main feature of power statement, so that the medieval seats of power were able to establish themselves as the vertices of the townscape.

7 THE DEATH OF ALTINUM (VENICE): SHOULD WE HAVE TO BLAME ATTLA?

Abstract author(s): Paiano, Jacopo (Ca' Foscari University, Venice; Scuola Interateneo di Specializzazione in Beni Archeologici - SISBA)

Abstract format: Oral

Altinum (Venice) was one of the most relevant urban settlements in the north of Italy in the Roman Imperial age, as testified by several historical sources and archaeological findings. The importance of the city and its centrality during the roman era does not harmonize with its complete abandonment at the beginning of the Early Middle Ages. It is also a matter of surprise that almost all the other roman towns in the area show patterns of continuity. In the past, archaeologists and historians paid little attention to the post-classical phases of the city. Local tradition adopted a specific narrative elaborated in later times for political reasons by the Serenissima: the end of the town has to be blamed on the destructions and invasions of different Barbarians. Attila and the Huns as a plague or the Lombards as destroyers: these ideas have also been a well-known leitmotiv in the archaeological literature. This view is not acceptable anymore.

This paper discusses the results of a GIS project that reconstructed the Late Antique and Medieval topography of Altinum, considering published literature and all the excavation data (grey literature) available in the local archives, including the topography of all the findings dating from the 4th century onwards. The data are discussed overlapping the detailed forma urbis discovered by remote sensing.

It appears that the urban landscape and its transformation were much more complex than simple barbarian destruction: archaeological data show early crises (2nd 3rd cent.) and substantial transformation during the Goth period, which should be compared with the urban destructuration patterns already studied in Northern Italy and the Adriatic area.

8 DESTROYED BY THE BARBARIANS OR FOLLOWING THE STREAM: TOWNSCAPE TRANSFORMATIONS IN THE NORTHERN ADRIATIC REGION (4TH-8TH CENTURIES)

Abstract author(s): Bergamo, Martina (Ca' Foscari University of Venice)

Abstract format: Oral

Were the substantial urban changes of the Roman cities in northeastern Italy the results of the warfare after the crisis of the Roman empire or the results of the environmental transformations?

The study of settlement in the northern Adriatic region between the Late Roman and Early Middle Ages received considerable attention during the last 30 years, with new excavations in relevant sites. Although in the territories between Aquileia and Adria the urban system endured, and many Roman towns survived, cities on the coast underwent some radical transformations involving the configuration of spaces and the appearance of new features in building techniques and material culture.

While the importance of road networks slowly diminished in favor of river/channel transportation of people and goods, the connection between the urban centers and their coastal and lagoonal surroundings became crucial as relevant shifts in the environmental configuration challenged their access to the sea. At the same time, many new settlements emerged in strategic locations alongside rivers and lagoons, granting the cities new docking infrastructures and configuring them as polycentric entities. Placed near the main waterways, with guaranteed access to the commercial networks and the production of specific goods, such as salt and fishery, some of them gradually gained relevant status in commercial and demic terms, absorbing some harbor functions, showing great economic vitality, and sometimes attracting new bishoprics.

This paper aims to follow this long process between the 4th and the 8th centuries, with a topographical and comparative approach focusing on fluvial axes flowing from the cities to the lagoons. Shifting to this perspective, it is possible to reconnect the urban and coastal elements, overcoming previous separate viewpoints, and re-narrate the traditional impact that "barbarian" destruction would have had.

9 DO WE LIVE IN CITIES IN THE EARLY MIDDLE AGES: THE DIFFICULT QUESTION OF HOUSE REMAINS

Abstract author(s): Lefebvre, Bastien (Universty of Toulouse Jean Jaurès; French Ministry of Culture)

Abstract format: Oral

In Western Europe, the question of the material reality of cities during the early Middle Ages has been debated for many years. While religious buildings are well documented by both texts and archaeology and funerary discoveries are not lacking, remains that have been interpreted as houses are extremely rare. Must we conclude that no one lived in

cities in the early Middle Ages or, more likely, that the nature and form of these houses left few traces? Several examples excavated in Italy, in France, and in England provide some avenues to explore and a glimpse of the diversity of the types of houses and their manner of construction. Between the antique domus the urban houses of the middle Middle Ages, numerous forms of housing, characterized by substantial regional, chronological, and social heterogeneity are hidden. This communication will address the subject according to three themes: the architecture of the houses, the organization of domestic spaces, and the topography of settlement in the cities.

10 URBAN ARCHAEOLOGY OF LJUBLJANA: THE EMERGENCE OF A MEDIEVAL TOWN ON THE RUINS OF ROMAN EMONA

Abstract author(s): Karo, Špela (Zavod za varstvo kulturne dediščine Slovenije) - Županek, Bernarda (Museum and Galleries of Ljubljana) - Draksler, Matej (Skupina STIK)

Abstract format: Oral

In the 4th and early 5th centuries, the appearance of the Roman colony of Emona changed; the town walls were partially reinforced, some entrances were walled up, and the defensive ditches were dug again, while a large part of the sewage system was no longer maintained. It is believed that the temple on the forum was demolished, and some large public buildings and buildings for Christian rituals were repaired or erected. These changes were closely related to a number of factors, such as the rise of Christianity, civil wars and conflicts, economic crises, and increasing pressure from Germanic peoples beyond the borders. Modest traces of the barbarian presence are found in individual graves and objects scattered throughout the town, as well as in burial grounds on the outskirts. For the period after the middle of the 5th century, there is little evidence of life in the town.

The urbanisation of the town can be traced again from the early 11th century. The excavations carried out in the last three decades in the historical centre of the town have significantly changed our knowledge about the beginnings of the medieval settlement and the early phases of its urban development. The archaeological findings locate the beginnings of the medieval settlement on the right bank of the Ljubljanica River, when the Castle Hill with its wooden fortification surrounded by a defensive ditch became the central control point. At that time, pre-urban settlement began at the foot of the hill, where evidence of a large-scale tannery was found. The oldest remains are wooden buildings and a ditch system derived from the watercourse of the Ljubljanica, which may have served the tanneries. The rise of Ljubljana took place in the 12th century under the Spanheims, when the castle once again became the focal point.

11 "SUFFERING UNSPEAKABLE DISASTERS AND CRUSHED BY POVERTY". CONTINUITY AND CHANGE IN THE EARLY MEDIEVAL PELOPONNESIAN CITIES

Abstract author(s): Simoni, Eleni (University of Patras) - Papagiannopoulos, Konstantinos (Institute of Local History)

Abstract format: Oral

After an "extraordinary flourishing" during the Late Roman period, the Peloponnesian cities enter a period of crisis in several levels of the life, including demographic shrinkage. Systematic work in Corinth, Messene and Sparta shows dramatic transformations of the topography. Despite lacking details in the real extent and the exact typology of the urban settlements, it appears that the cities were reduced in size, while the center of the social life moved to other zones within the walled area and public buildings shifted in use. In cases, individual tombs occupy the position of the agora. The first Christian cemeteries and basilicas appear marking the fusion of the new moral standards. Abandonment in urban space is often assigned to barbarians. However, in Olympia the major destructions are now attributed to an earthquake. By the same cause, many public buildings in Patras were destroyed in the late 3rd century. Then, after a second, historically documented, seismic event in the mid. 6th century, the city gradually shrinks and is confined inside its new-built castle. In this way, it manages to survive the Slavic attacks two centuries later.

We follow the evolution of the urban fabric in the Peloponnesian cities between the 4th and the 12th centuries. Not all cities are equally researched and studied. For example, excavations from Patras are unpublished in total and only preliminary reports are available. We try to overcome the limitations imposed by an imbalanced study of the region with the use of GIS and the employment of fuzzy logic. At the same time, a number of landscape projects that are being conducted in the Peloponnese and other neighboring regions broaden our scope, as they highlight changes in the countryside at the regional level and the resilience that the inhabitants demonstrated opposite multiple internal and external threats.

HOW DO WE BUILD IT? EARLY MEDIAEVAL PROTOURBAN CENTRES OF MORAVIA

Abstract author(s): Prištáková, Michaela (Department of Archaeology and Museology, Faculty of Arts, Masaryk University) - Mazuch, Marian (Institute of Archaeology, Czech Academy of Sciences) - Dresler, Petr (Department of Archaeology and Museology, Faculty of Arts, Masaryk University)

Abstract format: Oral

The second half of the first millennium AD falls within the period between the Frankish and Byzantine empires, a very turbulent period, characterised by a deep political and social transformation. The territory of today's Moravia (eastern part of the Czech Republic), inhabited by Slavs, was no exception.

This period is also described as proto-urban, which developed into the regular planned urban concept in the Mediaeval period. The proto-urban concept was reflected especially in the extensively fortified centres, often referred to as strongholds (e.g. Mikulčice, Pohansko, etc.). However these important centres of the 9th - 10th centuries AD were, unlike in the west, built "on greenfield sites" without previous settlements. Based on new research, these new proto-towns apparently did not last long and were abandoned after a very short period of time, so there must be an unexpected dynamic of development. All the factors mentioned above give us a unique opportunity to study situations that are little disturbed by previous or further interventions.

The urban concept in Great Moravian strongholds lacks easily defined and regular inner structure, which is more often present at strongholds in northern and western Europe. It was believed that the unorganised cluster form represents the predominant or even exclusive settlement form of the Slavic Early Middle Ages. This may not be completely true, as in recent years, we successfully recognised urban patterns. We were able to trace homesteads, roads passing through the strongholds, the spatial distribution of production areas, churches, churcheside but also solitary burial grounds, waste management etc. This points to the gradual evolution of the concept of urbanism. The paper will present the results of research on important early medieval Moravian strongholds from recent years with a focus on the description of the manifestations of urbanism.

PLISKA, PRESLAV AND THE EMERGENCE OF NEW MEGACITIES IN EARLY MEDIEVAL BULGARIA

Abstract author(s): Milo, Peter (MUNI - Ústav archeologie a muzeologie) - Aladzhev, Andrey - Dimitrov, Petar (National Archaeological Institute with Museum, Bulgarian Academy of Science) - Havelka, Jan (MUNI - Ústav archeologie a muzeologie) - Voykova, Maria (Varna Regional Museum of History) - Milová, Beáta (Archaeological Institute, Slovak Academy of Science) - Rekemová, Anna Mária - Šálka, Dávid - Tencer, Tomáš (MUNI - Ústav archeologie a muzeologie)

Abstract format: Oral

With the end of Roman rule over the eastern Balkans, most urban settlements came to an end. However, within the Bulgarian state established at the end of the 7th century, new settlements gradually emerged. This includes sites such as Pliska and Preslav, which belonged to the largest cities of the era, in terms of area comparable to the megacities such as Constantinople and Baghdad. Their history graphically illustrates the rise and fall of the First Bulgarian Kingdom as well as the re-occupation of the Eastern Balkans by the Byzantine Empire between the 8th and 11th centuries. Due to the rapid reduction of their occupied areas in the eleventh century and beyond, they represent the best-preserved metropolises from the Middle Byzantine period in the Balkans. As a result, many important parts of both cities have been archaeologically excavated – the Ruler's and Patriarchal complexes, aristocratic mansions, production and monastery ensembles, as well as numerous church buildings. The latest geophysical survey found that large parts of both sites show organized residential development of regular settlement structure with a regular network of roads lined with fenced courtyards. Our survey shows buildings of various kinds, including churches and multi-room residential stone houses often surrounded by a large number of wooden sunken huts. The structure of the built-up areas in Pliska and Preslav reveals a system for which we do not know a direct analogy. Although sunken huts are a common type of house in the Balkans, as well as in Central and Eastern Europe, the sacral and profane stone architecture – despite its local antecedents – has its roots mostly in Byzantium.

POTTERY BEYOND TYPOLOGY. PREHISTORIC VESSEL BIOGRAPHIES IN THE DOMESTIC SPHERE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Pyzel, Joanna (Maria Curie-Skłodowska University in Lublin) - Gomart, Louise (CNRS - UMR 8215 Trajectoires & Université Paris 1) - Stäuble, Harald (Heritage Office of Saxony)

Session format: Regular session

In this session we want to go beyond the very important function of prehistoric pottery for chrono-typological and cultural differentiation as the common praxis in archaeology, and take a closer look at the vessel biography including its whole lifespan from the production to the final deposition and at its large implications for the understanding of prehistoric domestic lifeways. We aim at gathering researchers working on various aspects of prehistoric pottery to discuss its production, use and discard in reference to the domestic sphere as a key to understand social life in prehistory. We want to address research methods and discuss how we can recognise different stages of production and uses within houses and settlement structures. We also intend to discuss various interpretations: where is the pottery production happening and who is producing it within or beyond the domestic sphere? Who used the pottery and how producers and users related to each other? Is there a difference between the intended meaning and the different social values of pottery? Does pottery social value change over time? Conversely, we want to consider which implications these topics have for the typological analysis of pottery and its interpretation.

We welcome contributions focusing on the following issues:

1. The production and the producers of pottery,
2. The different “uses” and the multiple ways of functioning of pottery (from intention to praxis),
3. The many cycles of vessels and the many lives of pottery (from vessel to sherd),
4. Fragmentation and its different meanings,
5. Repairing and refunctioning of vessels – the value of pottery,
6. The ultimate abandonment of pottery.

ABSTRACTS

1 WHAT IS A GOOD SHAPE? COMPARING PREHISTORIC VESSELS USING GEOMETRIC MORPHOMETRIC ANALYSIS

Abstract author(s): Pyzel, Joanna (Maria Curie-Skłodowska University in Lublin) - Suhrbier, Stefan (University of Cologne)

Abstract format: Oral

Standard pottery typology classifies vessels to various types basing on guesstimations of differences in shape, sometimes supported by some metric data such as basic height-width proportions. These types constitute a starting point of further studies, including hypothesis on vessels function and use but the basis of such typologies is seldom questioned. In our presentation we would like to test the applicability of geometric morphometric analysis for investigating hand-made prehistoric vessels. We will focus on two case studies from the Neolithic in Central Europe: the so-called globular vessels of the Linear Pottery Culture, which is a large group of loosely defined, quite various “globular” shapes, seldom differentiated. Here, we will analyse the assemblage of ca. 150 complete vessels from the region of Kuyavia in the Polish Lowlands. The other case study will comprise ca. 150 vessels of the Middle Neolithic in west and southwest Germany, for which a chronological trend is visible when comparing the proportions of different metric data. We intend to test if geometric morphometric analysis can bring us further beyond these results and how useful it can be for future pottery analysis.

2 FROM BITS AND PIECES. HOW STATISTICAL TOOLS CAN HELP US BETTER UNDERSTAND POTTERY ASSEMBLAGES

Abstract author(s): Hegedus, Zsuzsa (Hungarian National Museum National Institute of Archaeology; Eötvös Loránd University Institute of Archaeological Sciences; MTA-ELTE Lendület „Momentum“ Innovation Research Group)

Abstract format: Oral

The pottery assemblages of prehistoric settlements are often difficult to work with, mostly due to the high ratio of fragmented vessels. In a multitude of cases, this prevents the reconstruction of vessel shapes, and consequently, the traditional typological examinations. Due to this problem, a new approach should be considered: instead of trying to fit the pottery sherds into pre-existing typological categories, I propose a bottom-up classification method that

compares the characteristics of the fragments and forms clusters accordingly. With the use of a multi-step statistical analysis, it is possible to outline groups of sherds that reflect the different kinds of vessels used by the communities. Exploring the characteristics by which these groups of fragments can be defined gives us an insight into several aspects of pottery production and use. The clear distinctions signal that the potters were working within specific mental frameworks. Influenced by their sociocultural context and working with its toolset, the potters made a chain of conscious decisions to manufacture pottery that fulfils given practical functions. Although this function can vary, and we cannot reconstruct all the roles a vessel played throughout its lifetime, with the use of a wide range of ethnoarchaeological data, the specific characteristics can be linked to certain vessel functions. The functional reconstruction can then be used to better understand the behaviours linked to pottery use, and also the patterns of disposal.

Through the case study of fragmented pottery assemblages of the Hungarian Middle Copper Age (4000–3700 BC), I present the possibilities of a statistics-based methodology, aiming at functional reconstruction.

3 UNDERSTANDING POTTERY - A PREREQUISITE FOR TYPO-CHRONOLOGY

Abstract author(s): Frirdich, Christiane - Stäuble, Harald (Landesamt für Archäologie Dresden)

Abstract format: Oral

In 2009, a long-term project was realized in Eythra, a large-scale and find-rich Linear Pottery settlement in western Saxony. The aim was, besides the presentation of the finds and features, above all methodological criticism.

As usual in Eythra the chronological order of the finds and features had priority. In archaeology it is the necessary prerequisite for answering questions of cultural history. This is the reason for the primacy of typo-chronology, among others, in the settlement research of the Linear Pottery of Central Europe. Here, dating is based on the idea of linear style developments of ceramic decoration elements in the respective settlement area. Furthermore, it presupposes that in the past ,simultaneously' existing ornamental elements were deposited in closed, i.e., immediately filled and subsequently not changed contexts.

This model has been criticized on various occasions in the past. Style developments often do not proceed linearly even in relatively small settlement areas but are an expression of sometimes contradictory interests of the pottery producers. At the same time, so-called ,outliers' are found again and again in so-called closed deposits. Finds for which experts know that they cannot belong together chronologically. In fact, dating accuracies are getting worse and worse. What we do not know and accordingly cannot control has a negative effect on dating.

Addressing the issues announced in this lecture series should be the desideratum of any typo-chronological research. In this paper, some examples from Eythra will be used to show why typo-chronological research needs further knowledge about its source material.

4 THROUGH THE LOOKING GLASS: LBK POTTERY DECORATION

Abstract author(s): Pilar, Daniel - Kvetina, Petr (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic, Prague)

Abstract format: Oral

The aim of this paper is to test the possible influence of formation processes of the archaeological record on the conception of the chronological development of the LBK (5500-4900 BC) decorative style, using selected features from the site Bylany (Czech Republic) as an example. The development of the LBK chronology has so far been based on the relative representation of individual decorative styles within the house unit. However, the analysis of fragmentation shows that the individual decorative styles do not occur in features in a homogeneous qualitative state, and the formation processes also influence their frequency. The cause may be the different levels of recognisability of the decorative styles, but also the problem of possible non-synchronous filling of the objects. In this sense, the interpretation of the house unit as a chronologically homogeneous complex should also be considered problematic, as the spatial relationship of the pits to the house cannot be unambiguously determined in a high concentration of buildings especially in a long-time occupied settlement. At the same time, the infills of individual features are significantly heterogeneous and cannot be understood as the result of analogous processes. The above-mentioned circumstances thus considerably affect the current understanding of the chronology of LBK in Bohemia and indicate the fundamental importance of formation processes in the study of settlement sites.

5 WHAT CERAMIC CAN TELL US ABOUT THE (AFTER)LIFE OF AN LPC-HOUSE

Abstract author(s): Kreienbrink, Frauke (Archaeological Heritage Office of Saxony)

Abstract format: Oral

The aim of the paper is to show how not only the study of the features and the stratigraphy, but also the analysis of the find distribution and taphonomic studies of the pottery can contribute to understanding complex find and feature situations with a possible preservation of the living horizon. As an example, one of the large houses of a Linear Pottery

Culture (LPC) settlement in Clieben north of Dresden in Saxony, Germany, will be presented. The site was found on the Younger Lower Terrace in the immediate vicinity of the recent Elbe floodplain. Due to the later covering of the site by alluvial loam, hardly any erosion took place and thus an occupation layer with numerous embedded finds was preserved over a large area. The analysis of the find distribution promised so far unknown insights into activities within and around the houses. One of the houses revealed a specific finds situation with extensive concentrations of artefacts, which suggest a preserved floor surface within the house. In the course of detailed investigation, however, it becomes more and more apparent that this interpretation is not mandatory. Ceramic preservation and distribution obviously refer to the time after the house was abandoned. So it is necessary to consider the possible further use of the houses or their ruins respectively after they are no longer inhabited and what kind of traces this produces in the archaeological record. Ultimately, it is a question of how the abandoned houses or their ruins are dealt with in a settlement that continues to be inhabited and to what extent they are still part of the domestic sphere. The talk will focus on the particular contribution of taphonomic studies of pottery to clarifying these questions.

6 THE SENSE OF POTTERY BREAKAGE: HOW BROKEN POTS SHAPED SOCIAL PRACTICES IN EARLY NEOLITHIC KÖRÖS-CRIȘ SETTLEMENTS

Abstract author(s): Vindrola-Adrós, Bruno (XSCAPE Project on “Material Minds” - ERC 2020 Synergy Grant 951631)

Abstract format: Oral

This paper explores the social role of pottery breakage and, more importantly, how these phenomena effectively shape domestic activities. Pottery breakage has been normally understood in a linear fashion. That is, it is a process that happens after using vessels for a certain time and then these are either reused in some way or discarded. While this can certainly be the case sometimes, there is more to be understood about how breakage develops and what is done with the fragments produced. The aim of this paper is to illustrate how breakage modifies human behaviour in various ways throughout object's trajectories, from how we handle or observe objects that appear to be breaking to what we effectively do with the pieces. For this task, a first step taken in this paper is to follow a theory of breakage that understands these phenomena as constantly unfolding, rather than instantaneous events, which ultimately contributes to a broader understanding of the role pottery fragments can have in social practices. A series of methods are then presented for analysing the mechanical behaviour of ceramics, which informs us of how pots actually break, as well as sherd use-wear traces that indicate how fragments are reintegrated in specific human activities. These methods were applied to study potsherds from Early Neolithic pits and occupation layers in Körös-Criș settlements in the Upper Tisza/Tisa Basin, and unveiled: (1) that Körös-Criș organic-tempered ceramic replicas exhibit crack deflection and bridging mechanisms that increase its toughness (i.e. a ‘cracking technology’), and (2) that potsherds had important roles in pottery manufacture and potentially in cooking activities.

7 POTTERS AND HOUSES: FROM PRODUCTION CYCLES TO SETTLEMENT DYNAMICS IN THE EARLY NEOLITHIC OF THE PARIS BASIN

Abstract author(s): Gomart, Louise - Gabriele, Marzia (French National Centre for Scientific Research)

Abstract format: Oral

Excavations carried out over the past 40 years in the Aisne valley (Picardy, France) have yielded over a dozen LBK sites characterized by housing units with virtually no overlap, allowing for detailed analyses of their associated domestic assemblages. This context is an ideal case study for discussing the production and distribution cycles of pottery at the house level. Using the concept of chaîne opératoire to address pottery biography, this paper aims at reconstructing the sequences of technical gestures implemented by the early Neolithic potters, from the selection and preparation of raw materials to forming, finishing and firing in order to reveal technical traditions transmitted within learning networks. The combination in this study of petrographical, micro- and macroscopic surface and section analyses (notably using micro-tomography and microfibrils) allows for a high-resolution tracing of those learning networks in time and space at the scale of the Aisne valley, revealing the trajectories of distinct groups of producers in the various settlements and houses.

8 OLD HABITS DIE HARD: EARLY AND MIDDLE COPPER AGE CERAMIC TECHNICAL TRADITIONS IN THE BUDAPEST REGION, HUNGARY

Abstract author(s): Solnay, Eszter - Szilágyi, Márton (Eötvös Loránd University, Institute of Archaeological Sciences, MTA-ELTE Lendület „Momentum” Innovation Research Group) - Virág, Zsuzsanna - Szilas, Gábor - Kraus, Dávid (Budapest History Museum) - Siklósi, Zsuzsanna (Eötvös Loránd University, Institute of Archaeological Sciences, MTA-ELTE Lendület „Momentum” Innovation Research Group)

Abstract format: Oral

Many significant research results have recently been achieved in studies on the Early and Middle Copper Age in the Carpathian Basin (4500–3700 cal BC). One of these is a new chronological framework partly based on the disputing of traditional stylistic separation. Three settlements have recently been analysed in the Budapest Region: Budapest–Dobogókő street, Rákoscaba–Majorhegy and Budapest–Növény street. These sites were defined by three ceramic styles: Ludanice, Protoboleráz, and Furchenstich. However, using the traditional typological approach, we cannot identify long-term technical traditions and real social connections, what would be crucial to do given the geographic and chronological proximity of the sites.

Thus, a technological analysis was carried out on the ceramic assemblages to identify forming techniques which appear to be resistant to change. This is in absolute contrast with the rapidly changing pottery forms and decorative styles. It is caused by the fact that the necessary motoric and cognitive skills become automatic during the learning process which always takes place in socially connected communities of practices. Therefore, social relationships can be detected by examining long-term fashioning traditions.

The technological analysis of the pottery assemblage excavated at the three settlements enables us to understand Copper Age pottery production practices and the transmission of knowledge in the domestic sphere. Similarities or differences in ceramic fabrication can reveal communities of practices that might be linked with other regions in the Carpathian Basin. Thus, this strongly contributes to the understanding the Budapest Region’s intra- and extra-regional connections. Our contribution aims to re-examine the relationship between technological data and ceramic styles to understand more about the hidden patterns of cultural and social embeddedness.

9 TRACKING CERAMIC CHAÎNES OPÉRATOIRES WITHIN EVERYDAY LIFE SPACES TO BRIDGE VESSELS’ AND HUMANS’ BIOGRAPHIES. SOME METHODOLOGICAL REFLECTIONS FROM WEST-ASIAN FIELDWORKS

Abstract author(s): Zingarello, Melania (Oriental Institute of the Czech Academy of Sciences) - Baldi, Johnny Samuele (CNRS, Archéorient)

Abstract format: Oral

The study of vessels’ biographies – namely the series of actions, customs, gestures and procedures taking place throughout their cycle of interactions with humans – is often dominated by a polarisation of the focus on a specific phase of their ‘lifetime’ and the heuristic perspective that follows. By studying the ceramic chaînes opératoires, one looks at the methods, structure and organisation of the past production systems and craftspeople behind them. While analysing shapes, decorations, functions and ways of deposition means investigating the practices of handling and disposal of the pottery users. The spatial contextualisation of the pottery chaînes opératoires, especially within the domestic spaces of living and working, constitutes an approach that makes it possible to interpolate the study of craft production with that of the practices performed with the pots. Through case studies of late prehistoric (5th and 4th millennia BCE) and Early Bronze Age (3th Millennium BCE) contexts from Tell Feres al-Sharqi (in the Syrian Jazeera, Hassake Province) and Logardan (in Iraqi Kurdistan, Sulaymaniyah Governorate), this paper aims to present and discuss the conditions allowing for the application of this approach, as well as its informative potential as a heuristic means. The aim is to show what the mapping of the spatial distribution of operational sequences can reveal about the relationships structurally linking the various phases of a vessel’s biography as a function of the social organisation of the community that produced, used and discarded it.

10 POTTERY-MAKING AND USE DURING THE EARLY IRON AGE: DEVELOPMENT AND VALIDATION OF A FUNCTIONAL TYPOLOGY IN ITTENHEIM (ALSACE, FRANCE)

Abstract author(s): Philippe, Marie (ANTEA-Archéologie, UMR 6298 ArTeHiS)

Abstract format: Oral

More than 1,700 vessels dating from the Early Iron Age were discovered in two pits in Ittenheim (France). This huge quantity of sherds, discarded at the same place and during a short time interval, offers a strong recurrence without any spatial or chronological distortion. This gives the opportunity to question pottery intended function and actual use, referring to Skibo’s work.

A functional typology was first based on descriptors related to the intended function of the vessels: morphology, technology, decoration. Several steps were necessary to develop the typology. In the end, 1,285 vessels were classed into 13 groups. Referring to Rice and Skibo's works, the characteristics of each type were analyzed to suggest one or more possible functions: cooking, storage, preparation and service of liquids etc.

The most interesting part of the discussion is provided by a comparison with use-alteration traces. They are indeed specific and recurrent within each functional type. It reveals that several vessels among each type were used in a same way, this way being different from another type. Thus, use-alteration traces validate the groups and lead to discuss the correlation between the theoretical function and the actual use of ceramics. Moreover, one can question the way potters adapted their chaînes opératoires to a theoretical consumers' need. Beyond interesting methodological aspects, one reconstructs behaviors related to daily food processing and consumption. For example, this study suggests boiled food consumption and fermented beverages preparation. Some vessels have complex biographies, as they have been perforated afterwards to become filters. In this case, intended function and actual use do not correlate. In the end, this case study gives a rich understanding of how people made pottery, ate, and adapted their vessels to their needs. It is also helpful to discuss the signification one can give to a pottery typology.

11 TEMPER UNDER CONTROL. NEOLITHIC SHELL-TEMPERED COOKING POTS

Abstract author(s): Sobkowiak-Tabaka, Iwona (Faculty of Archaeology, Adam Mickiewicz University in Poznań) - Kurzawska, Aldona (Institute of Archaeology and Ethnology, Polish Academy of Sciences)

Abstract format: Oral

Mollusk shells, especially of freshwater origin, are raw materials widely used throughout prehistory to make ornaments, tools, and household utensils. Moreover, they were frequently used as a temper in pottery production and as ingredients of building materials. In Neolithic Central Europe, crushed shells were used as a temper in the production of cooking pots but only by specific communities. It was a significant technological innovation as pottery production required different procedures and knowledge related to resource management, manufacturing process, and their properties.

In our studies of the Trypolje cooking pots, we managed to identify shells used for temper production and their provenience. We traced the production process of shell-tempered pots through experiments starting from the making of the temper through the production of vessels and their use in cooking. Multiple analyses such as microscopic observations, lipid analysis (both GC-MS and UPLC-MS), and petrographic studies (thin section and XRD analysis) of ceramic fragments obtained during archaeological investigations were applied. Results from the analyses and the knowledge gained during the experiments led us to clarify the whole process of shell-tempered pottery making, their properties that affect the cooking process, the products cooked in them, what they were used for, and a possible reason for the temper choice.

12 LIFE-CYCLES OF NEOLITHIC POTTERY: USE AND SECONDARY USE VS. TYPOLOGY

Abstract author(s): Svirar, Marija (independent) - Vuković, Jasna (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

Abstract format: Oral

Although pottery is in focus of many research, biographies of ceramic containers are still challenging field of investigation. Research have shown that the Early and Late Neolithic ceramic containers in the Central Balkans went through dynamic use-lives, from their entering into the context of use, to their discard. Different stages in vessels' life-cycles will be presented both for Early and Late Neolithic: actual use – food (food preparation, thermal processing) and non-food related (storage of pigments and/or herbs; moistening of fibers); secondary use (storage of other vessels and tools, lids, usage of fragments as tools), and extended use, with specific emphasis on curation and repairs as expressions of social values. These various modes of usage urge the need for reconsidering the notion of ceramic assemblages, usually seen as contextually and chronologically associated group of finds. More importantly, identification of various stages in pottery life-cycles further leads to the need for re-examination of the role of typology as the most common methodological tool for pottery analysis and its relevance for understanding social relations and lifeways in the past.

13 VESSELS ON THE FLOOR - POTTERY IN THE CONSTRUCTION OF THE HOUSEHOLD

Abstract author(s): Soares, Inês (FCT – Foundation for Science and Technology; CIBIO InBio – ENVARCH; University of Coimbra)

Abstract format: Oral

Pottery containers, vessels, like any other object of our daily life, apart from their primary function, can bring together different uses.

The pottery vessels are the result of different transformations, related to the activities carried out within a community. The vessels are objects, exposed to a core of practices with different social and technical meanings, according to individual and/or collective actions, in a time and space of a complex social/physical and economic mosaic.

Given the variety of concepts to which the pottery object is exposed, we will, almost always, find it in the foundation and organization of the domestic unit, the household, i.e., an event - of and in - the construction of the domestic, physical and social space/sphere, an architecture and part of the architecture.

On the southern hill of Castelo do Sabugal (Sabugal, Guarda), Beira Interior of Portugal, the identification of an Iron Age hut, composed with a calcined clay floor, became the starting point to this approach.

Under the clay floor, several pottery fragments were collected, belonging to diverse containers (vessels) and, in this context, associated with the foundation levels and regularization of the circulation floor in the interior of the hut.

Any object is the skeleton, around which a scenario is organized, a way of non-verbal communication. In this way, we propose to understand the different meanings/uses of pottery fragments identified in this archaeological context - we intend to analyze the vessels, socially produced and socially used, in their life cycle, containers of practices/actions/forms and uses, up to the last function, under the flooring.

14 COOKING ANIMAL AND PLANT SUBSTANCES AMONG THE FIRST POTTERY-MAKING SOCIETIES IN SOUTHERN LEVANT: AN INSIGHT FROM CHARRED RESIDUES OF POTTERY

Abstract author(s): Vieugue, Julien (CNRS, Université de Paris-Nanterre, TEMPS) - Duncan, Lindsay (McDonald Institute for Archaeological Research, University of Cambridge) - Mazuy, Arnaud (Université Côte d'Azur, CNRS, CEPAM) - Ramsey, Monica (Department of Anthropology, University of Toronto Mississauga) - Regert, Martine (Université Côte d'Azur, CNRS, CEPAM)

Abstract format: Oral

It is now known that the first pottery-making societies in the Levant used pottery to cook their food. Nevertheless, many questions remain unanswered about the cuisine of these Neolithic communities who lived during the late 7th/early 6th millennium cal. BC: What type(s) of food preparations were cooked in the ceramic vessels? Which cooking technique(s) were used? How was the food cooking organized inside the Neolithic villages? To answer these questions, we undertook the thorough analysis of 153 cooking pots coming from the major Early Pottery Neolithic sites of Sha'ar Hagolan and Muntaha located in the Upper Jordan Valley. Our multidisciplinary study method, developed at the interface between traceology, chemistry and botany, is based on the combined macro-, microscopic, molecular and isotopic characterization of the inner charred residues of Neolithic pots. The visual aspects of the food crusts and their distribution alongside the profile of the ceramic vessels suggest that all the pots were used to boil foodstuffs by being placed in the center of stone hearths. The integrated analysis of lipids, phytoliths and starches trapped in the inner charred residues of these ceramic vessels revealed that they had contained various food preparations based on animal and plant substances - including domestic plants such as wheat and barley and wild grasses and fruits such as acorns. The spatial distribution of the cooking pots inside the two Neolithic villages clearly show that the preparation of meals was mainly carried out at the household scale.

15 BROKEN POTS, UNBROKEN HABITS: TRACES OF POTTERY USE-ALTERATION SPANNING THROUGH THE FIRST MILLENNIUM OF NEOLITHIC IN THE WESTERN CARPATHIAN BASIN

Abstract author(s): Jakucs, Janos (Eötvös Loránd Research Network Research Centre for the Humanities Institute of Archaeology) - Kreiter, Attila (Hungarian National Museum Laboratory of Applied Natural Sciences) - Oross, Krisztián - Gucsi, László (Eötvös Loránd Research Network Research Centre for the Humanities Institute of Archaeology) - Botić, Katarina (Institute of Archaeology, Zagreb) - Marton, Tibor (Eötvös Loránd Research Network Research Centre for the Humanities Institute of Archaeology)

Abstract format: Oral

The earliest production and use of ceramic vessels in the western part of the Carpathian Basin, was introduced by the first farming communities. Their Starčevo-style pottery is characterised by a bonded technological tradition and design implemented in fairly uniform manner over a large geographic area. In the middle of the 54th century cal BC, various pottery styles were created and homogeneity was replaced by stylistic diversity, represented by the co-occurrence of Vinča, LBK and Ražište styles in southern Transdanubia. Our analyses, recently performed on pottery samples from several Transdanubian sites turned the spotlight from the swampy ground of chrono-typological debates towards the technology and the role that craftspeople played in the wider social network. The analysis of wear patterns and alteration, however, is an area that has not been fully exploited in our region. Pottery not only conveys the different traditions of potters' workshops, but also works as a versatile tool widely used in everyday life either as a whole earthen ware or a potsherd, thus incorporating a whole range of social activities. The function of a pot can also go beyond its primary function of storing and preparing food, and it can be exposed to various effects. In our study we

intend to present traces left behind by users and recyclers from different regions and eras, deriving behavioral inferences. Our examinations of ceramic vessels from different sites revealed strikingly similar patterns of attrition, secondary modification, repair, and fragmentation in some cases, even though the vessels' technology and design show considerable differences. In our presentation we provide a summary of these marks, and identify some standardized habits, which appear to span the conventional boundaries of archaeological cultures and phases.

16 **CHRONOLOGICAL TRENDS IN POTTERY USE FROM THE NEOLITHIC TO THE IRON AGE IN SAXONY (GERMANY) USING LIPID RESIDUE ANALYSES**

Abstract author(s): Roffet-Salque, Melanie - Wiltshire, Isabel - Maule, Charlie - Abdelgani, Iman (Organic Geochemistry Unit, School of Chemistry, University of Bristol) - Conrad, Matthias - Halle, Matthias - Kretschmer, Saskia - Schmalfuß, Germa (Landesamt für Archäologie, Dresden) - Wolfram, Sabine (Staatliches Museum für Archäologie, Chemnitz) - Stäuble, Harald (Landesamt für Archäologie, Dresden)

Abstract format: Oral

The analysis of lipids preserved in the clay pores of archaeological pottery is a powerful method for investigating pottery function and past diet. The use of state-of-the-art analytical methods, including chromatographic, spectrometric and isotopic methods, allows for the identification and characterisation of terrestrial and aquatic animal fats, plant oils and waxes, that arise from the cooking of animal and plant products in ceramic vessels.

Here we investigate > 340 pottery fragments from 6 archaeological sites across Saxony spanning around four millennia of occupation, from the Early Neolithic (Linearbandkeramik) until the Iron Age. Using lipid analyses of pottery sherds, we explore diachronic change in pottery use, subsistence practices, herding strategies and freshwater resource exploitation. In particular, lipids provide unique insight into the exploitation of wild and domesticated resources in the region, where faunal remains are usually ill-preserved. This study provides a stepping stone in the construction of regional climate records using hydrogen isotopic analyses from animal fats extracted from pottery and the direct ¹⁴C dating of pottery lipids.

17 **RARE INSIGHTS INTO CERAMIC BIOGRAPHIES: REMARKABLE VESSELS FROM THREE LINEAR POTTERY WELLS FROM SAXONY, GERMANY**

Abstract author(s): Schell, Frank - Stäuble, Harald (Landesamt für Archäologie Sachsen)

Abstract format: Oral

The analysis of archaeological finds often focuses, by necessity, on their fragmentary occurrence. For example, regular pottery analysis from prehistoric contexts is limited to thousands of individual sherds that rarely represent more than 10% of a former vessel. Now, what about the rare cases where whole vessels are found? Beside the so-called grave pottery, about whose production, use and last function is discussed quite a lot, there is since some years a relatively new category of finds, in which whole vessels are found more often: the wells of the Linear Pottery Culture (LPC). Due to their storage in a humid environment, these vessels have also preserved organic material and thus a multitude of previously unknown details of clay vessels. Thus, rare insights into individual "fates" of some vessels are possible here.

In addition, the impression increasingly arises that the wells were at least partially deliberately refilled after their use as water sources. However, this was not done with "waste" material as in other pits of this culture, but with complete clay vessels, some of which are still intact and usable today. Thus, some of the meanwhile numerous Early Neolithic well finds showed that parts of the backfill of such well shafts must have been regularly deposited: The well as a momentary Pompeii premise.

On the basis of a selection of Linear Pottery well finds from Saxony, Germany, we want to present some individual vessel biographies, which show all aspects of a longer use and special treatment: the use, repair, redesign of the decoration and further use, but at the same time also their deposition and thus the abandonment of their "earthly" life.

18 **FLows, TRANSFORMATIONS, AND TEMPORALITIES IN POTS' LIFE HISTORY: THE CASE OF NEOLITHIC DISPILIO, NORTH GREECE**

Abstract author(s): Voulgari, Evangelia (Laboratory Teaching Staff, School of History and Archaeology Aristotle University of Thessaloniki) - Sofronidou, Marina (Ephorate of Antiquities of Drama) - Kotsakis, Kostas (Professor Emeritus of Prehistoric Archaeology, School of History and Archaeology, Aristotle University of Thessaloniki)

Abstract format: Oral

In this paper, we present practices of repairing, reshaping, and curating pottery containers from neolithic Dispilio. Dispilio is the first wetland site excavated in Greece and has been systematically investigated since the 1990s' by the Aristotle University of Thessaloniki. In the multi-layered diachronic development of the settlement from the mid-6th

to the early 5th mil BCE, we have recorded various changes in pottery repairing and restoration techniques and practices. Hundreds and different types of reworked sherds and more than 200 repaired pots in the large corpus of the about 1670 whole pots and profiles we have restored so far, provide us the necessary framework to shed light on the various forms the reuse of pottery had in different periods. In addition, the analysis of repairing attributes, such as the relative incidence of mending per pottery ware type, direction and size of the drilled holes, their place on the vessel body, and the visibility of the repairs, alongside the study of the great typological diversity of the ceramic tools provide new data on the economic and socio-ideological aspects that ceramic consumption had for neolithic communities in Greece. Our study is supported by the ERC-funded EXPLO Project.

19 THE BIOGRAPHY OF A NEOLITHIC STORAGE JAR IN LACONIA, GREECE

Abstract author(s): Katsarou, Stella - Darlas, Andreas (Ephorate of Palaeoanthropology-Speleology)

Abstract format: Oral

This presentation explores the biography of a storage jar going through changing yet interdependent 'life stages'. The container was found in a burial context (the double burial of a male and a female) dating from the end of the Neolithic in a coastal cave of Laconia, Greece. The site forms part of a network of funerary caves on the same coast. We reconstruct the thread of the life of the jar as a skillfully crafted product originally that became a practical household object subsequently and finally a funerary facility. Certain practices that occurred during the burial episode affected its physical integrity and mark the transition from the domestic to the funerary. Nonetheless, the pithos comes to the burial with a strong symbolic register accumulated from its previous role as a domestic apparatus. This 'stored' resource is integrated into the new context and even becomes inextricable for the transformation of the jar as well as the assemblage and an agent empowering worldviews about the relationship between life and death.

20 DESIGNED FOR LIFE OR DEATH? POTTERY CHARACTERIZATION STUDY TO ASSESS CULTURAL DYNAMICS AT THE BRONZE AGE SITE OF TORRE CASTELLUCCIA

Abstract author(s): Serino, Donatella - Palazzini, Flavia - Pizzuti, Elisa (Sapienza University of Rome)

Abstract format: Oral

The site of Torre Castelluccia is located on a coastal promontory facing the Gulf of Taranto (Apulia). It is one of the very few Bronze Age archaeological contexts in Italy where both dwelling areas and adjoining burials (i.e. grotticella tombs and a cremation cemetery) have been investigated. Recently, the renewed study of ceramics led to the definition of a reliable chrono-typological sequence for the site, whose occupation history goes from the South Italian Middle Bronze Age (1700-1300 BC) until Greek colonization (around 700 BC). Based on this dataset consisting of more than 1000 sherds and vessels, further research proceeded to examine the characteristics of impasto pottery from a technological perspective. The procedure began with the macroscopic observation of the pastes using a portable digital microscope. This preliminary step aided in the accurate description of a large number of sherds and in the diagnosis of the variability of the pottery assemblage, as well as in the selection of representative samples for the petrographic analysis. The opportunity to compare pots from different contexts of use (domestic and funerary spheres) – preferably considering analogous functional forms – increased the worth of the analysis by revealing specific features that may reflect two distinct pottery manufacturing lines. The key objective of this research was therefore to provide new data on the craft community, the social organization of pottery production and the biography of pots. Furthermore, it attempted to assess whether technological traditions at Torre Castelluccia varied over time due to functional and cultural choices. In this paper, we will discuss the project and the methodology used in the reconstruction of craft activities and their cultural implications.

21 DOMESTIC POTTERY IN A FUNERARY CONTEXT. UNDERSTANDING A SPECIFIC LIFE CYCLE OF VESSELS

Abstract author(s): Fülöp, Kristóf (Research Centre for the Humanities Institute of Archaeology)

Abstract format: Oral

With the appearance of cemeteries, the domestic and funerary areas became separated. Despite the territorial separation, the interconnection between these two spheres remained active and important until these days. This connectivity is often emphasised but rarely investigated from the perspective of domestic potteries which were selected and integrated by the living into the various phases of funerary ritual.

In my presentation, I will demonstrate the importance of this approach through the complex analysis of grave goods from a Late Bronze Age cremation cemetery (Jobbágyi, Hungary) and the comparative study with settlement materials of the Tumulus Grave period (1500-1300 B.C.). The analysis of use-wear traces, the undisturbed context of the grave pits, and the special characteristics of secondary burning during cremation allow the recognition of domestic vessels in the toolset of the burial ritual.

The aim of my presentation is to reconstruct a specific, so far little-examined life cycle of household potteries, which is the moment when the domestic and funerary spheres intertwine. What are the reasons and rules behind the selection and refunctioning? What old and new functional roles are associated with these objects? In what way does this transform the former social value of the vessels in this highly symbolic space? How are object and men, object and user interconnected in the expression of identity and status?

241 **TRADING GENES FOR CUSTOMS: RECONSTRUCTING CROSS-CULTURAL CONNECTIONS USING BIOMOLECULAR APPROACHES**

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Franicevic, Branka (University of Bradford) - Pareja Cummings, Marie Nicole (University of Pennsylvania)

Session format: Regular session

Despite methodological advancements being made in the area of biomolecular archaeology, some areas remain more thoroughly researched than others. Human migration, the fossil record, and animal domestication for instance attract large-scale research while studies regarding the relationships between culture and genes lag.

This session explores the integration of genome science into potential social structures of trade regions, and in doing so sets out to expand archaeological frameworks for interpreting genetic data.

What can ancient DNA tell us about cross-cultural connectivity and exchanges? How can plant and animal DNA inform us about the lifestyle and diet of the trade cities and ports? What can we learn from palaeomicrobiology about plagues spreading along trade routes and pathogen-population relationships? Can an application of genetics to historical evidence shed light on the dissemination of religions and religion-influenced behaviour, such as interfaith marriages, or gender mobility? What are the new genetic methods in biosocial archaeology? What are the approaches for standardisation of digital data usage and data sharing?

We are interested in wide-ranging contributions including field reports, case studies, and interdisciplinary research that interpret Afro-Eurasian gene culture circa 130 BC to 1450 AD. We encourage submissions from early-career scholars and researchers from the fields of genetics, bioinformatics, bioarchaeology, and anthropology.

ABSTRACTS

1 **BIOMOLECULAR STUDIES IN ARCHAEOLOGY: ETHICS, SAMPLING, AND CULTURAL HERITAGE**

Abstract author(s): Pareja, Marie (University of Pennsylvania; Aegean Bronze Age Study Initiative)

Abstract format: Oral

Although biomolecular studies in archaeology may contribute ample information to the field and allow for critical new insights into the lives and cultures of past peoples, such studies also raise several critical ethical questions. One such issue is related to the structural disturbance of human remains and rare artifacts. The risk of damaging unique archaeological specimens is often high, which may reduce the amount of information capable of being gathered from them in the future. Appropriate use and storage of the remaining samples is less frequently considered, as well as the use and application of the resulting data – particularly in light of potential for the misuse of such information. It is crucial for archaeologists and their collaborators to engage in open and ongoing dialogue about the ethical considerations of such methods, to ensure that the ever-developing best practices are followed to minimize potential harm to both cultural heritage and descendant communities.

2 **SISTER FROM ANOTHER MISTER? AN ELUSIVE CASE OF LITTLEMORE PRIORY**

Abstract author(s): Franicevic, Branka (University of Bradford)

Abstract format: Oral

Although molecular biology may allow a glimpse into a past lifestyle, its application can also pose an ethical dilemma. This project explores life behind the veil in a medieval Oxford nunnery, particularly health and daily monastic activities. Osteology and cemetery morphology were employed to establish biological profiles and to understand whether nuns were buried apart from the parishioners. To learn about the domestic, vocational, and financial backgrounds of religious women, historical sources were utilised. Low levels of illness and disease implied a wholesome diet and healthy lifestyle. The activity-induced musculoskeletal stress markers on the tali and tibiae indicated extensive squatting and kneeling. Among 92 excavated individuals, however, three adolescents and 13 children were identified. One young adult female was further buried in a prone position with a six-month-old baby. Written records indicate violations of

ordination vows, raising the debate of whether genetic relationships should be established among the cloistered clergy of Littlemore Priory.

3 MIGRATIONS BETWEEN BRITAIN AND IRELAND AND THE INDIAN SUBCONTINENT 710-94 BCE VIA THE BALTIC-VOLGA-CASPIAN ROUTE AND THE ROUTE AROUND AFRICA

Abstract author(s): Malmi, Pasi (Dassault Systemes)

Abstract format: Oral

According to the DH method, prehistory should be studied as a process in which genes, ecofacts, and cultural replicators migrate from region to region and from generation to another. This method recommends the usage of the Genetic Atlas of Human Admixture History (GAHAH), Least Cost Analysis (LCA), quantitative measurement of cultural similarities, lexicostatistical word lists, and onomastic databases in all studies of ancient times.

Based on GAHAH analysis, Pakistan received nine migration waves from the British Islands 4600 – 40 BCE, and sent one migration wave to Britain and Ireland around 500 BCE (range of confidence 710–94 BCE). Based on LCA and GAHAH analysis, the migrations towards Pakistan followed the Baltic – Volga – Caspian Sea route. This route is supported by linguistics and by a database study of 23 ancient name sets, which revealed relatively clear migration paths that matched this route.

The analysis of GAHAH data revealed also a migration corridor from the Indian Ocean to Namibia, Morocco, Iberia, and Britain and Ireland 850–400 BCE. This corridor is supported by three historical sources, according to which Indians had a colony in West Africa, Indigetes lived in the city of Indika in Iberia, and an Indian tribe had sailed to Germania to do commerce. It is also supported by lexicostatistical data, according to which Wolof (Senegal), Guanche (Canary Islands), and Basque have a 10–50% similarity with the Dravidian languages of India. In addition, the Indian haplogroup M1 appears at the Canary Islands and in ancient Basque tombs in the form of M1c, which did not migrate via continental Africa. According to archaeological evidence, the connection from India to East Africa started 3250–2500 BCE, when Asian bananas migrated to Africa, and African sorghum millet migrated to India.

4 DEMOGRAPHIC TRANSITIONS? ARCHAEOGENETIC ANALYSES OF LATE ANTIQUE AND EARLY MEDIEVAL CEMETERIES FROM THE RHINELAND

Abstract author(s): Lacher, Laura (Max-Planck Institute for evolutionary Anthropology) - Nieveler, Elke (Rheinisches Landesmuseum Bonn) - Pääffgen, Bernd (Ludwig-Maximilians-Universität München) - Schmauder, Michael (Rheinisches Landesmuseum Bonn; Universität Bonn) - Gretzinger, Joscha (Max-Planck Institute for evolutionary Anthropology) - Krause, Johannes (Max-Planck Institute for evolutionary Anthropology; Friedrich-Schiller-University Jena) - Schiffels, Stephan (Max-Planck Institute for evolutionary Anthropology)

Abstract format: Oral

The transition from late antiquity to the early medieval period in central Europe has long been a research focus in historical and archaeological sciences. Particularly, whether the observed political and cultural changes are accompanied by demographic changes, remains elusive. Here, we study ancient DNA from multiple cemeteries in the Rhineland spanning the period from 300 to 800 AD, including the transition point at 450 AD. We analyse burials from late Roman military contexts, Bonn and Jülich, and those from local population cemeteries, especially Alt-Inden. We benefit from precise archaeological dating to correlate our genetic results and view them as a high-resolution time-series in the time span before and after 450 AD.

First, we find evidence of different ancestry backgrounds between the legionary camps, suggesting that the camps were comprised of people from a similar region, but this origin was different between the two sites. Second we observe signals of ancestry shifts through time in both the legionary burials as well as the local cemeteries, which we interpret as the result of migration into the region. Last, we find haplotype sharing indicative of close familial relationships between Jülich and Alt-Inden, whereas the individuals from Bonn show no relatedness to any other site that we studied. In conclusion, our study provides a new high resolution temporal and spatial insight into the demographic patterns of the transition time between late antiquity and early middle ages in the Rhine region.

5 OLD SAMPLES, NEW ISSUES: EDUCATIONAL COMPASS FOR PALEOGENETIC CAREERS

Abstract author(s): Franicevic-Joyce, Nicole (University of Mostar)

Abstract format: Oral

Recent technological progress in ancient genetics has largely impacted the quality of studies and transformed the availability of research funds and research resources. However, a clear educational path leading to academic positions in paleogenetics is still in its infancy and extends to a scientific minority. This presentation will first provide a brief introduction to the current state of the field of ancient DNA (aDNA) to include the latest changes in the technologies used. Secondly, it will discuss challenges in research, such as training, data authentication, and sample preservation.

Thirdly, it will analyse the structural difference in training between the fields of bioinformatics, genetics, and archaeology that potentially impacts DNA research and career progress. Finally, it will explore alternative educational routes into the field and necessary strategies for successful collaborations such as support of the sovereignty of data, new collaborative venues, and empowerment of current educational programmes. The findings add to our current knowledge of the complexities of palaeogenetic careers that underpin a new era of archaeology research.

A. AN EFFECTIVE PIPELINE FOR ANCIENT DNA ANALYSIS OF THE HUMAN ORAL MICROBIOME

Abstract author(s): Standeven, Francesca - Dahlquist-Axe, Gwyn (University of Bradford) - Speller, Camilla (University of British Columbia) - Meehan, Conor (Nottingham Trent University) - Tedder, Andrew (University of Bradford)

Abstract format: Poster

Dental calculus (mineralised dental plaque) is regarded a valuable reservoir of ancient DNA (aDNA) and has the potential to give insights on a variety of archaeological topics including diet, disease, migratory patterns, culture, and gender studies. In recent years, metagenomic sequencing has been used to identify diverse microbial communities entrapped in dental calculus, allowing for extensive investigations into ancient diet and disease inferred from oral microbiomes spanning different historical periods and geographies. However, due to the complex nature of aDNA, such as extensive fragmentation, degradation, and contamination, the recovery of full metagenomic assembled genomes remains problematic. Furthermore, many archaeologists who may examine the ancient oral cavity on a macroscopic level are not well versed in the bioinformatics tools required for metagenomic aDNA analysis. Therefore, this study uses a dataset of 155 metagenomic samples from archaeological dental calculus sequenced using short-read technology spanning over 5000-years (across the Bronze/Iron Age, Roman Period, Viking Age, Anglo-Saxon Period, Medieval Period, Industrial Age, and modern day) to evaluate and construct a user-friendly, efficient workflow for ancient human oral microbiome analysis. The runtime, computational resources, ease of use and accuracy of results are all considered to ensure such a pipeline can be widely used by researchers in the field of archaeological science.

B. USING ANCIENT DNA TO INVESTIGATE THE IMPACT OF THE INDUSTRIAL REVOLUTION ON HUMAN ORAL MICROBIOME COMMUNITIES

Abstract author(s): Dahlquist-Axe, Gwyn - Standeven, Francesca (University of Bradford) - Speller, Camilla (University of British Columbia) - Tedder, Andrew (University of Bradford) - Meehan, Conor (Nottingham Trent University)

Abstract format: Poster

The Industrial Revolution marked a period of change to many aspects of human life, such as to migration patterns, subsistence strategies, recreational activities, and habitation patterns. Investigation of ancient DNA can lend insight to the effect of these changes on human health. The human microbiome has been recognized as closely linked to many aspects of human health, from dental disease to cancer. The oral microbiome in particular is heavily influenced by diet, disease, and daily habits.

In this project we use samples of ancient DNA obtained from the dental plaque of 134 ancient individuals from across England dating from the Iron Age until the post-Medieval Era to look at the impact of changes to dietary resources and population demographics on the oral microbiome. Specifically, we compare the abundances of different bacteria, particularly pathogens, before and after the Industrial Revolution, which brought an increase in pollution and availability of sugar and processed foods through trade and industrial innovation. Existing studies investigating the effects of the Industrial Revolution on human oral microbiomes in Europe generally include limited sample sizes that may mask correlations between specific lifestyle factors and changes in the oral microbiome. However, our findings show differences in alpha and beta diversity of the oral microbiome community about this time period, likely due to these sweeping changes in British culture and environment.

C. A MOLECULAR AND SPECTROMETRIC APPROACH FOR TRACING THE ORIGIN OF ANCIENT IVORY

Abstract author(s): Costa, Marina (HERCULES Laboratory & Chemistry and Biochemistry Department of Science and Technology School, University of Évora; MED – Mediterranean Institute for Agriculture, Environment and Development & CHANGE – Global Change and Sustainability Institute, Institute for Advanced Studies and Research, University of Évora; INIAV, National Institute of Agricultural and Veterinary Research) - Vicente, Cláudia (MED – Mediterranean Institute for Agriculture, Environment and Development & CHANGE – Global Change and Sustainability Institute, Institute for Advanced Studies and Research, University of Évora; INIAV, National Institute of Agricultural and Veterinary Research) - Espada, Margarida (MED – Mediterranean Institute for Agriculture, Environment and Development & CHANGE – Global Change and Sustainability Institute, Institute for Advanced Studies and Research, University of Évora) - Faria, Jorge (INIAV, National Institute of Agricultural and Veterinary Research; MED – Mediterranean Institute for Agriculture, Environment and Development & CHANGE – Global Change and Sustainability Institute, Institute for Advanced Studies and Research, University of Évora) - Teixeira, Jorge (HERCULES Laboratory & Chemistry and Biochemistry Department of Science and Technology School, University of Évora) - Bettencourt, José (CHAM–Center for the Humanities and History Department, -Universidade Nova de Lisboa) - Teixeira, Dora (HERCULES Laboratory & Chemistry and Biochemistry Department of Science and Technology School, University of Évora)

Abstract format: Poster

The remains recovered from ancient shipwrecks are a unique cultural, historical and archaeological heritage. The Horta Bay shipwreck (site BH-001), located at Faial Island, Azores archipelago, Portugal, was partially excavated between 2008 and 2012 and became of particular interest to scientists due to the quantity and diversity of artefacts recovered, with special emphasis to a vast elephant tusks collection of unknown origin. Named as “Ivory’s Shipwreck,” a preliminary study of the artefacts suggests that it was a merchant ship operating in the Atlantic in the early eighteenth century, with possible English origin. This assumption needs to be supported by a full study of these rare items, resorting to a modern multi-analytical approach.

The analysis of artefacts through advanced analytical chemistry and molecular biology techniques may provide information about the geographical origin of the ship, the route, its cargo, and a better understanding of the strategic importance of the Port of Horta in the 17th and 18th centuries.

The artefacts recovered from the BH-001 site cover a wide variety of materials and an extraordinary collection of about one hundred ivory elephant tusks. The material analysis of these samples can provide information about the Asian or African origin of the elephants. Although the African source of the BH-001 ivory cargo is the most probable, analytical confirmation would provide higher reliability.

In this work, we present the preliminary results obtained from the BH-001 archaeological site, using DNA-based methods for species identification (mitochondrial DNA barcoding) and spectroscopic methods, like Fourier transform infrared spectroscopy (FTIR) and X-ray Fluorescence (XRF). Important information was obtained for elephant species identification by optimizing DNA extraction methods, however, data confirmation must be performed using a larger number of samples from the “Ivory’s Shipwreck” cargo and, if possible, samples obtained from other wrecks of the same chronological period.

242 FORGOTTEN BODIES, INVISIBLE HISTORIES: ADDRESSING OVERLOOKED HUMAN NARRATIVES IN THE ARCHAEOLOGICAL RECORD

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Casna, Maia - Hall, Rachael (Leiden University) - Jackson, Veronica (Vrije Universiteit Brussel) - Sandoval, Elena (University of Bristol) - Tutwiler, Alex (Leiden University)

Session format: Regular session

Over the last few decades, several conceptual, epistemological, and philosophical advances have permeated archaeological practice and theory, bringing to light the fact that, despite our best efforts, much of human history remains undiscovered. While several of our limitations in the understanding of the human past are often caused by issues such as preservation, under-representation in archaeological assemblages, and lack of funding, many others can be attributed to investigator biases shaped by popular ideas and stereotypes built around our vision of the past.

Following this, many archaeologists have been actively working to expand on those previously overlooked narratives, such as the study of women and children, economic inequality and social marginalization. The result of such efforts is that our present understanding of the past is more detailed, complete, and accurate than ever before. Yet, while some narratives are now commonly explored by archaeologists (e.g., gender, children, socioeconomic disparities), many

others (such as the experience of those with intersex conditions, disabilities, mental health conditions, etc.) remain unexplored, invisible to our records.

This session aims to reflect on our approach to the past, and move towards a more diverse and inclusive understanding of our human history by exploring invisible peoples, as well as the embodiment of their lived experiences. We invite papers investigating innovative approaches to address invisible people in archaeology, with the aim of discussing future steps in the exploration of how our discipline can identify and analyze diverse narratives. We welcome archaeologists, anthropologists, historians, and other scholars to partake in a multidisciplinary dialogue on untold histories and invisible people.

ABSTRACTS

1 STORYBUILDING THROUGH TRADITIONAL AND INNOVATIVE ANALYSIS TECHNIQUES: EXCAVATIONS AT RANELAGH, CO. ROSCOMMON, IRELAND

Abstract author(s): Jones, Martin (Transport Infrastructure Ireland)

Abstract format: Oral

For centuries, excavation and the physical examination and interpretation of excavated material were the archaeologist's primary source of information. In recent decades, however, innovative scientific analysis techniques have emerged which allow the archaeologist to delve deeper into the everyday lives of communities, families, and individuals.

In 2015, as part of routine activity in advance of road construction, archaeological excavations revealed a previously unknown early medieval complex in Ranelagh, just north of Roscommon town, in the northwest of Ireland. The Ranelagh site was established around 450 CE as a simple, modestly sized defended farmstead which, for more than a millennium, underwent several phases of modification and expansion and eventually comprised an enclosed multi-generational cemetery, a livestock-rearing and processing centre, and a workshop for the manufacture of tools, weapons, and jewellery. By the late 1700s, any folk memory or historical record of this substantial site was erased or lost, and its presence had been entirely forgotten.

This paper focuses on several case studies from the expansive cemetery at the Ranelagh site. By weaving narratives suggested by the traditional examination of the human remains with those indicated by techniques such as aDNA and isotopic analysis it is possible to reveal previously unknowable details which those more traditional methods could not hope to on their own. These details expand not just the story of the Ranelagh site, but that of its heretofore invisible inhabitants as a group, and as individuals. These stories reveal the sometimes-diverse makeup of later prehistoric and early historic communities in Ireland and the bonds of kinship which extended beyond life and transcended modern conceptions of family.

2 FINDING "OTHERS" AND THE INDIVIDUAL IN THE AEGEAN BRONZE AGE

Abstract author(s): German, Senta (Montclair State University) - Simandiraki-Grimshaw, Anna (Museum of London Archaeology)

Abstract format: Oral

The overwhelming focus of archaeologists and historians working in the Aegean Bronze Age has been on the rise and fall of elite groups and networks. Because of this, very little has been revealed which concerns "normal" people and even less on slave or economically impoverished populations. Almost entirely absent are narratives of individual lives or experience. The proposed paper seeks to seed a "history from below" or Alltagsgeschichte approach in the field of Aegean prehistory and

perhaps establish a model which could be used in other historical fields. We begin with a brief historiographical overview of how elites and their political and economic networks have dominated the field and then argue for the usefulness of alternative investigatory models. Specifically, we will show how leveraging discrete assemblages, cross disciplinary and somatic approaches to focus on micro histories gets at individual life ways and experiences. Lastly, we discuss how emerging,

promising research can cause a methodological shift in approach. By focusing on aspects of the daily lives of non-elite people, including their struggles, practices, beliefs, values and mentalities, it is possible to explore individual agency and to highlight the complexity of their lived experience.

3 BEAUTY AND THE RECONSTRUCTED BODY: COUNTERING THE HOLLYWOOD EFFECT IN REPRESENTATIONS OF PAST PEOPLE

Abstract author(s): Hanson, Rosemary (Unaffiliated)

Abstract format: Oral

For all that archeology is working to incorporate a greater diversity of voices and perspectives into the way the past is written, visual reconstructions of past people remain remarkably conventional. The “standard” of human representation still leans towards slim figures, able bodies, hale complexions (even in death), prescriptive gender expressions, symmetrical unmarked faces, and an overall consistency with modern western beauty standards. Rare are the representations of disability, limb difference or loss, or facial difference. Rare too are variations in weight, gender presentation, heartiness, and signs of aging. The visual past seems too often to be peopled directly out of central casting. But what happens when we make reconstructions that resist this “beautification,” centering instead a more expansive range of bodies?

This project presents a series of simple reconstructions of Nordic objects, produced to center a variety of body types and presentations in archeological image production. Illustrating against the conservative representational trend reveals the pervasive hegemony in our representations of past people and the ways in which modern western beauty standards have been adopted as a “neutral” standard of representation. Thus, this illustration practice is not an errand in token inclusivity, but instead a visual exploration of the deeply ingrained biases that frame how we imagine the past: from Kantian notions of moral beauty to the undercurrents of white supremacy, ablism, and fatphobia. As such, this project seeks to demonstrate the value of illustrative practice within archeology as a tool of engagement, exploration, and resistance; imaging a past that is both more inclusive and more grounded in realism.

4 DIVERSIFYING RECONSTRUCTED IMAGES OF THE PAST - CURRENT EXAMPLES AND CHALLENGES

Abstract author(s): Matias, Jo Zalea (City Colleges of Chicago) - Annis, Karissa (Savannah College of Art & Design, University of Wisconsin-Milwaukee) - Scheyhing, Nicola (Independent Researcher) - Gutmiedl-Schumann, Doris (Universität der Bundeswehr München, Department of Social Sciences and Public Affairs, Historical Institute)

Abstract format: Oral

With the intensifying impact of aDNA research on the investigation of past migration, diseases, and physical appearance of past individuals, our knowledge of how past societies were composed and how their individual members may have looked have changed. Museums and institutions producing visual representations of such societies face new challenges in how they present individuals and past societies to their audiences, and how to deal with possible backlash.

In our contribution, we want to discuss recent examples of new, more diverse images that replaced older ones, and how the audience as well as the wider public reacted to them. We also want to discuss what museums in particular and archaeological science communication in general might learn from it, and what the challenges are. These include accusations of “faking” results and “wokeism” mainly from right-conservative voices.

Furthermore, extra costs of re-evaluation of images and reconstructions have to be taken into account, as more museums struggle with less funding and higher costs.

Individual case studies give us information on what a person looked like. If that is not what is expected, it might be dismissed as just a single case. How do we deal with that?

Who decides if reconstructions are redone and on what base?

Does the way museums and institutions display past individuals influence the broader public, and what possibilities are there to measure their impact?

In our talk, we will also discuss actual examples of what museums and representing institutions/artists did/are doing and the reactions by the audience: for example, the reconstruction of the so-called Cheddar Man in 2018. (<http://nhm.ac.uk>, revisited 29.10.2022)

5 RE-DEFINING MIGRATION: A CASE STUDY OF THE UKS FIRST NATIONAL MIGRATION MUSEUM

Abstract author(s): Bereznyckyj, Amber (NorthEastern University - London; Head of Heritage - RealDreams Non-Profit)

Abstract format: Oral

The UKs first, national, migration museum is in Lewisham shopping centre, South London. It was created with the intention of changing the stigma around migration in the UK and in the wider heritage industry. Archaeologists have commonly perpetuated traditional authorised heritage discourse which often excludes migrant and working communities. Therefore, the Migration Museum was created as an inclusive and safe space for those within the society that usually feel unwelcomed in traditional institutions.

The Migration Museum uses its unorthodox location and life-like reconstructions of the 'British High-Street' in order to create immersive experiences. Visitors go through a process of self-recognition rather than a process of 'being in migrants shoes'. The Migration Museum therefore, re-defines what it means to be a migrant in the UK by personalising visitor experience to recognise ones own heritage. This in turn creates an open dialogue for honest discussion.

The Migration Museum's people focused approach prioritises the protection of intangible cultural heritage in order to maintain centres of physical heritage value (such as Banglatown in London). By analysing audience reactions concerning the Migration Museum on social media platforms, we know that community generation is one of the most important factors in maintaining these sites. We also know that visitor priorities have forthrightly changed Post-COVID and so must our institutions.

As archaeologist's, we could implement this innovative approach to re-defining marginalised groups to encourage more open dialogue. This means, opening up definitions for interpretation, protecting the spiritual and intangible value of archaeology sites and engaging with established marginalised communities.

6 EVIDENCE OF ABSENCE: A PRESENCE AND ABSENCE CASE STUDY OF EARLY NEOLITHIC HUMAN REMAINS NEAR STONEHENGE WORLD HERITAGE SITE

Abstract author(s): Ward, Kat (TBC)

Abstract format: Oral

Investigation and interpretation of Early Neolithic mortuary remains is the primary source for our understanding of Early Neolithic society and culture in Britain. Modern interpretation is founded on findings from increasingly more detailed application of emerging scientific methods to known mortuary assemblages, overwhelmingly derived from chambered tombs. However, these interpretations are based on only a small sample of sites and creates the mistaken impression that interpretations from monumental burial sites are representative of Early Neolithic society and culture.

To address this bias, a systematic review of all Early Neolithic features in Wiltshire was undertaken, leading to the conclusion that the majority of Early Neolithic populations are absent from the archaeological record, and therefore are not included in current interpretations. A new approach to studying Early Neolithic mortuary practices has been developed called a presence and absence study. A presence and absence case study was undertaken in the Stonehenge World Heritage Site and around Salisbury which demonstrates the breadth of modern large-scale archaeological investigation compared to known and recovered Early Neolithic features, especially those containing human remains.

This case study shows empirically for the first time that the lack of both extant Early Neolithic features and corresponding skeletal remains is genuine and that the majority of lived populations from this period are represented by the 'absent dead' – those not seen in the archaeological record. Possible mortuary practices applied to the absent dead are explored therefore reinserting them into interpretations of Early Neolithic mortuary practices. These findings demonstrate the exclusiveness of Early Neolithic monumental burials and suggests the assumption that they are representative of Early Neolithic society and culture should be seriously challenged.

7 WHEN ANCIENT UNIVERSITIES HAVE BURIALS ON THEIR PREMISES: THE EXAMPLE OF THE COLLEGE OF JESUS OF THE UNIVERSITY OF COIMBRA

Abstract author(s): Gabriel, Bruna (University of Coimbra, Centre for Functional Ecology, Laboratory of Forensic Anthropology; Department of Life Sciences) - Monge Calleja, Álvaro (University of Coimbra, Research Centre for Anthropology and Health - CIAS, Department of Life Sciences) - Filipe, Sónia - Dias, Gina (Rectory of the University of Coimbra) - Cunha, Eugénia (University of Coimbra, Centre for Functional Ecology, Laboratory of Forensic Anthropology; Department of Life Sciences)

Abstract format: Oral

Within the urban archaeological project carried out by the Rectory of the University of Coimbra, a bioarchaeological intervention was accomplished between 2021-2023 in one of the ancient colleges. Although the University was founded in 1290, the College of Jesus was built in the 16th century to house the Society of Jesus, and was later adapted as a university space, dedicated to teaching in the 18th century, within the Pombaline reform.

The burial spaces intervened were aligned and organized throughout the cloister deambulatory. Although single graves were initially expected, the reality achieved is entirely different.

Individuals of all age groups, from fetuses to older adults, were exhumed. In total, 16 adults (eight females, two males, and six indeterminate) and 17 non-adults individuals were recovered from four graves excavated directly into the ground, plus eight burial spaces. In these later ones, thousands of bones (c. 9500) were also collected from secondary deposits (ossuary and scattered bones), which significantly increase the minimum number of individuals (MNI).

Regarding bone pathologies, cases such as anencephaly, atherosclerosis, severe infections, and articular and non-articular degenerative diseases were found. Evidence of surgical practices (trepanations) and poorly consolidated fractures were also retrieved.

Together with the remaining results of the archaeological excavation carried out, these people, until recently “hidden” shows great and valuable historical significance, allowing a better understanding of life in Coimbra (Portugal), after the foundation of the College of Jesus, between Modern and the Contemporary Period.

8 **A BONE TO PICK: BIOARCHAEOLOGICAL AND OSTEOBIOGRAPHICAL APPROACHES FOR INTERPRETING ROMANO-BRITISH FRAGMENTATION AND DECAPITATION MORTUARY PRACTICES AND FUNERARY EXPERIENCES**

Abstract author(s): Christie, Shaheen (University of Wisconsin-Milwaukee)

Abstract format: Oral

Bioarchaeological and mortuary analyses of Late Roman period (3rd – 5th century CE) decapitation burials in Britain reveal in some cases a continuation of Late Iron Age (100 BCE – 43 CE) fragmentation rites and other mortuary behaviors, such as the scattering of human remains in settlements, ditches, caves and other isolated deposits. Many earlier studies of such burials have yielded, at times, opposing interpretations for the motivation behind the act of decapitation and the mortuary treatment of those individuals, even in those contexts that appeared similar on the surface. Traditional interpretations about the motivations behind such burials include human sacrifice, execution, trophy taking, fear of the dead, punishment of the dead, witchcraft, veneration, or “outsider” status – traditionally associated with negative connotations. Recent studies by Crerar (2012, 2016), Smith (2018), Tucker (2011, 2012, 2014, 2016), and Wiseman et al. (2021), among others, have concluded there were regional and more nuanced site-by-site variations in mortuary treatment between decapitation and non-decapitation burial populations in Britain and other parts of the Roman world. In order to further understand the nature of those complex mortuary contexts, this paper presents a bioarchaeological and mortuary analysis of 122 decapitation burials from 42 Late Roman period sites in Oxfordshire and Gloucestershire (UK), and shows complex variation in the application of the rite and burial treatment experiences of the dead. The aim is to use an osteobiographical approach to determine if those communities utilized specialized mortuary rituals toward decapitated individuals, whether those practices may be classified as normative, minority, or non-normative, and, whether those bodies served to construct distinguished identities in specific phases of the funerary structure in Late Roman society.

9 **CROSSING THE LINE. INFANT BURIALS IN SOUTHERN ITALY BETWEEN THE 4TH AND 8TH CENTURIES CE**

Abstract author(s): Tulumello, Giorgia (University of Pisa) - Cucinotta, Francesca (IRCCS Centro Neurolesi „Bonino-Pulejo“)

Abstract format: Oral

The study and interpretation of infant burials represents a challenge in the field of funerary archaeology. These individuals, frequently absent in the archaeological record due to several factors, are often condemned to invisibility. The purpose of this work is to investigate, from an archaeological and anthropological point of view, the infant burials from various funerary areas located in Southern Italy (Apulia, Basilicata, Calabria, and Sicily), dating between the 4th and 8th centuries CE. By comparing data from different geographical areas and with different chronologies, it was possible to assess that different funerary practices existed intended for non-adults of different age groups. In some cases, we observed the presence of exclusively infantile burial typologies. Moreover, the analysis of the grave goods in several contexts has revealed a tangible and appreciable care reserved for these inhumed. The study of anthropological data has highlighted how, in some sites, a distinction existed between individuals who died between 0 and 3 years of age and older ones. The analysis of the data has revealed a thin and invisible line between non-adults aged 0-3 and older ones, possibly mirroring some developmental milestones of human growth. The study of archaeological and anthropological data, contextually combined with the analysis of children’s global development, can shed new light on the social and ritual treatment reserved to infants in the ancient world.

10 **CHILDREN AT WORK: RE-ASSESSING CHILD LABOR DURING POST-MEDIEVAL (1650-1850 CE) DUTCH INDUSTRIALIZATION USING AN OSTEOARCHAEOLOGICAL APPROACH**

Abstract author(s): Tutwiler, Alex - Schats, Rachel (Leiden University)

Abstract format: Oral

Child labour has been a consistent factor in global economic systems for most of recorded human history. Most notably, the post-medieval (1650-1850) wave of industrialization seen across Europe brought with it an increase in both the frequency and inherent riskiness of child labour practices. Due to the rise of major industrial communities and the increased demand for goods, children began working to supplement the workforce and financially support their families, and the Netherlands was no exception to this. While broad general information on child labour is available in historical accounts, it is unclear how exactly the rise of industrialization impacted the lives of Dutch children during

this period. Moreover, very little is known about the variation in child labour practices between rural and urban communities with different economic focuses and how this impacted the growing skeleton.

By approaching this research question from an osteoarchaeological perspective, this study will delve into the ways in which it is possible to fill in the gaps left in the historical record regarding the lived experiences of children in the workforce. Employing osteological analysis will also provide a better understanding of the types of labour they engaged in that have not been well documented. This data, in conjunction with the historical accounts of child labour practices during this time period, will provide a more detailed account of how child labour practices played into industrialization in post-medieval Dutch communities. This talk will present a preliminary palaeopathological analysis of skeletal lesions related to strenuous physical activity in children and young adults from Arnhem, a post-medieval community with known industrial labour practices. By comparing these pathological indicators with historical accounts of industrialization in Arnhem, this discussion will demonstrate the advantages of incorporating osteoarchaeological analysis into the study of child labour practices in the past.

11 SEXING NON-ADULTS: A NEW NON-DESTRUCTIVE METHOD USING METRICS OF THE PERMANENT CANINES

Abstract author(s): Jackson, Veronica (Historical Research into Urban Transformation Processes, Vrije Universiteit Brussel; Multidisciplinary Archaeology Research Institute, Vrije Universiteit Brussel; Anatomical Research and Clinical Studies, Vrije Universiteit Brussel) - Veselka, Barbara (Analytical, Environmental & Geo-Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeology Research Institute, Vrije Universiteit Brussel) - Provyn, Steven (Anatomical Research and Clinical Studies, Vrije Universiteit Brussel) - Snoeck, Christophe (Analytical, Environmental & Geo-Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeology Research Institute, Vrije Universiteit Brussel) - Spros, Rachèl (Analytical, Environmental & Geo-Chemistry, Vrije Universiteit Brussel; Multidisciplinary Archaeology Research Institute, Vrije Universiteit Brussel) - Burnett, Alexandra (ProGenTomics, Laboratory for Pharmaceutical Biotechnology, Faculty of Pharmaceutical Sciences, Ghent University; ArcheOs, Laboratory for Biological Anthropology, Faculty of Arts and Philosophy, Ghent University) - Palmer, Jessica (ArcheOs, Laboratory for Biological Anthropology, Faculty of Arts and Philosophy, Ghent University) - Daled, Simon (ProGenTomics, Laboratory for Pharmaceutical Biotechnology, Faculty of Pharmaceutical Sciences, Ghent University) - Lambert, Bart (Historical Research into Urban Transformation Processes, Vrije Universiteit Brussel)

Abstract format: Oral

Sex estimation of non-adult skeletal remains has long been an elusive goal within osteoarchaeology. While much progress has been made recently through destructive chemical analyses, a reliable technique that is non-destructive, inexpensive, and comparatively quick has yet to be established. This presentation outlines just such a method based on the crown and cervical dimensions of permanent canines, the most sexually dimorphic tooth in the human dentition. Using logistic regression on adult measurements, probability-of-group-membership equations are created using varying single measurements and measurement combinations. This facilitates maximal application where some measurement(s) may be unobservable in the non-adult individuals. The combination of resultant probabilities allows for a confident estimation of sex. Whether these equations are population- or regionally specific will be discussed.

Following a pilot study on a documented Dutch skeletal collection, the method was applied to the archaeological collection from Ypres, Belgium under study with the Make-Up of the City project. The accuracy of the results was tested using proteomics from tooth enamel and the method achieved accuracy rates well above accepted levels of accuracy in adult sex estimation. As little as one dimension may be used to estimate sex with an acceptable level of confidence. Although the application of this method relies on the presence of at least one permanent canine, when that condition is met the method can be applied to all non-adult individuals aged five years and above, as well as adult individuals whose state of preservation does not allow for morphometric sex estimation or whose morphological sex estimate is indeterminate. By providing reliable sex estimation in non-adult skeletal remains, this method greatly contributes to the field, enabling the refinement of osteological age estimation, growth studies, and pubertal timing and development, as well as more perceptive interpretations of the social, economic, or environmental implications of (bio)archaeological evidence.

12 DUDE LOOKS LIKE A LADY? - TRANSGENDER PEOPLE IN LIGHT OF THE MATERIAL CULTURE

Abstract author(s): Jaffe, Gali (Freelance Lecturer/Researcher)

Abstract format: Oral

While the Sex is a definition based on physical traits, Gender is based on a person's self-perception and the social structures surrounding them. This distinction is important and poses an additional layer of complexity when searching for Gender in the archaeological record.

This paper looks to identify trans and Queer people in the archaeological record through material culture and written evidence, presented through eyes of a Transwoman archaeologist.

Therefore, my aim in this paper is to show that, when we connect the existing archaeological evidence from different cultures and periods together, we find that an immense amount archaeological evidence already exists to support the claim that Trans and Queer people existed all throughout history.

I will, if so, show, beginning with 3rd millennium BC Mesopotamian priests called Gala who had feminine characteristics, through the dual-gendered grave goods of Hasanlu Tepe, and onto the Roman Period when Emperor Elagabalus, who is considered the world's first Transgender, lived and was possibly the first person in history to seek sexual reassignment surgery, that Transgender and Queer people have, without a doubt, existed all throughout history dating back at least 5000 years.

Essentially, this exploration considers how these individuals change our understanding of trans-people in the ancient world while exploring their existence within the socio-political context in which they lived.

13 **INVISIBLE BODIES: THE FORGOTTEN HISTORY OF CASTRATES**

Abstract author(s): Reusch, Kathryn (Metropolitan State University of Denver)

Abstract format: Oral

Castrates form a unique group of overlooked people in the archaeological and historical record. While a few occupied some of the highest positions possible in their societies, others barely had enough resources to survive. They were diverse groups of people ethnically, spiritually, and sociopolitically, while frequently also being geographically separated from their families and cultures. Their perceived gender difference gave them a liminal position in most societies, placing them into sometimes advantageous, but often highly prescribed social roles.

Castrates have been present in many hierarchical societies throughout Afro-Eurasia over the last six millennia, with several having the opportunity to change history and shape the world we live in today. Despite this, there is little understanding of them in the modern period. Most of the known history of castrates comes from (often highly critical) writings by intact male contemporaries. For most of recorded history, these disparaging writings influenced the perception of castrates, which determined who studied them and when they were studied for several centuries. There was a rush of medical and biological anthropology studies performed on castrates in the late 19th and early 20th centuries, which ended with the advent of the Second World War. Castrate studies have revived over the last few decades due to the different social and gender roles castrates filled in many societies, but many of these studies seem to forget the real, lived, embodied experience of these individuals. Modern bioarchaeological studies of castrates are beginning to bring disparate strands of evidence together to investigate the lived experiences of these overlooked individuals.

This paper will discuss the known history of castrates, merge the social and physical evidence of castrates that currently exists, lay out the current archaeological evidence, and explore potential areas of future research.

14 **METHODOLOGICAL APPROACHES TO THE STUDY OF INVISIBLE WOMEN OF PREDYNASTIC EGYPT**

Abstract author(s): Tamorri, Veronica (Leiden University)

Abstract format: Oral

Advances in gender studies over the last few decades, coupled with the development of more sophisticated methodological approaches in (bio)archaeology, have significantly fostered research on past women's lives. While this is generally the case for many geo-temporal contexts, women are noticeably underrepresented in narratives on the transition to complex society in 4th–3rd millennium BCE Nile Valley, compared to men. Crucially, this is not due to a lack of (bio)archaeological evidence, which is similar in quantity and quality for both sexes. Rather, it is the prevailing focus on Egypt's unification processes, traditionally considered from a male-centred perspective, that has prevented including wider social segments in the research agenda.

My current research project, aims to tackle this long-standing research gap on female individuals in pre-pharaonic Nile Valley via an interdisciplinary approach based on social bioarchaeology. Therefore, the first part of this presentation will illustrate the state-of-the-art in the field to date and suggest strategies to investigate the embodied life experiences of invisible women of the early Nile Valley. In this respect, I will argue that the combined use of methodologies such as the measurement of enthesal changes, paleopathology, dental health analysis (in view of diet) and archaeoethnology is key. In the second part of the presentation, I will discuss some of the preliminary results of the project on the health, nutrition, level of physical activity and burial rituals of the sampled female individuals.

15

A PRELIMINARY EXPLORATION OF THE ROLE OF WOMEN IN THE YAMNAYA HORIZON THROUGH A DIETARY LENS

Abstract author(s): Sandoval, Elena (University of Bristol)

Abstract format: Oral

Social positions of men and women in the past can be explored using dietary reconstruction. Variability in subsistence strategies across the sexes can indicate differences in the lived experience due to differences in dietary access. This approach has been applied to skeletal samples from the Yamnaya horizon, a major pastoralist phenomenon that swept through the Eurasian steppe from the east to the southwest at around 3000 BCE. Owing to the lack of permanent settlements, this horizon is characterized predominately by kurgan burials. It has been a long-accepted theory that the Yamnaya horizon was spearheaded by males, with females following in a highly gender stratified society. The kurgan burials were hypothesized to be reserved for high status males. The focus on a patriarchal societal model has resulted in much of the study and research of the Yamnaya horizon revolving around the male individuals ignoring the sizeable number of female individuals. This study attempts to bring the female narrative to the forefront by determining if the hypothesis of a strongly gendered society is plausible through a dietary lens, and in so doing, adds substantially to the little existing evidence on the lived experience of female Yamnaya. Of the current sample selection of 68 individuals from kurgans excavated throughout Bulgaria and Romania, 20% of the individuals are female, 59% are male, and 20% are unknown. The dietary practices of these 68 individuals of the Yamnaya horizon are reconstructed using bulk and compound-specific stable isotope analysis of human skeletal remains. The results of the isotopic values of these individuals are examined for statistically significant correlations to the sex to inform on differences in diet between males and females. Dietary differences, or the lack thereof, are then used to explore possible lifeways experienced by Yamnaya women.

16

THE LIFE STORY OF A DISABLED WOMAN, BURIED AT MUŠOV (MORAVIA, 6TH CENTURY CE) FROM THE PERSPECTIVE OF INTERDISCIPLINARY RESEARCH

Abstract author(s): Loskotová, Zuzana (Institut of Archaeology of the Czech Academy of Sciences) - Vaníčková, Eva (Moravian Museum) - Vargová, Lenka (Masaryk University, Department of Anatomy) - Vymazalová, Kateřina (Masaryk University, Department of Anatomy)

Abstract format: Oral

Human history was created not only by kings, warriors or „social elites“. Interdisciplinary cooperation in the field of history, archaeology, anthropology, paleopathology etc., enables a new perspective on the life stories of invisible peoples. A new excavations of the Institut of Archeology of the Czech Academy of Sciences; realized thanks to the project „Lombard population in Moravia. An interdisciplinary research into Migration Period necropolises.“ GA CR, led to the revelation of different members of contemporary communities, including women, children or people with some health disabilities. A special case is represented by the woman buried in the 6th century CE at Mušov, grave no. 48 (Moravia, CZ). According to the narrative of the archaeological sources (grave equipment), it is possible to guess, that this woman belonged to the common members of society; which also corresponds with anthropological assumption, that she maybe gave birth to one, but probably to more children. On the other side a detailed paleopathological analysis of the female skeleton from grave no. 48 revealed several pathological changes that had to significantly reduce the quality of life of this female. She probably had long-term headaches, back pain and, after an injury to the humerus also arthrosis in her left shoulder joint and partially paralyzed left upper limb. It is very likely that, due to her health condition, she required at least partial help from her surroundings in certain situations. Various kinds of other natural-science analyses were carried out, such as anthropological reconstruction of the appearance, isotopic analyses, radiocarbon dating etc. All these puzzles put together an interesting picture. The main aim of the paper is to present the life story of this woman as a model example of an interdisciplinary approach to the research of population of the Migration Period and the Early Middle Ages.

NATURE'S BOUNTY: THE ROLE OF GATHERED WILD RESOURCES IN PAST SUBSISTENCE [ARCHWILD]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Mooney, Dawn Elise (University of Stavanger) - Prado, Shalen (McMaster University) - Guðmundsdóttir, Lísabet (Institute of Archaeology, Iceland)

Session format: Regular session

Foraging has become mainstream over the last decade, with many people supplementing their diet with wild gathered foods. Archaeologists, however, have been less engaged with the use of gathered resources, especially in agrarian societies. Nonetheless, in many past societies agriculture, gathering, hunting and fishing all contributed to a varied

subsistence base, engendering patterns of seasonal movement even within “sedentary” societies. Gathered resources were also not only used for foods: fuels, fibres, dyes and pigments, and medicines were also among the resources collected from the hinterlands. However, gathering can be difficult to prove in the archaeological record: without clear practices of butchery, hunting tools, or the collection of seeds for consumption or sowing, evidence of wild resources can seem ephemeral at best. How do we prove that deadwood or driftwood was used as fuel rather than fresh wood? How do we identify the consumption of foods like seaweed and fungi? How do we know if shellfish were collected as food or for use as bait? How can we identify the use of non-grain-based alcohols, such as mead or berry wine? What evidence might we find for the collection and use of feathers and down? This session invites contributions which help us to glimpse these kinds of practices in the archaeological record, using both direct and indirect evidence. Papers and posters might showcase the use of new methods, or new applications of established methods. Contributions from all regions and periods are invited, however we will prioritise those exploring gathered wild resource use in agrarian societies. We also welcome contributions presenting ethnographic or ethnohistorical evidence that might inspire us to think about archaeological traces of gathered resource use in new ways.

ABSTRACTS

1 ‘REWILDING’ LATER PREHISTORIC BRITAIN: HUNTING AND GATHERING ‘BIG DATA’ ON PREHISTORIC ENTANGLEMENTS WITH WILDLIFE

Abstract author(s): Roushannafas, Tina - Cooper, Anwen (Oxford Archaeology)

Abstract format: Oral

Developer-funded ‘rescue archaeology’ continues to generate tremendous amounts of archaeological data, with routine sampling meaning that increasingly abundant (and often diverse, despite repeated standardisation initiatives) paleoenvironmental records are now being gathered. There is considerable potential for this ‘big data’ to shed light on the role of wild plants and animals in prehistoric subsistence. However, pressures of time and cost mean that wider synthetic research that engages with this material is less common than desirable. Furthermore, current data management practices mean that assembling these records is also often challenging.

This paper presents the ‘Rewilding’ Later Prehistory’ project’s approach to exploring human-wildlife entanglements in prehistory through a new mode of industry-led research and a survey of environmental archaeologists addressing approaches to recording and interpreting wild plant and vertebrate remains. Future plans to develop an ‘OASIS+’ module with the Archaeological Data Service will further aim to link up the often disjointed paleoenvironmental data held across different regional historic environment records. The initial results of this approach are presented through insights gleaned on Bronze and Iron Age interaction with wild plants and animals in the Upper Thames Valley of south-central England, one of several British case studies examined by the project. Here we seek to focus on engagement with wildlife as inextricably woven into prehistoric lifeways, as opposed to a tendency to present nature as a waning backdrop upon which humans imposed order through farming and domestication.

2 DOCUMENTING THE USE OF WILD PLANT AND ANIMAL FOODS DURING THE ROMAN IMPERIAL PERIOD AT THE VADA VOLATERRANA SITE

Abstract author(s): Carmody, Stephen (Troy University) - Menchelli, Simonetta - Sangriso, Paolo - Marini, Silvia - Marcheschi, Rocco - Belcari, Domingo (University of Pisa) - Carmody, Lydia (Troy University Archaeology Research Center) - Kennedy, Emily (Troy University)

Abstract format: Oral

Vada Volaterrana was the harbor system of the Etruscan city of Volterra. In imperial times it included a system of docks, pottery factories, and farms spreading across the coastal plain between the Fine and the Cecina rivers, having its main center in the area occupied by the modern-day small town of Vada (Municipality of Rosignano M.mo, Province of Livorno). Beginning in the 1980s, excavations conducted by the University of Pisa have revealed approximately a quarter of the harbor system at the San Gaetano site. It was built during the Augustan age and later abandoned in the late 7th century AD.

In 2015, a GPR survey identified structures in the southern sector of the site. Between the end of the 1st and the beginning of the 2nd c. AD, a large rectangular building comprised of seven rooms was built. At the beginning of the 3rd c. AD more rooms were added that included a large apsed wall. Rich decoration suggests the importance of this room, which possibly functioned as a meeting hall.

In the summer of 2019, a collaborative project between the University of Pisa and Troy University began focused on detailing the foodways of the site’s inhabitants. Flotation samples were collected from multiple rooms, different occupational sequences, and inside and outside the structures to detail changing subsistence strategies over time and across space. In the paper, we detail our preliminary results that include multiple species of wild animals including

rabbit, bird, and fish, and wild plant foods including nuts and fruits, and discuss how these resources were included into and supplemented an agricultural diet. We then use this data to describe the day-to-day life and subsistence activities focusing on the wild resources used by the men, women, and children that occupied the site.

3 TREE BAST, CORDAGE, KNOTS, NETS – SKILLFUL ARTISANS OF THE STONE AGE

Abstract author(s): Suomela, Jenni (University of Helsinki, Department of Education / Craft studies) - Lempiäinen-Avci, Mia (University of Turku, Biodiversity Unit) - Koivisto, Satu (University of Turku, Archaeology)

Abstract format: Oral

Research on Stone Age hunter-fisher-gatherers in northern Fennoscandia has largely focused on durable archaeological materials such as lithics, burnt bones, charred plant remains and pottery recovered from dryland contexts where organics have already degraded. We know regrettably little about the organic material culture, skills and crafting methods of Stone Age artisans in northern Fennoscandia.

This presentation focuses on tree bast fibre materials and discusses the manufacturing of fishing nets at the Neolithic lake settlement of Järvensuo 1 (c. 6000-2000 BC), in Finland. This wetland site provides numerous well-preserved organics, such as artefacts made of wood and bark, as well as fishnet fragments and sinker stones with remains of tree bast cordage. Järvensuo 1 is a rare example of a systematically studied wetland site in the north, where archaeological fieldwork is still mainly focused on dryland areas. In the eastern Baltic, few similar wetland sites with comparable materials are known. Identification of the tree bast fibre materials was conducted through microscopy and based on reference materials. The potential range of locally available tree bast materials was identified with the aid of macrofossil analysis. Accordingly, *Tilia*, *Salix* and *Populus* are the probable candidates for the bast material used in the Neolithic fishing-gear.

The tradition of tree bast cordage making continued in Finland until the 20th century. By combining micro-level knowledge from the incredible knots from Järvensuo 1 with ethnographic survey data, we can get a bit closer to understanding the advanced craftsmanship they possessed already in the Neolithic.

4 THE MANIFOLD USES OF GATHERED SEAWEEDS: DATA FROM THE ARCHAEOLOGICAL RECORD OF THE ATACAMA DESERT COAST

Abstract author(s): Power, Ximena (Universidad Católica del Norte, Instituto de Investigaciones Arqueológicas) - Sitzia, Luca (Universidad de Tarapacá, Departamento de Antropología; Laboratorio de Análisis e Investigaciones Arqueométricas) - Zurro, Debora (HUMANE Research Group. Institució Milà i Fontanals de Investigació en Humanidades- Consejo Superior de Investigaciones Científicas - IMF-CSIC) - Silva, Claudia (Museo de Historia Natural de Concepción) - Borie, César (Universidad Católica del Norte, Instituto de Investigaciones Arqueológicas)

Abstract format: Oral

The hyperarid coast of the Atacama Desert is one of the few areas worldwide with outstanding macroscopic evidence of archaeological seaweed. Nevertheless, the relevance of these wild aquatic resources in local coastal communities has yet to be discussed. This work provides the first synthesis of the archaeo-phycological record of the Atacama Desert coast to evaluate the long-term uses of seaweed along the seashore of the American South Pacific. The unusual conditions of preservation of organic remains in this coastal desert provide direct evidence of two genera of kelp-type seaweed (*Lessonia* and *Macrocystis*) in at least 23 archaeological contexts. These data allow us to record the uses of kelps as raw material for cordage, personal objects, mortuary offerings, artificial mummification practices, and mortars for architectural features. We also synthesize the preliminary results of an archaeometric research program showing the profuse use of kelp-type seaweed as fuel by local hunter-gatherer-fishers from ca. 5.500 cal. BP to the 20th century. Finally, we discuss the results concerning ethnohistoric and ethnographic sources from the American South Pacific coast. The study of different lines of evidence suggests that conspicuous kelp-type seaweeds, locally named “huiros,” were not gathered for food requirements but for a wide range of technological purposes involved in the daily and ritual life of the desert coastal communities.

5 WHERE ARE THE PINECONES? TAPHONOMY OF ARCHAEOBOTANICAL REMAINS OF PINUS SP IN THE IBERIAN PENINSULA IN PREHISTORY

Abstract author(s): Garay Palacios, Blanca - Berihuete-Azorín, Marian (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Department of Prehistory, Autonomous University of Barcelona - UAB)

Abstract format: Oral

Thanks to increasingly widespread archaeobotanical sampling and analysis, a great quantity of *Pinus* sp. remains have been recovered at archaeological sites from the Iberian Peninsula, dating from as early as the Palaeolithic. However, this growing corpus of information is biased towards one kind of materials: the wood charcoal.

Several *Pinus* species produce edible seeds. As is the case with other wild resources, pine nuts are often consumed raw and they require only minimal processing, which decreases the chances of archaeological recovery. Moreover, the high amount of oil contained by pine nuts makes their preservation by carbonization even more complicated. On the other hand, the low proportion of pinecone scales and pine nut shells in relation to wood charcoal seems odd. Therefore, it is not possible to have a good knowledge of the distribution and use of the carpological remains of *Pinus* by prehistoric human groups.

By means of a series of controlled charring experiments, this study aims to obtain a detailed picture of how this process affects the different parts (wood, pine scales, pine nut shells and pine nuts) of the main Iberian *Pinus* species. The goal is to assess the role of taphonomy on the differential preservation of the different parts, and to rule out (or not) human agency.

6 EVIDENCE FOR THE GATHERING AND USES OF BROWN PUFFBALL AND WILLOW AT A SCOTTISH IRON AGE WETLAND SETTLEMENT

Abstract author(s): Robertson, Jackaline (AOC Archaeology)

Abstract format: Oral

Most of the Iron Age archaeobotanical assemblages studied in Scotland are largely dominated by the presence of carbonised food remains such as cereal crops and hazelnut shells. Rarely is it possible to confidently identify any surviving evidence for the foraging of wild plant resources which have been used for other than a food resource.

The excavation at Black Loch of Myrton, Dumfries and Galloway uncovered a wetland settlement of six roundhouses from which a large and varied waterlogged and carbonised macroplant assemblage was recovered. The settlement practised a typical small scale subsistence economy based on the cultivation of cereal crops, but they also gathered a wide range of wild resources, some of which were probably used for specific purposes.

There is clear evidence that large caches of brown puffballs were gathered from the surrounding landscape and intentionally stored within two of the roundhouses; we argue that these might have been used as fire starters and possibly for their medical properties. Willow leaves were also intentionally brought to the settlement and these too were perhaps used as a medicine. By studying the wild species present, the quantities in which they were recovered and their spatial deposition within the settlement has allowed us to more confidently understand the valuable role the brown puffballs and willow had at Black Loch. Analysis of the Black Loch macroplant assemblage clearly demonstrates this community were willing to gather a wide range of wild resources from their surrounding landscape which they skilfully employed within their daily lives.

7 WILD PLANTS AND MONASTIC MEDICINE IN MEDIEVAL NORWAY

Abstract author(s): Blakeney, Rebecca (Natural History Museum, University of Oslo)

Abstract format: Oral

In this project we seek evidence for medicinal plant species from Nordic medieval monastic sites via a multi-proxy approach, including the recovery of macrobotanicals, pollen and sedimentary ancient DNA. As it is often difficult to pinpoint clear archaeological evidence of medicinal plant use, we have chosen monasteries as known locations for physical and spiritual healing in the Middle Ages, being destinations of pilgrimage and having been equipped with infirmaries and infirmary gardens. Research on medieval medicine provides opportunities to discuss ontological differences in perceptions of plant 'use' and 'medicine', as well as distinctions between 'wild' and 'cultivated' species in agrarian societies. Medicinal plants may have been gathered from 'wild' populations outside of the monastic complex, or ruderal species may have been encouraged to grow nearby, perhaps even within monastic gardens. We conducted targeted excavation and sampling at two sites in Norway, following the results of ground-penetrating radar surveys: a drain feature at Hovedøya Kloster in the Oslofjord and a garden feature on the site of Reins Kloster in Trøndelag, and both sites yielded medieval plant remains. Archaeological methods have been supplemented by information from local vegetation surveys and documentary sources on medieval medicine. While this research aims primarily to identify medicinal plant species, it also contributes to interdisciplinary research questions relating to Norway's plant biodiversity, as well as understandings of diet, health and medicine at Norway's medieval monasteries.

8 GETTING RID OF THE DEAD WOOD? EVIDENCE FOR DECAY IN CHARCOAL ASSEMBLAGES FROM NORWAY

Abstract author(s): Mooney, Dawn Elise (University of Stavanger)

Abstract format: Oral

We often imagine Scandinavia as being covered with dense forests, with no shortage of wood for any purpose. While this is to some extent true for much of the region, there are local variations: many coastal regions in western Norway were essentially deforested in the Neolithic and Bronze Age, and coastal northern Norway has never had any

significant tree cover. In northern Norway, driftwood was often used for fuel where it was available, but further south communities would have had to find different solutions to access firewood and timber. This will often have involved logistical arrangements: travelling to forest areas, trading, and/or managing fragmented local woodlands. However, there is mounting evidence that dead wood also played a role in these systems. We know that in Iceland, famous for its limited wood resources, there were laws governing the collection of dead wood from at least the Medieval period, and it is likely that similar customs were present in Norway. This paper presents evidence for decay and infestation in charcoal assemblages from western and northern Norway, mostly in the form of traces of wood-boring insects. The remains of domestic, industrial and ritual fuel woods from Iron Age and Medieval sites will be examined in order to explore trends in fuel acquisition strategies. So far, there has been very little research on charcoal assemblages from Norway, but this presentation showcases their potential while also inviting suggestions for future research avenues and applications of analytical techniques.

247 ENCOUNTERS AND TRANSFORMATIONS ON THE BORDERS OF THE ROMAN EMPIRE: FROM THE LATE IRON AGE TO LATE ANTIQUITY

Session theme: 6. Contested Pasts & Presents

Session organisers: Fernández-Götz, Manuel (University of Edinburgh) - Mihajlovic, Vladimir (University of Novi Sad)

Session format: Regular session

What was the impact of the Roman Empire on societies located at its borders? How did interactions change over time and space, and to what extent did life differ for communities located in the immediate inner vs. outside hinterlands of the frontier? These and other related questions have been at the heart of Late Iron Age and Roman studies for a long time, but can now be re-evaluated in light of new archaeological evidence as well as novel theoretical and methodological approaches. Development-led archaeology has significantly increased the corpus of available information in many regions, whereas increased chronological accuracy is proving crucial for obtaining higher-resolution insights into the transformations that took place before, during, and after the integration of territories into the Roman state. Isotopic and aDNA studies, for their part, are revolutionising our knowledge of aspects such as diet, health, and mobility within and outside the political borders of the Empire. Conceptually, the growing influence of perspectives derived from globalisation studies and postcolonial and decolonial theories is changing the way in which many scholars are interpreting the evidence, particularly in relation to the indigenous side of the story. In this session, we invite papers that address the topic of encounters and transformations along the border regions of the Roman Empire. Chronologically, the scope of the session extends from the 2nd century BC to the 5th century AD. Our aim is to bring together papers that address the situation in specific case studies and others that take wider, comparative perspectives.

ABSTRACTS

1 COMPARATIVE BORDERLANDS STUDIES FROM ARBEIA TO THE ALAMO

Abstract author(s): Gardner, Andrew (UCL Institute of Archaeology)

Abstract format: Oral

The field of border studies emerged in parallel with a backlash against globalisation in the early 2000s. That backlash took a variety of forms, economic, cultural and political, and it has had some disturbing consequences in the last few years, but it does speak to a recognition that human societies frequently seem to exist in a space of tension between connectivity and division. The Roman Empire is no different, in this respect, and increasingly scholarship within Roman archaeology also shifts from the globalisation turn to a border turn. This promises a welcome reintegration of the sub-fields of frontier and provincial archaeology and the more 'classical' tradition, and it also invites a new generation of comparisons between Roman and more recent forms of imperialism, which in turn still shape the world of today. In this paper, two axes of comparison will be considered to address these two ways of using borderlands to integrate Roman archaeology in new contexts: the role of three different frontiers in shaping Roman Britain, and the larger-scale legacies of frontiers in the Roman and Spanish empires.

2 RESILIENCE AND TRANSFORMATIONS IN THE IBERIAN ICONOGRAPHIC NARRATIVES OF THE UPPER GUADALQUIVIR (SPAIN) AFTER THE SECOND PUNIC WAR

Abstract author(s): Moreno Padilla, María Isabel (Instituto de Investigación en Arqueología Ibérica. Universidad de Jaén)

Abstract format: Oral

Iconography constitutes one of the most complex means of expressing identities and social realities in Antiquity. The images, heterogeneous and diverse, complex and multifunctional, legitimize the ideological structure while stimulating the mechanisms of social reproduction. In this paper, we propose an analysis of the iconography that developed after the end of the Second Punic War in the Upper Guadalquivir (Spain). Specifically, our study focuses on the material variability, on the scenarios where these objects were displayed, and on the phenomena of interaction, identity and memory derived from their use in a context marked by the conflict aftermaths, in a chronological framework comprised between the end of the 3rd century BC and the 1st century AD.

Our proposal emphasises the indigenous side of a period marked by the implementation of the Roman territorial structure. In addition, this approach seeks to incorporate other types of social readings into the general framework of the Archeology of the Conflict. We aim at understanding the impact of war on local communities, with a special interest in those elements that contribute to rebuilding community (and identity) in a context marked by the disintegration of Iberian territories of the 4th and 3rd centuries B.C. In this context, the dialogue between the local and imported images (in pottery, terracotta, stone and bronze), becomes an essential element for understanding a period marked by war trauma. In order to better understand this complex period, both from a diachronic and synchronous perspective, two case studies will be presented, which were recurring scenarios during the Second Punic War, as recorded in Roman sources and corroborated by archaeological evidence: Castulo and Iliturgi.

3 FINDING CARPETANIA. THE ROMAN CONQUEST OF MIDDLE TAGUS VALLEY AND THE CREATION OF A "NEW-TRADITIONAL" REALITY IN THE IBERIAN PENINSULA

Abstract author(s): Sánchez de Oro, Pablo (Department of Prehistory and Archaeology. Autonomous University of Madrid) - Berrocal-Rangel, Luis (Department of Prehistory and Archaeology. Autonomous University of Madrid)

Abstract format: Oral

The arrival of the Mediterranean powers to the Iberian Peninsula wrote a new page in History of Southwestern Europe. Carthaginians and Romans generated a great impact, altering the organisation, the settlement, and, even, the identities of these populations. Our aim is to show how this process took place in the Middle Tagus Valley, where, following the classical sources, the Carpetani people were established. Due to the importance and the prestige of these references, the idea of a homogeneous people with a shared idiosyncrasy has prevailed from the Renaissance to the late years of the 20th century. Nevertheless, the most current research prove that this traditional assumption was wrong. On the contrary, before the Roman conquest of this territory, his inhabitants lived in small communities organized in settlements of different type which acted as the truly generators of ethnicity. All of these in a framework where heterarchy was the mode. So, we pursue to illustrate —through a new and wide methodology based on an interdisciplinary approach (i.e., Geographical Information Technologies —GIT—, the review of classical sources and archaeological fieldworks and materials, and the comparison with analogues areas beyond the Iberian Peninsula)— how the encounter between Rome and the populations of the Middle Tagus Valley drastically transforms the reality of this space.

4 MEDITERRANEAN TRADE AND SOCIAL CHANGE IN NORTHWESTERN IRON AGE IBERIA: A CONTEXTUAL APPROACH

Abstract author(s): Sastre, Inés - Currás Refojos, Brais (CSIC) - Santos Cancelas, Alberto (Independent) - Orejas Saco del Valle, Almudena (CSIC) - Álvarez González, Yolanda - López González, Luis (Terra Arqueos)

Abstract format: Oral

Since the 1980s there has been a change in the assessment of Mediterranean contacts in the Northwest of the Iberian Peninsula during the Iron Age. In the last decade, new data has reinforced this perspective. While the Roman influence is still considered irrelevant until the Cantabrian-Asturian wars (29-19 BC environ), the presence of Phoenician merchants has become a key element in explaining the archaeological record of the forts and their processes of change mainly from 4th century BC onwards.

Our goal is to propose an alternative interpretation of the scope and impact of pre-Roman Mediterranean contacts based both on current knowledge about the Iron Age societies prior to the s. II BC and the entity of the imported materials. Many of the assumptions that are currently used to characterize the Phoenician-Punic exchanges in this region must be challenged and data from recent excavations in the castro of Elviña and other settlements will be

discussed. We will try to demonstrate that the intensity of the pre-Roman Mediterranean contacts do not allow us to affirm the existence of trade inserted in a market economy prior to the arrival of Rome, because this idea is inconsistent both with the social record of castro communities and with the verified quantification of imported items.

5 THE BRONZE HAND OF IRULEGI (ARANGUREN, NAVARRE): A TESTIMONY OF VASCONIC WRITING AND INDIGENOUS RITUAL FROM THE 1ST CENTURY BC

Abstract author(s): Aiestaran, Mattin (Aranzadi Science Society, Department of Archaeology; UPV/EHU, Department of Geography, Prehistory and Archaeology, Investigation Group of Prehistory IT-1223-19) - Velaza, Javier (University of Barcelona, Latin Philology Department) - Gorrochategui, Joaquin (UPV/EHU, Classic Studies Department) - Usúa, Carmen (ARTUS) - Iriarte Avilés, Eneko (University of Burgos, Department of History, Geography and Communication; Aranzadi Science Society, Department of Geology) - Narbarte Hernandez, Josu (University of the Basque Country - UPV/EHU, Research Group on Heritage and Cultural Landscapes; Aranzadi Science Society, Department of Archaeology) - Ruiz Gonzalez, Daniel (Aranzadi Science Society, Department of Prehistory; UPV/EHU, Department of Geography, Prehistory and Archaeology) - Mendizabal-Sandonís, Oihane (Aranzadi Science Society, Department of Archaeology; EHU/UPV, Classic Studies Department) - Agirre Mauleon, Juantxo (Aranzadi Science Society, Department of Archaeology)

Abstract format: Oral

The Iron Age hill fort of Irulegi (Aranguren Valley, Navarre), with various occupations from the 14th century B.C. until the 1st century BC, was located on the top of the mountain of the same name, between two pre-Pyrenean valleys. The last phase of this hill fort suffered a conflagration in the context of the Sertorian Wars, after which, the territory of the Vascones went from being in the orbit of the empire, to being part of it. The aforementioned conflagration led to the abandonment of the town and abundant artefacts in primary position have been found under the remains of the fallen buildings. An exceptional example of these artefacts is the inscription engraved in a Paleohispanic sign on a bronze sheet in the shape of an adult hand. Its morphology and decoration, its finding context (the threshold of a residential building), the use of a special variant of a Paleohispanic script and the appearance of the term *sorioneku* at the beginning of the text, echoing present-day Basque word “zorion” meaning “of good fortune”, lead us to interpret it as an apotropaic and ritual epigraph. This novel finding re-evaluate issues such as Vasconic epigraphy and literacy just before Romanization, and the influence Rome had on the writing system and rituals of the indigenous population of Navarre.

6 EXPLORING THE PERIPHERY: INITIAL FINDINGS OF A PALEODIETARY ANALYSIS OF A RURAL COMMUNITY IN SCORRIONE, SICILY

Abstract author(s): Schmidtova, Dominika (Department of Archaeology and Museology, Masaryk University) - Hukelova, Zuzana (Institute of Archaeology of the Slovak Academy of Sciences) - Vyskocilova, Gabriela (Department of Chemistry, Masaryk University) - Klontza, Vera (Department of Archaeology and Museology, Masaryk University) - Gil, Joan (Department of Archaeology, University of Hradec Králové) - Scerra, Saverio (Soprintendenza per i Beni Culturali ed Ambientali di Ragusa) - Fernandes, Ricardo (Max Planck Institute of the Geoanthropology; Climate Change and History Research Initiative, Princeton University; Department of Archaeology and Museology, Masaryk University)

Abstract format: Oral

The Scorrione West (Ragusa reg.) burial site is of great archaeological significance due to its function, location, and chronology. Our research focussed on one hypogeum D, which provided an exceptional set of information about the architecture of the burial complex, as well as its users during the Late Antiquity period. The complex was mainly used by small local rural communities between the 4th and 6th centuries, though the grave goods assemblages indicate intermingling with other cultures, evidenced by the presence of Vandal and Gothic artefacts alongside locally-made objects.

In this paper, we present the preliminary results of our bioarchaeological research. Carbon and nitrogen stable isotopes were analysed on a group of individuals from hypogeum D at Scorrione and a reference sample of five individuals from an analogous context in the Ragusa region (Cisternazzi catacombs). We have combined dietary isotopic data with paleopathological and archaeological results to gain an insight into the lifestyles of the local rural population in the south-east of Sicily. The initial results suggest that, despite being a detached rural community, they were not isolated from influences from mainland Italy or the African borderland.

7 SOCIETY ON THE PERIPHERY OF THE ROMAN EMPIRE: CONSTRAINTS FROM SR ISOTOPE SYSTEMATICS OF CREMATED INDIVIDUALS IN NIJMEGEN, THE NETHERLANDS

Abstract author(s): De Coster, Maura (Vrije Universiteit Amsterdam) - Hendriks, Joep (Gemeente Nijmegen) - Davies, Gareth - Kootker, Lisette (Vrije Universiteit Amsterdam)

Abstract format: Oral

The Dutch city of Nijmegen, which is located on the banks of the river Waal, provides a unique opportunity to study population dynamics in a Roman borderscape. Not only was Ulpia Noviomagus the most important Roman town built within the Netherlands between 100-270 CE, it was also a key strategic military location along the lower Germanic limes, the northernmost border of the Roman empire. Consequently, Ulpia Noviomagus attracted people from different parts of the Roman Empire and from a variety of different cultural backgrounds.

Cremation was the dominant burial ritual in Roman Nijmegen, not only in the urban and military cemeteries, but also in the rural cemeteries of the Batavian countryside north of the Waal. To date, more than a dozen grave sites containing at least 3000 individuals have been recovered. These graves provide new insights in population dynamics within the northern region of the Roman Empire and specifically along the lower Germanic limes borderscape. Sr isotopes and concentrations of the cremated remains prove to be excellent tools to show new understandings of the population that lived in Nijmegen. This paper gives a unique insight into the landscape and society on the periphery of the Empire.

8 SOUTH-WEST SLOVAKIA IN THE 1ST CENTURY B.C.: LATE LA TÈNE OPPIDUM IN BRATISLAVA AND ROMAN INFLUENCE

Abstract author(s): Kovár, Branislav (Institute of Archaeology, Slovak Academy of Sciences) - Čambal, Radoslav (Slovak National Museum – Archaeological Museum)

Abstract format: Oral

The area of south-west Slovakia and the neighbouring regions have become the centre of interactions of five ancient societies. These were the La Tène culture, the Celtic Boii tribe (which came later), Germanic tribes, the Dacians, and the Roman Empire. In our presentation, we will focus on research on these interactions. An important role was played by the region's strategic location at the crossroads of trade routes – the Danubian route, leading from the west to the east, and the Amber route, commencing in Aquileia and heading north, up to the Baltic Sea.

The centre of the area was at the oppidum of Bratislava, whose acropolis was located at today's Castle Hill. The foundations of the stone architecture, undoubtedly the work of Roman builders, were discovered here. They testify to the relations of the local elite with the Roman Empire.

The oppidum is connected with the Boii tribe. Generally, we suppose that they came here after the campaign of the Germans from Bohemia. Their departure is dated to the beginning of the 1st century B.C. The key information about the movement of the Boii is Caesar's note about their unsuccessful siege of Norea (64/63 B.C.). The decline of the oppidum is connected to the Boii-Dacian conflict (42/41 B.C.). However, the Celtic/Boii settlement of the oppida disappears later.

Unfortunately, since we have less relevant results of the cooperation between archaeology and natural sciences in the defined territory, we will focus mainly on material and written sources. The La Tène archaeological finds are not concentrated solely in Bratislava. We know of several other sites in the region with an intensive Celtic presence. We have a number of new finds that are evidence of the interaction between the Roman Empire on the one hand and the Celtic and Germanic cultures on the other.

9 MELTING POT PANNONIA

Abstract author(s): Schwenzer, Gerit (No affiliation)

Abstract format: Oral

The first couple of centuries AD saw some cultural changes and crossings in northern Pannonia. The late Iron Age – or pre-Roman Iron Age – came to an end and the process of Romanisation started. This is visible in artefacts such as pottery and jewellery, but also in fashion. Clothes, then and now, are part of identity and give a deep insight of influences and changes, or where traditions were kept. Although textile finds are extremely rare, fortunately there is evidence carved in stone, literally. Some examples of those image stones shall be presented in this paper.

Not only the locals changed under the influence of the Romans. Due to treaties people were moved to, from and around the Roman Empire. An example shall be given where food – or rather its remains – might point to a historical event, where Romans gave refuge to a peoples coming from north of the river Danube and therefore from outside the Empire. This refuge might be located in the north of Pannonia and shall also be presented in this paper.

This paper shall give – with the examples presented – a small insight of peoples who lived in the Roman Province of Pannonia near the River Danube, and who were caught between tradition and change, between borders and trading connections.

10 SPATIAL AND TEMPORAL VARIATION IN LIVESTOCK MORPHOLOGY AS EVIDENCE FOR VARYING ROMAN INFLUENCE IN SOUTHEAST EUROPE

Abstract author(s): Everett, Sarah (BioArCh, Department of Archaeology, University of York)

Abstract format: Oral

Among the many cultural and economic changes brought about by the Roman occupation were widespread developments in animal husbandry, production, and consumption, as newly-established provinces were brought within the sphere of Roman influence and integrated into the Roman economic system. Across occupied regions, the Roman period saw greater specialisation in husbandry practice, and the development of larger, more productive livestock, sustaining or accelerating trends in livestock size increase that first emerged during the Iron Age in many regions. Beyond the Empire, there is much less evidence for increased livestock size during the Roman period, emphasising the importance of direct Roman control and integration into a wider Roman economy for the development of larger livestock.

Via meta-analysis of published zooarchaeological data spanning the late Iron Age to late Antiquity in southeast Europe, this paper evaluates the impact of the Roman Empire on livestock morphology on both sides of the Danube limes. The paper presents data from three regions subject to varying levels of direct Roman control – (a) the Balkan provinces, under long-term Roman occupation, (b) Dacia, a Roman province in the second and third centuries CE, and (c) regions to the north that remained beyond the Empire. The study assesses the impact of varying duration of Roman occupation on the extent of change in livestock morphology, and on the longevity of any observed changes. The impact of pre-Roman livestock size is considered, as is the potential influence of climate, and the extent of morphological variation by site type.

11 NEGOTIATING MATERIAL AGENCY AT THE DANUBIAN EDGE OF ROMAN EMPIRE

Abstract author(s): Mihajlovic, Vladimir (Faculty of Philosophy, University of Novi Sad)

Abstract format: Oral

The emergence of the Roman Empire can be comprehended as a process of structuring generated by interactions of diverse types of actors. The frontier zones are especially telling cases in this regard because they initiated vivid, dense and tensed co-relations of the parties involved, which produced innumerable kinds and levels of outcomes. However, they were not simply spatio-political category defined by the shifting limits of Roman power, but also realms of transition permeated with intensive and continuous (re)negotiations of different sorts. The state of liminality caused transformation of a whole range of spheres, from political arrangements, social organization and economy, to culture in the widest sense of a term. Although the establishment of new relations was asymmetric in favor of the Empire's elites, local actors were by no means passive, and the newly emergent structures critically depended on their involvement and mediation of power.

All this inevitably involved materialities of different character: things from built environments to “trinkets” participated in articulation and manifestation of frontier's life. Of course, distinct objects worked in differing manners and ways, and with variable significances, but material components were co-constitutive in all phenomena that jointly composed the conditions of a border zone. Therefore, things, within the assemblages created from different actors (humans, natural environment, non-human animated or inanimate entities), played active parts in social realities. In this presentation I will discuss objects' potential to mediate meanings and facilitate social positions and roles by focusing on their capacity to translate and determine different sets of values. Basing my observations on the late Iron Age and early Roman closed deposits in the frontier zone of the middle Danube, I will try to show how certain types of artifacts were associated with changes and transitions that were initiated by expanding Empire and its relations with local communities.

12 RIVERS AND WALLS: ENCOUNTERS AND MATERIALITY ON ROMAN FRONTIER WATERSCAPES IN NORTHERN BRITAIN AND THE LOWER DANUBE

Abstract author(s): Hanscam, Emily (Linnaeus University) - Buchanan, Brian (Eastern Washington University)

Abstract format: Oral

Roman frontiers continue to have a significant impact on the contemporary geopolitical landscape across Europe. In East-Central Europe, the Lower Danube frontier serves as the border between Romania and Bulgaria, while Hadrian's Wall is persistently drawn into popular discourse as the imagined (if not actual) border between England and Scotland. These frontiers each involve waterscapes: in Roman Britain the River Tyne and Solway Firth bookended Hadrian's

Wall, while the Lower Danube river was central to the construction of the Limes. In both of these cases the waterways have a noteworthy impact on the frontier landscape and its continued memorialisation, although this impact is better recognised on the Lower Danube. On Hadrian's Wall, while the waterways both extended the built forms of the wall complexes and acted as conduits for transportation and trade, they are often discussed as minor contributions at the end of the complex, rather than being seen as important components of the frontier.

We argue that the waterways in and along frontiers are not only geographically expedient end points of the built environment, but have a linked materiality that has not been critically appraised and brought into discussions of these frontiers. Recent scholarship has noted the long afterlives of the Roman borders as nationalistic markers in the landscape, and through a comparative approach between Hadrian's Wall and the Lower Danube, this paper demonstrates that an understanding of the interactions between the built and natural boundaries is essential for both encounters and transformations on the border zones in Antiquity and for understanding their long-term impact on modern socio-political landscapes. Using spatial analysis within GIS, this paper probes the dual nature of these waterways as both barriers and networks, and how these aspects worked together to create perceived border zones that still exist in popular imagination of borders today.

13 **BEYOND HADRIAN'S WALL: NEW SURVEY APPROACHES TO INDIGENOUS AND ROMAN-PERIOD LANDSCAPES IN NORTHERN ENGLAND AND SOUTHERN SCOTLAND**

Abstract author(s): Hardwick, Ian (University of Edinburgh) - Cowley, Dave (Historic Environment Scotland) - Fernández-Götz, Manuel (University of Edinburgh) - McDonald, Sophie - Hamilton, Derek (SUERC, University of Glasgow)

Abstract format: Oral

This paper will discuss ongoing work within the Leverhulme-funded "Beyond Walls" project, focusing on new survey approaches to analyse settlement evidence around and beyond Rome's northernmost frontier (modern-day northern England and southern Scotland). We present preliminary results from the analysis of the archaeological settlement record collated from national and regional historic environment records, supplemented by newly-undertaken large-area surveys using remote sensing data sources. Evident patterning in the settlement record over the period from about 500 BC to AD 500 allows for the assessment of potential impacts on indigenous societies during the Roman presence in relation to longer-term trends. This paper will introduce the first two case studies from the project: 1) a transect running north from the major Roman urban centre and military base at Carlisle in north-west England into the Southern Uplands of Scotland; and 2) a block following the major Roman road of Dere Street through upland Northumberland into the area around Melrose in southern Scotland. So far, the project has created comprehensive databases for each case study, drawing upon a wide range of archaeological data, both new and legacy, working at a range of different spatial and temporal scales. The use of remote sensing techniques has allowed for the identification of numerous new sites, particularly small farmsteads that would have represented the living spaces for the majority of the population. The preliminary results are analysed taking into account elements of topography, land use, and relation to Roman military installations.

14 **LANDSCAPE AND SETTLEMENT "BEYOND WALLS": USING ARCHAEOLOGICAL SCIENCE TO EXPLORE SETTLEMENT AND LAND-USE DYNAMICS ON THE ROMAN EMPIRE'S NORTHERN FRONTIER**

Abstract author(s): McDonald, Sophie - Hamilton, Derek (Scottish Universities Environmental Research Centre; University of Glasgow) - Hardwick, Ian (University of Edinburgh) - Cowley, Dave (Historic Environment Scotland) - Fernández-Götz, Manuel (University of Edinburgh)

Abstract format: Oral

The Leverhulme-funded "Beyond Walls" project aims to explore the impact of Roman occupation in Northern Britain through analysis of settlement and land use in the area between and around Hadrian's Wall and the Antonine Wall. "Beyond Walls" is looking at trends and changes over the long-term – c.500 BC-AD 500 – in a study area extending from northern England to the southernmost part of the Scottish Highlands. The project is adopting a multi-scalar, interdisciplinary approach, reviewing published survey and excavation data and grey literature; incorporating remote-sensing data; producing new radiocarbon dates from excavated sites; and collating and producing palaeoenvironmental datasets. This paper will outline the methodologies and preliminary results of the radiocarbon dating and palaeoenvironmental analysis strands of the project. The first of these strands comprises a programme of radiocarbon dating of archival samples from selected excavated sites, including legacy research projects and more recent excavations by commercial units. These new dates are being used to create chronological models exploring and challenging existing narratives of Iron Age/Roman period settlement in this northern frontier area. Palaeoenvironmental techniques have for decades been used to further understand the potential impact of the Roman presence in Britain on the landscape, both in colonial and frontier contexts. However, many legacy palaeoenvironmental sequences from the

northern British frontier area are based on a relatively small number of scientific dates, limiting their interpretation. As part of the “Beyond Walls” project, we are producing new palaeoenvironmental datasets with improved chronological precision from selected sites in our study area, updating our understanding of the Iron Age and Roman-period landscapes of the northern British frontier zone.

15 ENCOUNTERS-AND-TRANSFORMATIONS-BEYOND-ROMAN-BORDERS: AN-INTEGRATED-PALEOENVIRONMENTAL, ARCHAEOLOGICAL AND HISTORICAL APPROACH-WHICH-WILL-EXPLORE-THE UNCONQUERED-SOCIETIES-LIVING BEYOND THE NORTHERN MOST ROMAN FRONTIER AND THEIR ENCOUNTERS WITH ROME

Abstract author(s): Jones, Samantha - Mighall, Tim (University of Aberdeen) - Blaauw, Maarten (Queen’s University Belfast) - Campbell, Ewan (University of Glasgow) - Hunter, Fraser (National Museums Scotland) - Martínez Cortizas, Antonio (University of Santiago de Compostela) - Noble, Gordon (University of Aberdeen)

Abstract format: Oral

It is well known that the Roman Empire expanded as far north as the Highlands of Scotland between the 1st and 2nd centuries AD before retreating to a series of frontiers in modern day central Scotland and northern England. Major changes to the everyday activities of locals and to the landscape, may have come with these events. From fragmented historical and available archaeological records, evidence suggests the Romans yielded considerable influence over at least some of the unconquered native communities. Influence came in the form of subsidies to promote peace and occasionally through violent campaigns to quell native uprisings, but Roman influence would not have been consistent or uniform; it would have varied regionally, impacting local communities differently and over generations with some communities becoming more Romanised than others. However, most 1st millennium AD archaeological sites north of the Antonine Wall have never been extensively excavated. Historical texts tend to be fragmentary, particularly for eastern Scotland, whilst palaeoecological investigations tend to use better-preserved lake or peat bog archives, often located some distance from archaeological sites at low chronological resolution. This means that we still know very little about the daily lives of native communities living in northern Britain, their economy, environment, or the impacts of social/environmental change. This paper presents the results so far of a new Leverhulme funded project which integrates higher resolution palaeoecological analysis with archaeological and historical archives, aimed at exploring how Roman occupation in Britain impacted the unconquered native communities living beyond the northern most Roman frontier.

16 UNRAVELLING TEXTILE PRODUCTION ON THE ROMAN FRONTIER

Abstract author(s): Vavle, Aboli (Teesside University) - Alberti, Marta (The Vindolanda Trust) - Hopkins Pepper, Heather (Independent Researcher) - Taylor, Gillian (Teesside University)

Abstract format: Oral

In this paper we discuss aspects of two ‘bookend’ steps of the chaine operatoire of textile production on the Roman frontier: spinning and dyeing. Scholarship on spindle whorls has often focused on functional analysis, yet whorls on the Roman frontier are also signifiers of female identity in a traditionally male dominated environment, and objects which can be both purpose-built or crafted out of recycled materials. Decoration and use wear on spindle whorls may offer insights on their making and use. Where possible, distributional analysis of their deposition and discard pattern may contribute to answer questions of status and industry. In the first part of the paper, we explore how a database of spindle whorls on the Roman Frontier would benefit the study of the subject, and the steps necessary towards achieving such an ambitious goal. Dyeing wool was integral to the production of textiles, and understanding which plants were used and how is still poorly understood. In the second part of this paper, we present results from a textile experiment using different mordants and birch dye, analysed using SEM-EDX, UPLC-PDA and UPLC/MS/MS. Preliminary results indicate that different wool and mordants can be identified by statistical analysis of flavonoids. With so many research questions to explore, and such a vast dataset to gather and standardize, international and interdisciplinary collaborations such as the ones we present are not only desirable: they are essential to further our understanding of textile tools and industry.

17 FRAGMENTS OF TWO IMPERIAL DONATIVA FROM NEWGRANGE (IRELAND)

Abstract author(s): Janiszewski, Robert (University of Warsaw)

Abstract format: Oral

Newgrange passage grave is arguably the most prominent monument of the Bru na Boinne, Irish famous archaeological complex. It is located in the River Boyne Valley in eastern part of Ireland. Although the grave was erected during Neolithic Period, it also played important role for the local population in the subsequent periods. During the Late Iron Age the site was used as a shrine where valuable Roman imports, including gold coins and ornaments, as well as

few native objects, were deposited as ritual offerings. Among recorded finds two intriguing fragments of gold objects were found, one as a stray 19 c. find, while the other was unearthed during excavation in 1960s, both are stored in the NMI Collection in Dublin. First of the pieces, a small tubular fragment decorated with repoussé relief, was donated to the RIA in 1863, and, according to author's research, it is a fragment of very distinct late Roman tubular bracelet, with parallel examples coming from hoards from Bonn and Hoxne. The second piece is even more enigmatic, it was made from a gold rod and it bears Latin inscription. Found in a curved form, due to its similarity to the terminals of famous gold torcs of Tara type, dated to the Bronze Age, in some publications it was interpreted as a Bronze Age gold fragment, reused during Late Iron Age. However, in the light of analogical objects, firmly dated to the 4 c. AD, it can be assigned to the same period, while results of chemical analysis confronted with the results characteristic for BA torcs clearly speaks against such possibility. Both analysed fragments, belonging to the group of prestigious, high status goods, indicate strong direct links between the élite of local population and Roman administration during the last century of Roman occupation of Britain.

18 THE BACKBONE OF EMPIRE: THE CASE FOR A CENTRAL PERSPECTIVE IN ROMAN ARCHAEOLOGY

Abstract author(s): Maschek, Dominik (Leibniz-Zentrum für Archäologie)

Abstract format: Oral

As evidenced by the famous Tabula Peutingeriana, late Roman map-makers envisaged the empire as dominated by a riverine backbone which bounded its transalpine provinces from Lower Germany all the way to the Black Sea. This, however, is a perspective which has never been fully adopted in Roman archaeology. For instance, the concept of Romanization has been developed and criticised from the perspective of the margins, mostly the northernmost Roman periphery, not only in terms of modern academia (Britain, Netherlands), but also with respect to the provincial society and material culture they were primarily concerned with. Since the Fall of the Iron Curtain, this situation has started to change. Recently, first synoptic studies on urbanism and material culture in the Danube provinces have been published which form an excellent basis for further theoretical work.

In this paper, I want to argue that this recent change in research also needs to be reflected in how we conceptualise the Roman world more broadly. In particular, the term 'frontiers' stands in the way of a clear perception of how important the provinces in central, eastern, and northwestern Europe actually were in the tissue of the empire. In the transalpine arc from northern to eastern Europe, new excavations and landscape studies shed light on the creation of distinctive productive regimes in the countryside, and on the emergence of urban culture and military strongholds. Moreover, its archaeology reveals an image of late Roman transition which is markedly different from places like Britain. Viewed from the imperial 'centre', the question is not merely one of 'Romanisation' or indigenous identities, but of corridors of movement, routes of invasion, trans-European trade links, and urbanisation and rural population growth in a vast area which had fascinated Greek and Roman writers since the days of Herodotus.

248 ARCHAEOLOGY AND THE CLIMATE CRISIS: RESILIENCE, ACTIVISM, AND PEDAGOGY

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Piper, Stephanie (University of York) - Patton, Katherine (University of Toronto)

Session format: Discussion session

Human responses to climate change and resilience have long been a focus of archaeological research, but we are only starting to think about the degree to which our discipline should address the current climate crisis. Archaeologists are grappling with a multitude of challenges presented by climate change - issues such as the sustainability of the discipline, how to respond to heritage loss on a variety of scales, and how best to communicate actionable policy advice based on our research. Yet it is in our teaching where we can have the largest impact, by inspiring students toward activism.

Building on Cobb and Croucher (2014; 2020), this session weaves together teaching and research practices to consolidate the relationship between archaeology and the climate crisis, and feed into a framework for archaeological and heritage education.

We welcome contributions that explore creative solutions to questions such as: how can we convey the relevancy of climate change matters from the deep and recent pasts to the present? Can we teach sustainably? Can the effects of the current climate crisis in archaeology be examined in our teaching? We would also like to use this as a space to share best practice. Are you changing how you teach/practice archaeology in response to climate change and if so, how? Are you working with communities to think about heritage loss due to climate change, or engaged with multi-vocal co-creation and student leadership in teaching? Are you collaborating with other disciplines or professions to actively tackle the current climate crisis? Does this translate into your teaching (both within and outside the classroom)?

1 MARITIME ARCHAEOLOGY WITHIN THE CLIMATE EMERGENCY: RESEARCH AND TEACHING POTENTIALS

Abstract author(s): Velentza, Aikaterini (University of Helsinki)

Abstract format: Oral

Maritime archaeology, an academic discipline with a multi-faceted and interdisciplinary nature, has been identified as a significant field amongst the humanities that could contribute to matters of climate change and sustainability (Wright 2016; Henderson 2019). This paper presents the experience of the author in her effort to adapt maritime archaeological research and teaching within the realities of the climate emergency. First, details regarding approaches to research will be presented. In this analysis, the author’s interdisciplinary project ‘Re-imagining the use of traditional watercraft in the Aegean Sea for a sustainable environment and economy’ and recent publication on ‘Maritime Archaeological Research, Sustainability, and Climate Resilience’ (Velentza 2022) will be included. Additionally, questions regarding necessary changes in the practice and conduct of maritime archaeological fieldwork will be raised, as for example the feasibility of using slow travel rather than air travel for research endeavours. Finally, the paper will focus on the potential of contributing to climate action through teaching at the university but also in the community. The significance of incorporating issues of climate change in two maritime archaeology courses (KUMA-AR511: Human-Environment Interactions in Maritime Spaces; KUMA-AR513: Issues in Maritime Archaeology – Past and Present: PART 2) taught at the University of Helsinki will be discussed, as well as the potential of raising awareness on sustainable adaptation and human-centred solutions through public outreach to maritime communities, who are and will be impacted by climate change effects. Through this review of research and teaching potentials it is hoped to set the basis for a larger framework for interlinking maritime archaeology, climate change and sustainability now and into the future.

2 CULTIVATING RESILIENCE THROUGH PEDAGOGY: LONG-TERM PLANT-HUMAN INTERACTION AND CREATING SUSTAINABLE FUTURES

Abstract author(s): Masur, Lindi - Michel, J.T. (Sewanee: The University of the South) - Colchado Kelley, Stephanie (Growing Roots)

Abstract format: Oral

Archaeologists in North America must actively work to materialize a decolonized and socially relevant discipline. Paleoethnobotanists first must heed Indigenous scholars admonishing the use of co-opted ontologies and traditional ecological knowledge for the construction of archaeological narratives. Through the acknowledgement of our settler positionality within the movement towards Indigenous cultural revitalization, we are increasingly aware of our unique role as educators as our contribution to the creation of resilience in the face of climate change. This paper illustrates the beneficial role of archaeological studies within the anthropology curricula at a small ecology- and sustainability-oriented liberal arts college in the southern U.S., including courses like environmental justice, food and culture, and histories of economic plants. It is apparent that Gen Z students engaged with climate change issues inside and outside of the classroom are confronted with not only a bleak future but “climate anxiety” and apathy towards long-term career, family, and community building. The inclusion of archaeological case studies of resilience in the face of past climate crises in the aforementioned courses has been both a relief and inspiration for students. Indeed, understanding local long-term plant-human interaction has much to contribute to imagining and implementing sustainable futures, particularly in addressing issues in agrobiodiversity and food justice. This paper addresses how issues of Indigenous food sovereignty and the archaeology of pre-colonization horticulture have been implemented within these curricula. Furthermore, through supporting student-led experimental horticulture of eastern North America’s “lost crops,” and creating class research projects in collaboration with a local food justice nonprofit and their community garden’s objectives, we reflect upon the outcomes of integrating resilience narratives and student activism within anthropological and archaeological pedagogy.

3 CLIMATE RESEARCH AND THE ARCHAEOLOGY OF SOUTHWEST ASIA: TOWARDS A NEW PEDAGOGICAL APPROACH

Abstract author(s): Welton, Lynn (University of Toronto) - Reculeau, Hervé (University of Chicago)

Abstract format: Oral

Discussions of climate change and its repercussions for modern society have become pervasive in the media and in general social discourse, reflecting global uncertainty and anxiety about the future of our planet. One region identified by the international scientific community as a critical climate hotspot that is particularly vulnerable to the impacts of climate change is Southwest Asia. The complex association between Western resource extraction, colonialism, and

archaeological exploration in this region also means that archaeologists working here have an obligation to consider the impacts of their research particularly carefully.

The authors (an archaeologist and an ancient historian) reflect on their experiences teaching courses focused on improving climate literacy among students of the ancient past, and challenging unhelpful narratives that reduce ancient societies to the status of passive victims of external natural forces. Instead, the focus should be placed on the agency and resilience of ancient social actors, allowing for the existence of collaboration, contradictions, and at times conflict between various groups and interests. This renewed approach is informed by years collaborating on multi-disciplinary projects that involve ancient historians, archaeologists, climate scientists, and modellers, which shed new light on how responses to climate change in the deep past can inform ongoing climate research and social responses to the anthropogenic climate crisis.

4 **ARCHAEOLOGICAL PLACES AND CLIMATE CHANGE IN WABANAKIK: THE SPACE BETWEEN ARCHAEOLOGICAL MITIGATION AND TRADITIONAL WAYS OF KNOWING**

Abstract author(s): Blair, Susan (University of New Brunswick) - Nicholas, Ramona (Tobique First Nation - Negutukuk)

Abstract format: Oral

In Wabanakik (a part of which is now known as the Canadian Maritime Provinces), as in the rest of Turtle Island, archaeological responses to climate change are generally informed by broad ethical frameworks that are centred on a particular approach to the preservation of archaeological places. Systems of archaeological practice that have developed alongside environmental impact legislation represent the efforts of non-Indigenous governments to manage the interaction between archaeology and economic development. These systems are organized around mitigating the damage to and destruction of archaeological “resources” due to development and (more recently) climate change, with excavation and data recovery. This Western framework operates in tension with many Indigenous views. In Wabanakik, place-making is relational, community-centred, and intimately connected to resilience and cultural, economic and spiritual survival. Places are woven into landscapes of meaning and identity, and no mitigation can moderate the impact of their loss. In this paper we explore the tension between these views and examine how they can play out in educational settings in complex ways, creating both challenges as well as opportunities for decolonization and reconciliation.

255 **“WARRIORS” AND “WEAVERS”: CHALLENGING GENDER STEREOTYPES IN ANTIQUITY [AGE]**

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Fulminante, Francesca (Bristol and Oxford University; Hanse-WissenschaftsKolleg 2022-23; University Roma Tre) - Benelli, Enrico (University Roma Tre) - Heitz, Christian (University of Innsbruck) - Martins, Ana Cristina (Universidade de Évora | IN2PAST) - Pope, Rachel (University of Liverpool)

Session format: Regular session

Two years ago, an EAA session, ‘To gender or not to gender’ organised by B. Gaydarska, K.Rebay-Salisbury, P. Ramirez-Valiente and J. E. Friez, challenged the then dominating view of gender development and symbolism in Euro-Mediterranean Antiquity, as elaborated by Robb and Harris. According to the latter, Neolithic gender representation is ambiguous and blurred, with a transition occurring in the Copper-Bronze Age towards greater distinction in the Iron Age-Archaic Period, of an emerging binary ideology which related men to the ‘martial warrior’ and female to the ‘beautiful weaver’.

The 2020 EAA session and other studies instead turned our focus to the association between gender and biological sex, revealing that the interplay between indicators of different personhood and identity aspects, such as age, status, class and even ethnicity, is much more complex than the old binary suggests, including now the emergence of different genders in the prehistoric data.

Building upon these foundations, it is also important to reconsider who has produced knowledge in this field, understanding if andro-centric narratives and/or, on the contrary, new perspectives have been proposed. Moreover, it is important to know how much these new analyses have and continue to contribute to a new narrative that will be expressed in different media, and types of dissemination, among which museums especially need to be analysed, to the most diverse territories and communities, contributing to the fulfilment of at least one of the SDGs, that of gender equality.

In this session, with an Introduction by M. Seifert and a Key-note paper by R. Whitehouse, we welcome papers challenging the current gender stereotypes in European and the Mediterranean antiquity and addressing the scholars who

work in these fields. We also invite papers from the New World or anthropological field for comparative perspectives. In this way we aim to achieve more nuanced and balanced interpretations to face modern challenges.

ABSTRACTS

1 BEYOND STEREOTYPES: BUILDING SECURE GENDER METHOD

Abstract author(s): Pope, Rachel (University of Liverpool) - Bickle, Penny (University of York)

Abstract format: Oral

Although often readily acknowledged as an important topic of analysis in Archaeology, gender is frequently side-lined in narratives of social change. As a direct result, stereotypes of masculinity and femininity often implicitly populate the major changes which shape prehistory. To move beyond this situation, we contend that greater attention to analytical methods used in archaeological studies of gender is required, to move us beyond critique, into charting the diversity found through time and space. Building on Gaydarska et al. (2023), we reject the 1970s' Cambridge notion of gender – that sex=gender and can be viewed as a universal structuring principle – towards an understanding out of 1980s gender archaeology as diverse and historically situated. Evolutionary approaches to gender (from fluid to binary), which seek to support the status quo by perpetuating modern gender stereotypes, fail to account for the variation we see in our datasets. Both of us found, in work carried out independently, different prehistoric genders in the Neolithic and Iron Age (Pope and Ralston 2011; Bickle 2020; Pope 2022). Here we detail the method used in these case studies, alongside recent German practice, as we isolate the mechanics of gender analysis – asking how can we build secure method around gender.

2 THE CONSTRUCTION OF SOCIAL IDENTITY IN EARLY IRON AGE GREEK: FROM THE MORTUARY PERSPECTIVE

Abstract author(s): Lin, Min (University of Cambridge)

Abstract format: Oral

Historian argues that 'gender is a primary way of signifying relationships of power. Changes in the organization of social relationships always correspond to changes in representations of power' (1986, p.1067). The study of gender relations and the construction of the social identity of men and women in the formative period poses an exciting challenge because this period often witnesses drastic socio-political changes that manifest in the shift of the social organisation of gender.

Early Iron Age was widely regarded as a formative period in Greece that inspired enduring debates on socio-political development. However, gender has been mostly left out of the discussion in the existing literature. Focusing on the mortuary data from Athens and elsewhere in Attica, the purpose of my research is to analyse, first of all, the employment of gender as a socially recognised concept. Secondly, how women's social identity is constructed in the mortuary sphere and how such construction changes according to socio-historical development and influence it in turn. Moreover, the study of men's social identity is crucial as it avoids studying women in isolation but examine how gender negotiation contribute to the construction of social identity.

I include all aspects of material traces into my analysis in an attempt to reconstruct the gendered body, retrace the material culture and re-enact the mortuary ritual through the period of over 300 years. By comparing the trajectories in the change of male and female identity, one can tease out how such identities affected and were affected by the broader socio-political development.

3 OH MOTHER! WHERE ART THOU? REPRESENTATIONS OF MOTHERS IN THE ANCIENT GREEK ARCHAEOLOGICAL RECORD

Abstract author(s): O'Keeffe, Amy (Trinity College Dublin)

Abstract format: Oral

Biases against motherhood in the ancient Greek archaeological record trace back to the inception of Classical archaeology as a discipline. These biases have become an unconscious status quo within the discipline, which are rarely questioned. They reflect harmful perceptions of ancient and modern women, especially mothers, and serve to obfus-

cate, and in some cases, erase their presence in history. The corpus of Mycenaean figurines illustrates this issue, in which the specialised types of kourotrophic figurines (woman and child), and charioteer figurines (perceived as male) are interpreted. The male figurines are perceived as depictions of everyday life, while the female and child figurines are interpreted as depictions of a “Mother Goddess”. Ancient women are rarely afforded the courtesy of their mortal agency and are instead diminished and obscured. By exploring this topic, it is possible to identify the issues that are inherent in how scholarship perceives the past, and the more modern ideologies and agendas which colour our representation of past cultures. By using a multidisciplinary approach, it is possible to create a more nuanced interpretation of material culture, as well as address more gendered material in a thoughtful and holistic manner. As with the discipline of Art History, where the feminist revolution has been making changes for decades, Archaeology benefits from fresh perspectives, inclusive ideologies, and interdisciplinary frameworks. Using kourotrophic Mycenaean figurines as a vehicle for feminist critique allows for a discussion of the diachronic history of the material, and the historiography of its study. While keeping the important role of motherhood central to this argument, the acknowledgement of human agency and complex identity beyond a single facet is important to remember. Their agency and identity, to some extent, is retrievable.

4 **EMPOWERING MOTHERHOOD - CREATION AND PRODUCTION DURING IBERIAN LATE PREHISTORY**

Abstract author(s): Vale, Ana (University of Porto - CITCEM/FLUP)

Abstract format: Oral

Women in Prehistory are defined by their sexuality. The prehistoric goddesses rely on their bodies - the naked body is fertile. The prehistoric goddesses persist in the modern Western imaginary through stereotypes like the femme-fatal, defined by her autonomous but distant sexuality. On the other hand, mothers in Prehistory are represented in archaeological imagery by the abstract qualities of being a mother; in the Christian tradition, inspired by the image of Mary - the body is dressed. This polarisation of the female body, between the sacred and the profane, naturalises the inferiority of female sexualised bodies. Although recent studies have interpreted the display of female sexual attributes in representations (rock and portable art) from late Prehistory as collective identifiers, male representations continue to be understood as integrated into a trajectory of individualisation of power whereas female sexuality is linked to collectiveness, natural characteristics, and the private sphere of human life.

In this presentation, I would like to argue that this perspective is based on an impoverished vision of motherhood. The concept of motherhood creates constraints even for feminists because it remains linked to procreation and reproduction, and to the idea of controlling women’s power within patriarchal societies. Motherhood does not define what it is to be a woman, but not revisiting this concept today implies a diminution of the rights of female mothers and a perpetuation of a bias in the past that relegated them to the private sphere. Understanding and studying motherhood as creation and production in Prehistory may contribute to guaranteeing the right and freedom to be a mother as a human project and free women from definitions based on androcentric sexual visions, which in Prehistory validate the definition given to motherhood by the modern Western world as a natural function of every female body.

5 **“WARRIORS” AND “WEAVERS” CHALLENGING GENDER STEREOTYPES IN ITALY: A COMPARATIVE PERSPECTIVE (OSTERIA DELL’OSA AND FOSSA)**

Abstract author(s): di Giovanni, Andrea (Università La Sapienza di Roma) - d’Ercole, Vincenzo (Università Gabriele d’Annunzio Chieti-Pescara) - Fulminante, Francesca (Hanse-Wissenschaft Kollegen, Bristol and Oxford University and University Roma Tre)

Abstract format: Oral

Already in the 1990s, John Robb provided a comprehensive overview of the development of gender symbolism and ideology in Prehistory. During the Neolithic gender representation seems to be much more ambiguous and blurred. With the Copper-Bronze Age and more distinctively with the Iron Age and Archaic Period, a binary ideology seems to emerge, especially from the funerary evidence, between ‘martial warriors’ and ‘beautiful weavers’ (Robb-Harris 2017).

While Robb-Harris’ model partially still holds today, many scholars have challenged this binary conception. The recent paper *Gender or not Gender* by Gaydarska et al. is the most up-to-date discussion on the topic and presents the state of the art (2023). In addition, several studies have showed that the intersectionality between indicators of personhood and identity aspects, such as age, status, class and even ethnicity and gender and sex is much more complex than previously thought.

We present a contextual analysis of the cemetery of Osteria dell’Osa (Latium vetus, 1000-500 BC) and Fossa (Abruzzo, 825 BC-100 AD), which show mostly gendered individuals. However, there is also a significant number of ungendered individuals, burials with both female and male elements and some burials anthropologically determined as female with male objects, and viceversa. In some cases anthropological analyses are ambiguous, or the odd objects could be votive offerings, but the study highlights some complex patterns that deserve further investigation. In future,

we plan to use peptides analyses to sex these individuals scientifically to disentangle objectively the complex relation between sex, gender, and identity in past populations.

6 THE ETRUSCANS AT LAKE ACCESA: GENDER RESEARCH AND NARRATION IN A COMMUNITY OF THE 7TH - 6TH CENTURY BC

Abstract author(s): Colombini, Matteo (Museo archeologico Massa Marittima)

Abstract format: Oral

Lake Accesa is located in southern Tuscany, near the city of Massa Marittima. Geographically it is about 10 km from the Tyrrhenian Sea and in the middle of Colline Metallifere, an important relief system that has been exploited since ancient times for its mineral deposits. Between the end of the VIII and second half of the VI century B.C. an Etruscan community developed here mining, farming and fishing. The research, started in the 80s and directed first by Professor G. Camporeale, then by S. Giuntoli, brought to light a very interesting context, abandoned at the end of the VI century and protected by the vegetation: it was possible to excavate the traces of the village and numerous burials, some of which have not been violated by the entry of tumb raiders. The opportunity to investigate a sealed context and layers not altered by subsequent settlements is very rare in the panorama of Etruscology and this allowed to propose fundamental theses regarding aspects such as urban planning and the socio-economic system of the archaic period. However, an anthropological re-reading of the skeletal remains found during the excavations suggests a re-evaluation of the role and weight of female figures within this periferic urban centre. In the current scientific narrative, from which the educational apparatuses of the Archaeological Park and the Museum of Massa Marittima also derive, women are relegated to a domestic context, reserving the role of warrior and political leader to men. By cross-referencing the anthropological data with the finds, the topography of the necropolis and the housing area the image of an egalitarian society emerges, in which the female figure has a central role in spiritual life and probably politics.

7 REFLECTIONS AND OPEN QUESTIONS ON GENDER IN THE LA TÈNE NORTHERN ITALY

Abstract author(s): Giannella, Giulia (University College Cork)

Abstract format: Oral

The topic of the social role of women has in past research been established as problematic, in part due to modern pre-conceptions on females' social position. Nonetheless, looking at archaeological finds it is now clear that the assumed correlation between gender and sex is not obvious and that gender concepts may have been very complex.

In the La Tène area in Northern Italy (especially, Oleggio and Dormelletto, in Lombardia region, and Santa Maria di Zevio, Isola Rizza and Valeggio sul Mincio, in Veneto region; all dated to the late La Tène) burials which contained grave goods that seem to relate both to a male and female gender were found. In other burials an 'opposite' correlation between the sex of the deceased and the gender implied by conventional interpretation of the grave goods exists (e.g., anthropological women with panoplies).

In the first case it seems possible to suggest more complex concepts of gender, due to specific characteristics or life-histories of the deceased. On the other hand, it could be also possible that some of the objects were deposited in the burials as part of funerary offerings, or that some objects had specific functions and/or symbolical meanings (such as, knives or chain belts). In the second type of burials, it seems possible to envisage a specific choice, maybe reflecting the use of items as status symbols – perhaps the case of anthropologically women buried with weapons – as well as linked maybe to particular roles and/or gender choices.

The aim of this poster is to give a brief overview (through targeted examples) of these cases to raise questions and reflect on the complexity and fluidity of gender. It is in fact likely that more and differentiated roles and genders existed in the La Tène society beyond male warriors and female weavers.

8 CONFLICTING PROPOSALS: SYMBOLIC STATUS OR EXPLOITATION. A THEORETICAL APPROACH FROM THE CASE OF NECROPOLIS 277 OF A-GROUP IN LOWER NUBIA

Abstract author(s): Rodríguez, Beatriz (Universidad Complutense)

Abstract format: Oral

In studies of funerary archaeology, we can often find references to the status of a collective according to the differentiation of the type of burial or the content of the grave goods deposited. However, the concept of "status" poses some problems when it comes to understanding the social reality of a given context. Unlike other concepts such as reciprocity or exploitation, status is an individual term that does not define the social relationships in which social subjects participate and in which material culture is produced, maintained or discarded.

Necropolis 277 from A-Group, analyzed from a processual approach, has been called “the women’s cemetery”. Based on a mathematical model of scores according to different variables (type and size of the grave, orientation, position of the body, contents of the grave goods...) it was concluded that women had a certain status, related to their condition of “givers of life”. Without overlooking these first contributions, with new approaches in hand (in this case, influenced by social archaeology and feminist theory), a critical review has been carried out, taking into account other factors and addressing different questions.

Focusing on what has already been highlighted (the evident relationship in the record of women with procreation), the aim is to understand the social reality, and therefore the social relations, that define this cultural group, trying to establish whether there are exploitative relationships between the subjects and on what basis. This analysis allows us to open the debate on the social organization of this cultural group, in general, and on the social role of each of the social subjects, men and women, in particular.

9 **WARRIORS, WEAVERS - OR WEAVING WARRIORESSES? GENDER-B(L)ENDING FEMALE PORTRAITURE FROM ROMAN ANTIQUITY**

Abstract author(s): Hollaender, Sarah (University of Graz)

Abstract format: Oral

Private portraits of women as mythological figures in cross-gendered dress were set-up in Roman funerary contexts between the late 1st and early 4th centuries CE. Women appear in the guise of Omphale, the mythical queen of Lydia, who ruled over Hercules at her court. She wields his club and lion skin, effectively transforming her into a “herculean” woman. Other women appear as warrioresses and huntresses, including Penthesilea, the queen of the Amazons; Virtus, the Roman goddess of “manliness”; Diana, the chaste goddess of the hunt; or Atalante, renowned for her role in the Kalydonian Boar Hunt. All of these women likewise take on garments and accessories predominantly associated with male figures in the visual record. This might initially seem surprising. Female-to-male cross-dressing was typically perceived as a transgressive act in Roman society; moreover, conventional portrait types tended to emphasize femininity, modesty, and passivity. As argued here though, these gender-b(l)ending features had the capacity to express particularly female forms of virtus (“manliness”), both on their own terms and in connection with other visual codes, which complemented their traditional female virtues in meaningful ways. These women are neither portrayed in a typically feminine way – as modestly draped, chaste, “weavers” – nor in a truly masculine way – as heroically nude “warriors”. Rather, their dress, as well as their pose, actions, and even their settings, opened up an imaginary space for so-called “weaving warrioresses”: these women are portrayed as strong, courageous, and virtuous, but this is ultimately connected back to their traditional female roles.

10 **WHERE ARE THE BRUNHILDS? WHAT CAN WEAPONS SAY ABOUT GENDER IN WIDER CENTRAL EUROPE IN LATE ANTIQUITY?**

Abstract author(s): Hrušovská, Barbora (Masaryk University)

Abstract format: Oral

The topic of women burials with weaponry is becoming more resonant thanks to the latest methods of determining the gender of the deceased. In this regard, the discovery from Birka supported by DNA analysis from 2016, caused a great controversy. Based on the analysis of graves containing weapons from the 5th and 6th century in wider Central Europe, as part of student’s dissertation, contribution aims to provide the insight into the current interpretation possibilities and an approach to the question of the connection between the grave inventory and the gender of the buried. In general, archaeology captures the phenomenon of the women with weapons during the Migration Period as a distinctly minority manifestation. This situation can be partly caused by the outdated archaeological determination of gender, since for a long time weapons were viewed as an exclusively male matter. This principle makes the very existence of the female graves with weapons impossible and may at least partially explain why the current record for these burials is so meager. Due to the difficulty of resources, we will follow the phenomenon mainly on the basis of anthropological analyses, with the obvious consideration of the possible shortcomings of the given method. The attention will largely be focused on the overall content of the grave equipment of the individual female graves and will also provide us with the opportunity to observe the possible equivalent grave equipment of individuals with the anthropologically determined male sex. This approach can, thus, verify the validity of gender stereotyping of some types of the subjects. Although, current archaeology for male graves with weapons allows for a wider range of different explanations and interpretations, including warrior status, for female graves with the same weaponry this principle has not been implemented and as such remains a problem.

Abstract author(s): Eriksen, Marianne Hem (University of Leicester)

Abstract format: Oral

It is oxymoronic that while sexuality is a foundational part of being human, we rarely talk about it in the past. ‘Whole beings of the past...cannot be comprehended, imagined, or interpreted unless their sexuality is regarded as basic to their...subjectivity as real persons’, argues Fuglestedt (2014). Yet, while some scholars of the first millennium argue that the power and qualities of leaders in the Iron and Viking Ages was deeply entangled with sexuality (Hedeager 2011; Solli 2008), there has been limited study of sexuality writ large. Sexuality is still seen as outside the remit of archaeology for most scholars, and therefore as a high-risk (or even risqué) topic to embark on, but one where the potential to develop new knowledge and a new discourse is significant. Sexuality is, as noted by Voss (2008), not only about interpersonal relationships or identity: sexuality intersects, feeds into, and is part of as diverse topics as state formation, economic systems, and religion.

How was sexuality, and especially women’s sexuality, understood in the Late Iron and Viking Ages, beyond reproduction? This paper investigate sexualized objects, historical sources describing sexual acts and violence, and depictions of sexual bodies, in order to explore Iron and Viking Age sexual imagery, ritualized sexuality, and sexual exploitation. In Iron and Viking Age studies, the sexual aspects of the ritual practice seiðr has generated relatively high scholarly attention including its interlinks with the concept ‘ergi’ denoting men taking an effeminate or passive sexual role. Yet this has not been incorporated in the political narratives of the period, but rather been placed in a separate discourse on ritual. In Foucauldian terms, sexuality is a complex political technology. How did politics of sex and the body relate to large-scale social and political development in these societies?

PLEISTOCENE LITHIC RAW MATERIALS CHARACTERIZATION TO INTERPRET MOBILITY PATTERNS AND SETTLEMENTS DYNAMICS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Gómez de Soler, Bruno (Institut Català de Paleoeologia Humana i Evolució Social - IPHES); Universitat Rovira i Virgili) - Soto, María (Madrid Institute for Advances Study; Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid) - Favreau, Julien (Department of Anthropology, McMaster University)

Session format: Regular session

Lithics represent one of the best lines of evidence to investigate human-environment interactions over time and space as Pleistocene toolmakers focalized a significant amount of their activities around raw material sources, which remain, by and large, observable in the present-day.

Seminal ethnoarchaeological studies have established that hunter-gatherers can be characterized as foragers and collectors according to their mobility, settlement, and subsistence practices. In turn, this has allowed archaeologists to classify site functions according to behavioral information, cultural traditions, and the distribution of natural resources.

Recent advances in the characterization of lithic raw materials have identified the utility of multi-scalar approaches to derive practical information. A combination of macro-/microscopic analytical methods complemented with geochemical analyses represents an ideal means by which archaeologists can glean deeper insights into the provenance, exploitation, and management of raw materials, which can have the overall effect of facilitating the identification of prehistoric mobility patterns and settlement dynamics.

In this session, we want to bring together specialists from across sub-disciplinary boundaries irrespective of time periods, regions, or rock types to serve as a forum to improve lithic raw material studies and expand upon the inferential insights they can offer.

1 OLDOWAN RAW MATERIAL SOURCING AND EVIDENCE FOR MOBILITY AT EWASS OLDUPA (OLDUPAI GORGE, TANZANIA)

Abstract author(s): Favreau, Julien (Department of Anthropology, McMaster University) - Cueva-Temprana, Arturo (Department of Archaeology, Max Planck Institute of Geoanthropology) - Soto, María (Madrid Institute for Advanced Study; Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid) - Durkin, Paul (Department of Geological Sciences, University of Manitoba) - Hubbard, Stephen (Department of Geoscience, University of Calgary) - Bushozi, Pastory (Department of Archaeology and Heritage Studies, University of Dar es Salaam) - Mercader, Julio (Department of Archaeology, Max Planck Institute of Geoanthropology; Department of Geoscience, University of Calgary; Department of Anthropology and Archaeology, University of Calgary; Institut Català de Paleocologia Humana i Evolució Social) - Carter, Tristan (Department of Anthropology, McMaster University; School of Earth, Environment & Society, McMaster University)

Abstract format: Oral

The totality of high-impact discoveries together with years of coordinated fieldwork by multiple research teams have positioned Oldupai Gorge (Tanzania) as a premier reference site for the investigation of hominin behaviour during the Pleistocene. Here, we present our research on the raw material sourcing from the oldest Oldowan site in the area known as Ewass Oldupa and offer evidence for mobility patterns. Systematic excavations have revealed that hominins recurrently occupied the site between ~2.0-1.8 Ma despite profound fluctuations in depositional environments. This is evidenced by Oldowan tools associated with meandering streams atop a volcanoclastic fan, mass flows, transgressive and regressive lacustrine cycles, and shifting fluvial systems. Palaeoenvironmental reconstructions across the stratigraphic sequence have shown the existence of fern meadows, woodland mosaics, palm groves, naturally-burned landscapes, and hyper-xeric steppes. Faunal remains retrieved in proximity to Oldowan tools include bovids, suids, equids, leporids, felids, hyaenids, hippopotami, crocodiles, turtles, birds, and cercopithecids. However, analyses of bone surface modifications indicate that hominins were not the primary accumulators of fauna. Stone tools include cores, spheroids, flakes, and retouched pieces manufactured on volcanic and metamorphic rock types with minimal evidence of technological variation through time. The geochemical characterisation of regional rock types using ED-XRF spectroscopy indicate that there are detectable differences at the inter-source scale. Comparative analyses of geological and artefactual data sorted by macroscopic categories allow for the probabilistic identification of raw material sources with accuracies ranging between 75-100% using computational statistics. Overall, our results indicate that the site's Oldowan toolmakers maintained a diversified supply of raw materials irrespective of palaeoenvironmental changes and clearly selected for specific varieties of quartzite. Moreover, hominins evidently ranged across the palaeobasin in patterned ways as a significant amount of stone tools is attributed to sources ~12 kilometres away while some artefacts imply even longer transport distances.

2 FLINT SOURCES OF HANDAXES FROM THE LATE ACHEULEAN SITE OF EVRON (ZINAT), WESTERN UPPER GALILEE, ISRAEL: IMPLICATIONS FOR PROVENANCE STUDIES

Abstract author(s): Finkel, Meir (Tel Aviv University) - Ben Dor, Yoav (Geological Survey of Israel) - Barkai, Ran - Gopher, Avi - Ben Yosef, Erez (Tel Aviv University) - Sharon, Gonen (Tel Hai College) - Agam, Aviad (Tel Aviv University)

Abstract format: Oral

The Acheulean site of Evron, which includes three localities (Quarry, Zinat, Pardes), is situated in the Western Galilee coast of Israel. More than 500 handaxes were retrieved from the Late Acheulean Zinat locality, from surface and from shallow excavation trenches. No flakes were found and no raw material sources is known from the vicinity of the site. Hence it was suggested that the handaxes produced near the raw material source and imported to the site as finished tools (Gilad & Ronen, 1977). Here we present ICP-MS based composition geochemical analysis of 11 handaxes from Zinat locality (and one from Early Acheulian Quarry locality). The results are compared to various potential flint sources in the Western and Central Upper Galilee which were identified in previous surveys. These localities have nodule size sufficient in size and morphology for the production of an Acheulian handaxe. The results attest to at least two different sources from which the raw material was obtained, one of an Eocene origin and one of a Cenomanian age. Both are located c. 10 km from the site. These results suggests good knowledge of the environment, long distance range of direct procurement strategy and selectivity of the raw material by its properties. The new data broaden our previous knowledge regarding flint provenance during the Lower Paleolithic from the Central and Eastern Upper Galilee, into the Western Galilee.

3 LOGISTICAL OR FORAGING MOBILITY? NEANDERTHAL TERRITORIAL MANAGEMENT STRATEGIES IN THE NE OF THE IBERIAN PENINSULA

Abstract author(s): Gómez de Soler, Bruno (Institut Català de Paleoecologia Humana i Evolució Social - IPHES); Universitat Rovira i Virgili - URV) - Muñoz del Pozo, Alicia (Universidad de Zaragoza - UNIZAR; Institut Català de Paleoecologia Humana i Evolució Social - IPHES) - Chacón, M. Gema (Institut Català de Paleoecologia Humana i Evolució Social - IPHES; Universitat Rovira i Virgili - URV; UMR7194 – HNHP - CNRS – MNHN – UPVD – Sorbonne Universités, Musée de l’Homme) - Allué, Ethel - Blasco, Ruth (Institut Català de Paleoecologia Humana i Evolució Social - IPHES; Universitat Rovira i Virgili - URV) - Rivals, Florent (ICREA; Institut Català de Paleoecologia Humana i Evolució Social - IPHES); Universitat Rovira i Virgili - URV) - Rosell, Jordi (Universitat Rovira i Virgili - URV; Institut Català de Paleoecologia Humana i Evolució Social - IPHES) - Rufà, Anna (ICArEHB – Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, Universidade do Algarve; Univ. Bordeaux, CNRS, MCC, PACEA, UMR 5199) - Saladié, Palmira - Vallverdú, Josep (Institut Català de Paleoecologia Humana i Evolució Social - IPHES; Universitat Rovira i Virgili - URV)

Abstract format: Oral

As Binford (1980) established, logistical and foraging strategies are the main mobility patterns among hunter-gatherer groups. Through the example of the Abric Romaní and Teixoneres cave, two Middle Paleolithic sites from MIS3 in the NE of the Iberian Peninsula, we will try to define the mobility patterns practised by the Neanderthals in each of these sites through the lithic procurement strategies and the type of occupation.

The two sites are about 50 km away and both are located on the east bank of the Catalan Central Depression, with the Montserrat mountains in between and in contact with the Prelittoral range. At Abric Romaní level M, chert is the most used raw material. Its main procurement area is located at 16 km (Sant Martí de Tous chert type), indicating different procurement strategies within a main mobility pattern based on a foraging radius in which the site is considered a residential camp. On the contrary, Teixoneres cave level III, with quartz and chert as the main raw material, has an immediate catchment area (quartz pebbles are abundant in the surroundings whereas chert nodules are found not beyond 12 km). The type of occupation in the site reflects - following Binford -, a field camp and suggests a mobility pattern as a part of a logistical system.

The fact of having two sites of similar chronology (ca. 50 ka BP) with, a priori, a diverse settlement pattern and mobility, provides an ideal framework for a first approach and to consider whether they are the consequence or not of the same subsistence-settlement system in the territory. We will try to deal with this issue and elucidate what territorial mobility strategy Neanderthals carried out in the NE of the Iberian Peninsula.

4 RAW MATERIALS: CAN THEY BE THE KEY TO UNDERSTANDING THE MOBILITY PATTERNS OF NEANDERTHALS? THE CASE OF TEIXONERES CAVE

Abstract author(s): Muñoz del Pozo, Alicia (Universidad de Zaragoza - UNIZAR, Departamento de Ciencias de la Tierra; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d’Història i Història de l’Art) - Gómez de Soler, Bruno (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d’Història i Història de l’Art) - Bustos-Pérez, Guillermo (Universidad Autónoma de Madrid - UAM, Departamento de Prehistoria y Arqueología. Facultad de Filosofía y Letras; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d’Història i Història de l’Art) - Chacón, María (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d’Història i Història de l’Art; UMR7194–HNHP - CNRS–MNHN–UPVD–Sorbonne Universités, Musée de l’Homme) - Picin, Andrea (Alma Mater Studiorum-Università di Bologna, Dipartimento di Chimica “G. Ciamician”) - Blasco, Ruth (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d’Història i Història de l’Art) - Rivals, Florent (ICREA; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d’Història i Història de l’Art) - Rufà, Anna (ICArEHB – Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, Universidade do Algarve; Univ. Bordeaux, CNRS, MCC, PACEA, UMR 5199, F-33600) - Rosell, Jordi (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d’Història i Història de l’Art)

Abstract format: Oral

Teixoneres Cave (Moià, Barcelona) is situated in the northeast of Iberia at 760 m a.s.l. in the highlands located between the Llobregat, Congost and Ter rivers, at the east, west and north respectively, connecting the inner part of the Catalanian region with the Mediterranean Sea. It forms part of the Toll Cave karstic system developed on sedimentary materials from the margin of the Central Catalan depression, in the Neogene limestones of the Collsuspina formation. The cave has been filled with Pleistocene sediments with a range between approximately 200 and 16 ka BP.

In this paper we focus on the macroscopic and microscopic analysis of the lithic raw materials from sub-unit IIIb (MIS 3) to determine its procurement areas and consequently establish the mobility patterns of the Neanderthals that occupied Teixoneres cave.

The main components of the lithic industry are quartz, followed by chert, and to a lesser extent, quartzite, hornfels and limestones. Quartz is collected within a 5 km-radius. The predominant chert variety (50% of the total chert) has a geological origin from the Muschelkalk formation. Its procurement was directly from its primary source, which is estimated to be located approximately 15 km to the east. Metamorphic rocks seem to come from secondary deposits, mainly the Congost river and its tributaries, 10 km to the east. Finally, limestones are obtained from the surroundings of the site. This suggests that the Neanderthal groups occupying Teixoneres cave had a wide range of mobility and were able to access different lithic raw materials from multiple sources.

5 DECODING THE TERRITORIAL ADAPTATION AMONG 'HOMO SAPIENS' THROUGH LITHIC RAW MATERIALS EXPLOITATION

Abstract author(s): Soto, Maria (Madrid Institute for Advanced Study.; Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid) - Morales, Juan (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Àrea de Prehistòria, Universitat Rovira i Virgili - URV; SERP, Departament d' Història i Arqueologia, Universitat de Barcelona) - Aouraghe, Hassan (Université Mohammed Premier, Faculté des Sciences, Département de Géologie) - Sala-Ramos, Robert (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Chacón, M. Gema (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Àrea de Prehistòria, Universitat Rovira i Virgili - URV; UMR7194 - HNHP - CNRS - MNHN - UPVD - Sorbonne Universités)

Abstract format: Oral

Mobilithics is a project exploring the exploitation of lithic raw materials among 'Homo sapiens' for understanding our territorial adaptiveness to various environmental, cultural, and biological conditions. The hypothesis of the project is that the rapid expansion and evolutionary success of our species were driven by our behavioral flexibility and diverse responses to territorial and ecological challenges.

The project endeavors a multi-scalar characterization of the lithic raw materials exploitation in two different areas, the Ain Beni Mathar - Jerada - Guefait basin (Eastern Morocco) and the Catalan Coast Range (Northeast of the Iberian Peninsula) during the Upper Pleistocene to gain a comprehensive understanding of the diachronic changes and their significance.

The discovery and excavation of several stratified open-air sites such as Sabh el Ghar 1, 2, or Tahya 3 and 4 in Eastern Morocco are offering novel sequences and material culture associated to the Middle and Later Stone Age. The lithic assemblages demonstrate technological changes, including the transition from flake to bladelet production strategies. The settlement patterns show a progressive association with fluvial deposits, likely as result of the significant climatic fluctuations occurring during the Upper Pleistocene that influenced the distribution of the resources across the landscape.

The Catalan Coast Range represents a key region to understand the expansion of our species, as it preserves the last evidence of the 'Homo neanderthalensis' and its substitution by modern human groups. A novel technological and biological scenario of the Middle to Upper Palaeolithic transition is represented by recently discovered sequences such as Cova Foradada, La Griera (Calafell) or Cova del Trader (Cubelles).

Systematic geoarchaeological surveys and sampling, elaboration thematic cartography through GIS, macroscopic, petrographic and geochemical analysis (Raman, EDS, and EDXRF) and multivariate statistics are being applied to determine the palaeoeconomic strategies to different paleoenvironmental, cultural and even biological scenarios.

6 MINERAL PIGMENT PROVISIONING AND LONG DISTANCE TRANSPORT IN STONE AGE ESWATINI

Abstract author(s): MacDonald, Brandi L (Archaeometry Lab, University of Missouri Research Reactor) - Bader, Gregor (Senckenberg Centre for Human Evolution, Universität Tübingen) - Velliky, Elizabeth (Centre for Early Sapiens Behavior, University of Bergen) - Forrester, Robert (Eswatini National Trust Commission) - Linstädter, Jörg (Deutsches Archäologisches Institut) - Riedesel, Svenja (University of Cologne) - Kuo, Alexandra (Archaeometry Lab, University of Missouri Research Reactor)

Abstract format: Oral

Earth mineral pigments, including iron and manganese oxides, were mined, transported, and used throughout the Middle Stone Age (MSA) and Late Stone Age (LSA) in Eswatini, southern Africa. This region is home to one of the earliest and longest used sites of iron oxide collection, Lion Cavern at the Ngwenya ochre mine, signaling a longstanding relationship with this mineral resource. Our study uses a multi-method approach to artifact provenance, including

elemental (neutron activation analysis, mass spectrometry, X-ray fluorescence), and mineral and structural (X-ray diffraction, electron microscopy, Raman spectroscopy) techniques to understand the composition, manipulation, and geologic origins of the mineral pigment assemblages. Here, we contextualize the results from our multi-site investigation of artifacts and mineral pigment sources, which has revealed networks of provisioning, long-distance transport, and use. Our study provides new insights into changing patterns of mobility and mineral pigment preferences during the Middle and Late Stone Ages in Eswatini.

7 **GEOLOGICAL KNOWLEDGE AND CONTEXTUAL DECISION-MAKING: ISSUES FOR RAW MATERIAL CHARACTERIZATION AND INTERPRETING PAST PRACTICES OF RAW MATERIAL SELECTION**

Abstract author(s): Thacker, Paul (Wake Forest University)

Abstract format: Oral

Integrating lithic provenance and characterization data with models of Late Pleistocene raw material economies requires building archaeological theory. The transport of stone over distance from a geologic source is significantly influenced by numerous variables including the function and use-life of specific artifacts, changing hunter-gatherer task needs, and the geographic range of group movements. Archaeologists should not assume a priori that the taxonomies and descriptors of stone composition, hardness, fracture properties, and other attributes established from contemporary geological science are comparable to the knowledge and material qualities that were important to past knappers. This paper explores the interface of technology, raw material selection, and the organization of hunter-gatherer settlement systems by intensively focusing on the local and site-level context of knapping decisions at a series of Middle and Upper Paleolithic open-air sites in central Portugal. Middle Paleolithic assemblages reveal a flexible technological organization with only a slight preference for quartz within an overall pattern of raw material equivalency. A very different pattern emerges in the Upper Paleolithic at sites such as Espadanal, where chert and quartz cobbles were selected for the manufacture of different tool forms and to perform different tasks. The two distinctive EUP chaînes opératoires are untethered from near-site raw material availability, a conclusion made possible by characterizing occurrence frequencies and size variation of local cobbles. Detailing the raw material variability present at the local/site level reveals the choices made by knappers and the value attributed to raw material attributes as knowledge components of chaînes opératoires. The interpretive significance of long-distance sourcing in lithic analysis similarly relies upon exploring the geography of stone deposits and the cultural practices that mediate raw material availability not only at distant geological deposits but at the final use and discard locations of artifact deposition.

8 **CHERT PROVISIONING AND USE DURING THE UPPER PALEOLITHIC IN SOUTHWESTERN IBERIA: THE CASE OF VALE BOI**

Abstract author(s): Belmiro, Joana (ICArEHB, Universidade do Algarve) - Sánchez-Martinez, Javier (ICArEHB, Universidade do Algarve; CEPARQ-UAB, Universitat Autònoma de Barcelona) - Galfi, Jovan (ICArEHB, Universidade do Algarve) - Terradas, Xavier (CSIC-IMF) - Bicho, Nuno - Cascalheira, João (ICArEHB, Universidade do Algarve)

Abstract format: Oral

Hunter-gatherers relied strongly on lithic raw materials, making them essential to characterize mobility and land use, raw material provisioning, exchange, and technology. Identifying changes in these patterns through time is key to understanding how different groups adapted and reorganized their material culture, especially in the Late Pleistocene, marked by abrupt climatic changes that sometimes severely impacted human ecodynamics. Territories like Southwestern Iberia functioned as refugia for hunter-gatherer communities throughout this time, making it ideal for comprehensive diachronic studies. This is reflected in archaeological sites such as Vale Boi, an eco-cultural niche with one of the region's most complete Upper Paleolithic sequences (c. 32 ka to 15 ka cal BP).

With several substantial lithic assemblages—most of which have been studied—, proximity to chert raw material sources, and a complete lithotheque of regional comparative chert samples, Vale Boi is a key site to study the provisioning strategies and chert use throughout the Upper Paleolithic.

This paper presents the chert raw material analysis results from the UP levels of Vale Boi of two main excavation areas: the terrace and rock shelter. The archaeological chert artifacts were analyzed through a multi-component approach (macroscopic and petrographic analyses) and compared to a regional reference collection. Whenever existent, technological data was combined with the raw material results. This allowed the characterization of hunter-gatherer mobility and economic and technological organization across time.

9 PROCUREMENT AND SELECTION OF THE COLOURING MATERIALS AT THE LATE EPIGRAVETTIAN SITE OF RIPARO TAGLIENTE (MONTI LESSINI, NORTH-EASTERN ITALY)

Abstract author(s): Sardelli, Giorgia (University of Ferrara; Université Savoie Mont Blanc, EDYTEM Laboratory – UMR5204) - Fontana, Federica (University of Ferrara) - Salomon, H el ene (EDYTEM Laboratory – UMR5204) - Zorzin, Roberto (Museo Civico di Storia Naturale di Verona)

Abstract format: Oral

Ferruginous colouring materials are one of the most exploited mineral resources during the latest part of the Pleistocene in Europe. Thanks to their wide fields of utilisation, such materials reflect the technical, economic and symbolic practices of human groups. For these reasons, investigation on the provenance, selection, and treatment of ferruginous colouring materials can provide an important contribution to understanding land use, resource management strategies and the technical practices adopted by Late Epigravettian hunter-gatherers in newly accessible territories after the end of the Late Glacial Maximum (LGM).

With this aim, we have investigated the cohesive iron-rich colouring materials of the Late Epigravettian sequence (13.986±60 BP – 12.040±170 BP) of Riparo Tagliente (Verona, NE Italy). This site represents the first human re-occupation of the Alpine region after the end of the LGM.

By applying a multi-scalar analytical approach, we have examined the ferruginous rocks recovered from the Northern sector of the site, characterised by dwelling structures, and from the trench, that documents the whole Late Epigravettian sequence from a diachronic perspective.

The results of macroscopic, mesoscopic and microscopic observations and analyses of the archaeological remains allowed us to identify the selection criteria of the exploited colouring materials among those offered by the local outcrops, along with their potential provenances. We gained also the first insights into the changes in the selection criteria during the Late Epigravettian at Riparo Tagliente.

10 ACQUISITION AND USE OF LITHIC RAW MATERIALS IN THE PLEISTOCENE-HOLOCENE TRANSITION: COVES OF SANTA MAIRA (CASTELL DE CASTELLS, ALICANTE, SPAIN)

Abstract author(s): Vadillo Conesa, Margarita - Aura Tortosa, J Emili (Universitat de Valencia) - Molina, F. Javier (Independent researcher) - Tarr i no, Andoni (Universidad del Pa s Vasco- EHU) - Carbayo Mart inez, Isabel A. (Independent researcher)

Abstract format: Oral

Coves de Santa Maira site is located in the central Mediterranean region of the Iberian Peninsula, about 30 kilometres from the present-day coast. Its occupations dated to ca. 14.5 - 10 ka cal BP have allowed us to analyze how climatic fluctuations affected the techno-economic evolution and mobility of human groups who occupied the site in this chronology. In this contribution, we present the results of the analysis of the raw materials used in the Epipalaeolithic lithic debitage productions, dated between the Younger Dryas and the beginning of the Holocene, and which are mainly intended for the configuration of projectile armatures. The results provide insight into the ways in which the lithic raw materials were collected and their relationship with the long laminar-microlaminar technological tradition that began in the Magdalenian period and which shows clear signs of transformation with the Early Mesolithic, known regionally as the notches and denticulates industries.

11 THE DOMESTICATION OF FLINT. 35 YEARS AFTER MORTENSEN

Abstract author(s): Thomalsky, Judith (German Archaeological Institute)

Abstract format: Oral

According to A. Leroi-Gourhan, the flint tool is a technological consequence of becoming human. Moreover, lithic artefacts are regarded as major tool category for the deciphering mental evolution of human intelligence and decision-making through time. Different modes of acquisition and consumption of the raw material, as well as distinguished techniques in tool-manufacture let us understand the social-economical lifestyle of the community and hence resultant socio-technological identity. Lithic tools can be regarded as a highly-dynamic artefact group that underwent specific influences of social organization, such like mobility, economy, or social networks. The homo faber as tool producer, however, is subjected in his technological choices to his direct social environment, rather than influenced by technological determinism or natural paleo-landscape. This concept can help to understand the significant variety in tool technology that exists from Late Paleolithic time onwards. Contextual analyses provide “activity zones” and the development towards standardized and specialized production which implicate the begin of complex societies. This is what Peder Mortensen called “the domestication of flint” (1988), and emphasized as a major aspect of the neolithization process. This contribution will follow the given pathway along selective case studies from Europe and Western Asia, in order to localize a probable temporal set up and starting point of this technical evolution.

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Watteaux, Magali (University Rennes 2; Research Unity) - Turner, Sam (Newcastle University; Centre for Landscape) - Citter, Carlo (University of Siena) - Hajnalova, Maria (Department of archaeology, Faculty of Arts, Constantine the Philosopher University in Nitra)

Session format: Regular session

Agrarian parcels are a fundamental and age-old dimension of rural areas. Studying them allows us to: (i) understand the spatial and temporal variability of land use in rural areas according to the specificities of geographical environments and to social needs; (ii) extend the notion of heritage to the agrarian structures still visible in the European countryside; (iii) demonstrate that they constitute a useful research object for thinking about the sustainability of current development projects in rural areas.

However, studying field boundaries – which are still in use, but also abandoned and fossilised – is not exactly the same as studying a normal archaeological structure or site. For example, in 2008 UNESCO classified a Greek ‘centuriation’ on the island of Hvar (Croatia) as a World Heritage Site, on the basis that it had remained ‘practically intact’ since the fourth century BC, testifying to the ‘permanence’ and ‘durability’ of land use systems and land tenure rules. While this desire to protect this heritage is legitimate, the argument nevertheless bears witness to a fixed conception of plot forms, which ignores the weight of time, passing off as fossil and authentic (ancient Greek) what is in fact the result of more than two thousand years of adaptation by the different societies living on this island.

Archaeological and archaeogeographical studies of landscapes, on the other hand, make it possible to better evaluate the role of time and societies in the transmission of agrarian plots since the Bronze Age. Such research has shown that agrarian land parcels evolve over time in complex ways that combine the creation and reuse of inherited social and geographical forms.

The aims of this session are two fold i) to present archaeological studies on the theme of rural landscapes in order to shed light on the transformations and transmissions that affect the evolution of landscape forms in different European contexts in the long term and ii) to discuss the most suitable methods for reconstruction of individual field plot use histories.

ABSTRACTS

1 “HOW MUCH LAND DOES A MAN NEED?” RECONSTRUCTING THE SIZE OF A LATE NEOLITHIC FARMSTEAD IN ARCHSUM (SYLT, NW GERMANY)

Abstract author(s): Bilotti, Giacomo - Filipovic, Dragana - Brozio, Jan-Piet - Kerig, Tim (Kiel University)

Abstract format: Oral

At the site of Archsum on the island of Sylt (NW Germany), dated to the Nordic Late Neolithic (2300-1700 BC), remains of a residential structure (house) and two ploughed pieces of land (cultivated plots) were discovered very close to each other on a hillside, and with no other residential structures in their immediate vicinity. We hypothesise that the house and the plots, along with several other adjacent features and activity areas, represent a habitation and food production unit (farming household). We use this unique case of directly associated house and cropland to reconstruct the number of residents (based on the house floor area) and the size of crop yields under several different cultivation regimes. Using these calculations and select ethnographic information, we test various combinations of household’s demographic structure, labour estimation, cereal yields, and cereal dietary contribution, and present a range of scenarios with respect to the number of household members, their diet and the intensity of cultivation. These scenarios allow us to evaluate the relevance of different factors (dwelling space, labour required, productivity, consumption) to the reconstruction of socio-economic structure of the site Archsum. We conclude that, varied rates of production and dietary contribution of cereals should be considered as a major factor in further calculations of the size of household supported by cereal cultivation and the size of land needed for it.

2 MEDIEVAL COLONISATION AND THE ESTABLISHMENT OF A NORMATIVE (AGRICULTURAL) LANDSCAPE IN CENTRAL EUROPE

Abstract author(s): Žaža, Petr - Mazáčková, Jana (Masaryk University)

Abstract format: Oral

The mountains and highlands of the Czech lands were permanently settled and transformed into cultural landscape during the High Middle Ages. In this presentation, this will be demonstrated on the example of the former Brtnice Lordship (Czech Republic). This newly settled area represents a suitable landscape segment for studying the es-

tablishing of settlements, their hinterland, as well as the influence of the landscape on the new anthropogenic relief under the control of its inhabitants. The archaeological evidence for adaptation and crises of the settlements (i.e., the disappearance of villages and castles/strongholds) and the secondary exploitation of their hinterland, and in some cases the disappearance of these hinterlands and their afforestation, constitutes a broad base of data on the evolution of the landscape from the late 12th century onwards. Since their foundation, the villages have used a parcel system that anchored their economic hinterland, and which can be studied archaeologically. For this reason, changes in the character of the village hinterland over time (its expansion or degradation) can be documented. Preliminary results point to the invariability of the parcellation of the landscape and its codification by the Stable cadastre in the first half of the 19th century. The strategies of the owner of the Lordship significantly defined the development of parcellation and allowed the development of different economies, although the basic economy was still agriculture even at the time of the dissolution of manorial system in the Austrian Empire in 1848. The involvement of various types of sources (archaeological, historical, etc.) has yielded significant data on the appearance of the studied landscape in the former Brtnice Lordship, which, in combination with the C14 data, push back the origin of the parcellation to the second half of the 12th century, almost a hundred years earlier than originally assumed.

3 THE PLUŽINA FIELDS SYSTEM IN THE CZECH REPUBLIC - THOUGHTFUL AND LANDSCAPE CHANGING

Abstract author(s): Šitnerová, Ivana (Laboratory of Archaeobotany and Palaeoecology, Faculty of Science, University of South Bohemia; Institute of Archaeology, Faculty of Arts, University of South Bohemia) - Beneš, Jaromír (Laboratory of Archaeobotany and Palaeoecology, Faculty of Science, University of South Bohemia) - Majerovičová, Tereza - Bumerl, Jiří (Laboratory of Archaeobotany and Palaeoecology, Faculty of Science, University of South Bohemia; Institute of Archaeology, Faculty of Arts, University of South Bohemia) - Fanta, Václav - Janečková, Kristina (Faculty of Environmental Sciences, Czech University of Life Sciences Prague)

Abstract format: Oral

The historical agricultural fields in the Czech Republic are called plužina. The most often is plužina defined as an all agriculturally cultivated hinterland of villages. Their origin is dated to the Middle Ages and New Age – from 12th century to the 16th century and they were created by locator directly during the foundation of villages. There are several shapes of plužina in the Czech Republic. It is confirmed that each type reflects specific environmental condition, the floor plan of the village and the social structures of peasants. For example, segmental plužina is typical for villages founded during early medieval period and the most common type – the croft plužina – is characteristic of late medieval colonisation and it is connected to forest line villages.

In last five year we had a project focused on the plužina fields systems in the Czech Republic. The main goal to this project was create a database of all exists plužina and got some archaeological and historical information about them. It will lead to the systematic record based on this information, because it is missing so far and due to it missing also their protection.

Thanks to the archaeological excavations and radiocarbon dating was confirmed almost all plužina systems falls into the time of adjacent village foundation. The most interesting founding during the excavation was discovering of basis of construction of hedgerows, which are boundary belts between each single fields. This construction was man made and showed the thoughtful work of all peasant communities. People reduced the slope and provided good conditions for water regime. The construction of agrarian fields was a big, planned activity which transformed whole landscape in village surroundings.

4 ANCIENT AGRICULTURAL LANDSCAPES IN POLAND

Abstract author(s): Jakubczak, Michal (Insitute of Archeology and Ethnology, Polish Academy of Sciences)

Abstract format: Oral

The ISOK project involved LiDAR scanning of the valleys of Poland's largest rivers, which began in 2010. In the end, the entire territory of Poland has been scanned as part of the project. The obtained data, in the form of DTM and measurement data, are available for free. As a result, there was an outbreak of archaeological discoveries in forested areas. Initially, archaeologists focused mainly on hill forts, burial mounds and flint mines, but as time went by, the attention of researchers was also drawn to less spectacular landscape features, such as charcoal piles or remnants of arable fields. Until recently, no complex of the "celtic fields" type was known from the territories of Poland. Currently, thanks to the work of researchers and amateur archaeologists, we know almost 500 complexes of arable fields preserved in the terrain and visible on LiDAR data. Comprehensive interdisciplinary archaeological work has only been carried out at one site in the Białowieża Forest, and even then only to a very limited scope. As a result, archaeologists urgently need further research focusing on chronology, morphological patterns, genesis, and settlement-field inter-relationships. It also confronts heritage services with the difficult problem of inventorying and protecting such a large number of sites.

In this paper I would like to present an overview of the current state of research on the remains of arable fields in Poland, as well as the needs and difficulties involved.

5 LAND OWNERSHIP AND THE PALAEOENVIRONMENT IN A LONG DURÉE PERSPECTIVE: FIRST RESULTS OF AN ARCHAEOGEOGRAPHICAL APPROACH IN THE GROSSETO AREA

Abstract author(s): Grosso, Simone (Université Paris 1 Pantheon Sorbonne; Service Départemental d'archéologie du Val d'Oise) - Patacchini, Andrea (University of Siena)

Abstract format: Oral

The territory surrounding the medieval city of Grosseto (Tuscany, Italy), founded in the 7th century, can be divided into two distinct zones: to the west, an alluvial and originally marshy plain, dedicated to the cereal cultivation and breeding; to the east, a hilly area dedicated to pasture and transhumance. Thanks to a broader project research on agrarian landscapes, PARCEDES, funded by the French "Agence Nationale de la Recherche", we have worked on this area to understand the history of these different landscapes. One of the aims of this project and, more specifically of this intervention, is to analyse these two different landscape realities from an archaeogeographical point of view and to compare them thanks to the study of the legal possession of land, their agricultural exploitation and changes of agrarian morphology in a longue durée chronological perspective (more precisely from Roman period to the 20th century). The georeferencing and vectorisation of the 19th-century cadastre, combined with the study of the real estate registry and the comparison with ancient sources, allowed to gain a precise spatial outlook of the land ownership and to identify its main transformations between the Middle Ages (especially the Papacy and the nobility) and the modern age (local church, nobility and privates). On the other hand, the analysis of the cadastral forms and structure of land parcels and toponyms made it possible to obtain more information on the relationship between legal land tenure and the paleo environmental characteristics of the place, especially about the processes of land reclamation in the lowlands. The outcome of this multi-source analysis is to understand the evolutionary trajectories that have affected the two sectors and are at the origin of today's landscape.

6 FIELD PATTERNS AND LAND USE DYNAMIC OVER TIME. ABOUT THE PARCEDES PROJECT

Abstract author(s): Watteaux, Magali (University of Rennes 2)

Abstract format: Oral

The project PARCEDES is funded by the French national agency of research (ANR) during 2022-2024 to study the organisation and evolution of agrarian allotment (plots of land) from Protohistory to the present day, based on four European areas: in France (Vendée and Nîmes), Italy (Grosseto) and England (Devon). The aim is to identify and to characterise the possible links between the changes of field patterns in time and societal and geographical parameters, and to study the phenomena of resilience of field boundaries in the long term. Largely based on the advances of French Archaeogeography, which evaluates the part of transformations and transmissions that affect the forms of landscapes, the project PARCEDES wishes to remove three scientific and methodological obstacles: (i) to solve the problem of the great dispersion and heterogeneity of the available data by making up archaeogeographical maps for each area, based on the compilation in a GIS of old and recent maps, cadastres, aerial photographs and archaeological data (especially preventive archaeological data in France); (ii) to go beyond local studies closed in on themselves by a comparative approach and a harmonised methodology; (iii) to improve the knowledge of agrarian earthworks by dating ten of them in Devon thanks to an innovative archaeometric method (OSL-Profiling & Dating).

In the long term, this work wishes to contribute to strengthening research on historical agrarian morphologies, in particular in preventive archaeology, whose legacies still permeate today's countryside, and to aware managers of heritage and contemporary territories showing that land parcels, far from being insignificant, are useful for thinking about the sustainability of development projects and that their history is worthy of being recounted and integrated in order to build the resilience of contemporary territories.

7 LANDSCAPE DYNAMICS IN NÎMES (GARD, FRANCE). ALLOTMENTS AND ROADS FROM THE IRON AGE TO THE MODERN PERIOD

Abstract author(s): Sejalon, Pierre (INRAP - National Institute for Preventive Archaeological Research) - Grosso, Simone (SDAVO)

Abstract format: Oral

The existence of Roman monuments, still standing in the city of Nîmes has caught the attention of scholars and researchers for a long time. From the supervision of construction sites to preventive excavations, the city has been the subject to systematic monitoring by the State Archaeological Services.

At the same time, since the end of the 1990's, a Flood Protection Plan and the development of Commercial Activity Zones (Zone d'Activité Commerciale) have had a major impact on the plain located to the south of the city. Large areas have been diagnosed by Inrap archaeologists using the standard methods of French archaeology.

Several pathways led from the oppidum across the countryside to the other main settlements of the time. The first rural establishments, bounded by ditches, will develop along this road network.

During the Republican phase, the number of rural farms is beginning to decline, but their individual size increases significantly. Around them, ditch networks that seem to delimit fields are created.

During the Roman period, settlements are erected all over the plain, leading to the creation of new allotments. We are questioning the influence of Roman cadastration on the organisation of these limits.

As part of the research project PARCEDES, our goal was to study all the ditches, discovered during the numerous diagnoses and to establish a database in order to be able to study the dynamics of this structuring of the landscape around Nîmes.

Thanks to the geo-referencing of the Napoleonic cadastre and few discoveries of remains from the Middle Ages, it will also be possible to continue the analysis until the modern period and to point out the resilience of plots of land, which could be at the origin of today's landscapes.

8 RECONSTRUCTING LOST AGRARIAN LANDSCAPES USING A MULTI-PROXY, LONGUE DURÉE APPROACH (WEST JUTLAND, DENMARK)

Abstract author(s): Søvsø, Morten (Museum of Southwest Jutland)

Abstract format: Oral

In the 19th C. vast areas on the heathlands of West Jutland held remains of abandoned, prehistoric field systems in the form of so-called Celtic fields. The arable land around the existing villages of the time was laid out as ridge and furrow field systems.

Since then, close to 100% of the former heathlands have been cultivated and most remains of Celtic fields are completely lost today. A few are vaguely traceable either on aerial photos from the mid-20th C. or as arid marks preserved underneath the present-day plough-soil. Modern ploughing has also erased the many small strips of ridge-and-furrow fields from the face of the earth.

The paper demonstrates how this lost agrarian landscape can be reconstructed using historical maps and written sources. It allows a close to 100% accurate reconstruction of both field systems and the surrounding heathlands, meadows, and streams as they appeared in 1683.

Museum of Southwest Jutland have worked together with metal detectorists since the 1980's. Today more than 7.000 finds are in the museum database with find spots.

Around the expanding, modern town of Esbjerg, lots of large-scale excavations have been conducted since the 1980's. In many cases the history of an agrarian village can be traced (with ups and downs) from the Early Modern period back to its origins in the Pre-Roman Iron Age.

It will be demonstrated how the distribution of both metal finds (1st-2nd millennium AD) and excavated settlement remains correlates with the agrarian landscape of 1683.

This multi-proxy approach using historical maps, written sources, metal detecting and archaeological excavation exposes the longue durée and seems to tell the same story for every village in (at least) Western Jutland.

9 THE RURAL LANDSCAPE OF THE UPPER TAMMARO VALLEY BETWEEN TRANSFORMATION AND PERSISTENCE. (BENEVENTO, CAMPANIA REGION, ITALY)

Abstract author(s): Cerbone, Oriana (Univeristy of Salerno)

Abstract format: Oral

The rural landscape took into account for this study is the upper valley of the Tammaro river (Benevento, Campania region, South Italy) from the IV BC to the VI AD century.

This territory is characterized by several human occupations, remains of ancient roads connected to the Via Appia, and transhumance routes, some of them still in use today. In this rural and marginal territory some elements of the ancient landscape have survived in the plots of the current one, following the past agrarian structures, others, such as the river or the mountains, have influenced the future agrarian plots development. In some cases part of the ancient landscape has been removed due to time and use, leaving an echo in the continuity of use, which has reached our time.

The dynamic process of transformation of the landscape has involved anthropic and environmental components. Over time different systems of occupation and use have alternated, leading to a continuous transformation of agrarian structures not yet clear.

Archaeological research in this area began in the mid-1800s. However, the data available are varied and disorganised. Purpose of this study is to give uniformity to this data taking in account the global archeology and the historical-archaeological evolution of the landscape and their main components: the river, the valleys, the plains, transhumance routes and rural settlements.

The results of this study can be used for planning the development of the territory, implementing policies for the protection of cultural heritage, and supporting the various stakeholders in shared decisions and informed policies.

10 **DEVELOPING A GIS DRIVEN INTEGRAL EVALUATION MODEL OF EARLY MEDIEVAL CULTURAL LANDSCAPES FOR THE NEEDS OF SUSTAINABLE SPATIAL PLANNING**

Abstract author(s): Magdic, Andrej (Institute for the protection of Cultural Heritage of Slovenia)

Abstract format: Oral

Today, in times of radical social pressure, caused by environmental changes, effective spatial planning has become key to the sustainable management of the living environment. The protection of traditional cultural landscapes has proven to be an important step towards the sustainable approach to which modern society strives. In most of continental Europe, the beginning of continuous settlement and thus the formation of pre-industrial cultural landscapes can be traced back to the Early Middle Ages.

After the decline of the Roman empire and the almost total collapse of the lowland settlement, autarkic agricultural communities in the 6th and 7th centuries settled the plains and valleys of North-Eastern Slovenia. As we can say based on GIS analyses of physical geographical features of early medieval fields and agricultural tools found, permanent plowed fields in the area under research were established probably no later than the 8th century. As agricultural production, beside small flock herding, casual hunting and picking forest fruit, was the main food source of these communities, their subsistence strategy was to reduce the risk of total crop failure to a minimum. Therefore, individual settlements established their fields in ecologically mixed areas, with complex moisture conditions, where at least some crops would grow, despite unfavorable seasonally weather conditions.

In the last few decades pre-industrial cultural landscapes have been recognized as a social value all over Europe. Their preservation is carried out through evaluation and spatial planning procedures. However, in the evaluation are usually only taken into account the levels of field biodiversity, the preservation of folk architecture and of modern construction interventions. The criterion of “maximum yield with minimum energy input, while taking into account possible seasonal weather extremes”, which is crucial in a crisis situation, is not used in today’s spatial planning. The model presented here attempts to remedy this deficiency.

11 **CHANGES AND CONTINUITY IN A PRE-HISPANIC AGROECOSYSTEM OF WEST MEXICO FROM AD 500 TO AD 1500**

Abstract author(s): Dorison, Antoine (Paris 1 Pantheon Sorbonne University; CNRS ArchAm Archaeology of the Americas; CNRS ArScAn team Environmental Archaeologies)

Abstract format: Oral

From the beginning of the Conquest of Mexico, the Spaniards noted the omnipresence of agrarian features (e.g., terraces, wetland features) around the towns and villages of the New World. For the past 10 years, the reality of this integration of the agrarian component within the settlements, until then barely grasped by archaeologists, has been brought to light in a striking manner by the multiplication of LiDAR coverage throughout Mesoamerica, and models based on textual sources have been shaken up. Excavations of agrarian features remain rare and the dating of these contexts poor in diagnostic material remains extremely difficult. In this respect, the concepts of archaeogeography and archaeopedology provide keys to characterize and reconstruct the dynamics of these anthropogenic ecosystems over time.

I present here a case study in western Mexico where the evolution of a pre-Hispanic agroecosystem in a volcanic environment could be reconstructed in its broad outlines over a millennium (AD 500-1500) based on a LiDAR-based archaeogeographical analysis and fieldwork in landscape archaeology and archaeopedology. It was then set in perspective with the post-Conquest period on the basis of anthropological sources. The study highlights continuities in pre-Hispanic practices but also marked breaks in land use strategies, chiefly triggered by cultural processes. They are materialized by modifications in the field patterns at the scale of the sites as well as in choice of specific soils of the volcanic landscape over time. The study also provides keys to a better understanding of the major rupture constituted by the forced establishment European agricultural norms in the 16th century and puts into perspective certain areas that are today marginalized with respect to indigenous agricultural traditions.“

EXPLORING LAND-USE IN ARID REGIONS BASED ON STATISTICAL ANALYSES OF THE AGRICULTURAL PLOTS IN AL-ULA OASIS (HEJAZ, SAUDI ARABIA)

Abstract author(s): Charbonnier, Julien (Archaïos) - Gravier, Julie (UMR 8557 ,Center for social analytics and mathematics' and UMR 8504 ,Géographie-cités', EHESS) - Leschallier de Lisle, Anne (Archaïos) - Boudia, Sofian - Koszarek, Valentin (Université Paris 1 Panthéon-Sorbonne) - Kanhoush, Yasmin (Archaïos and UMR 5133 ,Arché-orient', Lyon)

Abstract format: Oral

The Al-Ula Cultural Oasis Project (UCOP), carried out by Archaïos, funded and steered by the French Agency for AIUla Development (AFALULA) on behalf of the Royal Commission for AIUla (RCU), aims at understanding the history of this well-known oasis located in the northern Hejaz region (Kingdom of Saudi Arabia).

To do so, a large-scale comprehensive survey of over 4000ha of gardens has been conducted between 2019 and 2022 in order to create the archaeological map of the oasis. Beside archaeological sites, earthen-made walls and buildings, and other vernacular structures, the survey also allowed to delineate the current plot of land. The latter is the product of a long history that probably began in the middle Islamic period, as suggested by the significant morphological differences between the plots. A study of the field pattern was therefore initiated in order to provide information on the spatial development of the oasis during the Islamic period.

This peculiar chrono-cultural context also offered the opportunity to test the methodological approaches applied to Europe in a very different context where water, and its sharing, seems to have had a structuring role. One of the difficulties encountered in this study was the lack of land registry and old maps and it was therefore necessary to rely on archive aerial and satellite imagery. Spatial/cartographic analyses were conducted on the orientation of plots, as well as multivariate statistical analyses on their morphology. These data were then cross-referenced with parameters related to their occupancy (e.g. density of infra-parcel buildings) in order to establish typologies.

The implementation of agrarian parcel studies in Arabia is unprecedented and we expect this study to provide new information on the history of the understudied oases, as well as to renew researches on field patterns.

THE FIRST DISCOVERY OF A PREHISTORIC FIELD SYSTEM IN SLOVAKIA - MULTIPROXY APPROACH TO ITS DATING AND THE USE-HISTORY

Abstract author(s): Hajnalova, Maria (Department of Archaeology, Constantine the Philosopher University in Nitra) - Benediková, Lucia (Institute of archaeology, Slovak Academy of Sciences) - Zachar, Jan - Furman, Martin (The Monuments Board of the Slovak Republic) - Lieskovský, Tibor (Department of Theoretical Geodesy, Slovak University of Technology) - Lisá, Lenka (Institute of Geology, Czech Academy of Sciences) - Bajer, Aleš (Department of Geology and Pedology, Mendel University in Brno) - Murín, Igor (Institute of Archaeology, Slovak Academy of Sciences) - Pető, Ákos (Institute for Wildlife Management and Nature Conservation, Hungarian University of Agriculture and Life Sciences)

Abstract format: Oral

In Slovakia, and east-central Europe in general, the relics of ancient field systems or other kinds of prehistoric land parcellation or boundaries are extremely rare. It is mostly due to medieval and modern era policies and laws that repeatedly changed the system of land inheritance and land ownership and led to complete transformation and/or disappearance of their remnants from the landscape. Their relics could survive only in hilly regions and on the plots that were not exploited since the early Middle Ages for farming, mining, or intensive logging.

We present the first discovery of prehistoric field system detected on the territory of Slovakia, recognised through observation of LIDAR images, and verified through test-trenches excavation and pedological sounding sampling of preserved relief relics. We bring the results of multiproxy analyses which aimed to ascertain the dating of this field system to prehistory or protohistory and to reconstruct its use-history. This is achieved through combination of the results of archaeological stratigraphy, soil chemistry, micromorphology, phytolith and plant macro-remains analyses, with radiocarbon dating of charred plant remains.

Geochemical analyses and radiocarbon dating are not yet finalised, but the first results show, that the field system dates as back as to the Iron Age and/or Late Roman/Migration Period and is most probably connected with oikumene that used a fortified hilltop settlement at the Zvon hill in Lazisko (dist. Liptovský Mikuláš, northern Slovakia).

14 ANCIENT LANDSCAPES OF LOWLAND DEVON: NEW INSIGHTS ON ORIGINS AND TRANSMISSION

Abstract author(s): Turner, Sam - Ribas, Guillem (Newcastle University) - Kinnaird, Tim - Srivastava, Aayush (University of St Andrews) - Scutt, Win (English Heritage) - Watteaux, Magalli (Universite de Rennes 2)

Abstract format: Oral

Cultural landscapes are key elements in the common European heritage, but in many regions their development and the historic features that shape their character are not sufficiently understood. Landscape researchers have integrated archaeological and documentary sources with historical cartography (routinely using GIS), and used analytical tools like retrogressive analysis to unpick relationships between features. However, to fully understand how cultural landscapes were formed over the long term, including how elements from earlier landscapes contribute to today's landscapes, better ways to recognise their chronologies are needed.

In this paper we present results from a case-study completed as part of the PARCEDES project in Devon (UK). This part of south-west England has long been famous for its well-preserved upland prehistoric landscapes, but the development of the surrounding lowlands – and particularly the extent of any prehistoric legacy there – has been much harder to determine. Our project has used an innovative programme of field-profiling and sampling for chronometric analysis using OSL-PD (optically stimulated luminescence profiling and dating). The results are interpreted using GIS and spatial modelling to provide unprecedented insights into long-term landscape evolution from the Bronze Age onwards.

15 TO CHRONOLOGY AND BEYOND: USING LUMINESCENCE DATING METHODS FOR LAND USE RECONSTRUCTION OF CELTIC FIELDS IN THE NETHERLANDS

Abstract author(s): Choi, Jungyu - van Beek, Roy - Chamberlain, Elizabeth (Wageningen University) - Arnoldussen, Stijn (Groningen Institute of Archaeology) - Wallinga, Jakob (Wageningen University)

Abstract format: Oral

The eastern and southern parts of the Netherlands have an age-old agrarian history. The oldest agrarian parcellation systems that have left their mark on the present-day landscape are Celtic Fields. Despite sustained research efforts on this prehistoric field system, the chronology, land use, and formation process are still poorly understood.

This research aims to apply luminescence dating methods to investigate Celtic fields in the Netherlands, to gain insights into their chronology as well as their land-use history and formation processes. Luminescence dating has been introduced several decades ago, and now is one of the prominent methods that are applied in archaeology to establish the chronology of artefacts and archaeological sites. Recent advances in luminescence dating techniques allowed the dating method to go beyond the chronology, and attain further information within the deposited sediments at the site.

In this presentation, we introduce the novel application of single-grain post infrared-infrared (SG pIRIR) stimulated luminescence dating to interrogate agricultural soil formation and use history. We demonstrate how SG pIRIR can largely overcome problems caused by poorly bleached grains. Poor bleaching is a primary obstacle for applying luminescence dating to archaeological fields that were heavily influenced by intense human activities, such as ploughing and mulching. We also present a systematic approach to collecting luminescence dating samples on one of the Celtic field sites located in the eastern Netherlands, which can be further applied to archaeological research conducted in other parcelled field systems. Finally, we will share what information can be obtained when the new methods are applied to the Celtic fields, and how such data can be linked to the explanations of past landscape evolution.

A. SETTLEMENT PATTERNS IN THE EARLY MIDDLE AGES TO THE NORTH OF THE LOWER DANUBE

Abstract author(s): Ciuperca, Bogdan - Hila, Tudor - Dîscă, Cătalin - Anton, Alin (Prahova District Museum Of History And Archaeology)

Abstract format: Poster

To west of Târgșoru Vechi village, close to the left bank of Prahova River, in the so-called point Balastiera Holcim, was identified in 2019 a medieval settlement generally dated between the eight and tenth centuries A.D.

The investigations carried out between 2019-2022 by Prahova County Museum of History and Archaeology revealed a site extended over an area of several hectares, so far being excavated a number of 53 dwellings, 18 possible annexes, five freestanding fireplaces, three hoards of iron implements and weapons, six possible water wells, 16 burials, ten ceramic kilns, and tens of other archaeological features with various purposes. Due to the number and diversity of the archaeological features investigated this site can be interpreted as one of the largest and most important known so far in Wallachia.

The archaeological features of the above-mentioned site were identified on both banks of a dried stream, represented on maps from the beginning of the 20th century with the name “Bularu”. Based on the analysis of the ceramic materials and the radiocarbon dating, we assume that from a chronological point of view on this site developed at least two distinct settlements. In any case these settlements could have been occupied by the same community over different periods of time.

The development of similar patterns can be argued for the settlements from Bucov Tioca, Bucov Rotari, Dridu or for those from the Târșoru Vechi Archaeological Reservation area. In the last-mentioned case, a community seems to have occupied one or the other bank of Leaota stream in different periods of time.

Starting from these cases, we are trying to identify and discuss some patterns of land use by the populations of the early Middle Ages in the Romanian Plain (Dridu Phenomenon/ archaeological culture).

265 HOW IS ART SEEN? PERCEPTION AND THOUGHT IN PREHISTORIC ART [XSCAPE PROJECT]

Session theme: 3. Heritage Narratives and Representations

Session organisers: Santos-Estévez, Manuel (INCIPIT - CSIC) - Valdez-Tullett, Joana (Wessex Archaeology) - Díaz-Guardamino Uribe, Marta (Durham University) - Criado Boado, Felipe (INCIPIT - CSIC)

Session format: Regular session

How are landscapes, artefacts and ways of perceiving the world linked, and how do they interact? Every prehistoric art tradition has its own distribution, ornamental structures, designs and techniques, but to what extent are these features linked to thought systems, and how do they change over time?

Considering that material culture, and more specifically prehistoric art, such as rock art, sculpture, stelae and portable art, are closely related to the sociocultural systems within which it is produced, it is assumed that the various forms that it can take reflect the cultural thoughts of the artists or artisans. Likewise, we can invert this relationship and reflect on how art and material culture influence society's thought processes. What is the role of location patterns, visibility, decorative structures in the (re)production of ideology, social systems and ways of conceiving the world? What visual response and movement does prehistoric art produce?

In this session we will explore examples and illustrate how the entanglement between thought, society and prehistoric art can be explored. Studies developing, amongst others, approaches to emotion, sensoriality, embodiment, visual cognition and palaeopsychology, and reflections on the ontological and epistemological dimensions of these endeavours are welcome.

ABSTRACTS

1 NATURALISTIC, SCHEMATIC AND CONVENTIONAL STYLES IN THE PLEISTOCENE/HOLOCENE TRANSITION: NEW LATE MAGDALENIAN PORTABLE ART FROM AIZKOLTZO (BASQUE COUNTRY)

Abstract author(s): Ochoa, Blanca (Universidad Complutense de Madrid) - Ruiz-González, Daniel - Arevalo-Muñoz, Erik - Mujika-Alustiza, Jose (Universidad del País Vasco - UPV/EHU)

Abstract format: Oral

Aizkoltzo (Mendaro, Gipuzkoa) is a site with a late Pleistocene/early Holocene sequence with levels ranging from the Chalcolithic to the Late Magdalenian. In the Late Magdalenian layer six engraved portable art pieces were recovered: a multi-perforated batôn percé; a small broken pendant; a long whale bone fragment with a perforation; two fragments of a bird bone tube and a small rock. After their use, they were abandoned –or perhaps intentionally discarded– inside the cracks of the occupation floor dated to the Final Magdalenian; a moment when the site was heavily used due to the abundance of lithics, osseous industry and faunal remains found.

Some objects are simpler, with a single motif, while others combine multiple. The iconography of this ensemble is varied but also, peculiar, depicting both normative and non-normative figurative depictions with classical non-figurative motifs (multiple or parallel Xs or Vs, simple lines). Some of the figures are difficult to identify but are, conversely, very detailed, perhaps depicting European asses or rabbit; seals or fish combined with classical themes of this chronology: a doe, a horse, a frontal-view red deer and two antlers.

This combination of depictions with naturalistic details, schematic figures and conventional motifs is unique, allowing us to reflect on how varied the later Magdalenian portable art, combining the more naturalistic trends with the simpler trends typical of early Holocene art; indicating identity or ideological changes that accompany a changing world. This ensemble also corroborates the tight relation of the sites of the Cantabrian region with sites of the Bay of Biscay

and southern France, a pivotal position between two of the most relevant regions in the Pleistocene/Holocene transition. Thus, in this paper we will explore how these evolving styles in the transition reflect cultural thought processes, analysing the decorative structures that constitute the (re)production of ideology.

2 BEING AND SPACE: AN ONTOLOGICAL APPROACH TO THE STUDY OF PALAEOLITHIC ROCK ART IN THE DOURO BASIN

Abstract author(s): Santos, André (UNIRQ - Centro de Arqueologia da Universidade de Lisboa; Côa Parque – Fundação para a salvaguarda e valorização do Vale do Côa)

Abstract format: Oral

In the majority of the “ontological approaches” to the study of rock art only the images, and sometimes their media, are considered. Compositions are viewed, even if unconsciously, as isolated and self sufficient to approach the ontology of the societies that created and “lived” them. However, rock art has also a spatial dimension that enable us to approach how space was perceived and lived by these people. I argue that we have some clues in the ethnographic and rock art literature of the world that enables us to propose that depending on the mode of identification (sensu Descola, 2005) dominating a particular ontology, the landscape is differently approached. Consequently, I think that the study of the spatial dimensions of rock art is a crucial proxy to approach the ideas of “being” in past collectives. I will illustrate this with the case of the Palaeolithic rock art of the Douro Basin. In this region there is a huge concentration of rock art in the Côa Valley, but smaller sites are also known on other areas of the Douro basin. All these sites share not only the same morphology of imagery, but are also located within the territory where the sources of raw materials used in the lithic tools identified in excavations of the Côa Valley were found, thus demonstrating that the rock art was produced in the same world. Consequently, the differences that we may find in these sites can give us clues regarding that ontological world structure.

3 THE PRODUCTION, DISTRIBUTION AND CONSUMPTION OF ROCK ART. A COMPARATIVE STUDY OF HUNTER GATHERER SOCIETIES IN CHILE

Abstract author(s): Moya Cañoles, Francisca (Universitat de Barcelona)

Abstract format: Oral

Several authors link economies, ontologies, and epistemologies with the ways societies make and relate to art. Despite these assumptions, there are few comparative studies about prehistoric rock art and its relationship with lifestyles. In this paper, we present the results of a comparative study about hunter-gatherer rock paintings. Our study areas are North Central Chile (Coquimbo Region) and Central Western Patagonia (Aysén Region). We observe some similarities and relevant differences in the visual, technical and spatial attributes that we interpret as patterns of production, distribution, and consumption of rock art. Also, we recognize changes through time in each study area and distinct patterns of relationships with previous paintings. We link such differences with specific mobility ranges and strategies, uses of the landscapes and histories of peopling. Our study suggests the particularities of the rock art in each territory played important, but diverse roles in the reproduction of hunter-gatherer societies and the ways they inhabited their specific landscapes.

4 ROCK ART AS A REFLECTION OF ANDEAN SOCIETY AND THOUGHT IN THE LOCO RIVER BASIN, ANCASH, PERU

Abstract author(s): Perez Maestro, Carmen (Universidad de Alcalá)

Abstract format: Oral

The spatial and semiotic analysis of rock art associated with pre-Hispanic societies documented in the Loco river basin in present-day Peru has allowed us to glimpse how these visual resources reflect not only forms of thought but also distinct social practices within the same micro-territory. The repetition of minimal morphological units or graphic series, the eclectic spatial distribution of intra-site graphic patterns or the representation of certain canons are generally associated with distinctive Andean traits. However, the different ways identified of transforming the landscape, through spatial logics for the distribution of the graphics, the typology and visuality of the media and their capacity as a place of aggregation, different in each ecological floor of the valley, show two different modes of social organisation linked to human groups that moved and inhabited this space, coming from different ecosystems, the highlands and the coast. This is also inferred by the selection of different execution techniques, forms of representation, iconography and cultural patterns associated with this materiality.

5 ROCK ART - VISUAL REPRESENTATION, REUSE AND FOLDED TIME

Abstract author(s): Stebergløkken, Heidrun (NTNU Department of Historical and Classical studies)

Abstract format: Oral

Many of the rock art sites in Central Norway show characteristics of representing several different visits. Different types and styles, also panels representing both Northern tradition (Stone Age period) and Southern tradition (Bronze Age period), indicate returning to a specific place, revisiting, reuse of a place that were of great importance. However, does the usage or meaning behind the motifs change over this large timespan? This paper will try to explore these entanglements between the society, the rock art making (type/style and motif) and the prehistoric art using the case of the rock art site Mølnargården in Central Norway. This is a shelter with rock paintings that possibly dates from the Stone Age (approx. 6000 BCE) period to the Pre-Roman Iron Age (approx. 500 – the beginning of common era). However, dates from the cultural deposit layers continue until the Viking Age (approx. 800AD). This represents most probably a phase without rock art production, but the shelter itself was being used. Recent Viking Age research argues that re-engagement with the same site may, constitute itself as an occurrence – within which time folds. Time may have been perceived not as linear, but as folded where the line between past and present was blurred. I also think this can be applied at Mølnargården. What meaning does the past represent here? Maybe the site itself manifests a time depth that was important for the identities and self-perception of the social groups in this area. We are constantly surrounded with physical objects that are much older than our presence, this was also the case at Mølnargården from the Stone Age period until present time.

6 SYMBOLIC FEATURES AND ADAPTATION OF COMMUNICATION - THINKING THE CREATIVE PROCESS WITH MEGALITHIC ART

Abstract author(s): Silva, Denise (Faculdade de Letras da Universidade de Coimbra; FCT Scholarship 2020.04713. BD)

Abstract format: Oral

The tumular phenomenon stands at the forefront of several innovative conceptions in Prehistory, such as landscape manipulation and new behaviours towards death. Additional to that central debate, we can also discuss how information and knowledge were transmitted on the long run.

Besides the funerary structures themselves, the reproduction of symbolic features and visual characters (seen in the chambers and corridors) have the potential to be in the basis of variations in communication and early forms of record if we consider the shift in artistic manifestations from earlier periods to the megalithic era.

I will mainly consider the well-known and debated “The Thing” or “The object”, being one of the recurrent abstract motifs in some dolmens with corridor in the North of Portugal and Galicia and forward the concept of pattern recreation and recognition instead of symbolic creation, pondering on our understanding of human cognition and communication in Prehistory.

Following Material Engagement Theory as the main theoretical framework, I take two factors as a premise: the neocortex’s pattern recognition capability in developing and process patterns in nature, and the creative potential to translate them into easy and quick ways to make them transmissible and understandable to others.

7 HOW TO STAND BEFORE A ROCK. THE WAY OF SEEING THE ROCK ART DURING LATE PREHISTORY

Abstract author(s): Santos-Estévez, Manuel - Criado-Boado, Felipe (INCIPIT - CSIC, XSCAPE Project on “Material Minds” - ERC 2020 Synergy Grant 951631)

Abstract format: Oral

This work focuses on Atlantic rock art and also on Alpine and Scandinavian traditions. The changes that have taken place in main rock art regions across time in Late Prehistory can be observed not only in the iconography, but also in the way to observe the panels. The shape of the rock, the position of the panels, the arrangement of the figures or the perspective used have conditioned the way of seeing the art in each period. In Neolithic panels which are mainly horizontal, and decorated with geometrical designs, the observers can look at the panel from any point around the petroglyph. In Bronze and Iron Age rock art can adopt an almost vertical position, the scenes became more narrative with scenes of war and of hunting and the observers have to be in front of the carved surface and, at the same time, a virtual space is built creating the feeling of depth and movement.

Through Late Prehistory, we can identify important differences between periods, but in the transition between Neolithic and Bronze Age changes seems deeper. In Neolithic period, a group of observers could arrange around a petroglyph and none of them would have a privileged viewpoint. However, in Bronze and Iron Age the group of observers

should be placed in front of the panel, and therefore they would restrict their movement, there are fewer viewpoints to observe the panel, the rock cover part of the surrounding landscape imposing its observation.

8 EXAMINING INTERSPECIES RELATIONSHIPS AND NORDIC BRONZE AGE COSMOLOGIES THROUGH ART

Abstract author(s): Nic Aoidh, Nóra (UCD Dublin)

Abstract format: Oral

Despite roads and railways around the world being based on the widths of their bodies, non-human animals are now systematically excluded from much of modern western life. In some of the most human-populated areas, animals are forbidden from indoor spaces and from many private outdoor spaces. Yet humans are still heavily reliant on animals for survival, and beyond. Even the most frequently consumed products of modern human-animal relationships are cognitively detached from their origin: one rarely thinks of a thirsty calf when drinking cow's milk. However, this mental separation of animal product and animal source, and the carefully curated and restrictive interspecies relationships we participate in today, were almost certainly not present in the past. Examples of Bronze Age rock art and other artefacts convey a plethora of wildly different potential interpretations of how interspecies relationships were formed and performed, represented, and upheld in prehistory. Additionally, these media present us with questions of how art was conceived, created, and interacted with in the Bronze Age. The European Bronze Age is sometimes framed as a precursor to modern day capitalism, wherein animals were viewed as resources to be exploited. However, the wide range of real and imagined animal motifs on Nordic Bronze Age rock art panels, and their precise placement in rock and in the landscape, challenge these classically anthropocentric and capitalistic narratives of interspecies relationships. They also serve to contest standard naturalist categorisations as well as modern western ontologies. This project will demonstrate the value of posthumanist, experiential, and integrative landscape frameworks through case studies of rock art panels and artefacts with animal iconography from the Nordic Bronze Age. In doing so, it will contest rigid, naturalistic, and classically human-focused perspectives, and move towards a more holistic, post-humanist approach of understanding how different species (including humans) interacted in the past.

9 TO SEE THE UNSEEN AND UNSEE THE SEEN: PERCEIVING ADDITIVE AND SUBTRACTIVE ROCK ART IN NORTHERNMOST AUSTRALIA

Abstract author(s): Goldhahn, Joakim (The University of Western Australia)

Abstract format: Oral

'Art is solving problems that cannot be formulated before they have been solved. The shaping of the question is part of the answer'.

Following this thought-provoking grook of the Danish philosopher Piet Hein, this presentation will examine how different forms of rock art reveal themselves to an observer and how this intra-action later unfolds in various research outcomes. What kind of questions do we address towards different forms of artwork? Which questions remain to be raised? And, importantly, what forms of artworks do we see and acknowledge through our research as archaeologists, and what artworks remain unseen? Based on Karen Barad's agential realist perspectivism and recently conducted community-led fieldwork in northernmost Australia, this presentation will examine how additive (pictographs) and subtractive (petroglyphs) rock art have been perceived by European researchers. In trying to stay factual to Hein's grook, and by revisioning different forms of rock art and how these intra-acts with an onlooker, I hope to be able to formulate some new questions about how we see and perceive rock art globally. For example, how do we learn to 'see the unseen and unsee the seen'?

A. THE SECRETS OF THE FIRST TATTOOED

Abstract author(s): Fayer, Svetlana (Chercheur indépendant)

Abstract format: Poster

In 1900, six human bodies, naturally mummified, were exhumed by an English Egyptologist, near Gebelein (40 km., south of Thebes). They were buried in the fetal position, shallowly in the sand. Two of these bodies (male and female) are now in the British Museum. The date of their death has been estimated at 3351 and at 3017 BC. Recently, thanks to a new technology, scientists discovered on the man's arm, a tattoo of horned beasts, on the woman's upper shoulder four „S“ symbols and on her abdomen an „L“. [1] In our opinion, it could be a cultural code whose iconography reflects millennial beliefs where the feminine was associated with the snake and the masculine with the horned beast. According to the theory of Marija Gimbutas, these beliefs common to a very large territory (which we call a „common cultural horizon“) have persisted over a long period of time. She calls it „The Civilization of the Great Goddess“ [2] and believes it was run by matriarchy. We believe it is female monotheism. We have developed this idea in our new book

[3], in our latest article [4], as well as in our future presentation at the 90 ACFAS CONGRESS [5] and would also like to share it with you.

267 ANIMALS IN CRISIS: HOW CAN ARCHAEOLOGY CONTRIBUTE TOWARDS SOLVING CONTEMPORARY PROBLEMS IN ANIMAL WELFARE?

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Mannermaa, Kristiina (Department of Cultures, University of Helsinki) - Armstrong Oma, Kristin (University of Stavanger, Museum of Archaeology) - Brusgaard, Nathalie (University of Groningen, Groningen Institute of Archaeology) - Kirkinen, Tuija (Department of Cultures, University of Helsinki)

Session format: Regular session

Archaeology studies a wide array of human-animal relationships in past communities, such as hunting, trapping and fishing, animal husbandry, herding, and keeping companion animals – and everything in between. However, archaeological data and perspectives are underutilized in discussions on current ethical, moral, ecological and economic issues such as sustainable animal husbandry, biodiversity, rewilding, and pet breeding and trade. It could be argued that an essential element of the modern worldview is the assumption that animals are merely an amorphous mass rather than sentient, feeling individuals with their own agency. Animals are often “othered” to our human, conscious selves. Consequences of such views are, for example, keeping animals in small cages, hindering them from living out their species-specific behaviour or manufacturing and reproducing unhealthy breeds for human consumption or entertainment. Similarly, the current biodiversity crisis is sometimes linked to modern nature vs culture, us vs them dichotomies existent in many communities today. The local and global environmental consequences of these issues are plenty and dire. In this session, we call for papers that discuss how archaeological finds, case studies, and theoretical studies can participate in national and international debates concerning the moral, ethical, and practical aspects of today’s animal crises. Can we talk about animal welfare or exploitation in archaeological contexts? Can case studies from the past contribute to debates on rewilding, both practically and emotionally? Do we have finds demonstrating care and love towards domestic animals? And could archaeology become an agent for change towards best practices in contemporary human-animal relationships? We welcome discussion on these topics from a range of perspectives.

ABSTRACTS

1 THE ART OF LOOKING AT ANIMALS – MERGING PREHISTORIC AND CONTEMPORARY ART

Abstract author(s): Armstrong Oma, Kristin (University of Stavanger)

Abstract format: Oral

We cannot access the pair of eyes, the mind nor the hands that made, saw and touched prehistoric art. Oftentimes we don’t even identify objects as art, but as data, identity markers or mere objects of utility. In the process of preparing and installing the interdisciplinary art/archaeology exhibition *Eden and Everything After*, at the Museum of Archaeology, University of Stavanger, artistic practice, art history and archaeology combined to investigate renderings of animals in prehistoric, Modernist and contemporary art. Artist Tanja Thorjussen drew inspiration from engaging with prehistoric portable art and her reimaginings allows a glimpse of how people in the past knew animals from simultaneously keen observation and deep engagement. Making is seeing, and animals and their poignant presences appear as beings that can be experienced as imbued with spirituality and mysticism – qualities that inspired past and present artists. This paper explores prehistoric visions of animals as truly seen has the power to impact the present plight of animals.

2 ANIMALS AND AFTERIMAGES: THE ART OF REPRESENTING EXTINCTION AND AGENCY

Abstract author(s): Carey, Jean Marie (University of Stavanger Archaeology Museum)

Abstract format: Oral

As an art historian whose concern is the representation of animals across time, when I look at depictions of mammoths, rhinos, and aurochs in cave art, I see them in the environment where these images were conceived and developed, an environment that has remained pristine and unchanged. The cave acts as a frame that isolates and protects the animal figures it contains from the outside world of today. Yet these same animals who were delicately painted on rock surfaces disappeared from Europe millennia ago.

This type of immersive imaginative projection, a type of willed “slow looking,” can help us excavate the interiority of animal subjecthood of the past which in turn punctures our helplessness and apathy concerning the ongoing Sixth Mass Extinction. My project develops its methodological approach as an extrapolation from the writings of Hal Foster

on Nachträglichkeit, who himself builds upon the theories of Sigmund Freud and Jacques Lacan concerning “afterwardsness,” or deferred action.

Past and future tenses of continuity and rupture with the future of the will-have-been. This system of close looking and affirmative recovery can be used to assail – and to change – the socio-psychological barriers of how humans relate to animals. German aesthetic theory aids in such recovery because it further introduces Einfühlung – empathy – as a cognitive mode that proves capable of conveying such particularity.

Cognitive mediation of animals, using both empathy and imagination, assumes that animals are natural entities and vivid reminders of the self-activity of nature. This hypothesis is pursued through close readings of select texts and images from the late 1800s through the early 20th Century, during which the separation of archaeological and artistic modes of knowledge production was not yet decided and the idea of the sentience of animals was being controversially negotiated.

3 WHAT CAN WE LEARN ABOUT PAST HORSE HUSBANDRY PRACTICES?

Abstract author(s): Niskanen, Markku (University of Oulu)

Abstract format: Oral

Our domestic horse known as the DOM2 horse emerged on the Pontic-Caspian steppe during the third millennium BC, began dispersing at the end of that millennium, and had replaced all other horse lineages except those ancestral to the historic wild horses about a millennium later. Recent studies of ancient DNA of archaeological horses have revealed that past horse keepers managed to maintain genetic diversity but that starting about 2000 years ago breeding practices have reduced this diversity (especially that of Y-chromosome) and increased mutational loads. This process accelerated about 200 years ago when closed studbooks started to become common. As a result, genomic health of horses has suffered with obvious implications to their long-term viability and well-being compromising ability of especially “highly bred” breeds to survive in more “traditional” and natural conditions. We should partially return to earlier horse husbandry practices as well as protect and favor remaining landraces genetically adapted to their environment. We could also utilize information provided by genomic studies of past wild and domestic horses in breeding programs to enhance horses’ suitability for more traditional horse management practices and rewilding.

4 ANIMAL WELFARE IN LITHUANIA IN THE MIDDLE AGES AND THE EARLY MODERN PERIOD: EXPLOITED AND SOMETIMES PERHAPS LOVED

Abstract author(s): Piliciauskiene, Giedre - Vėlius, Gintautas - Minkevičius, Karolis - Vengalis, Rokas - Pilkauskas, Mindaugas (Vilnius University, Department of Archaeology)

Abstract format: Oral

One of the most informative sources on the welfare and use of animals are their skeletal remains and pathologies identified. Zooarchaeological material from the medieval castles and hillforts (Kernavė Aukuras Hill, Klaipėda castle, Vilnius Lower castle) and Early Modern period cities (Vilnius, Klaipėda) has revealed a wide range of pathologies and other evidence of how animals were used and the conditions under which they were kept. From a modern point of view, in many cases, animal life was hard and even cruel. However, there are also cases indicating that people treated and cared for sick animals. Although it is not clear whether this was done for practical reasons and the high value of the animals or simply for love of their pets. Moreover, written records from the 16th and 17th centuries AD indicate that nobles’ dogs were given a very high-level care, even by modern standards. In addition, animal pathology, historical data and the context of the sites show that cultural traditions and social environment played a role in the care and health of animals. In this paper we will try to discuss the welfare of domestic animals in Lithuania in the Middle Ages and the early modern period, based on zooarchaeological and historical data.

5 REWILDING THE PAST - THE PAST FOR REWILDING

Abstract author(s): Mannermaa, Kristiina (University of Helsinki) - Brusgaard, Nathalie (Groningen Institute of Archaeology)

Abstract format: Oral

Wild animals abound in the archaeological record, from deep prehistory up to modern times. Yet, after the transition of societies from hunting-gathering to agriculture and pastoralism, the broad social significance of wild animals is rarely recognised. They are used as a proxy for human subsistence and examined for their specific cultural purposes (e.g., elite hunting), but their societal relevance is studied often as secondary to that of domesticates. Conventional scholarly perceptions of wild fauna are interwoven with the role of these animals in western society today. We are currently facing a biodiversity crisis, the so-called sixth mass extinction event, with wild faunal and floral species dying off at an alarming rate. There is overall a recognised need for more ‘wild’ in the world and rewilding efforts provide hope for turning the tide. Yet the success of rewilding schemes is dependent on how socio-ecological dynamics are

addressed – i.e., how not just the ecosystem benefits, but also whether the social, the human-wild relationship, will prosper. Perceived threats by wild animals (such as damage to property) are a cause of serious setbacks in restoration programmes. This paper discusses how multi-disciplinary rewilding schemes can benefit from the robust baseline knowledge and crucial perspectives on the human-animal relationship that archaeology has to offer. It examines how we can learn more about the past and inform the future through paying more tribute to ‘the wild’ in the archaeological record.

6 POSSIBILITIES OF CONVIVIALITY: PAST-FORWARDING TO INSPIRE ALTERNATIVE FORMS OF MULTISPECIES CO-LIVING ON A DAMAGED PLANET

Abstract author(s): Hussain, Shumon (Aarhus University) - Stobiecka, Monika (University of Warsaw)

Abstract format: Oral

The increasing human alienation from nature – a result of Western lifeways and extractive ideologies – is often diagnosed as a root cause of many challenges characterizing the so-called ‘Anthropocene’. Relatedly, there is a growing consensus among environmental humanities scholars and critical theorists alike that foregrounding human solutions can only be part of the answer to these challenges, as the Anthropocene entails a fundamental disruption, and frequent eradication, of evolved forms of multispecies cohabitation. We here join nascent scholarship across the humanities to cash a notion of life that insists on the fundamental fact that life cannot be lived in isolation and that repairing the planet requires to recover, devise and cultivate alternative ways of living together with nonhuman others, including animals. We propose that archaeologists may respond to this urgent call by investigating and mapping past conditions and consequences of what Kate Rigby and others have called multispecies ‘conviviality’, provoking a critical redressing of how archaeologists commonly conceptualize and study human-animal interactions. In part, this also means that the past and deep past need to be re-imagined from the standpoint of a contested present in order to contribute to what may become possible in the future.

7 WHY ARCHAEOLOGY SHOULD CONTRIBUTE TO THE FIGHT FOR ANIMAL RIGHTS AND WELFARE: AN ACTIVIST’S PERSPECTIVE

Abstract author(s): Hakonen, Aki (University of Oulu)

Abstract format: Oral

Archaeology often bumps its head into issues of animal rights, whether past or present. In issues related to hunting, fishing, and animal husbandry, the scientific approach mandates a neutral stand. For this reason archaeology tends to see animals more as a human resource than any other. After all, without evidence of human use or consumption, animals are traditionally seen as outside the scope of archaeology. Despite the critical theoretical rhetoric, archaeology by default promotes human exceptionalism.

There is another kind of tradition to archaeology though, the kind that takes a stand for the powerless. For decades upon decades, archaeology has striven to decolonize itself. To rid itself of the presumptuous master-servant relations and to face up to the damage it has done in the name of science, especially to indigenous populations. Learning from past mistakes, archaeologists regularly speak out against racism, hatred, and injustice. Archaeological activism in this regard is implicitly encouraged.

What we know of non-human animal cognition, how they feel, how they fear, and the immeasurable quantity of misery humanity causes each day, forces archaeology to pick a side, again. To stay neutral in the face of expanding knowledge and worsening conditions for animals means siding with lazy social conservatism, which prefers to disregard new knowledge to justify the status quo. Archaeology is in a precarious position. It can be used to maintain the course, or it can have an actual real-life impact on making the world a better place. Staying neutral and languishing in irrelevance won’t do, for the stakes are high. Not for us though, as humans and archaeologists, but for the powerless defenseless others.

271 THE OTHER SIDE OF THE COIN: NEW INNOVATIONS IN NUMISMATICS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Ouellet, Jonathan (Leiden University) - Nol, Hagit (Goethe University Frankfurt)

Session format: Regular session

Coins are a common occurrence in archaeological excavations and a key tool in dating. Thus, they are an aspect of material culture that deserves further study. Coins should be understood in the context in which they were found. These studies can take a variety of forms including new and innovative techniques that utilize technology that was not available to archaeologists in the past. The papers in this session may be based on studies centered around any location or period which meets the following criteria:

- Coin finds from archaeological digs.
- Scientific studies based on techniques such as chemical analysis and network theory based on current and legacy data.
- Economic studies that are centered around coins as evidence.
- The use of coins outside of monetary functions such as jewellery or burial.
- Critiques of numismatic theory with an emphasis on how the field of numismatics fits into our modern global world.

This session aims to break the stereotype of catalogues and type lists and show new and innovative ways of studying numismatic collections. From new types of coins being dug out of trenches to scientific studies being done on silver and copper to determine mining and minting practices. Our session will also show the work of people from all parts of the world and bridge the gap between a field that is too often associated with archaeologists from the distant past, and show the diversity of the people working in the field.

ABSTRACTS

1 UTILITARIAN USE FOR PIERCED ROMAN COINS: PORTUGUESE EXAMPLES FROM EXCAVATIONS

Abstract author(s): Baeta, Alice - UNIARQ

Abstract format: Oral

Since the Republic and throughout the Empire, the Roman State made several monetary reforms and decreases in weight, size, and metal composition of the coin due to inflation. The copper coinage by the first century AD had a token value rather than intrinsic value. Therefore, coins of equal value would stop being interchangeable after these reforms and such created “out of circulation” coins. These coins that suddenly didn’t had official value could still be used for recoinage; melted, or just used for another purpose than monetary trading.

As the presentation will show, there are several pierced coins, originals and copies, from Portuguese archaeological excavations, found in contexts dating from the Republic to the early Empire, that were utilized for other functions than money. Eventually, these coins were selected because they would already be demonetized or were imitations of official coins. Being used as pendant-amulets, medals with a religious nature or in other more utilitarian functions, such as, simple studs. Such uses were not confined only to the Ancient World, lasting over time until the present day.

2 METALLURGICAL INVESTIGATION OF COPPER ALLOY COINS (5TH CENTURY BC - 3RD CENTURY AD): UNDERSTAND THEIR MANUFACTURING PROCESS

Abstract author(s): Bodet, Alexandre (Archéosciences Bordeaux; Bordeaux Montaigne University)

Abstract format: Oral

Compared to studies that already have tackled this topic but only for a specific coinage or period, our coins sample (135 coins from around the Mediterranean Sea and struck between 5th c. BC and 3rd c. A.D) allows to understand better the different coin manufacturing processes on a large geographical and chronological scale. Metallurgical investigations (metallographic observation, by optical and scanning electron microscopy) allows us to reconstruct the metallurgical history of these materials and to understand the savoir-faire used in their operational chain. The alloys used are determined by X-ray fluorescence spectrometry in addition to Vickers hardness tests, allowing us to understand the impact of minting. The study has already highlighted coins with a more complex metallurgical history than only casting and minting. This raises questions about the purpose and interest of this type of process for the craftsmen. Considering the geographical distribution of our samples, are there any similarities between their regions and years of issue? What about this distribution according to their categories and the different processes highlighted? Experimental archaeology sessions were carried out. The aim of these sessions was to investigate the relevance and implementation of some of the steps revealed by the analyses. Various treatments (mechanical, thermal) that may have been involved in the manufacturing process of ancient coins were investigated. Such as quenching, overstriking, or hot striking (still discussed today). In order to compare (in terms of microstructures and hardness) the results obtained from reproduced samples to archaeological ones. And, to assess whether these treatments have been implemented (or not).

3 THE PROJECT CLARENET: CLASSIFICATIONS AND REPRESENTATIONS FOR NETWORKS. LEVERING RESOURCES ON CELTIC NUMISMATICS WITH LINKED OPEN DATA

Abstract author(s): Wigg-Wolf, David - Brand, Mirko (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts - RGK) - Deligio, Chrisowalandis (Goethe University Frankfurt) - Hofmann, Kerstin - Möller, Markus - von Nicolai, Caroline - Rösler, Katja - Tietz, Julia (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts - RGK) - Tolle, Karsten (Goethe University Frankfurt)

Abstract format: Oral

The Semantic Web has opened up new possibilities for collecting, recording and analysing data, and within the Digital Humanities numismatics are very much one of the success stories of the Digital Turn. On the one hand, coins have long lent themselves to a wide range of computational and statistical analyses, and more recently have attracted a number of projects involving automatic image recognition and machine learning.

But the standardised nature of the core data for coins (the who, what, when and where), also makes them ideal material for approaches involving Linked Open Data. The international collaborative project Nomisma.org provides stable digital representations of numismatic concepts according to the principles of Linked Open Data. These concepts comprise a controlled vocabulary and an ontology (the grammar to accompany the vocabulary) that are now widely accepted within the numismatic community.

Their implementation facilitates communication and exchange not only between data resources with very different structures, but also of a very diverse nature, for example typologies, catalogues, collections and coin find repositories. A coin that is at the same an instance of a type, an object in a collection and a coin find, can thus at once be accessed and analysed in all these different contexts.

This contribution will draw on the experience of the numismatic project ClaReNet: Classifications and Representations for Networks (<https://clarenet.hypotheses.org>), financed by the German Ministry for Education and Research, in developing a virtual union catalogue Online Celtic Coinage(OCC) and discuss the challenges involved. We will explain how we have used the technology and mechanisms of Linked Open Data, as well as the flexible data management system Dédalo, to develop OCC and demonstrate how this approach does indeed “break the stereotypes of catalogues and type lists”.

4 THE USE OF COINS IN ROMAN RED SEA PORTS: FINDS FROM BERENIKE AND MYOS HORMOS REVISITED

Abstract author(s): Smagur, Emilia (Polish Centre of Mediterranean Archaeology, Univeristy of Warsaw)

Abstract format: Oral

Coins constitute a fascinating group of objects found at Indian Ocean port sites. Indigenous and foreign, they are being discovered in hoards and as stray finds, deposited in religious buildings, graves, and residential structures, or being casual losses. However, their common perception as indicators of fluctuations of trade and site prosperity resulted in relatively little interest in their roles beyond that of their economic value.

This paper aims to discuss the potential of coin finds as a tool for understanding the economic and social history of ancient Red Sea port communities inhabiting Myos Hormos and Berenike. More generally, its purpose is to create a narrative on creating and expressing the value through the study of the coin-use in the Western Indian Ocean ports. The issue of how people inhabiting and visiting Berenike and Myos Hormos understood and engaged with coins, as well as how their attitudes to these objects were linked to everyday life, human identities, and behaviors will be discussed as well.

5 A VERY OLD-FASHIONED INNOVATION IN THE STUDY OF COIN FINDS FROM BYZANTINE EGYPT: A CASE OF MAREA NUMISMATIC PROJECT

Abstract author(s): Jaworski, Piotr (Faculty of Archaeology, University of Warsaw)

Abstract format: Oral

The slightly provocative title of the paper is intended to draw attention to the existence in the numismatics of Byzantine Egypt of the phenomenon of selection of coin finds subjected to be studied and its negative consequences. The latter often consists in distorting the image of monetary mass in circulation. The economy of Egypt at the end of antiquity was strongly monetarized. As a result, the amount of coins obtained during excavations often exceeds the capabilities of even the most diligent numismatist trying to elaborate on them. A significant percentage of these coins are barely legible, badly corroded minimi, and their cast imitations or blank flans. Although they seem to be the key to understanding the monetary economy of Byzantine Egypt, minimi are often the material that is put aside for later study or marginalized in publications. The paper will present the assumptions of a new numismatic project conducted at the Faculty of Archaeology of the University of Warsaw, the aim of which is to comprehensively study all (literally)

monetary finds from Polish excavations carried out in Marea near Alexandria since 2000, the number of which exceeded 8,000.

273 DARK PREHISTORY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Mlekuž Vrhovnik, Dimitrij (University of Ljubljana; Institute for the protection of the cultural heritage of Slovenia) - Armstrong Oma, Kristin (University of Stavanger, Museum of Archaeology)

Session format: Regular session

The third science revolution in archaeology has brought a new hope that the past is ultimately knowable, an optimism that science can ultimately answer almost any question about the past. This has also brought a host of increasingly simplified views and explanations of the past, prehistory understood in modern Western categories and based on positive, scientific knowledge.

This is a bright, light, positive prehistory.

Our premise is that there is a dark side to the past. This darkness is not simply the absence of knowledge, but it figures as a constitutive element of prehistory. Prehistory is defined by its radical alterity.

This alterity also figures as a condition of reality we humans dwell in. What is unknowable, weird, alien, uncomfortable, painful and negative yet forms a constitutive element of being human? What is inaccessible, dark, and weird but integral to the prehistory itself? The radical alterity of prehistory should not be explained away by Western categories or dismissed as merely a colourful interpretation of reality. Instead, it should be a starting point for rethinking the past itself.

We want to focus on the negative, dark side of prehistory. We are interested in studies that treat prehistory as alien, weird, and inaccessible, defined by lack, negativity, death, absence and loss. We want to explore conceptual shadows, negativities, hidden and dark sides of prehistory.

We are interested in studies that focus on the harsh, hidden, uncomfortable, violent and grittier dimensions of social life; madness, violence, terror, and the subjective experience of these dimensions.

We welcome studies that deal with uncomfortable others, people, animals, and places.

Ultimately, opening to the dark side has revolutionary potential; it should throw us, archaeologists, our materials, and our sources into a state of vulnerability and risk. The dark prehistory opens the radical possibilities of the past.

ABSTRACTS

1 BODIES IN THE DARK: HUMAN REMAINS IN THE CAVES

Abstract author(s): Mlekuž Vrhovnik, Dimitrij (University of Ljubljana; Institute for the protection of the cultural heritage of Slovenia)

Abstract format: Oral

What are isolated human remains doing in the caves? Why would people go there to die possibly or to deposit a human body? When facing such a difficult conundrum, questions without obvious and straightforward answers, I turn to psychoanalysis, a theory that confronts humans with the most radical dimensions of existence.

Caves are ruptures in the fabric of the world, where its monstrous innards become exposed and tangible. This is a world we do not quite know, and for all we know, it might not even be ours. Here things are not just simple representations of pre-given social or political realities but operate on their own largely unknown principles. This radical unknowability of the world is always in relation to us, humans. We, as speaking beings, have a difficult time tolerating this lack of knowledge, this void, this gap. A cave, gap in a landscape, simultaneously marks a limit of discourse.

Crucial here is the Lacanian idea of a zone “between two deaths”, which brings the notion of a second or symbolic death. The cave offers the possibility not only of a biological death but, by getting lost and deposited in the monstrous innards of the world, of the radical annihilation of the symbolic texture through which social reality is constituted, an annihilation of the symbolic order, the symbolic pact which regulates social exchanges and sustains debts, honours, obligations.

But paradoxically, this second death opens a void in a symbolic texture, around which the symbolic network can re-articulate itself. This void makes symbolic activity possible; this void makes the (new) history possible. This second death has the potential for a radical renewal of symbolic order.

2 OH, TO BE HUMAN...

Abstract author(s): Pantmann, Pernille (Museum of North Zealand)

Abstract format: Oral

What is human value, what justifies human sacrifice, and what is the meaning of using human bones as raw material? Questions such as these are typical for archaeological studies of human remains in “special contexts”. The history of archaeology is full of examples of how prehistoric behavior towards humans and human remains has been explained and interpreted. Often the choice of vocabulary and terminology illustrates a preconceived idea or even judgement of the ancient societies’ dealings with human remains. Cutmarks on human bones is associated with cannibalism or excarnation. And human remains in bogs are sometimes described as human sacrifices with the implicit understanding that they represented the ultimate sacrifice. Thus, the sacrifice of a human being has traditionally been considered more valuable than the sacrifice of any other living creature or item. But the same elevated status does not seem to reflect on the loose human bones from contexts, such as household waste. Though they have been explained as disturbed graves they are rarely understood as the obvious: simple household waste. The question is if these examples of human behavior towards other humans and human remains reflect a dark side of human nature? A subsequent question would be: who are we to decide if a human behavior, lifestyle, or religion is dark or not? Is such an idea not another example of judging the past by our standards?

3 THE DEAD BODIES IN PIECES: HUMAN REMAINS FROM BRONZE AGE SETTLEMENTS IN THE CARPATHIAN BASIN

Abstract author(s): Szeverenyi, Vajk (Deri Muzeum)

Abstract format: Oral

The mortuary behaviour of prehistoric communities, their relationship to death and dead bodies is often characterized by what we might call radical alterity. While dead bodies neatly lain down in cemeteries separated from the realm of the living are a dominant and familiar phenomenon, there are also numerous exceptions. Human remains from prehistoric settlements in the Carpathian Basin are rare finds mostly referred to in the literature as “irregular burials”, and thought of as victims of unique events such as epidemic or warfare. During the past few years, such remains from Early and Middle Bronze Age (ca. 2600-1500 BC) settlements were collected in a database and analysed as part of a postdoctoral research project. These remains entered the archaeological record in various forms, in various phases of the decomposition of the dead bodies, and obviously thanks to various cultural practices. Murder, mutilation, mass graves, miscarriage, warfare, epidemic, and surprising and sometimes – to us at least – morbid practices can be identified through the study of these human remains. But are they “dark” and “negative”? While they might be alien for us, they seem to have been an integral part of Bronze Age life and death. What kind of social and ritual practices can be reconstructed through the analysis of these remains? What might be their relationship to “normative” burial rites? Who or whose remains were selected for burial or deposition within settlements? The aim of paper is to try to answer some of these questions.

4 THE CONCEITS OF DOMESTICATION: VIOLENCE, KILLING, AND THE UNDERPINNINGS OF HUMAN-ANIMAL COMMUNICATION

Abstract author(s): Kanne, Katherine (University College Dublin; University of Exeter)

Abstract format: Oral

These are bright times for human-animal research in archaeology. From the archaeogenetic revolution to relational, multispecies, and posthumanist approaches, the depth, complexity, and multifaceted prehistories of our entanglements with animals are being revealed with ever greater resolution and care. The domination model of domestication is untenable. Animal agencies are increasingly recognized in the mutuality of domestication processes and human-animal coexistences.

However, this paper asks the dark question, what if the threat of violence and death ultimately underpins how we communicate with domesticates? Exploring power imbalances between humans and animals, it examines our ways of communicating with, living with, and making a living off of our animals where we meet: namely by deferring threats of violence and death in trade for the promise of food and relief, so long as we receive benefits. Focusing on the language of human-domesticate communication, ‘enainment’, ‘enskilment’, and ‘intra-actions’, are predicated on a series of repeatable and repetitive gestures that seemingly invoke threats of violence, no matter how minor or removed from real violence, resulting in kindness tempered by the spectre of viciousness. How have animals co-created, worked within, reacted to, and directed this communicative nexus? How are people drawn into communicating in ways to avoid the threat of harm from the animals with which they work?

The aim to not diminish the ways in which recent scholarship highlights the deep history of multispecies symbiosis and mutual becomings, or the ways in which people and animals largely worked together without violence in daily activities.

On the contrary, it interrogates how our languages of communication are part of our negotiated co-evolutionary prehistories, drawing from ethology and zoosemiotics, considered through process theory, posthumanist thought, and the archaeology of inequality. Exposing the conceits of violence and death inherent in domestication processes can radically open our interpretations of more-than-human pasts.

5 DARK SOULS. THE IDEA OF VIOLENCE IN THE SCOPE OF WESTERN EUROPEAN MEGALITHISM: CONCEPTS, DISCOURSES AND MATERIALITIES

Abstract author(s): Agosto, Frederico (UNIQ – Center of Archaeology of the University of Lisbon; CFUL – Center of Philosophy of the University of Lisbon; FCT – Foundation for Science and Technology) - Carvalho, Daniel (UNIQ – Center of Archaeology of the University of Lisbon; LAQU – Quantitative Archaeology Lab of Universitat Autònoma de Barcelona; FCT – Foundation for Science and Technology)

Abstract format: Oral

Being a concept that possesses a long genealogy, the idea of violence has dotted the prehistoric discourses in Europe, where megalithism – hereby understood as all forms of the megalithic phenomenon – has become a prime stage for this discussion.

Initially, the idea of violence in prehistory was commonly framed between that of a noble savage or a violent barbarian, but, lately, violence has started to encompass a wider range of realities and materialities, bolstering its conceptual robustness. Moreover, the archaeological record has long given us a multitude of evidence for violent conflicts in Europe, such as the neolithic sites of Achenheim and Bergheim in Alsace-Lorraine (France), or even contexts of cannibalism and sacrifice in the neolithic site of Cournanel (Aude, France).

The megalithic phenomenon in the Iberian Peninsula also serves as an empirical basis for the discussion of such topics (e.g., San Juan Ante Portam Latinam, Álava, Spain), where multiple examples of violent encounters and social instability are visible, temporarily framed between the 4th and 3rd Millennium BCE.

In our paper we proposed to discuss the definition and concept of violence and presenting the materialities and contexts associated with violence within the megalithic phenomenon, while framing it within the overall discourse on violence in the study of megalithism in Western Europe.

6 PANOPTICONS OF CONTROL? CONSIDERING STONE CIRCLES AS PARANOID ARCHITECTURES

Abstract author(s): Lambert, Rebecca (Birkbeck, University of London; University of Glasgow)

Abstract format: Oral

British Neolithic architectural monumentality has often been considered through a lens of communal construction equating to social cohesion. It has been suggested that the Neolithic, especially the later phase, was a halcyon existence for its inhabitants, both locally and on a broader scale. But what if this was not the case?

Focusing on stone circles, this paper will explore the possibility that the construction of Later Prehistoric monuments may have been a means to, potentially, control others, both physically and psychologically.

Is it possible to identify hierarchical power through the analysis of stone circles? Can we ascertain whether social control was apparent through the choice of location and organisation of labour? Were there consequences for failing to complete constructions, or for refusing to take part in these communal projects? Or did authority only arise once the monument was completed?

Were stone circles panopticons of control; structures that channeled malignancy, intimidation and fear, rather than altruism and spiritual care? Together, we will contemplate these enigmatic monuments and consider whether they can be deemed Paranoid Architecture and thus, an essential element of a Dark Prehistory.

7 THE TALE OF THE TWO VINČA CITIES

Abstract author(s): Kocic, Miroslav (Center for Archaeology University of Kragujevac)

Abstract format: Oral

The primary paradigm of the Neolithic in Balkan archaeology was one of the peaceful farming communities. This was especially the case with the Vinča culture of the Central Balkans, where the narrative went that those populations lived in small hamlets, with Vinča Belo Brdo being the eponymous and the most important site of the culture. Hallmark postcard that this narrative made was so entrenched that even a suggestion of a defensive ditch that was excavated on Vinča Belo Brdo was dismissed as a methodological error. Within the last two decades much has changed with few methodological as well as paradigm shifts. Now, thanks to geophysical prospection, we know that there is not a single Vinča site that was surveyed that does not have extensive fortifications. These fortifications were excavated on number of sites showing very elaborate systems of both practical and symbolical fortifications and delineations.

Striking and abruptly dark characteristics come into the limelight when settlement features and regional patterns are looked upon.

Dismembered human remains found in the defensive ditches became more of a rule than an exception. Regional settlement patterns in systematic pedestrian surveys show strong centralization that no “light past” pattern can fully explain. This paper will analyze and contrast these two tales of Vinča, using the results from recent research on sites of Oreškovića, Grivac, Kusovac and Klenak Adžine Njive and the darker aspects of the culture that are emerging.

8 WHAT LURKED IN THE DARKNESS IN THE NORDIC BRONZE AGE WORLD?

Abstract author(s): Melheim, Lene (Museum of Cultural History University of Oslo) - Armstrong-Oma, Kristin (University of Stavanger, Museum of Archaeology)

Abstract format: Oral

Since the advent of archaeology, the Bronze Age discourse has centered around the sun and its life-giving warmth, resulting in a reconstruction of a sun cult and mythology (e.g. the schematic journey of the sun through day and night, by Flemming Kaul (1998) in “Ships on Bronzes”). Bronze Age iconography is pervaded with sun symbols in the form of circular shapes and iconography with spirals, concentric circles and solar rays. And still, such objects are often found deposited in dark and murky waters. Strange objects such as the Nebra disc with its night sky and the Trundholm horse with its sun and moon disc also appear, but their reference to the dark side - the time between sunset and dawn when Kaul’s night ship traverses the realm of the sea, but also night, darkness and death - is almost without exception overlooked. On the Scandinavian Peninsula, mountains, rock shelters and screes seem to have played a similar role as waterbodies, as openings to other worlds. The psychological aspect of these locations have, however largely been ignored.

In this paper we will start a journey into the darker, unexplored sides of the Nordic Bronze Age world, and compile and assess some sources that will allow us a glimpse of perceptions, myths and practices associated with aspects of life that were physically and mentally in the dark.

277 IT'S A MATTER OF SPACE: THE MATERIALITY OF SPACES OF NEGOTIATION AND SOCIAL COMPETITION FROM PREHISTORY TO MEDIEVAL TIMES

Session theme: 6. Contested Pasts & Presents

Session organisers: Orfanou, Vana (Ludwig-Maximilians-Universität) - Zapelloni Pavia, Arianna (Institute of Classical Archaeology, Charles University Prague) - Scarci, Azzurra (Römisch-Germanisches Zentralmuseum, Mainz)

Session format: Regular session

Social competition was a key aspect of community interactions in the past. This session adopts a material culture and materiality perspective to the diachronic investigation of social negotiation, including notions of ‘otherness’, in antiquity as understood through their tangible expressions. We consider spaces of negotiation as cultural settings of antagonism, where groups and individuals engaged in identity formation and consolidation through mechanisms of social competition, often through confrontation with the ‘other’, purposefully or unintentionally.

In this session, we investigate how material remains from spaces of social negotiation and mediation can shed light on the dynamics of community competition. The spaces under scrutiny include—but are not limited to: 1) cult and ritual spaces, which attracted visitors from all walks of life, and burial grounds, which often represented the backdrop for the expression and creation of group and individual identities; 2) crossroads, which facilitated the – often circumstantial - give-and-take of materials (trade, exchange) along with ideas (cultural negotiation); 3) borders as meeting places, which formed the settings for long term negotiation of cultural and collective identities, as well as socio-economic and political influence; and 4) domestic and craft localities, which can act as platforms for cultural negotiation on a smaller scale such as with migrants and itinerant craftspeople.

This session aims to tackle questions on the modes and impacts of cultural interactions as viewed broadly through the lenses of their material remains. We welcome papers that investigate material culture, including scientific / analytical approaches, over a long time span from prehistory to the medieval times. Papers will explore the mechanics of cultural negotiation diachronically through social synergies and competition, influence, and the management of competing identities (political, social, individual, collective) in a variety of social contexts

1 SANCTUARIES AS SPACES OF IDENTITY NEGOTIATION: THREE CASE STUDIES FROM THE GREEK AND ROMAN WORLD

Abstract author(s): Orfanou, Vana (Ludwig-Maximilians-Universität) - Zapelloni Pavia, Arianna (Institute of Classical Archaeology, Charles University Prague) - Scarci, Azzurra (Leibniz-Zentrum für Archäologie)

Abstract format: Oral

Sanctuaries in the Greek and Roman world were the par excellence sites for the performance of religious rituals and social interactions. They provided marked spaces as platforms for expression of collective and individual identities. Here, we explore identity negotiation in three sanctuaries in Italy and Greece during the 1st mil. BC as seen through the lens of metal votive offerings. Firstly, inscriptions from the sanctuary at Bagni di San Casciano, near Siena, reveal the dynamics of interaction and competition between the Etruscans and the Romans in the last centuries of the Roman Republic, when power was slowly transitioning to the Romans. Inscriptions on artefacts featuring both Etruscan and Latin names suggest that the sanctuary attracted devotees from both cultural groups, which aimed to assert local identities at a time of dramatic political change. Secondly, the reconsideration of an assemblage of >300 offensive iron Greek and indigenous weapons from a tiny sanctuary at the Greek subcolony Kasmenai, in south-eastern Sicily, offers an alternative view of the other. The indigenous weapons, originally considered to represent the booty taken from the locals by the Greeks, thus assuming hostile interactions, are now seen to represent the other as allies and cohabitants interacting in a typically Greek sanctuary space. Lastly, at the early Greek sanctuary of Thavlios Zeus, near Volos, at an important crossroad in central Greece, devotees from different cultural groups were visiting with their respective votive offerings. The study of hundreds of metal fibulae showed that types with geographical links in Thessaly and further north in Epirus also featured a distinct technology including the use of local raw materials. All three case studies highlight the role of the sanctuaries as social negotiation spaces where votive offerings aimed not only to appease the gods but also to assert the identity of the devotees.

2 WAS DELPHI THE CENTER OF THE WORLD ? THE MYTH OF THE OMPHALOS AND THE ROAD-NETWORK OF ANCIENT DELPHI

Abstract author(s): Vorsanger, Adèle (Université de Caen Normandie)

Abstract format: Oral

The oracular sanctuary of Delphi, in Central Greece, attracted thousands of worshippers from the entire Greek world throughout Antiquity : private pilgrims, sacred embassies, athletes, merchants... According to a well-known myth, Delphi was believed to represent the centre of the world, where two eagles sent by Zeus from the opposite ends of the universe would meet. Strabo has rationalised this legend by reckoning the sanctuary to sit in the middle of the Greek world, being thus easily reachable from any part of Hellas. This point of view is commonly accepted in modern historiography and the prestige of the oracle is often linked with its situation at a crossroad between long-reaching regional axis. But this apparent determinism must be challenged, especially by investigating the materiality of the road-network around Delphi. Is the site of the oracle really served by significant regional roads ? Was Delphi an important sanctuary because of this alledged road-network, or should we also consider the opposite hypothesis, that roads and circulations centered around Delphi due to its religious significance ? This communication aims to reconsider the dynamics of circulations to and from ancient Delphi, by acknowledging the major contribution of recent works about ancient greek roads. Through a case study combining archaeological, epigraphic and literary sources, this communication will shed light on an essential phenomenon of mobility in the Greek world, where religious and geopolitical issues are intertwined.

3 DYMAIA CHORA DECODED: THE SOCIAL DYNAMICS OF REGION OF WESTERN ACHAEA AT NW PELOPONNESE THROUGH FUNERARY PRACTICES

Abstract author(s): Argyropoulos, Vassilios (Ephorate of Antiquity of Achaea)

Abstract format: Oral

The area of study, is located at NW Peloponnese, western Achaea (Dymaia Chora) and, centered on the city of Dyme, one of the major cities that founded the 2nd Achaean League. The latest archaeological excavations and, especially the revelation of cemeteries, have given us the evidence, for further interpretations regarding the political, social and cultural changes and transformations in the countryside of western Achaea through the study of the dialectic of the inhabitants' dead. The period of interest extends from the mid-5th century B.C., to the end of the 4th century B.C. coinciding with the founding of the city-state.

The study of the burial practices and rituals, give us not only the possibility to reveal the changing social hierarchies, the social competitions, the political, social/ individual identities of the inhabitants of the region, but also a great understanding of the transformations and reconfigurations of the local society. The luxury of the tombs and the adoption of the custom of cremation at Dymaia is also a strong indication of the social changes that took place during this period. The choice of funerary practices is a manifestation of social differentiation, in the same way that the elite under consideration or the leadership groups of Dymaia Chora were trying, not only to legitimize their position, but also to create a hierarchy. Considering that the dynamics of social/individual competition contributed to the historical development reshaping the common and social organization of the area, we aim to present through new excavation data an interpretation of the social identity of the inhabitants of Dymaia, established through the mechanisms of social competition in the post-classical period.

4 GLOBAL VS LOCAL? CENTRAL APULIAN ELITE IDENTITY IN THE LATE 4TH CENTURY BCE

Abstract author(s): Peruzzi, Bice (Rutgers State University of New Jersey)

Abstract format: Oral

The study of Central Apulian graves from the Classical and Hellenistic periods show that the funeral was the pivotal moment in the funerary practices of this region. Evidence from burials illustrates how funerals were used as arenas to create relationships among social groups (with the exclusion of others); assert and negotiate status through the provision of both wine and food; and legitimize power through the consumption of artifacts that highlighted ties within and outside the community.

This is clearly illustrated by the profound shift in elite burial practices in the second half of the 4th century BCE. Suddenly, high expenditure tombs adopted assemblages with monumental vases, decorated with sophisticated iconographies that referenced Greek tragedies; furthermore, locally produced matt-painted wares, one of the cultural markers of Central Apulian populations since the 8th century BCE, virtually disappeared.

I argue that these changes were driven by a mix of internal and external causes. In the second half of the 4th century, Apulia had become the backdrop of many important historical events –from the arrival of Alexander the Molossian and the other “condottieri,” to the war between the Tarantines and the Messapians, to the beginning of the Roman conquest. Thus, using late 4th century graves from Ruvo, Altamura, and Timmari as case studies, it is possible to explore evidence for the complex strategies adopted by the local elites (e.g., bilingualism, invented genealogies, trade) to navigate this new broader world, and present themselves in a way that could be understood not just by their communities but also by a larger, “international” audience.

5 ELITE NEGOTIATION IN A PRE-URBAN WORLD: CENTRAL ANATOLIA BETWEEN THE HELLENISTIC AND THE ROMAN PERIODS

Abstract author(s): Maranzana, Paolo (Bosphoros University)

Abstract format: Oral

This study examines the impact of elite negotiation on settlement development in northern central Anatolia during the Hellenistic and Early Roman periods (ca. 2nd c. BC to 2nd AD). The research demonstrates that before the Roman conquest, the region was inhabited by different populations, including Phrygians and Galatians, and their settlements were primarily located on fortified hilltops, which were controlled by local chiefs. Most of the sites discovered so far are relatively small, although monumentality seems to increase in the later Hellenistic Period, mostly due to contacts as well as direct investments on the part of foreign powers, such as Pergamon. After the Roman conquest, city building was initiated, but it was only established in areas of direct imperial interest and through the collaboration of local urban elites, as evident in the cases of Ankara and Pessinus. Urbanism was, however, not widespread in Roman central Anatolia. This paper will also compare the role of local elites in areas where cities were established, such as the upper Sakarya river valley (greater Ankara region), and in regions where extensive urbanism was lacking, such as southern Pontus (Tokat).

6 THE MATERIAL CULTURE OF DIPLOMATIC GIFTS AS A STATUS SYMBOL - EXAMPLE OF LATE MEDIEVAL DUBROVNIK

Abstract author(s): Zovko Šoštarić, Valentina (University of Zadar, Department of history)

Abstract format: Oral

This presentation focuses on the detection of gifts that Ragusan ambassadors presented to their hosts at various places: European courts, private houses, public squares, summer residences, and the Sublime Porte (mid-14th-early 15th c.). Those places, private and public were used as sites of diplomatic rituals that were an important and effective tool in reaching desired benefits in a formal or more intimate manner.

The material culture of diplomatic gifts is seen as a determinant of power and a visible sign of the status symbol of the receiver. City authorities have shown expertise in the selection of gifts, their procurement, circulation, and production while respecting the personal preferences of the recipient, the dominant style, and economic and aesthetic values sublimed at the taste of the epoch shared across cultural boundaries. At the same time, gifts carried carefully wrapped messages regarding the community identity features promoting local craftsmanship, luxury goods, and materials in complex cross-cultural settings. Of special interest is to compare specific presents gifted to various people presented at the same courts and to notice how those gifts directed to the same individuals diachronically altered.

Sources kept in the Dubrovnik State Archive allow us to reconstruct the list of Dubrovnik's diplomatic gifts presented to various recipients of different political hierarchies, gender, age, profession, and religion. Interpretation of the reasoning underlying the selection of gifts offers an interdisciplinary approach to analyzing their pragmatic purposes, origin and production, value (economic, social, cultural, practical, emotional), and manipulation of their usage over a longue durée. As well as influencing contemporary and future political relations, the gifts encouraged symbolic, material, and cultural exchanges between similar as well as diverse civilizations, cultures, and religions.

7 SPACE, MARGINALITY AND ECOLOGICAL SHIFTS IN MID-REPUBLICAN ITALY: THE CASE OF CANUSIUM-DAUNIA, 325-200 BCE

Abstract author(s): Scopacasa, Rafael (Universidade de São Paulo/ University of Exeter) - Perego, Elisa (University College London)

Abstract format: Oral

The early Roman expansion in Italy saw the reshuffling of power relations across the peninsula. Recent studies suggest that these sociopolitical changes took place in an overall context of climatic shifts connected with the onset of the "Roman Warm Period" (RWP), which may have altered the profile of Italian natural environments. This paper brings together written, material and environmental data pertaining to the ancient town of Canusium in the Ofanto valley in southern Italy (Daunia); it explores how an integrated approach to historical, archaeological and environmental trends at the microscale can afford a finer-grained picture of how broad geopolitical shifts were linked with changing dynamics of subordination and marginalization at the local level. The Ofanto valley houses different socioenvironmental niches closely juxtaposed in space: the main urban centre, the well-watered river valley, and highly drought-sensitive plateaus (Tavoliere and Murge), whose agricultural potential depends on a fine margin of climatic stability. Survey evidence points to changing occupation of these spaces c.350-200 BCE: there was an accelerated infill of the countryside around the city, as elsewhere in mid-republican Italy; yet, our data indicate that the infill at Canusium targeted not the river valley but the drought-sensitive plateaus, which might have become increasingly challenging owing to the onset of the RWP; while the urban centre displays growing signs of elite self-affirmation (e.g. monumental chamber tombs). By analyzing these trends in relation to their spatial and environmental context, we envisage different possible directions in which the renegotiation of power dynamics between urban elites and agricultural workers may have moved under the rising Roman imperialism.

8 SOCIAL NEGOTIATION IS MULTICONTEXTURAL

Abstract author(s): Small, David (Lehigh University)

Abstract format: Oral

As archaeologists we too often concentrate on a particular social context to analyze social competition and negotiation, drawing larger community wide conclusions from observations limited to a single context. This approach has been partially productive, but I argue that this concentration also misses the much larger picture of social negotiation within communities. Individuals and groups employ a range of community contexts for negotiation, often moving from one context to another in their strategies of social positioning. I will describe how groups used various contexts for community positions, focusing on cases from ancient Greece, looking at social negotiation in domestic, civic, religious, and funerary contexts. My analysis is based on understanding the dynamics of the material contexts of each social context and how these arenas of negotiation are linked in larger strategies of social competition. The situation for ancient Greece will be compared to social status negotiation in other cultural communities such as the ancient Maya, Rome, and more modern cultures.

9 NEGOTIATING IDENTITIES THROUGH PREHISTORIC COPPER MINING: EVIDENCE FROM THE GREAT ORME MINE, NORTH WALES, UK

Abstract author(s): Wager, Emma (Independent Researcher)

Abstract format: Oral

The ore sources accessible in prehistory were bounded geological entities, forming delineated spaces where people from different communities and/or locations may have come together to work alongside one another. The ore ex-

tracted was the starting point for the Bronze Age ‘metal supply’. As such, we can envisage that prehistoric mines were settings for social competition centred on the procurement of copper ore for smelting.

This paper investigates how collective participation in mining at these localities could be a vehicle for the negotiation and reworking of individual and community identities, in ways that may have persisted beyond the physical confines of the ore source and the moment of mining.

This idea is explored using the material evidence for copper ore mining in the second millennium BC at one of Europe’s larger and most accessible prehistoric mines, on the Great Orme, north Wales, UK. A specifically technological perspective is proposed, in which all technical activities are understood to be intrinsically social and political. Also emphasised is the important role the broader social context plays in understanding the configuration of local processes of social competition during the Bronze Age.

10 “WHAT WE DO IS WHO WE ARE” CRAFTSMANSHIP AND IDENTITY ISSUES IN A BORDER ZONE

Abstract author(s): Paralovo, Elena (Charles University, Prague)

Abstract format: Oral

Ceramic pyro-technology addresses not only technological issues concerning pottery production but also a broad range of social behaviours and cultural aspects. In this regard, the current research focuses on a specific class of objects, the kiln spacers, which emerged from two rescue excavations at the site of Mantova. Mantova is known to be an Etruscan centre founded in the 5th BCE during the so-called “colonization phase” of the Po Plain (6th-5th centuries BCE), a fertile crossroads area where different cultures were active. Even though the interest in this territory is spread among scholars, a deep study of the production activities is still missing.

The objects of this presentation are 14 ring-shaped spacers for kilns, simple supports that allow the separation of the pots into the cooking chamber to optimize the circulation of the heat. A detailed analysis of the mineralogical characterization of the spacers has been achieved by the application of X-ray powder diffraction (XRPD) combined with scanning electron microscopy (SEM), alongside an accurate investigation of the ceramic petrography. By adding archaeometric results to a solid study of the firing techniques and devices (kilns) characterizing the Iron Age production in northern Italy, it will be possible to achieve an extensive understanding of the thermal profile of the spacers and even a deeper knowledge concerning the technological choices.

It frequently happens that the people living in a border zone tend to be seen with fascination. Due to their geographic position, they share characteristics of different cultures, adopting some features and rejecting others according to what they perceive as proper and representative. It is then intriguing trying to grasp these people by looking not only at the material culture but also and especially at the technological choices that lay behind the production activities, by pursuing a label-free perspective on these liminal communities.

A. BURIED BY TIME. OS CASTRULLOS AND THE PROBLEM OF THE ‘HENGIFORMS’ SITES IN GALICIA (SPAIN)

Abstract author(s): Prieto-Martínez, M. Pilar (EcoPast, USC; CISPAC) - Nieto-Muñiz, Eduardo-Breogán (Breogán Arqueología) - Cordeiro-Maañón, Luis (EcoPast, USC) - Castro-González, M. Guadalupe (EcoPast, USC; CISPAC)

Abstract format: Poster

The so-called circular enclosures or ‘hengiforms’ sites in Galicia are a new type of site identified for the first time in 2006 that is still not totally defined. These enclosures are circular-shaped sites defined by an exterior perimeter ditch and parapet and by the scarce material culture found inside their structures. Today they are hidden sites in the landscape, but they were probably very visible when they were in use.

Six of these sites have been partially excavated and only four have radiocarbon dates ranging from the middle of the second millennium BC to the end of the first millennium BC. We still do not know the specific use of these sites, but their architectural features and their material culture suggest that they may have had a ceremonial function related to community or intercommunity social relations and linked to funerary rites. Os Castrullos site, located in Forcas (Parada de Sil, Ourense, NW of Spain), is the most recently excavated hengiform site in Galicia. Our objective is to show the preliminary results of the small excavation carried out at this site, such as its construction, the material culture identified or its C14 dating, to later analyze it in a broader regional context.

COMMODITY, CONTAINER, CONSUMPTION - EUROPEAN STONWARE BETWEEN REGIONAL AND GLOBAL TRADE SYSTEMS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Keller, Christoph (LVR - Amt für Bodendenkmalpflege im Rheinland) - Hall, Derek (Independent Researcher) - Röser, Christian (LVR - LandesMuseum Bonn) - Witte, Frauke (Museum Sønderjylland)

Session format: Regular session

During the 13th century a significant change in ceramic technology took place, when potters in different European regions began to produce stoneware. Since then vessels for drinking, serving and storing were made not only for local consumers, but were also distributed to distant markets. Products from potteries like Martincamp (FR), Siegburg (D) or Nottingham (GB) can be found frequently in archaeological sites not only in Europe but also in former overseas colonies, which raises numerous questions concerning trade, demand and use of stoneware vessels.

The session will investigate the development in producer-consumer relations, which changed trade routes and resulting distribution patterns. Can stoneware be primarily seen as trade good or must one rather assume that they were used as containers for all sorts of commodities like Rhenish Bartmann jugs, which were shipped in large numbers to England to serve as transport containers for wine retail? Did preferences for specific stoneware workshops exist in past communities, which resulted in rising demand, or even the founding of new workshops?

In addition to the trade and direct use of stoneware vessels, the session will also focus on their meaning for the consumers. Was Rhenish stoneware really an expression of a "Hanseatic culture" in an urban context, as postulated in past research, or do finds in rural settlements in the Baltic paint a different picture? Were stoneware vessels really seen as part of a wealthy table or is this interpretation more likely to be due to the bias of the archaeological record? Did consumers care about the origin of products?

ABSTRACTS

1 DISTINCTION OF PROTO- AND FULLY DEVELOPED STONWARE FROM BRÜHL-PINGSDORF, SIEGBURG AND BEYOND WITH NON-DESTRUCTIVE XRF ANALYSIS

Abstract author(s): Wilke, Detlef (Dr. Wilke Management & Consulting GmbH) - Stephan, Hans-Georg (Institut fuer Kunstgeschichte und Archäologien Europas, Archäologie des Mittelalters und der Neuzeit, Martin-Luther-Universität Halle-Wittenberg)

Abstract format: Oral

After several centuries of large-scale regional and far distance export orientated earthenware production in the left-Rhenish potter's villages of Badorf, Eckdorf and Pingsdorf, proto-stoneware was developed around 1200. At the same time pottery production was intensified for the first time on a large scale in Siegburg, some 20 km across the River Rhine, where even higher quality tertiary clay deposits allowed for the technical development of fully sintered stoneware in the course of the 13th century. During the 14th century Siegburg acquired its leading production and export position, which was kept for almost three centuries. As in case of proto-stoneware the commercial attractiveness of fully fused stoneware motivated other workshops to join this technological and stylistic trend in the later middle ages, although often on a much lower production scale and for a shorter period of time only.

Indeed in Brühl using clays from nearby Pingsdorf, a production of fully developed stoneware with almost identical stylistic features has been established, which is difficult to be distinguished from Siegburg ware by mere visual criteria, particularly in highly fragmented status. Non-destructive X-ray fluorescence analysis is an appropriate method for allocating both intact museum specimens as well as sizeable sherd collections from archaeological find contexts to Siegburg and Brühl-Pingsdorf element patterns, respectively, which is based on minor compositional differences in the clay deposits on both sides of the Rhine valley.

The early Rhenish production sites were of crucial importance for the subsequent European stoneware manufacture. Inter alia other pottery locations in the Rhineland as well as in Hesse, Lower-Saxony and Central Germany were influenced by their innovations and participated in the development from c. 1250 onwards.

2 LATE MEDIEVAL COPYRIGHT VIOLATION? „MANGANESE VIOLET PROTO-STONEWARE“ - A BESTSELLER AND ITS POSSIBLE IMITATIONS

Abstract author(s): Hanauska, Petra (Landesamt für Denkmalpflege Hessen, hessenARCHÄOLOGIE) - Sonnemann, Thorsten (Archäologisches Museum Frankfurt)

Abstract format: Oral

The late Middle Ages saw in Germany the distribution of a pottery product, immediately recognisable by its characteristic colour and its metallic gloss – the so-called Manganese Purple Proto-Stoneware. It must have been very popular with costumers, because it was produced at several sites in today's state Hessen. At least one more production centre was situated outside Hessen in Mayen (Rheinland-Pfalz). Because the ware was so popular, it comes to light in a large number of late medieval settlement contexts for example in the Rhein-Main-Area.

Two of these pottery villages, Dippenhausen and Aulhausen, are neighbours in the Rheingau area, which is why their products are called “Rheingau Ware”. The earthenware comprises mainly cooking pots while the Proto-Stoneware came in handy for drinking vessels, namely jugs and beakers. The products of these two villages are so similar, most museums did not even label them separately in their collections. This is why statements about each village's economic potential are impossible without scientific analyses, in this case with a hand-held XRD analyser. Who supplied whom with ceramics?

Around 100 km to the northeast lies Aulendiebach, another production centre of Manganese Purple Proto-Stoneware and some of these products were also examined by a hand-held XRD analyser. The most remarkable thing is, that the workshops in Aulendiebach also produced earthenware beakers with a purple slip on the outside (!) as to imitate their proto-stoneware cousins. It seems that the customers cared more about the colour than about the suitability of the beakers for drinking liquids. Can we trace here late medieval product pirates? Or were these bargain goods?

Since the research on Hessen's Manganese Purple Proto-Stoneware is still in progress, the presentation summarises the current results from the “classical” archaeological investigations as well as those that were achieved by undertaking chemical analyses.

3 MARBLES: THE ENIGMATIC ALL-ROUNDERS AMONG STONEWARE

Abstract author(s): Liebetrau, Sabrina (freelance archaeologist)

Abstract format: Oral

In the sixteenth century, stoneware marbles began to replace the centuries-old earthenware types. Two centuries later, the Hessian pottery production centre Großalmerode reportedly produced millions of brownish salt-glazed stoneware balls called ‘Knicker’ or ‘Schusser’ and sold them all over the world. These stoneware marbles seem to have been so characteristic of the place that they were even included in the town's coat of arms (together with the famous crucibles) when Großalmerode was granted town rights in 1775. Quite often recovered from excavations, and mentioned in reports and papers, they are rarely discussed in detail. Therefore, it is still not fully understood what people actually did with the masses of stoneware balls.

Combining archaeological, historical, and cultural anthropological data, this study seeks to clarify the use and distribution of the variously sized stoneware balls between 1600 and 1900. The key to interpreting them lies in their multi-functionality. While eighteenth century sources describe production methods and trans-regional trade, their claims that the stoneware balls were used as toys and ammunition in shotguns and cartridges are not fully convincing given the huge production numbers. A look at rural customs shows that there may have been an everyday use in bird hunting with blowguns until the nineteenth century. Another possible explanation would be a technical use, which could explain not only the large production volume and long-distance trade but also the range of sizes. Thus the talk presents a group of understudied stoneware objects which are closely related to stoneware vessels due to their mode of production, yet occupy several different niches in material culture.

4 FRENCH STONEWARE FROM THE WORKSHOPS OF SAVIGNIES (BEAUVAISIS): NEW RESEARCH

Abstract author(s): Miellé, Lauriane (Service Archéologique Municipal de Beauvais)

Abstract format: Oral

The first research about the french stoneware of the village of Savignies (Beauvaisis region) have beginning in the 1960s, by the Groupe de Recherche sur la Céramique du Beauvaisis (GRECB). The diffusion of the search stayed incomplete, and the articles on the topic are rare. Today, the workshops situated in the village are better known. The evolution of the ceramic activity is attested between the end of the medieval period until the XVIIth century.

The recent studies and the recent excavations make possible the elaboration of new typology, with the evolution of forms. A focus is realized about the tableware, which is traded in all the worldwide. The jugs and the the small cups are the best known models. Nevertheless, flasks, ewers, plates or more simply the lids are an important part of the

production. The “masterpieces “ -results from special order- are known thanks to the excavation realized in the town of Beauvais, situated at 12 km from the village of Savignies.

This paper is a synthesis about the new research.

5 ANALYSIS OF STONWARE FROM THE NORTH OF FRANCE BASED ON PRODUCTION AND CONSUMPTION SITES

Abstract author(s): Vincent, Vaiana (INRAP)

Abstract format: Oral

The Hauts-de-France region (located at the northern end of France) has several stoneware workshops in its territory, notably in the Beauvaisis region of Picardy. To this must be added the proximity of production sites in Normandy (Bessin-Cotentin, Domfrontais and, of course, Martincamp) and the Belgian workshop of Bouffioulx, not forgetting the Rhine stoneware which are barely 200 km from the study area. More recently, a new stoneware production site was uncovered last year in the Pas-de-Calais, in the commune of Montreuil-sur-Mer. This paper will present the uncovered production, dated to the end of the 16th-beginning of the 17th century, its similarities and particularities compared to other objects of the same period. Secondly, an analysis of the stoneware from the consumption sites in the region will allow us to identify the places of production, which is not always an easy task given the extreme similarity of certain productions and the variety of colour and appearance of certain stoneware. Indeed, the example of the Montreuil-sur-Mer workshop, of which, to our knowledge, no clay-to-make-stoneware is known in the region, shows that the clay is likely to have been imported, which greatly complicates identifications. Analyses are underway. Another interesting point is the concomitant presence, on the consumption sites, of Siegburg and Beauvaisis stoneware. In fact, these two centres produced identical objects, which are sometimes difficult to distinguish with a fairly similar evolution. However, the analysis of their representativeness on the consumption sites shows a differential distribution, probably illustrating different trade flows and preferential networks.

6 STONWARE PRODUCTION ALONG THE MEUSE IN BELGIUM. HIGHLIGHT ON A DEVELOPING FIELD OF RESEARCH

Abstract author(s): Pirson, Marisa (Agence Wallonne du Patrimoine)

Abstract format: Oral

Belgium stands in the middle of the European stoneware sphere: situated right at the west of the famous German centres, it is known for its workshops in Châtelet-Bouffioulx, especially active between the 15th and 17th centuries. But other little-known stoneware production centres seem to have existed as well, including along the river Meuse, where traces of potters have been observed. Historical research in the 19th century mentioned them, and from the end of the 20th century, archaeology has brought to light some solid evidence.

In Namur, misfired stoneware from the 17th and 18th centuries has been excavated during archaeological digs that took place in 2020 and 2021 on the « Herbatte » site. According to the archives, they could come from the manufacture of Jean-Baptiste Chabotteau, who seems to have started his stoneware production upstream of the Meuse at Dinant, before developing workshops in Namur as well.

We can connect those production shreds to discoveries made at the consumption site of the « Hôpital Saint-Gilles » in Namur, where a waste pit dating to the same period and containing lots of similar stoneware was dug out.

In Huy, further on the Meuse, other shreds of misfired stoneware and production artefacts were found in 1999 on the « Place Saint-Jacques » site. Dating from around the same period, the workshop from which they came from was not found either.

The Meuse's stoneware is richly decorated with a wide variety of ornaments mostly moulded then applied, coloured in blue and mauve. It can be linked to the Westerwald productions from a typological and decorative point of view. However, it developed local and regional particularities that enlighten us on the local trends and on the way of life of those populations.

7 NEW INSIGHTS INTO EARLY STONWARE IN AMSTERDAM

Abstract author(s): Jayasena, Ranjith (Gemeente Amsterdam)

Abstract format: Oral

In recent years the development of a typo-chronological overview of ceramics in Amsterdam, based on the national classification system of ceramics, known as the Deventer System, triggered a renewed analysis of ceramic assemblages and their contexts excavated in Amsterdam since the 1950s. This exercise, with a key role for stoneware, resulted in a refined ceramics chronology, as well as new insights into the chronology of the urban development. For decades the dating of the city's earliest ceramics was under debate. For example, the transition from proto-stoneware to real

stoneware was dated earlier in Amsterdam compared to the rest of the country. These differing interpretations had impact on the theories about the city's development in the 13th and 14th century. New insights not only synchronised the chronology of stoneware with the rest of The Netherlands, these also offered new dating information refining our insights into the introduction of stoneware on a national scale.

8 BEER, BURGHERS, BERGEN – MEDIEVAL AND EARLY MODERN STONEWARE SEEN FROM NORWAY

Abstract author(s): Demuth, Volker (Museum of Archaeology / University of Stavanger)

Abstract format: Oral

As a country without domestic pottery production from the 11th to the 17th century, ceramics from Norway reflects the northern European trade and use of pottery in this period in a special way. Bergen was the largest medieval city in Scandinavia and the largest town in Norway before industrialization. The city housed one out of four Hanseatic kontors and a large migrant community from Hanseatic towns. Archaeological excavations provided a large pool of stratified archaeological material, with ceramics as the largest find group and stoneware as one of the most frequent types of pottery. Outside the urban centers, much less medieval and early modern ceramic is known in Norway, but stoneware from several non-urban findspots, shed informative light on distribution and use of these wares.

German stoneware” is a much-used term in historical archaeology, yet it comprises different ceramic wares, which despite technological and functional similarities, may be interpreted on their respective cultural-historical background. Wares as Rhinish proto-stoneware, lower Saxon medieval stoneware, fully developed Siegburg stoneware and Renaissance stoneware with molded decoration reflect quite specific social and economic phenomena and should be discussed accordingly.

One thing that strongly links many of these vessels, is however their obviously primary use for the consumption of alcoholic beverages. In a Norwegian context, stoneware illustrates mainly the import and consumption of beer from the Hanseatic cities, but also the import and use of wine seems to certain degrees reflected in stoneware finds. Aside the purely economic aspects of this barter, drinking habits are also highly social issues, which are highlighted by the presence of stoneware-vessels. The Norwegian case may offer a foil to discuss general cultural-historical aspects concerning the use and distribution of stoneware in a broader perspective.

9 “MY THOUGHTS ARE WHIRLED LIKE A POTTER’S WHEEL” – STONEWARE, SCOTLAND AND IRELAND

Abstract author(s): Hall, Derek (Independent Researcher)

Abstract format: Oral

Medieval Scotland always looked towards Continental Europe for its trade and contact and this is probably best expressed in William Wallace’s ‘Lubeck letter’ of 1297 after his victory over the English at the Battle of Stirling Bridge telling everyone that Scotland was open for business again. This strong relationship is reflected in the wide range of imported pottery that is recovered from excavations in the burghs and monasteries of what was a vibrant independent Kingdom until its Union with England in 1707. Stoneware vessels from Germany and France begin to appear in Scotland from around 1350 and are recovered from excavations in the major Scottish burghs and monastic houses. This paper will consider the results of more than 40 years of excavation, largely in advance of development, and assess what sorts of vessels are represented, where they are coming from, how they got to Scotland and why Stoneware manufacture in Scotland is not something that really happens until the massive Industrial boom of the 19th century. A brief overview of stonewares excavated from Dublin in the Republic of Ireland will also be given.

10 NOT ONLY FOR DRINKING PURPOSES - FUNCTIONS OF HIGHLY DECORATED RHENISH STONEWARE IN CENTRAL EUROPA IN THE 16TH CENTURY

Abstract author(s): Pfeiffer, Sören (LVR-Landesmuseum Bonn)

Abstract format: Oral

The highly decorated stoneware of the 16th century has been brought to our attention by the collecting activity at the time of historicism. Apart from its form and its technological features, it was considered part of aristocratic table manners precisely because of its ornate design. However, the applied illustrations also show that the vessels were used in various functions in the early modern period and were involved in actions outside of the context of drinking. These include, for example, diplomatic gifts, the use as a baptismal vessel or the integration into the culture of remembrance. This contribution attempts to present the range of different functions of rhenish stoneware of the 16th century. For this purpose, art historical information, historical sources and, of course, archaeological sources are included in the analysis. Furthermore, the lecture tries to take a quick look at the table manners of the 16th century in

Central Europe, to outline existing differences and examines stoneware as a drinking vessel in this context. In addition, the question is raised whether highly decorated stoneware was only to be found at the table of the nobility or not.

11 CERAMIC COMPETITORS - THE DISTRIBUTION OF 16TH CENTURY SIEGBURG AND COLOGNE STONEWARE IN THE WEST

Abstract author(s): Keller, Christoph (LVR - Amt für Bodendenkmalpflege im Rheinland)

Abstract format: Oral

During the 16th century highly decorated brown stoneware was developed by potters in Cologne (Germany). By the mid 16th century some of them moved to nearby Frechen, where they had family ties, and started to produce the same kind of decorated wares there. During the second half of the 16th century potters at Siegburg started to copy designs and vessel forms in a white stoneware.

All three production centres were competing for the market exporting their products to northern Europe. While the potters guild from Siegburg could rely on long established trade links within the network of the Hanseatic league, the newcomers were forced to set up new connections. Cologne as the major trade hub in western Germany was the first step in this newly established trade system. Toll records of the Rhine trade differentiate between “Cologne” and “Siegburg” pottery indicating that custom officials as well as customers were well aware of the different wares.

By looking on the distribution of the different Rhenish stonewares in the west of Europe (from Spain to Ireland) and in the New World the talk will focus on the question, why Siegburg stoneware was never really able to expand its sales area beyond the Hanseatic network in the North Sea and the Baltic. Did they rely on their established trade connections, while potters from Cologne and Frechen made contacts with the rising merchant community in England and the Netherlands?

12 STONEWARE GLOBAL TRADE SYSTEM AT STRAIT OF GIBRALTAR AND CÁDIZ BAY

Abstract author(s): Ruiz-Gil, José-Antonio (Universidad de Cádiz)

Abstract format: Oral

The objective of the communication to this session of the EAA will be to present the known and published stoneware specimens from the southern coasts of Spain (Bay of Cádiz and Strait of Gibraltar). In this sense we have two types of stoneware characteristic of different but very specific periods. Its distribution marks very precise historical moments in the Modern Age (second half of the 16th century-early 17th century) and in the Contemporary Age (19th century).

The first of these consists of three pieces from the vaults of the procession cloister of the convent of Santo Domingo in Jerez de la Frontera (province of Cádiz). These are bottles that have a ball-shaped body, a neck with a handle and a characteristic decoration of a bearded character (“bartmannkrüge” in Dutch) on the neck and the beginning of the belly opposite the handle. In Spain they are related to the Catholic Cardinal Roberto Bellarmine, which is why they are called “belarmines”. It is a very specific container, of a product that probably had to be transported from Flanders.

The second is also very defined. They are also bottles, but cylindrical in shape, with a short neck and a handle. As a main feature, they have stamps printed with the names of the distilleries that produced the packaged product: gin (Fine Genever type). The specimens we have studied belong to the bays of Cádiz and Algeciras. The distribution centre would be in Gibraltar and maritime communication explains the origin of the cans found both at the bottom of the sea, and in coastal towns, such as El Puerto de Santa María, San Fernando, or Jerez de la Frontera. In addition, the existence of a smuggling land route is shown.

13 SMALL FRAGMENTS HERE AND THERE, THEY'RE ALMOST EVERYWHERE! STONEWARE IN FINLAND

Abstract author(s): Helamaa, Maija (Muuritutkimus Ltd.)

Abstract format: Oral

Small amounts of stoneware are found in almost every archaeological site, especially urban contexts, around Finland. Medieval and post-medieval rural sites are less excavated, but stoneware sherds are present in many cases. The medieval vessels are introduced by Hanseatic merchants and the trade routes of the Baltic Sea play major role during the post-medieval and early modern periods as well. This paper will give a basic overview of stoneware distribution in Finland.

The pottery assemblages in Turku, southwestern Finland, allows to examine the stoneware in more detail. A case study focuses on the post-medieval vessels found in different parts of the town. Does the status of the districts reflect in the amount or types of stoneware found in them?

The imported stoneware is not listed in the 16th and 17th C. toll registers. They were perhaps shipped in really small amounts and / or considered as too little value. The stoneware vessels may have been sent as gifts as well. Maybe they were sometimes brought by merchants and sailors who didn't have to declare their own small personal cargo.

Stoneware was rare but still customary in the households in Turku. Were the vessels special, or just convenient for liquids? Were they in everyday use? When it comes to the highly decorated renaissance wares, what did the decoration mean to Finnish consumers? Did they know the meanings of the depictions on their jugs and tankards or were they just nice pictures?

14 STONEWARES ON THE PERIPHERY

Abstract author(s): Ratkai, Stephanie (Barbican Research Associates)

Abstract format: Oral

Stonewares were plentiful across Europe except when and where they were not. Can we give a universal meaning to stoneware in any given period without examining the relative frequency and geography of these wares?

This paper will try to alter the perspective from which stonewares are viewed in England. This arises largely from Eastern England and important sea and riverine ports such as London, Southampton, Newcastle and Exeter and their hinterlands. The perspective is also influenced by the relative proportion of work undertaken in different areas of the country, but the West Midlands, which forms the basis of this study, although relatively impoverished in terms of large excavations has had enough excavation in both urban and rural sites to provide sufficient comparanda for the late 15th to mid-17th century.

Site types considered in this study will include Dudley Castle, Stafford Castle (both in Staffordshire) and Wigmore Castle (Herefordshire), important towns and cities such as Coventry, Warwick and Birmingham (Warwickshire), Hereford and Shrewsbury, religious sites such as Haughmond Abbey (Shropshire) and rural settlements including Burton Dassett (Warwickshire).

Does the relative infrequency of stonewares in the West Midlands bestow a different value on them. If so, how might this be revealed? How do we account for 'motto jugs' in rural areas where the population, even if not illiterate, was unlikely to be familiar with a foreign language.

15 NO JUGS NEEDED? THE LACK OF STONWARE IN PARTS OF DENMARK

Abstract author(s): Witte, Frauke - Hartwig, Anders (Museum of Southern Jutland)

Abstract format: Oral

Since stoneware began to be produced in many areas of Europe, it became a sought-after commodity in areas where local production of stoneware was not possible. The lack of raw materials and technology also led to imports in Denmark over several centuries. The oldest stoneware imports date from the 14th century from the Rhenish area.

Especially in excavations in towns, various stoneware is found in the cultural layers. In the countryside, on the other hand, only isolated sherds are found. Naturally, the accumulation of finds is concentrated in the merchant towns, where the ships with the merchandise docked. From there, the goods were distributed into the countryside - but seemingly only in very small quantities.

Apparently, the goods only reached the north and north-east coasts by sea, but the country was not provided by land. This proves the trade routes that were the main routes for goods traffic to Denmark during the Hanseatic period and afterwards. And it also proves that people only docked in certain places and that the distribution of goods from there was only continued into the country to a limited extent.

This paper will focus on the stoneware on the southern part of Denmark and give an overview about the finds in towns and on the rural sites.

16 THE GLOBAL DISTRIBUTION OF RHENISH BARTMANN JUGS IN THE AGE OF COLONIALISM

Abstract author(s): Röser, Christian (LVR-LandesMuseum Bonn)

Abstract format: Oral

One of the most widespread and iconic products of the Rhenish stoneware potteries were the Bartmann jugs (also known as bellarmines). They were produced in different and over time changing variations in a number of production sites in the Rhineland, among which Frechen is the most prominent due to its high output quantities. From there, Bartmann jugs were exported via the established trade routes along the Rhine, initially downstream to the Netherlands and from there eventually further to England. In both countries, Rhenish Bartmann Jugs were an integral part of material culture and drinking habits in the early modern period. Understanding the ways in which the vessels spread beyond this into the European powers' overseas colonies is more complicated and cannot be reduced to the idea of Bartmann Jugs being distributed as a commodity. Evidence shows for example that they also served as containers for

various liquids that were used on board ships or in the colonial sites. Therefore, this paper aims to give an overview of the Bartmann Jug phenomenon, starting at the production sides and following the trade routes and shipment to their final destinations while also considering their cultural impact in the respective environment.

281 CONTEMPORARY ARCHAEOLOGY AND COMMUNITY INVOLVEMENT [PUBLIC ARCHAEOLOGY COMMUNITY]

Session theme: 3. Heritage Narratives and Representations

Session organisers: Benetti, Francesca (Independent Researcher) - Oldham, Mark (Norsk institutt for kulturminneforskning) - Westmont, Camille (University of Cambridge)

Session format: Regular session

Contemporary archaeology is a growing field of interest, and often deals with sensitive topics (e.g. conflicts, or marginalised social groups). Due to its nature closely linked to today's society, it can enhance sense of place or social cohesion, thus contributing to a positive political agenda, fostered both globally with the UN 2030 goals, and in the EU (through policies and dedicated funding streams). However, it can also be exposed to political (mis)use or critique. A strong link with local communities is often a typical trait of contemporary archaeology projects, and it requires particular attention from archaeologists.

This session aims to explore how communities are (or can be) involved in contemporary archaeology projects, what are the opportunities, but also the risks to be taken into account, and how can we mitigate them. What are the factors of success of a contemporary archaeology project involving local communities? Can collaboration between archaeologists at the European level (e.g. through EAA Communities) help? Is it possible to find elements useful to build a shared practice?

ABSTRACTS

1 WYLDemerck: COLLABORATIVE CONTEMPORARY ARCHAEOLOGY WITHIN A DUTCH-MOLUCCAN POSTCOLONIAL CONTEXT

Abstract author(s): Kok, Marjolijn (Bureau Archeologie en Toekomst)

Abstract format: Oral

Collaboration at every level of research and contemporary archaeology is a fruitful combination. The participants have intimate knowledge of the material culture and contemporary archaeology can explore new ways of looking at their heritage. Furthermore, this is the kind of heritage that migrant groups can take equal part in. In this way they become part of the heritage of their (not-so) new homes. Rules and regulations may pose problems but projects like these can also shift policies. And contemporary archaeology does not necessarily depend on excavation, leaving more room to manoeuvre.

In the project Wyldemerck contemporary archaeologists and old-inhabitants, family and local friends do archaeological research at an Islamic Moluccan camp in the Netherlands.

After the independence of Indonesia, the Moluccan people who had served in the Dutch colonial army (KNIL) were ordered to move to the Netherlands for a few months but most never returned home. On arrival in the Netherlands they were fired from the army and forced to live in 90 camps, including former concentration camps. A minority was Islamic and after years of struggle to practise their religion freely, were placed in a separate camp in Wyldemerck. They lived there for fifteen years until 1969. They were moved to housing in several towns over hundred kilometres away. This project is one of the first successful Dutch archaeological projects where the participants determine the research goals. It goes beyond the local as people live across the Netherlands and connects with the locals of Wyldemerck who still have bonds with the Moluccan people. We rediscovered the location of the second mosque in the Netherlands. A forgotten colonial history within the Netherlands has gained a place in the heritage discourse. Showing that migrants have important histories to tell that intertwine the global and the local.

2 COMMUNITY ARCHAEOLOGY IN THE MIDDLE MOUNTAINS OF VERSILIA (ITALY)

Abstract author(s): Anichini, Francesca - Gattiglia, Gabriele - Basile, Salvatore - Sciuto, Claudia (University of Pisa)

Abstract format: Oral

In the last four years, The MAPPa Lab of the University of Pisa has been researching the abandonment processes in the mountains of Versilia, northern Tuscany (Italy). An area we define as the middle mountains: neither characterised by the highest peaks nor hills but by the continuous negotiations between humans and the environment. The research focuses on the last two centuries, particularly the second half of the 20th century, strongly scarred by the Second

World War. How did landscapes, tasksapes, and human and non-human relationships on the mountain change when the world started accelerating? Which tangible and intangible traces mark these transformations? And, which is the perception of the abandonment processes by the local communities? Beginning to observe and listen needs of the communities, we started to build a multilayers map, including mapping and incorporating data from archaeological surveys, memories and identity co-designed cartography involving schools (teachers, children, and families), collecting ethnographic data through interviews, and more than one collective counter-mapping of memories associated with landmarks. The aim is to link and preserve tangible and intangible memories to return as the result of shared and community work. Working with communities is not simple: it requires work, continuity, empathy, and proximity to create relationships and confidence and share knowledge and skills with a common aim.

3 FIRST WORLD WAR REMAINS IN THE ALPINE AREA IN ITALY: POTENTIAL AND PITFALLS OF PUBLIC INVOLVEMENT

Abstract author(s): Benetti, Francesca (Independent Researcher) - Cappellozza, Nicola (SAP Società Archeologica)

Abstract format: Oral

In Italy, the law for the protection of cultural heritage states that archaeological research must be authorised by the Ministry of Culture, and all archaeological remains have to be reported to the Soprintendenze (peripheral offices of the Ministry). Hobbyist metal detecting is forbidden in archaeological areas, but allowed in all other areas, provided that metal detectorists abide by the law and report archaeological finds. However, First World War remains are often not perceived as archaeology, and frequently not reported. This results in the loss of archaeological knowledge – but can have more serious ethical consequences. If finds are not scattered remains but part of a grave or of a primary deposition, an un-cautious excavation can result in the loss of the possibility to give the buried person a name, and therefore an identity. This presentation will explore operational pitfalls of the legislation, present some case studies and initiatives that archaeologists are doing to involve local communities, catalysing their interest towards common goals. Finally, we will call for a better structural collaboration with the public. Due to climate change, which is putting at serious threat several remains dating to the First World War in the Alpine area, this is a urgent call for action.

4 LEGAL DEFINITIONS AS A CORNERSTONE FOR PROTECTING ARCHAEOLOGICAL FINDS FROM ILLEGAL EXPORT AND TRADE

Abstract author(s): Antal, Robert (Institute of Archaeology of the Czech Academy of Sciences) - Lewis, Michael (British Museum)

Abstract format: Oral

Defining ‘cultural property’ is fundamental to protecting archaeological heritage, but these legal definitions can vary from state to state, even within individual territories - England within the UK is a good example of the latter. Consequently, similar artifacts may have differing legal status (and therefore protection) depending on their country of origin. The task of this contribution is to examine - using the example of the Czech Republic and England (within the UK) - how these legal definitions affect the volume of protected objects and human behaviour towards cultural property, specifically in relation to searching for archaeological finds to trade or sell. Furthermore, we will consider how Europe might, on a theoretical level, benefit from states moving together in developing legislation that could protect the exploitation of archaeological material for personal gain. In order to comprehensively examine the problem, obstacles preventing states in moving national legislations together will be presented.

5 METAL DETECTING: A HOBBY OF RANDOM SEARCHING FOR CASUAL LOSSES?

Abstract author(s): Westcott, Keith (DIF. The Detectorists Institute & Foundation)

Abstract format: Oral

Regularly practiced by approximately 40,000 hobbyists, Government figures state that over one million individuals across England and Wales have used a metal detector at some point, across a 12-month period... current issues of a fast-depleting resource of portable antiquities and a scarcity of ‘undetected’ land, go hand in hand.

Defended by those who often prosper from the highly monetised sector of metal detecting, the narrative of pursuing a harmless hobby finding ‘decontextualised’ old things, cloak the reality of an on-mass targeting of historical artefacts and archaeological sites. Evidenced in the approach to promoting ‘pay to dig’ rallies, locating digs on and around recognised archaeological sites is a preferred way to attract the numbers required, to pay landowners and create a profit. Coinciding with today’s media fixation with the monetary outcome of finding treasure, is the online availability of digital archives and platforms providing lidar, aerial images and locations of many ‘yet to be defined’, archaeological sites. Often unaware of their land’s historical significance, the landowners, and farmers in considering their typical yield per acre, welcome the income from a visit from a few hundred detectorists... detectorists who know very well (or conversely, should know) the archaeological potential of the land.

A community approach: The metal detector, particularly when spatially plotting finds/dating evidence in combination with geophysical surveys, is an effective archaeological tool. Introducing DAPAS: Detailed and Partial Artefact Survey - Our award-winning course held at the University of Oxford is designed to create a new Practitioner level of detectorist, a competent assistant to archaeologists capable of field walking whilst detecting, interested in all material artefacts. Hobbyists too, can adopt our conservational best practice approach and engage with local community archaeologists and history societies.

Detectorists have a great potential in becoming citizen scientists... our mission is to provide the opportunity.

6 CULTURAL HERITAGE AND TRADITIONAL KNOWLEDGE IN A RIGHTS PROCESS IN NORTHERN NORWAY

Abstract author(s): Thuestad, Alma (NIKU - Norwegian Institute for Cultural Heritage Research)

Abstract format: Oral

The Finnmark Act of 2005 transferred about 96% of the area in Finnmark in northern Norway to the county's inhabitants. The Finnmark Commission has, since 2005, had a statutory duty to survey existing rights of use and ownership people in Finnmark have acquired based on long-term use of this formerly state-owned land. The Norwegian Institute of Cultural Heritage Research has, on behalf of the Commission, undertaken expert reviews on historical and contemporary traditional use of land and natural resources throughout the region. The reviews are primarily based on map-based interview surveys of local and Indigenous knowledge concerning traditional use. This includes information on physical structures and remains of structures linked to traditional use. Through this work, a unique knowledge base on traditional use of land and natural resources in a multi-cultural area is under preparation. Cultural heritage encompasses all traces of human activity in our physical environment, including places associated with historical events, beliefs and traditions according to Norwegian legislation. Cultural heritage, both immaterial and material, is thus a part of the knowledge base for the Commission and the ongoing rights processes in northern Norway. Some of the Commission's rulings regarding rights of use and ownership are now contested by locals and special interest groups, for example reindeer herder's associations and local land use associations. The overall aim of this study is to investigate the role of cultural heritage and traditional knowledge in the ongoing rights processes in northern Norway. I will; 1) discuss our methodological approach aimed at providing data relevant and applicable for such a rights process, and 2) clarify and discuss what kind of data concerning use and heritage the Commission and local associations, respectively, regard as relevant and important for these processes.

7 ORDINARY CITIZENS AT THE FOREFRONT OF HERITAGE PROTECTION

Abstract author(s): Ulrich-Horn, Marietta (ARCH-Europe) - Benard, Cheryl (ARCH International)

Abstract format: Oral

Much attention has been paid - and appropriately so - to the dangers posed to historic sites and archaeological work by "civilian intruders" - everything from tourists to careless campers and acquisitive amateur scavengers.

These indeed can cause a lot of damage. But there is a converse side. In many locations, it is the ordinary citizens who love, guard, protect, and are instrumental in the conservation of heritage sites and archaeological exploration.

In one of our project locations, for example - Pavlopetri in Greece - the local population waged a decade long battle against the ships anchoring in their bay and damaging the underwater city it held. They formed human chains from the coastline into the sea, sent petitions to Athens and never gave up.

Dr. Nic Flemming, the lead archaeologist who discovered the site, credits their efforts with rescuing this unique place for the next generation of archaeological explorers.

In Austria, an innocent Alpine lodge built for the convenience of hikers and mountaineers, twice was occupied by militias and army units and was burned to the ground twice, in WW I and after lovingly being rebuilt, again in WWII.

Today, civil society groups and heritage organizations from three countries meet at this site regularly to celebrate festivals together and to talk about shared concerns such as environmental protection of the surrounding forest and meadows. The role of Citizen Historians and Citizen Heritage Activists and their strategies around cooperating with heritage professionals to protect sites will be explored in our paper.

8 COLLABORATIVE AND COMMUNITY-BASED ARCHAEOLOGY: A VIEW FROM THE UNITED STATES

Abstract author(s): Bello, Charles (Federal Emergency Management Agency) - Dillian, Carolyn (Coastal Carolina University)

Abstract format: Oral

Collaborative and Community-Based Archaeology continues to be an important and relevant topic in our profession – involving an ever-increasing (& often innovative) range of activities. I have organized nine sessions on this topic at Society for American Archaeology conferences – with over 60 participants. We remain committed to the concept of conducting research (& other types of historic preservation endeavors) in effective partnership with a wide spectrum of stakeholders. This just makes sense, is only fair, and contributes greatly to research. Clearly, our projects impact indigenous, resident, and descendant communities in many ways. And, although things are changing, often these groups still have relatively little input into what “others” are trying to accomplish. There are key concepts and recurring purposes and goals: tangible and intangible aspects of heritage; roles of descendant communities / other stakeholders; equitable decision-making; whole-community benefits; insider perspectives; and long-term community commitments. Community involvement gives a voice to groups that have been essentially voiceless, and also empowers all players, especially on projects that involve “multiple pasts.” Soliciting other views and asking for input just makes sense and is appropriate. As for my tenure as an archaeologist employed by the U.S. Federal Government, community involvement and consultation with interested parties is par for the course. More and more often, there are real opportunities for the whole-community (Indigenous, ancestral, recent residents, landowners, politicians, educators, etc.) to become involved in projects in really meaningful ways. It seems that we have now entered the “alternate dimension of conventional archaeology” (to quote a 2008 article in *Current Anthropology* assessing community involvement in South Africa). From my viewpoint we as a profession are now pretty well engaged in this new paradigm – we just have to continue to move forward!

9 PUBLIC PARTICIPATION, LANDSCAPE AND ARCHAEOLOGY FOR A COMMON WELLBEING

Abstract author(s): Maruri Arana, Ainhua - Pérez Cano, Maria Teresa (University of Seville) - Stagno, Anna (Università di Genova)

Abstract format: Oral

Archaeological sites have an intrinsic and undeniable relationship with landscape, since the choice of their emplacement is motivated by the strategic advantages and the characteristics of the territory. The accumulation of traces and knowledge has shaped the landscape over time, becoming a complex reality that shows human activity throughout the centuries, but which, nevertheless, is fragile, being at risk of abandonment and destruction. For the archaeological complex under consideration, taking its landscape dimension into account may represent new opportunities on different levels: understanding or explaining its original meaning and its evolution later of protection, of management, in a situation in which the social demand for its knowledge or enjoyment grows and, lastly, of management.

The definition of landscape since the European Landscape Convention (Council of Europe, 2000) defines landscape “as perceived by local people or visitors” which means that public participation must be part of any proposals involving landscape, and thus, archaeology, so it becomes a shared resource for the benefit of the population. Nevertheless, it is not always easy to involve people in this discipline due to the distance set by the technical level of it. This paper discusses the actual situation of the relations between archaeology, landscape and community participation, underlining the importance of making decisions with the engagement of society.

10 THE RELATIONSHIP BETWEEN THE GREEK PUBLIC AND THE UNDERWATER CULTURAL HERITAGE

Abstract author(s): Papadimitriou, Athanasia (Ionian University)

Abstract format: Oral

Highlighting the uniqueness and otherness of the underwater archaeological heritage and its inclusion in a wider social, political and economic context, require a contemplation in order to promote not only its commonly known but also its detailed history. In the context of underwater cultural heritage management, it is necessary that we redefine and redesign the targeted actions to communicate the vulnerability of the underwater cultural heritage to society and to expand the accessibility through active participation of the local community in its protection and promotion.

This paper examines the relationship of underwater antiquities with local society in southern Laconia. Thus, I focus on submerged and semi-submerged settlements as well as wrecks of ancient ships. More specifically, some of the sites that have been so far investigated in the research include Pavlopetri, ancient Asopos (modern Plytra) and the Kaptan Ismail shipwreck. The aim is to create a psychological profile of the local residents in order to identify their beliefs, their expectations, their interaction with tourism and finally their relationship with the maritime tradition of the area,

in order to create the appropriate management framework through the active and efficient integration of the local community and the local authorities. It then examines the ways in which scientific knowledge can be “translated” in order to present it in a simple and comprehensive way to the general public, creating the ground and the necessary tools for the development and evolution of innovative ideas.

Through the case studies, we will clarify the dilemma between the promotion and use of the underwater archaeological sites versus their protection, while highlighting that the best solution is the involvement of the local community.

11 **GROUNDING THEORY TO THE PRACTICE: BUREAUCRATIC AND POLICY PROBLEMS IN COMMUNITY ORIENTED SITE MANAGEMENT. THE CASE OF ITALY**

Abstract author(s): De Vivo, Caterina (Centro Studi Interdisciplinari Gaiola Onlus - Progetto Museo)

Abstract format: Oral

In 2020, Italy finally ratified Faro Convention officially recognizing the importance of engaging communities in cultural heritage management policies and strategies. In this framework, it is particularly relevant the innovation to the Italian heritage system introduced by the bottom-up approach to manage cultural heritage sites, which could become a model at European level. This approach, which started to be introduced in the early 2000s, is nowadays a very important tool in the Italian scenario; it is based on the idea of entrusting NGOs made of professionals with the task of managing abandoned or mismanaged archaeological sites or cultural institutions owned by the State (or other public bodies). Throughout the last decade, these experiences opened up the gate to community engagement projects and to community oriented management models, especially in respect to more traditionally managed sites, whose activities are more and more income oriented. Nevertheless, at a national level there are still many bureaucratic and policies implementation issues that are needed to be targeted to really implement the principles indicated by international guidelines. The involvement of volunteers, for an instance, is still very complicated for both a misunderstanding of the role of volunteers by the professionals themselves and legislative obstacles. At the same time, the private/public management of the sites still implies considerable sustainability problems which threaten the development of social projects that are often sacrificed to a more commercial use of the cultural heritage. This presentation is aimed at pointing out these issues starting from the direct experience in two bottom-up managed sites and in several state managed sites in the city of Naples (Pausilypon Archeological Park and Gaiola Underwater Park).

12 **AIMING SDG 11 ‘SUSTAINABLE CITIES AND COMMUNITIES’: URBAN ARCHAEOLOGICAL HERITAGE SITE INTERVENTIONS**

Abstract author(s): Hetemoglu, Asli (PhD candidate)

Abstract format: Oral

Population growth in urban centres leads to radical transformations in terms of super structural and infrastructural systems’ planning. Modern concerns and needs, such as industrialization, commerce, transportation, changing land use, and zoning, also pressure existing urban tissues and communities. Indeed, it leads to adverse impacts on urban archaeological heritage sites. Historic urban centres worldwide, such as Istanbul, Athens, and Rome, have faced such profound functional and social changes that test the ability to combine the maintenance of urban archaeological areas with new socio-economic realities. These changes must be well managed for the continuity of cities and communities.

On the other hand, the 2030 Agenda for Sustainable Development highlights the importance of culture in ensuring sustainability. SDG 11 and its targets, known as ‘sustainable cities and communities’, clearly point out the vital role of safeguarding heritage in making cities and human settlements sustainable amidst modern conflicts. However, historic urban areas confront severe challenges in balancing traditional and modern between a city of progress and a city of culture. This failure to establish a balanced policy in historic urban areas triggers conservation, management, and presentation problems for urban archaeological areas.

This research mainly aims to reassess the process of urban archaeological sites’ integration into ‘sustainable city’. Within this scope, different case studies from Türkiye, Italy, and the UK will be investigated to present the intervention ways and methods, especially in focusing on gains and losses. Besides, the term ‘sustainable city’ will be discussed in relation to urban heritage sites. How are urban archaeological sites affected by being conserved, managed, and presented under huge-scale modern architectural structures? Can urban archaeological sites be integrated into our contemporary lives without losing their cultural value?

Session theme: 3. Heritage Narratives and Representations

Session organisers: Dalen, Elin (Heritage management) - Kars, Eva (Commercial) - Bongers, Toon (University)

Session format: Regular session

Over the last 30 years, the archaeological field has significantly professionalised. It has evolved from a predominantly state-run sector to a development-led field where the responsibility of heritage management is divided between national agencies, universities, municipal governments, and private-owned companies. All the while, commercial archaeological companies are responsible for the majority of excavations, where new data is generated.

Despite this professionalisation, we are witnessing increased fragmentation. Fragmentation not only includes the division of responsibilities but can take many forms. On the one hand, data from commercial excavations may never be published or elaborated. On the other hand, the results from academic research may never reach people working in commercial archaeology or cultural management. Are we witnessing a gap between data generation, knowledge production, and agenda setting?

There are, however, promising examples of how to bridge these gaps. For instance, governments are allocating funds to study and synthesise data from old excavations, while heritage agencies are working with private companies and academia to set national research agendas.

This session critically investigates the characteristics and consequences of a fragmented archaeological field. Are the current developments for the better? In other words, has managing archaeological resources become a commodity instead of a field geared toward generating and preserving knowledge for future generations? Does a fragmented archaeological field lead to more efficient research and better results?

We welcome submissions from the entire archaeological field (e.g., academia, commercial archaeologists, and government officials) across all periods and disciplines to demonstrate, evaluate, and discuss fragmentation in archaeology with a solution-oriented approach.

ABSTRACTS

1 ARCHAEOLOGICAL LANDSCAPES OF CRIMEA UNDER OCCUPATION: FROM DESTRUCTION TO DECONTEXTUALIZATION

Abstract author(s): Yashnyi, Denys (National preserve)

Abstract format: Oral

After the occupation of the Crimea in 2014, the Russian Federation implemented several construction projects: the highway “Kerch-Sevastopol”, the gas main “Kuban Crimea”. An obligatory part of them was illegal excavations of more than 150 archaeological sites in the area allocated for construction, which led to the destruction of historical landscapes in certain regions.

During our research we analyzed the illegal digging carried out by Russia on the territories of the medieval agricultural landscapes of the South-Western Crimea and the defensive structures of the Bosporan kingdom in the East of the peninsula.

The system of fortifications of the Bosporan kingdom in the East of the Crimea consisted of three ramparts known today as Akmonaisky, Tiritaksky and Chokraksky. In 2014–2018 local archaeological excavations were carried out on these objects, but the fortifications were investigated exclusively at the sites of future trenching and construction. The historical landscape was divided into separate sections and lost its integrity. To facilitate the work of construction equipment, gas pipes were laid through the gates of the defensive ramparts, which are unique for this region.

“Stone mounds” or “cairns” that had been part of the medieval agricultural landscape of the Southwestern Crimea were subjected to illegal excavations for the construction of the Kerch-Sevastopol highway in their place. During digging of these objects on the Kok-Agach-Daglary Plateau, due to lack of experience and qualifications, archaeologists from the Institute of Archeology of the Russian Academy of Sciences made a mistake in interpreting the objects and identified them as specific mounds and sanctuaries of the Tauris.

Using the example of how Russia treated these historical landscapes, we can say that large-scale construction in the Crimea after 2014 led to the mass destruction of archeological monuments, their misinterpretation, and subsequent decontextualization.

2 ARCHEOLOGY IN CULTURAL POLICY OF MONTENEGRO: CURRENT POSITION, CHALLENGES AND GUIDELINES FOR IMPROVEMENT

Abstract author(s): Medin, Dušan (Faculty of Culture and Tourism University of Donja Gorica)

Abstract format: Oral

In this paper, the author presents part of his research on the current position of archeology in Montenegro, the country where he lives and works. Despite the existence of (more or less) adequate legislation and an institutional framework, as well as a more than century-long tradition of archaeological excavations, and – the most importantly – big archaeological heritage from prehistoric eras to modern times, the situation in Montenegro regarding the status of archeology should be improved. For example, there is still no national archaeological museum, the Society of Archaeologists of Montenegro (founded in 1974) practically does not function for years, there is no archaeological scientific institute or faculty/department of archaeology (but also for ethnology, anthropology, art history, heritage, natural heritage, museology, archives and library studies...). Also, more than ten years the previous national cultural institution Center for Archaeological Research of Montenegro was shut down, and big transformation on cultural heritage protection sector in Montenegro was conducted – not always with good results in practice. On the other hand, fortunately, archeology is still present and archaeologists are active in some of the national and local cultural institutions (e.g. Center for Conservation and Archaeology, local museums), and in recent years thanks to the role of the Montenegrin Academy of Sciences and Arts. So, this paper points out the key challenges facing archeology in Montenegro, and offers guidelines for its improvement.

3 EVERY CITY IS UNIQUE, BUT SOME CITIES ARE MORE UNIQUE THAN OTHERS. COUNTERING FRAGMENTATION IN URBAN ARCHAEOLOGY

Abstract author(s): Bouwmeester, Jeroen (Cultural Heritage Agency of the Netherlands)

Abstract format: Oral

Independence is in the city's DNA. Every city is in competition with other cities, especially those nearby. This has been the case since the first cities were founded in the Middle Ages. Sometimes it seems as if urban archaeologists have adopted this. Many of them emphasise what is special about their city in order to maintain their own position within the city. After all, a city councillor does not want to hear what makes his city similar to other cities, but what makes it unique. Time and money for research is scarce, and the choice of local interest is quickly made. When companies conduct research in cities without their own archaeologists, it is usually no different.

This is reflected in supra-local synthesising research, or rather the lack of it. A focus on the particular ensures that underlying patterns between cities are not seen. And paradoxically, this in itself works against this local view. If you don't know what fits into the patterns, then you don't see the uniqueness either. Or everything becomes unique...

The consequences for the field are profound. In terms of theorising and unravelling larger patterns and connections, urban archaeology is at a disadvantage. But there are also major improvements to be made in terms of methods and techniques. And all this in the context of a changing system and role for archaeology in society.(1)

The tide can be turned. Initiatives are being taken at different levels. It is up to us as urban archaeologists to link up with them and engage in debate with each other. Both at regional and national level and internationally, such as in the EAA Urban Archaeology Community.

(1) Bouwmeester & Belford 2020: Introduction: issues, principles and practice. In: P. Belford & J. Bouwmeester, *Managing Archaeology in Dynamic Urban Centres*. (Leiden). p. 7-18.

4 FROM ARTEFACT TO ALGORITHM

Abstract author(s): Nicolaij, Stephan (WOODAN Foundation)

Abstract format: Oral

WOODAN is a free to use, public database on archaeological wooden artifacts: www.woodan.org. The project started in the Netherlands and is now expanding abroad, seeking specialists who are willing to work together in creating a central database for the collection and accessibility of wooden artifacts. This has led to a system that is already available in four languages (Dutch, English, German, and French) and contains several thousand artifacts.

The WOODAN Foundation is a private research institute that collaborates with researchers from several countries to produce a freely accessible database. As of now we are working with specialists from the Netherlands, Belgium, Germany, Poland, and Austria. Our main project for 2023 is part of an effort by the Flemish government to synthesize and publish commercially excavated data. Our goal for the following years is finding more specialists or creating new partnerships with whom to further develop or expand our system / data.

Building an international archaeological database comes with its challenges. First there are the logistical challenges, such as [how do we finance the database?], [how can we ensure the database remains independent and free to use?]

or [how can we get universities or companies interested in participating?]. Next there are archaeological challenges such as [how can you talk of archaeological periods when different countries may have different definitions?] or [how can you ensure that the lists that you use are uniformly understood and accepted?]. Finally, there are technical challenges such as [what kind of database do you build?] or [what is the best way to link to a publication (refer to, link to or host)?]. These and many more are the subject of a presentation and open discussion called From Artefact to Algorithm.

5 AMERICAN ARCHAEOLOGISTS ABROAD: EXPLORING THE BENEFITS (AND DRAWBACKS) OF EUROPEAN FIELD SCHOOLS IN PREPARATION FOR CAREERS IN US-BASED COMMERCIAL ARCHAEOLOGY

Abstract author(s): Knierim, Rebekka (SWCA Environmental Consultants, Inc.) - Beglane, Fiona (Atlantic Technological University, Sligo) - Vellanoweth, René (California State University, Los Angeles)

Abstract format: Oral

Thousands of American archaeology students choose from hundreds of overseas field schools each year to learn excavation and field techniques first-hand. Indeed, it is quite common to encounter an American archaeologist whose first archaeological field experience was through a European field school. Participation in a field school is typically required to graduate with an archaeology degree in American universities, and moreover, is often essential on a CV when applying for a position in Cultural Resource Management (CRM), the US equivalent of commercial archaeology. But do European field schools adequately prepare students for a career in CRM?

The presenter, an American supervisor of field schools in Ireland and California, and a hiring manager for a US-based CRM company, uses as a case study her experience supervising excavations at Disert, a medieval monastic settlement and ritual pilgrim landscape in Co. Donegal, Ireland. The month-long field school in July 2022 was part of a multi-year project facilitated by the Institute for Field Research (IFR) in conjunction with Atlantic Technological University, Sligo and California State University, Los Angeles.

This presentation examines the benefits and disadvantages of European field schools in preparation for a career in a US-based CRM company. The presenter specifically details many examples of ways in which field schools in Ireland and California are similar (i.e. interpersonal student dynamics, basic excavation methods), and how they differ (i.e. site recording techniques, terminologies, and the laws and regulations associated with heritage management). The presenter then considers concepts and suggestions that academic field schools in Europe can incorporate to best prepare students for a life-long career in commercial archaeology, while meeting the required research objectives and providing students with the academic archaeological experience they desire.

286 AGENT-BASED MODELLING FOR ARCHAEOLOGISTS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Rocks-Macqueen, Doug (Landward Research) - Visser, Ronald (Saxion | University of Applied Sciences) - van der Knaap, Laura - Lambers, Karsten (Leiden University)

Session format: Workshop

In the last few years simulation approaches, such as agent-based modelling, have become increasingly popular among archaeologists. The aim of this workshop is to provide an introduction to agent-based modelling for archaeologists who have no previous experience in building archaeological simulations. Participants will finish the workshop with an understanding of agent-based modelling methods and the essential functionality of NetLogo.

The workshop will focus on explaining the process of developing a simulation as well as provide a practical hands-on introduction to NetLogo - an open-source platform for building agent-based models. NetLogo's user-friendly interface, simple coding language and a vast library of model examples make it an ideal starting point for entry-level modellers, as well as a useful prototyping tool for more experienced programmers. The first part of the workshop will be devoted to demonstrating the basics of modelling with NetLogo through newly developed open educational resources. These are guided tutorials that will take you through the NetLogo software and show you how to model with it, developed as part of the Erasmus+ project - Agent-Based Modelling for Archaeologists.

This introduction will give each participant enough skills and confidence to tackle the second exercise of the day: building an archaeologically-inspired simulation in a small group. Here we follow the popular concept of a "Hack-a-Thon" where participants aim to code a problem in small groups. The aim is for participants to work together to solve an archaeological problem. In this way, participants will walk away from the workshop with a piece of working code that they can use in future research.

No previous coding experience is necessary. Please bring your laptop along and install NetLogo beforehand: <https://ccl.northwestern.edu/netlogo/download.shtml>

NEW PERSPECTIVES ON CHILDHOOD ARCHAEOLOGY PAST, PRESENT AND FUTURE: PAPERS IN HONOUR OF GRETE LILLEHAMMER

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Ardren, Traci (University of Miami) - Lewis, Carenza (University of Lincoln)

Session format: Regular session

Few scholars have contributed as much to the development of the interdisciplinary field of Childhood Studies, and for as long a period of time, as Norwegian archaeologist Grete Lillehammer. From her early foundational article “A Child is Born: The Child’s World in an Archaeological Perspective” published in 1989, to her 2018 publication “The History of the Archaeology of Childhood,” Grete has paved the way for archaeologists around the world to grapple with the culturally specific definitions and experiences of childhood. This session aims to pay honour to the prolific and inspirational career of a pioneer in the archaeological study of age-based identities. It includes papers on aspects of the archaeology of childhood that seek, like Grete’s work, to define and understand the child’s world in time, space and society, with a particular interest in new insights or approaches to this still-elusive subject, reflecting Grete’s interest in future arenas of investigation yet to be explored within the archaeology of childhood.

ABSTRACTS

1 FLIPPING THE SCRIPT ON FEMINIST SCHOLARSHIP: CELEBRATING GRETE LILLEHAMMER AND THE ARCHAEOLOGY OF CHILDHOOD

Abstract author(s): Baxter, Jane (DePaul University)

Abstract format: Oral

Many studies have demonstrated that archaeological scholarship produced by women is not cited as frequently as works produced by men. Feminist scholarship also has demonstrated that topics perceived to be feminine or associated primarily with women are often marginalized, and considered relatively unimportant in the broader field of archaeology. This paper does not argue against these views, because they are valid and empirically supported. This paper does ask that we all take a moment to “flip the script” and celebrate success; particularly the incredible growth, fluorescence, and scholarly acceptance of childhood as a significant and serious topic of archaeological scholarship. This success can be traced directly to the publication of Grete Lillehammer’s 1989, „The Child’s World.“ Childhood now enjoys a widespread acceptance in the field, is increasingly prominent in publications and on conference programs, and has been integrated into larger dialogs on migration, labor, health, craft production and situated learning, households, ritual, care, and emotion- to name a few. These successes stem from a very brave and original work from an important foremother in our field, and have been carried forward primarily by women’s scholarship. We should take time to reflect on this success, on the work of an extraordinary woman, and say thank you for the inspiration her scholarship has provided to so many.

2 LIVE AND LEARN - IN SEARCH OF THE PIONEER CHILDREN IN THE COASTAL AND MOUNTAIN LANDSCAPES OF SOUTHWESTERN NORWAY

Abstract author(s): Dugstad, Sigrid (University of Stavanger)

Abstract format: Oral

Studies of skill transmission in lithic technology is important when trying to identify children in the archaeological record. In this paper, the results from a study of lithics from mountain and coastal sites in southwestern Norway will be presented. What can lithic analysis tell us about technological strategies, social organization, and hunter-gatherer childhoods? In Early Mesolithic Norway people were predominantly coastal hunter-gatherers. However, settlement sites in the mountains also provides evidence of seasonal exploitation of mountain resources. Researchers have for many years discussed who travelled to the mountain sites. Some have argued for the whole group (family group) while others have claimed that only task groups (a few adult males) visited the mountain region. This problem will be addressed from a technological perspective, and skill is used as an indicator to discuss site demography. Knowledge about lithic technology becomes especially important when evidence from organic material of any kind is lacking, as it is in Norway. An important aim is thus to demonstrate the potential in assessing the entire lithic material - what do this really consist of and why, and are there differences between coastal and mountain sites? Analysis of raw material strategies and individual sequences are considered essential keys to achieve a better understanding of activities, relationships, and the character of the social groups.

3 **GROWING UP IN LITTLE ICE AGE GREENLAND-THE CONTRASTING ROLES OF NORSE AND THULE CHILDREN IN ADAPTING TO CHANGING CLIMATES**

Abstract author(s): Vestergaard Meyer, Mathilde (Aarhus University)

Abstract format: Oral

Medieval Greenland (10th to 16th centuries) is an iconic case of one society – the agricultural and entrepreneurial Norse – failing while another – the foraging Thule Inuit – thriving under conditions of adverse climate change. What role did children play in these societies, and what does it mean growing up under conditions that likely were not only radically different socially but also changed dramatically over time? Living in Greenland during the second millennium CE entailed demanding adaptations to the long, cold winters and short, cool summers. The material culture of the Thule culture that entered Greenland in the 12th century is characterized by diversity and innovativeness, including a wide range of miniatures intended for children. Vivaly, Inuit youngsters needed to acquire technological expertise, mostly through observation and experimentation; both ethnographic and archaeological evidence paints a picture of independent and playful learning, for which the many miniatures they were provided with served as essential scaffolds. Thus, toys played a big part in Inuit children's lives – they were essential trappings in their ontogenetic niche. Norse children, in contrast, appear to have used a much more restricted range of toys, reflecting more normative and perhaps less playful childhoods. Notably, these toys are mostly limited to the agricultural niche the Norse brought with them from Iceland, and with competition. Furthermore, they show little change over time. Placed within a framework inspired by so-called niche construction theory and using methods that make visible the cognitive demands and processes related to toys (chaîne opératoire /cognigrammetry), I show how growing up differently has implications for being in the world differently, and how this helps us in understanding how these societies adapted – or failed to adapt – to the climatic changes of the Little Ice Age.

4 **FORAGING FOR FUN: ANSWERING LILLEHAMMER'S CALL TO EXPLORE THE SPATIAL WORLD OF CHILDHOOD**

Abstract author(s): Ardren, Traci (University of Miami)

Abstract format: Oral

Not every culture identifies and defines childhood as a unique identity with its own spatial dimension. Grete Lillehammer pushed archaeologists to critically investigate the evolution of a separate 'child's world', a specific period in the life cycle but also a unique time, space, and place (Lillehammer 1989, 2015). In some cultures distinct spaces that reinforce and create the identity of child are plentiful, while in others they are absent. How does the spatial dimension create "the child"? Children can be more or less isolated from adults and adult activities, the spaces in which they operate delineated as child-centric or without any indication of child-based identities. Archaeologists can measure "the separated or joined worlds of children and adults" but we have shied away from seeking evidence for childhood in cultures where children were unmarked as a distinct category of personhood.

Ethnographic studies of hunter-gatherer-forager societies have shown that while "children" is a key concept people use in relation to human and non-human relationships with the natural world, "adult" and "child" are not separate or distinct categories of being. H-G-F societies typically have a greater number of child care providers per child than state level societies, and perhaps collective child-rearing blurs the boundaries between child and adult spaces, at least to modern Western eyes. Multi-aged child groups are more common in H-G-F societies which suggests rather less segregation of children into age grades and thus into discrete identity groups. In such cultures play, work, and socialization blend together and people of all ages contribute to food provisioning. With these observations in mind, this paper concludes with examination of where children can be found in the H-G-F societies of pre-Columbian Florida, where evidence of a separate child's world has yet to be found in the material record.

5 **FOREVER IN THE HOME, FOREVER WITH THE FAMILY: AN ANALYSIS OF CHILD BURIALS WITHIN SETTLEMENTS AND HOMES IN EGYPT**

Abstract author(s): Crawford, Courtney (American University in Cairo)

Abstract format: Oral

During the First Intermediate Period and the Middle Kingdom, many children were buried inside homes or near settlement structures. Although this tradition has been noted by several scholars, Petrie, Wegner, von Pilgrim, Gobeil, and Picardio, the topic has yet to be properly analyzed. Child burials were found within homes and settlements at the following sites: Lahun, Wah-sut, Ballas, Tell el Daba'a/Avaris, 'Ain Asil, and Elephantine. There has also been ethnographic research describing similar practices in Egypt until modern times. In the 1920s, Blackman recorded women burying fetuses and newborns within the walls of their homes in order to keep the child with the family, even after death. Although the 1920s happened 100 years ago, recent research has shown this tradition still continues in small villages in Upper Egypt. Women said that even if a child does not reach full term, they are still considered members

of the family that should remain within the home. In spite of the fact that house burials from ancient Egypt into modern times cover a 4,000-year span, understanding why women bury fetuses and newborns inside of homes can help provide context to the ideas and practices of people in ancient Egypt. The combination of archaeological studies of ancient Egypt and modern ethnographic research can illuminate ideas behind funerary practices and highlight the continuation from the past into the present. This research also emphasizes the importance of children in Egyptian culture, both past, and present.

6 THE STORIES WE TELL: CHILDREN, ORAL STORYTELLING, AND KNOWLEDGE TRANSMISSION IN THE EUROPEAN UPPER PALEOLITHIC

Abstract author(s): Nowell, April (University of Victoria)

Abstract format: Oral

In her seminal 1989 article 'A Child is Born', Grete Lillehammer identifies three important child-centered relationships – a child's relationship to the environment, to adults and to other children. She argues that these relationships are related to core concepts in archaeology such as adaptation, intergenerational knowledge transmission and enculturation and can be studied through traditional methods in our field. In this paper, I consider the layered relationships of children in deep time through an analysis of storytelling. Storytelling, whether around a campfire, in a café or a sold out theater, is ubiquitous in human culture. The universality of storytelling suggests that this behavior has deep roots. It also begs the questions of why we as humans find stories so compelling and what the evolutionary context for this behavior might be. The ways in which children learn in foraging societies differ from the classroom-based style of learning and teaching typical of industrialized societies in the West. This difference, however, has often been mischaracterized by anthropologists as an absence or rarity of direct teaching in foraging societies. In this talk, following the work of Scalise Sugiyama, I argue that oral storytelling is a form of pedagogy in foraging societies that shares many of the features of direct teaching. Building on ethnographic data, I explore the evolutionary context, adaptive features and cognitive underpinnings of storytelling. I then present archaeological evidence for storytelling and narrative in the Upper Paleolithic. Finally, arguing that storytelling is a vehicle for cumulative culture, I consider the implications of this form of teaching for skill acquisition and knowledge transmission among Upper Paleolithic children and adolescents and for their role as drivers of human cultural evolution.

7 THE ARCHAEOLOGY OF CHILDHOOD IN PRE-ROMAN ITALY (1ST MILLENNIUM BC): A NEW RESEARCH PERSPECTIVE

Abstract author(s): Govi, Elisabetta (Alma Mater Studiorum University of Bologna)

Abstract format: Oral

As G. Lillehammer pointed out (Lillehammer 2010), the archaeology of childhood needs a specific focus on material evidence, in order to trace the faint presence of children. During the 1st millennium BC, Italy is a mosaic of peoples and cultures and in this context, the archaeology of childhood has never been investigated systematically and through a comparative analysis. To fill the knowledge gap, the multidisciplinary project BIRTH (Burial Infant Ritual THeme) aims to record child burials in Etruria and Italy reconstructing a broad and detailed database. The research interests subadults in all its manifestations (funerary archaeology, inhabited areas, sanctuaries). The first concrete result is the open access publication (E. Govi (ed.), BIRTH. Archeologia dell'infanzia nell'Italia preoromana, Bologna 2021) and the BIRTH website (available on 2023).

This contribution displays the main considerations on the phenomenon, considering both methodological and cultural aspects. Besides focusing on different areas and displaying a rigorous contextual approach, the study investigates which parameters had shown to be useful for recognizing children, especially in funerary archaeology. Important considerations concern the access to formal burial, the definition of the different age groups, and the significant thresholds in funeral treatment. Strong discrimination emerges for perinatal and children within one year of age. Spatial analysis reveals the relationship between children and adults. The enormous amount of data now available allow us to assess the child's social and cultural value within the various communities of Pre-roman Italy.

8 CHILDHOOD THROUGH IMAGES AND CONTEXTS IN PRE-ROMAN ITALY

Abstract author(s): Pizzirani, Chiara (Alma Mater Studiorum Università di Bologna)

Abstract format: Oral

Iconography has always been an outstanding instrument for the discovery and interpretation of childhood in Classical Antiquity. Moreover, relating to classical archaeology, it could be stated that the study of children itself began thanks to iconographical research on classical art (Klein 1932).

Although images can often consist of a “visual construction”, instead of faithful photographs of the ancient reality, nonetheless the wealth of themes, details and meanings are an absolutely crucial source of information to improve our knowledge of children in classical times.

By this point of view, focusing on Pre-Roman Italy is particularly relevant, because among Etruscans and Italic peoples several myths, literary and epigraphic sources show the importance given to babies and children.

Nevertheless, child representation is certainly produced by adults, expressing their perception of childhood, the articulation of age categories, and consequently their treatment and position within society.

In conclusion, the ongoing research aim to investigate both the “children = biology” perspective and the “childhood = social” perspective, as G. Lillehammer stated in 2015. Images are a valuable tool and Pre-Roman Italy a notable historical context to reach the target in classical times.

9 INEXPERIENCED KNAPPERS, BUT NOT WANDERING AROUND

Abstract author(s): Gomes de Almeida, Miguel (Dryas / Octopetala; Morph, Lda.; Uniarq / FLUL - Faculdade de Letras da Universidade de Lisboa) - Aubry, Thierry (FCP - Fundação Côa Parque) - Walter, Bertrand - Peyrouse, Jean-Baptiste (SERAP Vallée de la Claise)

Abstract format: Oral

Located near a permanent stream, at the base of a smooth slope, directly over Turonian deposits delivering excellent flint nodules, the Maîtreaux archaeological site (Indre-et-Loire, France) shows a series of exceptionally well preserved Solutrean occupation levels characterized by the abundance of lithic remains derived from systematic production of shouldered points, backed bladelet blanks and large bifacial laurel leaves, all to be exported from the site either as preforms or finished tool elements.

The multidisciplinary study of the site produced an image of consecutive, seemingly short, stays of relatively small groups, mostly composed of experienced knappers coming to the site to explore the local flint sources and produce reserves of specialized lithic tools.

Nonetheless, a small portion of the refitted lithic operative chains undoubtedly testifies the presence of less competent knappers (moreover showing very diverse technicity levels, conceptual knowledge, experience, access to proper knapping tools, and specific patterns of intra-site spatial distribution), thus complicating the “experienced knappers party” picture.

If any direct interpretation of technological evidence of insufficient knowledge or knapping experience as the “work” of children or juveniles should be ruled out as oversimplifying, at Les Maîtreaux, it is the combined analysis of technological, raw-material, and spatial data that can shed light on the on-site actions of these inexperienced knappers and help understand their role in the group and their presence at Maîtreaux.

10 „LOST” CHILDHOOD OF LITTLE ONES IN PROTOHISTORY IN THE SOUTHERN CARPATHIAN BASIN

Abstract author(s): Ložnjak Dizdar, Daria (Institute of Archaeology) - Rajić Šikanjić, Petra (Institute for Anthropological Research)

Abstract format: Oral

The study of childhood in protohistory in the southern Carpathian Basin within the CSF ARHKIDS project has identified many material traces of children in settlements, cemeteries, and hoards. Any analysis of direct evidence of children and their relationship with the environment and the world of adults is limited by the state of preservation of material traces and reliable child-related contexts. The narrative on childhood in the southern Carpathian Basin grows from cremated anthropological remains, numerous miniature and small-volume objects found in child-related contexts, and hard-to-read traces of children in settlements and of their everyday work and contribution to the community. In our interdisciplinary research, we run into many obstacles and dead ends (e.g. children’s health from cremated anthropological remains, settlement areas where children lived and played, small objects such as toys (?), mortuary practices), but we try to recognize them within the childhood research process together with all the challenges repeatedly pointed out by G. Lillehammer from the perspective of childhood archaeology studies (1989, 2010, 2015). We respond to challenges within the possibilities offered by archaeological material traces in the analyses of age, diet, health, death, funerals, identity, play, learning, and rituals.

11 CHILDHOOD AND MEMORY IN THE YUCATAN PENINSULA: A DIACHRONIC APPROACH

Abstract author(s): Fernández-Souza, Lilia (Autonomous University of Yucatan)

Abstract format: Oral

Since Grete Lillehammer's seminal 1989 article, 'A child is born. The child's world in an archaeological perspective', children and childhood have gained an important place in archaeological studies. In this paper, I explore one of the central points suggested by Lillehammer to approach the child's world: childhood as a common experience between children and adults, and the way it is linked to memory. I am interested in how infancy is remembered, commemorated, or celebrated, both by the relatives of a dead child and by the adult who reminisces, recreates, or reinterprets the child he or she was in the past. By using a diachronic approach, the paper will focus on the Yucatan Peninsula, a region occupied by the ancient Maya in Pre-Columbian times, and conquered by Spaniards in the sixteenth century. I propose to understand, on the one hand, how children's agency, gender and performance were manifested in recognizable artifacts such as toys and learning objects or in non-material acts as rituals or games. On the other hand, I will explore how adults expressed their memories, sense of loss or nostalgia, love, and affection for their dead or grown-up children through patterns of burials, offerings, monuments, and representations.

12 ABORIGINAL CHILDHOOD: THE TALE OF THE CHILDREN WHO COULDN'T GROW UP

Abstract author(s): Rodríguez-Caraballo, Selene (University of La Laguna)

Abstract format: Oral

The aboriginal child population from Canary Islands has occupied a shady place in the archaeological investigation of the archipelago until now. For this reason, childhood should be understood as a historical agent deserving of its own historiographical discourse, as proposed by the Archaeology of Childhood. The child presence in different sites in Tenerife and La Gomera evidences their presence in the Guanche communities over time. Methodologically, it will be considered the specificities of the study of subadult osteological material, due to the very conditions of fragility and conservation. But it is also intended to address the documentary sources that we have for the study of the ancient populations of the archipelago: the chronicles about the conquest. Thus, it is intended to interpret the presence of some subadult individuals in different archaeological sites in Canary Islands in relation to various aboriginal contexts on the island to understand in depth the pre-Hispanic childhood.

13 BECOMING: A LIFE COURSE AND INTER-GENERATIONAL APPROACH TO INFANCY IN THE PAST

Abstract author(s): Gowland, Rebecca (Durham University)

Abstract format: Oral

Feminist archaeology has been pivotal for foregrounding topics such as childhood, infancy and reproduction in studies of the past. Scholars such as Grete Lillehammer have played a pivotal role in showcasing the varied perceptions and experiences of past infants and children as well as the importance of inter-generational relationships. This paper builds upon this seminal work through a synthesis and discussion of recent theoretical and methodological advances in the bioarchaeological study of infancy and the mother/infant nexus. The Developmental Origins of Health and Disease (DOHaD) hypothesis has highlighted the life-long and inter-generational significance of early life adversity for disease risk. DOHaD focuses on developmental plasticity during the first 1000 days of life (from the point of conception) and emphasises the centrality of infancy for overall population health. This work has implications for our interpretations of health in the past, including the need to consider this from a life course and inter-generational perspective. Furthermore, new biomolecular techniques are allowing archaeologists to obtain insights into maternal health via the analysis of infant bodies, providing hitherto unexplored links between generations. The maternal body has been characterised as both a 'buffer' and 'vector', 'protector' and 'threat' to the developing fetus, but her bodily resources and capacity is, in turn, the product of her own childhood and that of her recent predecessors. This study will draw upon the work of Karen Barad to conceptualise infant bodies as simultaneously coming from and 'becoming with' the social, material and biological world that both surrounds and pre-exists them.

A. SOME FUNERARY FEATURES OF CHILDREN'S ARCHAEOLOGY IN SOUTHERN MEDIEVAL ITALY

Abstract author(s): Bruno, Brunella - Diciano, Giuseppe (University of Salento)

Abstract format: Poster

Archaeology of Children focuses on many aspects of children's perception in the past. Thanks to Grete Lillehammer's studies, it was possible to explore different ways of approach to the subject. The approach used in this work regards the funerary world of children, a world too often considered secondary to adult's funerary world. Even though artifacts are not always identifiable as related to childhood or the body inside the tomb, it is possible to reconstruct the actions that have taken place during the burials. These actions differ for social structure or beliefs, but can guarantee data about age and importance of the deceased. Another factor is the place where these actions are made. It is not uncommon

to find exclusive burial areas for children or different treatment based on the age of the child, as we will see. It was difficult to analyze all the data, mostly because of the lack of studies about Children's Archaeology in Southern Italy. Medieval funerary contexts of Southern Italy show a lack of children's burials in archaeological record. Only few of these contexts show studies and systematic analyses of children's burials. Moreover, it is hard to study children's burials due to the rarity of materials associated with individuals for burials dated from Late Antiquity to Early Medieval Age. This work gives an overview of the data, rethinking the relation between children's and adult burials in burial areas and reconsidering the different aspects of the funerary world of children and children's material culture.

290 TRANSITIONS IN IRON AGE EUROPE: ENVIRONMENT AND FOODWAYS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Esposito, Carmen (Department of Cultural Heritage, University of Bologna; School of History, Archaeology and Religion, Cardiff University) - Madgwick, Richard - Dibble, Flint (School of History, Archaeology and Religion, Cardiff University)

Session format: Regular session

Significant changes in material culture, settlement patterns, political organization, and mobility of goods and people have been clearly evidenced across Europe in the first half of the first millennium BCE. Methodological advancements in environmental archaeology and food studies have made particularly important contributions in providing alternative perspectives to understand these changes and explore the diverse responses to these shifts in different populations. Traditionally material culture and settlement have dominated narratives, but it is clear that foodways, the agricultural economy and human-environment relations more broadly are at the very core of this transitional phase.

This session will examine how the study of environment and foodways can contribute to narratives of social transition in Iron Age Europe and the Mediterranean. From subsistence to feasting or climate change to settlement patterns, environment and food are topics that are ripe for comparison across periods and regions. We hope for a wide range of papers covering cultural transitions from the Bronze Age to the Iron Age or within the Iron Age of the first millennium BCE in any of the areas that encompass Europe or the greater Mediterranean (including North Africa and Southwest Asia). We encourage papers that employ a diverse set of methods and those that investigate topics of resilience or adaptation, social organization or networks, cuisine or diet, mobility or seasonality, and more.

ABSTRACTS

1 SAVOUR AND SIGNIFY: DEVELOPMENTS IN CUISINE AND IDENTITY FORMATION IN IRON AGE BRITAIN

Abstract author(s): Enayat, Misha (Independent researcher)

Abstract format: Oral

Southeast England witnessed rapid social, cultural, economic and political change between the Middle and Late Iron Age, with the emergence of novel forms of mortuary rites, settlement types, hierarchical organisation and material culture. Against this precarious and dynamic backdrop, the archaeological record indicates significant developments in foodways, consumption habits, eating- and drinking-related material culture, and social and political uses of food and drink. Elite cuisine in particular changed dramatically following the introduction of imported foodstuffs, tablewares and novel eating practices. While many of the emerging traditions may have had parallels across the Channel, however, the forms they took on post-adoption were often distinctly British.

This paper will present a discussion of these culinary developments based on a synthetic assessment of the archaeobotanical, archaeozoological, ceramic and small finds data from published and unpublished excavation reports from across southeast England. More specifically, it will discuss how conspicuous consumption during this period transitioned from a model of competition in the Middle Iron Age to one of exclusivity by the Late Iron Age, and argues that the emergence of an haute cuisine culinary culture and table etiquette begin to become archaeologically recognisable during the latter period. Finally, taking Late Iron Age Britain as an example of a colonial frontier, the paper will explore how indigenous Britons responded to the rapidly changing socio-political landscape by using food and dining to fashion and express complex 'hybridised' frontier identities, most visible in the burial record of the period.

2 FEASTING NETWORKS AT THE BRONZE AGE-IRON AGE TRANSITION IN SOUTHERN BRITAIN: EXPLORING MOBILITY AND ANIMAL MANAGEMENT

Abstract author(s): Madgwick, Richard (School of History, Archaeology and Religion, Cardiff University) - Esposito, Carmen (The British School at Rome; University of Bologna) - Lamb, Angela (NEIF, British Geological Survey)

Abstract format: Oral

The Late Bronze Age and Early Iron Age (c. 800-400BCE) saw the rise of a new site type in southern Britain, commonly termed a midden. These vast monumental mounds, some comprising millions of artefacts/ecofacts dominated by animal bone and ceramics, signal a societal refocus towards agricultural intensification and communal feasting on a grand scale. These sites hint at the coming together of vast numbers of people and animals for feasts, potentially providing anchors for new networks after the breakdown of networks surrounding the production and trade of Bronze. In spite of the exceptional resource middens provide, they have been subject to relatively limited scientific study. Major questions remain surrounding the scale and nature of these networks, whether local, regional or wider and also about the strategies employed to enhance agricultural productivity at a time of climatic deterioration.

The FeastNet project (funded by the UK Arts and Humanities Research Council) is attempting to address these questions through a programme of multi-isotope analysis on fauna from two major regions of midden accumulation: the Vale of Pewsey and the Thames Valley. This paper presents data from six sites: East Chisenbury, Potterne, All Cannings Cross and Stanton St. Bernard in Wiltshire and Runnymede and Wallingford in the Thames Valley. The programme of strontium, oxygen, sulphur, carbon and nitrogen analysis demonstrates different site catchments and variable husbandry regimes across both sites and species. These data provide new insights on the problematic issue of how the economy and patterns of connectivity changed during this transitional phase.

3 FOOD STORAGE AND SECURITY IN BRONZE AGE IRELAND

Abstract author(s): Johnston, Penny - McClatchie, Meriel (School of Archaeology, University College Dublin) - Cleary, Kerri (Archaeological Consultancy Services Unit) - Doyle, Clodagh (National Museum of Ireland)

Abstract format: Oral

Intensification of agricultural production is evident in Bronze Age Ireland, however, little attention has been paid to issues such as food surplus, storage and security that underpinned this intensification. These had important implications for those who controlled the means of production and distribution of produce. Food security has a crucial role to play in our understanding of the social organisation of the period, and of the transition into the Iron Age.

This paper will present interim results from a two-year project (FOODSEC) which aims to provide a new scientific basis to understand how past societies managed food security. The project focuses on data from Ireland, where excavations during the past three decades have revealed evidence of extensive Bronze Age settlement with a high standard of associated agricultural data. We will present collated evidence for food remains (plant and animal) and food storage facilities (containers, storage pits and above-ground structures) from selected archaeological sites. These results will be integrated with the evidence for traditional methods of food storage that comes from Ireland's extensive collections of folklife/ethnographic material.

Ireland has sometimes been regarded as a marginal zone when compared to other areas of prehistoric Europe. As well as providing new insights into the evidence from Ireland, the innovative, multi-strand approaches taken in FOODSEC complements work on food security carried out in other areas of Europe. We hope that this will encourage more comprehensive integration of the evidence from Ireland into discussions of European food surplus, storage and security in the future.

4 DEVELOPMENT OF FOODWAYS DURING THE LATE BRONZE AGE - IRON AGE TRANSITION IN THE EASTERN BALTIC REGION

Abstract author(s): Micelicaite, Viktorija - Podėnas, Vytenis (Lithuanian Institute of History) - Vėlius, Gintautas (Vilnius University) - Vengalis, Rokas (Lithuanian Institute of History)

Abstract format: Oral

The most significant dietary changes of the Eastern Baltic population followed the emergence of animal husbandry during the third millennium BC and the adoption of crop cultivation ca. 1400-1200 cal BC. At first, some inhabitants moved from a diet based on freshwater sources to mixed sources with the significant intake of terrestrial animals. From the first millennium BC, the role of fishing diminished significantly as local communities intensified their farming. However, these changes have not been uniform and the intraregional variety of subsistence economy developed during the transition to Iron Age. In this paper, we aim to review the evidence on local diet from the first millennium BC and early first millennium AD and discuss how the development of iron technology corresponded to the foodways of the local population. As the Neolithisation of the economy has happened significantly later than in the Western Baltic region or Central Europe, the Eastern Baltic region presents an intriguing case of social transition.

Based on the latest zooarchaeological and stable isotope studies, a significant dietary change could be inferred from the 1000 cal BC. Moreover, the consumption of millet seems to be of higher significance only during a short period of the Late Bronze Age. Lastly, data from eastern and western Lithuania indicate a separate development of culinary and consumption traditions.

5 **BON APPÉTIT! FEASTING IN LATE BRONZE AGE FRANCE**

Abstract author(s): Peake, Rebecca (INRAP - National Institute for Preventive Archaeological Research)

Abstract format: Oral

The excavation by Inrap of the Villiers-sur-Seine site „le Gros Buisson“, a Late Bronze Age settlement dating to the 9th century B.C., provides the main focus of this study that sheds new light on foodways in domestic contexts of this pivotal period. Villiers-sur-Seine is located in the Upper Seine Valley to the south-east of the Paris Basin where Bronze Age and Early Iron Age sites are numerous. It is a fortified settlement with an organised plan, abundant finds, in particular animal bone that points to the massive consumption of young pigs and game (red deer and boar) that probably occurred during collective feasting. The data reveal that these commensal events were probably seasonal, taking place regularly over a relatively short period, probably equating to less than a hundred years. In this paper, we aim to place Villiers-sur-Seine within the wider context of contemporary LBA settlements of the Seine Valley with the aim of understanding the socio-political organisation of the area and the role played by high status sites and feasting during this period.

6 **BRINGING WATER TO THE SEELAND: THE TRANSITION FROM THE BRONZE TO THE IRON AGE IN THE SEELAND REGION, BERNE**

Abstract author(s): Geitlinger, Timo - Blum, Jonas (University of Zurich) - Winkler, Alexandra - Ramstein, Marianne (Archaeological Service of the Canton of Berne) - Della Casa, Philippe (University of Zurich)

Abstract format: Oral

The «Seeland» (See = German for Lake) is a micro-region in western Switzerland, encompassing the area between lake Neuchâtel, lake Morat, and lake Bièvre. It is subject to the interdisciplinary research project “ArchSeeland” conducted by the University of Zurich in cooperation with the Archaeological Service of the Canton of Berne.

The Seeland is situated at the northern foot of the Jura Mountains and consists of distinct hills and flat plains. As the name suggests, rivers, lakes, and bogs are the most dominant topographical features of the Seeland. Furthermore, water also appears to be key for the understanding of the transition of the Late Bronze Age to the Early Iron Age.

With a few exceptions, the best evidence for Late Bronze Age settlements is found at lakeshores. Due to waterlogged preservation, the region is particularly rich in Late Bronze Age structural wooden remains. Especially the results of the dendroarchaeological analysis presented within this paper paint a vivid portrait of the conscious economic behaviour, use of resources, landscape modifications, and settlement organisation of Late Bronze Age societies.

While material culture and burial locations point towards a continuous transition between the Bronze Age and the Iron Age in the Seeland, the greater abundance of rich burials and changes in the location of settlements are evident. In the Early Iron Age, settlement remains are almost entirely lacking and often occur on hills. Although climatic changes at around 800 BCE likely induced sea level fluctuations, water kept its importance for the Early Iron Age inhabitants of the Seeland. GIS-based modellings show the importance of water as transportation route within the Seeland. It possibly also shaped the outlines of local territories. Additionally, depositions emphasise the newly occurring importance of water as ritual space.

7 **INTERROGATING THE FOOD AND ENVIRONMENT TRANSITION FROM THE LATE SECOND MILLENNIUM TO THE MID FIRST MILLENNIUM IN CENTRAL ITALY**

Abstract author(s): Stoddart, Simon - Zeviani, Camilla - Schmidt, Frijda (University of Cambridge) - Prato, Ornella (University College, London) - Trentacoste, Angela (University of Kiel) - Magnini, Luigi (University of Sassari) - McLaughlin, Rowan (National University of Maynooth) - Gaveriaux, Fanny (Independent) - Bagnasco, Giovanna - Marzullo, Matilde (University of Milan)

Abstract format: Oral

The transition at the end of the second millennium/beginning of the first millennium BC in central Italy has been well measured in terms of settlement change from villages to nucleated centres and, in the course of the first millennium BC, the development of frontiers around the new metropolises. Less attention has been paid to the impact that these social and political changes had on food production and the environment.

This paper will examine the implications of these changes (enhanced by simulation of settlement densities and distribution in unresearched areas (Magnini) by modelling Land Utilisation Types for a number of sample areas in the

territories of Murlo, Tarquinia and Cerveteri (Zeviani) and setting these against the available evidence from archaeological remains (Gaveriaux, Schmidt, Trentacoste and Prato), isotopic research (Gaveriaux and Trentacoste) and environmental impact from erosion and land use from pollen (Stoddart). The detailed sample areas will be contextualized within a broader model of spatially defined political change generated from the permanent powerful places of the landscape (Stoddart).

The overall result will be an understanding of the political economy that underwrote the impressive visual culture of the Etruscans, a theme that has dominated previous research.

8 TULAR: TRANSCULTURALITY AND SOCIAL INNOVATION IN VILLANOVAN AREAS OF PRE-ROMAN ITALY

Abstract author(s): Esposito, Carmen (Department of Cultural Heritage, University of Bologna; British School at Rome) - Bondioli, Luca (Department of Cultural Heritage, University of Bologna; Department of Cultural Heritage, University of Padua) - Coppa, Alfredo (Department of Environmental Biology, Sapienza University of Rome) - Sperduti, Alessandra (Bioarchaeology Service, Museum of Civilizations) - Madgwick, Richard (School of History, Archaeology and Religion, Cardiff University) - Müller, Wolfgang (Institute of Geosciences, Goethe University Frankfurt; Frankfurt Isotope and Element Research Center - FIERCE, Goethe University Frankfurt) - Trucco, Flavia (Independent scholar) - Lugli, Federico (Department of Cultural Heritage, University of Bologna; Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia) - Stoddart, Simon (Department of Archaeology, University of Cambridge) - Benazzi, Stefano (Department of Cultural Heritage, University of Bologna)

Abstract format: Oral

Transitions in societies are caused by various factors; among those, human connectivity can have a crucial role. The early first millennium BCE of central Italy was marked by significant geopolitical changes involving extensive population nucleation, recognised as early forms of urbanisation. The archaeological record has traditionally hinted at large movements of people. Several studies have recently explored this transformation through multi-isotope and aDNA analysis of human and faunal remains in centres across the peninsula. The MSCA project TULAR (June 2023-June 2025) looks at human mobility and transculturality (the coexistence of diverse cultures) of Villanovan (also known as proto-Etruscan) sites of pre-Roman Italy, which experienced diverse outcomes in historical time, investigating their demographic, cultural and political dynamics. This multidisciplinary project will consist of the archaeological, osteological, isotope and aDNA analysis of some Villanovan sites across the peninsula, i.e. Pontecagnano, Sala Consilina (Campania region) and Vulci (Latium region), revising the traditional narrative of the Etruscan civilisation. This paper presents the first set of data from previous and ongoing research on human mobility from Tarquinia (9th century BCE; Latium) and Fermo (9th-5th century BCE; Marche) and discuss them in light of their archaeological contexts. Tarquinia was in Etruria and became one of the major Etruscan city-states in historical times. Fermo, a Villanovan enclave located in the Picene territory, did not have an urban phase, pointing to a completely different development. $^{87}\text{Sr}/^{86}\text{Sr}$ isotope results on human remains (cremated and inhumed) show a high proportion of non-local individuals in both necropolises. Mobility in Tarquinia is represented across the entire 9th century, while in Fermo the non-local individuals are found in the 9th-8th century BCE with no outliers later (7th-6th century BCE). Future works will help us to unravel these dynamics, providing a compelling reworking of our understanding of the European Iron Age.

9 THE GENOMICS OF AN IRON AGE SITE IN FERMO, MARCHE

Abstract author(s): Breslin, Emily (Trinity College Dublin) - Esposito, Carmen (The British School at Rome; The University of Bologna) - Mattiangeli, Valeria (Trinity College Dublin) - Miranda, Pasquale (Università degli Studi di Napoli Federico II) - Blaauw, Maarten - Reimer, Paula (Queen's University Belfast) - Bradley, Daniel (Trinity College Dublin)

Abstract format: Oral

The Villanovan, or proto-Etruscan, culture of early Iron Age Italy is key in the study of the processes of urbanisation and mobility in Italy. Genetic studies on Villanovan and Etruscan groups have so far focussed on sites within Etruria, and on individuals from more “typical” archaeological contexts. These ancient genomes revealed that the Villanovans and early Etruscans carry a genetic signature typical of Iron Age European populations, and that the origin of these groups appears to be autochthonous. In this study we present 19 new shotgun sequenced genomes from the Villanovan enclave of Fermo, Marche. Using ancient DNA and isotopic analysis we examine the connections between the population at Fermo and the contemporaneous populations of Etruria, and reveal a pattern of both group and individual mobility. We also examine the trajectory of these Iron Age populations to the present day, and how migration and changes in mobility have shaped the Italian peninsula since the Iron Age. Within Fermo itself we find evidence of extensive kinship networks, illuminating the underlying social structure of the settlement.

PUNIC FOODWAYS AT NORA (SARDINIA, ITALY): STABLE ISOTOPE ANALYSIS FOR THE STUDY OF ANCIENT DIET IN A PUNIC POPULATION

Abstract author(s): Ruberti, Noemi (Department of Cultural Heritage, University of Padua) - Madgwick, Richard (School of History, Archaeology and Religion, Cardiff University) - Esposito, Carmen (Department of Cultural Heritage, University of Bologna) - Nederbragt, Alexandra (School of Earth and Environmental Sciences, Cardiff University) - Mazzariol, Alessandro - Bonetto, Jacopo - Gigante, Melania (Department of Cultural Heritage, University of Padua)

Abstract format: Oral

Reconstructing past human foodways has long been challenging in Punic archaeology. Our knowledge derives mainly from indirect evidence such as written sources, material culture, and archaeozoological and archaeobotanical evidence. Scientific research employing human skeletal evidence to investigate nutritional patterns is still underrepresented.

Focusing on the Punic Sardinia, this research represents the first attempt to employ carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) isotope analysis of bone collagen to explore the diet of the population from the Punic cemetery of Nora. Located at the heart of the western Mediterranean Sea, ancient Nora was an ideal landing point for ships heading along Mediterranean routes, becoming an important commercial crossroads. Archaeological evidence from the Phoenician, Punic and Roman periods testify to a settlement life spanning over fifteen centuries (8th century BCE – 7th century CE).

The isotope research forms part of a wider project involving anthropological (osteobiographies, provenance and mobility, kinship and ancestry), environmental (pollens, macro and micro remain), and archaeological (material and immaterial culture) evidence. Bone and dentine collagen was extracted from 42 human samples (N = 29 individuals) from 7 collective tombs dated between the 7th and the 3rd century BCE. Both subadults (n = 13) and adults (n = 16) were sampled to highlight possible differences in social organization, food and primary resources access, and habits by age and/or sex; multiple elements (e.g. ribs and teeth) were sampled in some instances to investigate in-life dietary change. Further n = 15 faunal bone samples (*Ovis aries*; *Capra hircus*; *Bos taurus*; *Equus caballus*; *Cervus elaphus*, *Sus domesticus*; *Gallus gallus*; *Spaurus aurata*) characterized locally available food sources.

Coupling with demographic profile, funerary customs, and reconstruction of the local environment, these results provide information on human-environment relations at the site.

11

MOBILITY DYNAMICS AND MIXED FUNERARY RITUALS DURING THE TRANSITION TO URBANISM IN MIDDLE IRON AGE PADOVA: THE NECROPOLIS OF PIOVEGO

Abstract author(s): Capasso, Giusy (Department of Cultural Heritage, University of Padova) - Beck De Lotto, Michael Allen (Department of Cardiac, Thoracic, Vascular Sciences, and Public Health, University of Padua) - Lugli, Federico (Department of Cultural Heritage, University of Bologna) - Cipriani, Anna (Department of Chemical and Geological Science, University of Modena and Reggio Emilia) - Gallo, Veronica - Cupitò, Michele - Vidale, Massimo (Department of Cultural Heritage, University of Padova)

Abstract format: Oral

The Piovego necropolis (second half of the VI - first half of the IV century BCE) is crucial for understanding the socio-political transformations that invested Padova during the transition into a fully urban phase. Following the funerary codes of the Middle Iron Age Venetic ritual, the necropolis returned cremations (prevailing), inhumations, horse burials, and the grave of a man with a horse. Given the contrasting poverty of the inhumations' grave goods when compared to cremations and the evidence of 'anomalous burials' that suggest violent deaths for some of the inhumed individuals, the latter has been hypothesized to be foreigners and/or belong to a lower social status.

To highlight relationships between funerary rituals and possible mobility dynamics at the site, we performed a strontium isotope analysis sampling dental enamel from the first permanent molars for the inhumed individuals (n=22) and petrous bones for the cremated ones (n=40). $87\text{Sr}/86\text{Sr}$ ratios were determined through solution MC-ICPMS analyses. Due to the location of the necropolis in a modern urbanized area, we relied on the Italian Sr isoscape (<https://www.geochem.unimore.it/sr-isoscape-of-italy/>) and the shape of the human sample distribution to identify outliers (i.e. possible non-local individuals). Based on Tukey's outlier detecting method, the local baseline likely ranges between 0.7087 and 0.7103. This range matches with the distribution of the isoscape values within a ~10 km radius from the site.

Eleven individuals fall outside this baseline, with the percentage of non-locals among the inhumed (n=8, 36.4%) quintupling if compared to the cremated ones (n=3, 7.5%). Interestingly, three non-local inhumed individuals show skeletal evidence of violent trauma.

The differential prevalence of non-locals among the samples (Fisher's exact test $p=0.012$) and evidence of trauma in some non-local inhumed individuals, seem to support both the hypotheses of a different geographic origin and lower social status for the latter.

12 ANIMAL HUSBANDRY AND SOCIAL CHANGES IN THE BALEARIC PREHISTORY. RESULTS FROM ZOOARCHAEOLOGICAL MULTIPROXY ANALYSES FROM S'HOSPITALET VELL VILLAGE (MALLORCA, SPAIN)

Abstract author(s): Valenzuela-Suau, Lua (ArchaeoUIB Research Group, Universitat de les Illes Balears, Dpt. de Ciències Històriques i Teoria de les Arts; SERP Research Group, Secció de Prehistòria i Arqueologia, Departament d'Història i Arqueologia, Institut d'Arqueologia-UB, Facultat de Geografia i Història, Universitat de Barcelona) - Ramis, Damià (Independent researcher) - Pons, Guillem (Universitat de les Illes Balears. Dpt. de Geografia) - Rivals, Florent (ICREA; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d'Història i Història de l'Art) - Pena, Leopoldo D. (Geociències Marines. Facultat de Ciències de la Terra, Universitat de Barcelona, Dpt. de Dinàmica de la Terra i de l'Oceà) - Salas, Magdalena (Museu d'Història de Manacor) - Valenzuela-Lamas, Sílvia (Archaeology of Social Dynamics - ASD, Consejo Superior de Investigaciones Científicas-Institució Milà i Fontanals - CSIC-IMF)

Abstract format: Oral

The Prehistory of the Balearic Islands shows a local and singular cultural dynamics, embedding elements of change and continuity from their early settlement in the 3rd millennium BC to the Roman conquest of Mallorca and Menorca in 123 BC. The Middle and Late Bronze Age of the Balearic Islands (ca. 1600-850 cal. BCE) is characterized by the appearance and apogee of the navetic culture. During this time period, people from the islands lived in open-air villages without defensive walls in most cases, and they had a mixed economy. During the Late Bronze and Iron Age period (ca. 1200-123 cal. BCE) the societies of the Balearic Islands were involved in complex socio-economical changes perceivable in the settlement scheme and the architecture (e.g. massive towers, sanctuaries, territorial marks, visibility between sites). In parallel, there is an increase in external contacts, that will be especially apparent during the Late Iron Age mostly due to Punic trade. In this sense, zooarchaeological studies allow us to provide information about how these social, economic, ideological and political evolution affected to animal husbandry, meat diet and the landscape.

In this communication these topics will be discussed with a multiproxy zooarchaeological analysis of the case study of S'Hospitalet Vell, in Mallorca. Located near the in the eastern coast of the island, this site had a long-term use that embraced the Bronze Iron Ages. After 20 years of uninterrupted excavations at the site, several bone assemblages belonging to different phases between ca. 1600 and 100 BC have been recovered and analysed. Results from NISP, strontium isotopes and microwear analyses from the two main periods (BA and IA) and from different types of buildings (i.e. houses and a communal structure) will be presented and contextualised with other Balearic sites.

13 SOCIAL STRUCTURE, DIETARY VARIATION AND MOBILITY IN EARLY IRON AGE, GREECE

Abstract author(s): Panagiotopoulou, Eleni (The Acropolis of Athens)

Abstract format: Oral

How can we interpret diversity observed in the burial practices? This is the main question dealing with, while studying the Early Iron Age (1100-900 BC) in Greece.

The aim of this paper is to shed light on that topic, by integrating the contextual analysis of the mortuary practices with the isotope analysis for diet reconstruction and the study of mobility.

The beginning of the Early Iron Age, the so-called Protogeometric Period, was characterised by social regression, but also by partial recovery and increased population mobility. The case study of Thessaly (central Greek mainland), which was affected by the decline and disintegration of the Mycenaean civilisation as the northern margin of the old Mycenaean world, is particularly interesting because it demonstrates intense variability in mortuary practices. Furthermore, diet, as is seen here, plays an important role in social life and it may reproduce social differentiation, while the coexistence of local and non-local individuals may likewise induce differentiation patterns. Therefore, the results from the isotope analysis were interpreted while compared with the results from the contextual analysis of mortuary practices and the osteological analysis of the skeletal assemblage.

Hence, this integrated approach explored the process of social formation and social change and provided a deeper understanding of social structure during this turbulent period.

14 TRADE, FOOD SUPPLY AND CULTIVATION STRATEGIES IN ATTICA DURING THE FIRST MILLENNIUM BCE: AN INTEGRATIVE APPROACH

Abstract author(s): Bonnier, Anton (Uppsala university)

Abstract format: Oral

Past research on the ancient Athenian agricultural economy has largely been focused on the productive capacity of the rural hinterland (Attica), and the ability of the hinterland to feed the city and the need to import foreign grain. Such studies have primarily utilised fragmentary evidence from written sources together with agricultural yields in more recent periods to examine the agricultural economy of Attica, building on the assumption that land use strategies were more or less static. New paleoenvironmental data and spatial analyses of archaeological legacy data can, however, provide new avenues to explore agricultural land use in Attica and changes occurring over time. Through an integrative approach we can engage in a discussion on the way in which trade and changes in the pattern of food supply impacted cultivation strategies and land use over time. Pollen records from multiple Attic locations are analysed in connection with potential agricultural surfaces, defined in a GIS environment. The spatial and diachronic data relating to ancient land use is further discussed in light of evidence for trade and food supply stemming from written sources. The study will highlight the potential of integrating cultural and paleoenvironmental data sources in our understanding of dialectics between trade patterns, food supply and land use dynamics around large urban sites in the ancient Mediterranean.

15 THE ZOOARCHAEOLOGY OF ANCIENT CRETE. BONES, ISOTOPES, PEOPLE, AND ENVIRONMENT

Abstract author(s): Dibble, Flint - Madgwick, Richard (Cardiff University)

Abstract format: Oral

While the iconographic and textual evidence for animals in the historical Greek world is well-trodden, the evidence from animal bones and biomolecular evidence from animal teeth on the island of Crete provide a new perspective on animals and humans in the first millennium BCE. After the end of the Bronze Age, the faunal record suggests a shift away from sheep to goat management in eastern Crete, likely as an adaptation to a drying climate in the drier regions of the island. This taxonomic shift in the zooarchaeological record is complemented by evidence for various animal management strategies evident from sequential isotope analysis: pasturing, foddering, and seasonal mobility are all evident. These various strategies relate to the management of animals consumed both in houses and in larger civic feasts, and they provide new detail to the socioeconomy of city-states that develop across the island in the Archaic, Classical, and Hellenistic periods.

294 BUILDING MATERIALS AND CONSTRUCTION TECHNIQUES IN ANTIQUITY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Negru, Mircea (Spiru Haret University; University of Craiova) - Klenina, Elena (Adam Mickiewicz University Poznań)

Session format: Regular session

Building materials are a subject seldom addressed in modern research, although all structures are made of them. For various reasons related to their banality, number and prevalence of forms, scholars are less interested in them and mention them only in passing.

Our session aims to deepen our knowledge of the history of construction. The purpose of the session is to improve the general awareness of the materials used in buildings from various historical periods discovered during archaeological exploration.

Several key questions will shape the contributions to this session: Which building materials were used in Ancient times? What interdisciplinary methods have been successfully involved in the research of building materials and techniques? Which type of interdisciplinary collaboration provides the best way to study building materials? By addressing these questions, this session will contribute to the study of building materials, ancient construction techniques, etc.

In this session, we would like to explore the use of different building materials such as wood, stone and mud used in the construction of roofs, of wheat straw and reed for thatches, as well as wood and tiles. All these materials, which rarely appear in archaeological research reports, have many properties that made them useful over time for the design of houses, fortifications, infrastructure works, tombs etc. The choice of building materials depended on many factors: traditions, fashion, climate and the resources offered by the environment of the respective era.

This session will be the starting point for a further systematic interdisciplinary approach to the study of building materials. In the future, it will be possible to develop more specialized sessions for different categories and historical periods. There is considerable potential for interdisciplinary research involving physicists, chemists, biologists, architects and other specialists.

1 BUILDING IDALION: AN ARCHAEOMETRIC STUDY OF PLASTERS USED IN VARIOUS ARCHITECTURAL STRUCTURES IN THE ANCIENT CITY-KINGDOM OF IDALION

Abstract author(s): Kalofonou, Myrto - Hadjipanteli, Savvina (University of Cyprus)

Abstract format: Oral

The city of Idalion was an ancient city-kingdom during the Classical Period of Cyprus (475B.C.- 310B.C.). The city-kingdom is located inland near the modern village of Dali, 25km from the modern capital of the island, Nicosia. In the archaeological site of Idalion, several structures with different functions (administrative rooms, production sites, storage rooms) have been excavated. These architectural complexes were built with a variety of lime and gypsum plasters and mortars. With the use of different archaeometric techniques, we can identify the physio-chemical characteristics of these building materials. Plasters and mortars have played a great role as building materials during all periods of Antiquity and recent history and their study can give a good insight into the technology that was used during different chronological periods. The plasters studied in this research are roof, floor, and wall plasters, plasters from water cisterns/reservoirs, and plasters from a cistern used in olive oil production. Using macroscopic observations, petrographic analysis (optical microscopy), mineralogical analysis with X-ray Diffraction analysis (XRD), Thermal Analysis (DTA-TG), and other archaeometric techniques we can identify the different materials and recipes (binders, aggregates, additives), and building techniques (possible hydraulicity) that builders of that chronological period implemented for the construction of Idalion.

2 BUILDING IN PREHISTORIC SCOTLAND; A DIALOGUE BETWEEN PEOPLE AND PLACE

Abstract author(s): Barber, John (AOC Archaeology Group)

Abstract format: Oral

Structures in prehistoric Scotland are built with Hard-rock or Sedimentary-rock types. Hard rocks are predominantly volcanic or metamorphic rock types whilst the sedimentary rock types include sandstone and limestone deposits. Hard rock describes a hard, high density lithic usually breaking into angular masses that are not ideal building material. Sedimentary rock is softer, low density and usually cleaves along parallel planes to form tabular masses ideal for dry stone building. Structural forms and architectural detailing are constrained by the stone type of which they are built. We shall explore the regionality of chambered cairn types form whose spread is largely coterminous with the rock type used in their construction. Conversely, the broch towers are standardised structures. However, the hard rock brochs are uniformly 20% smaller than the sedimentary examples but their building costs are relatively invariant.

We argue that the creative tension between the materiality of construction and the design intent of the builders explains the difference in building response. The socially conditioned responses are driven by the physical properties of the basic material. Buildings arise in a dialogue between people and material and depending on the contingent circumstances one or other will lead the dialogue. The material strongly influences the outcomes in the Scottish Neolithic, while the social context, together with the novel form of the broch tower, severely constrains variation in the Middle Iron Age.

3 LATE ROMAN ROOF TILES FROM THE SOUTH-WESTERN CRIMEA: FORMS AND ORIGIN

Abstract author(s): Dmytro, Moisieiev (CO «Crimean institute of strategic studies»)

Abstract format: Oral

In the Late Roman period, despite minimizing relations between Roman Empire and Crimea, antique civilization expanded its cultural and technological influence on barbarian territories in mountainous and southern coastal regions of the peninsula. Up to this moment the barbarian population of these territories did not know neither production of ceramic building materials, neither the construction technologies of the Roman world.

Hitherto building ceramics, such as tegulae, laconian tiles, imbrices and plinth, were produced and applied only in Tauric Chersonesos. The production of laconian tiles in Chersonesos began only in the Late Roman time. Presumably, up to the 3-5 centuries laconian tiles, tegulae and imbrices were imported. Thus, the use of several roof tile traditions of the eastern part of the Roman Empire was spread in the region. Fundamental changes in roof tile traditions began in the 1st half of the 5th century with the import of flanged tiles (keramides) to Chersonesos. By the middle of the 6th century flanged tiles are already known on the barbarian territory in the Mountainous Crimea (Mangup). The region of origin of these flanged tiles is unknown, however tiles with similar fabric were produced in this period in Paphlagonia.

In addition, in the 2nd half of the 5th century the producing of tegulae and imbrices started on the barbarian territory of the peninsula (workshop Bodrak). Around the middle of the 6th century barbarians have already had another workshop (Ilka), that produced flanged and laconian style tiles. The closest place and probable region of origin of that technology is Macedonia.

Thus, in the Late Roman period South-Western Crimea experienced a transformation of roof tile traditions. There was a developed local Roman tradition in Chersonesos and new workshops, founded in the barbarian territory of the region, where the production of ceramic building materials was hitherto unknown.

4 **BUILDING MATERIAL AND TECHNIQUES OF THE LATE ANTIQUITY: THE CASE OF NOVAE (MOESIA SECUNDA)**

Abstract author(s): Klenina, Elena (Uniwersytet Im. Adama Mickiewicza w Poznaniu)

Abstract format: Oral

The phrase “recycled building material” is ubiquitous nowadays. Various categories of building material are obtained from demolition projects, for example bricks and stone blocks. We use this material for ecological and economic reasons. In the late antiquity, building elements were reused for construction and reconstruction mainly due to economic reasons. We cannot ignore other circumstances, such as the leveling of the area together with remnants of existing buildings or tight deadlines for erecting new buildings. Building stone that is repurposed for new construction projects or decorative sculpture and reused in new buildings is called spolia. So far, scholars focused primarily on Greek and Roman architectural elements and details reused in later buildings, and reused building elements were studied only in general terms as iconographic and epigraphic evidence. The aim of the article is to present the category of mass building material, such as rusticated stone blocks, bricks and roof tiles, reused for the construction of public buildings in the early Byzantine city of Novae in the province of Moesia Secunda, together with their origins and reasons for reuse.

5 **BUILDING TECHNIQUES AND MATERIALS OF CONSTRUCTION AT SUCIDAVA (3RD - 6TH CENTURIES AD)**

Abstract author(s): Negru, Mircea (University of Bucharest; Spiru Haret University; University of Craiova) - Bohiltea-Mihut, Florica (University of Bucharest) - Dinu, Andrei-Alexandru - Badica, Petre (National Institute of Material Physics) - Batalu, Dan (Politehnica University of Bucharest) - Artene, Ilinca („Ion Creanga“ National High-school) - Basasteanu, Exter (University of Craiova)

Abstract format: Oral

From the middle of the 3rd century AD, the Lower Danube limes was one of the critical borders of the Roman Empire. In this context, in the late of 3rd century AD Roman Province of Dacia was lost probably before to be abandoned by Aurelianus Emperor.

The case of Sucidava suggests that since the late of the 3rd century AD, the Roman Empire was settled in a defensive position. A part of the settlement was surrounded by wall built in the Aurelianus reigns, that was rebuilt in the Constantin Period and then in the 6th century AD, on the almost the same location. The fort was built following the highest zone of the settlement, but there the included area in the Fortification zone was less than 10% of the settlement surface.

Also, we have to mention that in Late Roman Period, at Sucidava were some changes of some elements of construction techniques and materials. These are the alternations of the brick and stone rows in the construction walls and also the insertion of the brick fragments in the mortar.

Inside of the fortification there was constructed a Secret Fountain to provide water for the military troops in the time of the long sieges. It was built in bricks and stone. The lower part was built in stones and the upper one it was built with bricks.

In all edifices built since the end of the 3rd century until the end of the 6th century AD, there were used mortars that contained and little fragments of bricks.

Aknowledgements: Authors thank University of Oxford, Wolfson College, The Ancient World Research Cluster, United Kingdom for financial support through Lorne Thyssen Research grant and The Research Institute of the University of Bucharest through Scientific Research Projects Funds.

6 **A DIGITAL APPROACH TO THE STUDY OF BUILDING MATERIALS TO QUANTIFY THE ARCHITECTURAL ECONOMY OF ROMAN CIRCUSES**

Abstract author(s): Dininno, Domenica (Lund University; Institute of Cultural Heritage Sciences - CNR-ISPC)

Abstract format: Oral

The Roman circuses, capable of accommodating over 250,000 spectators, are considered among the greatest sporting venues of all time and are an example of the refinement in Roman construction techniques.

Their large size represents a potentially representative dataset because they better reflect economic trends but also the willingness of local elites to invest, through munificentia, in the growth of cities.

What building materials were used to build Roman circuses? And how much did it cost to build a circus? Did it cost the same in all regions of the Empire?

In recent years there have been numerous publications focusing on the economics of various construction and work processes (e.g. Abrams 1989, DeLaine 1997).

The well-preserved remains of the cavea of the Circus of Massenzio make it a perfect case study for calculating construction costs. This article will present the results of a pilot project focused on this case study, to be continued with 4 other circuses located in the Roman Empire.

The research proposed in this work is an ongoing interdisciplinary project and has a multilevel approach, involving socio-economic studies, and architectural energy, with the use of Building Information Modelling (BIM) and Machine Learning applied to archaeology.

The purpose of this study is to quantify the construction costs of circuses, starting from the calculation of the construction elements using a digital approach.

The methods used are: a) deconstructing buildings into measurable components and quantifying them using BIM. b) quantifying the number of bricks of a portion of the circus using new tools for classification, such as Machine Learning applied to archaeology (Dininno 2016 ; Dininno 2017; Grilli et al. 2018), c) estimating volumes and materials used in ancient buildings through architectural energetics in archaeology, which generates estimates of the amount of work and time dedicated to the construction of monuments.

7 BUILDING MATERIALS AND CONSTRUCTION TECHNIQUES IN EARLY MEDIAEVAL BOHEMIA: CASE STUDY OF THE ST. PETER AND PAUL ROTUNDA AT BUDEČ

Abstract author(s): Tomanova, Pavla (Institute of Archaeology of the Czech Academy of Sciences) - Valek, Jan - Kotková, Kristýna - Kozlovce, Petr (Institute of Theoretical and Applied Mechanics of the Czech Academy of Sciences)

Abstract format: Oral

The St. Peter and Paul Rotunda at Budeč, built in the late 9th or early 10th century, is the oldest fully preserved masonry construction in Bohemia (Czech Republic). Due to its high state of preservation and references to its erection in early medieval legends (in particular *Crescente fide* [bav 183 and cz 58], Kristian's Legend [28–29], Gumpold's Legend [148] and the Second Old Church Slavonic Life of Saint Wenceslas [89]), the church became a locus of historical memory. Its local significance made the church the focus of conservation efforts from the 19th century, as well as the subject of architectural, historical, and archaeological research. The findings allow the reconstruction of the historical framework and the macro-definition of the building materials used, which exemplify early masonry construction in the central European region. Recently, we began to investigate the mortars used. We have analysed their composition, technical quality of the materials used for in their production, and the possibilities of determining their chronology by radiocarbon dating.

The aim of this paper is to present the rotunda at Budeč as an example of early construction development in Bohemia and the approach to monumental conservation in the 19th and 20th centuries, summarise the results of past research and present the results of the latest mortar analyses.

8 THE SHAPE FOLLOWS MATERIAL: ARCHAEOLOGICAL TYPOLOGY OF IMPERIAL ROCKERY

Abstract author(s): Zhao, Yajing (Peking University, School of Archaeology and Museology; University of Bristol, School of Earth Science)

Abstract format: Oral

This paper presents a comprehensive examination of rockery, a type of stonework found in archaeological sites, with a focus on typology. Rockery, a unique stonework, expresses its artistic characters with plain texture and piling hand-crafts. Unlike previous studies, which have primarily focused on the shapes of these constructions, this research takes a more interdisciplinary approach, incorporating both materials and shapes. To be specific, the paper classifies five types of stone used in the rockery and uses modern geological surveys and mine sites to determine each source. Sampling hand specimens and thin sections from 23 royal garden sites are carried out to further understand the materials used. The study then subcategorizes the stones by size and shape, identifying a positive relationship between materials and shapes. Finally, the results of the choreology analysis suggest that changes in rock preference and alterations in shape and scale were influenced by the materials used in the rockery. The innovation of this research lies in its use of geoarchaeological methods. In particular, it aims to bridge the gap between historical literature and scientific petrology. Besides the temporal-spatial framework, it will rekindle the work of the Society for the Study of Chinese Architecture and inspire further studies in the handicraft industry from a technological history.

ON THE MARGINS: UNDERSTANDING THE CENTRE - PERIPHERY INTERACTION DURING THE TRANSITION TO FARMING [PAM]

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Tóth, Peter (Masaryk University) - Bickle, Penny (University of York) - Ivanova-Bieg, Maria (University of Vienna)

Session format: Regular session

In many regions, explanations for the spread of farming often focus on key sites in the region where the culture first develops or spreads out. These areas are often well researched and the target of multi-method approaches. For example, in the area of research we focus on, the Linearbandkeramik (LBK), the core areas of its origin, in Central Europe, and its spread westwards across central Europe have been the subject of many years of detailed and innovative research. Areas where the LBK later arrived - on the periphery of the culture's geographical distribution - are now beginning to see parallel research agendas being developed. This means we are currently in an excellent position to compare the "centre" and "periphery" (or marginal and border areas). The aim of this session is to debate and explore the similarities and differences we see arising from the processes of Neolithisation, presented in subsistence strategies, social structures, settlement patterns and material culture exchanges, between central and peripheral areas during the spread of agriculture, noting that once peripheral areas can become core over time. We invite papers that explore these themes in a wider range of early Neolithic cultures in Europe and further afield; and multiple methodological approaches (including those from the natural and social sciences). Our aim is, through discussion, to develop an idea of the general trends we see in research, and how we might further develop research agendas in these periphery - but no less important - regions of study.

ABSTRACTS

1 CONTACTING EACH OTHER, LEARNING FROM EACH OTHER - THE MARGINS BETWEEN THE NORTHERN BALKANS AND CENTRAL EUROPE, 6000-5500 BC

Abstract author(s): Banffy, Eszter (Institute of Archaeology Research Centre for the Humanities)

Abstract format: Oral

The short paper focuses on the consequences of meeting various, local and migrant groups with different subsistence strategies, and on how these strategies of all groups changed in the course of contacting each other, while every player had to adjust themselves to the changing environmental conditions, too. Under these circumstances, social conditions, cognitive changes as well as re-structuring in the ritual sphere followed as consequences. The scene is the Drava, Duna valley to the Lake Balaton region in the South western and Western half of the Carpathian basin. I shall present new results, mainly on architecture, cattle breeding and also, on some changes in the cognition of groups living aside each other, before genetic contacts emerged. I shall also talk about possibilities and challenges to reconcile aDNA data with the current archaeological record, but above all, the high diversity of stories about early farmers in the area in focus, and the emergence of the earliest LBK groups will be highlighted.

2 LIVING ON THE EDGE: THE EASTERNMOST LBK

Abstract author(s): Saile, Thomas (UWA) - Debiec, Maciej (University of Rzeszow) - Posselt, Martin (University of Regensburg) - Preoteasa, Constantin (Cucuteni Neolithic Art Museum)

Abstract format: Oral

Our lecture deals with settlement and cultural contacts in the eastern province of the Linienbandkeramik (LBK). Mobility and exchange contributed to the comparatively high degree of homogeneity observed across the large interaction zone of the LBK between the Seine and the Dnieper Rivers. This also applies to the pottery, whose decorative system developed in the eastern regions in a similar, if less differentiated way than in the core landscapes of the LBK further west. Since the LBK lands to the east of the Vistula River and the Carpathian Mountains once formed an integral part of the Bandkeramik cultural complex, it comes as no surprise that the emblematic element of the LBK, the longhouse, is now proven to have existed in its easternmost regions. However, settlement structures on the eastern periphery generally seem to extend only over smaller areas.

On the eastern fringes of the LBK, inspiration was drawn from the Mesolithic, the Bug-Dniester culture and the Neolithic communities of the Lower Danube. The expansion of the Linear Pottery culture came to a halt at the western edges of the steppe. Here the forest farmers of the LBK encountered their agro-ecological limits in the face of an increasingly continental climate. Towards the end of its cultural cycle, the LBK seems to have had little impact on the subsequent formation of other Neolithic cultures.

3 TRACING THE NEOLITHIC TRANSITION THROUGH THE LIPID ANALYSIS OF THE FIRST POTTERY

Abstract author(s): Tóth, Peter (Masaryk University) - Pokutta, Dalia (Masaryk University; University of Stockholm) - Bickle, Penny (University of York) - Slavíček, Karel (Masaryk University) - Pavúk, Juraj (Institute of Archaeology of Slovak Academy of Sciences) - Vizdal, Marián (independent) - Kaminská, Ľubomíra (Institute of Archaeology of Slovak Academy of Sciences) - Isaksson, Sven (University of Stockholm)

Abstract format: Oral

Transition to the Neolithic is usually connected with changes in settlement patterns, social and economic systems, as well as the adoption of new technologies, such as pottery. Lipid analysis of pottery vessels can act as a proxy to identify the economy, culinary traditions and social networks in this crucial period of human history. Evidence from the Mediterranean and South-Eastern Europe demonstrates that the spread of the Neolithic is, to some extent, linked to the availability of dairy products as a calorie-rich and potentially storable food source. However, increasing evidence from Northern Europe suggests that pottery vessels were part of a pre-farming package of technological innovations that led to more intensive food procurement, increased sedentism, higher population density and new exchange networks.

We want to contribute to the debate about the origins of farming through the lipid analysis of pottery during the Neolithisation in Slovakia. Until now, no such studies have been carried out in this area. We selected 11 sites covering Late Mesolithic and Early LBK, from which we analysed 50 samples from pottery for the presence of lipids. Preliminary results show the exploitation of various resources, including freshwater and marine, which challenge the existing theories about the Neolithisation and food in the region. It documents that the adoption of pottery was part of a new subsistence strategy, which enabled more intensive exploitation of particular food sources. The work is supported by the Grant Agency of the Czech Republic under contract No. GA20-19542S (Tracing the Neolithic transition through the first pottery; NEOPOT project).

4 "CENTRES AND PERIPHERIES" OF THE LBK IN NORTHERN LOWER AUSTRIA - CURRENT PROJECTS AND FIRST RESULTS

Abstract author(s): Pieler, Franz (State Collections of Lower Austria) - Längauer, Julia - Maurer, Jakob (University for Continuing Education Krems)

Abstract format: Oral

The spatial distribution of known LBK sites in northern Lower Austria (Middle Danube Region) suggests a structure of regional settlement clusters. As the inhomogeneous dispersal of the individual sites does not seem to be solely due to e.g. landscape features, to the state of preservation or to the level of research, we think that this structure might reflect socio-political factors.

In the northern part of Lower Austria, there are - until now - at least eight such regional clusters apparent, six of which contain one single large site each, often referred to as "central settlement". These large settlements are not just "more of the same", compared to smaller sites, but are outstanding in the quality and composition of the find spectre. Recent research established that these six large settlements possessed extensive enclosures, adding to their potentially "central" character.

In our contribution, we will first give an overview of the fortified potential Bandkeramik centres of Lower Austria and then focus on two clusters:

- 1) Breitenreich 5 and the Horn Basin cluster, where extensive field walking and geomagnetic prospection were carried out. Detailed site analysis allowed defining this region as a possible role model for a regional settlement network.
- 2) The other focus will be laid on the so far little known site cluster surrounding the famous settlement of Asparn/Schletz in the central Weinviertel region. Here, a new project ("United by Crisis?") focuses on the structure and development of the settlement cluster and its possible interaction with the "central site".

5 A MARGINAL NEOLITHIC? CONTRIBUTIONS OF PYRENEAN SITES TO THE UNDERSTANDING OF THE NEOLITHISATION OF THE NORTH-EAST OF THE IBERIAN PENINSULA

Abstract author(s): Gassiot Ballbè, Ermengol (Department of Prehistory, Autonomous University of Barcelona; Group of High Mountain Archaeology - UAB-CSIC) - Antolin Tutusaus, Ferran (Natural Sciences Division, German Archaeological Institute; IPNA/IPAS, Department of Environmental Sciences, University of Basel) - Clemente Conte, Ignacio (Institucion Milà i Fontanals - Spanish National Research Council - IMF-CSIC; Group of High Mountain Archaeology - UAB-CSIC) - Díaz Bonilla, Sara - Obea Gómez, Laura (Department of Prehistory, Autonomous University of Barcelona; Group of High Mountain Archaeology - UAB-CSIC) - Mata Ferrer, Sergi (Department of Prehistory, Autonomous University of Barcelona) - Mazzucco, Niccolò (Dipartimento di Civiltà e Forme del Sapere Dipartimento di Civiltà e Forme del Sapere, Pisa University) - Navarrete Belda, Vanessa (Laboratório HERCULES, Universidade de Évora) - Saña Seguí, Maria - Sierra Sainz-Aja, Alejandro (Department of Prehistory, Autonomous University of Barcelona)

Abstract format: Oral

Archaeological research in „marginal“ territories shown us that very often new perspectives on historical processes are obtained from these supposed margins. In many cases, these are perspectives that can hardly be offered by an exclusive focus on the key sites or the supposedly nuclear areas of these processes. The intensification of research on the Neolithisation of the mountain areas of the Pyrenees is a good example of this. On the one hand, it offers a wide range of new data on chronologically, technologically, subsistence, ecologically, etc., often obtained in the context of multi-method approaches studies. On the other hand, the information that these new contexts offer complements and qualifies previous perspectives on Early Neolithic in northeastern Iberia. Very often these perspectives assumed 1) a late Neolithification of mountain areas, with little or no interest in the subalpine and alpine altitudinal stages, and 2) a duality between a livestock-raising Neolithic in mountain areas versus an agricultural village Neolithic in the lowlands. The Pyrenean Neolithic sites introduce serious doubts about the viability of this model. Firstly, their earliest chronologies do not differ significantly from those of the lowland sites. Secondly, they show a mixed subsistence, with relatively diversified livestock and consolidated agricultural activity. Finally, they also seem to confirm a settlement pattern focused on valley and mid-slope areas from which the alpine areas were exploited for specific purposes. From a regional perspective, these data suggest that the Neolithisation of northeastern Iberia was a fairly rapid process and, in its early stages, with fairly homogeneous economic patterns territorially.

6 MAIZE AT THE MARGINS: EXPLORING CORE-PERIPHERY INTERACTIONS AND THE SPREAD OF THE FREMONT

Abstract author(s): Vernon, Kenneth (University of Colorado) - McCool, Weston (University of Utah) - Yaworsky, Peter (Aarhus University) - Medina, Ishmael (University of Utah) - Spangler, Jerry (Colorado Plateau Archaeological Alliance) - Brewer, Simon - Codding, Brian (University of Utah)

Abstract format: Oral

The spread of farming almost always involves interactions between a core farming population and a peripheral hunter-gatherer population. Here, we seek to explore those interactions directly, focusing on how they structure the spread of farming. Specifically, we seek to answer the following questions (i) Where do core farming areas tend to occur and why do they occur there? and (ii) How does the structure of peripheral populations affect their distribution? It remains a challenge, however, to incorporate such interactions into a statistical model. Fortunately, a lot of good work has been done on similar problems in ecology, particularly through the application of space-time point process or species distribution models that are fit using a Bayesian method known as Integrated Nested Laplace Approximation (INLA). As a test case, we use archaeological populations of mixed hunter-gatherers and maize farmers known collectively as „the Fremont“ who lived at the far northern periphery of maize agriculture in western North America, in an area encompassing much of the modern state of Utah north of the Virgin and Colorado Rivers, from roughly 2000 to 700 years BP.

A. THE DIET OF THE FIRST FARMERS RECONSTRUCTED ON FATTY ACIDS EXTRACTED FROM THE POTTERY

Abstract author(s): Malířková, Johana - Tóth, Peter (Masaryk University, Brno) - Kučera, Lukáš (Palacký University, Olomouc)

Abstract format: Poster

Sedentary lifestyle, agriculture and production of ceramic vessels are just a few aspects connected with the transition to farming, which in Central Europe happened around 5500 calBC. The first farming communities are associated with the Linear Pottery culture, which occupied large parts of Europe. The subsistence patterns of these communities are usually based on the study of archaeozoological or archaeobotanical material. However, they are not found in

large quantities compared to abundant pottery vessels. Recent research has demonstrated that ceramic vessels may contain lipids that can inform the type of food cooked, served or stored inside the vessels. We were interested in how subsistence strategy changes depending on various environmental conditions (lowland, upland, foothill and basin) with regard to individual spatial and socio-economic units – households. We chose 4 sites representing different environment, from which we selected well-preserved vessels of variable shape and size to extract samples for the presence of lipids. Preliminary results show culinary patterns based on fatty acid analysis extracted from the pottery to understand the variability of the first farmers' diet, the households' social-economic impact, and the function of pottery during food processing. The work is supported by the Internal Grant Agency of Masaryk University under contract No. MUNI/IGA/1179/2021 (Diet of the first farmers in Moravia based on lipid analysis; NEOLIP project).

B. EVIDENCE OF CRANIAL SURGERY 5000 BC AT SCHLETZ/LOWER AUSTRIA

Abstract author(s): Teschler-Nicola, Maria (Natural History Museum Vienna, Department of Anthropology; University of Vienna, Department for Evolutionary Anthropology) - Novotny, Friederike (Natural History Museum Vienna, Department of Anthropology) - Maurer, Jakob - Längauer, Julia - Hascher, Cornelia (University for Continuing Education Krems, Center for Museum Collection Management) - Pieler, Franz (State Collection of Lower Austria)

Abstract format: Poster

The Early Neolithic (Linear Pottery Culture, LBK) site of Asparn/Schletz, Lower Austria, comprises a settlement enclosed by a complex fortification system (including younger and older trenches). The excavations carried out between 1983 and 2005 yielded a wealth of unexpected archaeological finds and features; moreover, human skeletal remains of more than 130 individuals were recovered. These remains were in large parts found at the base of the outer trench, they are consistently incompletely represented, characterised by a variety of traces of fatal injuries (multiple traumas of peri-mortem origin caused by close combat weapons or distance weapons) and defects of the skeletons ascribable to gnawing by animals. Thus, we assume that the inhabitants of the Schletz site became victims of a violent attack to the settlement around 5000 BC.

Among the human remains we identified two skulls that did not only exhibit lethal injuries caused during the “big conflict” at the end of the LBK, but they also reveal signs of trepanation, possibly surgical treatments. Bony reactions at the edge of these injuries, verified by μ CT inspection and REM, indicate healing and survival by several years. Trepanned skulls from the late Neolithic have been reported relatively frequently, but there is only one comparable individual (a male from Ensisheim) which also dates to the final phase of the LBK. The two cases from Schletz are reported and discussed here within the context of the “United by Crisis”-project. They represent the oldest finds of a medical intervention on the Austrian territory and will deepen our knowledge about social interactions and a possibly arising conflict-potential at the final phase of the settlement; this new discovery may also underscore the existence of therapeutic and anatomical knowledge in this Early Neolithic community.

298 COMPANIONS, COMPETITORS, FELLOW TRAVELERS – BIOMOLECULAR AND ZOOARCHAEOLOGICAL EVIDENCE OF HUMAN-CARNIVORE INTERACTIONS IN THE PAST

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Popovic, Danijela (Centre of New Technologies, University of Warsaw) - Bauman, Chris (Department of Geosciences and Geography, University of Helsinki; Department of Geosciences, University of Tübingen) - Krajcarz, Maciej (Institute of Geological Sciences, Polish Academy of Sciences) - Krajcarz, Magdalena (Department of Geosciences, University of Tübingen; Institute of Archaeology, Nicolaus Copernicus University in Toruń)

Session format: Regular session

The common history of human-carnivoran coexistence combines a millennia-long record of mutual events and interactions: predation, competition, commensalism, migration, domestication, and extinction. The causes, types, and intensity of such interactions were undoubtedly the result of the complex impact of environmental conditions, evolutionary adaptations, the development of human culture and civilization, and human perception. Large carnivorans were perceived as a direct physical threat to people, simultaneously being most vulnerable to rapid extinction in human-dominated landscapes, while the smaller species had a larger potential to co-adapt.

A history of such past interactions can be traced using a zooarchaeological record. But in the last decades, it has been tremendously complemented by a wide range of molecular methods, such as direct dating, proteomics, genetics, and stable isotopes. The results allowed an in-depth look at carnivoran biogeography, population history, diet, and ecology. Following the recent advances and discoveries, the session will focus on the past relationships between humans and carnivorous mammals and birds across time and space – from the earliest stages of humanity until modern times. The aim is to bring together case studies from different parts of the globe and for a variety of carnivore taxa and to open up

a discussion between the biomolecular record and interpreting archaeological evidence. The theme intends to explore the dynamics and evolution of the relationships through time, seen from an ecological and cultural perspective. The session is also open to palaeobiological and conservation-related issues with the aim of integrating archaeological and present perspectives on managing the coexistence of carnivores and humans.

ABSTRACTS

1 THE PALEO-SYNANTHROPIC NICHE: A FIRST ATTEMPT TO DEFINE ANIMAL'S ADAPTATION TO A HUMAN-MADE MICRO-ENVIRONMENT IN THE LATE PLEISTOCENE

Abstract author(s): Baumann, Chris (Senckenberg Gesellschaft für Naturforschung)

Abstract format: Oral

Synanthropic behavior, i.e., behavior of wild animals that benefit from a shared ecology with humans, has existed long before the sedentarization of *Homo sapiens* during the Neolithic, around 10,000 years ago. This study describes and discusses the concept of an older animal-human relationship: paleo-synanthropic behavior and the associated paleo-synanthropic niche. Key features of this new niche are anthropogenic food waste from mobile hunter-gatherers as a stable food base for small opportunistic scavengers and a human-near environment safe from large predators. By linking the niche to human behavior rather than to a specific location or structure, this niche was accessible for a long time, even in the Late Pleistocene. Like modern synanthropic animals, members of the paleo-synanthropic niche experienced an increase in population density and a decrease in home range. This, in turn, made it easier for humans to capture these animals and use them as resources for meat, fur, or feathers, as seen in the zooarchaeological record of many European Late Pleistocene sites. As a disadvantage, diseases such as zoonoses may have spread more easily.

2 THE SCAVENGERS IN MY GARDEN: THE HISTORY OF HUMAN-RAPTOR RELATIONSHIPS IN THE UK THROUGH STABLE ISOTOPE ANALYSIS

Abstract author(s): Waterman, Juliette - Black, Stuart (University of Reading) - Sykes, Naomi (University of Exeter) - Fellowes, Mark (University of Reading)

Abstract format: Oral

Wild birds of prey have a complex and chequered history in the UK, having been at various times under legal protection as valued scavengers and at others targeted by laws placing bounties on 'competing' wildlife. Today persecution remains a persistent problem, but public feeding stations and garden feeding of reintroduced birds are common. This project aims to unpick these complex relationships between humans, raptors, and food using stable isotopes to explore variation in diets. We focus on the red kite (*Milvus milvus*) and white-tailed eagle (*Haliaeetus albicilla*), both opportunistic scavengers which seem to have occasionally occupied a commensal role in past environments and likely exploited human foodstuffs. Depending on context this may include household or commercial waste, livestock, poultry or game animals (as live or scavenged prey), and deliberately provisioned food. Although they may have lived in closer proximity to past settlements, both were persecuted to near- or complete extinction in the 19th-20th centuries with a subsequent reintroduction in the late 20th century. We present a dataset of carbon and nitrogen isotope values from bone collagen from 58 Scottish kites and eagles held by the National Museum of Scotland dating between 1894-2013. This dataset includes several historic individuals from before the birds became extinct, with the majority dating from the reintroduction period onwards. As they were collected in relation to ongoing monitoring during reintroduction many have high-resolution biographical data including age, sex, place of origin, cause of death, and nutritional status. The results show identifiable differences between birds and groups that may relate to the consumption of anthropogenic food. The aim of this dataset is to build a baseline of scavenger dietary isotopes from historic and modern birds which will allow for comparisons with later analyses on archaeological birds.

3 EATING AT THE SAME TABLE: TRACKING THE INTENSIFICATION OF HUMAN-CANID RELATIONSHIPS THROUGH DIETARY ISOTOPES AND ZOOARCHAEOLOGY

Abstract author(s): Ameen, Carly - Peto, Jessica - Sykes, Naomi (University of Exeter) - Evin, Allowen (CNRS, University of Montpellier)

Abstract format: Oral

The Late Pleistocene partnership between humans and a carnivore competitor which led to humanity's first domesticate stands at odds with the docile companions we know as dogs today. Despite extensive efforts to unravel the timing and location of the domestication of the dog from a population of grey wolves, definitive answers remain elusive. Increasingly, zooarchaeologists are turning to cultural clues to decipher the changing intensity of the relationship between humans and canids which better capture the dynamic and fluid nature of domestic partnerships as opposed to a single definitive event in time. Dietary stable isotopes provide an exceptionally powerful window into the lives of

individuals in the past. While many studies focus on the role that dogs can play in acting as a dietary proxy for their human companions, this paper will explore how a deeper analysis of the changing diet of canids in their own right, when compared to contemporary human diets, can reveal valuable insights into the dietary changes which occurred during the transition from wild to domestic canids. By exploring these changes in diet through time, we can examine the intensification of human management of canids, and the tightening and loosening of the control humans had over canids through time. This paper will provide important insights into the role that dietary changes played in shaping the relationship between humans and canids in the past. This reconsideration of dietary isotopes alongside zooarchaeological data will help our understanding of the processes of animal domestication, the role that intentional (or inadvertent) anthropogenic feeding had on solidifying those relationships, and will contribute to the ongoing debate around the timing and nature of the origins of the domestic dog.

4 THE LOST WOLF: USING ZOOARCHAEOLOGICAL AND BIOMOLECULAR TECHNIQUES TO UNDERSTAND WOLF EXTINCTION AND CHANGING HUMAN-WOLF RELATIONSHIPS IN THE UK

Abstract author(s): Peto, Jessica - Ameen, Carly (University of Exeter) - Barclay, Alistair (Cotswold Archaeology) - Lamb, Angela (British Geological Survey) - Madgwick, Richard (Cardiff University) - Sykes, Naomi (University of Exeter)

Abstract format: Oral

The timing of the extinction of wolves in the UK, as well as factors that contributed, is currently unknown. Historical evidence refers to a thriving population of wolves existing into the Medieval period before being hunted into extinction. These textual sources are seen by many historical ecologists as definitive evidence for the persistence of wolves; however, this is not supported by the archaeological evidence. There are very few wolf bones post-dating the Roman period, and currently a wolf mandible dated to 1840 ± 22 years BP represents the most recent, definitively identified wolf in England. Yet even many of the Roman finds could be associated with traded skins rather than evidence of a persistent wolf population in the UK. This zooarchaeological absence of wolf remains has been argued away on the basis that differentiating between wolf and dog bones is difficult. Whilst separation between the species can be problematic, especially for post-cranial bones, the two can be easily speciated using mandible and tooth morphology. This paper will focus on clarifying the wild or domestic status of large canids recovered from Roman and Medieval sites utilising a combination of dietary isotopes and carnassial tooth metrics. It will present an accurate methodology for the identification of wolves from archaeological contexts, and explore how canid dietary isotopes can shed light on how a dwindling population of UK wolves adapted to the coming threat of extinction. Together, these methods will allow us to reconsider the identification of wolves lost from the archaeological record, as well as explore the physical evidence for the hypothesis that wolves were extinct, or at least struggling, long before the Medieval period. Understanding the factors leading to the extinction can provide insight into how the actions of humans contributed to the disappearance of wolves.

5 ISOTOPIC PALEOECOLOGY OF MESOCARNIVORANS IN POLISH JURA DURING THE HOLOCENE - THE HISTORY OF ADAPTATION CAUSED BY ANTHROPOPRESSURE

Abstract author(s): Krajcarz, Maciej (Institute of Geological Sciences, Polish Academy of Sciences) - Krajcarz, Magdalena (Department of Geosciences, University of Tübingen) - Baumann, Chris (Department of Geosciences, University of Tübingen; University of Tübingen Department of Geosciences and Geography, University of Helsinki) - Wilczyński, Jarosław (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences) - Sudół-Procyk, Magdalena (Institute of Archaeology, Nicolaus Copernicus University)

Abstract format: Oral

During the hunting-gathering phase of prehistory, human caused a relatively limited impact on ecological systems. The increase of human population, development of densely populated centers, and introduction of new subsistence modes, had strongly influenced the ecological balance. Anthropopressure on wild carnivores during the several last millennia included ecological limitations, but in some cases, it also provided new food sources and new landscapes to exploit. The guild of mesocarnivorans (mid-sized mammalian carnivores) is often underestimated in palaeoecological studies. Unlike large carnivores, mesocarnivorans are still present in the human-modified world. Some of them survived in even better status, but not unharmed – with habitats altered, geographical ranges shrank and ecological niches shifted.

In our study, we focus on the last 10,000 years of mesocarnivorans ecological history in Polish Jura (southern Poland). Well preserved and extensively studied Holocene cave sediments provided numerous fossils of four genera: *Vulpes*, *Martes*, *Meles* and *Felis*. We use stable isotope analysis of collagen C and N to reconstruct the nutrition-related issues, including intra-taxon characteristics and inter-taxon relationships. Using stratigraphic constraints and a large number of direct radiocarbon dates we identify the chronology of variable ecological adaptations and changes within the mesocarnivoran guild, including the sharing or taking over the niches, and the manner and extent of the

exploitation of anthropogenic resources and artificial environments. We focus on several periods related to large-scale culturally-induced environmental changes, which include: the beginning of the Neolithization marking the end of ecological balance during the Mesolithic; the Eneolithic transformation of agriculture toward extensive cropping and arrival of synanthropic/domestic mesocarnivorans; the stabilization and further growth of a settlement network during the Bronze Age-Iron Age; until the strong development of agriculture, urbanization and deforestation during Middle Ages and modern period.

The study was funded by the National Science Center of Poland, grant No. 2017/27/B/NZ8/00728.

6 THE RELATION OF FOXES AND OTHER WILD CARNIVORES WITH HUMAN COMMUNITIES DURING THE NEOLITHIC OF ROMANIA: A STABLE ISOTOPES APPROACH

Abstract author(s): García-Vázquez, Ana (ArchaeoSciences Division, Research Institute of the University of Bucharest) - Bălăşescu, Adrian (“Vasile Pârvan” Institute of Archaeology, Romanian Academy) - Radu, Valentin (ArchaeoScience Division, Research Institute of the University of Bucharest - ICUB, University of Bucharest; National Museum of Romanian History) - Lazăr, Cătălin (ArchaeoScience Division, Research Institute of the University of Bucharest - ICUB, University of Bucharest)

Abstract format: Oral

Currently, red fox show synanthropic behaviour: they move around human settlements to eat human leftovers, feed on micromammals on agricultural fields, but also could attack domestic animals, which makes the fox a beneficial but also a controversial species.

Human groups associated with Boian and Hamangia cultures, emerged in the 6th millennium BC in the Northern Balkans (Southeaster Romania and Northeaster Bulgaria) on the Lower Danube valley and the Black Sea coast. Later, in the middle of the 5th millennium BC, these communities evolve into the Kodjadermn-Gumelnita-Karanovo VI (KGK VI) culture. These societies were characterised by agricultural and livestock economies exploiting natural resources from hunting, fishing and gathering wild fruits.

In this work, we are going to analysis de diet of red foxes and other carnivores (Eurasian badger, marten, wild cat and Eurasian otter) (n = 30) by means of stable isotopes for 4 sites in Romania: Cheia, Gumelnița, Hârșova, and Vitănești (that covers Boian, Hamangia and KGK VI), and compare it with the published data of the domestic and wild animals from those sites, in order to set up the trophic relations of the Neolithic foxes. The remains of these carnivores, as well as the domestic animals (including the dogs), were found in pits (in the cemetary) or rubbish areas on the tell settlement but not in graves. The primary use could be for their fur, although their use as food cannot be ruled out.

The $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ values resulting from foxes investigated show a similar diet of some of Neolithic dogs, suggesting that the Neolithic foxes of Southeastern Europe already exhibited synanthropic behaviour.

This work was supported by two grants of the Romanian Ministry of Research, Innovation, and Digitisation and CNCS - UEFISCDI, project number PN-III-P4-ID-PCE-2020-2369, and contract number 41PFE/30.12.2021, within PNCDI III.

7 HOW MUCH CARNIVOROUS ARE YOU? ADVANCES IN SINGLE COMPOUND NITROGEN ISOTOPIC ANALYSIS OF CARNIVORE TROPHIC POSITION

Abstract author(s): Krajcarz, Magdalena (Department of Geosciences, University of Tübingen) - Krajcarz, Maciej (Institute of Geological Sciences, Polish Academy of Sciences) - Bocherens, Hervé (Department of Geosciences, University of Tübingen; Senckenberg Centre for Human Evolution and Palaeoenvironment)

Abstract format: Oral

Estimating the trophic position of animals and humans is among the most common applications of stable isotopes in paleoecology. It allows, among others, concluding on the level of human carnivory; comparing ecological niches of humans and other carnivores; and reconstructing the importance of meat in the diet of synanthropic or domestic carnivorans. The principal rule is that amount of ^{15}N increases along a trophic chain. The bulk collagen $\delta^{15}\text{N}$ analysis has several limitations, especially while exploring complex anthropogenic environments. The development of mass spectrometry and isolation techniques during the last decade allows measuring the $\delta^{15}\text{N}$ in individual amino acids (AA), isolated from fossil collagen. The main parameter is the Glu-Phe trophic discrimination factor (TDF), which represents a difference in $\delta^{15}\text{N}$ between glutamic acid and phenylalanine – two AAs that have different rate of $^{15}\text{N}/^{14}\text{N}$ increase along the trophic chain. Using the TDF offers a great research potential; however, the exact value of TDF has not been yet verified in terrestrial mammal-based collagen-to-collagen systems. Improving the method by better approximation of the TDF is the objective of the new ‘IsoTroph’ project, implemented at the University of Tübingen. This is to be obtained by the analysis of $\delta^{15}\text{N}$ in Glu and Phe of a predator population and that of its prey. To achieve this, the project will involve a study of modern populations (collections of recent bones of wolf, lynx, red fox, and their prey), as well as a collection of fossils from a Pleistocene carnivore den (cave hyena and its prey). These

collections will provide insight into four species of mammalian carnivores representing variable ecology (both hyper-carnivores and omnivores) and different chronology (recent and Pleistocene).

Project is funded by the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 101023317.

8 BRONZE AGE AGROPASTORALISTS AND SEAL HUNTERS FROM SAAREMAA ISLAND (ESTONIA)

Abstract author(s): Wojtal, Piotr - Kowalik, Nina (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences) - Lõugas, Lembi (Archaeological Research Collection, Tallinn University) - Pospuła, Sylwia - Religa-Sobczyk, Joanna - Sawka-Gądek, Natalia (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences) - Spötl, Christoph (Institute of Geology, University of Innsbruck)

Abstract format: Oral

Only some aspects of the Bronze Age cultures in Europe have been well studied, most notably the material culture and manufacturing economies that developed after the introduction of bronze as a new raw material for toolmaking. Not many studies have been carried out on animal husbandry and hunting practices among the Bronze Age societies at the peripheries of this cultural area. And few analyses have been performed on animal remains from the sites with rather harsh environmental conditions, such as the islands of the south-eastern Baltic Sea. We studied mammal remains from two Estonian settlements on the Saaremaa Island of Asva and Ridala, both of which provide a rich and variable archaeological and zoological material. Results of the zooarchaeological investigations show that domestic as well as wild animals, especially seals, were of great importance for the inhabitants of Saaremaa during the Bronze Age. Analyses of isotopes (strontium and oxygen), aDNA and season of death complement the zooarchaeological investigations. Oxygen isotope data of the dental enamel of domestic mammals are consistent with the $\delta^{18}\text{O}$ isotope composition of drinking water in these locations, suggesting that the animals may have used these water sources. Analyses also revealed that $\delta^{18}\text{O}$ isotope composition of dental enamel records seasonal diet changes. This record will be combined with the results of Sr-isotope analyses in order to investigate provenance, trade and seasonal pastoral practices. The study of the light and dark bands in seasonally forming tooth cementum increments, revealed that the domestic mammals died in summer, and that farmers kept them for over one year. Analyses of the tooth cementum increments, the isotopic (Sr and O) composition, as well as aDNA analyses of the seals from these Bronze Age sites are currently underway.

9 DOMESTIC CAT IN CENTRAL EUROPE: HUMAN-MEDIATED DISPERSAL OR NATURAL INTROGRESSION?

Abstract author(s): Popovic, Danijela (Centre of New Technologies, University of Warsaw) - Krajcarz, Magdalena (Institute of Archaeology, Nicolaus Copernicus University in Toruń) - Krajcarz, Maciej (Institute of Geological Sciences, Polish Academy of Sciences) - Golubiński, Michał (Centre of New Technologies, University of Warsaw) - Makowiecki, Daniel (Institute of Archaeology, Nicolaus Copernicus University in Toruń) - Marciszak, Adrian (Department of Palaeozoology, University of Wrocław) - Wilczyński, Jarosław (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences) - Baca, Mateusz (Centre of New Technologies, University of Warsaw)

Abstract format: Oral

Despite the very dynamic development of paleogenomics and the increasing amount of new data on animal domestication, we still know nothing about cats. Until now, it was known that only one species, the Near Eastern wildcat (*Felis silvestris lybica*), was domesticated. The domestication process probably occurred in the two centers, the Near East and Egypt. From this area, tamed/domesticated cats spread throughout the Mediterranean and beyond. It has been accepted that the primary role in cat's expansion through the northern part of Europe was that of the Roman legions. However, we found that cats that carried mitochondrial DNA (mtDNA) haplotypes of wildcats from the Near East were already present in Central Europe in the Neolithic. This indicates that the cats' route from the domestication centers to Central Europe might have been more complex than previously thought and could be related to human migrations. Our new results revealed the presence of the mtDNA haplotypes of the Near Eastern wildcats in Poland even in the pre-Neolithic period. This could suggest that the natural range of the Near Eastern wildcat was much broader than was assumed. We believe that our ongoing nuclear DNA analyses will elucidate whether the appearance of mtDNA of the Near Eastern wildcats in Central Europe was a natural admixture between two subspecies or was human-mediated dispersal of tamed/domesticated cats.

The study is supported by the National Science Centre, Poland, grant no. 2019/35/B/HS3/02923.

FULL MITOCHONDRIAL GENOMES OF THE UPPER PALEOLITHIC RED FOX AND ARCTIC FOX FROM THE SWABIAN JURA, SOUTHWESTERN GERMANY

Abstract author(s): Tarusawa, Yumeko (Institute for Archaeological Sciences, Archaeo- and Palaeogenetics, Eberhard-Karls University of Tuebingen; Graduate School of Agriculture, Kyoto University) - Furtwängler, Anja (Institute for Archaeological Sciences, Archaeo- and Palaeogenetics, Eberhard-Karls University of Tuebingen; Senckenberg Centre for Human Evolution and Palaeoenvironment at the Eberhard-Karls University of Tuebingen; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Reiter, Ella (Institute for Archaeological Sciences, Archaeo- and Palaeogenetics, Eberhard-Karls University of Tuebingen) - Morozova, Irina (Senckenberg Centre for Human Evolution and Palaeoenvironment at the Eberhard-Karls University of Tuebingen) - Conard, Nicholas (Senckenberg Centre for Human Evolution and Palaeoenvironment at the Eberhard-Karls University of Tuebingen; Department of Early Prehistory and Quaternary Ecology, Eberhard-Karls University of Tuebingen) - Krause, Johannes (Institute for Archaeological Sciences, Archaeo- and Palaeogenetics, Eberhard-Karls University of Tuebingen; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Department of Archaeogenetics, Max Planck Institute for the Science of Human History)

Abstract format: Oral

Where have all the arctic foxes in the south gone after the Last Glacial Maximum (LGM)? Do the red foxes in temperate Europe maintain genetic continuity up until now? An ancient DNA study of red and arctic foxes holds keys to answering these questions.

We examined fox remains recovered from the pre- and post-LGM deposits from caves in the Swabian Jura, Southwestern Germany. This study reports the full mitochondrial genome sequences of prehistoric foxes, including the oldest and the southernmost arctic fox individuals, and the oldest prehistoric red fox individuals.

These ancient arctic foxes carry novel haplotypes that are not observed in modern ones, suggesting the loss of genetic diversity after the LGM. Some arctic fox individuals shared haplotypes with modern ones, on the other hand implying the genetic contribution from the ancient Central European arctic foxes to the modern Holarctic ones.

The ancient red fox sequences from this study form three different clusters. An individual from clade 1 carries a unique haplotype and is similar to the Nearctic North American clade. Individuals from clade 2 carrying unique haplotypes are closely related to the modern Holarctic basal clades, including the European and Middle Eastern individuals. Clade 3 shares the haplotypes with the modern Holarctic individuals. These observations imply that there used to be a basal clade across Holarctic region around the LGM. We hypothesize that subsequently, red foxes spread across Eurasia and North America to form the modern genetic diversity.

THE DIFFERENT ROLE OF CARNIVORES IN ANTHROPOGENIC CONTEXTS: A TAPHONOMICAL APPROACH FROM THETOLL AND TEIXONERES CAVES (BARCELONA, SPAIN)

Abstract author(s): Rosell, Jordi - Blasco, Ruth (IPHES-CERCA; URV) - Rivals, Florent (ICREA; IPHES-CERCA; URV) - Rufà, Anna (ICArEHB - Universidade Do Algarve; Université de Bordeaux)

Abstract format: Oral

The usual appearance of carnivore remains - and bone modifications produced by their activities - in Middle Palaeolithic (MP) sites has generated a long discussion on the influence of these animals in the Neanderthal lifeways and on the modelling of their behaviour. Confrontation, dependency (scavenging) and competition concerning the use of caves and/or prey acquisition are some of the scenarios emerging on these mutual relationships. However, detecting evidence of direct interaction in the MP record is not an easy task for archaeologists. Most of these localities are palimpsests composed of an alternation of human and carnivore occupations, which usually means temporal distance between scenarios and, therefore, an absence of contact. Nevertheless, on some occasions it is possible to identify evidence of direct interaction, especially in the form of human-induced damage on carnivore bones. In this study, we attempt to contribute to the topic by presenting taphonomical data from the Toll and Teixoneres caves (Barcelona, Spain, MIS 3). Toll Cave is interpreted as a hibernation place for the cave bears and frequently used as den by other carnivores, mainly hyenas. Some lithic artefacts associated with cut-marked bear bones have been recovered, suggesting periodic human visits to the cave, either to take advantage of the carcasses of bears that have died during hibernation or to take advantage of the bears' lethargy to hunt them. Teixoneres Cave draws a totally different scene despite being located no more than 100m away. This locality contains an alternation of carnivore dens and Neanderthal campsites. Although no evidence of direct contact or confrontation have been detected, the spatial distribution and the absence of specific anatomical parts suggest frequent carnivore scavenging events. Our attempt here is to provide data on the role of carnivores in anthropogenic contexts, as a sign on a road map of hominid-carnivore interactions during the MP.

THE LEVANTINE SPOTTED HYENA: DIETARY PREFERENCES AND THEIR IMPLICATIONS FOR THE INTERACTION WITH HUMANS IN THE LATE PLEISTOCENE LEVANT

Abstract author(s): Orbach, Meir (Zinman Institute of Archaeology, University of Haifa)

Abstract format: Oral

Late Pleistocene humans and hyenas shared several common traits: top predators, social hunters, bone collectors and cave users, making their niches very similar. Furthermore, their documented hunting preferences that emphasized taking medium-sized ungulates, could have brought them into strong competition.

A core question in the study of the extirpated *Crocota* population of the Levant is when they became hunters. This question is interesting by itself as it sheds light on the ecology of an extinct population, but also bears significance for paleoanthropology. Bone remains are a lot more abundant in Pleistocene hyena dens than in recent African dens. It been suggested that since recent African *Crocota* populations hunt, they collect less bones than the scavenging Pleistocene hyenas, i.e. their hunting behavior evolved recently. In the very same time, Levantine Upper Paleolithic hunters changed their hunting preference and leaned heavily on the small local antelope, mountain gazelle. Did the Levantine humans and hyenas changed their diet simultaneously?

Change in teeth is an excellent indicator for dietary shifts. Kurten (1965) noticed slight differences in the proportions of the front and the back teeth between European and Levantine Pleistocene hyenas. Those can be attributed to feeding adaptations, namely hunting vs. scavenging.

New excavations of several Israeli caves during the last decade yielded numerous hyenid remains, enabling us to check Kurten's hypotheses and the human vs *Crocota* diet. Zooarchaeological, taphonomic and osteological analysis of the new finds as well as the old fossils and comparative materials will help us to explore the Levant human and hyenid feeding behavior.

MAN'S TASTY FRIEND. DOG POPULATIONS, THEIR RELATIONS WITH HUMANS, AND THEIR IMPACT ON NEOLITHIC OSTEOARCHAEOLOGICAL ASSEMBLAGES

Abstract author(s): Wilczynski, Jaroslaw - Pospuła, Sylwia - Matyaszczyk, Lena (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences) - Sobkowiak-Tabaka, Iwona (Faculty of Archaeology, Adam Mickiewicz University)

Abstract format: Oral

As the first domesticated animal species, the dog has accompanied man for at least a dozen thousand years. During this time, he served as a companion, guard, shepherd, and even a meal for human societies. In our contribution, we would like to present the results of the latest studies of animal osteological assemblages collected from today Poland's Early Neolithic and Eneolithic settlements. In our studies, we were interested in the dog's impact on the preserved osteological material and the dog's remains. Our presentation will focus on dog populations; their body size, and cranial and post-cranial skeleton morphometry. We will also take a closer look at the dog's remains for disclosure of any marks left by humans and carnivores and the pathological changes resulting from their breeding conditions and age. On this basis, we will trace the close relationships between Neolithic societies and their four-legged companions. This question is very important not only because of the human-animal relations study itself but also because carnivores are an important taphonomic factor affecting bone assemblages, limiting and shaping their quantity, quality, and value.

DOG SKELETAL DEPOSITS FROM THE PRZEWORSK CULTURE IN KUYAVIA REGION, POLAND: ZOOARCHAEOLOGICAL ANALYSIS

Abstract author(s): Majbrodzka, Zuzanna (Institute of Archaeology, Nicolaus Copernicus University in Toruń)

Abstract format: Oral

For many years, archaeologists have been discovering complete or partial dog skeletons deposited on the sites of Przeworsk culture on the territory of modern Poland. They were deposited both during the La Tene and the Roman period. The latter shows a particular abundance of dog deposits, and it may tell us something about the ritual practices of people of this time. The Kuyavia region, which is now part of the Kuyavian-Pomeranian voivodeship of north-central Poland, is especially rich in findings of this kind. The dog deposits were found in various contexts: within and outside the households, in pits, wells, and so-called ritual spaces. The deposits were often discussed in the scientific literature. However, they lacked a more detailed zooarchaeological analysis, which could shed new light on the subject. With this presentation, the author wants to present a group of dog deposits found on the site of Sławsko Wielkie 12 (Kuyavian-Pomeranian Voivodeship, Poland). It summarizes the results of a recently conducted anatomical, osteometric and paleopathological analysis compiled with available archaeological context. Additionally, the results of conducted

radiocarbon dating will be presented. All of this can be used to widen our previous knowledge of cultural practices related to dogs in the Iron Age.

15 LAYING DOWN WITH DOGS: THE ROLE OF CANIS FAMILIARIS IN MONGOLIA AND TRANSBAIKAL DURING THE XIONGNU PERIOD (C.250 BC-150 AD)

Abstract author(s): Cameron, Asa (Yale University)

Abstract format: Oral

The Xiongnu Period (c. 250 BC-150 AD) of Mongolia and Transbaikial marks the rise of the first nomadic empire in eastern Eurasia. This shift in political organization brought with it novel forms of burial practices, farther reaching and more intensive long-distance trade and interaction networks, and fundamental alterations to subsistence practices. In addition, under the Xiongnu there is a dramatic change in the frequency and treatment of domestic dogs (*Canis familiaris*) in the archaeological record. While this shift in burial and consumptive practices are indirectly acknowledged in the academic literature, the potential causes for and meaning behind the elevated importance of dogs during the Xiongnu Period remains unexplored. This study examines human-canine relationships during the Xiongnu Period through a review of dog mortuary offerings and the presence of dog skeletal remains in faunal assemblages at burial and settlement sites across Mongolia and Transbaikial. Included in this discussion are new skeletal data recovered during recent excavations at Khurts Del, a Xiongnu Period ring grave cemetery located in the Gobi-steppe of south-eastern Mongolia. A comparison of these data with dog remains documented in adjacent regions of Eurasia allows for speculation of the potential causes for the shifting nature and prominence of human-canine relationships in the archaeological record at this time.

16 DINNER GUESTS OR CIRCUMSTANTIAL ASSOCIATION OF HUMANS AND CARNIVORES

Abstract author(s): Arroyo-Cabales, Joaquin (Instituto Nacional de Antropología e e Historia) - Morett-Alatorre, Luis (Museo de Agricultura, Universidad Autónoma Chapingo) - Johnson, Eileen (Museum of Texas Tech University)

Abstract format: Oral

The TOCUILA Archaeological-Paleontological site (State of Mexico) is located at the eastern edge of the original Texcoco Lake in the Basin of Mexico. The late Pleistocene locality formed by several volcanic ash mudflows that moved and buried more than a thousand bone elements pertaining to Columbian mammoth (*Mammuthus columbi*) and other animals, such as camels, horses, felids, and small mammals, between 10 to 12 thousand years ago. Several bones with anthropic marks were identified from the excavation unit UE1. Furthermore, the presence of carnivore gnawing, mainly on long bones epiphyses and diaphyses as well as rib fragments, and previous or after human-related evidences, provides the occasion to think about the potential "agreement" relationships or reciprocal beneficial society between humans and some carnivore species. This initial study involved carnivore marks found on the mammoth bones, trying to identify the actual species; actualism assays involving looking at weathering patterns on bovine femuri and breakage behavior on direct impact; and looking at patterns of bones consumption and gnawing produce by dogs. Finally, comparisons are made with other sites with human-carnivore relationships. At Lubbock Lake Landmark (Texas), within both adult and juvenile mammoth remains exhibit carnivore marks in conjunction with cultural modifications. Wolf (*Canis lupus*) is the primary contender, but dire wolf (*Aenocyon dirus*) cannot be ruled out yet. The proximal end of a short-faced bear (*Arctodus simus*) radius exhibits various cultural modifications, including evidence of its use as an expediency tool in butchering operations. In late Holocene deposits (dating ~350 radiocarbon years), a kennel pattern involving bones from a bison kill suggest the presence of domestic dog. At Lehner Ranch, calcined bear cub teeth found in a roasting pit dating ~10,940 radiocarbon years suggests bear was on the menu for Clovis peoples.

17 EXPLORING THE RELATIONSHIP BETWEEN CANIDS AND PEOPLE OF THE SOUTHERN HIGH PLAINS (USA). CARNIVORE MODIFICATION IN A MID-18TH CENTURY BONEBED

Abstract author(s): Jones, Lila - Johnson, Eileen (Museum of Texas Tech University)

Abstract format: Oral

Taphonomic analysis of a mid-18th century bison and horse bone bed yielded carnivore modified bone of both species. Radiocarbon dating of a bison periotic dated the site to the mid-1700s (~1756; 194± 20 BP), a time of Comanche occupation of the region. Furrowing and scooping of cancellous bone were recorded along with crenulated edges. In some cases, long bone epiphysis were removed entirely. Long bones and ribs of both adult and juvenile specimens presented varying intensity of modification. Wolf (*Canis lupus*) and domestic dog (*Canis familiaris*) were the main contenders for the canid modifications. Wolves were present on the Southern High Plains of North America since the Pleistocene but now are extirpated. Comanche and other Southern Plains tribes were known to have dogs. Geometric morphometrics of post-cranial specimens from a canid encountered within the assemblage, and overall lack

of diagnostic skeletal elements recovered, left the species of the canid uncertain. It appeared to be neither wolf nor domestic dog and suggests the possibility of a wolf-dog hybrid. Such hybrids were known for Plains tribes at this time. The intensive modification of some of the ungulate bone recovered in the assemblage may be the result of scavenging after humans had moved their camp, or possibly evidence of domestic canid companions to the occupants of the site.

A. AN UNUSUAL BURIAL COMPANION: A FELINE SKELETON FROM THE AVAR PERIOD SITE IN OBID (SLOVAKIA)

Abstract author(s): Barta, Peter (Nuclear Physics Institute, Czech Academy of Sciences; Bratislava City Museum) - Bielichová, Zora (Institute of Archaeology, Slovak Academy of Sciences) - Popović, Danijela (Centre of New Technologies, University of Warsaw)

Abstract format: Poster

Extremely rich finds from more than 100 burial grounds and 6,000 graves in SW Slovakia testify to the significance of animals in burial customs of Slavic and Avar tribes in the Carpathian Basin (7th–8th cent. AD). Despite the inter-site variations in species, age and sex, elements deposited and their location in graves, the most important were domestic animals, among others the cattle, sheep and chicken. Together with the eggs of poultry, they represent the most common food and symbolic offerings.

The graves of horsemen with complete body of horse buried next to rider are usually present in the Avar period. In addition to the deposited animals or their body parts, solitary burned bones scattered in the graves' backfill indicate consumption or incineration of animals in further parts of the funeral ritual.

Until recently, the only carnivore occurring in the Avar period burials was the domestic dog. Yet, the new analysis of the archaeofaunal material from Obid brought to light an unexpected discovery of a feline skeleton in one of the graves.

In our poster we present osteological and palaeogenetic research confirming that the animal bone remains accompanying an old man belong to a young adult domestic cat (*Felis silvestris catus* L.) skinned shortly before or during the funeral ceremony. We also present two ¹⁴C dates on cat and one on human bone collagen, and discuss the need of IRMS identification of aquatic reservoir offsets.

No. CZ.02.1.01/0.0/0.0/16_019/ 0000728, grant no. 2019/35/B/H53/02923 funded by the National Science Centre, Poland and the project VEGA 1-0240-21 funded by the Ministry of Education, Science, Research and Sport of the Slovak Republic.

299 FROM WHAT THINGS ARE TO WHAT THINGS OUGHT TO BE: ETHICAL CONCERNS ON ARCHAEOLOGICAL AND FORENSIC HUMAN REMAINS

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Veiga-Rilo, Clara (CRETUS. Group EcoPast - GI-1553, Area of Archaeology, Department of History, Faculdade de Xeografía e Historia, Universidade de Santiago de Compostela) - Silva-Bessa, Angela (Laboratory of Forensic Anthropology, Centre for Functional Ecology - Science for People & the Planet; Department of Life Sciences, University of Coimbra; Laboratory of Toxicology, UCIBIO - REQUIMTE, Department of Biological Sciences, University of Porto; TOXRUN - Toxicology Research Unit, University Institute of Health Sciences, Advanced Polytechnic and University Cooperative - CESPU) - Colmenares-Prado, Marta (CRETUS. Group EcoPast - GI-1553, Area of Archaeology, Department of History, Faculdade de Xeografía e Historia, Universidade de Santiago de Compostela)

Session format: Regular session

Human remains have always played a fundamental role in the knowledge of human societies, and the ethical concerns regarding the treatment of the former have come a long way. However, there is still room for debate. Currently, experts are still experiencing situations where archaeological human remains are considered mere archaeological material, leaving aside their dimension as individuals. This contrasts with the cognizance of human remnants in the forensic field, whose dimension of humanity is unquestioned. Therefore, the chronological proximity between the living and the dead seems to be a determining feature. Throughout history, measures have been developed to protect the human essence of skeletal remains, despite no universal protocol ever having been established that takes into account a wider chronological and cultural range. The aim of this session is to delve into the ethics surrounding the handling of human remains, bearing in mind the perceptual differences between ancient and modern remains. The session may include presentations on the comparison of the treatment of remains according to their ascribed chronology; research on how the state of preservation of human remains influences the way they are managed (e.g., mummified bodies); studies on the ethics of sampling, methods of analysis and their implications (e.g., facial reconstruction); the

role of the archaeological discipline in cultural appropriation phenomena; and dissemination tools and their impact on experts and laypeople (e.g., public display of human remains). Contributions related to the management of human remains after their recovery and analysis are also welcome. Finally, this session might also embrace legislative differences at an international European level in order to broaden and enrich horizons on the matter.

ABSTRACTS

1 **PATHOLOGICAL BODIES: VISITOR ATTITUDES TOWARDS THE DISPLAY OF HISTORICAL POTTED SPECIMENS AT TWO BRITISH MEDICAL MUSEUMS**

Abstract author(s): Sutton-Butler, Aoife (University of Bradford)

Abstract format: Oral

Across Britain there are institutions which hold collections of anatomical and pathological fluid preserved potted human remains, sometimes referred to as ‘wet specimens’, often collected in dubious circumstances during the 18th and 19th centuries. This paper will present data collected at the Surgeons Hall Museum (Edinburgh) and the Old Operating Theatre Museum and Herb Garrett (London). One hundred and forty visitors were surveyed on the display of these human remains and comments from the visitor’s book were also analysed. Although these collections are still being used in teaching and research, some authors have called them ‘obsolete’ (Lee and Strkalj 2017). Potted specimen collections were the focus of the study for several reasons. They were considered the most valuable type of specimen by anatomists in the 18th century, and they still require a skill set which is not widely specialised in (Moore 2005; Bocaage et al 2013). These collections are also unique in appearance as they have soft tissue attached, despite being a couple of hundred years old. They are different to the archaeological remains on display in museums which are skeletonised or mummified in appearance and are sometimes used to compliment osteology students in the teaching of paleopathology (University of Bradford). The visitor surveys revealed that the public finds these collections interesting, not upsetting, and they often ‘see themselves’ in these collections through shared pathologies. Anatomical and pathological potted specimens of the past have the potential to open up conversations linked to themes such as death, ethics, organ donation, the body on display, the preserved body, and socioeconomic status (Richardson 2006).

2 **THUMBS UP? NEWS READER’S RESPONSES TO REPATRIATIONS OF HUMAN REMAINS AT THE NHM VIENNA AND ITS IMPLICATIONS FOR CITIZEN SCIENCE**

Abstract author(s): Schattke, Constanze (Department of Anthropology, Natural History Museum Vienna; Vienna Doctoral School of Ecology and Evolution) - Ritschard, Elena (Department of Science Communication, Natural History Museum Vienna) - Wieser, Angela - Deiß, Helena (EDUCULT - Institute of Cultural Policy and Cultural Management) - Eggers, Sabine (Department of Anthropology, Natural History Museum Vienna)

Abstract format: Oral

Although Austria never formally held colonies overseas, the Natural History Museum Vienna (NHMW) actively participated in gaining human remains for its collection through colonial-spirited expeditions and private collectors during the 18th to 20th century. Here we explore how this acquisition of human remains and ethnographic objects is commented anonymously and online in an Austrian newspaper with half a million daily readers. This study will highlight the different positions and misconceptions on the topic and elicit what is needed to start working towards a better understanding of museum provenance research through scientific communication. Lastly, it is presented how the NHMW is approaching its human remains collections while simultaneously engaging the public through a citizen science project titled “Colonialism today? What does that have to do with me?”. Here, young students are reflecting on the provenance of selected museal objects and discuss how colonial contexts could be displayed by creating and conducting their own projects.

3 **SENTENCED TO DISPLAY: MUSEUM ETHICS AND THE HUMAN REMAINS OF CRIMINALS**

Abstract author(s): Tarlow, Sarah (School of Archaeology and Ancient History)

Abstract format: Oral

Many of the human remains owned and displayed by European museums belonged to individuals convicted of serious crime. The use of criminal bodies in public anatomy was often part of the post-mortem punishment, as was the denial of normal disposal by interment. Displaying heads or bodies was part, formally or informally of punitive sanctions taken by the state against those who broke its rules. But such display continues into the present day, within museum walls.

The display of bones, skin, hair and sometimes other body parts that were taken from notorious criminals is part of the glamorous grotesque. These are often popular attractions for visitors. But what of the ethics of displaying human remains? After 200 years or more, are these individuals still being punished for their crimes? This short presentation asks whether and how knowing the identity of the criminals from whom human remains were taken affects the de-

cision to display and the kind of display that is appropriate. Should this display of criminal bodies be considered as a punishment, a thrill, an education or a vestige of historical systems of justice?

4 **THE OLD, THE NEW, AND ALL IN BETWEEN: CONSIDERATIONS ON “TIME” AND CHRONOLOGY WHEN HANDLING HUMAN REMAINS**

Abstract author(s): Alves-Cardoso, Francisca (Centro em Rede de Investigação em Antropologia - CRIA)

Abstract format: Oral

This paper explores the concepts of “old” and “new” in relation to human remains. This classification is often in line with legislation related to archaeological works or intrinsically linked with people/communities’ historical and chronological events. For these reasons, human remains display and handling issues are complex and can cause strong emotions depending on the chronology of the remains and their contextual and historical provenance. This paper explores thirty manuscripts addressing the display of human remains and people’s responses to those queries. These were published between 2002 and 2022, mostly in peer review articles and books, and were all written in English, conditioning a worldwide language inclusiveness on the topic. Alongside expressed opinions and the justification for positive/negative reactions to human remains displaying, research will also consider the provenance of the remains under scrutiny, their chronology, and legislation associated with human remains excavation and/or curation. The aim is to incite a debate over the concept of time and whether it is a limitation when considering ethical issues of handling, studying, and displaying human remains. Time sensitivity to human remains is explored beyond communities, and a person’s life expectancy, supporting the view of shared responsibility toward all human remains, viewed as ancestors.

5 **HANDLING LIMINALITY. A SURVEY OF ATTITUDES TO HUMAN REMAINS IN SWEDISH MUSEUMS**

Abstract author(s): Nilsson Stutz, Liv (Linnaeus University)

Abstract format: Oral

Human remains are a complex category situated on a sliding scale between objects of science and lived lives. They are neither one or the other, and at the same time they are both, literally embodying a unique liminal category in museums and in research. For “old” human remains from archaeological or historical contexts, this state of liminality is particularly salient. Traditionally, they were often viewed almost exclusively as human biomaterials or scientific specimens, and while attitudes are different nowadays, the handling of them is still very rarely regulated by legislation, forming a stark contrast to the medical and forensic fields. In recent years, this attitude has become increasingly questioned. Part of the critique emerges in a postcolonial debate, often through the prism of repatriation cases. But, recognition of the complexity of this issue is also embedded within the disciplines themselves, where, like in archaeology, the actual research process centers on the lived lives of people in the past through, for example, osteobiographies. This paper takes as its point of departure the unregulated field of the handling of human remains in museums and research. It presents a study of the handling of human remains in Swedish museums based on a large-scale survey and a series of interviews with museum professionals. The study seeks to go beyond “best practices” and “codes of ethics” to map the everyday practices and attitudes in the handling of human remains and focuses on complexities involved in daily practice, routine, and decision making.

6 **THE MULTIPLE ETHICS OF BIOMOLECULAR RESEARCH ON HUMAN REMAINS: RESEARCHERS’ PERSPECTIVES**

Abstract author(s): Peyroteo Stjerna, Rita (Linnaeus University; Uppsala University; University of Gothenburg; UNIARQ - University of Lisbon) - Nilsson Stutz, Liv (Linnaeus University)

Abstract format: Oral

The development of archaeology as a scientific subject is intertwined with mortuary spaces. As places of commemoration and memory, these can be wonderfully monumental and persist in the landscape for millennia. Striking architecture and material culture have attracted generations of archaeologists, while the human bones, often fragmented and poorly preserved, have remained largely silent in museum collections throughout the world. That was until the third scientific revolution in archaeology. In recent years, the excitement around the development of biomolecular techniques such as stable isotope analyses, proteomics, and the breakthrough of the next generation sequencing of ancient DNA, have revolutionized the field and placed human remains at the centre of the research agenda. This rapid development aggravated a number of already existing challenges and underlined the ethical entanglements of research using human remains in a highly unregulated field.

This study investigates the ethical dimensions of ancient DNA research and other ancient biomolecules, with a particular focus on those requiring destructive sampling of ancient human remains for scientific analysis. The purpose of this research is to identify conscious and unconscious value systems underlying the decision making, from a research

point of view. We conducted individual interviews with researchers and technical staff carrying out biomolecular research on human remains from archaeological, ethnographic, and medical-anthropological collections, to map and analyze the attitudes, rationales and arguments informing practices and choices. This study is part of a larger research project - Ethical Entanglements: The Care for Human Remains in Museums and Research, which seeks to strengthen the competence and awareness, among museum professionals and researchers of the complex ethical dimensions of research and curation of human remains. Here, we present for the first time, the preliminary results of our qualitative data analysis, and aim to find common ground by disentangling multiple perspectives.

7 DEAD OR ALIVE? – HUMAN REMAINS IN DANISH ARCHAEOLOGY

Abstract author(s): Thegen, Ina (Aarhus University)

Abstract format: Oral

In early 21st century Denmark, practices of excavation, curation, and research dealing with ancient and modern human remains are more the result of numerous, disparate historical factors than the reflection of a deliberated, common, and ethical strategy or legislative framework. Whereas indigenous populations and other activists have been driving forces in establishing such frameworks elsewhere, Danish archaeology has experienced strikingly little debate or concern for human remains from non-archaeologists. As a direct result, human remains are at present informally understood as somewhat unproblematic and uncontroversial 'liminal materials' – not really subjective agents, nor really objective, agent-less items. These remains take the role of something or someone, depending on ontology, that has the ability to nudge archaeologists and other professionals to demonstrate a certain kind of reverence, or a subjective kind of 'respect' and 'ethics' – but meanwhile are also reduced to study objects, sampling reservoirs and great eye-catching displays and Facebook advertisements without rights or demands. Concurrently, human remains in Denmark are caught between the traditional structures and interests of developer-funded field archaeology, osteological collections at medical institutions, exhibiting culture-historical museums and research-oriented academic archaeology, as no formal framework is in place to define or delimit their properties, possibilities or associated 'ethics'. The aim of this paper is to provide an insight into the seemingly uncontroversial and unquestioned practices currently established in the Danish archaeological landscape with an emphasis on structural and legislative premises and how they shape and interfere with excavation, curation and research on human remains from an archaeological perspective. The paper is based on the preliminary results of a qualitative survey conducted among the 27 museums with excavation responsibilities in Denmark during the summer of 2022. These insights will be contrasted and problematized in relation to international developments, legislations and initiatives.

8 PLURI-ETHICAL ASPECTS REGARDING OSTEOARCHAEOLOGICAL STUDIES ON FEMALE MONASTIC COMMUNITIES

Abstract author(s): Veiga-Rilo, Clara (CRETUS. Group EcoPast - GI-1553, Area of Archaeology, Department of History, Facultade de Xeografía e Historia, Universidade de Santiago de Compostela) - López-Costas, Olalla (CRETUS. Group EcoPast - GI-1553, Area of Archaeology, Department of History, Facultade de Xeografía e Historia, Universidade de Santiago de Compostela; Archaeological Research Laboratory, Stockholm University, Wallenberglaboratoriet, SE-10691; Laboratorio de Antropología Física, Facultad de Medicina, Universidad de Granada, 18012)

Abstract format: Oral

Chronology and identity are key when considering the most appropriate treatment of archaeological human remains. Both help us to link the remains with the cultural background of the nearest living population. The chronology and the chronological continuity have a bearing on the ability to attribute the dimension of humanity to past populations, blurring over time. Therefore, the study of more current historical populations or those more connected with today society are more likely to create ethical concerns. Some female Christian monastic communities are linked to the present because they remain active since their foundation on the Middle Ages, such as the Order of Saint Clare founded in the 13th century. Identity involves the set of values, beliefs, and customs of the culture of ascription – several identities co-lived in the same society. Religious communities have a defined identity, being the female ones different from the male ones. The archaeological literature reveals a greater effort to study the male than the female ones. However, in areas such as the Iberian Peninsula, female monasteries tend to be preferably located in the center of cities, so their study could create a larger impact on society. Cloistered cleric intrigues us but also the bodies of nuns are often seen as sacred or untouchable. This paper focuses on these ethical aspects of medieval human remains from female Christian (Catholic) monastic Orders in comparison with non-conventual necropoleis. We will discuss, among other, the vision provided by media and social media, and the reburial dilemma using as a vehicular case study the convent of Santa Clara in Pontevedra.

9 ESTABLISHING ETHICAL NORMS FOR ANCIENT HUMAN REMAINS RESEARCH AT THE NATIONAL LEVEL: THE NORWEGIAN MODEL

Abstract author(s): Denham, Sean (Norwegian National Committee for Research Ethics on Human Remains; Museum of Archaeology, University of Stavanger)

Abstract format: Oral

One of the challenges in developing and maintaining ethical norms in ancient human remains research at a national level is establishing who has the responsibility for guiding the process. In Norway, the National Committee for Research Ethics on Human Remains (Human Remains Committee), an interdisciplinary committee under The Norwegian National Research Ethics Committees (ultimately under the Norwegian Ministry of Education and Research), functions as a national resource for the promotion of responsible and ethically sound research in this area. It sets out ethical guidelines, contributes to training and teaching, and provides advice to researchers, research institutions and authorities on both general ethical issues within the field and specific cases/research projects. Although strictly advisory, in practice most Norwegian institutions require that proposed projects be evaluated by the Human Remains Committee before granting access to material.

The Human Remains Committee was established in 2008, initially in response to questions regarding research on human remains from Norway's indigenous group, the Sami, and requests for the repatriation of Sami human remains from national collections. Over time, however, the committee has come to engage with a broad range of topics and ethical dilemmas within the field of ancient human remains research. This talk will present the overall framework within which the committee functions, its guidelines and some case studies illustrating the nature of its work.

10 DOUBLE STANDARDS: ETHICS OF ANATOMICAL DONATION BEFORE AND AFTER DEATH

Abstract author(s): Silva-Bessa, Angela (Laboratory of Forensic Anthropology, Centre for Functional Ecology, University of Coimbra; UCIBIO-REQUIMTE, Laboratory of Toxicology, Faculty of Pharmacy, University of Porto; TOXRUN – Toxicology Research Unit, University Institute of Health Sciences, CESPU) - Dinis-Oliveira, Ricardo (UCIBIO-REQUIMTE, Laboratory of Toxicology, Faculty of Pharmacy, University of Porto; TOXRUN – Toxicology Research Unit, University Institute of Health Sciences, CESPU; Department of Public Health and Forensic Sciences, and Medical Education, Faculty of Medicine, University of Porto; MTG Research and Development Lab) - Forbes, Shari (Department of Chemistry and Biochemistry, University of Windsor) - Ferreira, Maria (Laboratory of Forensic Anthropology, Centre for Functional Ecology, University of Coimbra)

Abstract format: Oral

In Portugal, no one is obliged to be an organ donor. For this reason, in 1994, the Registo Nacional de Não Dadores (RENNDA – National Register of Non-Donors) was established for those who would like to oppose organ and/or tissue donation after death. Therefore, all public and private hospitals, and legal medicine institutes which carry out postmortem collection of organs and tissues must verify the existence of any opposition or restriction to donation contained in the RENNDA database. Afterwards, once an individual is buried at a cemetery, relatives are considered legally responsible for deciding what to do with the remains when exhumed. However, if the graves are not cared for, and the relatives are unreachable after a period of ten years, the legal responsibility passes to cemeteries and their corresponding city halls. Although there is no national register where an individual can affirm their will as to what to do with their remains so long after death, it can be assumed that if someone refuses to be an organ/tissue donor, they might as well refuse to donate their human remnants to osteological collections and scientific research studies. In such circumstances, the dead will not have the final say. Should RENNDA be extended to longer postmortem periods and become accessible to cemetery workers? Or should a distinct national register be established for such situations? Framed in a doctoral project, this communication intends to raise awareness on gaps in the law that may stir relevant ethical concerns.

11 ETHICAL USE OF HUMAN REMAINS FOR RESEARCH AND TEACHING: A BEST PRACTICE RECOMMENDATION

Abstract author(s): Passalacqua, Nicholas (Western Carolina University) - Bartelink, Eric (California State University, Chico) - McQuade, Wendy (UNT Center for Human Identification) - Steadman, Dawnie (University of Tennessee, Knoxville) - Boyd, Donna (Radford University) - Spradley, Kate (Texas State University) - Sauerwein, Kelly (National Institute of Standards and Technology) - Ho, Rane (Onondaga County Center for Forensic Sciences)

Abstract format: Oral

Here we present a best practice recommendation for the use of human skeletal remains in education and research contexts. These recommendations were generated by members of the Anthropology subcommittee of the Organization of Scientific Area Committees for Forensic Science (OSAC). The OSAC is charged with drafting standards and best practice recommendations for the practice of various aspects of forensic science in the United States.

Forensic anthropologists often use curated human skeletal remains for research purposes. Additionally, human skeletal remains are necessary to provide adequate education and training to students and professionals. While many institutions curating large skeletal collections have policies and procedures addressing issues such as informed consent, there are no guidelines for how and when human remains may be used in research and education contexts.

Core principles of this best practice recommendation include: seeking and obtaining appropriate permission(s) (i.e., informed consent) for the use of human remains in forensic anthropological research and/or education, as well as ensuring their proper handling and curation. The guidelines clarify which entities can provide consent based on the remains' origin (donated, unclaimed, or unidentified) and how obtained permissions—in addition to institutional policies and procedures—dictate the ethical use of remains for education or research. Guidance is also provided for the use of information associated with remains (e.g., images, measurements), loaning of remains or associated data, and final disposition of remains.

301 EXOTIC FIBRES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Zuchowska, Marta (University of Warsaw, Faculty of Archaeology) - Klein, Astrid (Leipzig University; Research Centre „Buddhist Murals of Kucha on the Northern Silk Road“)

Session format: Regular session

From ancient times exotic fibres attracted people with their mysterious origin and fascinated with their different textures, colour, weight, or properties to warm or cool. Although textile production was usually based on locally accessible raw materials, which caused a strong regionalism in the development of textile technologies, the phenomenon of fibre trade is already known from early prehistory. Not only silk or cotton was desired and traded, but also special types of wool and other animal fleece.

The recent development of scientific methods in ancient textile research allows for more accurate analysis of fibres and better determination of their origin, opening the field for further research and discussion on the phenomenon of fibre trade and exchange.

We warmly welcome all papers addressing to the methodology of research and analyses of archaeological finds of exotic fibres and their context, as well as more interdisciplinary studies using archaeological, iconographic and written sources from diverse geographic and chronological contexts.

The main topics to be discussed in relation to exotic fibres include, but are not restricted to:

- How can they be determined in archaeological material?
- Are they recognisable in visual art, and how are they represented in iconography?
- How were they used, valued and perceived outside their place of origin?
- Was the influx of exotic fibres related to major geopolitical changes or specific people, and how did it influence local textile technology, economy and dress?

ABSTRACTS

1 IMAGEJ SHAPE ANALYSIS EVALUATION OF TEXTILE PLANT FIBRE CROSS-SECTIONAL AREA AS A CONTRIBUTORY FIBRE DIAGNOSTIC FEATURE

Abstract author(s): Waudby, Denis (University of Bradford)

Abstract format: Oral

Subjective shape descriptions that characterise archaeological artefacts serve to aid their diagnostic interpretation. However, differential personal subjective determinations applied to artifact descriptions can compromise such diagnoses.

In particular, textile plant fibres share similar physical and material properties, which make them difficult to distinguish within the archaeological record. Identification of bast fibres from archaeological textile assemblages is essential to understanding prehistoric material culture and social structures. It has long been recognised that only a small proportion of plant products used in the past are represented in the archaeological record. Evaluation of the description of plant fibre remains illustrates the rarity and fragility of such finds. The principal methods of plant fibre diagnosis are microfibrillar angle (MFA) and the subjective description of cross-sectional shape, as evaluated from microscopic imagery. However, the diagnosis is severely limited by fibre degradation in all but the most beneficial depositional environment. The research programme reports the comparison and contrast of mathematical and ImageJ computation of plant fibre cross-sectional circularity (Ct) to determine their reliability as diagnostic determinants in quantifying subjective shape descriptions.

ImageJ imaging analysis software is becoming used increasingly among a vast array of different disciplines. In this report, the computer-based programme demonstrates the potential for applying particle analysis in determining the plant fibre circularity. Ct, a separative operator, is used to construct a database acquired from a complex of similar shape images. In addition, the work includes a review of the results obtained from previous modern fibre CSA determinations to reflect the suitability of shape analysis to aid plant fibre diagnosis.

2 EXOTIC PROTEOMES: A SURVEY OF UNUSUAL ANIMAL FIBRES IDENTIFIED BY PROTEOMICS

Abstract author(s): Solazzo, Caroline (Smithsonian Institution) - Lee, Boyoung (Korea University) - Phipps, Elena (University of California Los Angeles)

Abstract format: Oral

In the search for unusual protein fibres used in the past, proteomics has risen as a well-suited analytical tool. Fibrous proteins are highly-organized structural proteins forming filaments or sheets, providing strength and resistance; in textiles, they typically include keratin families (hair, wool), and fibroins in silk. Proteomics can be used to identify or confirm the presence of unusual fibres in a yarn, and detect animal fibrous proteins in indeterminate archaeological remains. It is particularly useful when microscopic identification is difficult or impossible due to similarities with other fibres, lack of recognizable features, or the degradation of the textile. To identify fibres, proteomics-based methodologies start by building reference databases of peptidic markers, which can be done by comparison with known or collected reference specimens, peptide matching in public protein database, and de novo sequencing (often needed for exotic species whose genomes are not yet known). This paper will review proteomics methods to identify animal fibres, and present examples of exotic fibres from past and new studies. Among the unusual fibres identified by proteomics are viscacha hair, an extremely fine fibre from the Chinchillidae family used in Precolumbian textiles. We will also present the characterization of silk by proteomics, in particular wild silks and sea silk, a rare protein fibre known as byssus used in luxurious textiles.

3 FROM „GRASS THAT IS LIKE COCOONS“? - PICTORIAL REPRESENTATION OF RESIST-DYED FABRICS IN KUCHA ON THE NORTHERN SILK ROAD

Abstract author(s): Klein, Astrid (Leipzig University)

Abstract format: Oral

In Kucha, some early Buddhist wall paintings (5th-6th century) show types of a pearl roundel pattern, possibly referring to a fabric that was still “exotic” in the region at the time, but was already depicted in various ways: donors in wide trousers patterned with roundels in pearl nets (Kizil 118), deities in wrap-over skirts with a pattern of small scattered pearl roundels (Kumtura GK21), and sermon scenes in which a hanging with rows of roundels with a double pearl rim cover the Buddha’s seat (Kizil Cave 207). These examples open up a new perspective on the exchange of patterned fabrics in Xinjiang. For contrary to the previous assumption that the pearl roundel is representative of later painting (6th-7th century) and silks, which only reached Kucha under the Göktürks, this talk shows that roundel-patterned fabrics were already present before.

Reconstruction drawings make it clear that these, however, differ iconographically and compositionally from the later representations. This could indicate a different fabric, e.g. resist-dyed cotton. Cotton fabrics were probably imported into Xinjiang from India from the 3rd-4th century, and also produced locally around the 5th-6th century – this is referred to in the Chinese chronicle *Liangshu* (fasc. 54), which still highlights the exotic character of a grass that can be picked and which “is like cocoons with a silk thread that is like hemp.” The painted representation could refer to a particular type of patterned cotton or to a pattern in the technique of resist-dyeing, which was first applied to cotton but later adopted for silk or linen as finds from Xinjiang and Egypt show.

4 „TEXTILES OF THE WESTERN FOREIGNERS“ - WOOL IN ANCIENT AND EARLY MEDIEVAL CHINA

Abstract author(s): Zuchowska, Marta (Faculty of Archaeology, University of Warsaw)

Abstract format: Oral

Wool, along with flax and hemp was one of the main sources of fibre in Eurasia during the ancient and medieval periods. In China, however, it did not gain popularity until modern times, except in the western and northern borderland,

inhabited by the non-Chinese population. Although the traces of sheep breeding are attested already on the neolithic sites in the middle course of the Yellow River, written sources from the early periods attest only the use of sheep hides, but not the processed fibre. The first mention of wool processing techniques in literary sources dates to the 5th century AD. Archaeological and written sources suggest that woollen fabrics were imported to China and used, even by the elites. The aim of this paper is an analysis of the archaeological and written sources in order to understand why and when animal hair started to be used in Chinese textile production, and how wool and woollen fabrics were perceived and valued by Chinese society.

5 ROBES IN CHILDREN'S BURIALS FROM THE 17TH TO 19TH CENTURIES (POLAND)

Abstract author(s): Grupa, Dawid - Jasiak, Krzysztof (Nicolaus Copernicus University in Torun)

Abstract format: Oral

Archaeological investigations carried out in the crypts in the last two decades have provided a large number of silk fabrics found in the grave furnishings of both adults and children. 99% of these are silk fabrics. Linen and woollen fabrics are found very rarely. The knowledge of grave clothing obtained only from the analysis of silk garments has so far been limited and incomplete. In fact, only in the crypts under the presbytery of the Shchuchin church has a full set of grave clothes been found on mummified remains. The Szczuczyn finds fill in the gaps in terms of grave furnishings and clearly indicate the disparity between garments made of silk and linen. The analysis of this material shows that silk fabrics did not exceed 30% of the grave clothing. These figures indicate that grave clothes made of silk fabrics are only a part of it. Dresses, headpieces and sometimes pillowcases were sewn from them. However, the largest number in the tomb collections are the various types of pasamons adorning both silk, wool and linen dresses.

An analysis of the relics of grave clothing obtained from crypts in Poland shows that deceased children of both sexes from wealthy families were dressed in the same way for burial. The most popular form of children's grave robes was a simple cut garment in the form of a long shirt, usually sewn from plain fabrics. Children's clothing was complemented by headdresses decorated similarly to the dresses. The simplicity and versatility of such clothing means that gender differences disappear, making it impossible, or very difficult, to determine the sex of the deceased solely on the basis of their clothing.

302 DYNAMICS OF EARLY AGRICULTURE IN EUROPE AND BEYOND

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Scharl, Silvine (Institute of Prehistoric Archaeology, University of Cologne) - Antolin, Ferran (German Archaeological Institute, Berlin) - Gerling, Claudia (Integrative Prehistory and Archeological Science - IPAS, Basel University)

Session format: Regular session

First evidence for food production in continental Europe dates to the late 7th (Southeast Europe) and the 6th mil. BC (Central and Western Europe). This early agriculture in Europe is regionally very diverse and the spectra of cultivated crops and of domestic animals vary substantially. We can explain this variability by cultural choices and varying environmental conditions (amongst others) but also, for example, by the different ways that the innovation 'agriculture' spread (e.g., in respect to the involvement of local hunter-gatherer groups). Early farming practices, however, were not static and underwent considerable changes and developments in all the regions in the centuries and millennia following its beginning or arrival. Regionally varying – non-linear-evolutionary – processes of standardisation and diversification can be observed.

The session aims at bringing together experts who investigate the dynamics of early agriculture, i.e. the diversity and transformations in food production in the centuries and millennia after its beginning/arrival with a focus on diachronic comparative or synchronic comparative approaches on local, regional or supra-regional levels. We ask about the causes for these dynamics, which can be externally triggered, but can also be caused by internal change. Methodologically, the questions can be explored using archaeological and/or environmental proxies preferentially through quantitative approaches to explore the entanglement of agriculture, environment and lifestyle in early farming societies. Our starting point is the Neolithic period in Europe, but since these questions are not restricted to Neolithic Europe, but concern early agricultural systems on a global scale, we also welcome contributions on other geographic regions

1 DIET AND ANIMAL HUSBANDRY DURING THE NEOLITHIC - LIPID ANALYSIS ON CERAMIC VESSELS FROM THE LOWER RHINE BAY

Abstract author(s): Krewer, Elisabeth (Institute of Prehistoric Archaeology, University of Cologne) - Heim, Christine (Institute of Geology and Mineralogy, University of Cologne) - Scharl, Silvine (Institute of Prehistoric Archaeology, University of Cologne)

Abstract format: Oral

Analysis of organic residues in ceramic vessels can reveal traces of plant and animal residues and thus allow the reconstruction of diet and subsistence strategies in the past, even in the absence of human or animal remains. The Neolithic is a time of massive changes in settlement patterns and agricultural behavior. Organic residue analysis offers the possibility to answer fundamental questions about subsistence strategies in this critical time period.

The PhD project targets well-known Neolithic sites in the Rhineland (especially in the Lower Rhine Bay), which suffer from strong decalcification of the loess soils and poor preservation of animal bones. Hence, inferences about animal husbandry and the reconstruction of diets (meat and milk consumption) based on bone collagen analysis is difficult or even impossible.

Lipid analyses and the stable isotope compositions of animal fats from selected Neolithic pottery (6th-3rd millennium BC) can make a fundamental contribution to understanding the diachronic development of diet and animal husbandry, and here on the introduction of milk. Next to a diachronic perspective the project also aims at a synchronous comparison of settlements located in the center and in the periphery of documented settlement areas. For the central and the peripheral locations of the settlement distribution, vessels from sites of different size, period of occupation and dating were sampled.

First results on the beginning of the Neolithic settlement of the Lower Rhine Bay of the 6th and 5th millennium BC will be presented.

2 DYNAMICS OF EARLY AGRICULTURE REFLECTED IN SETTLEMENT PATTERNS DURING THE 5TH MIL. BCE IN CENTRAL EUROPE

Abstract author(s): Stöcker, Anna - Scharl, Silvine - Suhrbier, Stefan (Institute of Prehistoric Archaeology, University of Cologne)

Abstract format: Oral

During the 5th mil. BCE in Central Europe agricultural practice and techniques are changing and diversifying. At the same time, a transformation of settlement patterns can be documented. The correlation of these processes is investigated in an interdisciplinary research project. In the framework of a landscape archaeology approach the data is analysed on different scales. In our talk we will present first results of our research with a focus on the development of settlements.

On a macroscale, sites from the Rhineland and Northern Bavaria dating to c. 4900-4300 BCE are analysed in terms of the development of settlement patterns and associated environmental conditions such as precipitation, temperature, soil and landscape. Quantitative analyses can show a correlation between some of these conditions and the chronological sequence. In this context, bundles of conditions can be interpreted as an ecological environment (e.g., warmer - wetter - better soil vs. colder - drier - less suitable soil) and provide information about the conditions of agriculture.

Changes will also be analysed on a micro scale by examining the internal structure and architecture of three settlements dating to the period c. 4900-4500 BCE. The structural patterns within these settlements indicate changes in economic activity and the development of architecture implies different social structures. While the settlements of the preceding Linear Pottery Culture show a very uniform structure, with longhouses and surrounding pits working as autonomous economic units that are usually designated to nuclear families, in the following 5th millennium BCE, the settlements display a different relationship between longhouses and pits, as well as other structural elements. We are seeking to understand these changes by analysing the sites, comparing them to contemporaneous as well as later sites in the research area and to connect them to archaeobotanical and -zoological analysis.

3 ANALYSING TRANSFORMATIONS OF CROP CULTIVATION IN THE RHINELAND (GERMANY) DURING THE 5TH MILLENNIUM BCE

Abstract author(s): Zerl, Tanja (Laboratory of Archaeobotany, Department of Prehistoric Archaeology, University of Cologne) - Suhrbier, Stefan (Department of Prehistoric Archaeology, University of Cologne) - Röpke, Astrid (Laboratory of Archaeobotany, Department of Prehistoric Archaeology, University of Cologne)

Abstract format: Oral

During the 5th millennium BCE, a cultural, social and economic change took place in Central Europe which is particularly visible in the farming system. In addition to the expansion of the economic space into less favourable areas, the crop spectrum of the previous Linear Pottery culture was broadened with naked barley and naked wheat. These new cereals made agriculture more complex, but also more flexible in terms of cultivation areas and labour organisation. However, it is still unclear in which way this development took place in the course of the 5th millennium BCE and whether the different cultures and regions varied in this respect.

In order to take a closer look at this transformation of crop cultivation, the archaeobotanical data of a favourable landscape - the Rhineland (North Rhine-Westphalia, Germany) - were examined in more detail. This "Altsiedellandschaft" comprises the fertile loess region west of Cologne and has been continuously settled since the Early Neolithic (from approx. 5300 BCE). Thanks to 60 years of archaeobotanical research, numerous plant assemblages from the various archaeological cultures of the Early (Linear Pottery culture), Middle (Großgartach, Rössen, Bischheim cultures) and Young Neolithic (Michelsberg culture) are available from this region and can be compared with each other.

The aim of this comparison is to understand the changes in agriculture from the 6th to the 4th millennium BCE more precisely. In this regard, multivariate analyses show a statistically significant correlation between the cultural development of the Neolithic and the cultivation of crops. The question is whether there is also a verifiable correlation between environmental data (e.g. temperature, rainfall, water balance, soil). In addition, it should be discussed if a continuous development has taken place or if breaks can be determined.

4 EVALUATING POSSIBLE ENVIRONMENTAL INFLUENCES ON CHANGES IN EARLY FARMING PRACTICES IN NORTHWEST CENTRAL EUROPE BETWEEN 5300 AND 4000 BCE

Abstract author(s): Broich, Manuel - Frank, Thomas (Laboratory of Dendroarchaeology, University of Cologne) - Kaczka, Ryszard (Department of Physical Geography and Geoecology, Charles University) - Westphal, Thorsten (Laboratory of Dendroarchaeology, University of Cologne) - Scharl, Silvine (Department of Prehistoric Archaeology, University of Cologne)

Abstract format: Oral

The Neolithic mode of subsistence reached the fertile loess regions west of the Lower Rhine Basin at about 5300 BCE and is strongly connected to the so-called Linear Pottery Culture (LBK) of the Early Neolithic, lasting till c. 4950 BCE. Half a millennium later, from 4900 BCE onwards, the archaeological record reflects changes in the material culture, in settlement patterns and in the agricultural system (e.g. introduction of new crops). These developments are summarised by the definition of the archaeological cultures of Großgartach, Rössen and Bischheim during the Middle Neolithic (4900-4400 BCE).

In our project we search for answers to the question whether these changes were triggered by natural external factors, summarised as environmental changes in temperature and/or precipitation.

To evaluate possible environmental influences, we use yearly resolved dendrochronological data from mainly subfossil oaks (*Quercus* spp.) of gravel pit activities near the River Weser and wooden archaeological constructions of the Early Neolithic discovered in the Rhineland. Various tree ring properties, like width, stable isotopes ($\delta^{13}C/\delta^{18}O$) in the wood tissue and Blue Intensity values of the latewood are examined in order to draw conclusions about possible environmental changes. These dendrochronological time series are then compared to independent archaeological proxy data to detect potential responses of the early agrarian societies in question to environmental variation and we discuss possible causalities.

Our results show that on the one hand variation of precipitation on a yearly or decadal time scale may have caused LBK societies to construct water wells to cope with dry years or decades. On the other hand we detected in our tree ring width chronology a phase (5100-4400 BCE) of less variable tree ring widths, which corresponds more or less with the archaeologically defined Middle Neolithic (4900-4400 BCE).

5 LAND USE DYNAMICS IN THE WETTERAU REGION FROM THE 6TH TO THE 5TH MILLENNIUM BCE

Abstract author(s): Lindemann, Hannah - Stobbe, Astrid (Goethe-University Frankfurt)

Abstract format: Oral

In the 6th millennium BCE the first farmers and cattle breeders of the Linear Pottery culture in Central Europe settled in favourable areas with fertile soils. Later, in the first half of the 5th millennium BCE, there are signs of an expansion of settlement and economic areas to locations that are less suitable, in particular for arable farming. This includes the use of alluvial areas, but especially of the lower and higher parts of the surrounding mountain ranges. An example of these changes is the favourable lowland of the Wetterau (Hesse, Germany) with the Taunus mountains in the west and the Vogelsberg massif in the east. In the central Wetterau, which is a typical 'Altsiedellandschaft', the first clearings are evident during the Linear Pottery Culture in the second half of the 6th millennium BCE, mainly for the creation of settlement areas and arable land. In the 5th millennium the proportion of open spaces and agricultural activities seems almost unchanged. In the vicinity of the 'Altsiedellandschaft', on the other hand, declining tree pollen proportions and increased values of anthropogenic indicators in the pollen spectrum have only been proven since the Middle Neolithic, especially since the Rössen phase (c. 4630-4380 BCE). By the example of various pollen profiles, the different land use within and on the fringes of the Wetterau will be presented and possible causes for this will be discussed.

6 OPEN YOUR MOUTH AND SHOW ME YOUR TEETH - A ZOOARCHAEOLOGICAL STUDY FROM 5TH MILLENNIUM BCE SITES IN SOUTHERN GERMANY

Abstract author(s): Nolde, Nadine (Institute for Prehistory, University of Cologne; Laboratory for Archaeozoology) - Suhrbier, Stefan (Institute for Prehistory, University of Cologne)

Abstract format: Oral

While the first farmers in Central Europe settled on fertile soils derived from loess in the first half of the 5th millennium BCE (Middle Neolithic), a transition to less attractive areas by an agricultural expansion can be observed. One possible explanation is the specialisation in animal husbandry, which led to a spatial expansion into new pastures. In general, faunal analyses show that the species distribution of domestic animal species depends on the landscape conditions and that abundance varies regionally. In many Middle Neolithic sites, cattle represent more than half of the domestic animal species, but pig, sheep and goat remains have also been found in large numbers under suitable habitat conditions. The palynological record shows a progressive clearing of the forests beyond the former settlements, not only to create new arable land or for timber extraction but also as evidence of an expansion of animal husbandry, accompanied by extensive woodland pasture and intensification of leaf harvesting for fodder. Microscopic traces on the enamel bands of teeth – known as dental microwear – of sheep and goats from different sites in southern Germany indicate that some animals show patterns typical of woodland pasture and/or a diet rich in leafy hay. Others, however, had a phytolith-rich, grass-based diet indicating increased ingestion of abrasive soil particles consumed with the plant cover, and are interpreted as reflecting eroded winter pastures, high stocking densities and/or limited grazing areas for the small ruminants. By including cattle and pigs in this study, we aim to use dental microwear and classical archaeozoological methods to highlight the diversity of different husbandry and dietary practices of livestock from six different southern German sites of the 5th millennium BCE, and to gain an understanding of the complex dynamics of early animal husbandry through a diachronic and synchronic comparison.

7 AN ISOTOPIC VIEW ON THE ECONOMIC DYNAMICS IN NE SWITZERLAND DURING THE NEOLITHIC

Abstract author(s): Gerling, Claudia (University of Basel, Department of Environmental Sciences and Department of Ancient Civilizations) - Antolin, Ferran (German Archaeological Institute, Natural Sciences Division)

Abstract format: Oral

Intensive excavations of and investigations on the Neolithic and Bronze Age wetland sites around the central European Alps during the last decades brought enormous amounts of well-preserved organic materials to light, enabling detailed interdisciplinary studies on settlement chronology, community organisation, and economic strategies. Two major projects focussing on the Lake Zurich region, Switzerland, during the Neolithic period, i.e., ca. 4300-2500 BCE, investigated the dynamics of agriculture and animal management using archaeobotanical and archaeozoological remains.

The analysis of cattle tooth enamel for strontium, carbon, and oxygen and human bone for carbon and nitrogen stable isotope ratios, provided insights into the herding practices of the main domesticated species as well as the role domestic and wild animal products played in the human diet at the time. The application of carbon and nitrogen stable isotope analysis to charred grains enabled a better understanding of changing regimes in crop husbandry.

In this contribution, we present and discuss the results of the two studies, with a special focus on changes over the 2000 years of Neolithic occupation, and put them into the wider context of cultural choices and environmental adaptations related to the economy of the pre-alpine Neolithic wetland sites.

8 TO BE OR NOT TO BE A FARMER - SOME THOUGHTS ON THE NEIGHBOURS OF EARLY FARMERS IN NW-EUROPE

Abstract author(s): Kalis, Arie (Goethe Universität Frankfurt am Main) - Meurers-Balke, Jutta (Universität zu Köln)

Abstract format: Oral

From an archaeobotanical view, neolithization in two adjacent landscapes in NW Europe will be compared for the period 5500 and 3500 BC. The loess landscape between Maastricht and Cologne and the delta area of the Rhine and Meuse adjacent to the north will be discussed.

In the Rhenish loess area, the Neolithic began 5300 BC with the immigration of farmers of the Linear Bandceramic Culture. They brought a fully matured agricultural system from central Europe. The impact of their agricultural activities in the archaeobotanical material is given evidence by charred remains of cultivated plants and pollen diagrams reflecting a woodland manipulation by the farmers and their domesticated animals. The delta area adjacent to the north was inhabited by hunter-gatherers of the Swifterbant Culture. Their activities are archaeobotanically hardly visible.

Ca. 5000 BC, in the middle Neolithic, the agricultural system in the loess area changed. A larger spectrum of cultivated plant species was used. Pollen analysis shows an ongoing manipulation of the woodland stimulating early successional species especially ash. In the delta area, there are still no traces of arable farming but pollen analysis shows first traces of forest manipulation, probably for the benefit of domesticated animals.

The agricultural system changed again 4200 BC. In the loess area, macro remains shows a shift of the cultivated plant spectrum towards summer cereal cultivation. Pollen analysis shows intensified animal husbandry, especially outside the area for arable farming. In the delta area, finds of cultivated plants show that arable farming was now also practiced by the Swifterbant people.

It is our aim to bring a concept that will diachronically and causally connect the above mentioned Neolithization processes in both areas.

9 EVALUATING CAPRINE REMAINS OF THE SWEDISH FUNNEL BEAKER CULTURE THROUGH ZOOMS

Abstract author(s): Sjögren, Karl-Göran (Dep of historical studies, Gothenburg university) - Buckley, Michael (The University of Manchester, Manchester Institute of Biotechnology) - Vretemark, Maria (Västergötlands museum) - Axelsson, Tony (Dep of historical studies, Gothenburg university)

Abstract format: Oral

In northern Europe, the first indications of a Neolithic lifestyle appear around 4000 cal BC from northern Germany up to middle Sweden and south-eastern Norway in an apparently short period of time, largely carried by immigrant populations bringing new species of plants and animals into the region. However, the nature of this domestication “package” is not everywhere the same, whereby both environmental and cultural filters acted on the particular set of species cultivated and bred in different regions. In Neolithic Scandinavia, cattle, pigs and caprines (sheep and goat) are all present in varying proportions, with cattle more prominent in Denmark and pigs more prominent in more northerly areas. However, little is known about the ratio of sheep to goat remains within this region, largely due to difficulties in morphologically separating the two species. In this paper we report the results from ZooMS analysis of 45 sheep/goat bone samples from two recently excavated Funnel Beaker settlements in Karleby, Falbygden, Sweden.

The ZooMS analyses gave a clear and somewhat surprising result: 33 of the samples were classed as sheep, one as deer, and none of them as goat. In all likelihood, goats have not been present at all on these sites. A survey of the literature shows that while small numbers of goats are likely present in Denmark from the Early Neolithic, their presence in Sweden at this time is ambiguous and the few claims merit reassessment. Furthermore, the low numbers in Scandinavia compared to central and southern Europe suggests an overall geographic trend, with decreasing proportions of caprines as well as goats in the north.

EVIDENCE OF AGRICULTURAL DIVERSIFICATION: ARCHAEOBOTANICAL STUDY IN JIANGLIU SITE IN 5000 BP, SHAANXI, NW CHINA

Abstract author(s): Li, Jingbo (Stanford University) - Tian, Duo (Northwest University) - Pei, Xuesong - Wang, Hongying (Shaanxi Academy of Archaeology)

Abstract format: Oral

Yangshao Culture (5000-7000 BP) is one of the most influential Neolithic Cultures in north China, featured by millet agriculture. During this period, the cultural communication network in China has been well established, and as the earliest domesticated crop and staple food in South China, rice appeared in the territory of Yangshao Culture. Jiangliu site is a Neolithic settlement of the late Yangshao Culture in central Shaanxi, Northwest China. Bell-shaped storage pits, pottery kilns, large ring-shaped trenches, and burials, with a large number of artifacts like pottery (amphoras, wide edge basins, etc.), bone tools, and ornaments were discovered. Archaeobotanical flotation results show the macro-remains are dominated by carbonized foxtail millet and broomcorn millet, with a small amount of rice with rachis. A considerable number of weed species that reflect wet and saline-alkali landscapes were also found in the samples. Additionally, the micro-fossils of millet and rice, including phytoliths and starch grains, were recovered from the residue in amphoras. Combined with the data from other sites of Yangshao Culture, we argue that rice, as an exotic crop from the south, was consumed as a supplementary food and used for alcohol brewing. This study provides evidence of agricultural diversification in the period of Yangshao Culture, corresponding with continuous cultural expansion and exchange in Neolithic China.

A. FOOD CHANGE IN THE EARLY AGRICULTURAL INITIATION IN SOUTHEASTERN JAPAN

Abstract author(s): Shiroishi, Tetsuya (Yamagata University) - Shinohara, Kazuhiro (Shizuoka University) - Miyata, Yoshiki (The University Museum, The University of Tokyo)

Abstract format: Poster

The early formation of agricultural society in the Japanese Islands begins around 2,800 years ago. However, it is not a result of natural spontaneous production. The origins of agricultural culture are in the Yangtze River basin in southern China, and Japan is the most eastern part of that region. The rice-based agricultural culture that began in the middle and lower reaches of the Yangtze River developed extensively, mainly in Asia. The route of spread to the Japanese islands is thought to be mostly from the Korean Peninsula to the northern part of Kyushu Island. Later, rice farming culture developed and took root throughout the Japanese islands. In this study, we focus on the southeastern region of the islands of Japan, which stretches from north to south, and use archeological and physico-chemical proxies to examine changes over several hundred years from before the beginning of rice farming to the settlement of rice cultivation. In particular, the pottery will be used as a base to show the current limits of the transformation of early agricultural society from a change in „food“ to an agricultural society. Specifically, the following methods will be used: (1) changes in the location of settlements (environment), (2) changes in excavated artifacts (agricultural tools), and (3) changes in the cooking traces of pottery (use traces and cooking contents) to provide information and discussion that will contribute to the observation of the non-linear transformation process of standardization and diversification that varies from region to region, which is the goal of this session. The session will be held in the following areas.

304 DIFFERENT STORIES FOR DIFFERENT PEOPLE? SHAPING NARRATIVES: FROM INDIVIDUAL RESEARCH SITES TO MAJOR INFRASTRUCTURE PROJECTS

Session theme: 3. Heritage Narratives and Representations

Session organisers: Halsted, John (HS2 Ltd) - Fushiya, Tomomi (University of Warsaw)

Session format: Regular session

Major Infrastructure projects through their sheer scale clearly have the potential to both generate and challenge archaeological narratives. They also have a responsibility to communicate narratives more widely as part of realising the benefits of such extensive programmes of work. This session will focus on the potential ways of communicating archaeological narratives from projects of all sizes, and from long running research excavations such as those at Nea Paphos, Cyprus, to large commercial infrastructure programmes.

There may be much to learn for large scale infrastructure from approaches taken at individual sites and research projects which have focussed on communicating the outcomes of their work to a variety of audiences. From the implementation of the Historic Environment Research and Delivery Strategy on HS2 Phase 1, a number of themes emerge:

- How does fieldwork practice and decision-making influence narratives?
- To what extent do question-led approaches change narratives?
- How are narratives communicated to wider audiences?

- Who are those audiences and which narratives do we choose to present?
- How do we consider less heard voices and ensure we are inclusive?

We invite papers from a range of cultural heritage projects, both small and large scale, that consider how archaeological narratives are generated and how those narratives are communicated more widely. To what extent are different narratives communicated to different audiences and how do we identify the stories we wish to tell? What are the types of communication and dissemination that best reflect results and to what extent do they differ between different types of investigation?? How can dialogue with a range of audiences contribute to the shaping of narratives? To what extent can different delivery mechanisms be used to reach different audiences?

ABSTRACTS

1 BRINGING THE PAST TO LIFE. CASE STUDIES AND IDEAS FOR CONVEYING THE PAST TO DIFFERENT AUDIENCES

Abstract author(s): Waddington, Clive (Archaeological Research Services Ltd)

Abstract format: Oral

This paper will deliver a concise look at case studies from a range of projects undertaken by the author in the UK, from big footprint infrastructure to community projects, that highlight different ways of narrating the past to different audiences, as well as assess their effectiveness. This will include consideration of different types of text, books and storylines through to the use of experiment, 'reconstruction' and wider community articulation of the past such as its inclusion in, for example, contemporary folk music and beer names and labels. Audiences digest the past in different ways with some people preferring written text, some prefer more visual stimulus whereas others prefer hands-on and physical engagement with the past. Digital technology provides a wealth of opportunities for communicating in different ways all across the world and this has opened up ways of communicating the past through a wide variety of formats which are still in their infancy. The paper will conclude with some ideas that could be applied to the Analysis and Publication phases of projects.

2 SHAPING NARRATIVES THROUGH AUDIENCE MAPPING

Abstract author(s): Ruddy, Mary (WSP)

Abstract format: Oral

HS2 is a new UK high-speed railway planned to link London and the Midlands to Manchester. Following years of planning, the construction stage of the Phase One London to Birmingham leg has begun. The preparation 'enabling' works on this vast scheme encompassed a programme of historic environment investigation considered the largest in the UK. The route crosses a fascinating historic landscape that has generated highly significant archaeological investigations and many narratives. The scheme spans numerous places and communities, and the approach embedded by the Historic Environment Research and Delivery Strategy (HERDS) to use heritage for public benefit and to inspire via education is a central tenet. This paper discusses the HERDS framework of principles and overarching aims that could be transferred to other major schemes and sites through discoveries in HS2 Area North (The Midlands). The engagement programme brought together local heritage groups, museums, universities, schools and the public to share and learn through activities such as webinars, YouTube series, exhibitions, schools' workshops, careers films and a new Young Archaeologists Club. Engagement can deliver different stories for different people, but this relies on understanding target audiences and early and sustained engagement to enhance relevance. Narratives should take shape around community interests, welcome interaction and adapt mode and style, rather than taking a broadcast media approach. For coherence in large-scale infrastructure, Audience Development and Activity Planning need joining up at project level. Drawing on expertise from sister professions for audience mapping, quantifying impact and measuring social value could be a valuable tactic for commercial and research archaeology.

3 SELECTING SITES AND TELLING STORIES: HOW FIELDWORK PRACTICE CAN INFLUENCE ARCHAEOLOGICAL NARRATIVES. HS2 PHASE ONE, UK

Abstract author(s): Halsted, John (HS2 Ltd)

Abstract format: Oral

The interpretation of our investigations into the past, whether that be the chronological development of a site, the activities of its inhabitants or the environment in which they lived, culminate in the formation of archaeological narratives. These may take the form of a discussion in an archaeological report, a conference presentation, a story in the media or educational activities. The narratives we develop as a result of archaeological fieldwork are directly influenced by the methodologies we employ. On a large-scale project such as HS2 Phase One, those methodologies can include a variety of survey and sampling strategies culminating in the selection of specific locations for further investigation.

The methodology and decision-making process has been influenced by the Specific Objectives as set out in the Historic Environment Research and Delivery Strategy (HERDS). The narratives produced will be generated for both academic historic environment audiences and the wider public, including local communities and school children. This paper will examine the types of narratives and stories that are produced for different audiences and consider which themes are chosen and the extent to which those are influenced by the research questions we have set out. Any lessons learnt from the approaches taken will be considered.

4 THE BROTHEL OF LATE ANTIQUE ASCALON: A FALSE NARRATIVE AND ITS CONSEQUENCES

Abstract author(s): Ehrlich, Simeon (Fulbright U.S. Scholar Program; The Hebrew University of Jerusalem -The Institute of Archaeology)

Abstract format: Oral

Excavations at the Romano-Byzantine port of Ascalon in the 1980s and 1990s uncovered a series of scandalous discoveries: a pool with an inscription beckoning passersby to “enter, enjoy, and...”, a cache of lamps with erotic scenes, and the bones of 100 infants in the sewer beneath. Initial academic publications were tempered, offering matter-of-fact descriptions of the finds, and downplaying any interpretations not fully substantiated by the material remains. Public-facing communications showed no such restraint: the excavators had found a brothel and the unwanted children of the prostitutes who worked within.

This sensationalized narrative took hold in the popular imagination and left its mark in a variety of print and visual media. In time, it came to influence scholarship as well, both that about Ascalon itself and that about other sites for which Ascalon was used as comparandum. Yet, recent research shows that the brothel narrative is entirely false, being based on misinterpretations, insinuations, and exaggerations, and having no basis in a culturally-aware understanding of the excavated material.

This paper is about the challenges of public engagement and the dangers inherent in prioritizing mass appeal over scholarly rigor. It argues that the benefits of short-term boosts in public interest are heavily outweighed by the costs of achieving correctives to false narratives that propagate among the public.

The fact that public communications do not undergo the same sort of rigorous peer review as academic publications means that scholars must take extra care to avoid making aggrandized or unsubstantiated claims that will go unchallenged.

5 THE RESTORATION OF ARCHAEOLOGICAL SITES, NEW NARRATIVES AND OLD PERCEPTIONS: THE CASE OF SPARTA

Abstract author(s): Giannakaki, Charikleia (Greek Ministry of Culture and Sports, Ephorate of Antiquities of Lakonia)

Abstract format: Oral

Sparta is an emblematic city-state of ancient Greece, with an important and distinct historical footprint due to its involvement in major events of ancient Greek history, as documented in many ancient sources, but also because of the „peculiarities“ attributed to the constitution and life of the classical city. This approach is already evident in ancient written sources, which chose narratives that presented Sparta as a national and patriotic model of severity, discipline and austerity. Over time, these narratives have fascinated heterogeneous groups of audiences and were often exploited for ideological and political purposes, as in the case of Nazi Germany, where Sparta emerged as an important model for the domination of National Socialists and for an education based on racial ideology. Having survived to the present day they are even revived in contemporary popular culture, as in the Hollywood film „300“. At the local level, they affected the features of the society and the expectations of the visitors and the scholars of Sparta. Major projects for the restoration of archaeological sites in the area were systematically implemented rather late, in the late 20th and early 21st century. In addition to the presentation of these projects, the proposed paper will focus on the case of Sparta by discussing the ways in which an organized and accessible archaeological site and the narratives it communicates could reach different audiences and thereby lead to the revision of established perceptions that affect the local identity, the evolution of the region and the interaction with its visitors.

WEAVING AND WEARING NARRATIVES OF IDENTITY. PRODUCTION, TRADE, AND CONSUMPTION OF TEXTILES AND PERSONAL JEWELLERY AS MARKERS OF IDENTITIES [COMTEX]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Longhitano, Gabriella (University of Catania) - Dickey, Alistair (Independent Archaeologist) - Muti, Giulia (Cyprus American Archaeological Research Institute - CAARI) - Hitchens, Sarah (University of Liverpool)

Session format: Regular session

In the ancient Mediterranean, people engaged in the production, trade, and consumption of a vast array of staple and luxury goods. The well-known case of the Phoenicians, who were both skilled producers and large-scale traders of many goods (i.e., ivory artefacts, metals, textiles, etc.), is a paradigmatic example of how production and trade could be formative aspects of social identity. In parallel, the consumption of valuable Phoenician products across the Mediterranean was a means of self-representation, cultural affiliation, and embodiment of specific social values.

The relationship between crafting and/or product consumption and social identity is particularly evident when it comes to textiles. Over the last 20 years, scholars have reflected on how social groups used textiles to forge, embody, and convey different identities, including cultural/ethnic ones. Nevertheless, this is not exclusive to textile production. Other ancient crafts show a similar entanglement between the producers, traders, and consumers. For instance, possessing and wearing jewellery was closely connected to identity and thereby a potential means through which individual and social identity could be expressed. At the same time, producing jewellery (i.e., pins, fibulae, necklaces, rings, etc.) or other kinds of artefacts to be worn (i.e., weapons) would have given the craftspeople a certain role in society, enabling them to build a work-related identity.

This interdisciplinary session wishes to bring together contributions with the main focus on all goods to be worn (textiles, jewellery, and weapons) through which social identity could be shaped and expressed. We welcome papers covering the period from prehistory to 1000 CE across the wider Mediterranean and Europe. The goal is to stimulate a broad discussion on the materiality and materialisation of ancient identities through the 'production-exchange-consumption' paradigm of these specific goods.

ABSTRACTS

1 AN INTRODUCTION TO „WEAVING AND WEARING NARRATIVES OF IDENTITY“

Abstract author(s): Muti, Giulia (Cyprus American Archaeological Research Institute - CAARI) - Longhitano, Gabriella (Università degli Studi di Catania) - Dickey, Alistair (Independent archaeologist) - Hitchens, Sarah (University of Liverpool)

Abstract format: Oral

This presentation serves as an introduction to the session topic. Its aim is to guide the attendees through the papers presented and provide them with a background on the main concepts discussed. Specifically, we intend to briefly unpack the themes and theoretical concepts behind the Session, which revolves around the relationship between the production, trade and consumption of artefacts that can be worn or are in close contact with the human body as agents or creators of social identity. We will draw attention to some of the main controversies that have shaped the debate during the last decades around the concept of identity and the importance of a more interdisciplinary approach in dealing with it.

Engaging with a variety of materials – from ornaments to textiles – we will stress how these different pieces of evidence, coming from research on new materials or re-analysis of past excavations, interact with and complement others to enhance our understanding of social identity in ancient times. Then, the general structure of the Session is explained and the single contributions are introduced. In this regard, the introduction offers the perfect occasion to mention the periods and areas touched by the presentations within the Session's wide region and chronological framework.

2 ELEMENTS OF IDENTITY TO BE WORN: DRESS ORNAMENTS AMONG THE VIII-VI C. BC COMMUNITIES IN SICILY

Abstract author(s): Longhitano, Gabriella (University of Catania)

Abstract format: Oral

Specific types of metal dress ornaments and fibulae have been traditionally considered as distinctive elements of material culture among the VIII-VI c. BC communities in Sicily.

This paper focuses on the analysis of two funerary contexts chosen as paradigmatic examples of the hybrid cultural context characterising Sicily between the VIII-VI c. BC. These are two well-known sites, which have been long studied to understand a crucial period of Sicilian archaeology.

A detailed analysis of metal ornaments adorning garments of dead and their position on the body for the first time has made it possible the interpretation of their original function and the reconstruct of the kind of garments worn. The comparison between different times and contexts shows that new luxury ornaments were adopted by local communities, likely coming from the cultural interaction with Greek people settled on the island from the end of VIII c. BC. However, the local tradition of fastening and adorning garments appears to continue in contrast to the Greek tradition. Through the analysis, we will question: who was using and wearing which type of fibulae or other kind of ornaments? who was adopting new ornaments and/or new dress?

This study on how garments were fastened, worn and adorned will shed light on the social complexity of local society and how identity was expressed through types of garment and textile ornaments.

3 JEWELLERY FASHION IN THE GREEK COLONIES

Abstract author(s): Liveri, Angeliki (Greek Ministry of Education and Religious Affairs)

Abstract format: Oral

This paper presents gold jewellery in Greek style, which was found as burial offerings in the Greek colonies of South Italy (e.g., Taras) and of the Northern Black Sea (Crimea and Taman peninsulae), focusing on diadems, earrings and necklaces dated in the 4th century BCE. We aim to demonstrate the iconographic and stylistic similarities and differences between artefacts of these regions and similar pieces unearthed in Metropolitan Greece. We will address the following topics: The creators of these artefacts followed the Greek Jewellery tradition or they also created new works according to the time trends and depending on the customers taste? Whether this Greek jewellery style was worn by members of the respective local Greek society, constituting a characteristic of national identity and differentiation from other “barbarian” inhabitants of the colony. If non-Greek residents followed this fashion? We will also attempt to identify the social-economic status of the jewellery owners and if the creators of these pieces were travelling Greek craftsmen or they were produced by permanent workshops situated in specific areas.

4 SPINNING ON FEMALE IDENTITY IN THE IBERIAN CULTURE

Abstract author(s): Rosell Garrido, Patricia (University of Alicante)

Abstract format: Oral

As Ephorus (F. H. G., III, 456) already mentioned, during the 5th century BC, the Iberian communities celebrated an annual festival dedicated to textiles, in which the women wove their garments in order to make the winner the one with the best textile piece and, therefore, the best weaving skills. Thus, this activity, which was originally carried out for the maintenance and self-consumption of the family, reached a high level of importance for Iberian Culture. However, its importance lay not only in the quality of the textile products, but also in the techniques, their uses and functions as well as their economic weight, becoming one of the main handicraft production manufactures developed by these Iberian groups.

Thus, the study and review of the archaeological remains, dwellings and iconography allow us to identify this work as one of the main tasks that define the female sphere of Iberian culture and underpin the identity of Iberian women. In turn, a detailed analysis allows us to understand its importance from a socio-economic perspective for the group, the type of resulting pieces, how they could be worn, similarities and differences in their attire with respect to other groups of Mediterranean Antiquity and to differentiate the young-adolescent and adult-mature female agents and their social rank, where even jewelry and hairstyle come into play. In short, the spinning of a whole narrative in which the gender-feminist reading of the textile presents it as a basic piece for an adequate interpretation of the social role of Iberian women.

5 YOU ARE WHAT YOU WEAR FROM YOUR FEET TO YOUR HAIR: ADORNMENT AS IDENTITY IN LATE ANTIQUE BURIALS IN EGYPT

Abstract author(s): South, Kristin (Fag el-Gamus Excavation)

Abstract format: Oral

The practice of mummification in Egypt involved the use of multiple wrapped layers of linen in addition to inclusions of jewelry and amulets to display wealth and social identity. By the early Roman era, coincident with and related to the rise of Christianity, a newer form of burial appeared. These burials continued to use linen wrappings but could now also include clothing to be worn in death as it had been in life. Together with jewelry and other inclusions, these materials could express age, gender, wealth, and social identities. Taking the necropolis of Fag el-Gamus in Egypt's Fayum as an example, this paper examines a range of consumables that were considered important (or unimportant!) enough

to accompany a person into the afterlife. The presence – and sometimes equally telling, the absence – of clothing, jewelry, head and foot wear, and objects of daily life can provide modern interpreters with a glimpse into how ancient identities interacted with material objects.

6 FASHIONING IDENTITIES ALONG THE MIDDLE NILE. LOINCLOTH OUTFITS IN LATE ANTIQUE AND EARLY MEDIEVAL SUDAN (C. 100 – 800 CE)

Abstract author(s): Yvanez, Elsa - Wozniak, Magdalena (University of Copenhagen)

Abstract format: Oral

The arid climate of the Middle Nile valley has guaranteed the preservation of a very large body of archaeological textiles dated to the Late Antique and Medieval periods. In Sudan and Nubia, this time marks the transition between the ancient Kushite Meroitic kingdom and the Christian Makurian kingdom (c. 100 – 800 CE). Usually found in funerary contexts to dress, wrap, or support the dead, textiles are closely related to the individuals and communities who used and reused them. They can also be compared with many iconographic representations of dressed people, leading to the reconstruction of garment types and assemblages. Paired with the study of their archaeological and historical contexts of use and discard, ancient Sudanese textiles offer the precious opportunity to analyze different narratives of identity. This is the aim of the newly started project Fashioning Sudan. Archaeology of dress along the Middle Nile (ERC 101039416).

While this presentation will first introduce the project as a whole, it will also question different approaches to the study of identities in clothing artefacts. How can we, as archaeologists, recognize tenets of ‘identity’ in garments? How did past populations craft their identities through the manufacture of their garments? In addition, how did clothing help them perform these identities during life and death? These questions will be explored through the study of a specific type of male outfit, composed of a loincloth and apron or belt. Attested by many iterations and developments of similar specimens through time and space, this outfit helped fashioning the identity of a very specific group of the ancient population.

7 ALL THAT GLITTERS AIN'T GOLD: JEWELLERY AND DRESS ORNAMENTS AS IDENTITY MARKERS IN AVAR-PERIOD (7TH-8TH CENTURY AD) FUNERARY CONTEXTS

Abstract author(s): Bühler, Birgit (Vienna Institute for Archaeological Science - VIAS, University of Vienna)

Abstract format: Oral

The material culture of the Avar empire (7th-8th century AD) in the Carpathian Basin, in particular the jewellery and dress ornaments, demonstrates processes of cultural transfer, integration and assimilation with the Byzantine Empire, but also with other adjacent cultures. In particular, a tendency to display status via Byzantine-type products in Avar society, especially dress ornaments and jewellery, has been noted by many researchers. Significantly, jewellery and dress ornaments from Avar-period funerary contexts were produced using a wide range of precious metal alloys and their „imitations”: For example, a product which appears to be made of silver, may in fact be a high-tin copper alloy, or exhibit a tinned surface. Such observations can, for example, be evidence for personal mobility and for technology transfer. Archaeometallurgical data and technological observations are also relevant for studying socio-economic status: However, we should beware of simplistic hierarchies based on the (modern) material value of metals: Gold, silver, bronze, and so on. The choice of materials and techniques is determined by a variety of different aspects: We should consider not only the goldsmiths but also their customers and cultural environments. Hence, research at the interface between early medieval burial customs, material culture (especially dress ornaments and jewellery), metalworking techniques and metal composition seems particularly promising, focusing on questions such as: Who is using and/or wearing which type of product? Previous archaeological and osteological research provides evidence for the existence of intercategory social complexity in mortuary contexts of the Avar period: Social categories may intersect and therefore should not be analysed separately. As will be discussed in this paper, using case studies, interdisciplinary co-operation will be crucial for investigating intercategory social complexity in Avar-period funerary contexts.

8 OLD SCRAP FOR NEW IDENTITIES – ROMAN OBJECTS AS JEWELLERY COMPONENTS IN ANGLO-SAXON FEMALE DRESS, 5TH TO 7TH CENTURIES AD

Abstract author(s): Werthmann-Carroll, Indra (Durham University)

Abstract format: Oral

Reused Roman objects in Anglo-Saxon graves have been frequently discussed in the past and interpreted as chance finds originating from a collapsed Roman economy or as apotropaic items rather than being integral parts of Anglo-Saxon dress. Metalwork such as coins, brooches and belt buckles were used as jewellery components in a low number of predominantly female burials across Anglo-Saxon graves in Kent and East Anglia. However, the consist-

ency of the type of finds and care taken to curate them evidenced by use wear suggests that these antiques held a deeper meaning for their wearer than its intrinsic value. Objects are tied to people and transformed through their use and reuse in time, creating their own life histories while also becoming integral parts of their owner's biographies. This paper will discuss the meaning of Roman objects as jewellery components in Anglo-Saxon dress and its significance to shape the identity of the wearer; it will shed light on whether these antiques were used for economic reasons, as symbols for a Roman past or by its reuse, take on completely new meanings as markers for unique individuals in Anglo-Saxon communities.

306 MULTIPROXY GEOARCHAEOLOGY TO UNDERSTAND HUMAN-ENVIRONMENTAL INTERACTIONS FROM LOCAL TO GLOBAL CHANGES

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Marras, Gian (University of Cambridge) - Kristiansen, Søren (Institute for Geoscience - Aarhus University; iCLIMATE Aarhus University Interdisciplinary Centre for Climate Change; Institut for Kultur og Samfund - Centre for Urban Network Evolutions - UrbNet)

Session format: Regular session

Palaeoenvironmental studies have demonstrated that our planet during the last 11,700 years has been punctuated by tremendous changes in local and regional ecosystems. This was characterised by significant variability not only in terms of intensity and chronology but also of the underlying forcing mechanisms. Understanding these variations on a regional scale has often been tackled by studies focused on the vegetation history inferred from fossil pollen sequences from single sedimentary archives, and correlating the environmental changes with variations in past climate conditions.

However, increasing geomorphodynamics evidence and soil formation-erosion phases highlight the role of past human societies in driving cross-latitude landscape changes since the Early Holocene on several continents. Furthermore, the use of multi-proxy analysis (e.g. geochemistry, soil micromorphology, isotope analysis, a.o.) of archaeological and sedimentary deposits to reconstruct past climate conditions and understand past human impact is still largely underrepresented within palaeoenvironmental research. As an example, how can the integrated approach of geoarchaeological and geochemical techniques help unfold the forcing mechanisms of Holocene environmental change at a local scale? How can the combined investigation of archaeological sites and sedimentary archives at larger scale refine current narratives of environmental change at a local to regional scale? Can a geoarchaeological multiproxy site-based approach provide relevant insight into human-climate-environmental interactions?

For this session, we would like to invite works that have followed innovative multidisciplinary approaches to disentangle the cause and mechanisms of past environmental changes or human-environmental responses. In particular, we wish to discuss the potential of combining pollen, other bioarchaeological methods, soil micromorphological, isotope approaches, and geochemical analysis from archaeological sites and sedimentary deposits from sites around the world and from polar to tropical environments.

ABSTRACTS

1 A COMBINED PALAEOECOLOGICAL AND GEOCHEMICAL APPROACH TO IDENTIFYING PAST HUMAN RESPONSES TO CLIMATE CHANGE IN THE PERUVIAN ANDES

Abstract author(s): Handley, Josie - Branch, Nicholas (University of Reading) - Farfan, Carlos (Universidad Nacional Federico Villareal)

Abstract format: Oral

Despite the growing number of high-resolution palaeoclimate records for Peru from lake, cave (speleothems), ice, and marine records, there remains a paucity of palaeoenvironmental data documenting changing human-environment interactions, especially from wetlands proximal to areas of intensive human activity. The analysis of wetland records located within a key life-zone of the Peruvian Andes (3000-4000m a.s.l.), provide valuable records of past socio-economic responses to environmental and climatic changes. Pre-Hispanic societies seemingly adapted in response to periods of known climate change during the Late Holocene, through the construction of water storage and transportation networks (reservoirs, canals and water catchment features) and by adapting agricultural practices (construction of terraces, multi-cropping, and agroforestry), and in doing so were able to endure variabilities in natural resources. The results of our new multi-proxy study using palaeoecological analysis (pollen) in combination with sediment geochemistry (micro-XRF ITRAX analysis) from a wetland site (Antaycocha) within the Chillón Valley, Peru, reveal how Late Holocene human societies modified the landscape to mitigate against the impacts of climate change. More specifically, the community around the site of Antaycocha constructed a dam wall to allow water to build up

within what was once a natural basin, the timing of which coincided with a period of increased precipitation during the Little Ice Age. The construction of a reservoir would have ensured the success of agro-pastoral communities within the surrounding landscape associated with the near-by archaeological site of Cantamarca. The results of this study have highlighted a novel approach to dating an archaeological structure (the dam wall) using paleoenvironmental analysis, which would otherwise be difficult to precisely date, and allow us to better assess societal responses to climate change. Consequently, these records can also act as an analogue for the possible impact of current and projected climate change within the highly sensitive Peruvian Andes.

2 RECONSTRUCTING CARIBBEAN PALAEOENVIRONMENTS: A NEW PATH

Abstract author(s): Pilgrim, Chike (Department of Archaeology, University of Cambridge)

Abstract format: Oral

This paper concerns the landscape historical ecology of Trinidad and Tobago during the early to mid-Holocene and its relationship to the active settlement of the island during the same period. It has often been the case that palaeoenvironmental reconstructions and historical ecologies are made possible through the analysis of pollen and phytoliths from soil and sediment cores, and indeed my fieldwork has meant obtaining soil and sediment cores extensively from both Archaic sites and wetlands across Trinidad and Tobago.

However, preceding this pollen analysis can be other very useful lab-work, such as the preparation of portions of soil cores into thin section slides and the micro-morphological analysis of these slides. Electrical Conductivity, pH tests, and particle size tests on soil from these sites may also be compared, not only to previous geochemical tests around the islands, but also to data from micro-morphological study, and to future data provided by the analysis of pollen and phytoliths from sediment cores.

This paper therefore aims to illustrate how significant palaeoenvironmental information in the Caribbean might be produced from geochemical study and soil micro-morphology, and how this might provide a basis for palaeoenvironmental reconstructions and of historical ecologies in the region. This may be accomplished even in the absence of more traditional methods of palaeoenvironmental analysis, namely the examination of sediment cores and their cache of pollen and non-pollen palynomorphs.

3 A MULTISCALE APPROACH TO UNDERSTANDING PALAEO-LANDSCAPES AND HUMAN-ENVIRONMENT INTERACTIONS IN SOUTHEASTERN NIGERIA C.800-1200 CE

Abstract author(s): Daraojimba, Kingsley (University of Cambridge; University of Nigeria Nsukka)

Abstract format: Oral

Geoarchaeology has been transforming our understanding of human-environment interactions across tropical environments, revealing new histories of human landscapes and social complexity. West African environments remain somewhat peripheral to these developments, despite a rich archaeological record. This paper presents the results of new dataset at Igbo-Ukwu, southern Nigeria's earliest complex society dating to the early first millennium CE. Whilst Igbo-Ukwu is world-famous for returning some of the finest intricately crafted metal objects and rich material culture in West Africa, little is known about the environmental settings sustaining such developments. Recent work at Igbo-Ukwu, integrating landscape-scale geoarchaeological survey, soil micromorphological and palynological analyses has produced the first records of buried soils and archaeological sediments. Our integrated multiscale approach has enabled the recovery and correlations of environmental and anthropic records across Igbo-Ukwu's cultural landscape, while also showing the relevance and feasibility of examining buried soil sequence to understand human-environmental interplay in tropical West Africa.

4 MAPPING PAST INTEGRATED WATER SYSTEMS: MULTISCALAR APPROACHES TO GREAT ZIMBABWE'S URBAN LANDSCAPE

Abstract author(s): Kristiansen, Søren (Department of Geoscience, Aarhus University; Center of Urban Network Evolution - UrbNet, Department of Culture and Society, Aarhus University) - Pikirayi, Innocent (Department of Anthropology, Archaeology and Development Studies, University of Pretoria) - Sagiya, Munyaradzi (Department of Culture and Heritage Studies, Bindura University of Science Education) - Stott, David (Moesgaard Museum, Højbjerg) - Sulas, Federica (McDonald Institute for Archaeological Research, University of Cambridge)

Abstract format: Oral

Integrating remote sensing, geoarchaeological and historical records, new research has revealed the presence of an integrated water management system supporting Great Zimbabwe, centre of southern Africa's earliest state society. Geoarchaeological field investigations and laboratory analysis first mapped past and present water sources within and around the main urban area, detecting the presence of large water reservoirs next to elite residential complexes. Next, spatial analysis, combining LiDAR survey and hydrological modelling, revealed the extent and distribution of

other large water reservoirs within and surrounding the ancient urban settlement. These reservoirs have been used by the inhabitants of Great Zimbabwe for water storage and harvesting for a long time, possibly since the development of the ancient settlement in the mid-second millennium CE. The reservoirs were part of a landscape-scale water management system that exploited catchment hydrology and groundwater by means of artificial reservoirs, wells and springs to secure water for subsistence, spiritual services, and crops. Understanding past water management in such a water-scarce region is not only important for reconstructing how the ancient Great Zimbabwe urban society negotiated water security, but also contemporary human-environmental challenges around the same.

5 ASSESSING HUMAN IMPACT ON DUTCH WADDEN SEA SALT-MARSH LANDSCAPES BEYOND TERP MOUNDS BETWEEN 650 BC AND AD 800

Abstract author(s): Schepers, Mans (University of Groningen) - Pierik, Harm Jan - Feiken, Rik (Cultural Heritage Agency of the Netherlands) - Nicolay, Johan - Bakker, Marco (University of Groningen)

Abstract format: Oral

From around 650 BC people started colonizing the salt marshes along the Wadden Sea coast of the present Netherlands. Because these marshes were subject to flooding, people lived on terps (artificial dwelling mounds). Salt-marsh ridges and tidal-fluvial natural levees with a top soil mainly consisting of sandy clay dominated the land. In between them lower floodplains were present with a more clayey top soil. On the southern fringe of the salt-marsh area, a dynamic transition existed from clayey to increasingly more peaty soil.

Early research in the area focused on the terps proper. Extensive archaeological research over the past decades in the immediate vicinity of the terp has shown that humans also severely impacted the surrounding landscape as well, e.g. by digging ditches and constructing (summer) dikes. So far, human activities at larger distance from the terps received little attention. Recent studies however, show that various activities affected these areas as well, thus testifying to more profound landscape impact than previously thought.

To expand our understanding of off-site activities in a salt-marsh area, we will combine data from excavations, soil coring, digital elevation maps, and palaeoecological analyses. Special attention is paid to diversity in geomorphological and soil units within the area, and their relation to the variety of human activities. With respect to the peat, and clay-on-peat areas in particular, we will also discuss how human actions altered these areas as a result of reclaiming and agricultural exploitation.

We will present first results and plans for the near future. We will also highlight some unknowns and pitfalls we have identified so far. Finally, we will place this subject in a wider debate regarding the substantial human impact on the Dutch lowlands, which is still affecting the living conditions in this area up to today.

6 GEOCHRONOLOGY OF ANTHROPOGENIC LANDSCAPE TRANSFORMATION DURING THE LATE MIDDLE HOLOCENE IN NORTH-CENTRAL SARDINIA

Abstract author(s): Marras, Gian Battista (Department of Archaeology, University of Cambridge) - Robin, Guillaume (School of History, Classics and Archaeology, University of Edinburgh)

Abstract format: Oral

Multidisciplinary palaeoenvironmental research has highlighted profound changes in the vegetation and climate history of the Mediterranean region in the Middle Holocene. However, the timing and extent of human contribution to palaeoenvironmental change remain poorly understood. New evidence from Sardinia shows geochronological correlations between settlement dynamics, geomorphological and soil processes that expose correspondences and discrepancies between large-scale regional patterns across the Mediterranean basin and localised responses.

Geoarchaeological investigations in the uplands of Punta Ferulosu, in northern-central Sardinia, exposed palaeosols and hillwash deposits associated with Copper Age (ca. 5500 – 4200 years BP) settlement. Geochronological, geochemical, and micromorphological analysis of palaeosols and archaeological sediments established new cultural-environmental sequences of soil disruption following the emergence of settlement, reconfiguring the landscape to a point of no return. This finding informs into Middle Holocene human-environmental interactions providing one of the first geochronological evidence of anthropic impact on the island and broadening the knowledge of the past interplay between humans, climate, and environment in the Mediterranean region.

7 "SUBAQUATIC BEING": REPOPULATING WETLANDS WITH MESOLITHIC ENVIRONMENT-HUMAN INTERACTIONS USING PALYNOLOGY, SEDDNA AND MICROSCOPIC CHARCOAL ANALYSIS (DAGSMOSSE, SWEDEN)

Abstract author(s): Blaesild, Paulina (University of Gothenburg)

Abstract format: Oral

Wetlands and humans have, in various exploitive and non-exploitive ways, been connected to one another throughout (pre)history. In a Northern European context, evidence of bog dwelling—that is, the concept of settling down at sites located in the midst of an active fenland, on naturally occurring consoles of decomposing reed or in reed and sedge belts surrounding nutritious lakes—during the Mesolithic was discovered in modern-day Baltic and southern Scandinavia during the 20th century. However, later findings have shown a wider spread of this phenomenon. The discovery of multiple well-preserved Mesolithic sites within the wetland complex Dagsmosse in Östergötland, Sweden, contest previous notions of a Mesolithic blank spot around the Middle Swedish lakes and hinterlands. Materials retrieved from the Middle Mesolithic bog dwelling site Jussberg depict a wide variety of faunal representation, ecofacts, archaeobotanical materials to environmental proxies, fishing equipment, portable weir basketries, stationary constructions and vast quantities of food preparation or production residues. The purpose of this PhD project, in conjunction with the ongoing excavations at site Jussberg, has been to construct high-resolution models of vegetation development and environmental changes at Dagsmosse during the early Holocene, to further expand the understanding of human/wetland interplay during the Mesolithic. This presentation will regard ongoing research and attempts in combining palynological analyses of multiple sedimentary cores with sedDNA data, microscopic charcoal analysis and lithological studies to detect place-specific and local variations in (modest) taxa succession—rather than tending to clearly marked and general trends in the often highlighted arboreal pollen dataset. Adapting to contemporary research strand describing hunting-gathering-fishing lifeways as constituted by a knowledge-based sensitivity towards the ecological systems they live in, by and through, this project aims at locating alternative perspectives and interpretations of pollen-diagrams-with-humans in environments with highly integrated agents.

8 POLLEN INDICATORS OF SLASH-AND-BURN AGRICULTURE IN BURIED SOILS AND PEATLANDS: A CASE STUDY OF MOSCOW REGION (RUSSIA)

Abstract author(s): Ershova, Ekaterina (-) - Ponomarenko, Elena (University of Ottawa)

Abstract format: Oral

Our studies of forest soils of the East-European Southern Taiga showed that soil horizons affected by the slash-and-burn cultivation in the past have a set of diagnostic features in the soil morphology, grain size composition, and composition of charcoal, pollen, and phytolith spectra. Based on these features, several episodes of swidden cultivation ranging in age from 800 to 1800 cal. yrs. BP were recorded in paleosols buried under Medieval Slavonic kurgans. Pollen spectra of the swidden layers in paleosols were compared to pollen spectra of peat layers of the same age in the adjacent peatland. The pollen spectra of all swidden horizons of paleosols appeared very similar, with a high proportion of AP, the dominance of *Betula*, and simultaneous presence of indicators of cultivation (*Cerealia*-type pollen) and those of post-fire successions (*Chamaenerion*, *Pteridium* and *Marchantia*). In the peat pollen diagrams, the onset of swidden cultivation was marked by the sharp decrease in the pollen of late-successional and broadleaved tree taxa (*Picea*, *Quercus*), by the increase in early successional taxa (*Betula*), and by the appearance of agricultural indicators (cultivated grasses and weeds), along with various herbs, indicative of forest clearance. A high proportion of *Betula* in swidden landscapes was documented in pollen spectra of both paleosol and peat layers, reflecting local birch groves, common in landscapes with a long practice of shifting cultivation. The overall taxonomic diversity of anthropogenic indicators in peat spectra was significantly higher than in soil, while the groundcover taxa indicative of post-pyrogenic successions (*Chamaenerion*, *Pteridium*, and *Marchantia*) were considerably more noticeable in the swidden horizons. Our results show that pollen spectra of paleosols identify and localize ancient swiddens more reliably, while the pollen spectra of peatlands provide a more adequate picture of the proportion of agricultural lands in the region and their temporal dynamics.

A. LOCAL VEGETATION OF THE KAMCHATKA RIVER VALLEY DURING THE HOLOCENE: RECONSTRUCTION BASED ON PALYNOLOGICAL AND TEPHROCHRONOLOGICAL DATA

Abstract author(s): Pimenov, Valerii (-) - Ershova, Ekaterina (-) - Krenke, Nikolay (-)

Abstract format: Poster

The Kamchatka Peninsula offers a unique opportunity for conducting large-scale, multidisciplinary research projects. Despite numerous studies of regional reconstruction, a comprehensive understanding of the ecological history of local plant communities in the region has been lacking. This study aims to reconstruct the Holocene vegetation of the

Kamchatka River valley and link our findings with tephrochronological studies. We hypothesize that volcanic activity has significantly impacted the dynamics of local vegetation over the past 12,000 years.

We conducted pollen analysis on four soil sections from archaeological sites in the Kamchatka River valley and used statistical processing techniques like principal component analysis and cluster analysis. AMS radiocarbon dating was used, along with tephrochronological dating.

Our findings challenge the existing belief that grass tundra-steppe communities spread in the late Pleistocene (12730-11940 BP) and instead suggest the presence of arboreal taxa (AP). Principal component analysis of pollen spectra from soil samples identified volcanic activity and hydrological conditions as the main factors influencing the formation of local vegetation during the Holocene.

Despite the results obtained, we acknowledge, that climate also played a role in forming regional vegetation. However, since soil samples only reflect the local plant component and are influenced by high pollen-producing plants growing near the sampling point, it is necessary to study modern pollen spectra for a more comprehensive understanding of the factors determining local vegetation development in the valley.

Our study complements previous research and provides a clearer understanding of the interaction between past plant communities and environmental factors in Kamchatka. Therefore, further research into the interaction between climate and vegetation dynamics in Kamchatka is needed to gain a more complete understanding of the ecological history of the peninsula.

B. WOOD USE IN CURONIAN CREMATION RITUALS AND ITS IMPACT ON THE ENVIRONMENT AND LANDSCAPE IN WESTERN LATVIA

Abstract author(s): Donina-Kalnina, Inga - Bērziņš, Valdis (Institute of Latvian History, University of Latvia) - Stivrins, Normunds (Department of Geography, University of Latvia; Institute of Latvian History, University of Latvia)

Abstract format: Poster

The research will present the results of analysis of archaeologically recovered wood charcoal from Curonian cremation cemeteries as well as palaeobotanical and palaeoecological analysis of Lake Ķikuri (Latvia) sediments. This research examines cremation cemeteries in western Latvia during the 10/11th–15th century AD. During this period, cremation graves constituted the dominant burial form in the region. Attention will focus on the analysis of wood charcoal as well as pollen and plant macrofossil samples, seeking to assess to what degree they reflect the palaeoecology of the study region and/or funerary beliefs and traditions. The results will provide evidence of the wood resources available in the environs of the burial site, and fuelwood selection for cremation (random gathering or special selection of species). Other rituals relating to burials will be also evaluated. That the Curonians did attach special importance to the choice of wood for cremation is suggested by the account given of pagan Curonian cremation practices by the French traveller Guillebert de Lannoy (early 15th century), where he states that exclusively oak was used for this purpose.

Note/comment:

307 CONTRADICTIONS OR COMPLEMENTARITIES? THE SCIENTIFIC SIGNIFICANCE OF RESCUE EXCAVATIONS AND THEIR IMPLICATIONS FOR ARCHAEOLOGICAL RESEARCH

Session theme: 3. Heritage Narratives and Representations

Session organisers: Staeuble, Harald (Heritage Office of Saxony) - Demoule, Jean-Paul (Institut Universitaire de France & Université de Paris I) - Glørstad, Håkon (University of Oslo, Museum of Cultural History)

Session format: Regular session

Thanks to the successful enforcement of European conventions as well as the gradual upgrading of national monument protection laws after 1990, heritage services have gained unprecedented possibilities to save threatened monuments - be it through their conservation, their preservation or their documentation through excavations.

As result, the number of large-scale excavations paid for by polluters has increased considerably in recent years. They provide us with an enormous increase in knowledge that frequently leads to new and unexpected results that permanently change our understanding of the past. They are paradigm shifting or at least significantly boost knowledge, and, at least in part, they occur by chance! In this respect, such large-scale excavations, give us an opportunity to reach beyond entrenched patterns of thought, and beyond circular arguments.

At the same time, a general decline in archaeological funding can be observed, resulting in a shortage of teaching staff and research funding at many university departments. This leads to a decreasing availability of local expertise and it

is becoming increasingly difficult to organise excavations for research and teaching, which can then per se only be small-scale and thus rarely representative - especially when it comes to settlement and landscape archaeology, which needs a large-scale view.

Upon this background, we propose to address the overall lack of productive and lasting cooperation between heritage agencies on the one hand and universities on the other. The conceptual differences between large rescue or “preventive excavations” led by development work and small “research excavations” initiated by academics seems to be exaggerated, and the discipline, including university training, certainly benefit from their better synergies and integration. Ultimately, the aim is to reduce supposed antagonisms and to promote cooperation instead of confrontation, for the benefit of archaeological knowledge.

We invite to an open exchange of controversial views from all parties concerned.

ABSTRACTS

1 TOWARDS THE END OF ANTAGONISM BETWEEN ACADEMIC AND PREVENTIVE ARCHAEOLOGICAL RESEARCH: A FRENCH PERSPECTIVE

Abstract author(s): Salas Rossenbach, Kai - Marx, Amala - Bouiron, Marc (INRAP - National Institute for Preventive Archaeological Research)

Abstract format: Oral

Since the implementation of a law on preventive archaeology in France, the number and quality of archaeological interventions has increased significantly. The scientific policy of preventive archaeology carried out mainly by the Institut national de recherches archéologiques préventives (Inrap) is materialised by more than 2000 field operations each year in extremely variable contexts. From the point of view of the more academic structures (universities and research establishments), the field research activity takes the form of dozens of programmed operations (in France and abroad) carried out over a longer term and most often focused on one site. These contexts of archaeological knowledge creation are some time depicted as antagonist in their goals, means and results. Repositioning these different activities from the point of view of their context of exercise, their scientific output and their social utility, offers a global vision of the complementarity of the different players in an original national archaeological system whose common aim is to be a shared common good.

2 GLOBAL TRENDS AND DEVELOPMENT-LED ARCHAEOLOGY IN NORWAY

Abstract author(s): Glorstad, Hakon - Kallhovd, Karl (University of Oslo)

Abstract format: Oral

One of the most striking features of Norwegian archaeology is the strong dominance of development-led archaeology. Legislation going back to the beginning of the 20th century and the strong position of the university museums in Norwegian archaeology are two important factors explaining this dominance. The university museums are still doing the vast majority of development-led excavations, combining this activity with research, collection management and development as well as education and public outreach. This system has acted as a vital ecosystem of knowledge for decades.

The last twenty years Norwegian archaeology has been considerably influenced by globalism, marked liberalism and identity thinking. The strong connection between development-led archaeology and the museums has given this influence a distinct character, presumably slightly different from other national systems. This paper discusses some of these relations, questioning whether these factors have challenged the established system of knowledge production in Norwegian archaeology. This is a pertinent question as the government has initiated a total revision of the Cultural Heritage Act, which has given juridical legitimacy to the present integration of development-led archaeology into the universities' knowledge production.

3 STONE AGE RESCUE EXCAVATIONS AND RESEARCH IN WESTERN NORWAY - CHALLENGES AND POSSIBILITIES

Abstract author(s): Bergsvik, Knut Andreas - Lundström, Victor (University Museum, University of Bergen) - Aksdal, Jostein (Vestland County Council)

Abstract format: Oral

In Norway, the Norwegian state – effectively the five archaeological University Museums – has the responsibility for performing rescue excavations of prehistoric sites and monuments that are destroyed by modern development. According to the law of antiquities, these excavations are financed by the developers, which sometimes are private firms and corporations, but for the most part companies that are owned by the state itself. Since the mid-1950s, there has

been massive development along the Norwegian coast and mountain plateaux, which were preceded by rescue excavations. Such excavations has been particularly common since 1980, and during 1980–2015 the University Museum of Bergen carried out 165 Stone Age excavations in western Norway. Parallel to this, the number of research excavations in this region has been low. An overview of the rescue excavated sites was published in 2020 and since then, the museum has continued the work on establishing databases covering surveyed sites and stray-finds in addition to excavated sites. These different databases show that there are significant discrepancies between the distribution of the different data types, which indicates that rescue excavations only cover a part of the site- types and landscapes that were used during the Stone Age. It is argued that a new strategy is needed to catch up on this problem, which requires active collaboration within the University sector as well as towards archaeologists in the County Council. Without a doubt, there is a need for targeted survey campaigns in new landscapes which are followed up by research excavations.

4 DEVELOPER-LED MEDIEVAL ARCHAEOLOGY AND RESEARCH IN NORWAY

Abstract author(s): Bakken, Kristin (NIKU)

Abstract format: Oral

NIKU (Norwegian Institute for Cultural Heritage Research) has the public mandate to conduct developer-led archaeological excavations in Norway's medieval towns as well as in medieval church sites and burial grounds. The excavations are always funded by „the polluter“, and the budgets are set by the ministry. The budget model includes the excavation and on-site documentation, cataloguing and conservation of finds as well as the production of the archaeological report. There is no funding for academic publication within these budgets. In this paper I will first present the mechanisms by which NIKU see to that our work is carried through in line with current research questions and in dialogue with the research community. Then I will outline how our results are fed into the Norwegian archaeological research infrastructure. Thirdly I will outline the institute's own research opportunities and priorities. I will conclude by pointing to ways that our national practices and cooperation might be improved.

5 CHALLENGES AND OPPORTUNITIES IN CONTRACT ARCHAEOLOGY - GRASCA A PATH FOR THE FUTURE

Abstract author(s): Eboskog, Mikael - Nyqvist, Roger (Bohusläns museum; GRASCA)

Abstract format: Oral

As an archaeological department within a county museum we faced considerable challenges in 2006 and forward when Swedish archaeological system changed. Field archaeology become exposed to competition, making it a “market”, but at the same time not completely release it from state control. The county administrative boards were stipulated to work for a diversity of contract archaeological actors. Much can be said about the system that emerged, what long-term effects on archaeology this has led to and how the market works, but here we will focus on a new approach and the creation of opportunities from the challenges this paradigm shift in contract archaeology created.

It can be said that it was a shocking and challenging time for the archaeology departments in museums. As a museum we were less suited to a competition-driven contract archaeology than private companies for varied reasons. Since the market was still regulated by the state the volume has not increased significantly, although the number of actors and archaeologists has multiplied. It creates a financial pressure on everyone, and economic survival. It's our long-term ability to maintain and develop archaeology that the ideas grow into what came to be GRASCA.

The need to broaden contract archaeology and thus the market, we needed to go beyond field archaeology, create and develop new services for archaeology. This created the opportunity to start a new graduate school in cooperation with companies (and museums), based on contract archaeology and the connection between humanistic views and future societies. Through nine doctoral students, GRASCA has broadened the horizons of what archaeology and archaeologists can contribute to the benefit of society and its development. For us, an expanded role for the archaeologist provides an excellent opportunity to contribute in more ways to the benefit of society in addition to the purely economic benefit.

6 ACADEMIC RESEARCH, BASIS FOR PLANNING OR POPULAR SCIENCE? THE CONTRADICTION OF SWEDISH CONTRACT ARCHAEOLOGY

Abstract author(s): Sundkvist, Anneli (Societas Archaeologica Upsaliensis)

Abstract format: Oral

The earliest version of the Swedish Historic Environment Laws dates to the 17th century, which makes the law one of the oldest in Europe. However, the professionalisation of contract archaeology started much later. Social change and large building projects after World War II created a need for large-scale excavations and with them, a need for more archaeologist than universities and museums could employ on an all-year-basis.

Half a century later, 'Contract archaeologist' (Sw: uppdragsarkeolog), has become a specialisation within the profession of archaeology. The main part of archaeological texts produced in Sweden constitutes of reports and articles about sites excavated as contract archaeological projects. The outcome should be 'of scientific quality' as well as possible to use by different actors in community planning and enjoyed by the public. The question that needs to be asked is where this leaves the results and the data. Is it possible to fulfil all these goals or do we risk to end up with data that is not suitable for future research?

7 THE CHALLENGE OF PRODUCING KNOWLEDGE FROM DEVELOPER-LED ARCHAEOLOGY AND FROM WORKING WITH METAL DETECTORISTS

Abstract author(s): Ravn, Mads (Vejle Museums)

Abstract format: Oral

Since Denmark ratified the Malta convention in 2003, a large amount of data has been generated from developer-led excavations. Also, a liberal attitude towards volunteer detectorists is generating large amounts of metal finds that need precise documentation. Due to the decentral organization of the 27 archaeological museums which conduct the excavations in each region, the challenge has been to organize the large amount of data, digital excavation plans, C-14 dates, natural science data, and numerous finds coming in from metal detectorist, to create new knowledge. The need for cross-regional or central databases and initiatives is beginning to show, while the central authorities are losing the initiative, due to insufficient funds. This paper outlines the challenges and the initiatives that have appeared the last 20 years. It also discusses a number of bottom-up solutions that have appeared, e.g., the DIME detector database where volunteers register finds themselves by GPS. Also, other initiatives begin to appear, initiatives which potential and quality I need to share and discuss with you.

8 COMPANIES ARE KEY, BUT CANNOT WORK ALONE. TOWARDS WORKING TOGETHER ON ACHIEVING SCIENTIFIC AND COMMERCIAL SUCCESS

Abstract author(s): Oosterhout, Floris (Arcadis)

Abstract format: Oral

In the Netherlands there is a fully developed archaeological practice, in which various (commercial) companies carry out archaeological research under certificate.

The Dutch system has ensured a reliable output in terms of processual quality, but there is a deeply rooted illusion that it could also be used to sufficiently organize the scientific quality of the research.

I am convinced that the latter can only be achieved with a combination of expertise from the (commercial) field, scientific community and the responsible authorities.

It is the public authority that ultimately sets the requirements for the investigation, but it can only function if the commercial parties are recognized for their vital position within the framework of spatial development in The Netherlands.

As a heritage consultant at Arcadis, a large engineering and consultancy firm responsible for various large-scale programs in the spatial domain, I am in the position to organize and facilitate archaeological research on a large scale. Arcadis carries out integrated projects, and archaeology is one aspect. We are one of the largest clients of archaeological subcontractors and we see it as our task to carry out meaningful and scientifically relevant research within our projects. In The Netherlands we are far beyond the point of calling this rescue archaeology. In my contribution I would like to demonstrate this with examples from our practice, such as the construction of a hydrogen network throughout The Netherlands, the reinforcement of the Afsluitdijk and the large-scale programs to improve the ecological quality along the major rivers.

9 30 YEARS OF LARGE-SCALE RESCUE EXCAVATIONS IN ROMANIA: A SWOT ANALYSIS ABOUT OPPORTUNITIES & CHALLENGES FOR ARCHAEOLOGICAL KNOWLEDGE AND HERITAGE

Abstract author(s): Damian, Paul Cristian - Bors, Corina (National History Museum of Romania - MNIR)

Abstract format: Oral

The European convention for the protection of the archaeological heritage was ratified by Romania in 1997, and set the premises for a new national legislation in regard to this issue. After a void of specific legislation which lasted for an entire decade, in 2000 was adopted the new law concerning archaeology and rather soon the "polluters/developers pay" principle was necessary to be implemented since a series of private industrial projects and public motorways projects were initiated. This was a completely new reality for the archaeology and the archaeologists in Romania. It's very useful that, two decades later to undertake an analysis about how was understood by the different stakeholder the development led archaeology and how is was perceived by the academic environment, the heritage agencies and, last but not least by the institutions involved in this "new kind" of archaeology.

An in-depth analysis will be made, considering the experience of the National History Museum of Romania, which has an important expertise as concerns the rescue/preventive/development-led archaeology in Romania during the last 3 decades. The paper will present a series of key issues such as: the importance of these large-scale rescue excavation in providing new understanding and knowledge about the archaeological heritage; how to negotiate and communicate with the stakeholders in the benefit of archaeological heritage; the difficult dialogue between the administrative milieu (the heritage agencies) and the professional environment; the opportunities and constraints for developing a professional carrier in archaeology etc. The perspective provided by the paper encompasses certain positive evolutions, but also takes a closer look to the challenges which had to be overcome while undertaking large scale preventive excavation in Romania and recognizing their role in such paradigm shifting.

10 WHAT DO WE OWE TO THE DEVELOPMENT-LED ARCHAEOLOGY IN HUNGARY? THE LAST 30 YEARS FROM THE PERSPECTIVE OF SCIENTIFIC OUTPUT

Abstract author(s): Anders, Alexandra - Bartus, Dávid (Institute of Archaeological Sciences, Eötvös Loránd University) - Ernyey, Katalin (Government Office of the Capital City Budapest, Heritage Department) - Rácz, Zsófia - Raczky, Pál - V. Szabó, Gábor (Institute of Archaeological Sciences, Eötvös Loránd University)

Abstract format: Oral

As a result of a trend that began in the 1990s, the greater part of archaeological fieldwork in Hungary is currently conducted as part of preventive archaeology. Due to the archaeological tradition and the legislative background in Hungary, excavation activities involve museums, universities and research institutes as well as private companies. The Institute of Archaeological Sciences at Eötvös Loránd University (ELTE) has played a key role in this process from the very beginning, including the creation of a standardized archaeological protocol. According to the legal regulation of excavation activities, the excavation, documentation, primary conservation, and storage has to be financed by the developer („polluter pays“). However, this regulation does not provide resources for publicity, either academic or public, even though Article 6 of the Valetta Convention (in force in Hungary since 2000) stipulates „public financial support for a scientific summary record as well as for the full publication and recording of the findings“. In this situation, the scientific assessment of the finds can only be undertaken from other, scarce sources of funding, in which academic institutes were able to play a greater role than museums. In our presentation, we briefly review how, despite these difficulties, the vast amounts of information and finds that have been uncovered can nevertheless be academically utilised. The role of ELTE will be discussed at greater length. We have been able to integrate the assessment of at least a part of the excavations into our teaching/research activities. Several BA, MA, and PhD theses are based on these excavations and several major ongoing research projects have grown out of them. We certainly consider it useful to have been involved in these development-led archaeology.

11 GEOPHYSICAL PROSPECTION AND RESCUE ARCHAEOLOGY IN THE CZECH AND SLOVAK REPUBLIC

Abstract author(s): Tencer, Tomáš - Havelka, Jan - Milo, Peter - Šálka, David - Vágner, Michal (MUNI - Ústav archeologie a muzeologie)

Abstract format: Oral

The recent construction boom in former Czechoslovakia has led to increased demand for archaeological excavation and has necessitated the development of more efficient and effective methods for identifying and protecting cultural heritage sites. As a result, geophysical prospection has become a crucial tool in modern archaeology, offering a rapid and non-invasive means of mapping subsurface archaeological features.

This study presents the current state-of-the-art of geomagnetic prospection as applied to rescue archaeology in the Czech and Slovak Republic by examining several large-scale magnetometry surveys conducted in recent years. The paper highlights the advantages and limitations of these surveys and emphasises the importance of cooperation between cultural heritage management bodies and investors in realising the full potential of archaeogeophysical prospection.

The knowledge gained from geophysical prospection in rescue archaeology has numerous applications in scientific archaeology research and academia. For instance, geomagnetic data can be utilised to reconstruct the cultural landscape, understand the relationship between buried features and the broader landscape, and evaluate the significance of archaeological sites for future study. This information can inform research on past settlement patterns, subsistence practices, and social organisation, as well as provide insight into the interpretation of cultural heritage sites for the general public. The results of these rescue excavations have the potential to reveal paradigm-shifting discoveries, contributing to our understanding of the history of human civilisation.

Despite the acknowledged benefits of geomagnetic prospection in rescue archaeology, its integration into the field remains limited due to a lack of legislation and standards. Nevertheless, this study underscores the invaluable role of geomagnetic prospection in preserving cultural heritage sites and advancing scientific research and academic inquiry.

12

RESCUE OR SCIENTIFIC EXCAVATION? TWO SHIPS THAT ARE JUST PASSING EACH OTHER

Abstract author(s): Marik, Jan (Institute of Archaeology of the Academy of Sciences of the Czech Republic, Prague)

Abstract format: Oral

The 1990s were not only a crucial new period for archaeology in the Czech Republic. Major legislative changes came surprisingly in the late 1980s as if foreseeing the following developments. The end of the centrally controlled economy also meant the end of many large-scale scientifically oriented researches and a massive increase in development-led excavations. This radical change made it possible to compare the positive and negative aspects of both approaches in a very short period.

The decentralisation of the state system also led to the emergence of a number of regional university departments that had interests and priorities that went in a completely different direction from development-led excavations. The current problem of university education is not the reduction of support for the relatively dense network of university departments (they suffer permanently from a lack of funding), but rather the decline in the number of people interested in studying and a certain degree of fragmentation of the scientific potential of the upcoming generations.

The experience of the last 30 years shows that whether large-scale discoveries or small-scale, targeted research organised in the context of university education is irrelevant for paradigm shifting or at least significantly boost knowledge. There is no supposed antagonism between university departments and rescue archaeology. Rather, they are two disparate worlds that have very little to share in common.

The development of archaeology in the Czech Republic over the last three decades differs significantly from the picture presented by the organisers of the session, and it is therefore entirely appropriate to question the reasons for this and to look for opportunities for beneficial and synergistic cooperation.

13

THE SIGNIFICANCE FOR THE ARCHAEOLOGICAL KNOWLEDGE IN LINEAR INFRASTRUCTURE PROJECTS IN BAVARIA

Abstract author(s): Berg, Stefanie (Bayerisches Landesamt für Denkmalpflege)

Abstract format: Oral

Since 2004, excavations as parts of linear infrastructure projects in Bavaria have not only been focused on known archaeological monuments but also include areas, that might have been favourable for settlements especially in pre- and early history. These areas include e.g. lower and upper terraces of rivers and streams and as well as fertile loess areas. In many of the supported excavation projects it has also been possible to explore areas without any indications for archaeological monuments. These conditions allowed a comparison between the prediction accuracy of monuments and their real presence.

My primary concerns refer to an insight of our longterm experiences and their impact on our work and secondly the problems and possibilities for the development of cooperations with universities and other institutions for further archaeological research.

In my presentation focused on the following issues:

- How does a heritage agency like the Bavarian State Department for Cultural Heritage handle these challenges?
- What are the implications for the work for government's heritage management and for archaeological research?
- What suggestions arise in practice to achieve our goals on behalf of the protection, the investigation and research of archaeological monuments?

14

GENEROUS IN OVERVIEW AND PRECISE IN DETAIL! COOPERATION BETWEEN HERITAGE CONSERVATION AND UNIVERSITY EDUCATION USING THE EXAMPLE OF SAXONY, GERMANY

Abstract author(s): Staeuble, Harald - Kretschmer, Saskia (Archaeological Heritage Office Saxony)

Abstract format: Oral

Whatever one's personal attitude to lignite mining - or to other large-scale soil sealing/destruction - the fact is that they can be gold mines for archaeological research. Not only can one investigate settlements and their surroundings over a large area and in their wider context, but one usually also has the chance to pursue specific questions or to identify and excavate individual special find situations in detail. In order to excavate and research such large archaeological areas, however, compromises have to be made and excavation techniques adapted accordingly. On the other hand, it is also possible to separate out individual smaller areas in order to apply very special excavation techniques or methods of analysis and differentiated evaluation. Here, research traditions that are usually regarded as opposing can come together. They are mistakenly contrasted under the catchwords „rescue excavations“ and „research excavations“. In Saxony, not only has a new monument protection law come into force since the early 1990s, opening up many possibilities, but the heritage office responsible for its implementation has also made good use of them. Using the example of the large-scale excavations in Saxony's open-cast lignite mines - e.g. the LPC settlement Eythra in

the Zwenkau open-cast mine, which was excavated over an area of 30 ha, or the somewhat less well-known but all the more significant LPC settlements Droßdorf and Kieritzsch in the Peres open-cast mine - the aim is to show what opportunities there are for good joint cooperation between the State Office for the Preservation of Archaeological Monuments in Dresden and the Archaeological Institute of the University of Leipzig, but also where there is still room for improvement.

308 MATERIALITIES OF DEATH, RITUALS, AND BELIEFS: IN SEARCH FOR NEW UNDERSTANDINGS OF BURIAL PRACTICE ACROSS HIGH AND LATE MEDIEVAL EUROPE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Dahlström, Hanna (Museum of Copenhagen) - Søvsø, Mette (Museum of Southwest Jutland) - Petersen, Anna - Lorvik, Katharina (Norwegian Institute for Cultural Heritage Research- NIKU)

Session format: Regular session

According to Christian beliefs, the buried body should not be accompanied by grave goods – a break with earlier traditions in many pre-historic cultures. However, recent research has focused on the fact that many medieval cemeteries throughout Europe contain a wide variety of objects, and other forms of deposit, in graves, seemingly related to the burial ritual. Some are clearly linked to Christian belief (such as rosaries and pilgrim badges), but others are more difficult to interpret – for instance stones placed on the body, charcoal deposits and pottery sherds arranged in the grave. Some expressions are diffuse, and easy to overlook – and it is sometimes unclear if the material remains are intentionally placed or a result of taphonomic processes.

We believe that a wider awareness of such unusual deposits would increase the frequency of them being identified and interpreted as part of the burial ritual. By asking new questions, such as: What actions are seen in the burial?; and Who do we see in the material expressions in the grave?, we may discuss the meanings behind the material traces and shed new light on medieval lived religion, including Christian ideology, folkloric traditions, views of death and the body, as well as social relations in medieval communities across Europe.

In this session we are looking for examples of high and late medieval churchyards and graves (AD 1000-1500) showing various expressions of mortuary practice, both objects, and other deposits and features related to burial rituals. We are interested in the presentation of case studies, interpretations and hypotheses, and theoretical considerations of materiality and practice in relation to death and burial. The aim is to enhance knowledge of the materiality of medieval burials in Europe, to discuss variations, meanings, and to consider how material expressions of burial rituals may be identified in archaeological practice.

ABSTRACTS

1 A SPACE FOR THE DEAD. THE ARRANGEMENTS OF GRAVES AS AN EXPRESSION OF CHANGING CONCEPTS OF DEATH IN MEDIEVAL ODENSE

Abstract author(s): Bjerregaard, Mikael (Museum Odense)

Abstract format: Oral

This paper shows how the materiality of medieval graves can be seen as an expression of changing views of death in the 10th – 16th centuries. Based on the stratigraphical and contextual information on more than 800 graves excavated in St. Alban's cemetery in Odense, we can observe chronological changes in mortuary practices. This paper will discuss if the commonly accepted chronology in changing arm positions applies, and if so, how can it be explained. A variety of arrangements of the graves below ground suggest that relatives of the deceased oversaw the material aspect of the burial and that a focal point often would be to create a protective space around the dead. This suggests a discrepancy between the clergy and the lay people concerning what would happen to the inhumated body. On the one hand, the intercutting of graves and scattering of bodily remains seemed to be routine; on the other hand, some burial practices tried to prevent exactly that.

This paper contributes to the session's theme by emphasizing the need to apply a reinforced focus on features in the arrangement of graves to better understand medieval burial practices. One way to do this is for field archaeologists to consider the human remains as the primary material object in the grave and not just a case to be left to the biological anthropologists. Indeed, closer collaboration with for instance anthropologists and pollen analysts in the field work could heighten the quality of our observations. One prerequisite for discussing changes in mortuary practices (as well as for instance in health and pathology) is to get more exact dating of graves, which is what we hope to obtain in a future study conducted in collaboration with Unit of Forensic Anthropology (University of Southern Denmark).

2 GOD COMMANDED BUT THEY DID NOT COMPLY: ISLAMIC BURIALS WITH GRAVE GOODS

Abstract author(s): Gonzaga, Raquel (University of Coimbra)

Abstract format: Oral

The norms of the Islamic religion are methodical leaving little room for ambiguity in the practices of a good Muslim. For those who follow Islam, it is crucial to strictly comply with various rituals throughout their earthly life to guarantee entry to Paradise.

In Islam, God instructed the prophet Mohammed to guide the faithful and teach them how to bury their loved ones. The prophet taught that the deceased should be positioned in right lateral decubitus, facing the holy city of Mecca, without sumptuous graves and without any kind of grave goods.

In Islam, funerary austerity and equality in death is mandatory. This conduct is practiced since the beginning of the creation of Islam (7th century) to the present day.

However, as we proceed with the inventory of the Islamic necropolises from the 7th to the 13th century of Gharb al-Andalus – in present-day Portuguese territory – several recorded burials do not fit the rules indicated by the prophet Mohammed. Among these, there are burials with grave goods that depart from the norm of the Islamic orthodox rite. Pots, coins, rings and lamps are just a few examples.

In this session, I'm looking to present these exceptions that allow us to inquire about various social and ideological aspects of the communities that buried their dead in the Gharb al-Andalus.

3 WHAT IF THERE REALLY ARE NO FINDS IN THE GRAVES? FUNERARY CUSTOMS OF MORLAKS FROM THE ŠIBENIK HINTERLANDS: MUKOŠE SITE

Abstract author(s): Belaj, Juraj - Kokotović, Tea (The Institute of Archaeology, Zagreb)

Abstract format: Oral

Archaeologists are occasionally faced with the absence of finds in graves. But can this always be attributed to the community's Christian beliefs, or can we speculate about other possibilities?

After the Ottoman–Venetian war (1499–1503) the border area around Šibenik was deserted, and Christian Morlaks from Hercegovina settled here. A number of historical sources attest to this migration, while archaeological evidence is still very scarce. A unique instance is the multilayer site of Mukošće, where the remains of a rectangular building with five apses were discovered. The function and age of this building are still unknown, but according to the map from the 16th century (K1), during the late Middle Ages the building was already in ruins. In the 16th century, the Morlak population began to bury their dead in the collapsed remains. Archaeological excavations of the site revealed 48 graves; the graves' construction is similar to that of other burial sites in Dalmatia: the deceased were placed in a rectangular structure made of vertically placed stone plates with an identically constructed cover. While the graves' orientations vary, many of them adhere to the structure's ground plan. The graves were not superimposed, and there were few finds in them.

These circumstances prompted a couple of questions. What does the paucity of finds, or better yet, the absence of Christian or “pagan” elements, reflect? Is this a reflection of the community's poverty and destitution, or is it a part of their burial practice? Does the burial in the collapsed remains suggest a symbolic connection to the building and “continuity of the sacred place”? In this lecture, we aim to reconstruct the funerary practice of the Christian Morlaks interred at the Mukošće site by combining historical sources, results of the osteological analysis, and comparative analysis with contemporary burials in the area.

4 STATUS, DEVOTION AND CARE – BURIAL PRACTICE IN HIGH AND LATE MEDIEVAL RIBE (DENMARK)

Abstract author(s): Knudsen, Maria (Museum of Southwest Jutland)

Abstract format: Oral

In 1993 and 2008–12, hundreds of high and late medieval burials were excavated at the former Franciscan friary and at the cathedral in Ribe. The digitized and phased material sheds light on many and diverse aspects of medieval burial practice.

This paper will present the variation in burial forms and their development over time, but also try to point out several other, perhaps less obvious aspects of the material:

Patterns in the distribution of religious objects in the graves may indicate a special religious dedication for some groups. At the same time, there seems to be a correlation between gender and age distribution in relation to which burials contain objects, and sometimes also in relation to the location of the graves (inside/outside).

The location of the burials, their physical setting and the presence of certain objects in some cases challenge the dogma that everyone was equal before God in death. On the contrary, there is some evidence that all these attributes could indeed be used to signal qualities such as piety or status, both in the worldly life one left behind, but also – and perhaps just as importantly – in the afterlife/purgatory.

Burials with two or more individuals in the later phases of burial may represent the few traces we have of epidemics, but are these grave types merely a practical solution in a situation with many dead bodies? Or could the dead support each other through physical proximity? The idea of care both for, but also between the dead may also underlie the gathering of bones from disturbed graves in special pits, or the deliberate placement of bones from other individuals in newly constructed graves.

5 VARIATIONS IN BURIAL PRACTICE AS A WINDOW INTO MEDIEVAL SOCIETY - CASES FROM TRONDHEIM AND COPENHAGEN

Abstract author(s): Lorvik, Katharina (NIKU - Norwegian Institute for Cultural Heritage Research) - Dahlström, Hanna (Museum of Copenhagen) - Petersen, Anna (NIKU - Norwegian Institute for Cultural Heritage Research)

Abstract format: Oral

Recent excavations of medieval cemeteries in two Scandinavian towns – Trondheim, Norway, and Copenhagen, Denmark – have produced interesting results regarding local variations in burial practice that need to be problematized and discussed. Two sites in Trondheim and two sites in Copenhagen were documented using the same methodological standards which enabled high-definition study combining detailed information of skeletal remains, archaeological stratigraphic contexts, environmental data, and absolute chronology. There are certain similarities between the towns when it comes to the physical expression of the burials, such as in the use of material components like stones or charcoal. It is also noteworthy that differences between the two cemetery sites within each town were observed. Only one of the cemeteries in each town displayed variation in burial practice, while the other did not, despite both cemeteries being closely situated and contemporary (11th – 14th centuries). Our results show that contrary to the normative perception of Christian burial practices as simple and homogeneous, variations existed both within and between cemeteries in both towns.

This presentation will give an overview of the material attributes seen in these cemeteries and discuss possible meanings behind the variations. It is unlikely that these examples of variations in medieval burial practices are unique, although it might to some extent be an urban rather than a rural phenomenon. Furthermore, variations are not easily detectable during excavation, requiring skilled awareness by archaeologists. Simply put, one needs to know which material expressions to look for and be able to assess whether they are random, results of taphonomic processes, or indicative of a particular burial practice.

6 VARIATIONS IN MEDIEVAL BURIAL PRACTICES IN FINLAND

Abstract author(s): Moilanen, Ulla (University of Helsinki)

Abstract format: Oral

There is a considerable variation in Finnish early medieval and medieval (c. 900-1400 CE) burial practices. The inhumation graves of the period include various burial positions, treatments and orientations, double and multiple burials, spearheads that may have been struck through the coffins, and the use of cremated bones and objects. Based on new analysis, it is possible that many of the features can be explained by individual choices made at different stages of the burial ritual. Again, different social motivations, beliefs and local events may have influenced these choices. It seems that around 1200 CE, double and multiple burials became slightly more common, and at the same time, typologically older spearheads were struck into the coffins. These phenomena may be linked to a short-term mortality crisis that could have resulted from crop failures and epidemics. The period's political instability may also have triggered local power struggles, which may have emphasised the ritual importance of ancestors, which led to the placement of old, cremated material in inhumation burials. Overall, the contextualisation and taphonomic analysis of graves will allow multiple interpretations and help raise new questions that will help to integrate the data into a broader geographical, temporal and theoretical debate on burial practices in medieval northern Europe.

7 THE MATERIALITY OF DEATH IN THE HOUSEHOLD, AS SEEN IN THE EARLY CHRISTIAN CEMETERIES OF NORTHERN ICELAND

Abstract author(s): Zoega, Gudny (Hólar University)

Abstract format: Oral

In recent years a number of early Christian cemeteries have been excavated in the region of Skagafjörður, North Iceland. These cemeteries were owned and operated by individual households and date from around AD 1000 into the first decades of the 12th century. Superficially, these structures seem uniform and there is a conspicuous lack

of grave goods. But with the comparative material from three fully and 15 partially excavated cemeteries, the view becomes more nuanced and certain traditions and practices come into focus. It has become clear that from the onset a Christian cemetery was in no way a static entity but, rather, existed as a fluid construction imbued with meaning and structure. There are certain external features, such as uniform shape and size, that seem to indicate a pre-ordained form of burial space. However, when the internal layout of graves and grave furnishings are examined, there was room for variation that speaks of both tradition and individual touches. The materiality of death is visible in the internal landscaping and layout of graves, selective relocation of bodies, selective use of coffins, the use of tephra and turf as grave furnishings and deliberately placed stones in the graves. Analysis of burial customs and the osteological material indicate that the bounded cemetery space served as a reflection of the social realities of the population it served. In this talk I want to give an overview of the findings of the analysis of the burial material, what it tells us about early Christian burial tradition in Iceland, and to what extent the burial space may reflect a continuation of earlier non-Christian traditions.

8 UNCOMMON PRACTICES - THE USE OF GRAVE GOODS IN MEDIEVAL DENMARK

Abstract author(s): Struer, Anine (Museum of Copenhagen)

Abstract format: Oral

This paper presents the main conclusions of a study of the use of grave goods in medieval eastern Denmark. While most published research on the topic in a Danish context focuses on either one specific type of artefact or the finds from one specific cemetery, this study aimed at a more systematic approach by including all excavated burials with grave goods within the area of research. This provided not only information on the range of artifacts that followed medieval people into to grave. By using a bird's eye view, it has been possible to discern certain patterns within the material, relating to the types of artifacts and to the context within which they have been found.

No doubt the placing of artefacts with the dead in many instances had religious purpose or background. One of the questions is what purpose or belief was behind and to what extent these where in accordance with or in opposition to the established religious framework of the Church. In an attempt to get a more thorough understanding of the meaning(s) of this un-common practice of grave goods, the results of the study are discussed in relation to ecclesiastical legislation, liturgy, and theology of the period. Additionally, some common interpretations of the grave goods are critically examined.

9 MAGIC AS AND INTERPRETATIVE FRAMEWORK IN HIGH AND LATE MEDIEVAL BURIALS

Abstract author(s): Knight, Gwendolyn (Centre for Medieval Studies, Stockholm University)

Abstract format: Oral

Recent work by, for example, Roberta Gilchrist, has highlighted the possibilities of considering the role of magic when interpreting objects in high and late medieval burials. Such an interpretation encourages us to add flexibility to our perceptions of the worldviews held by medieval people as well as our interpretations of their ritual practices. Nevertheless, debates in different disciplines (such as anthropology and history) surrounding the definition of 'magic', and the inconsistent engagement with these debates within archaeology, means that precisely what is being identified as 'magic' and what it means to identify a given object or behaviour as related to 'magic' remain fraught questions. This paper will map out the current landscape of 'magic' as an interpretative framework and, having identified the difficult areas, propose a path to navigate them. It will furthermore provide concrete examples from the North Sea region, and draw comparisons with written evidence (such as legal material or hagiography) where relevant.

10 A SYMBOLIC PILGRIMAGE? - PILGRIM BADGES, SHELLS AND RELATED OBJECTS IN MEDIEVAL DANISH BURIALS

Abstract author(s): Søvsø, Mette (Museum of Southwest Jutland)

Abstract format: Oral

Pilgrim souvenirs, mostly in the form of scallops, are known from a number of Danish burials dated between the 12th and 16th century. Traditionally, they are perceived as tokens brought home from pilgrimage by the deceased. As symbols on journeys to sacred places, they protected the dead through purgatory presenting the pilgrim as pious. Recent research into Danish finds of pilgrim badges and related objects has generated new observations, adding more facets to these artefacts and to their use and meaning in medieval society.

Comparison with other archaeological finds from the period may indicate, that the presence of the artefacts in burials are an expression of a belief in the inherent powers of certain artefacts, that may have roots back in pre-Christian time. With Danish high- and late medieval burials as turning point, this paper will focus on new observations of ritual practice and perception of death based on burial contexts, the buried, as well as the artefact types, their positions in the graves as well as traces of use and wear.

11 THE MAN IN THE PARCEL

Abstract author(s): Ahlstrom Arcini, Caroline - Konsmar, Annika (The Archaeologist, National Historical Museum)

Abstract format: Oral

The sight that met the archaeologist during the excavation of a grave in Gårdby church on the island of Öland, Sweden, made a lasting impression. In front of the archaeologist lay the skeleton of a man, with his mouth open and a length of rope looped around his head so that it formed a cross over his face. This cord continued down the body, allowing it to be bound around the deceased's ankles.

The rope was not the only element associated with the skeleton. Pieces of a dry organic material also lay among the bones, but what did these fragments come from? Could they be dried and waxed linen fabric, or some sort of leather? The possibility that they were remains of the corpse itself seemed to be discounted by the presence of fragments lying both on top of and below the rope. Another curious feature was presented by a small, pointed stick lying between the man's fifth and sixth ribs on the left side of his chest. The individual is dated to 1030-1060 AD.

Similar cases of mortuary practice have been seen in Denmark and England. The grave of a 12th-century king, Valdemar the Great had also been carefully trussed up in an animal skin prior to burial and 'The man from St Bee' that was discovered in 1981, during excavations within the grounds of St Bees Priory, Cumbria, England was like the man from Gårdby wrapped up like a package.

What are the reasons for these unusual care of their bodies before burial? Was it an unusual handling or was it just discovered thanks to good preservation conditions? Can we also discover the same form of pre-burial treatment in graves where the preservation condition is not as optimal as these?

12 BURIALS IN TRANSITION: EARLY MEDIEVAL BARK GRAVES IN WESTERN SWEDEN

Abstract author(s): Beckman, Anna - Lennblad, Astrid (Lödöse museum) - Ahlström Arcini, Caroline (Arkeologerna/Statens Historiska Museer)

Abstract format: Oral

The transition between the Viking age and the Middle Ages in Scandinavia, around 1000 AD, is a period of rapid transformation when old pagan traditions meet new practices inspired by the slow process of Christianisation.

In 1981, archaeologists were surprised to find several Viking age and early medieval burials underneath Nödinge kyrka, western Sweden. The current church, dated to the 17th century, was built over an older one dating to the 12th century.

Fifteen burials were discovered underneath the older church. Some of them in a fashion that is unique in this area - the dead were buried in a shroud of bark or birch bark, which in some cases was sewn together with linden bast. In western Sweden, only two similar graves have been excavated archaeologically. Several of the dead were accompanied by hazel sticks and one individual had been fitted with an elaborate cap made of birch bark. In other cases, objects such as ring buckles and one presumed paddle were found within the graves.

Until now, only two of the Nödinge burials have been radiocarbon dated, both to around 1050 AD. No proper excavation report has been published about the findings. Therefore, a research project has been launched with the specific aim to create a comprehensive analysis of this important material. Traditional osteological analysis in combination with additional carbon 14 dating's and strontium isotope analysis will hopefully help us to gain exciting new knowledge about the people that were buried here and about the rare custom of bark burials.

The purpose of this paper is to present both the material and the result of the project so far. Furthermore, we hope that this presentation will serve as a starting point for an exchange of knowledge about these kinds of burials in other parts of Europe.

13 BISHOP STEFAN WIERZBOSKI: PATRON DURING HIS LIFETIME AND A „MONUMENT“ AFTER DEATH - ANALYSIS OF THE BURIAL

Abstract author(s): Dabralet, Igor (Nicolaus Copernicus University on Torun) - Dobek, Mikolaj (Nicolaus Copernicus University in Torun)

Abstract format: Oral

The main purpose of archaeologists' examination of burials, both of lay people and of the clergy, is to search for traces that would make it possible to learn about funeral behavior from centuries ago. An example of works that showed how much importance was attached to the dignified and proper emphasis of the social position of the buried deceased is the study of Bishop Stefan Wierzbowski burial.

Wierzbowski was one of the most important figures in 17th century Poland. However, there were many such people in the world of diplomacy and most of their activities fell into oblivion. It would probably be the same with the story of Wierzbowski, if not for the founding of the city of Góra Kalwaria. After death, the bishop was buried in his city. Wierzbowski was so revered that he is treated almost as a saint - every year in Góra Kalwaria commemorative ceremonies

commemorating the town's founder are held. In addition, all conservation work is carried out with donations from the city's residents. The cult of the deceased turned out to have a real impact on the state of the archaeological deposit. The care of his remains can be said thanks to the archaeological research. We know that the remains of the mummified bishop were moved three times. The fact that Wierzbowski's outfit was "updated" three times during the subsequent transfers of the corpse caused, that the burial examined by archaeologists from Nicolaus Copernicus University became an outstanding treasury of knowledge about liturgical costumes. The analysis of liturgical sets found in his sarcophagus that became the basis for telling the story of the burial itself and the circumstances surrounding it. It also became possible to focus on the issue of the role of burials of outstanding residents in the life of the local community.

HUMAN IMPACT AS A PRIMARY CAUSE OF ENVIRONMENTAL TRANSFORMATION: URBANIZATION IN CENTRAL ASIA AND IRAN FROM PREHISTORY TO HISTORICAL PERIODS

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Cerasetti, Barbara (ISMEO – The International Association for Mediterranean and Oriental Studies) - Arciero, Roberto (Faculty of Archaeology, Leiden University) - Stančo, Ladislav (Institute for Classical Archaeology, Faculty of Arts, Charles University in Prague)

Session format: Regular session

Human activities strongly affected the environment over the millennia and changed the local landscape(s) in different ways. Extensive agricultural projects, management of water resources, deforestation, intensive grazing vegetation, ore mining, burning fossil fuels, pollution, and more recently extraction of oil and gas, have tremendously impacted the environment of Central Asia and Iran (e.g., the Aral Sea region). Since the 3rd millennium BCE, early urbanization largely contributed to shaping the local landscape in the regions such as the Iranian Plateau, the Kopet-Dagh piedmont, the Murghab alluvial fan, the Oxus region, and later also in the oases of Sogdiana.

This session aims to explore the impact that urban system(s) had as a primary cause of environmental transformation in Central Asia and Iran, from prehistory to historical periods.

We welcome multidisciplinary contributions on the following questions (but not limited to):

- How urbanization modified the local environment
- How the local environment influenced local urbanization
- How local communities adapted to often harsh semi-arid environments and (re)adjusted urban strategies
- How water management planning, in and around urban areas, has shaped the local environment and what consequences intensive agriculture has brought

We would like to explore and analyze the topic with a holistic approach, and we encourage papers from different fields, including (but not limited to) remote sensing, geoarchaeology, architecture, archaeology, and history. The main aim of the session is to expand our knowledge on this subject and connect scholars from different (sub)fields studying Central Asia and Iran, and to have the opportunity to discuss and explore new constructive approaches.

ABSTRACTS

1 BRONZE AGE ECOLOGY IN SOUTHEASTERN IRAN

Abstract author(s): Ebrahimiabareghi, Setareh (University of Bern)

Abstract format: Oral

All human cultural activities are shaped by geographical and ecological conditions. According to this perspective, cultural behavior is influenced by both natural and social environments. In Iran, at the beginning and the middle of the late Holocene, suitable climatic conditions emerged, and civilizations that flourished in the desert areas, such as Shahr-i Sokhta in Sistan and Konar Sandal in Halil Rud Valley, strongly depended on the climate and environment.

Despite numerous archeological studies in the southeastern region of Iran, the environmental changes during the Bronze Age have not yet been extensively considered in this area. The research I would like to present aims to reconstruct the ecological condition of the region during this period and the influential factors in the cultural transformations of the settlements. It will develop an understanding of the Bronze Age environment by using analytical methods that are based on evidence, such as seals, pottery, figurines, bone, and plant remains in the Sistan plain. The analysis of the findings indicates that droughts and crop failures have been caused by sediment accumulation in the plain, as well as changes in riverbeds due to frequent droughts, arid climate, low precipitation, lack of groundwater, and strong winds.

2 URBAN PLANNING AND ENVIRONMENTAL CONSTRAINTS IN THE MURGHAB (SOUTHERN TURKMENISTAN) DURING THE MIDDLE AND LATE BRONZE AGE

Abstract author(s): Arciero, Roberto (Leiden University)

Abstract format: Oral

While proto-urban development characterized the Kopet-Dag region (southern Turkmenistan) since the early 4th Millennium BCE, it is only from the Middle Bronze Age (late 3rd- early 2nd Millennium BCE) that urban expansion took place in the Murghab region as well. This expansion gave rise to the Bactria-Margiana Archaeological Complex (also known as Oxus Civilization or Greater Khorasan Civilization) that expands over southern Turkmenistan, northern Afghanistan, and as far as northeastern Iran, southwestern Uzbekistan and south Tajikistan. From Middle Bronze Age onwards, the core region of the Murghab started to be characterized by large sites, such as Gonur Depe, with a complex planning, including fortresses and large defensive walls with massive towers. Early Soviet research mainly concentrated on the excavations of main sites such as Kelleli or Auchin. As a result, landscape investigations and how the local environment played a role in the urban strategies system remain poorly understood. Likewise, how water resources shaped the local settlements system is still an underresearched topic.

This paper aims to focus on the hydrological landscape and how environmental constraints shaped urban and rural settlements and their agricultural practices. I will focus on the urban areas of the Murghab and their water systems, like natural channels and canals. Likewise, I will explore water relations in terms of water management policy between local communities in the region. Scholars have long argued for possible centralized management of the water systems in urban centers. However, managing large irrigation systems may take different forms, and centralized control is just one of the alternatives. As such, I will use a multidisciplinary approach, including archaeological evidence and ethnographic sources that can broaden our understanding of the water management relationship in the 3rd and 2nd millennium BCE, and how it influenced the development of urban planning and settlement patterns in the region.

3 UNDERTHESANDS: TANDEM-X, MULTI-TEMPORAL SENTINEL, AND HEXAGON SATELLITE IMAGERY IN THE STUDY OF THE MURGHAB'S IRRIGATION LANDSCAPE

Abstract author(s): Bulawka, Nazarij - Orengo, Hèctor (Landscape Archaeology Research Group, Catalan Institute of Classical Archaeology)

Abstract format: Oral

Landscape undergoes long-term social-natural co-evolution (McGlade 2005, 460), particularly evident in the alluvial plains where irrigation has been initially practised as a human adaptation to natural hydrology, eventually leading to significant landscape modification (Wilkinson, Rayne, and Jotheri 2015). This makes the study of irrigation landscapes challenging and necessitates using innovative methods, like those proposed by UnderTheSands (HORIZON-MS-CA-2021-PF-01-101062705), funded by The European Union.

UnderTheSands will utilize multiple data sources and techniques, including remote sensing, terrain analysis, hybrid machine/deep learning methods, archaeomorphology, spatial correlation indices, and historical research (including multispectral imaging, synthetic aperture radar, and TanDEM-X (DEM_HYDR3723)). The Google Earth Engine program enables the project to incorporate multi-temporal images into most workflows, allowing for the efficient processing of large amounts of data.

The paper presents the selected results of the UnderTheSands project in the studies of the Murghab river's alluvial fan in southern Turkmenistan. The area has been the subject of investigations by The Archaeological Map of the Murghab Delta, Ancient Merv Project, and TAP - Togolok Archaeological Project, resulting in the discovery of over 1700 sites from various periods. Research suggests that the first settlements in the area are dated to the Early Bronze Age (ca. 2800-2400 BCE), but the significant occupation started in the Middle Bronze Age (2400-1950 BCE). Its landscape underwent a gradual transformation due to irrigation - particularly during the Iron Age (ca. 1350-300 BC), Parthian (247 BC-224 AD), Sasanian (224-651 AD), and Islamic periods, which makes it particularly interesting for landscape studies. The paper focuses on the eastern part of the delta and employs multi-temporal satellite imagery and digital elevation models to examine the fluvial transformation and the remains of ancient irrigation systems related to the Iron Age settlement pattern (Gubaev et al., 1998; Salvatori et al., 2008).

4 HUMAN IMPACT ON ARID/SEMI-ARID ENVIRONMENTS: MIXED URBANIZATION IN THE WATER SYSTEMS OF MURGHAB (SOUTHERN TURKMENISTAN) AND KARAKUL (WESTERN UZBEKISTAN) RIVERS

Abstract author(s): Cerasetti, Barbara (ISMEO – The International Association for Mediterranean and Oriental Studies)

Abstract format: Oral

Since ancient times, Central Asia and neighboring Iran have been affected by profound climate changes. The consequent radical transformations of the territory by human beings to survive have strongly endangered the delicate ecosystem of these geographical areas, often with catastrophic effects.

During the 2nd millennium BCE, urbanization extensively modified and deeply influenced the local environment of vast water systems, from Helmand in Iranian Sistan to Murghab in prehistoric Margiana, and Karakul to the west of Bukhara region. A specific aspect of this phenomenon deserves to be taken into consideration, i.e. the resulting settlement pattern after the “distribution” of territories between GKC (Greater Khorasan Civilization) and Andronovo-related populations in the alluvial fan of the Murghab River (southern Turkmenistan) and the fossil system of Makhan-darya (western Uzbekistan). In particular, how the spatial interaction (intra/off-site) between these two cultures has been deeply influenced by the difficult adaptation of the techniques, known at that time, to the exploitation of water and primary resources.

5 FROM CITIES TO VILLAGES: ADAPTATION STRATEGIES OF IRON AGE SOCIETIES. CASE STUDY IN THE PASHKURT VALLEY

Abstract author(s): Lhuillier, Johanna (CNRS)

Abstract format: Oral

The transition from the Bronze Age to the Iron Age (around 1500 BCE) shows in Central Asia a somewhat counter-intuitive evolution of the urbanisation process, the Bronze Age cities being abandoned in favour of a more extensive settlement through a network of small villages. Both the increasing number of Iron Age sites and the extension of the territory covered show a relationship to the environment now based on extensive exploitation of a larger territory. Through the example of the Pashkurt valley in southern Uzbekistan, we will question the means implemented by local communities to adapt to a semi-arid environment. Several fortified sites dating from this period have indeed been identified in this area and constitute the only known habitat in an altitude zone. Studies on settlement pattern, architectural techniques, and management of water resources are approached through a multidisciplinary approach combining archaeology, geomagnetic prospection, geoarchaeology and archaeo-botany. We will discuss the processes of socio-economic and environmental adaptation that follow this cultural transition in order to identify avenues of reflection on the evolution of the relationship with the environment of protohistoric societies in Central Asia.

6 HUMAN IMPACT ON LOWLAND LANDSCAPE OF SOUTHERN CENTRAL ASIA IN PROTOHISTORY: CASE OF THE SHERABAD RIVER BASIN, SOUTH UZBEKISTAN

Abstract author(s): Stanco, Ladislav (Charles University) - Petřík, Jan (Masaryk University)

Abstract format: Oral

Being sparsely populated in prehistory (in both the Bronze and Early Iron Age), the Sherabad Plain undergone substantial change during what is called Protohistory (Greco-Bactrian and Kushan periods according to the local terminology). This very period bore witness to emergence of the first larger urban centres in northern Bactria, while rural settlements in their hinterlands mushroomed along the newly constructed water canals. These developments caused population growth, increasing social complexity, but also affected heavily the so-far largely undisturbed natural landscape.

The results of OSL dating of floodplain sediments indicate a geomorphological change in the first millennium BCE, and this change could be related to gradually increasing pressure on the landscape due to factors such as agriculture and deforestation, in addition to climatic development and tectonics. Further studies of floodplain sediments will investigate pedological development and weathering indices to indicate changes in climatic conditions.

In this contribution, we also aim to test previous hypotheses regarding the extent of human intervention in the lowland landscape of southern Central Asia during Protohistory, using newly available data on water canals and settlements in the Sherabad River basin of South Uzbekistan. Hexagon high-resolution aerial imagery will be utilized in testing the extent of human impact on the landscape. The Sherabad Plain was selected as the testing area due to its extensive study by our team, which has provided a complex set of basic data.

7 ENVIRONMENTAL (MIS)MANAGEMENT AND URBAN SUSTAINABILITY IN THE OTRAR OASIS, KAZAKHSTAN

Abstract author(s): Campbell, Katie (University of Cambridge)

Abstract format: Oral

Sustaining urban populations requires careful management of agricultural resources, and a level of flexibility to respond to political shocks, environmental change, and natural disasters including plague, earthquakes and floods. In the oases of Transoxiana, large, abandoned medieval cities testify to a breakdown in the capacity of an urban population to sustain themselves, although at present sparse data exists to confidently explore the causes of this. Contemporary accounts see the Mongol conquest, shifting water sources and nomadic raiding as a primary reason for medieval urban abandonment, but these narratives mask a complex situation, which demands a variety of approaches.

Environmental decline or mismanagement is both a likely contributor to urban decline in these space-limited oases, and a salient current issue. Focussing on the abandoned city of Otrar (Farab) on the Syr Darya, I will outline present evidence for environmental and urban management in the city and its hinterland, and introduce approaches which might provide data for a more coherent narrative of the changing environment between the 12th and 15th centuries. Urban stratigraphy is used to date population decline in the city and explore how the urban space was managed, as well as demonstrating the manner of its abandonment. In the broader oasis, reservoirs, canals and extensive irrigation networks testify to the importance of water management for washing, agricultural and industrial purposes, and ongoing work is providing primary data for shifts in water provision and their causes. Finally, charred seeds can provide an insight into crop choices and subsistence strategies of the inhabitants of Otrar and may show not only a decline but also a response to changing environmental circumstances.

8 TOWARDS A SLOW SCIENCE OF THE ARAL SEA

Abstract author(s): Brite, Elizabeth (Purdue University)

Abstract format: Oral

Scientific attention to the Aral Sea intensified and was sustained in the decades following the collapse of the Soviet Union as a shared concern emerged about the sea's disappearance. Beginning in the 1990's, recession of the Aral Sea's shoreline was widely and publicly understood as a representation of global climate change, and it produced a host of scientific and humanistic practices to recount, monitor, temporalize, track, and admonish human impacts across millennia. This discourse differed markedly from earlier studies on Aral Sea human-environment relations produced primarily by Soviet archaeologists. Drawing on Isabelle Stengers' concept of "slow science," this paper pauses to re-examine the pursuit of anthropogenic facts about the Aral Sea, giving thought to whether researchers from different epistemological traditions maintain disparate concerns about the Aral Sea's long-term relations with humanity. The case of Istemes Lake, a terminal lake within the Aral Sea Basin and adjacent to the archaeological site of Akchakhan-kala, is offered as an example of the ways that empirical validation may be inadequate to settle these differences in approaches towards environmental archaeology in the 21st century. More generally, before we get to answers about human impacts on the environments of Central Asia, this paper considers first why archaeologists ask these questions to begin with, and whether we are failing to perceive significant differences among us and thus the possibilities for greater multivocality.

9 WATER MANAGEMENT SYSTEM OF HARAPPAN CIVILIZATION

Abstract author(s): Kumar, Dr. Pardeep (Assistant Professor , Deptt of History, Kanya Mahavidyalaya Kharkhoda , Sonipat ,Haryana) - Navneet, Navneet (Research Scholar, Jamia Millia University New Delhi)

Abstract format: Oral

Harappan civilization is one of the most prominent cultures in ancient world's Bronze Age. Harappan civilization in Indian sub continent has led to numerous innovations in water management technique. Water is the basic necessity of human life which helps to develop of a culture. If we draw the settlement pattern of this civilization we find that most of the sites of this culture are situated at the banks of rivers. Hydrologic knowledge of this civilization starts developing since 2750 B.C. – 1750 B.C. Harappan people are famous for their civil engineering especially in town planning and water management. The aim of this paper is to understand the water management system of Harappan civilization. Some excavated sites of this culture will study to explain it. Archaeological reports of few sites such as Mohenjo-Dararo, Harappa, Dholavira, Lothal, Rakhigarhi and Kalibanga have been published. Most of the sites of this culture have technical drainage system, water storage, irrigation and water harvesting techniques. All the aspects of water management system will be studied with the help of new modern tools of documentation. The comparative method will be used for the study civil engineering features. Here we have discussed specially about water management system of this culture. After research we able to learn a lot about the techniques of these people and will be utilised for future research & projects.

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Val-Peón, Cristina (Institute of Neotectonics and Natural Hazards, RWTH Aachen University) - Ochando Tomás, Juan (Dipartimento di Biologia Ambientale, Sapienza University of Rome) - Fernández-García, Mónica (Grupo de I+D+i EVOADAPTA - Evolución Humana y Adaptaciones durante la Prehistoria, Dpto. Ciencias Históricas, Universidad de Cantabria)

Session format: Regular session

Neanderthals inhabited Eurasia during more than 300.000 years, being able to adapt to different ecological areas and diverse climatic conditions. Climate has always been considered a key factor influencing biogeographical rearrangement. Environmental changes may have played a fundamental role in the distribution of plant and animal communities, the availability of resources, and migration scenarios, thus affecting Neanderthal's adaptive behaviour.

Neanderthals have traditionally been regarded as a species adapted to cold conditions, whereas the wide biogeographical area over which they spread and the vast period of time during which they lived seem to show a more complex reality. Another controversial issue is related to the causal factors that led them to their disappearance, given that this can be framed within a period of critical climatic episodes.

The Mediterranean region has been the subject of several studies in recent years, as it has been considered a biodiversity hotspot with a wide complexity of landscapes and habitats that may have acted as a refuge during periods of climatic instability. These characteristics may have been decisive for Neanderthal populations to settle and endure in this region, as reflected by the existence of several archaeological sites spanning from MIS5 until the progressive extinction of these populations in southern Iberia during MIS3. Is this endurance over time a consequence of a relatively stable climate and environmental conditions compared to other regions with more extreme habitats, or are there other causes behind this?

In this session, we would like to create a forum to discuss recent research and advances about the diverse environments Neanderthals inhabited across Southern Eurasia and their peninsulas in the Mediterranean context, covering different biogeographical areas and chronological periods. Interdisciplinary studies focused on bioarchaeological remains, such as palynology, anthracology, large and small mammal paleoecology or biomolecular approaches (stable isotopes; ZooMS) are welcome.

ABSTRACTS

1 BALKAN NEANDERTHALS: THE UPPER-PLEISTOCENE PALAEOECOLOGICAL SEQUENCE OF PEŠTURINA CAVE (NIŠ, SERBIA)

Abstract author(s): Ochando Tomás, Juan (University of La Sapienza) - Carrión, José (University of Murcia) - Magri, Donatella (University of La Sapienza) - Amorós, Gabriela (University of Murcia) - Di Rita, Federico (University of La Sapienza) - Munuera, Manuel (Polytechnic University of Cartagena) - Marín Arroyo, Ana (University of Cantabria) - Bogičević, Katarina (University of Belgrade) - Roksandic, Mirjana (University of Winnipeg) - Mihailovic, Dusan (University of Belgrade)

Abstract format: Oral

The Central Balkans appear as a key biogeographical region in Southern Europe, in a central European-Mediterranean climate context, which served as a refugium and as a propitious territory for the dispersion and migration of both Neanderthals and modern human populations. This study presents pollen analyses on sediment samples and hyaena coprolites from Pešturina Cave, Central Balkans, with the aim of depicting the vegetation landscapes of Balkan Neanderthals and modern humans during the Mid-Upper Paleolithic (MIS 5e-3). Semi-forested environments prevail from the beginning of the sequence MIS 5e-5c (archaeological layers 4c and 4b) to MIS 5b-5a (layer 4a) characterized by Pinus, evergreen and deciduous Quercus, Tilia and woody legumes, accompanied by heliophytes such as Artemisia and Poaceae. During MIS 4-3 (layers 3-2) the vegetation is dominated by Artemisia-Poaceae steppes with Quercus patches, conifers and woody legumes. Apart from these major components, other palaeoecologically meaningful taxa are found, including Juniperus, Acer, Alnus, Betula, Carpinus betulus, Ostrya, Castanea, Corylus, Fagus, Juglans, Fraxinus, Salix, Ulmus, Buxus, Ilex, Olea, Phillyrea, Pistacia, Erica, Cistaceae and Rosaceae, among others. The Upper Pleistocene vegetation obtained from pollen records in Pešturina Cave depicts a mosaic of landscapes embracing mesophytes, thermophytes, xerophytes, and Mediterranean elements. Neanderthals and early Upper Palaeolithic people lived in a highly diverse refugium, probably offering opportunities for survival during the cold stadials of the Pleistocene.

2 SMALL MAMMAL ASSEMBLAGES USED TO RECONSTRUCT PAST ENVIRONMENTAL CONDITIONS WHERE NEANDERTHALS LIVED IN SOUTHERN EUROPE

Abstract author(s): López-García, Juan Manuel (Institut Català de Paleoeologia Humana i Evolució Social - IPHES; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Berto, Claudio (University of Warsaw, Faculty of Archaeology) - Lebreton, Loïc (Institut de Paleoeologia Humana i Evolució Social - IPHES)

Abstract format: Oral

The environmental and climatic evolution of the Middle Paleolithic (late Middle Pleistocene to Late Pleistocene) of Southern Europe is determined for Marine Isotope Stage 7 (MIS 7) to MIS 3 on the basis of a study of the small-mammal (insectivore, bat and rodent) assemblages. This work provides a synthesis of previously published sets of environmental and climatic data from various Middle Paleolithic sites, such as Lazaret cave in France, Cova del Gegant in Spain or Fumane cave in Italy, all of which are located in the European western Mediterranean region. Using the habitat weighting method and the bioclimatic model to reconstruct the environment, temperature and rainfall, the results show great variability in the landscape and climate of the area. However, the various layers from the studied sites in which the human presence is more intense coincide with landscapes dominated by woodland formations in mild climatic conditions. A comparison of our results with those from other sites with studies of small mammals in Italy, southern France and the Iberian Peninsula reveals the same pattern, showing that the hominins that inhabited the western Mediterranean region in the late Middle Pleistocene and Late Pleistocene were closely related to forested area.

3 THE LATE NEANDERTHALS IN NORTHERN IBERIA: CLIMATE AND SEASONALITY BASED ON OXYGEN STABLE ISOTOPE FROM UNGULATES TEETH

Abstract author(s): Fernández García, Mónica (1 Grupo de I+D+i EVOADAPTA - Evolución Humana y durante la Prehistoria, Dpto. Ciencias Históricas, Universidad de Cantabria) - Pederzani, Sarah (Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology) - Britton, Kate (Department of Archaeology, University of Aberdeen; Department of Human Evolution, Max Planck Institute for Evolutionary Anthropology) - Fourel, François (Univ Lyon, Université Claude Bernard Lyon 1, CNRS, ENTPE, UMR 5023, LEHNA, F-69622) - Lécuyer, Christophe (Univ Lyon, Univ Lyon 1, ENSL, CNRS, LGL-TPE, 69622) - Marín-Arroyo, Ana (1 Grupo de I+D+i EVOADAPTA - Evolución Humana y durante la Prehistoria, Dpto. Ciencias Históricas, Universidad de Cantabria)

Abstract format: Oral

This work focuses on the analysis of the oxygen isotope composition ($\delta^{18}\text{O}$) on ungulate tooth enamel recovered in three northern Iberian archaeological cave sites: El Castillo (Cantabria), Axlor (Vizcaya), and Labeko Koba (Guipuzcoa). Through the biochemical analysis of 22 bovine and 17 equid teeth, found in radiocarbon-dated archaeological levels, a high-resolution reconstruction of the past climatic conditions connected to human activity has been obtained. This climate reconstruction is based on the double relationship between $\delta^{18}\text{O}$ in environmental water and $\delta^{18}\text{O}$ in mammal body tissues, especially in obligate drinkers, as well as $\delta^{18}\text{O}$ in environmental water and past air temperatures. The analyses of the phosphate fraction on tooth enamel, combined with carbonate analysis, provide a reliable signal to estimate paleotemperatures. Combining the three archaeological sites that included the cultural technocomplexes of Mousterian, Châtelperronian, Transitional Aurignacian, and Aurignacian, we estimate the climatic evolution from 50,000 to 35,000 cal BP. The climatic characterization of this period is a clue to evaluate the late Neanderthals' subsistence strategies in northern Iberia, where their disappearance occurred earlier than in other parts of Iberia. Moreover, combining our results with recent regional climatic reviews based on archaeofaunal and archaeobotanical proxies (mainly, small-mammals and pollen), as well as the Net Primary Productivity reconstruction, results indicate that a cold and arid climatic phase was experienced in this region during this human replacement.

4 FUEL AND FIRE: THE FIRE RECORD AS AN ARCHIVE OF NEANDERTHAL BEHAVIOUR AND THEIR ECOLOGICAL ENVIRONMENT

Abstract author(s): Burguet-Coca, Aitor (Leiden University, Faculty of Archaeology, Department of Archaeological Sciences; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d'Història i Història de l'Art) - Allué, Ethel (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d'Història i Història de l'Art) - Cabanes, Dan (Department of Anthropology, Rutgers University) - Martínez-Moreno, Jorge (Centre d'Estudis del Patrimoni Arqueològic, Universitat Autònoma de Barcelona) - Benito-Calvo, Alfonso (CENIEH Centro Nacional de Investigación sobre la Evolución Humana) - Albert, Rosa Maria (ICREA; Universitat Autònoma de Barcelona, Departament de Prehistòria, Facultat de Filosofia i Lletres) - Mora, Rafael (Centre d'Estudis del Patrimoni Arqueològic, Universitat Autònoma de Barcelona)

Abstract format: Oral

Firewood is the main fuel used by Neanderthals during the Middle Palaeolithic. The abundance or scarcity of fuel conditions human groups' relationship with fire. The pyroarchaeological record -fire record in archaeological sites- is a key archaeological aspect for understanding Neanderthal behaviour and environmental conditions.

In this work, we focus on the importance of understanding the surrounding vegetation, potentially used as fuel, to understand fire management by Neanderthals. The results are based on the phytolith and charcoal record documented in the late Middle Palaeolithic levels of Cova Gran de Santa Linya (Les Avellanes, Lleida). We will evaluate the potential of each analysis, the limits, and the complementarities between disciplines when dealing with the use of fuel and fire.

The obtained results indicate similar patterns in fuel use, wood was selected as the main fuel, and more precisely montane pine wood. This indicates that the selection criteria was possibly based on the most abundant and available wood, showing no scarcity periods and the presence of a forest of cryophilous pines in the surroundings. Along with the use of wood, the phytolith results showed the use of grasses, complementing the results of anthracology with the identification of non-woody plants, providing us with a more complete picture of exploitable plant resources and fire management.

This study suggests that the availability of wood resources was determinant in the occupation and probably condition the mobility patterns of human groups. The analysis of the pyroarchaeological record can also be a way of approximating the settlement patterns and forest environment by Neanderthals groups.

5 PALAEOVEGETATIONAL CONTEXT OF NEANDERTHAL OCCUPATIONS AT THE ARCHAEOLOGICAL SITE OF EL SALT (SE IBERIA)

Abstract author(s): Val-Peón, Cristina (Institute of Neotectonics and Natural Hazards, RWTH Aachen University) - Burjachs, Francesc (Institució Catalana de Recerca i Estudis Avançats - ICREA; Institut Català de Paleoecologia Humana i Evolució Social -IPHES; Àrea de Prehistòria, Universitat Rovira i Virgili - URV) - Galván, Bertila (Àrea de Prehistòria, Unidad de Docencia e Investigación de Prehistoria, Arqueología e Historia Antigua, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna) - Hernández, Cristo (Àrea de Prehistòria, Unidad de Docencia e Investigación de Prehistoria, Arqueología e Historia Antigua, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna); Archaeological Micromorphology and Biomarkers Laboratory, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Mallol, Carolina (Àrea de Prehistòria, Unidad de Docencia e Investigación de Prehistoria, Arqueología e Historia Antigua, Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers Laboratory, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna)

Abstract format: Oral

The period spanning from Marine Isotope Stages 4 to 3 has been characterised by millennial to centennial changes between cold-dry and moist-warm periods. Rapid climate changes have been recorded in continental and marine deposits, as well as correlated with Greenland Stadials and Interstadials. Nevertheless, while some natural sites evidenced open landscapes for these critical times, different archaeological sites documented the presence of mixed forests for the same chronologies in Western Mediterranean.

The Iberian Peninsula has been considered a refugium in moments of climatic instability during this period (71-29 ka BP), which may have been crucial for Neanderthals to settle in this territory until their disappearance. Thus, it is of great importance to explore past environments from a local-regional perspective and on a small time scale.

In this paper, we present the palynological results and evaluate the preservation potential of palynomorphs from different profiles of El Salt, emphasizing the importance of identifying possible biases caused by taphonomic factors that may affect the reconstruction of the palaeovegetation.

The first approach to the study of the palaeovegetation at the archaeological site of El Salt was carried out by Dupré. Since then, new samples have been collected in recent campaigns to better contextualise the palynological data within the framework of the last environmental studies at the site. Preliminary results show the existence of mixed Mediterranean forests alternating with some periods in which xerophytic vegetation increased. Because some samples were sterile and others contained poorly preserved pollen grains, taphonomic alterations were also recorded.

6 INVESTIGATING THE HYDROCLIMATE CONDITIONS AT THE MIDDLE PALAEO-LITHIC SITE OF EL SALT (EASTERN IBERIA) USING GEOCHEMICAL PROXIES

Abstract author(s): Davara, Javier (Archaeological Micromorphology and Biomarker Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna; Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna) - Iriarte, Eneko (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Facultad de Humanidades y Comunicación, Universidad de Burgos) - Jambriña-Enríquez, Margarita (Archaeological Micromorphology and Biomarker Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna; Departamento de Biología Animal, Edafología y Geología, Facultad de Ciencias, Universidad de La Laguna) - Hernández, Cristo (Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna) - Herrera-Herrera, Antonio (Archaeological Micromorphology and Biomarker Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna) - Mallol, Carolina (Archaeological Micromorphology and Biomarker Research Lab, Instituto Universitario de Bio-Orgánica Antonio González, Universidad de La Laguna; Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna; Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour - ICArEHB, Universidade Do Algarve)

Abstract format: Oral

The Iberian Peninsula is a key region for investigating Neanderthal-climate interactions due to its extensive archaeological record and its role as a Late Pleistocene refugium. However, our paleoclimate knowledge from that time largely relies on data obtained from high resolution geological records, poorly linked to the archaeological evidence. Here, micro contextually-sampled sediments from the stratigraphic units XIII, XII, XI and X at the Middle Palaeolithic site of El Salt (Eastern Iberia) (ca. 81.5 - 52.3 ka BP) has been analyzed for lipid biomarkers (n-alkanes), stable isotopes ($\delta^{13}\text{C}$ and δD values of n-alkanes, and $\delta^{13}\text{C}$ and $\delta^{18}\text{O}$ values of carbonates), and bulk geochemistry (LOI, XRF) with the aim of gaining information about the paleoclimate context of the site at the onset of the last glacial period. Our data allowed us to identify a tentative arid episode at the base of the sedimentary sequence (SUs XIII and lower XII) coinciding with the first Neanderthal occupation of the site after the end of MIS 5, and a general humid phase between SUs upper XII and X, where rich archaeological assemblages have been identified. These hydroclimate shifts are probably linked to the Dansgaard-Oeschger suborbital climate fluctuations that occurred largely during the last glacial period. These results highlight the usefulness of the micro-contextual and multi-proxy approaches for reconstructing the paleoenvironmental conditions in archaeological settings, and show potential for tracking the Neanderthal behavioral responses to the rapid and harsh climate shifts of the Late Pleistocene.

7 HIGH-RESOLUTION VEGETATION AND CLIMATE CHANGES DURING HEINRICH STADIAL 4 IN THE ALBORAN SEA: IMPLICATIONS FOR THE SCENARIO OF NEANDERTHAL EXTINCTION

Abstract author(s): Charton, Liz - Combourieu-Nebout, Nathalie (Histoire Naturelle de l'Homme Préhistorique, UMR 7194 CNRS, Muséum national d'Histoire naturelle) - Bertini, Adele (Dipartimento di Scienze della Terra, Università degli Studi di Firenze) - Sassoon, Dael - Lebreton, Vincent (Histoire Naturelle de l'Homme Préhistorique, UMR 7194 CNRS, Muséum national d'Histoire naturelle) - Peyron, Odile (Institut des Sciences de l'Évolution de Montpellier, UMR 5554 CNRS, Université de Montpellier)

Abstract format: Oral

Climate changes recorded during the last glacial period are believed to have impacted human population dynamics in Mediterranean Europe, forcing late Neanderthals towards the southern refugia of the peninsulas during less favourable periods. Heinrich Stadials (HS) represent the most severe expression of these climate oscillations, associated with a fast spread of semi-desertic vegetation characteristic of dry and cold climatic conditions in the Mediterranean area. The marine sequence from the Leg 161 site ODP 976, located in the Alboran sea (South-Eastern Spain), has continuously recorded regional environmental changes of the last climatic cycle. Here, we present the results of palynological analyses and quantitative climatic reconstructions for Heinrich Stadial 4 (HS4, ~39–38.5 ka BP) with extremely high-resolution of up to 20 years. The pollen data show a severe transition, at centennial scale, from interstadial to Heinrich Stadial vegetation, characterized by the dominance of semi-desertic taxa ('Artemisia', 'Ephedra', Chenopodiaceae). Then, the temperate forests expansion characteristic of Dansgaard-Oeschger interstadial DO 8 is also very quick. Climate changes reconstructed from a multimethod approach (MAT, WAPLS, and machine learning as BRT) show a different pattern during HS4, with strong changes in the seasonal precipitation. This arid climatic episode

has long played a central role in the debate on Neanderthal's demise, representing either a final blow or an ultimate favourable window for the last Neanderthals. Population and adaptive changes based on late Middle and Early Upper Palaeolithic sites in the Iberian Peninsula are discussed in light of these high-resolution palaeoecological changes. This study highlights the necessity to establish (1) an accurate chronological frame for the timing of late Neanderthal occupations of Mediterranean Europe, (2) high-resolution palaeoenvironmental reconstructions to assess the impact of rapid climate variability on Neanderthal populations.

316 MOUNTAINS AS INTERACTION ZONES – HUMAN IMPACT ON THE ALPINE LANDSCAPE THROUGH TIME

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Marti, Cynthia (University of Bern, Institute of Archaeological Sciences) - Nicolis, Franco (Soprintendenza per i beni culturali, Ufficio beni archeologici, Trento)

Session format: Regular session

Mountains were at no time an insurmountable barrier, but rather a lively cultural landscape allowing connections between the areas inside and outside the alpine zones. Humans have interacted in mountainous regions since the Palaeolithic and adapted their way of subsistence to the sensitive ecosystem, showing that this supposedly inhospitable landscape has always been an attractive living and economic space, holding a rich archaeological heritage today. Pasture and livestock farming have dominated the alpine areas since the Neolithic, as well as the mining of raw materials such as copper or rock crystal. Furthermore, the spiritual perception and ritual use of alpine landscapes should not be underestimated. Archaeological sites can therefore be found at all altitudes from the valleys up to the high mountains. Nevertheless, many of these sites are threatened by natural forces such as erosion, relocation or flooding and the melting of glaciers and permafrost caused by climate change. During the last few years, numerous objects melted from the ice were reported, revealing historical and archaeological finds, ranging from Mesolithic artefacts to remains of the World Wars. This increases data and knowledge on alpine land use in the past but at the same time drives their destruction, once they are exposed to environmental forces. Thus arises the question, of how archaeologists can research and preserve the archaeological heritage in light of environmental changes? The aim of the session is a diachronic discussion on the human impact on the alpine landscape in a long-term perspective, starting with early land use by Late Palaeolithic hunter-gatherers up to archaeological and historical finds from the 20th century. We are looking forward to papers on past and future land use and management, pastoralism, mobility and mining of raw material in the Alps and other mountain ranges in Europe.

ABSTRACTS

1 IMPACT AND RESILIENCE: HUMAN – ENVIRONMENT INTERACTIONS IN THE HIGH AREAS OF THE CENTRAL PYRENEES THROUGH THE HOLOCENE

Abstract author(s): Obea Gómez, Laura - Gassiot Ballbè, Ermengol - Barba Pérez, Marcos (Group of High Mountain Archaeology. Department of Prehistory. Autonomous University of Barcelona) - Clemente Conte, Ignacio (Group of High Mountain Archaeology. Department of Prehistory. Department of Archaeology and Anthropology. Institution Milà i Fontanals – CSIC) - Díaz Bonilla, Sara (Group of High Mountain Archaeology. Department of Prehistory. Autonomous University of Barcelona) - Garcia Casas, David (Group of High Mountain Archaeology. Institute of Heritage Sciences. Spanish National Research Council) - Rey Lanaspá, Javier (Group of High Mountain Archaeology) - Rodríguez Anton, David (Group of High Mountain Archaeology. Catalan Institute for Human Palaeoecology and Social Evolution) - Salvador Baiges, Guillem (Group of High Mountain Archaeology. Department of Prehistory. Autonomous University of Barcelona)

Abstract format: Oral

Recent archaeological research illustrates that the Pyrenees was not an unoccupied area throughout prehistory. From the end of the Pleistocene, and much more intensely in the Holocene, different areas of the massif hosted human occupations that gained altitude as the glaciers retreated. Thus, throughout the Holocene, practically all the altitudinal stages of the mountain range have been frequented by human groups, initially foragers and later linked to other economic activities, such as livestock farming, mining and even agriculture. In a complementary way, advances in palaeoecological and palaeoenvironmental research also show that during the same period mountain and high mountain ecosystems change over time, with dynamics that cannot always be explained by natural causes alone.

In this paper we present, from a long-term perspective, the archaeological and palaeoecological sequences of the central Pyrenees during the last 10.000 years. Through them, we analyse the main phases of human occupation, the environmental conditions in which they took place and their effect mainly on vegetal landscapes, increasingly noticeably from the end of the Neolithic. Thus, we address the signs of fires, the increase in pastures, the decrease in forest

biodiversity or the presence of cereals and their relationship with the different periods of human occupation within the Holocene climatic variability. Understanding these past interactions should contribute to the debate on the use and human occupation of high mountain environments that have changed over time and are currently affected by new exploitation models (e.g. linked to skiing and second homes) and global climate change.

2 TRACING CLIMATE AND HUMAN IMPACT IN MOUNTAIN PEATLANDS: FROM THE 8.2 KA EVENT TO LAND USE IN THE CENTRAL ALPS

Abstract author(s): von Scheffer, Clemens (Geography and Environment, School of Geosciences, University of Aberdeen; Institute for Ecosystem Research, Christian-Albrecht University) - De Vleeschouwer, François (Inst. Franco-Argentino para el Estudio del Clima y sus Impactos - UMI IFAECI/CNRS-IRD-CONICET-UBA, Dpto. de Ciencias de la Atmosfera y los Océanos, FCEN, Universidad de Buenos Aires) - Le Roux, Gaël (Laboratoire Écologie Fonctionnelle et Environnement, Université de Toulouse, CNRS, Toulouse INP, Université Toulouse 3 - Paul Sabatier - UPS) - Unkel, Ingmar (Institute of Geography, Heidelberg University; Institute for Ecosystem Research, Christian-Albrecht University)

Abstract format: Oral

Where archaeological sites get overprinted or destroyed over the course of millennia or objects give only isolated evidence for a certain moment in time, sedimentary archives, like cores from lakes or peatlands, can fill gaps and provide continuous records of environmental change from either human impact or climate. However, it can be challenging to decipher between human and natural drivers when looking at pollen or geochemical proxies only, which is when, in turn, archaeological or historical evidence can provide missing pieces of the puzzle.

Our study uses sedimentological and quantitative geochemical proxies, measured with inductively coupled plasma - mass spectrometry and portable X-ray fluorescence scanning, to trace episodes of increased inputs of mineral matter and metals (Pb, Cu, Sb) in several contrasting peatlands of three different areas in the Central Alps: Fimba Valley/ Val Fenga (2400 m asl), Piller Sattel (1500 m asl) and Kleinwalsertal Valley (1100 m asl). What they have in common is their proximity to places of archaeological relevance, like bronze hoards, ritual sites, pastoralist structures or potentially mined natural resources. While climatic signals appear to be well registered at high altitude, our high-resolution geochemical data reveals anthropogenic signals emanating from erosive land use and landscape change (e.g. forest clearances, pastoralism), but also from local or regional mining or metallurgy. Especially over the past 1500 years, our records also suggest interactions between climate and human activity during colder episodes in the Central Alps.

3 THE ENGSTLIGENALP IN THE BERNE ALPS - THE DIACHRONIC VIEW OF AN ALPINE LANDSCAPE

Abstract author(s): Marti, Cynthia (Archäologie Schweiz; University of Bern) - Hafner, Albert - Hinz, Martin - Heitz, Caroline - Brunner, Mirco (University of Bern)

Abstract format: Oral

In 2018 the Institute of Archaeological Sciences of the University of Bern, in collaboration with the Institute of Archaeology of the University of Zurich, held the first Swiss International Summer School for Alpine Archaeology (SISA). The summer school usually consists of workshops with external experts to discuss current research on archaeology in the Alps. Moreover, fieldwork is included in order to train practical excavation and prospection methods in (high) alpine area. This year's SISA will take place in the Bernese Alps, in Adelboden and on the Engstligenalp. The main topics of the Summer School are the Alps as a communication area as well as prospecting and excavation methods in high alpine terrain. The SISA is combined with preceding field research that will take place in a rock shelter above the Engstligenalp at around 2600 m asl. The Engstligenalp and the rock shelter is a hitherto archaeologically unexplored terrain, but one that shows great potential due to outstanding sites in the region like the nearby Schnidejoch pass and the Tierberg rock shelter. It is known from written sources that alpine farming has been practised on the Engstligenalp since the Middle Ages. The aim of the fieldwork is to trace the prehistoric usage of the alp, in order to create a holistic and diachronic view of land use on the alps and to record the area as a communication and interaction zone. In this presentation we will present the history of SISA, the event of the current SISA 2023 and the results of the fieldwork.

4 CENTRAL ALPS AS MOUNTAIN CULTURAL LANDSCAPES FROM PREHISTORY TO CONTEMPORARY PAST

Abstract author(s): Nicolis, Franco (Archaeological Heritage Office Trento)

Abstract format: Oral

The current framework of knowledge as it regards human occupation of the alpine environment in ancient times is no longer conditioned by the traditional image of poor, inhospitable areas inhabited by coarse, warlike peoples. The

prevailing picture today is of regions with considerable economic potential. A case study site will be presented where a series of clues have been found suggesting pioneering colonization of the high mountains between the end of the Early Bronze Age and the beginning of the Middle Bronze Age.

During the Late and Final Bronze Age (fourteenth century–eleventh century BC) the metal production and diffusion in Europe develops into a continental-size organized system. Within this frame a substantial copper metal production is observed in the highlands of the Trentino area, undoubtedly related to diffusion of the products within a larger area.

Today global warming is changing the alpine landscape. The melting of ice is bringing to light evidence of the human presence at high altitudes from prehistory to contemporary times. The icon of this phenomenon is Ötzi the Iceman. But a lot of other evidence is coming to light from the Alps, first of all the remains of the battlefields fought during the First World War.

5 THE RED GEMSTONE FROM THE HEART OF EUROPE. MINING OF THE EASTERN ALPINE GARNET IN MODERN TIMES

Abstract author(s): Zerobin, Bianca - Goldenberg, Gert (Institute for Archaeology, University Innsbruck)

Abstract format: Oral

Gemstones have fascinated people since earliest times. One gemstone that is particularly popular because of its red colour is the garnet in its varieties almandine and pyrope. Red almandine was mined commercially from the end of the 18th century until the early 20th century in the rear Zillertal in the Austrian Alps. At the Rosstrugg in the Zemmgrund the miners used black powder and dynamite to blast out the garnet bearing mica schist at an altitude up to almost 3,000 metres a. s. l. The heyday of garnet mining included the period of the „Little Ice Age“ around 1850. The stones were transported by sledges on the glacier. The miners' living and working huts were built from stone and wood on the sparse ice-free zones. The workforce of up to 18 men lived at 2,000 m a. s. l. throughout the summer and prepared the garnet by various methods. While the mining of the gemstone sometimes resulted in craters several metres wide being blasted out of the rock, further down next the workers' huts, dumps were created with finely piled up waste rock material (mica schist), remaining from the extraction of the garnet. In the huts the garnet was separated from its source rock by hand or by a water-driven stamp mill and further processed by roller mills. The tumbled garnets were then sold on to gemstone cutters especially in Bohemia, where they were used for jewellery. Together with the red garnets (pyrope) from the bohemian occurrences, the cutted alpine garnets were then marketed as „Bohemian Garnets“, a brand which became famous in Europe and also overseas. Nowadays, almost no one takes into consideration that parts of „Bohemian Garnet“ jewellery may also contain garnet from the former glacial region of the Eastern Alpine. But the evidence is there.

6 PASTORALISM, METALWORK AND LONG-RANGE NETWORKS: ACROSS THE EIA ABRUZZO APENNINE MOUNTAINS

Abstract author(s): Bevilacqua, Adriano - d'Ercole, Vincenzo (Università degli studi di Chieti-Pescara) - Di Giovanni, Andrea (Università degli studi di Roma)

Abstract format: Oral

The pastoral economy centred on the vertical transhumance typical of the Apennine and Alpine mountain valleys is applied in Protohistoric Abruzzo in a wool production-oriented manner, as the archaeozoological data show. Adaptation to this form of economy is evident in the archaeological record as clearly shown by the materials from the Iron Age necropolises of the Vestina Cismontana area, clearly the most ‚alpine‘ environment of the entire Apennine chain with the presence of the Gran Sasso massif, i.e. the highest peak of the Apennine chain and therefore of peninsular Italy. In particular, this is evidenced by several classes of materials such as mountain walking sticks, crampon boots and the unfortunately named omega hooks, which are now recognised as shoe fasteners.

The presence of these classes of materials highlights the mastery of the mountain environment by the peoples of northern protohistoric Abruzzo to such an extent that interchange with trans-Apennine environments was possible, as shown by the imports of material from Etruria (and beyond) present within the aforementioned necropolises, but it is the trade from the Adriatic world towards the Tyrrhenian world that is the most interesting, particularly in relation to the products of the particularly skilled and precocious vestina ironworks.

The picture outlined above shows how the inhabitants of the Vestine sector of L'Aquila experienced the mountains as an inestimable source of resources for their economy (sheep-farming and metallurgy), allowing us to understand how the mountains were perceived as a permeable barrier for culture and goods rather than an impassable border.

UNDERSTANDING LADAKHI POPULATION IN CONTEXT TO ITS ARCHAEOLOGICAL EVIDENCE, ADAPTATION TO HIGH ALTITUDE, AND GENETIC DIVERSITY

Abstract author(s): Dolma, Sonam (Deccan College Pune India)

Abstract format: Oral

Ladakh is a high-altitude cold desert in India, landlocked with the highest mountain ranges in the world. It encompasses the Great Himalayan, Ladakh Range, Zaskar Range, and Karakoram. Geographically, the Great Himalayas acts as a buffer from the western monsoon thus allowing inadequate precipitation and causing extreme aridity. However, such harsh rugged terrain and inhospitable environmental settings did not hinder humans in the past to inhabit this territory. The prolonged exposure to extreme environmental conditions, low temperature, and hypoxia are reflected in the genetic adaptation to high altitude. Previous studies on how hypoxia directly affects human growth have been extensively investigated. Also, studies exhibit genetic transmission and eventual admixture of the population from the surrounding geography. In fact, later in time, Ladakh was a nexus point for trade for many centuries, connecting East Asia to West Asia and Central Asia to South Asia, witnessed cultural diffusion, genetic exchange, and demographic movements resulting in a rich multiethnic history. The descendants of these early settlers have been exposed to population admixture, comprising the Tibetan ancestry, Dardic population, and blend of neighboring Indo-Aryan populations reflected in the genetic data examined from a few handfuls of research.

A CONTROLLED VOCABULARY FOR ARCHAEOLOGY: A NECESSARY REQUIREMENT FOR THE DEVELOPMENT OF A SUSTAINABLE RESEARCH PRACTICE INTO THE 21ST CENTURY

Session theme: 3. Heritage Narratives and Representations

Session organisers: Sinclair, Anthony (University of Liverpool) - Aitchison, Kenneth (Landward Research Ltd; University of Liverpool) - Brughmans, Tom (University of Aarhus)

Session format: Discussion session

Do archaeologists need a controlled vocabulary?

Controlled vocabularies are agreed sets of single- or multiple-word phrases used as key terms for elements of research. These exist for other disciplines, such as psychology, chemistry and astronomy, with agreed sets of standardised keywords for journal articles,

Controlled vocabularies are not fixed sets of terms; they are periodically and dynamically reviewed to include new terms and to cover the international application of scientific techniques within a discipline and their associated evidence.

Existing archaeological vocabularies are partial, fragmented and used in isolated research communities. And simultaneously, archaeological research grows in size. Far more than 100,000 archaeological articles have been published since 1960, with the total number of research outputs doubling every 7 to 10 years. By 2030 metadata will exist for at least 200,000 published documents and possibly as many as 600,000. Yet this still severely underestimates the real number, as no more than 30% of published academic literature is currently tracked on databases such as Web of Science, Scopus or Lens, with indexing biased towards publications in English and major developed world journals. More importantly still, this does not include metadata on research documents generated by development-led archaeology.

A controlled vocabulary, therefore, might ensure a consistency of descriptions of archaeological research, and could potentially be a necessary first step for the development of a database of document metadata for archaeology that will hold basic information on all archaeological research publications both applied (development-led) and academic.

We welcome papers that address any aspects of the possible development of, or the nature of a controlled vocabulary in archaeology. We would also welcome papers that discuss existing projects to develop vocabularies for archaeology, or that raise issues or problems that might make archaeology unsuitable for the development and introduction of a controlled vocabulary.

1 BUILDING UPON A PREVIOUSLY CREATED VOCABULARY AT THE AUSTRIAN ARCHAEOLOGICAL INSTITUTE

Abstract author(s): Welte, Micheline (Austrian Archaeological Institute)

Abstract format: Oral

In the process of trying to link their in-house database systems together, the Austrian Archaeological Institute (OeAI) has faced many challenges: one of which is the creation of a multi-lingual controlled vocabulary that could be easily managed and updated by the OeAI, and that would work across the OeAI databases. Originally based on vocabulary from the OeAI image database, the cleaning, translation, defining and resorting of terms from a previously-created vocabulary list has been a huge undertaking. From deciding what terms to keep and what to throw away, how to categorize terms, translation issues, and correctly defining terms with expert feedback – the process also became rather lengthy and time-consuming in addition to other pitfalls. With multiple database system types and disparate projects, how do the technical constraints of the OeAI databases affect the vocabulary? How does one expand and refine a previously created vocabulary? How can disputes regarding term definitions be handled? The OeAI will discuss their workflow and current progress in their vocabulary creation, going over what they learned as well as some possible time-saving ideas and tools to help speed up and simplify the process.

2 DEFINE, DESCRIBE, DISSEMINATE. THE EXPERIENCE OF THE NATIONAL GEOPORTAL FOR ARCHEOLOGY FOR THE STANDARDIZATION OF DATA COLLECTION IN ITALY

Abstract author(s): Boi, Valeria - Acconcia, Valeria - Marino, Domenico - Falcone, Annalisa (Istituto Centrale per l'Archeologia) - Gabucci, Ada (freelance archaeologist)

Abstract format: Oral

The National Geoportal for Archaeology (GNA) is a project of the Central Institute for Archaeology (ICA) of Italian Ministry of Culture. It is part of a broader project for the standardisation of scientific documentation produced during archaeological research carried out in Italy. Its structure and data-model have been developed through a long phase of technical and methodological analysis concerning the creation of a hub for the publication of data mainly coming from preventive and more generally development-led archaeology, which normally are not fully published or catalogued, and data coming from research excavations made by Universities and other research bodies.

In designing the platform, great importance was given to the structuring of closed vocabularies for the description of the archaeological record, in all its most important aspects, so as to make it easier to search within the contents of the database and allow for comparison and analysis some data. Starting from the existing national standards, the aspects related to the definition of the chronology and the description of the movable materials, in particular the ceramic finds, have been studied in depth.

3 CONTROLLED VOCABULARIES IN THE BUILT HERITAGE AND GLAM SECTOR

Abstract author(s): Carlisle, Phil (Historic England) - Thomas, David (Royal Commission on the Ancient and Historical Monuments of Wales) - McKeague, Peter (Historic Environment Scotland)

Abstract format: Oral

With the increasing development of national and local Historic Environment Record databases in the late 1980s the need for a consistent terminology to describe the archaeology and architecture of the UK led to the development of various controlled vocabularies. In 1996 this, in turn, led to the establishment of a dedicated Data Standards Unit within the Royal Commission on the Historic Monuments of England (RCHME) to oversee the maintenance and development of a suite of vocabularies for use by the cultural heritage sector. Unlike other resources available at the time, such as the Getty AAT, these were made freely available to anyone who wanted to use them and were provided to software developers for inclusion in heritage databases.

In collaboration with the mda (now the Collections Trust), National Museums of Wales and the British Museum, the Archaeology Terminology Working Party was established in the late 1990s to deliver a thesaurus for describing archaeological objects. Now known as the FISH Terminology Working Group (FISH TWG) and with additional input from RCAHMS and RCAHMW, this collaboration continues, with the remit to develop and maintain controlled vocabularies for use by cultural heritage organizations both in the UK and internationally.

Since 2013, thanks to the SENESCHAL Project (undertaken by the University of South Wales Hypermedia Research Group, Archaeology Data Service and partners) these vocabularies have been available as Linked Open Data via the heritagedata.org website -<https://www.heritagedata.org/blog/vocabulary-providers/> and have been used in projects such as the Portable Antiquities Scheme - <https://finds.org.uk/> and OASIS -<https://oasis.ac.uk/>

The FISH TWG is keen to collaborate with the academic sector to further develop the vocabularies to ensure that they are fit for purpose and remain relevant for the whole sector. This abstract is intended to facilitate a discussion on this subject.

4 THE MULTILINGUAL HERITAGE HEREIN THESAURUS AND ITS ARCHAEOLOGICAL TERMS

Abstract author(s): Ernyey, Katalin (Government Office of the Capital City Budapest, Heritage Department)

Abstract format: Oral

In 1999 Hungary joined to the European Cultural Heritage Information Network. 'HEREIN was established by the Council of Europe at the request of the Member States to take stock of the changes in legislation and practices in the participating countries and provide a forum for pooling and sharing information on cultural heritage.' <https://www.coe.int/en/web/herein-system/about>

The HEREIN Thesaurus originally was conceived in English, French, Spanish. From 2001 it was the Hungarian National Office of Cultural Heritage that coordinated the programme further enlargement, the author of this abstract was national correspondent and thesaurus coordinator till 2010. Today, according to the official home page it exists in 15 languages: Bulgarian, Croatian, Dutch, English, Finnish, French, German, Greek, Hungarian, Norwegian, Polish, Portuguese, Romanian, Slovenian, Spanish.

The Thesaurus was built according to the requirements of the ISO 2788 (Monolingual), ISO 5964 (Plurilingual) standards, taking into consideration the linguistic differences, the particular electronic utilization, indexing the national reports. Its main characteristic is that there is no hierarchy in between the languages. There are 500–600 terms per language divided into 9 groups.

There are c. 30 archaeological expressions in the Thesaurus, related to basic concepts as excavation, archaeological find, archaeological heritage, etc. At the round table the description of the HEREIN Thesaurus in general, the way of building it, its archaeological terms and the debate on 'development-led, preventive, rescue archaeology, excavation' terminology, would be presented.

5 DEVELOPING CONTROLLED VOCABULARIES FOR HERITAGE DATA IN NORTHERN IRELAND

Abstract author(s): Murphy, John - Enlander, Rebecca (Department for Communities - Historic Environment Division)

Abstract format: Oral

Northern Ireland boasts a rich and deep historic resource, which includes buried archaeological remains and up-standing historic monuments and buildings, as well as industrial, defence and maritime heritage and historic gardens and demesnes: this resource is underpinned by a wealth of publicly available archaeological data. For over 80 years the Department for Communities' Historic Environment Division, and its predecessors, have undertaken a series of broad archaeological surveys by county, undertaken large thematic surveys of Northern Ireland's industrial, defence and marine heritage, and collated data derived from research and commercial investigations and excavations. Access to this public resource has, however, been hampered by a lack of standardisation between the individual datasets themselves. Only recently has there been attempts at achieving consistency in recording chronological, typological or administrative data, an issue which has prevented researchers, heritage professionals and the public from getting the most benefit from the data.

The Historic Environment Division has remediated this issue through the application of the CIDOC Conceptual Reference Model to create an object orientated model for Northern Irish heritage datasets, and through the ongoing development of controlled vocabularies for heritage data. This has involved a review of the existing terminologies used in archaeological data held by central government and the application of ontology engineering principles to these datasets to develop controlled vocabularies. Northern Irish specific archaeological terms have been compared to controlled vocabularies in neighboring jurisdictions, particularly the Forum on Information Standards in Heritage (FISH) vocabularies for England, Scotland and Wales, and the vocabularies used by the National Monuments Service in Ireland. Through this development and comparative analysis, the Department is creating a comprehensive hierarchical resource that will enhance the discoverability and interoperability of archaeological data in Northern Ireland.

6 THE GROWTH OF ARCHAEOLOGICAL LITERATURE AND THE PROBLEM OF INFORMATION SEARCH THROUGH TERMS

Abstract author(s): Sinclair, Anthony (University of Liverpool)

Abstract format: Oral

Since 1960 archaeological research publications have grown at an almost exponential rate. The number of research pieces have grown from tens of documents to several thousand published each year, whilst the cumulative total has doubled approximately every 10 years. Science maps of cited journals reveal an ever-widening growth in multi-dis-

ciplinarly and the incorporation of an ever greater range of scientific and digital methods. Maps of terms - keywords and extracted terms - show the extraordinary range of themes that archaeologists cover. Yet this is just a snapshot of academic literature indexed in the major citation databases. There is an enormous number of research documents generated through professional archaeological practice that are largely invisible - the grey literature. This growth highlights the need for archaeologists to focus on the vocabularies of terms used to co-ordinate a controlled vocabulary for describing their research and for searching this literature. A number of vocabularies already exist (FISH, Getty) co-ordinating the terms for describing the physical nature of archaeological materials, but the language of archaeological science and theoretical interpretation is largely missing. A controlled vocabulary potentially offers a mechanism for bringing all archaeological research into accessible reach.

7 AN EXPLORATION OF THE EFFECTS OF ARCHAEOLOGICAL KEYWORDS ON BIBLIOMETRIC STUDIES: THE CASE OF ARCHAEOLOGICAL NETWORK RESEARCH

Abstract author(s): Brughmans, Tom (Centre for Urban Network Evolutions - UrbNet and Classical Archaeology, Aarhus University)

Abstract format: Oral
