The written sources are well elaborated by earlier historical research, from what it is known that the protection of the castle was organised then by the Aulic Chamber, which meant the finance of castle captains, mercenaries and the building or renewal of fortifications. Since the collected money often could not reach it's the actual destination, the maintenance required ad hoc solutions. Other sources tell that most of the palisades were erected by villagers. The survey of the existing castles and the planning of new fortifications was part of the even higher Viennese Court's Aulic War Council's commission. In this Upper-Hungarian region, the Angelini family produced most of the surveys and also the best quality ones. Last, but not least, trial trench excavation of the palisade structures was carried out in the fall of 2018, initiated by the Hungarian National Castle and Mansion Program.

From the different sources, it is possible to get to know a whole society that was responsible for the outcome of such fortifications, providing vivid stories of the everyday life of a borderzone castle.

7 NORWEGIAN HILLFORTS: KNOWLEDGE STATUS AND INTERPRETATIONAL FRAMEWORK

Abstract author(s): Ystgaard, Ingrid (NTNU University Museum)

Abstract format: Oral

In my talk I aim to give an overview over the present knowledge status of hillforts in Norway in terms of empirical knowledge and interpretational framework. Detailed knowledge of the features, dates, functions, and contexts of the almost 500 known hillforts must be described as very limited, even though hillforts attract great interest in local communities as well as among archaeologists. There is a general agreement that hillforts served military purposes, but that other purposes, such as temporary central places, and ritual and cultic functions, cannot be excluded from interpretation. However, the interpretational framework of the violence and warfare in which hill forts took part, can often be described as superficial. One reason behind this could be that a Clausewitzian understanding of warfare underlies early interpretations of the warfare of the Norwegian Iron Age. Which concepts of warfare and society can offer deeper interpretations of the warfare that caused the erection of this large number of hillforts?

8 THE TOWER OF LLOBEROLA. NEW CASE STUDY IN THE ANDALUSIAN-CATALAN BORDERS (VIII-XTH CENTURIES)

Abstract author(s): Pancorbo Picó, Ainhoa (Independent Researcher)

Abstract format: Oral

A first archaeological approach has been recently carried out to a tower located in the inner Catalan territory, known as Lloberola. Although in a very incipient stage, this study has already provided new information about the fabric and chronology of its construction, knowledge that can be added now to the data gathered some years ago from other medieval towers in the same frontier, such as Vallferosa or Ardèvol.

All of them have been always considered border towers and traditionally dated back to the end of the millennium or already in the eleventh century according to the first written sources. Now, they have been the subject of new studies and radiocarbon analyses that have allowed their reinterpretation from new points of view.

The detailed study of its walls, the analysis of mortars, and the dating by C14, together with the rereading of the written sources and a new approach to toponymy, offer a new panorama for this kind of construction. Thus it has gone from the traditional framing as Christian towers on the border, to towers of the seventh to tenth centuries, when these spaces were far from the hypothetical new lines or even in clear territories under Islamic control.

We wonder, then, not only about their chronology, but also about its exclusive identification as military-type fortifications, specially as constructions to control not the border itself but the routes in relation to it, whether the transhumance ones or the trading ones between the Pyrenees and the coast and also the salary ones, which are cited all along the medieval and modern written documents.

CASTLE IN THE DEFENSE SYSTEM AND CULTURAL LANDSCAPE OF UKRAINIAN CITIES AND TOWNS OF THE EARLY MODERN PERIOD

Abstract author(s): Vynogradska, Larysa (Institute of Archaeology National Academy of Sciences of Ukraine)

Abstract format: Oral

In the development of the defensive and socio-spatial structure of the cities and towns of the Right-Bank Ukraine of the post-Mongolian and early modern times, the main role was played by the castle, which primarily performed colonization and military functions, was the military-administrative center of the city and was usually financed by the state (Lithuanian colonization period 14-15 centuries.). For their construction, earthen fortifications of settlements of the 12th-13th centuries were used, which, as a rule, were located on cape elevations above the river. The defensive nodes of the castles followed the natural relief of the territory of the settlement, so the fortifications were irregular in plan. Under the protection of castles, on the basis of the „genetic“ factor, a street planning structure of cities was formed, which had a fan-shaped character (from the castle). During the Lithuanian period, a system of duties of the city to the castle was formed, the basis of which was military service. With the gradual introduction of the Magdeburg law in Ukrainian cities, the castle becomes a mandatory requirement for the settlement to receive the status of a city, which gave various benefits to settlements. The castle played a major role in the development of urbanization processes in cities, the formation of their socio-spatial and spiritual culture. Around the castle there was a local cultural landscape (anthropogenic), closely related to natural landscapes, waterways and urban topography. This influenced the architectural and planning structure of cities, their spatial connections (street network, the system of architectural dominants and the nature of city fortifications). Castles were an axial fortification landscape for the city, which housed sacred and social buildings and settled various ethnic groups (Polish, Lithuanian, Ukrainian, Armenian, Jewish, Tatar and others, the so-called urban residential landscapes with their own ethnic characteristics).

529 BEYOND IDENTITIES: CRAFTING INFORMATION IN THE OLD WORLD FROM THE BRONZE AGE UNTIL THE LATE 1ST MILLENNIUM BCE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Gorgues, Alexis (UMR 5607 Ausonius; Université Bordeaux Montaigne) - Brysbaert, Ann (Leiden University, Faculty of Archaeology; Netherlands Institute at Athens)

Session format: Regular session

Ample research has already been devoted to exploring the mutual relationship between identities and materiality. Yet, artefacts can carry other kinds of information as well. Through the materials used, the shapes given, the way they may be adorned, they encapsulate technical information about who crafted them and where they came from (e.g. a Greek vase in Etruria). All these qualities can be read and interpreted by users, and craft-persons. Artefacts may carry memories potentially associated with specific events or individuals, as have long been shown through object biographies' research (see Homer's works). Artefacts could also narrate things by themselves, through the scenes that may adorn them or through signs or writings that people could access directly or reinterpret, according to their own ideological background. Their shape, characteristics or volume may carry information about quantities, origins and qualities. Such kinds of information are clearly central when dealing with transport containers, but not only. Drinking vessels can carry information about the share its users were entitled to in a feast or banquet, an information related with hierarchy and social practices. A metal object can be assumed to weigh a certain amount, and therefore its shape provides information about its mass, which may be associated to its value (Bronze Age axe heads may often be discussed in such a way)... Objects carry information about themselves, their makers, their users, and the institutions they belonged to, were involved with, or were acknowledged by.

This session invites contributions dealing aspects with the non-verbal transmission of technical, ideological, narrative or economic information through all kind of artefacts (pottery, metal, organic materials...), on a very wide area spreading from the Middle East to Western Europe, and from the Bronze Age to the late 1st millennium BCE. Theoretical presentations are welcome, as well as case or local/regional studies.

ABSTRACTS

1 INTRODUCTION. MAKING, OWNING, CONNECTING: CRAFTS AND INFORMATION

Abstract author(s): Gorgues, Alexis (Independent researcher) - Brysbaert, Ann (Leiden University, Faculty of Archaeology; Netherlands Institute at Athens)

Abstract format: Oral

Making is a key component of human identity, one that is embedded in individuals, small and large groups and in society at large, and even in institutions. Crafting, then, is both the chaîne opératoire of making from a raw material to

a finished item, and the making of personal self-identity and, in extension, of belonging to a community, a corporate group, a network. In psychology, the processes that lead to identity formation in this context have been assigned to a level of 'ownership' (Pierce et al. 2003; see also Brysbaert and Hochscheid 2021): ownership developed towards a range of material and immaterial objects. This ownership sits primarily at three levels: (1) self-identity in which objects serve as a material expression of people's identity in relation to others: e.g. passing on tools through generations; (2) efficacy and effectance as a way of having control over and impact on one's environment, e.g. knowledge on where to mine for ores. That second factor lays the basis for (3) people's sense of belonging grounded in place, e.g. owning a bike in the Netherlands.

In addition to this 'ownership' level, craft is also active in support of non-verbal communication: a crafted good, made by someone else than his/her owner, and potentially somewhere else, can carry information over long distances, to other cultural areas and spheres, and where it can be (mis)understood. Having the cultural keys to decipher or interpret this information (functional, technical, iconographic, institutional, etc.) is a way to connect oneself, directly or remotely, to a network, an institutional framework (and therefore a policy), a group structured by common practices (artisans making luxury items, elite members) in spite of being geographically dispersed.

This introduction will consider these different dimensions of crafting through several case studies, in order to provide ground for further discussion.

2 BUILDING INFORMATION: ARCHITECTURAL TRADITIONS OF MAINLAND GREECE AT THE END OF THE EARLY AND MIDDLE BRONZE AGES

Abstract author(s): Jazwa, Kyle (Maastricht University)

Abstract format: Oral

This paper highlights the potential of domestic architecture to materialize information about the construction event, the multi-generational building traditions of its inhabitants, and, in some cases, social group differences within a community. This is demonstrated with a single case study, the domestic architecture of mainland Greece at the end of the Early Bronze Age (Early Helladic [EH] III period) and in the Middle Bronze Age. From these periods, all published vernacular buildings were individually examined for the presence of nearly two hundred distinct construction methods and aspects of spatial organization. Groups of structures that were statistically determined to have had the greatest correspondence in these aspects most likely represent distinct networks of interaction among the inhabitants/builders in which the relevant construction knowledge was circulated, i.e., a "building tradition." The reconstructed building traditions and the collection of construction methods for each were further examined diachronically and contemporaneously alongside the broader archaeological evidence for contextualization.

With this survey, two distinct and coherent building traditions that co-existed at individual settlements were identified. Over time, the differences between these groups diminished until the two traditions merged. It is argued that the initially dichotomy may be material evidence for the settlement of formerly mobile groups alongside an established sedentary population. After several centuries of co-habitation, the materialization of this historic event(s) disappeared. This study also shows that at least one of these groups may have possibly leveraged a specific building form, the apsidal plan, as an emic marker of affiliation, because buildings of this type are exclusively constructed in just one of these building traditions. As such, this case study also highlights the tension/relationship between information conveyed by an object's form and in the less visible traces of construction.

3 FINGERPRINT EVIDENCE FOR FEMALE POTTERS IN LATE BRONZE AGE CANAAN: THE DEMOGRAPHICS OF POTTERS AND DIVISION OF LABOUR AT BURNA

Abstract author(s): Ross, Jon - Shai, Itzick (Ariel University) - Fowler, Kent (The University of Manitoba) - McKinny, Chris (Gesher Media)

Abstract format: Oral

Techno-stylistic studies in ceramic analysis have largely focused on characterising production groups, based on the similarity of various objects and how they were made. The demographics of potters and the division of labour often remain enigmatic in current chaîne opératoire research. A growing number of biometric studies have demonstrated the potential of fingerprints preserved on ceramic surfaces for classifying the age and sex of potters. There are few fingerprint studies that combine both age and sex determination. In this paper, we use a recently introduced identification matrix to model labour divisions based on 52 fingerprints preserved on a diverse range of objects (figurines and vessels) from the Late Bronze Age II stratum at Tel Burna. The sample includes objects from the recently exposed Canaanite cultic enclosure dated to the 13th century bce. Based on broad ethnographic considerations, it is suggested that women were the principal potters in Canaanite society. Our fingerprint study tests this hypothesis with regards to who made pottery for cultic use, at a time when city-states were under the influence of Egyptian New Kingdom imperialism. We identify patterns in age categories and a sexual division of labour for the manufacture of select ob-

jects and vessel types. Our results provide the first compelling insights into the social relations of pottery production at a time when Egypt exercised hegemony over the city-states of the Southern Levant.

4 SPECIAL CONTAINERS FOR THE DEAD? CREMATION BURIALS WITH(IN) SPECIAL VESSELS IN THE BRONZE AND EARLY IRON AGE ACROSS EUROPE

Abstract author(s): Brinkmann, Johanna - Kneisel, Jutta (Institut fuer Ur- und Fruehgeschichte Kiel)

Abstract format: Oral

This contribution presents the outline of a research project that aims to investigate known routes and channels of exchange, together with changes in Europe in technical, ideological and social domains. These fields incorporate religious ideas, cosmological models and political concepts, technology in the form of tools, skills and processes as well as customs, ritual practices and habits. Building on existing catalogues and collections the transfer of knowledge is traced across Europe analysing different forms of Bronze and Early Iron Age cremation burials, which have been deposited with or within special vessels. These include face-, house- and box urns (Kastenuernen), wagon shaped cauldrons (Kesselwagen) as well as urnfield and Hallstatt wagon burials. In addition, a new analysis of the ribbed bronze buckets (Ciste a Cordoni/Rippenzisten) is presented, which at least in some cases served as a special form of container for the human remains of the deceased. An analysis of the distribution of these cremation burials with special forms of ceramic urns or bronze vessels and artefacts will be able to trace knowledge transmission and exchange through Europe and facilitate the identification of ideological changes in the Late Bronze and Early Iron Age.

5 CRAFTING AND CONSUMING SOS AMPHORAE: TECHNOLOGY AND NON-VERBAL TRANSMISSION CONCERNING MAKERS AND CONSUMERS

Abstract author(s): Bartlet Balicki, Holly (Institute of Nanoscience and Nanotechnology, NCSR „Demokritos“) - Chryssoulaki, Stella (Hellenic Ministry of Culture and Sport) - Pappas, Ioannis (University of Crete) - Hein, Anno - Kilikoglou, Vassilis - Day, Peter (Institute of Nanoscience and Nanotechnology, NCSR „Demokritos“)

Abstract format: Oral

Attic SOS amphorae, produced between the second half of the eighth century and the first half of the sixth century BCE, are large wheel-made vessels with a fine fabric and distinctive painted external decoration. The choices made in production and decoration are crucial for the information the vessel transmits, both in their place of production and the many places of consumption throughout the Mediterranean and Black Sea areas. Although very large vessels, SOS amphorae are comparable in their clay choices, finish and firing to fineware vessels from Attica, and this contrasts both with similar amphorae in neighbouring areas of production and with the local production of other pottery types.

This paper presents a characterisation of Attic SOS amphorae within a broader ceramic study of Attic pottery production in the Late Geometric and Archaic periods, analysing samples from the Phaleron Delta cemetery excavations in Attica, Greece. Clay selection, manipulation, forming and firing practices are studied through thin section petrography, scanning electron microscopy (SEM-EDS), mechanical properties testing and finite element analysis (FEA) to consider the design and technology of the vessel and its key role in communicating to various audiences.

In contrast to contemporary maritime transport containers, such as the Corinthian Type A amphora, the technological characteristics of the Attic SOS amphora are distinctive, and perhaps unexpected for such a large vessel. As storage and/or transport containers, Attic SOS amphorae convey not only information about the quantities, origins and qualities of their contents, but also their link to fineware pottery production and commensal activities, especially drinking. The similarities of Attic SOS technology and decoration with fineware pottery, compared to other contemporary Attic ceramic technologies shows not only their production by different groups of potters, but is a social choice, with deep implications for value, meaning and differing perceptions.

6 CHAINE OPÉRAIRE AND 'SPHERES OF EXCHANGE'. RECONSTRUCTING SOCIAL INTERACTION FROM POTTERY ASSEMBLAGES IN PRE-ROMAN CENTRAL ITALY (600-400 BC)

Abstract author(s): Dominici, Corso (University of Oxford)

Abstract format: Oral

When assessing the period comprised between 600 and 400 BC in which a system of interconnected city-states developed and flourished in central Italy, scholars usually focus on urban realities and their elites. Datasets from rural and marginal areas are overlooked since they often consist of materials difficult to assess—such as kilos of coarse potsherds—while considerably lacking more telling finds—such as inscriptions, fine pottery productions, coins, etc. So, despite a wealth of archaeological records yet to be tapped by academia, we still do not know how these rural areas related to the nearby city centres, and most of all we do not know much about the rural society itself. This paper

contributes to filling this gap by presenting the results of a thorough technical analysis recently performed on the totality of the pottery assemblage coming from the settlements recorded in two neighbouring valleys in the inner Apennines—Casentino, the upper Arno valley, and Valtiberina, the upper Tiber valley. Three tons of ceramic material from 38 sites dated between 600 and 400 BC were assessed using the chaîne opératoire approach, to implement a network analysis of the diffusion of techniques of production and pottery goods with different functions, among neighbouring, coeval settlements. Three differential networks of production and exchange were thus discovered. This paper argues that these differential networks are in fact ‘spheres of exchange’ (see Brondino-Pompeo 2021, cfr. Kopytoff 1986), pertaining to the supply of different needs among the local communities. In this nick of the woods, this supply came concurrently from professional workshops and house productions. These spheres of exchange are thus descriptive of a lively, changing, rural society in which a basic knowledge of production was commonplace.

7 **‘PROSTHETIC’ IDENTITIES – SPEAKING OBJECTS AS EXTENSIONS OF THE HUMAN SELF**

Abstract author(s): Kretschmer, Julia (University of Basel)

Abstract format: Oral

With the birth of writing in the second half of the eighth century BCE, several objects start to speak by themselves. These ‘oggetti parlanti’ informed their reader about a variety of subjects, including signatures of their makers, threatening statements of ownership, acts of dedicating something precious to a god, and the materialisation of grief for a deceased loved one – and by doing so, they used either a verb form in the first person (‘I’) or the personal pronoun (‘me’), thus declaring themselves as ‘actants’. The basic aim of this paper is to return to this intriguing group of objects and reassess previous assumptions about whose identity was expressed through these autodeictic inscribed objects. By combining the purely verbal with the non-verbal transmission of information, it is envisaged to explore the tension between the identities of the speaking thing and the reading/reciting individual and to clarify whether those identities were incompatible or complementary to each other. The inherent non-verbal information of these objects (material, shape, ergonomics, function, praxeological context), which was only sporadically addressed in previous research, is essential for understanding the ways in which human and non-human entities interacted with each other and articulated their multiple identities.

8 **A “POTTERY BALL OF MASKS”: IDENTITY, SELF-REPRESENTATION AND IDEOLOGICAL NARRATIVES IN SOUTHERN IBERIA THROUGH THE LATE 1ST MILLENNIUM CERAMICS**

Abstract author(s): Sánchez Moral, Carmen María (Universidad Autónoma de Madrid)

Abstract format: Oral

The main object of this paper is to address the assumption and integration of foreign ceramics - mainly kitchenwares and tablewares-, shapes and new foodways, and their use as a way of self-representation.

In order to do so, we will focus on a special high density area as for trade and cultural exchanges, a real crossroads due to its geostrategically privileged location between two continents and two seas: the so-called Circle of the Strait of Gibraltar -whose ancient pottery has been the object of my PhD Thesis-. However, although it constitutes an optimal case of study, further examples from other Mediterranean areas and even different timeframes will also be considered as (ethnographic) parallels.

The chronological framework of this study will be the transition from the Late Punic to the Roman world, a period of syncretism, cultural hybridisation and population movements. These processes can be perfectly traced back through the study of ancient foodways and the ceramological examination of cooking pots and tableware pottery when put in the light of an interdisciplinary, holistic and diachronic perspective, given their nature as major yet silent witnesses of daily culinary practices -crucial social markers.

Finally, we will take into account not only the materiality of the archaeological record -technology, shape, typological evolution...-, but also other social aspects such as cooking methods, commensality and taste.

The analysis of the “dialogue” between local and imported ceramic productions, that is, tradition and innovation, and subsequential phenomena such as reinterpretation, imitation and resignification, allows us to infer and understand identities construction mechanisms and the following dynamics of weaving new social narratives.

A. **BRONZE AGE DAGGERS FROM THE LOWER AND MIDDLE COURSE OF THE TUNDZHA RIVER, BULGARIA**

Abstract author(s): Valchev, Todor (Regional historical museum)

Abstract format: Poster

The Tundzha River passes through the territory of south-east Bulgaria. The Lower and Middle courses of the river flows through the Yambol region. The Tundzha River valley represents a very important passage, which connects the

Aegean coast with the lands north of Stara Planina Mountain and the Danube River Basin. The Balkan Peninsula is a natural cross-road of cultural influences from Mediterranean Sea, Central Europe and South Russian steppes.

The aim of this poster is to present three bronze daggers from the fund of Regional historical museum in Yambol. The first one has riveted form, Aegean in origin and is dated from the Early Bronze Age. The second and the third ones have tanged form, North-Pontic in origin and are dated from the Late Bronze Age.

Daggers were a common type of weapon throughout all phases of the Bronze Age. With the development of warfare, they became a symbol for warriors. In most cases, they are found in burial mounds as private objects. The presence of weapons south or north of their common area shows the mobility of people, objects and ideas during the Bronze Age.

530 EURASIA BEFORE AND AFTER THE 8.2 KA BP EVENT - A SIGNIFICANT HORIZON OF CULTURAL CHANGE? [PAM]

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Rabuñal, José Ramón (Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico - INAPH, University of Alicante; Department of Archaeology and Heritage Studies, Aarhus University) - Riede, Felix (Department of Archaeology and Heritage Studies, Aarhus University) - Manninen, Mikael A. (Eco-systems and Environment Research Programme and Helsinki Institute of Sustainability Science - HELSUS, Faculty of Biological and Environmental Sciences, University of Helsinki) - Fernández-López de Pablo, Javier (Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico - INAPH, University of Alicante)

Session format: Regular session

The Early Holocene was a period of climate amelioration, yet paleoclimate records show punctuated episodes of climate change. Premier among these is the '8.2 ka BP event'. While centered on 8.2 ka BP, the duration of this abrupt cooling oscillation was likely much longer, and its onset reaching back to 8.4 ka BP. The synchronicity of the event across the Northern Hemisphere seems undisputed, but its specific regional climatic signature appears to have varied strongly. In some places, temperatures dropped sharply and precipitation decreased; elsewhere, sea-level rose or seasonality became more pronounced. The magnitude of these effects and how they triggered ecological and societal change appear to have been variable across Eurasia. Given this spatial variability, it is likely that this event would have had both positive and negative consequences on the exploited ecosystems, regarding resource availability and distribution, environmental productivity and carrying capacity. These variable environmental characteristics would in turn have imposed different limiting factors and adaptive pressures on contemporaneous human communities. This session seeks to bring together researchers from across Eurasia dealing with the impacts of the 8.2 ka BP event on human socio-ecological systems. Our aim is to take stock of the climatic, ecological, and cultural signals associated with this episode of within-Holocene climate change. We invite presentations focused on different ecological settings, and on different topics such as settlement patterns, subsistence, technology, or palaeodemography. The goal is to together review the variability of palaeoecological effects of the 8.2 ka BP event across Eurasia, and against this background to discuss the range of human responses to it. Our ambition is to chart the variable archaeological signatures of the adaptive strategies taken during this time of climatic upheaval, along with showcasing state-of-the-art methodological approaches and research designs able to address questions of resilience, vulnerability and human impacts.

ABSTRACTS

1 THE 8.2 KA BP COOLING EVENT AND THE DEVELOPMENT OF EARLY VILLAGE LIFE IN NORTH CHINA: PROCESS AND VARIABILITY

Abstract author(s): Tu, Dongdong (ShanghaiTech University)

Abstract format: Oral

Current archaeological data has demonstrated that by some 8,000 years ago, sedentary communities whose subsistence relied on, at least a partly, domesticated species have been well established in North China. This vital transition emerged after the period of a climatic cooling event at 8.2 ka BP. How this climate event affected the transition to Neolithic lifeways within various ecological settings of North China? And how people responded to this climate fluctuation and how such responses generated the interlocked social formations? This paper attempts to explore the interplay between humans' adaptations and climate change before and after the 8.2 ka BP event in four subregions of North China: Northeast China, Northwest China, the Central Plains and Shandong. The analysis indicates that because of various environmental characteristics regarding topography and resource availability and distribution, the 8.2 ka BP cooling event affected these subregions at varied degrees. In addition, prior to the cooling event, people have developed different coping strategies for climate fluctuations during the late Pleistocene and early Holocene period in

these subregions. The pre-existing changes in human adaptive behaviors, combined with environmental variability, present the complex transitional process to early village life in North China.

2 FORTS IN THE TAIGA – ON THE DIVERSIFICATION OF HUNTER-GATHERER WORLDS IN WEST SIBERIA 8000 YEARS AGO

Abstract author(s): Piezonka, Henny - Schreiber, Tanja (Christian Albrechts University Kiel)

Abstract format: Oral

The seemingly remote expanses of the North Eurasian landmass have remained largely beneath the radar of international archaeological research. However, in the Western Siberian taiga c. 8000 years ago, local hunter-gatherers built what are likely the world's oldest forts. These incipient defensive structures are part of an unprecedented, non-farming package of innovation taking hold of the Western Siberian basin at the end of the 7th millennium cal BC. A population expansion, settlement intensification, and technical innovation including pottery bear witness to major socio-economic, political and cultural transformations. Broadly coinciding with the 8.2 ka global climatic event, this phenomenon opens up a unique new laboratory on human social responses to landscape vulnerability and to the ecological challenges of climate change. Over the last years, our Russian-German team has started to investigate this conundrum through new fieldwork and multi-disciplinary analyses. We pursued four interrelated research objectives: (1) How did global climatic fluctuations in the Early Holocene such as the 8.2 ka cooling event impact on climate and environmental change in Western Siberia? (2) What changes in resource availability are discernible from the archaeological record, is there evidence of economic intensification? (3) How did settlement patterns and seasonal occupation change compared to the preceding period, and is there evidence for increased territoriality? (4) How are the complex settlement systems and fortifications related to incipient hunter-gatherer socio-political diversification, both within the societies and on an intergroup scale? This work has started to fill a white spot in the study of prehistoric Trans-Eurasian connectivity by opening up Western Siberia as a key region within wider networks. Further work is needed on the early Holocene environmental history of this Sub-Arctic inland setting in order to better understand the potential impact of the 8.2 ka event and a unique range of human social responses.

3 NOW YOU SEE IT, NOW YOU DON'T: ELUSIVE HUMAN RESPONSES TO THE 8.2 KA EVENT IN FENNOSCANDIA AND BEYOND

Abstract author(s): Manninen, Mikael - Eronen, Jussi - Kaaronen, Roope - Tallavaara, Miikka (University of Helsinki)

Abstract format: Oral

Not many studies have explicitly tackled human responses to the 8.2 ka event in the Fennoscandian Peninsula. Those that have, do not necessarily find clear responses, while others detect responses that are deemed too minor or inconclusive by other researchers. In yet other cases, evidence that first appears clear is later found to be statistically insignificant. This has led some to assume that Mesolithic hunter-gatherer adaptations had inbuilt resilience that helped them to counter climatic and environmental deterioration without a need to change their subsistence strategies or organizational structure at any significant level. In this paper we discuss some of the Fennoscandian cases, present long term population trends and mechanisms used by later hunter-gatherers in the region to counter risk and resource fluctuation, argue, based on these examples, that change was most likely inevitable and resilience against climatic downturns is an unlikely explanation for our inability to detect more responses to the event from the archaeological record, and finally try to shed light on the underlying question of significant vs. insignificant change.

4 HUMAN POPULATION SIZE RESPONSE TO 8.2 KA BP EVENT IN FENNOSCANDIA

Abstract author(s): Tallavaara, Miikka - Pesonen, Petro (University of Helsinki) - Jørgensen, Erlend (Norwegian Institute for Cultural Heritage Research) - Manninen, Mikael - Salonen, J. Sakari (University of Helsinki) - Schenk, Frederik (Stockholm University)

Abstract format: Oral

High-resolution paleoenvironmental and archaeological proxy records in Fennoscandia offer great potential to study human responses to past environmental variability including Early Holocene climate events. Here, we use data from Northern Norway and Finland to track human population size responses to the 8.2 ka event across a north-south transect from the coast of Barents Sea to southern Finland. While the 8.2 ka event is widely recorded in circum-North Atlantic paleoclimate proxies such as southern Fennoscandian pollen records, in northern Fennoscandia, the proxies have generally failed to detect the event. However, new high-resolution proxy data from NE Finland indicate a strong tree cover disturbance at 8.4-8.0 ka, showing that the climate event reached the European high latitudes. This new data also suggests that the forest disturbance was possibly related to increased drought during the event. As seen in different archaeological population size proxies, the responses of human populations to the 8.2 ka event appear to have been relatively small. We found a stronger population response in coastal regions than inland. In the latter, we

were not able to detect a significant response. Furthermore, we modeled the amplitude of hunter-gatherers' expected response to short-lived climatic perturbation using ethnographic data. We also simulated radiocarbon date data to evaluate the potential amplitude of human population responses seen in archaeological proxies. Our results suggest that calibration influences the signal of the population response to Early Holocene climate events in radiocarbon date-based population proxies by creating spurious responses and/or masking true, but low-amplitude responses. The lack of consistently significant signal of population response in Fennoscandian data nevertheless indicates that climate changes around 8.2 ka did not induce profound human population size responses.

5 HUMAN IMPACTS OF THE 8.2KA EVENT ON MESOLITHIC FORAGERS IN WESTERN DENMARK

Abstract author(s): Riede, Felix - Yaworsky, Peter (Department of Archaeology and Heritage Studies, Aarhus University) - Andreasen, Kathrine (Museum Odense)

Abstract format: Oral

The so-called '8.2ka event' had a major but also regionally variable climatic impact in the Northern Hemisphere. In Denmark, it appears to have had an influence on lakes and rivers, which were essential landscape features for contemporaneous foragers. In western Denmark there is also evidence for a marked increase in sand drift. Around the same time as the 8.2ka event, the Storegga tsunami affected the North Sea Basin. While there is considerable debate about the loss of lives and livelihoods associated with this event, we here explore whether the combination and convergence of these event-like environmental changes lead to changing land-use amongst contemporaneous Maglemosian foragers in western Denmark. Placed in a theoretical framework derived from disaster risk reduction research, we focus in particular on sites in the catchment area of the River Gudenå but also draw on regional-scale proxies of population processes around this time (e.g., site counts, radiocarbon dates). In combining these disparate lines of evidence, we explore the possibility of a major reorientation from inland to coastal, and from networks reaching westwards towards networks with a preferential eastern orientation. Interestingly, the time of the 8.2ka event broadly coincides with a traditionally recognized cultural transition from the so-called Maglemose culture to the Kongemose culture, raising the question of whether the environmental upheavals around this time are causally implicated.

6 TESTING HUMAN RESILIENCE TO THE COMBINED EFFECTS OF SEA LEVEL RISE AND THE 8.2 KA CAL BP EVENT IN MEDITERRANEAN-IBERIA

Abstract author(s): Fernández-López de Pablo, Javier - Moya Ruiz, Raquel (I.U.I en Arqueología y Patrimonio Histórico - INAPH, University of Alicante) - Sánchez García, Carlos (Department of Geography, University of Barcelona. FluvAlps-PaleoRisks Research Group; IPHES, Catalan Institute for Human Palaeoecology and Social Evolution) - Rabuñal, José Ramón (I.U.I en Arqueología y Patrimonio Histórico - INAPH, University of Alicante; Department of Archaeology and Heritage Studies, Aarhus University) - Gómez-Puche, Magdalena (I.U.I en Arqueología y Patrimonio Histórico - INAPH, University of Alicante)

Abstract format: Oral

In the Iberian Mediterranean region, the 8.2 ka cal BP climatic event has been recurrently related to a significant increase of aridity conditions, forcing changes in Late Mesolithic settlement patterns and human mobility systems.

However, in this area of Southern Europe, the inferential framework about societal responses to this event of abrupt climatic change is strongly biased towards the analysis of the radiocarbon evidence from inland sites (e.g. The Ebro River Valley).

Yet, the combined impacts of gradual sea level change and aridity on Mesolithic communities still remain poorly understood.

In this contribution, we present the results of a multi-proxy approach applied to the central sector of the Iberian Mediterranean region (Alicante and South Valencia provinces). First, we will discuss novel high-resolution XRD evidence of inland endorheic-lake sediments, which allow to fine tune the chronological resolution of aridity patterns and its palaeohydrological signature in the study area. Then, we will review recent works about the reconstruction of postglacial sea level rise and the changing configuration of coastal biotopes. Finally, we will present an integrated approach focused on zooarchaeological and palaeodietary evidences, the spatio-temporal distribution of archaeological sites and ¹⁴C palaeodemographic modelling.

Our results suggest a negative impact of sea level rise and aridity patterns on environmental carrying capacity during the Early to Middle Holocene transition, leading to a significant decrease in population size during the Final Mesolithic.

7 NORTHERN BRITAIN BEFORE AND AFTER THE 8.2KA EVENT: MULTIPLE ENVIRONMENTAL IMPACTS AND LONG TERM CONSEQUENCES

Abstract author(s): Mithen, Steven (University of Reading)

Abstract format: Oral

Late Glacial hunter-gatherers made periodic visits to the region now designated as northern Britain, leaving a sparse and little understood record of their presence. Permanent occupation occurred in the Early Holocene, with the first in-situ and dated Early Mesolithic activity located at Rubha Port an t-Seilich, Isle of Islay, western Scotland in 2022. Radiocarbon dates indicate a gradual population increase up until the mid- and later 9th century BP. Multiple environmental events caused a dramatic population collapse, these involving the rise in sea level, 8.2ka abrupt climatic event and the storrega tsunami. Untangling the respective impact of these events is challenging, and they need to be considered as part of a single package of continuous environmental change to which humans responded. They had both short term impacts and long term consequences reaching to the arrival of Neolithic immigrants at the start of the 6th millennium BC. Rubha Port an t-Seilich provides a continuous record of the Mesolithic presence during this period of climatic, cultural and population change.

531 MIGRATION AND ARCHAEOLOGY AFTER THE 3RD SCIENTIFIC REVOLUTION: ADNA, ISOTOPES AND NEW THEORETICAL PERSPECTIVES

Session theme: 4. People of the Present – Peopling the Past

Session organisers: McSparron, Cormac (Queen's University Belfast) - McLaughlin, Rowan (Maynooth University) - Cassidy, Lara (Trinity College Dublin)

Session format: Regular session

Migration, the permanent change of residence by an individual or group, was once a key explanatory mechanism for change in the archaeological record. Migration is distinct from the “mobilities paradigm”, which looks at more generalised movements of peoples, technologies and ideas. With the advent of the “new archaeology”, and specifically from David Clark’s 1966 paper onwards, archaeologists have played down the importance of migration as a driver of cultural change. Some archaeologists eschewed the concept, believing it a hangover from an outdated culture-history paradigm. Others realised that whilst migration had utility as a concept, migration, its forms and how they could be identified in the archaeological record, were poorly understood by archaeologists. Change began in the 90s with the work of David Anthony, who developed models of different migration types and their correlates. More recent work has focused on how migrant groups expressed identity materially, and how the agency of migrant groups affected how they display identity through material culture, or influenced the material identity of host communities. Nevertheless, migration has remained something of an unwanted child of archaeology despite migration theory having provided explicit models which can be compared with the large amount of scientific data obtained over the last two decades, from analysis of radiocarbon dates, stable isotopes and aDNA, data which often forms patterns seemingly only explainable within a migratory framework.

This session calls for papers which examine migration as a driver of cultural change over time. These can include papers which look at direct evidence of migration from the new techniques of the “3rd scientific revolution”, papers which seek to broaden our understanding of migration and its correlates, or papers which adopt theoretical models of migration to predict or explain patterning in the archaeological record. We particularly invite contributions where two or more approaches are combined.

ABSTRACTS

1 AN OVERVIEW OF ARCHAEOLOGICAL THEORIES OF MIGRATION

Abstract author(s): McSparron, Cormac (School of Natural and Built Environment, Queen's University Belfast)

Abstract format: Oral

The term migration has sometimes been used loosely. Archaeologists have often had a naive understanding of migration as wholesale movement of peoples, with their animals and artefacts, from one territory to another with dramatic cultural changes for the host region. This simplistic model limited the ability of migration to explain past events, and coupled with its overuse by cultural-historical archaeologists diminished migration’s reputation as an explanatory mechanism. In the 90s however, archaeologists, led by David A. Anthony, began to re-look at migration. Anthony used the work of geographers and sociologists like Ravenstein and Lee to build more realistic models of different types of migrations, how they functioned, and what types of signatures they might leave for archaeologists. Successive work by Stefan Burmeister built on Anthony’s explicit models of migration and suggested that migrants would display more adaptation to the host communities in their external life, what he called the “external domain” and display aspects of

their traditional culture in their private life, “internal domain”. Further work by McSparron, Donnelly, Murphy and Geber, saw the agency of the migrant group as a mechanism for linking different scales of migration in a single body of theory with “group agency” as a mediator of how much the internal and external domains reflected the host or migrant culture, noting how with migrations of powerful groups, it was the host culture which may adapt its external domain to fit the migrant culture and continue its own practices in the internal domain. This paper will give an outline of the development of migration theory, and things we may need to think about to allow migration theory to successfully integrate with the data becoming available from the new techniques associated with the 3rd scientific revolution.

2 LATE UPPER PALAEOLITHIC GENOMES FROM THE SOUTH OF FRANCE

Abstract author(s): Bradley, Daniel - Breslin, Emily - Matttiangeli, Valeria (Trinity College Dublin) - Langlais, Mathieu - Banks, William - Ducasse, Sylvain (CNRS, University of Boreaux) - Cassidy, Lara (Trinity College Dublin) - Manica, Andrea (University of Cambridge)

Abstract format: Oral

The genomic makeup of Europe from the end of the Last Glacial Maximum (LGM) is only beginning to be unravelled. In the Late Upper Palaeolithic of west Europe several distinct genetic ancestries have previously been reported. The first is associated with individuals from Magdalenian contexts in central Europe. The other, often named after the Palaeolithic Villabruna individual, represents the genetic ancestry which later formed the major ancestry fraction of the west European Mesolithic individuals. The processes by which these major genetic lineages of post-glacial Europe originated and admixed are only partially understood. The south-west of France is a key region in decoding these changes, as a region which may have been continuously occupied since the Aurignacian period. In this study we present six new shotgun sequenced genomes spanning over 10,000 years, from the end of the LGM to the beginning of the Holocene. Through the co-analysis of these genomes with existing genetic data we present a framework for population movements and contact during the late Upper Palaeolithic.

3 ROLE OF GENETIC RESEARCH IN ATHAPASKAN MIGRATION STUDIES

Abstract author(s): Lewandowska, Magdalena (Jagiellonian University)

Abstract format: Oral

The arrival of the ancestors of the Apaches and Navajo to the North American Southwest, the so-called Athapaskan or Apachean migration is one of the most widely discussed issue in American archaeology. Since the 19th century, after connections were discovered between the Athapaskan language family, potential routes, directions and causes of migration between the Arctic and Subarctic region (inhabited by the Northern Athapaskans) and the Southwest (inhabited by the Southern Athapaskans) began to be considered.

Another interesting issue are the connections that were formed between migrating hunter-gatherer Athapaskans and agricultural Pueblo that inhabited the Southwest. Whether they were friendly or hostile or, as often seems to be the case, we should mark them as “complicated”.

New methods of genetic research that emerged with the “3rd scientific revolution” shed new light on many aspects related to the Apachean migration. They allowed us to look differently not only at the migrating group but also its connections with both the Northern Athapaskans and the Pueblo.

In my presentation I aim to present the results of genetic research in context of understanding Athapaskan migration. I would also like to present the problems and challenges that we can face while applying those studies in North American archaeology.

4 THE IMPACT OF DNA RESULTS ON MODELLING THE MESOLITHIC-NEOLITHIC TRANSITION IN BRITAIN AND IRELAND

Abstract author(s): Sheridan, Alison (Dept. Scottish History & Archaeology,)

Abstract format: Oral

People have been debating the Mesolithic-Neolithic transition in Britain and Ireland for over a century. This archipelago is one of the last places in Europe to see agro-pastoral farming being established, with a gap of at least 700 years from when it was established on the near Continent. The debate has revolved around whether the prime movers for this radical change in lifestyle were the indigenous hunter-fisher-forager groups or migrant farming groups from the Continent. The advent of DNA results for Mesolithic and Neolithic individuals in Britain and Ireland, along with a growing database of DNA results for 5th and 4th millennium individuals on the Continent, has demonstrated that farming was indeed introduced by migrant farmers from the Continent - probably from more than one part of northern/NW France. Various misconceptions have arisen from the DNA work, principally the idea that there may be connections between Iberia and Britain/Ireland, or between Britain and Scandinavia. These will be addressed. The question of the reactions of indigenous communities to the incoming farmers will be discussed and a multi-strand

model of Neolithisation, from different parts of N/NW France to different parts of Britain and Ireland at various times between c. 4350 BC and 3800 BC, for various reasons and with varying reactions, will be presented.

5 - 70 YEARS OF RESEARCH. A GRAVE FROM THE CORDED WARE CULTURE, EASTERN MIDDLE SWEDEN

Abstract author(s): Carlsson, Tom (Arkeologerna SHM)

Abstract format: Oral

The grave with the two adults, an infant, and a dog is by far the best-preserved grave from the Corded Ware Culture (i.e. the battle- or boat ax culture) in Sweden. The discovery was made in 1953 and exhibited in the county museum as early as 1954. The burial with the three skeletons and the artefacts has been interpreted, discussed, and repeatedly reinterpreted for 70 years. The burial has been in a constantly ongoing scientific light.

Natural scientific analyses (a-DNA and isotopes) in recent years have provided new opportunities to shed light on who the people in the grave were, their relationship to each other, and their ancestry.

The data from natural science also highlights an important challenge for archeology: putting the numbers, calculations, and statistics into a social science perspective. After all, it was people who moved, interacted, negotiated, fought, got sick, and died.

The purpose of my paper is to briefly summarize the 70 years of research and put the scientific analyzes in a current archaeological context.

6 ANCIENT CATTLE GENOMICS TO EXPLORE MIGRATION ON THE WESTERN ATLANTIC EDGE OF EUROPE

Abstract author(s): Mullin, Victoria - Bradley, Dan (Trinity College, The University of Dublin)

Abstract format: Oral

The domestication of taurine cattle marks a significant period of time in human prehistory. The initial migration of cattle across Western Europe concluded with the movement of animals to the Western Atlantic Edge, the islands of Ireland and Britain. Since their domestication, cattle and humans have shaped one another. One route to explore the cattle:human relationship is the sequencing of ancient cattle nuclear genomes. We have sequenced a time series of 80+ ancient cattle genomes from Europe, with a specific focus on the Western Atlantic Edge, spanning from the Neolithic to the Middle Ages. This dataset provides a snapshot of the genetic diversity present in the past and allows for the comparison of animals across time and space, enabling us to identify changes in population structure and even selection of specific genes through time. We will apply population genomic techniques to these data to provide new insights into the prehistoric cattle of the region.

7 STRAWBERRY TREE AS A POTENTIAL MARKER FOR BRONZE AGE COPPER MINING EXPLORATION ROUTES IN NW EUROPE

Abstract author(s): Sheehy Skeffington, Micheline (University of Galway) - Scott, Nick (Teach na Tuisceana)

Abstract format: Oral

The distribution of Strawberry Tree, *Arbutus unedo*, in Ireland and Britain is strongly associated with Bronze Age copper mining activity. The largest population, around Lough Leane, Killarney, surrounds the first copper mine in northern Europe, at Ross Island. Other smaller populations in south-west Ireland have Bronze Age copper mines nearby and the population on the Great Orme, in north Wales, is adjacent to the largest Bronze Age copper mine in Britain. The Ross Island excavation and a palynological investigation both date its arrival at around 4,300BP. A previous genetic study suggests this Mediterranean tree was originally brought to Ireland from north Spain, where copper mines were active up to this date, an introduction which appears to be described in Irish myth. As plant ecologists, we will present what we know about this species, its ecology and behaviour, that may be pertinent to this apparent connection to Bronze Age copper mining activity. Strawberry tree is one of sixteen Irish plant species with disjunct 'Lusitanian' distributions indicating a possible ancient maritime trade route between western Ireland and the Iberian Peninsula. A more thorough genetic study we are currently undertaking includes all Irish populations, as well as several in Britain and Brittany.

8 RADIOCARBON EVIDENCE INDICATES THAT MIGRANTS INTRODUCED FARMING TO LATE NEOLITHIC NORWAY

Abstract author(s): Solheim, Steinar (Museum of Cultural History University of Oslo)

Abstract format: Oral

At the start of the third millennium BCE, differences were present across the European continent in terms of subsistence, material culture and burial customs. Foragers inhabited the Scandinavian Peninsula and the eastern Baltic region while farming groups were settled across the rest of Europe. Similarities occurred in material culture and cultural practices over large areas, but the archaeological material also informs us about a heterogeneous and diversified cultural development with local adaptations.

In Southern Norway, the region in focus here, important changes took place in the second part of the third millennium. Farming was introduced late to this region, and robust evidence for farming is not seen until after 2400 BCE. This is often explained as a rapid transformation of society, evidenced by the introduction of new technologies, new modes of production and an economy based on the farm as a production unit. Migration is suggested as the most likely explanation, but no genetic studies or isotope analysis provide information to the archaeological material regarding this.

A possible way to obtain information on demographic development is to apply radiocarbon dates as a population proxy and use this to explore local demographic regimes, including population fluctuation and growth rates. Here, I aim to investigate the local demographic development and consider how population dynamics can explain the economic and cultural shift in third millennium Southern Norway.

The analysis will estimate a precise as possible start of farming and introduction of two-aisled houses by applying Bayesian age models. Secondly, I use radiocarbon dates to generate a summed probability distribution plot to infer local population dynamics. Finally, I estimate the long and short term growth rates to investigate how population growth relate to cultural change and discuss this in terms of migration into the region.

9 EMIGRATION AS A FACTOR IN THE DECLINE TO THE IRISH DOWRIS C 'DARK AGE'

Abstract author(s): Scott, Brian - McSparron, Cormac (Queen's University Belfast) - McLaughlin, Rowan (Maynooth University)

Abstract format: Oral

The Later Bronze Age (LBA) is known as one of the most prolific periods in Irish prehistory, to which large numbers of artefacts, settlements, major fortifications, and burials, have been attributed. It is also a time when the output of metalworkers reached heights of technical excellence, especially in the field of weaponry. A characteristic of the earlier part of the period is the palynological evidence consistent with an increasingly intensively farmed landscape. Characteristic also is the growing body of evidence for conflict between power blocs, which may be interpreted as resulting in no small part from competition for a range of resources.

After several decades of well-funded rescue excavations in Ireland, and a commensurate increase in the number of prehistoric radiocarbon dates, summed probability distributions of this dataset seem to indicate that the period saw major population growth also. But then something very unusual seems to happen in the 9th – 8th centuries BC, during which the number of radiocarbon dates declines rapidly, and remains much lower than its LBA peak for several centuries. We note that this comes some two centuries after the apparent cessation of native mining and smelting/casting of Irish copper ores.

In this paper, we will examine the reasons for this decline, and will suggest that – rather than population decline caused primarily by famine or disease or climate deterioration – Ireland may well have seen significant out-migration to neighbouring countries, quite possibly with Irish metal traders acting as scouts for larger migrant groups. We suggest that this is evidenced by various indicators of Irish metalworking practice abroad, and the appearance in Ireland of early native ironworking represents technologies brought to Ireland via this expanding network of international contacts.

10 LINGUISTIC FACTORS IN THE CELTICISATION OF THE WESTERN ARCHIPELAGO AND THE GAELICISATION OF IRELAND

Abstract author(s): Stifter, David (Maynooth University)

Abstract format: Oral

Until recently, language-internal considerations (e.g., diachronic phonology and morphology) and archaeology furnished the main arguments for theories about the time horizon for the arrival of Celtic languages on the islands of Britain and Ireland. But the lack of archaeological traces of late immigration, and the striking similarities of the ancient stages of the Insular Celtic languages with the ancient Continental Celtic languages, have proved to be irreconcilable with each other.

Two new exciting and potentially powerful sources of information offer new insights into the problem. Ancient DNA (aDNA) analysed in palaeogenetics shines a light on prehistoric population movements. In the field of historical linguistics, refined methods of research into substratums and lost precursor languages allow glimpses into the distribution of undocumented prehistoric languages. The new data challenge assumptions in both traditional approaches: aDNA studies have once and for all put to rest theories about Hamito-Semitic substrates in the Western Isles, and language contact studies and substratum research leave little room for ideas of Celtic having a deep history in the West. However, the problems do not stop with the arrival of Celtic to the islands, but they continue up to the dawn of the Middle Ages. Questions that need to be addressed in meaningful explanatory models include: How did the languages evolve on the islands and how did they achieve their characteristic appearance? What are the best models to account for the rapid phonological transformations of the Insular Celtic languages around the middle of the 1st millennium A.D.? Why does Old Irish look so homogenous at the time of its first written documentation?

In this talk I want to set out the historical-linguistic factors that need to be taken into consideration when trying to interpret the data about Late Bronze and Early Iron Age population movements and linguistic contacts.

11 MASS MIGRATION AND MICROHISTORIES IN EARLY MEDIEVAL ENGLAND

Abstract author(s): Gretzinger, Joscha (Max Planck Institute for Evolutionary Anthropology) - Sayer, Duncan (University of Central Lancashire) - Schiffels, Stephan (Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

Migration has been a key focus for European early medieval scholarship for decades, with focus on its scale, extent, and impact. The process of moving places might have a profound impact on an individual, a community, or a way of life, even ushering in wider cultural change. In this context, ancient genomics has the power to identify both individual mobility and large-scale migration events, linking the emergence of genetic patterns to archaeological transitions and historically recorded events. However, by integrating large numbers of individuals from geographically confined sampling areas, ancient DNA research also allows to explore social structures such as kinship and site organization. Here, we present how recently published genomic data from 460 northwestern European individuals (including 278 ancient English) can provide insights into one of the most intensely debated events in British history, the Anglo-Saxon migration to England. Besides the demonstration of mass migration, we show how this data in combination with state-of-the-art population genetic methods and extensive archaeological context data can facilitate sociocultural inferences, revealing the interrelationship between ancestry and residence patterns or funerary practices, as well as consanguinity and intercontinental mobility in early medieval Britain.

12 THEORETICAL MODELS OF MIGRATION AND SOME PREDICTIONS FOR EMPIRICAL WORK

Abstract author(s): McLaughlin, Rowan (Maynooth University)

Abstract format: Oral

In response to the conference theme of 'weaving narratives' this paper represents an attempt to formalise archaeological narratives of human migration using simulation techniques. As a concept, the meaning of the term 'migration' is surprisingly fluid in archaeology and ancient genomics; it can refer to the appearance of new peoples or cultures over centuries, or the shifting geographies of human experience within a single lifetime. Whilst archaeological science is getting ever better at resolving these processes, there is little explicit attention of what happening at a granular level, and how these add up to the manifestation of signals of migration detectable in the archaeological record. This limits current work in archaeology and ancient DNA to the observational level, with little scope for testing hypotheses. Through mathematical and simulation (agent-based) modelling we explore a number of different migration scenarios. The models are then used to make predictions about patterns in archaeological data, and what the limits of knowledge of these past processes are when viewed through the lens of the archaeological record.

13 BRONZE AGE MIGRATION TO BRITAIN AND IRELAND: A VIEW FROM THE WEST

Abstract author(s): Cassidy, Lara (Trinity College Dublin)

Abstract format: Oral

Over the course of the 3rd millennium BC, northern Europe experienced large-scale migration from the Pontic steppe, resulting in major demographic, cultural and linguistic change. Steppe-related ancestry arrived in Britain and Ireland during the Chalcolithic and Early Bronze Age, associated with the Bell Beaker culture. In Britain, it has been suggested that this movement resulted in a 90% population replacement within centuries, although others have cautioned against catastrophism, arguing this was unlikely to have been a rapid process. Here, I contrast the emerging genomic picture for Britain with that of Ireland using 45 new whole genome sequences. Ireland differs from Britain in its uptake of Bell Beaker culture, with Beaker material mainly found in domestic and megalithic contexts, suggesting influence from an Atlantic cultural sphere. Crouched single burials appear a little later, c. 2150 BC, concentrated mostly in the north and east of the island. When genomes from crouched burials alone are considered, I estimate a

similar level of population replacement in Early Bronze Age Ireland as seen in Britain (85-92%). However, genomes from megalithic tombs show markedly reduced levels of steppe ancestry, a signal which persists until c. 1800-1600 BC. This suggests a level of demographic continuity across the Neolithic-Bronze Age transition in Ireland, with prolonged barriers to interbreeding between local and migrant groups. These barriers may have had a geographical, as well as cultural dimension, given that megalithic construction continued mostly in the western half of the island. Ireland retains lower levels of steppe ancestry compared to Britain into the Late Bronze Age. This is relevant for modelling Late Bronze Age migration into Britain, which experiences a dilution in steppe ancestry through time.

532 **SYMBOLIC BODIES – UNDERSTANDING THE SIGNIFICANCE OF DEATH AND THE DEAD IN PREHISTORIC NORTHERN AND WESTERN EUROPE [PAM]**

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Chaumont Sturtevant, Elisabeth - Crozier, Rebecca (University of Aberdeen) - Oxenham, Marc (Australian National University - ANU)

Session format: Regular session

Upon death, the individual body presents a non-avoidable and arguably, vital agent in the funerary process. Societies have had to adjust around a flexible calendar of death, forging attitudes and belief systems regarding mortality.

The deliberate choices made in handling the corpse from an array of treatments (e.g., inhumation, cremation, excarnation) have made the body a vital source of information. The body can become a tangible, symbolic gateway between the living and the dead. Such variations in manipulations and care of the body have led archaeologists to investigate rich theoretical frameworks, which include personhood, ancestral beings, and of course, the tempo of the mortuary practices themselves.

This session seeks to explore the agency of the body in death as the driver behind funerary practices from the Mesolithic through Iron Age Northern Europe. This topic includes discerning societal structural rules and traditions as well as the more personal and intimate gestures performed during the funerary process.

We would welcome contributions presenting micro or macro studies, applying hard sciences as well as theoretical approaches, examining how the circumstance behind a death (e.g., good death vs bad death) reveals itself in the physical remains, not just of the body, but through the context of deposition (e.g., communal vs individual – preservation vs destruction). The timeframe of interaction between the living and the body may speak to the relationship and role of the dead in the wider funerary landscape and cosmology.

Beyond the human body and its accompanying embellishments, topics on the role of floral and faunal remains associated with the burial are also of interest. Overall, this session aims to further explore the influence of Death on prehistoric societies in Europe.

ABSTRACTS

1 **FINAL FLIGHT? DEATH, FIRE AND RAPTORS IN BRONZE AGE MAINLAND SCOTLAND**

Abstract author(s): Chaumont Sturtevant, Elisabeth - Masson-MacLean, Edouard (University of Aberdeen) - Oxenham, Marc (Australian National University) - Crozier, Rebecca (University of Aberdeen)

Abstract format: Oral

Within the burial context, faunal remains may be ‘read’ through a variety of lenses; a companion in the afterlife, votive offering, totem, feasting debris - the inherent symbolism derives from the context of recovery. How might we ever hope to distinguish the rationale for their inclusion, if they are indeed intentionally included? Our interpretations become particularly problematic in the context of cremation burial. Disarticulated, warped, and fragmented by the ravages of the process, simply recognising the presence of faunal remains is challenging, never mind identification to species level.

During a recent analysis of cremated remains from Broomend of Crichtie Henge, a complex Bronze Age mortuary site in Aberdeenshire (Northeast Scotland), a singular large burnt bird phalanx was identified. The shape and size of the avian remains suggests a bird of prey, possibly a white-tailed or golden eagle. The importance of these apex predators in Bronze Age burials has been documented in the Scottish Islands but not on the mainland. The aim of this paper is to reflect on the significance of birds of prey for Bronze Age communities in mainland Scotland. These remains may suggest simple ornamentation with a value/status conferred by the danger inherent in obtaining such an object. More direct affiliations to specialist hunting behaviors including a protective allegory may also be inferred when deposited in children’s burials. This paper will explore not just the symbolism of the talon itself, but the significance of its depositional context.

2 THE ESKER OF THE DEAD – GRAVES AND BURIAL RITUALS ON NORWEGIAN HUNTING GROUNDS DURING THE EARLY IRON AGE

Abstract author(s): Stene, Katherine (Museum of Cultural History University of Oslo) - Boethius, Adam (Lund University)

Abstract format: Oral

Skavernodden is a prominent and steep esker that pushes out into a large lake in the wooded inland of southern Norway. This prominent part of the landscape was for several hundred years, during the Early Iron Age (ca. 50 BC–AD 550), used as a burial and ritual site. Archaeological investigations in 2016–2021 have uncovered several burials of various shapes and content and ritual activity areas.

Both the ritual activity area and the human burials include large numbers of highly fragmented animal bones and the burials often also include various types of artefacts.

The characteristic feature of the bone material is that it is highly affected by fire, crushed and heavily fragmented. Humans were cremated while the animal bones show a wider range of burning, from unburned to fully calcified. All evidence suggests a significant amount of preparation and work has been done connected to the burials and sacrifices.

The graves are not homogeneous – ranging from including only one single individual to several and both seniors, adults and infants have been identified. The animals included in the burial rituals mainly consist of wild animal species, with only very few domestic specimens present. Antlers and skulls from elk dominate the assemblage but bone fragments from bear skulls are also frequently encountered. The bear is represented by both unburnt teeth and fully calcified skull fragments while the elk fragments are mainly affected by fire on one side.

Here we will present the preliminary results of the investigations and the cultural and economic landscape where the site is found. A focus on how both human and animal remains were interred, ritualized, treated and deposited, in combination with over 60 radiocarbon dates enables a study of contingency, resilience and change during the 500 years of ritual practice at Skavernodden.

3 RECONSTRUCTING A PATH TO THE OTHERWORLD: A MULTIPROXY APPROACH TO THE RITUAL AT PAPROTKI CEMETERY, NORTHEASTERN POLAND

Abstract author(s): Karczewski, Maciej (Faculty of History and International Relations) - French, Katherine (University of Cardiff) - Banerjee, Rowena (University of Reading) - Karczewska, Małgorzata (OBESW) - Pluskowski, Aleksander (University of Reading) - Cywa, Katarzyna (Institute of Botany Polish Academy of Science in Krakow) - Mueller-Bieniek, Aldona - Budziszewski, Adam (Faculty of Archaeology Warsaw University) - Musiał, Adrianna (Department of Animal Molecular Biology, National Research Institute of Animal Production)

Abstract format: Oral

Western Baltic tribal cemeteries were bustling foci for ritual and socioeconomic activity during the period of Roman Influence (2nd–5th centuries CE). Recognized primarily for the deposits of sacrificed horses amongst human cremation burials, the evidence suggests that rituals were far more complex. Cemeteries were not simply used for the disposal of the dead, but also for social competition and sites of general cult activity. However, environmental and geoarchaeological excavation approaches have been underutilised at these sites, with resources dedicated to typologising artifact and burial styles. Traditional approaches have failed to address long-standing questions concerning sacrificial choices, the role of plants and other animal species in funerary rites, the tempo of clustered deposition, and the temporal relationship between ritual features. In response, the National Geographic Society-funded Path to the Otherworld project centred environmental and geoarchaeological approaches during excavation at the Bogaczevo period cemetery of Paprotki Kolonia, Warmian-Masurian Voivodeship, Poland. Our international project team deployed a full suite of cutting-edge biomolecular, geoarchaeological, and paleobotanical analyses, to comprehensively reconstruct the range of ritual choices, actions, and the chronological and spatial relationship between the human graves and the plant and animal offerings. The reconstruction of the role of horses will be additionally supported by the aDNA analyses. This paper will present the results of this year-long collaboration, highlighting the complex role that plants and animals played in spiritual life amongst late prehistoric Baltic tribes.

4 RECTANGULAR STRUCTURES IN THE LOW COUNTRIES: AN IRON AGE PLACE FOR INTERACTION WITH THE SPIRITS OF THE DEAD

Abstract author(s): de Leeuwe, Roosje (Leiden University; RAAP Archaeology)

Abstract format: Oral

Specific types of larger structures are regularly encountered in excavations of Iron Age sites in Belgium and the Netherlands. These structures typically consist of a rectangular ditch and are often associated with cremation burials. However, the rectangular structures cannot simply be interpreted as cemetery demarcations, as most of the graves

are found outside of the enclosures. This is why they are often referred to as ‘open air cult places’ and compared to Iron Age sanctuaries found in the north of France. The evidence these structures deliver does not testify to long usage, modifications, disarticulated human remains, animal bones or Iron Age weaponry that is to be expected of a sanctuary. Rather, short term utilisation, pottery depositions and a vaguely defined relation to cremation graves typify the rectangular structures. Conceivably, the structures and accompanying depositions cannot be perceived as the result of actions to invoke gods or deities, but rather, the finds and features seem more fitting as a part of ancestral worship. Although, what does that actually entail? How did Iron Age people actually conceptualise or practice interaction with ancestral spirits? The structures fulfilled a special sociocultural position in Iron Age society, emphasised by the deliberately chosen liminal location in the increasingly structured Iron Age landscape.

5 INTERACTING WITH THE DEAD: BODIES, CONSTRUCTIONS AND PRACTICES IN THE KING’S MOUND

Abstract author(s): Nitenberg, Annelie (Västsvensk arkeologi)

Abstract format: Oral

In the 7th century AD, two men were cremated on the shore of Lake Vänern in Västergötland, Sweden. Their bodies were arranged together on a huge pyre. Forty-six animals were led to slaughter and stacked around the human remains in a special way. The sacrifice consisted of four horses, 20 dogs, two cattle, three pigs, three sheep/goats, two hens, two geese, one duck, one hazel grouse, four Northern goshawks, one peregrine, one Eurasian eagle-owl, one common roach and one perch. A claw and teeth of a young bear indicate that a fur and perhaps also a bear tooth amulet were included on the pyre as well as a lot of other objects.

When the cremation fire had died down, only ashes, white bones and fragments remained. A finger ring of pure gold was then broken into pieces and spread on the remains of the men. People rolled up large boulders to seal the grave and a massive cairn was heaped up. Finally, soil, sand and turf were brought to the scene and a built mound encapsulated it all.

But this is not the end of the story. Constructions of stone and wood in the mound suggests platforms and channels for communication between the living and the dead. The dead were still important to interact with, and the mound itself, with its content, had the ability to work socially. This paper will focus on the arrangement of bodies in relation to construction elements that can be interpreted as contact areas between living and dead.

The mound is by tradition called the King’s mound and is in third place among excavated graves in Sweden when it comes to the amount of bones. The archaeological experience tell us that the buried men were part of the elite of the Late Iron Age society.

6 BOGS, BONES AND BODIES: THE DEPOSITION OF HUMAN REMAINS IN NORTHERN EUROPEAN MIRES (9000 BC-AD 1900)

Abstract author(s): Beek, Roy (Wageningen University & Research) - Bergerbrant, Sophie (Linnaeus University, Kalmar/Vaxjo) - Huisman, Floor (University College Dublin)

Abstract format: Oral

Earlier this year the first large-scale overview of well-dated human remains from northern European mires was published, based on a database of 266 sites and more than 1000 bog mummies, bog skeletons and disarticulated/partial skeletal remains. This new study made clear that these different find categories need to be studied integrally in order to arrive at a more ‘complete’ and nuanced understanding of ‘the bog body phenomenon’. The results point to fluctuating depositions of human remains between the Early Neolithic and early modern times, significant and shifting spatial clustering, and variation in site characteristics (e.g. preservation, use frequency, cause of death). Additionally, they emphasise previously unrecognised activity phases and highlight issues with categorising motives, especially around ritual violence. In this paper we elaborate on and reflect upon the main conclusions of the article. Special attention is given to differences in preservation across northern Europe and the striking diversity in site types. Finally, we discuss promising pathways for future bog body research.

7 NORTHERN BRONZE AGE TRANSFORMATIONS IN BODY TREATMENTS

Abstract author(s): Schaefer-Di Maida, Stefanie (CAU, Institut für Ur- und Frühgeschichte; CRC 1266)

Abstract format: Oral

With the change from inhumation to cremation around 1300 BCE in Europe, a striking new way of dealing with the dead becomes apparent. Even though there are many speculations about the reasons for this change, we can reconstruct the burial transformation in great detail with regard to the findings and the temporal component. For northern Germany, this transformation process could be identified with the help of the latest Radiocarbon dating and osteoarchaeological analyses, so that there are also new indications for how and in which ways the cremation custom

spread. At the site of Mang de Barga (district Segeberg, northern Germany), for example, it was possible to precisely reconstruct burial rites and how the body treatment developed especially between the Middle Bronze Age and the pre-Roman Iron Age with regard to transformation in the grave construction (including grave mounds, urns as well as stone structures) and the behaviour of depositing cremated remains. In conjunction with other contemporaneous transformations (e.g., new settlement patterns, new symbols, changes in grave furnishing as well as changes in grave occurrences) we can find indications that the new treatment of the dead also points to a social change in society. In addition to that, fragmentations and representativeness of bodies, as well as different cremation techniques show not only the control of body material, but also means of exchange and the transformation of bodies. Finally, this paper will discuss the various interpretations of the treatments of the dead against the background of the latest dating and osteoarchaeological analyses, as well as different social aspects.

8 LET THEM LIE: AN OSTEOBIOGRAPHICAL EXPLORATION OF EARLY NEOLITHIC ARTICULATED BODIES FROM CAUSEWAYED ENCLOSURES IN SOUTHERN BRITAIN

Abstract author(s): Becker, Katharina (University of Exeter)

Abstract format: Oral

Neolithic people in Britain engaged in a wide range of funerary practices, sometimes exhuming bodies before disarticulating and fragmenting the bones and then interring them in chambered tombs or long barrows, while other individuals were cremated or deposited in rivers or caves. These practices indicate that the Neolithic had an intimate relationship with the dead and frequently interacted with human remains. However, some individuals were also buried at specific locations as fleshed bodies. With such a clear interest in laying clean bones to rest rather than whole bodies, why were these individuals treated differently?

This PhD project uses a holistic, osteobiographical approach to explore the individual characteristics of the people who were buried at causewayed enclosures across southern Britain; both articulated bodies and disturbed/disarticulated remains. This paper will present some of the research conducted so far into the nature of these articulated burials in the form of osteobiographical profiles for several individuals from Neolithic causewayed enclosures. A pattern is emerging which may suggest the significance of pathological conditions which affected either an individual's appearance or their perception of the world, raising the possibility that these individuals were singled out to be buried as whole bodies and at causewayed enclosures for this reason. The presentation will focus on the osteological features of the bones themselves and the taphonomic evidence of the grave contexts, highlighting the effectiveness of both osteobiographical and taphonomic approaches. It will conclude by tying this evidence to key research questions - why bury people as whole bodies? What is the difference between these individuals and those deposited in barrows? Where do disarticulated remains fit into the Neolithic funerary landscape? It will conclude with a brief outline of the next stages of this research project.

9 PUNISHMENT IN THE IRON AGE? A CASE STUDY FROM NORTHWEST IRELAND

Abstract author(s): Tobin, Maeve - McIlreavy, David (IAC Archaeology) - Montgomery, Janet - Moore, Joanna (Durham University)

Abstract format: Oral

The Irish Iron Age is a relatively enigmatic period, a time of profound societal and environmental change, and while our understanding has been greatly expanded over the last few decades the nuances of life at the time remain ambiguous. Recent excavations at Carroweighter, Co. Roscommon in Ireland revealed intriguing and rare evidence for contrasting burial practices dating to the latter centuries of the first millennium BC. The archaeological remains represent a single cremation burial of a seemingly important local individual placed in the centre of a large enclosure, and the mutilated unburnt body of a non-local male dumped in the open ditch of the same site. While not precisely contemporary, the timing of the latter burial appears to have occurred within living memory of the cremation, suggesting that this monument retained significance for the community and was deliberately selected for this event. Analysis of multi-isotope data suggests that the man in the ditch arrived in this locale during his older childhood, having spent his formative years in a much colder climate than western Ireland. His consequence was such that at the time of his death he was afforded the privilege of burial at an ancestral burial monument, however the mode of his ignominious deposition indicates a dramatic reduction in social status, and perhaps reflects enactment of a punitive code for an unknown transgression. This paper presents the results of multidisciplinary analyses (including osteological, isotopic, artefactual, environmental and radiocarbon dating evidence) undertaken to investigate the identity of the two individuals buried at Carroweighter and poses some tentative interpretation of their respective treatment in death.

10

IS IT SYMBOLIC? A POSSIBLE FOUR-YEAR-OLD TROPHY HEAD FROM THE IRON AGE (EL PALOMAR, OLIETE, SPAIN)

Abstract author(s): López Onaindia, Diego (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199, F-33600) - Lucas Aragay, Marta (Departament d'Història i Arqueologia, Universitat de Barcelona - UB) - Sala, Nohemi - Pantoja-Pérez, Ana (Centro Nacional de Investigación Sobre la Evolución Humana - CENIEH) - de Belvalet, Harmony (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199, F-33600) - Escriche Jaime, Carmen - Vicente Redón, Jaime (Museo de Teruel) - Pruvost, Mélanie (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199, F-33600) - Noguera, Jaume (Departament d'Història i Arqueologia, Universitat de Barcelona - UB)

Abstract format: Oral

Since the Chalcolithic and Bronze Age, there is evidence of the collections of heads of deceased individuals as a social tool in Western Europe, and specifically in the Iberian Peninsula. This is evident in collective burials, where the skulls are piled in concrete zones, or where they are missing. In addition, this phenomenon became notably widespread in the Iberian region and the meridional Gaulle with the practice of the “nailed heads” during the second Iron Age.

This practice is already recorded since the ancient Greco-Latin texts. According to previous studies, except for a few individuals aged 15-18 years old at the time of death, these nailed-heads would correspond to adult individuals and interpreted as individuals in military-capacity ages. Recent studies have also suggested that these heads were not only cut and nailed, but also embalmed, suggesting great care of the treatment.

The Iron-Age village of El Palomar de Oliete (Teruel, Iberian Peninsula) was excavated between 1977-1981, these works uncovered a well-structured neighborhood consisting of 11 houses and different warehouses from the III-I centuries BCE. Inside 6 of these houses, the excavations recovered the burials of 21 perinates and one fetal individual under the floor.

Here we present the case of an isolated cranium of a four-year-old individual found in “House 6”, one of the houses where perinate individuals were also buried. This cranium was buried in the main room of the house under graveled sediment. The bone preservation and taphonomic analyses suggest that the head was removed from the rest of the body while soft tissue was still preserved. In addition, micro-CT imaging has allowed us to diagnose one potential blunt trauma on the base of the cranium. Finally, we have conducted radiocarbon dates and genomic analyses to determine the chronology and sex of this unusual but probably symbolic burial.

11

RITUAL VIOLENCE OR VIOLENT RITUAL? DISENTANGLING DEATH NARRATIVES IN THE ORCADIAN NEOLITHIC

Abstract author(s): Crozier, Rebecca - Dittmar, Jenna (Dept of Archaeology, University of Aberdeen) - Oxenham, Marc (School of Archaeology and Anthropology, Australian National University)

Abstract format: Oral

The skeletal remains constrained within the megalithic architecture on the archipelago of Orkney, Scotland, have long provided a significant challenge for definitive interpretation. Lacking in bodily integrity and often-times characterised by significant fragmentation, the challenging nature of the assemblages has generated sophisticated yet diverse reconstructions of the significance of death in these early communities. Interpretations oscillate from the more natural ravages of time and nature, to considerations of ever more complex and sophisticated cosmologies of ancestors, personhood, embodiment and enchainment. The inherent equifinality of these competing narratives demands new evidence. The context of deposition within these megalithic structures renders the small number of tangible individuals as ostensibly distinct, special, somehow outstanding compared to all those who have, ‘disappeared’. What else, beyond their locality, might give voice to the significance of these remains for those communities who originally engaged with them? This paper presents new evidence following a reassessment of the human remains from the chambered cairn of the Knowe of Rowiegar, Rousay, Orkney. Excavated in 1937, the skeletal assemblage, minimally representing 28 individuals, is dominated by fragmentary cranial remains. Although previous work has noted three perimortem cranial injuries, a recent reassessment has identified significantly more. The patterning of trauma across this assemblage is contextualised with previous work by RC, where similar injuries have been noted in Cuween chambered cairn, Mainland Orkney, and by others at Isbister, South Ronaldsay, Orkney. Multiple injuries to some individuals suggest a hitherto unrecognised intensity of violent interaction with the body. Faced with the ever-present issue of equifinality we ask, are these remains indicative of a ritualised mortuary practice, requiring a violent interaction with the deceased, or is this the end-stage of a violently dark death?

DIVERSITY IN THE SPREAD OF NEOLITHIC LIFEWAYS: EXPLORING REGIONAL DIFFERENCES ACROSS EURASIA [PAM]

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Connolly, Rory - Kačar, Sonja - Power, Robert (School of Archaeology, University College Dublin) - Pichon, Fiona (IMF-CSIC, Barcelona) - Salazar-García, Domingo (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València; Department of Geological Sciences, University of Cape Town)

Session format: Regular session

Across Eurasia, the adoption of farming is associated with major socio-economic, technological, cultural, symbolic and biological transformations. This process is understood as the largely rapid spread of a sedentary economy based on agriculture, herding, and new technologies like pottery and polished stone tools, which originally dispersed from southwest Asia through demic diffusion and local interactions. However, regional differences are evident and there is considerable variability in the tempo of these processes. In some areas, the characteristic hallmarks of the Neolithic are absent or uncorrelated with the appearance of farming communities. In addition, subsistence strategies based on hunting, fishing, and gathering, typically associated with Mesolithic communities, persisted in some locations despite the confirmed presence of domesticates, pointing to encounters between hunter-gatherers and farming communities living in close proximity to one another. This undoubtedly contributed to some of the diversity visible in the archaeological record, however, there is still uncertainty about how and why regional differences arose. For instance, how did different Neolithisation routes affect the timing and spread? Or what role did local environmental factors play? Recent advances in techniques such as aDNA and a combination of isotopic analyses have provided valuable information on the spread and consolidation of Neolithic populations (ancestry) as well as economy (diet), and helped to discern the timing of overlap. Similarly, innovative and nuanced archaeological approaches to material culture have given rise to a number of wide-ranging studies which highlight and address the extent of diversity in the spread of Neolithic lifeways.

In this session, we welcome submissions from different regions across Eurasia with the aim of illustrating how the Neolithic, due to the cultural and environmental diversity in which it developed, manifests in different ways. The session will provide an opportunity to examine and discuss what factors lay behind these regional differences.

ABSTRACTS

1 THE NEOLITHISATION OF SOUTH-EASTERN EUROPE: UNDERSTANDING SOCIAL INTERACTIONS AND CULTURAL RELATIONS BETWEEN STARČEVO AND IMPRESSED WARE THROUGH LITHIC PRODUCTION SYSTEMS

Abstract author(s): Kacar, Sonja (University College Dublin)

Abstract format: Oral

Neolithic cultures in Europe are generally defined on the basis of different ceramic styles, with early farming groups distinguished by differences in pottery production.

In the case of Southeast Europe, two main Neolithic groups have been identified based on two different ceramic styles: the Impressed Ware culture of the coastal areas (Adriatic) and the Starčevo–Körös–Criş complex of the continental Balkans.

Because of these differences in ceramic style and other aspects of material culture - such as the presence/absence of anthropomorphic figurines - archaeologists have tended to study these groups separately, as representative of two distinct paths of Neolithisation (maritime vs continental).

To re-examine the development of the Neolithic in South-Eastern Europe and the relations between these apparently distinct groups, this presentation considers lithic data obtained from coastal and inland sites of Croatia and Montenegro, associated with both Impressed Ware and Starčevo cultures.

Are there significant differences in lithic production traditions (e.g. use of different methods and techniques, different types of tools) and if so, do they coincide with traditional distinctions between these two archaeological cultures?

Do differences in lithic (and ceramic) production signal different processes of Neolithisation, with varying influences of migrant farmers from different regions of the Near East and local hunter-gatherers?

Finally, are there similarities between Starčevo and Impressed Ware production, which could point to the existence of contacts between these two cultural groups? To answer these questions requires re-focusing attention on the logistics of material culture production at the borderlands (cultural peripheries) where interaction is most likely to have occurred.

2 CHANGES IN MANDIBULAR MORPHOLOGY IN THE MESOLITHIC - NEOLITHIC TRANSITION IN WESTERN IBERIA: EVIDENCE AND POSSIBLE CAUSES

Abstract author(s): Godinho, Ricardo Miguel (ICArEHB, University of Algarve) - Umbelino, Cláudia (CIAS, University of Coimbra; ICArEHB, University of Algarve) - Valera, António (ICArEHB, University of Algarve; Era Arqueologia) - Carvalho, António (CEAACP, University of Algarve) - Gonçalves, Célia (ICArEHB, University of Algarve) - Smith, Patricia (Faculties of Medicine and Dental Medicine and NNHC, Hebrew University)

Abstract format: Oral

Farming and animal husbandry originated in the Near East and were introduced into Iberia by migrating populations no later than 5500 BCE. This introduction caused profound changes in the economy, settlement patterns, ideology, diet, and biology (including gene pool, health, and morphology) of the Iberian populations. To date, little research has been devoted to the impact of this transition on mandibular morphology, which is regrettable since it is impacted by population history and diet.

We examined the impact of this transition by comparing Mesolithic, Neolithic, and Chalcolithic mandibles from western Iberia. We also included a late 5th to mid-4th millennium BCE Chalcolithic sample from the Southern Levant to examine the relationship between the Iberian samples and a Near Eastern population that had a well-developed agro-pastoralist subsistence base. To this end, we digitized the specimens and examined morphology using Geometric Morphometric methods. Dental wear was scored using the scale developed by Smith (1984). Based on previous aDNA studies and the relationship between mandibular form and population history, we expected significant differences between the Iberian Mesolithic and the Southern Levant samples and that the post-Mesolithic Iberian samples would be intermediate between these two.

As predicted, the Iberian post-Mesolithic Iberian specimens are morphologically intermediate between the significantly different Mesolithic Iberian and Chalcolithic Southern Levant mandibles. Dental wear is generally comparable between Mesolithic Iberia and the Chalcolithic Levant, and most different when compared to post-Mesolithic Iberians. Altogether, our results are consistent with greater impact of population history on morphology rather than masticatory mechanics.

3 INVESTIGATING DAIRY PRODUCTS FROM THE NEOLITHIC TO THE BRONZE AGE IN MEDITERRANEAN IBERIA: A LIPID RESIDUE ANALYSIS AND PROTEOMIC APPROACH

Abstract author(s): Salazar García, Domingo Carlos (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València; Department of Geological Sciences, University of Cape Town) - Spiteri, Cynthianne (Dipartimento di Scienze della Vita e Biologia dei Sistemi, University of Torino; Institute for Prehistory, Early History and Medieval Archaeology, Eberhard Karls University Tübingen) - De la Cruz Córdoba, Manuela (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València) - Teoh, Fallen Kai Yik (Dipartimento di Scienze della Vita e Biologia dei Sistemi, University of Torino) - García Borja, Pablo (Universidad Nacional de Educación a Distancia. Centro asociado Alzira-València) - Demarchi, Beatrice (Dipartimento di Scienze della Vita e Biologia dei Sistemi, University of Torino)

Abstract format: Oral

The consumption of dairy products during prehistoric times is relevant to better understand dietary habits, culinary traditions and economic activities from past populations. Their role during Recent Prehistory is, in this context, of special interest to shed new light on food resource adaptation during the Neolithization process and the development of more complex societies during the Chalcolithic and Bronze Age. Biomolecular methods developed during the last decades allow us to directly assess the presence of dairy lipids in archaeological material culture, such as pottery, and of specific milk proteins like β -lactoglobulin (BLG) in human dental calculus. Combining both organic lipid residue analysis and palaeoproteomic analysis is the way to link dairy consumption to individual osteobiographies, as well as a tool to help detect changes in dairy processing and consumption patterns that might have resulted in higher human exposure to milk whey and thus lactose. While this type of analysis, especially organic lipid residue analysis, has been carried out profusely along several regions of Eurasia, the Western Mediterranean region is still relatively underexplored. We present here preliminary results of organic residue analysis on pottery and palaeoproteomics on human dental calculus from Neolithic to Bronze Age sites of Eastern Iberia.

4 TANGLED WAY OF NEOLITHIZATION AT THE INNER PERIPHERY: A CASE STUDY OF SOUTH BOHEMIA (CZ)

Abstract author(s): Vondrovský, Václav (Institute of Archaeology of the Czech Academy of Sciences) - Ptáková, Michaela (University of South Bohemia) - Šída, Petr (Institute of Archaeology of the CAS) - Prach, Jindřich (Centre for Theoretical Study, Charles University and the CAS) - Pták, Martin - Bumerl, Jiří (University of South Bohemia) - Pokorný, Petr (Centre for Theoretical Study, Charles University and the CAS)

Abstract format: Oral

After 5400 BC the expansion of Linear Pottery culture (LBK) disseminated the sedentary way of life rapidly across fertile lowlands of Central Europe. However, most of the upland regions were omitted by the early colonisation being settled much later if ever. In our paper, we will follow the neolithization process in South Bohemia (Czech Republic) which constituted a relatively isolated and spatially limited enclave within the LBK milieu. Our multidisciplinary project, therefore, examined potential differences and adaptations in subsistence and settlement strategies employed by local farmers. According to radiocarbon chronology, the region was settled by farming communities about 100 years later than all surrounding areas and even after that, hunter-gatherers still thrived around local lakes. Substantial evidence for contacts is missing in the archaeological record, but they must have been inevitable considering the spatial proximity of sites inhabited by these two groups. Yet at agrarian settlements, inhabitants followed the conservative LBK repertoire of material culture. Substantial alternations were revealed by archaeobotanical analysis for the spectrum of cultivated crops. It is interpreted as an effort to accommodate farming practices for less favourable environmental conditions of South Bohemia. Despite attempts for adaptation, a steep decrease in occupation density is recorded after 5000 BC suggesting a collapse after which the occupation was not restored to a similar extent for 2000 years. The case of South Bohemia illustrates how unstraightforward the process of neolithization could have been when a biased research focus on fertile lowlands with an abundant archaeological record is abandoned.

5 INVESTIGATING THE VARIABILITY OF FRESHWATER RESOURCE USE BY EARLY FARMERS IN CENTRAL EUROPE

Abstract author(s): Davis, Izzy - Roffet-Salque, Mélanie (Organic Geochemistry Unit, University of Bristol)

Abstract format: Oral

The Linear Pottery Culture (LBK) spread rapidly across central Europe and is associated with the first livestock-keeping and pottery use in the region. Zooarchaeological assemblages indicate a reliance on domestic animals, although recent research has shown regional variation across the LBK distribution in terms of meat and dairy exploitation. Hunting and fishing seem to play a lesser role, with freshwater fish remains rarely recovered from LBK sites, despite their close proximity to rivers and lakes. Due to poor preservation and unsuitable recovery methods, zooarchaeological remains may not provide an accurate insight into the exploitation of freshwater resources by these early farming populations.

The processing of freshwater resources in pottery vessels can be identified through the analysis of lipid residues. The detection of lipid biomarkers deriving from fish and other aquatic products provides direct evidence for the processing of aquatic resources, and biomarkers can be detected at low concentrations to reveal low levels of freshwater resource use.

Organic residue analysis is used to investigate freshwater resource use within the LBK, providing new insights into the relationship between early farming populations and freshwater environments in central Europe. The results indicate variability within the LBK in terms of the importance of freshwater resources, relating to environmental setting and potential socio-cultural factors. The findings are compared to other regions of Neolithic Europe, where the beginning of agriculture saw a shift to a terrestrial economy or the continued exploitation of aquatic resources alongside domestic animal products, highlighting the diversity of Neolithic.

6 NEOLITHIC MARINE RESOURCE EXPLOITATION IN ATLANTIC EUROPE: RECENT EVIDENCE FROM CO. SLIGO, NW IRELAND

Abstract author(s): Connolly, Rory (University College Dublin)

Abstract format: Oral

The role and significance of marine resource use has been the subject of much scholarly discussion in the field of European Neolithic studies. Despite this, the precise nature, magnitude, and geographic extent of post-agricultural prehistoric marine exploitation in Europe remain unclear. The continued accumulation of substantial shell middens in regions such as County Sligo in the northwest of Ireland subsequent to the introduction of agriculture highlights the noteworthy social and economic interest in littoral resources among coastal farming communities.

These shell middens, which are comprised predominantly of oyster remains and can be up to 3 metres thick in places, are exposed along the coast in eroding sections for hundreds of metres. Recent isotopic evidence indicates that Neolithic communities in Ireland subsisted on a predominantly terrestrial diet, raising interesting questions about the deposition of these middens. Specifically, it remains unclear whether the exploitation of the marine environment at this time represents a sporadic, local response to climate change, intermittent crop failure, or a long-term strategy to mitigate environmental constraints in remote Atlantic coastal settings.

Here we present preliminary results from the NeoMarE project (Neolithic Marine Resource Exploitation in Atlantic Europe), which seeks to address these issues through a targeted programme of radiocarbon dating, archaeological soil micromorphology, and lipid biomarker analysis for palaeoenvironmental reconstruction. This is coupled with a bottom-up citizen science initiative to help identify and target midden sites that are imminently threatened by coastal erosion.

The results of this project are considered alongside recent studies from other regions of Europe and offer fresh evidence for critically re-evaluating competing hypotheses about Neolithic coastal resource exploitation in Atlantic coastal environments.

7 DENTAL CALCULUS PERSPECTIVES TO NEOLITHIC IRISH DIET

Abstract author(s): Power, Robert (School of Archaeology, University College Dublin) - Mackie, Meaghan (School of Archaeology, University College Dublin; Dipartimento di Scienze della Vita e Biologia dei Sistemi) - McClatchie, Meriel (School of Archaeology, University College Dublin) - Spiteri, Cynthianne (Dipartimento di Scienze della Vita e Biologia dei Sistemi; Institute for Prehistory, Early History and Medieval Archaeology, Eberhard Karls University Tübingen) - Demarchi, Beatrice (Dipartimento di Scienze della Vita e Biologia dei Sistemi)

Abstract format: Oral

Archaeological research on Irish Neolithic sites (4000–2500 cal BC) have provided a sizeable corpus of information on the nature of diet during the Irish Neolithic. Research has identified a package of crops and livestock, that arrived in Ireland within a demic diffusion framework. Carpology studies, from infrastructure-funded excavations, nearly always of carbonised seeds, have shown widespread evidence of cereal husbandry. Assemblages show a dominance of emmer and lesser amounts of other wheats, hulled and naked barley, flax and hazelnuts, indicating low numbers of species relative to many parts of Europe. Zooarchaeological, stable isotopic and molecular evidence has demonstrated the raising of cattle, with significant amounts of pig and caprines. In contrast, there is little evidence of fish, birds and wild mammals. Patchy evidence hinders attempts to understand how farming and herding spread and adapted to Ireland. For example, archaeobotanical and zooarchaeological assemblages sizes are commonly small and may not be representative. While some have suggested that the seeming paucity of assemblages in the Late Neolithic reflects a trend towards pastoralism, it may also indicate preservation biases.

To complement this dietary record, there has been increasing attention on alternative approaches, including the analysis of dietary remains from dental calculus, mineralised dental plaque. When well preserved, this material can entomb a complex variety of dietary remains such as phytoliths, starches, lipids and proteins as an individualised record of diet, so far not applied in Irish prehistory. In this paper, we report initial microscopy findings of dental calculus from human individuals, inhumed in a variety of Middle, Later Neolithic and Early Bronze Age funerary traditions including Linkardstown, passage and wedge tombs, and cists.

535 PRECARIOUS LIVING CONDITIONS IN THE PAST: A MULTIDISCIPLINARY AND TRANSCRONOLOGICAL APPROACH

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Gijón, Ramón (Departamento de Medicina Legal, Toxicología y Antropología Física, Universidad de Granada) - Tejerizo, Carlos (Dipartimento di Antichità, Filosofia, Storia e Geografia, Università degli Studi di Genova) - Díaz-Zorita Bonilla, Marta (Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters, University of Tübingen) - Camarós, Edgard (Department of Archaeology, University of Cambridge)

Session format: Regular session

In our present, precarious living conditions are worldwide spread and increasing due to socioeconomic differences related to differential access to essential resources, security and basic needs. Causes may be linked to political and economic policies (intrinsic), climate catastrophes (extrinsic) or both (e.g., climate change) and can be long or short lasting, and individual or collective. Therefore, precarious living conditions are a major issue affecting people in the present as it affected people in the past. Untangling such ways of living from an archaeological perspective is essential to reconstruct living dynamics that affected human health, architecture or social organization among others from daily life conditions to historical perspectives in a given moment (e.g., crisis, conflicts or pandemics) or period (e.g., absence of hygiene, housing, slavery or poverty among others). Such individual or collective precarious conditions can

be recovered archaeologically and our discipline is directing its interest towards them to reconstruct past lives and define socioeconomic dynamics of ancient societies.

In the present session we will discuss how we evidence precarious living conditions in the past using a wide range of perspectives and materiality (e.g., human and animal bones and other organic materials, pottery, lithic, structures and the landscape among many others) and what they tell us about ancient societies. We seek for general studies, case-studies and methodological advances from different periods and geographical locations with the aim of discussing precarious living conditions in the past. Furthermore, the session aims to define and discuss what precarious living conditions are in the past beyond the modern definition and in light of their historical contexts.

ABSTRACTS

1 WAS HUNTING SAVING THE DAY DURING THE TIMES OF UNCERTAINTY AND SHORTAGE AT THE LENGYEL SITE OF SVODÍN (SLOVAKIA)?

Abstract author(s): Hukelova, Zuzana - Krošláková, Mária - Oravkinová, Dominika - Nezvalová, Lucia - Olšav, Štefan (Institute of Archaeology of the Slovak Academy of Sciences)

Abstract format: Oral

Based on the archaeological record, the remains of domesticated species prevail over those of wild animals in the central-European Neolithic (app. 5700/5500 - 4300 BC). At the end of the period, however, the proportions of wild and domesticated animal remains seem to vary by site, with apparent increase of the bones of wild animals. It has been suggested that these differences may have been connected with local environmental changes and repeated periods of crop failure. The increased proportion of the bones of wild animals during the presumed periods of drought may in fact point to climate deterioration in the area. Animal proteins may have been consumed to compensate for the shortage of plant proteins. Compared to the Early Neolithic, the level of violence seems to have increased in the late phase of the period as well, suggesting also social change. The results of osteological evaluation of Late-Neolithic population from Svodín, Slovakia, seem to be consistent with the theory of environmental/social changes and nutritional shortage also indicated by non-osteological data. The population manifests signs of poor health status – from low stature, high proportion of non-specific stress indicators, such as dental enamel hypoplasia and inflammatory changes, to metabolic disorders. In addition, skeletal markers as well as archaeological context (grave inventories including boar tusks and a variety of weapons) indicate demanding lifestyle and distinct position of mature males, implying the importance of hunting and those who were able to help overcoming the period of hardship.

2 SOCIAL ORGANISATION AND HUMAN RESILIENCE AT THE BINIADRÍS CAVE DURING THE LATE BRONZE AND IRON AGES (MENORCA, SPAIN)

Abstract author(s): Timm, Monice (SFB1070 Ressourcenkulturen, Eberhard Karls Universität Tübingen) - Díaz-Zorita Bonilla, Marta (Institut für Ur- und Urgeschichte und Archäologie des Mittelalters, Eberhard Karls Universität Tübingen; SFB1070 Ressourcenkulturen, Eberhard Karls Universität Tübingen) - Alarcón García, Eva - Moreno Onorato, Auxilio (Department of Prehistory and Archaeology, University of Granada) - Marciales Daza, Mauricio (SFB1070 Ressourcenkulturen, Eberhard Karls Universität Tübingen) - Baten, Jörg (Economic History Department, Eberhard Karls Universität Tübingen; SFB1070 Ressourcenkulturen, Eberhard Karls Universität Tübingen)

Abstract format: Oral

The island of Menorca is one of the last inhabited islands within the Mediterranean Sea. Despite the difficult living conditions, due to the rather rocky topography and the few areas that can be used as habitats, the prehistory of this island stands out for its vast amount of monumental architecture and prehistoric sites. The social-economic structure fits well into the cultural setting of the Western Mediterranean, but there are still many missing links in the Menorcan past regarding their social organisation and funerary behaviour. In order to gain detailed insights into population adaptation to the living conditions, research has been conducted in the Biniadrís cave (Menorca, Spain) since 2015. These preliminary results will consider the social organisations and human resilience of the population who inhabited Biniadrís during the Late Bronze and Iron Ages. Therefore, bioarchaeological methods, including the focus of musculoskeletal markers and skeletal pathologies, with the use of geometric morphometrics were applied aiming to investigate in detail the health status. In this study, the differences between the sexes in their social structure as well as the differences between the age groups (mainly subadult and adult individuals) will be examined. The cave allows such an in-depth study due to its remarkably bone preservation, but it is limited through its commingled context. Therefore, it will be meaningful to contrast non-adult and adult individuals as they are buried together in the same cave. Having an overview of the differences will help to comprehend which status children had in this society, considering the particular living conditions of this vulnerable age group.

3 REVISITING THE RURAL LANDSCAPE: THE PUTICULI, A FORGOTTEN PHENOMENON FOR THE FORGOTTEN ONES

Abstract author(s): Carrasco López, José (Universitat Autònoma de Barcelona)

Abstract format: Oral

In late Roman times, extensive burial areas developed around the rural settlements of Ager Tarraconensis. Frequently these areas allocated space with the *pars rusticae* of many of them. Currently, it has been possible to document a phenomenon with few parallels in the archaeological record.

This phenomenon, recurring in the Northeast of the peninsula, is characterized by collective inhumations of individuals dumped without any type of burial or funeral ritual in abandoned grain silos. These wells used as landfills, became the ideal place to dump broken objects and elements, including burials.

Our presentation aims to describe this phenomenon and introduce a recent case study based on excavations around the provincial capital. We believe that these structures, having discarded their storage function, are used as a place to deposit garbage: a concept that the sources consider as a *puticuli*.

Traditionally, the *puticuli* have been explained as large wells located outside the cities. It served as garbage dumps and places where some sectors of the population were discarded after their death. Do these garbage dumps have a hitherto unidentified rural parallel?

4 OSTE BIOGRAPHICAL MARKERS OF PRECARIETY AND INEQUALITY FROM ANTIQUITY TO THE MIDDLE AGES IN CANTABRIAN SPAIN: PALEOPATHOLOGICAL LANDSCAPES OF SOCIOECONOMIC CHANGE

Abstract author(s): Camarós, Edgard (Universidad de Santiago de Compostela; University of Cambridge) - Carniceiro, Sílvia (Universidad de Cantabria)

Abstract format: Oral

Precarious living conditions and inequality can be read on the human skeleton through stress-markers and pathologies reflected on bones. However, the presence of such osteological signatures are not enough to claim precarious and unequal social conditions during lifetime. To do so, comparisons are required among contemporaneous population and across time to provide a comparative framework that reflects such living conditions. In this presentation, we discuss the case of the transition from the Late Antiquity to the Middle Ages in Cantabrian Spain where we have identified osteobiographical evidence of precarity and social inequality. Different skeletal assemblages are presented from the 7th to the 12th century AD and the osteological markers identified contextualised in a historical period of socio-economic change. Our results show that this is a period with high infant mortality, ample record of osteological stress-markers and sufficient pathological conditions to reconstruct a landscape of precarity and inequality among certain sectors of the Cantabrian population, specially from rural setting, in the chronological transition from Late Antiquity to the Middle Ages.

5 CONTRIBUTION OF IDENTIFIED SKELETAL COLLECTIONS FOR ASSESSING SOCIAL ASYMMETRIES IN THE PAST: THE CASE OF THREE PORTUGUESE SAMPLES (19TH-21ST CENTURIES)

Abstract author(s): de Carvalho, Líliana (University of Coimbra, Research Centre for Anthropology and Health, Department of Life Sciences) - Wasterlain, Sofia (University of Coimbra, Research Centre for Anthropology and Health, Department of Life Sciences; Centre for Functional Ecology, Department of Life Sciences, University of Coimbra)

Abstract format: Oral

Paleodemography is helpful in studying levels of health/disease of past populations and their relationship with socio-economic conditions.

Although not of archaeological origin, identified skeletal collections constitute an important mean of obtaining knowledge on past populations, mainly due to the knowledge about the context in which they were formed and who integrates them (usually - but not always - individuals with lower social support, such as the poor, sick, and “lunatics” or outsiders).

To assess the impact that childhood stress may have had on past societies with marked socioeconomic differences, children’s stress indicators will be studied in 360 adults from three identified Portuguese osteological collections (Identified Skeletal Collection of the University of Coimbra, Identified Skeletal Collection of the National Museum of Natural Science - Lisbon, Collection of Identified Skeletons of the 21st Century - University of Coimbra). All individuals were born between the mid-19th century and the late 20th century, an extended period that includes

the biosocial changes of the post-industrial revolution, the discovery of the “theory of germs,” and improvements in prophylaxis and medicine. Nevertheless, this period also constituted a milestone of social poverty and underdevelopment in Portugal that prevailed between the end of the monarchy in 1910 and the end of the dictatorship in 1974.

In general, it is expected that individuals born in the 19th century will be more likely to suffer from stress in childhood and, therefore, be significantly more affected by morbidity during adult life, dying earlier than their peers who lived a healthier childhood. Individuals born during the 20th century, although with a childhood often similar to that of the previous century, would have benefited from some medical advances that would mitigate their greater propensity for health problems in adulthood, thus increasing the average life expectancy.

6 FROM AUTONOMY TO PRECARIY: THE MATERIAL IMPACT OF INDUSTRY IN THE NORTHWESTERN IBERIAN RURAL WORLD (19TH-21ST C.)

Abstract author(s): Tejerizo, Carlos (Università degli Studi di Genova)

Abstract format: Oral

The impact of industry in prior pre-industrial economies has been a common topic of discussion in Social Sciences. In the case of Archaeology, the development of Industrial Archaeology since mid-20th century has fostered new compelling insights on the topic, delving into questions such as the material conditions of the working classes, the technological development of industry or the transformation of the patterns of distribution and consumption. However, these analyses have not commonly addressed the historical development of such impacts in pre-industrial societies from a material point of view, or the dialectics that emerges in this process. Moreover, analysis have focused mainly in the urban world, leaving aside the rural areas, considered as peripheric. In this paper, I will describe the material traces of the impact of industry in a peasant-based economy, and how this society was transformed while conserving traces of the pre-industrial past. For this purpose, I will use a case study coming from north-western Iberia, centred in the little village of Casaio (current Galicia), where we have been conducting different research projects since 2017. This village, a typical peripheral rural context located in the mountains, was totally transformed in less of one generation in the 20th century through the introduction of two main forms of industry: one related to the tungsten exploitation regarding the Second World War, and the slate mining of the second half of the 20th century. Through the archaeological analysis of different landscapes and sites I will materially characterize the pre-industrial social and economic landscape of Casaio to deeply understand the impact of tungsten and slate industry and how this historical process operated from a local point of view. Thus, I will discuss the transformation from an autonomous, although complex and contradictory, society, into an industrial and capitalistic economy based on high levels of precarity.

7 PARASITES AS PROBES OF PRECARIOUS LIVING CONDITIONS: THE SPANISH CIVIL WAR CASE

Abstract author(s): Gijón, Ramón - Méndez, Francisco - Gutiérrez, Laura - Miranda, Erik (Universidad de Granada)

Abstract format: Oral

Parasitic evidence, associated with archaeological materials, allows us to take a bioarchaeological approach to different questions, concerning the populations under study. These include different elements, such as socio-economic conditions, hygienic and sanitary conditions, the presence of domestic and peridomestic animals or population movement, among others.

Due to the precarious conditions that occur during a war, the discovery of parasites allows us to gain first-hand knowledge of the conditions that individuals had to suffer, such as overcrowding, ingestion of food in poor conditions or hygienic problems, among others.

Despite the discipline's proven interest in transdisciplinary contributions, studies carried out on past populations subjected to wartime conditions are scarce. This work wants to provide new data about the different parasites found in archaeological material, associated with war cases. In particular, this contribution reviews the existing knowledge of parasites in these conditions and provides a new study on parasites from skeletal individuals from the Spanish Civil War (1936-1939).

8 THE MATERIALITY OF PRECARIY AND MIGRATION IN CONTEMPORARY GREECE FROM AN ARCHAEOLOGICAL PERSPECTIVE

Abstract author(s): Jungfleisch, Johannes (Ruhr-University Bochum)

Abstract format: Oral

The precarity of people on the move arises from the interplay of different elements. Following Anna Tsing, precarity is a modality of life characterised by instability, indeterminacy, and vulnerability. Precisely these aspects determine the living conditions of many migrants in the present who leave their home countries for a variety of reasons. But what makes people in motion especially vulnerable is their frequently undocumented status in the transit and destination countries produced by the border regime of nation states.

Forced, undocumented and work-related migration produces material traces and complexes reflecting people's living conditions at the distinct stages of their contingent migrant journeys. These material remains document not only how people on the move physically encounter the perils and obstacles during their clandestine travels, for example, the forces of nature in the wilderness and the border security infrastructures. Migrants' material worlds also show how people on the move attempt to remake a sense of home in the foreignness of their new environments. Therefore, the archaeological investigation of the material remains of contemporary migration may reveal the precarious conditions of migrants' transient lives.

Based on two case studies conducted in Turkey and Greece in 2017 and 2022, this paper discusses, on one side, the material remains people on the move leave behind during their undocumented travel to Europe. On the other side, I focus on the material culture of their lives in Greece. In this way, I attempt to trace the material remains of migration as material witnesses to the precarity of migrants at the different stages of their journeys to Europe and during their lives in Greece. This contemporary perspective on precarity may serve as an analogy to similar conditions in the past.

538 ASSEMBLING HOARDS: OBJECT BIOGRAPHIES, PAST LIVES AND THE PROCESS OF COLLECTING AND ACCUMULATING OBJECTS INTO HOARDS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Goldberg, Martin (National Museums Scotland) - Becker, Katharina (University College Cork) - Scarci, Azzurra (Römisch-Germanisches Zentralmuseum – Mainz)

Session format: Discussion session

Hoarding – the deliberate collection of objects – is typically studied by archaeologists through deposition. This final act, on this final day, tells us very little about all the other actions that the objects were involved in or about all the other days and lives these objects encountered.

Hoards recovered through controlled excavation offer more possibilities for interpretation. Evidence for grouping or parcels are most obvious when objects are contained in vessels, but where organic evidence is preserved, more subtle groups such as bags or bundles can be recognised. These active distinctions between objects (even where there are material relationships across the whole assemblage) can provide residual information about the process of accumulation. Objects biographies can be reconstructed from wear, repair or fragmentation and increasingly potent scientific analyses allow us to investigate a range of questions about how, and why, people created these collections of objects before burial:

- What were objects used for before they were hoarded and why were they buried together?
- Who might have owned these objects and why were they valued?
- What distances, either in time or space, did objects travel before being hoarded?
- In the case of heirloom or curated objects, why were they no longer retained?
- How were processes of assembling ritualised or otherwise made meaningful?

By focusing on the actions behind hoarding, this session intends to ask how, and why, people amassed and valued curated objects in the first place. We are curious about comparisons with other complex assemblages (burial, sanctuary deposits), forensic approaches to modern discoveries, or fresh thinking on older collections. We are seeking to make thematic connections between participants in this session and the UKRI-funded 'Unwrapping the Galloway Hoard' project in order to encourage the cross-fertilization of ideas and approaches, especially between historic and prehistoric research into hoarding and deposition.

ABSTRACTS

1 A HOARD WITHIN A HOARD – TRANSFORMING OBJECT BIOGRAPHIES. AN EXAMPLE FROM THE DANISH LATE BRONZE AGE

Abstract author(s): Metzner-Nebelsick, Carola (LMU Munich)

Abstract format: Oral

The paper will introduce the Montelius Period IV hoard of Mønsted near Viborg in central Jutland, Denmark. Several deliberately fragmented golden objects; two bracelets with double-looped ends, pieces of gold wire and folded sheet gold were stuffed into the socket of a bronze axe. This type of bronze hoard with ritually fragmented metal artefacts blocking axe sockets is well attested in the Late Bronze Age, with clusters in the Carpathian Basin, Britain, Ireland and Northwest France. Single axes blocked with gold ornaments, however, represent a typical hoard type in Britain and Ireland. So far, Mønsted seems to be the only example from Denmark or southern Scandinavia. The paper will elucidate the biographies of the single items of the Mønsted hoard. They represent, so to say, a hoard within a hoard. Golden bracelets with double-looped ends are symbols of power with remarkable longevity ranging from the Early Middle

Bronze Age to the end of the late Bronze Age according to continental European chronology, thus covering ca. 900 years of continuous use. However rare items, they were worn in large areas of continental and northern Europe, signifying a shared understanding of their symbolic agency beyond cultural boundaries. The fragmentation of these special body ornaments will be a focus of discussion, since until Per. III golden bracelets of this type were almost exclusively deposited as body ornaments in male elite graves in the northern cluster of their distribution.

2 MOUNTS OF A BRONZE AGE SHIP FROM THE 14TH CENTURY BC HOARD NEAR KRYVA IN CARPATHIAN UKRAINE.

Abstract author(s): Nebelsick, Louis D. (Unwersytet Kardynala Stefana Wyszyńskiego w Warszawie)

Abstract format: Oral

A hoard of Uriu-Opály type (Brz D/14-13th century BC) was discovered in a Lăpuș style conical necked vessel on a high terrace of the Tisza River near Kryva, rajon Chust in the Ukrainian Maramures in 1966. It was composed of a typical assemblage of conical and disk butted axes and spiral jewelry but also two remarkable cast bronze mounts: An upswept socket with lentoid button shaped finial and a pointed triangular element with a zoomorphic snout have not been adequately explained. I believe that they are best seen as the bronze mounts of the prow and stern of an inceptive Late Bronze Age ostentatious ship. Comparable mounts, which are also likely to have decorated the extremities of ships, were found in the hoard Lozova II in Moldavia. In this paper further bronze mounts, remains of early ships and iconographic parallels are consulted from a vast region including Scandinavia, Western Europe, the Aegean and the Near East in order to propose a narrative explaining how these mounts that show affinities with both Aegean and Scandinavian ships ended up in a northern Carpathian hoard

3 BREAKING VOTIVE OFFERINGS IN THE PANHELLENIC SANCTUARY OF OLYMPIA

Abstract author(s): Scarci, Azzurra (Leibniz-Zentrum für Archäologie)

Abstract format: Oral

Large numbers of fragmented and intentionally destroyed bronze votive offerings from the Geometric and Archaic periods have been retrieved from the panhellenic sanctuary of Olympia in Greece. These copper-based fragments bring to mind scrap metal found in numerous Bronze Age hoards in Europe.

This study aims to present the results of an ongoing project at Leibniz-Zentrum für Archäologie in Mainz, in collaboration with the German Archaeological Institute in Athens, focusing on identifying specific fragmentation and breakage patterns in selected groups of material (tripod cauldrons, griffin heads and Sicilian-Italian artefacts) analysing them statistically according to their measurements and weights, and investigating the spatial distribution of the objects and their relationship to specific functional areas of the sanctuary (e.g. workshops, altars, temples). The use of different approaches will help to understand better the meaning of this phenomenon, how and when these votive offerings were destroyed and the reasons why they were recovered in large numbers within the sanctuary.

4 GATHERING BONES: ASTRAGALOI IN GREEK ARCHAEOLOGICAL CONTEXT

Abstract author(s): Care, Barbara (University of Fribourg, Switzerland; ERC Locus Ludi)

Abstract format: Oral

The contribution focuses on ongoing research concerning formation dynamics of astragal deposits, collected in thousands of specimens in Greek archaeological contexts. The interpretation of these finds has heavily relied on the content of documentary sources, highlighting their role as game tools, and the direction taken by modern scholarship has not moved significantly away from this traditional approach. In fact, the game practice is still believed to be so popular to justify the abundant archaeological and visual evidence come down to us from antiquity.

It is rather an obvious point, but forgotten when it comes to astragali, that contexts matter. Placing those archaeological remains within their physical, cultural, geographical and chronological setting is crucial to give them meaning. This research directs attention to the shifting roles of astragali, which are first and foremost physical remains of a once-living being, and addresses how these roles change and are renegotiated through time, space and social context. Looking also at depositional features and ritual-specific behaviours in the various contexts, especially in votive areas, the study provides a more holistic viewpoint for a deeper understanding of the reasons behind the selection and gathering of these bones.

A. MARTINČEK AND LIPTOVSKÉ SLIAČE - THE TALE OF TWO SWORD HOARDS

Abstract author(s): Havlíková, Markéta (MUNI - Ústav archeologie a muzeologie) - Bača, Martin (Department of Archaeology, Faculty of Arts, Comenius University in Bratislava) - Sliacka, Simona (Liptov museum in Ružomberok)

Abstract format: Poster

In this poster, we will focus on two Late Bronze Age sword hoards from northern Slovakia. The first one, from Martinček, was found at the beginning of the twentieth century in the field by local farmers and consisted of sixteen swords. The second one, from Liptovské Sliache, was found in the middle of the twentieth century in the travertine mound by miners and consisted of six swords. Both hoards could be considered very interesting and valuable find assemblages. Unfortunately, because of the time of discovery, not much could be said about them besides the typo-chronological perspective. Therefore in 2023, we decided to re-examine both hoards including a complete metalwork wear analysis as well as an analysis of element composition to reconstruct a possible (more complex) story behind both sword hoards. Interestingly, what seemed to be an example of a rather uniform practice of sword deposition, common in this area of Central Europe, now seems to be a more differentiated phenomenon.

539 NEW RESEARCH IN ROMAN RITUAL: OBJECTS AND TEMPLE SITES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Stemberger Flegar, Kaja (PJP d.o.o.) - Lundock, Jason (Full Sail University)

Session format: Regular session

In this session we will explore some new research into the material practice of ritual behaviour in the Roman world. As a material representation of the attempt to put order and definition to one's world, examining ritual practice offers insight into both social and cosmological structures within a given cultural context. The empire of ancient Rome, being the most multi-cultural political union in the ancient world, offers a useful view into how diverse cultural traditions negotiate with each other to develop new concepts of identity and meaning through both inclusive and exclusive ritual behavior. New discoveries in the field and fresh perspectives continue to deepen our understanding of the Roman ritual landscape. By bringing together research on small finds, depositional practice, and temple sites, this panel will examine how ritual reflected and defined the Roman experience to those who lived it. While the session's primary focus is on studying material culture, we will also incorporate theoretical perspectives to offer greater depth in our understanding and interpretation of ritual behavior in the wider Roman world.

ABSTRACTS

1 LARRAHE: A VASCONIC DEITY IN THE NORTH OF NAVARRE

Abstract author(s): Ruiz-Gonzalez, Daniel (Aranzadi Science Society) - Mendizabal-Sandonis, Oihane (EHU/UPV, Classic Studies Department; Aranzadi Science Society) - Aiestaran, Mattin (UPV/EHU, Department of Geography, Prehistory and Archeology, Investigation Group of Prehistory IT-1223-19; Aranzadi Science Society) - Narbarte, Josu (Aranzadi Science Society) - Velaza, Javier (University of Barcelona, Latin Philology Department) - Gorrochategui, Joaquín (UPV/EHU, Classic Studies Department) - Pescador, Aitor - Esain, Peio - Agirre-Mauleón, Jantxo (Aranzadi Science Society)

Abstract format: Oral

At the top of Mount Arriaundi, located at an altitude of 942m and 24km from Pamplona (Itza, Navarre), archaeological excavations have been carried out over the last 11 years around the Early Middle Age monastery of Doneztebe (1075-1100 AD). This site must be understood as part of the policies of the monarchy of the Kingdom of Pamplona for the control and domination of its territory. As this is a strategic site, in an earlier phase of the Roman period (I - III centuries AD) it was also used as a defensive enclave as it visually dominates the city of Pompaelo and the route of the Roman road Iler XXIV that linked Burdigala with Asturica. In the course of the excavations, a Roman altar (I-II century AD) dedicated to the indigenous deity Larrahe was unearthed from an early medieval well filled with construction debris. Epigraphic and linguistic studies link it to the Vasconic language and to three other similar altars dedicated to this deity found by chance in the south of Navarre. This is a good example of syncretism, a mixture of local beliefs and customs adapted to typical Roman votive altar formats. Furthermore, the location of this new altar is the northernmost artefact of the sort discovered so far, and its proximity to the Atlantic slope provides us with valuable information on the distribution of religious beliefs and the language of the indigenous Vascones that inhabited Navarre.

2 BUILDING + TABULA ANSATA + SKEWERS = TEMPLE?

Abstract author(s): Ravnik, Mateja (Institute for the Protection of Cultural Heritage of Slovenia) - Jančar, Mojca (Terarhis) - Miškec, Alenka (National Museum of Slovenia, Numismatic Cabinet) - Ragolič, Anja (Research Centre of the Slovenian Academy of Sciences and Arts, Institute of Archaeology) - Tica, Gojko (Tica Sistem)

Abstract format: Oral

In the Roman period, the settlement of the area between Sevnica and Brestanica in Slovenia shows an interesting picture. Most researchers place via publica Celeia – Neviodunum on the left bank of the Sava River, where is the majority of the discovered Roman villas. An exception is the archaeological site Log – Groblje located on the right bank. In 2008, the area was investigated as a part of the construction of hydroelectric power plants. A multi-period site, with the majority of architectural and material remains belonging to the Roman period, was discovered.

Three bigger buildings, which probably belong to a complex of villa rustica, perhaps a river port or a transshipment station, represent the first Roman phase. To the second Roman phase, we attributed only one smaller building. It has relatively strong rubble layers and massive foundations. It has only two rooms, with all the walls built simultaneously, and it was located in the middle of the first phase building. Next to the building, a larger waste pit, which contained pottery, coins, metal objects and carbonized figs and olives, was also documented. In the rubble layers around the building, we discovered numerous iron objects interpreted as skewers with endings in the form of animal heads. Similar skewers were found as well in the temple in Colatio/Stari trg near Slovenj Gradec. Additionally, in the rubble layers was a large number of coins from the middle of the third and first half of the fourth century and 11 fragments of marble slabs, three of which have incised parallel lines, probably an inscription field in the form of a tabula ansata.

Perhaps, based on the stratigraphic situation and the discovered archaeological finds, we can interpret the building as a smaller temple erected after (part of) the estate was abandoned.

3 URBAN TEMPLES AND PAGANISM IN THE FOURTH-CENTURY LEVANT: PRAGMATISM AND IDEOLOGY BETWEEN ARCHAEOLOGY AND LITERATURE

Abstract author(s): Dolci, Jacopo (University of Nottingham)

Abstract format: Oral

The fourth century was a crucial moment for the Roman Empire as Christianity took hold first with Constantine the Great's Edict of Milan (313) and then became the state religion under Theodosius, as an effect of the edict of Thessaloniki (380). Literary sources widely advocate for an immediate 'de-paganization' of cities, culminating in Christian violence and raids on temples; a pattern which seems however poorly represented in the archaeological records. In fact, both the recent excavation projects (e.g. Caesarea, Hippos, Sepphoris), and the extensive reconsideration of early-1900s archaeological investigations (e.g. Baalbek, Palmyra, Gerasa) support a more nuanced situation in which urban temples were generally left untouched or little affected.

This paper provides an overview of the archaeological evidence for the closure, dismantlement, reuse, and preservation of urban pagan sanctuaries, which will be integrated and compared with the late antique literary evidence. The aim is to understand what happened to temples in the fourth century and get crucial insight into the different possible 'fates' these buildings underwent. Moreover, it will explore whether and how governments endorsed actions against sanctuaries and to what extent they worked; or whether the 'afterlife' of sanctuaries was the result of a widespread adaptation to common circumstances. This paper will shed light on the religious life of a multi-confession region as the late antique Levant through spatial analysis and by advancing an interpretation of the variegated situation in which the temples were in the fourth century.

4 A SYSTEMATIC GIS-BASED ANALYSIS OF TEMPLE SITES DEVELOPMENTS IN THE RELIGIOUS LANDSCAPE OF THEBAID IN THE LATE ROMAN PERIOD

Abstract author(s): Guimerà, Ariadna (Autonomous University of Barcelona)

Abstract format: Oral

The story of religion in Roman Egypt was dominated by the triumph of Christianity at expense of pagan religion. Generally studied in binary terms, the decline of the old gods of Egypt had its own dynamic away from the orthodox Church. Indeed, there were material signs that all was not well with the Egyptian paganism before Christians had achieved the religious control of the Empire. And Thebes, the old capital, is an excellent example of that.

Since the middle of the third century the hieroglyphic and Greek texts on the walls of temples showed a very low quality work. For thousand years, pharaohs and Ptolemaic kings had recorded their involvement to the restauration and embellishment of temples as a sign of wealthy cultic activity. This legacy continued under the Roman Empire but at a speedily declining rate. At Deir el Medina there is nothing later than Domitian; at Philae of Caracalla; at Esna

of Decius. So, it is difficult to avoid that the imperial support for decoration of Egyptian temples drop after Tiberius, shrank after Hadrian and fade away with Constantine.

This communication will give a panoramic view of the sunset of institutional Egyptian and Greco-roman religion through the study of the pagan temples in the Thebaid and how this was related with the outset of Coptic Church. Furthermore, through the historical analysis it will be reconsidered the historiographical phenomenon of the abandon, destruction and Christianization of pagan temples and which are the new archeological perspectives for its study.

5 COMMUNITY AS CULT IN PRE- AND POST-CONQUEST GAUL

Abstract author(s): Irvin, Aaron (Murray State University)

Abstract format: Oral

Beginning with the concept of orthopraxis, this presentation will focus on cult practice and ritual as a communal activity, defining the make-up and participants of communities from imperial, provincial, tribal, municipal, and local levels through participation in cult and interaction with conceptions of the divine. Cult and communal ritual associated with cult served to define the boundaries and contours of communities, and clearly identify, through orthopraxic activities, those to be credited as either insiders or outsiders. In doing so, this chapter will argue that Gallic communities developed first as cult communities tied through ritual to certain sites within Gaul, and that it was this common underlying cultic membership and cultic connection with specific topoi that defined Gallic identity. The subsequent development of Gallo-Roman religion was not the development of a new religious belief system, or even the syncretism of Roman and Gallic religious customs, but rather a new system of political/religious order that incorporated a new community of religious actors and a new system of political authority.

6 BEING ROMAN IN MALTA. ARTEFACTS, PEOPLE, AND RITUALS IN THE SANCTUARY OF TAS SILG

Abstract author(s): Grassi, Elisa (CRN-ISPC) - Bonzano, Francesca - Airoidi, Filippo (Università Cattolica del Sacro Cuore, Milano)

Abstract format: Oral

Malta, placed in the very centre of the Mediterranean, has always been open to influences from a large number of regions and cultures. The Maltese sanctuary of Tas-Silg has witnessed many physical and cultural transformations: the structures of the original late neolithic temple were re-used for a Phoenician sanctuary dedicated to Astarte, and it subsequently was turned into a Hellenistic temple of Hera, a Roman shrine for Juno, and eventually a Byzantine church consecrated to the Virgin Mary.

As the name of the female deity changed over time, her main features remained unchanged, in a process of interpretatio well documented within the Roman world.

The Roman imperial age is the least known period of the history of the sanctuary, given the lack of significant building activity. Yet, there is evidence suggesting that Malta – now a Roman province – still perceived the goddess worshipped here as a strong element of political and religious identity. Therefore, it was attempted to draw a clearer picture of the sanctuary in this period, with its rituals and its daily life, relying on the data provided by stratigraphic evidence and artefacts. Endeavouring to assess quantification, chronology, provenance and distribution of pottery and small finds can highlight patterns in artefacts consumption; likewise, striving to reconstruct the spatial transformation of the site can enhance our comprehension of changes in rituals and ceremonies. Moreover, a better knowledge of the dynamics of the decline of the sanctuary in the context of the development of Malta during the Roman Imperial age will provide a deeper understanding of the shifting of cultural and political balance within the island.

7 THE CRAFTSMAN'S TALE : GROPING FOR RITUALS AND BELIEFS IN THE ARCHAEOLOGICAL RECORD

Abstract author(s): Willems, Sonja (Royal museums of Art and History, Brussels)

Abstract format: Oral

Traces of rituals and beliefs are not easy to grasp in the archaeological record, since most critique dismisses the presence of structured gestures, shaming the rapid overinterpretation of “if we don’t understand it, it’s ritual”. This has in recent years often resulted in the omitting of ritual behavior outside the restricted context of sanctuaries.

A quick look into ethnographic and cross-chronological literature on craft spaces and handicraft in general, indicates that beliefs and the gestures that accompany them, whether they leave traces in the archaeological record or not, are part of the everyday life of the craftsman. This is surely the case for most of the crafts where fire plays an important role in the production process. Whether it concerns prayers, or forbidding the presence of women, or the offering

of anthropophagic objects to protect the production, each stage of the process is probably accompanied by specific gestures, known, and performed by every craftsman of a given group.

Based on recent survey on pottery craft spaces in the North of France, systematic analysis of the installation and abandoning of pottery kilns has shown presence of recurring gestures. Comparison is often difficult because of the limited publication of the fillings of the structures, mostly reduced to the illustration of the empty kiln structure, as well as their partial or rapid excavation. This contribution therefore wants to point out the possibilities of detailed excavation, combined to the development of a database for gestures in craft spaces that will enable to assess the possibility of structured behavior.

8 CULTURAL EXCHANGE, PUNIC INFLUENCES, OR JUST FASHION? THE USE OF CUPAE IN FUNERARY CONTEXTS IN LUSITANIA AND BAETICA

Abstract author(s): Cáceres-Puerto, Carlos (Instituto de Arqueología de Mérida-CSIC) - Ramos Soldado, José Luis (Laboratory of Palaeobiology, Andalusian Institute of Historical Heritage-IAPH)

Abstract format: Oral

Mobility and cultural exchange were not uncommon during Roman times around the Mediterranean, as it continued a long-lasting tradition of interconnectivity spanning hundreds of years. However, when we address migration we often associate it with warfare and forceful displacement of population, rather than economic and cultural mobility, whether it was undertaken voluntarily or not. It usually leads us to misjudge the implications for the people involved in these processes, and the impact they had on their destinations. Without modern communication systems, migration in Antiquity often implied a one-way ticket to the unknown, which was often accompanied by a sense of cultural loss, uncertainty, and eagerness to identify themselves with their motherland. Upon their deaths, those fortunate enough had the opportunity to build something to be remembered for. However, those funerary monuments tell us more than a desire for eternity, conveying the cultural background of the displaced, and preserving their cultural ethos in a foreign land.

In addition, these conveyors of identity were often copied by local communities eager to assimilate the newest fashion trends, even in the funerary monuments. Cupae have been present in the Iberian Peninsula since Roman Republican times. However, they belong to a far earlier cultural background. They originated in Eastern Mediterranean, later spreading their presence through North Africa. This Semitic origin was not ignored during the Punic conquest of Southern Iberia, as it was widely used in several settlements. Hence, this cultural background made us question the purpose, and reason, of these funerary monuments in Southern Iberia: were they transmitting the story of a community, or following a cultural trend instead? To what extent could both be mutually exclusive? In this paper, we analyse the presence, distribution, and cultural background of the cupae in the provinces of Lusitania and Baetica.

540 ZOOMING IN/OUT/PAST THE VIKING AGE: INTEGRATING LOCAL, REGIONAL AND GLOBAL FUNERARY PRACTICES IN THE BALTIC-NORTH SEA-ATLANTIC AXIS, AD750-1050

Session theme: 6. Contested Pasts & Presents

Session organisers: Ó Ríagáin, Russell (School of Archaeology, University College Dublin) - Espolin Norstein, Frida (Stockholm University) - Maldonado, Adrián (National Museums Scotland)

Session format: Regular session

For many parts of the Afro-Eurasian landmass, the period c.AD750–1050 was characterized by a contraction of conceptual space and increased chains of social interaction and interdependence. This session will trace practices of transculturation in the well-documented funerary spaces of one part of that landmass: the Baltic–North Sea–Atlantic axis. Change and stasis in funerary practices will be a point of entry for exploring local, regional and pan-regional material manifestations of the processes of transculturation brought about through the resulting movement of people, objects, and ideas in an area not generally studied as a zone of networked identities.

The agents of change in this zone have traditionally been referred to as ‘vikings’, but migrants, raiders, and traders were just some of the many people on the move. Scholars, nomads, diplomats, craftspeople, settlers, missionaries, refugees, the enslaved, and the betrothed were all part of this maelstrom of movement, with a range of short- and long-term outcomes in terms of transculturation. Both human and non-human agents are at play here, as the serialized production of trade goods and influxes of raw materials created new chains of interdependence and avenues for transculturation. Funerary practices in context allow us to study these processes in progress.

Papers seeking to integrate localized shifts in material manifestations of funerary practices with the wider social processes at work are particularly welcome, including those which seek to decentralize agency in this period. Also welcome are treatments of the problematic binary of colonizer–colonized, and the way that transculturation better

captures the material record resulting from these complex interactions over time. So too papers concerned with questioning the exceptionality of the period. Finally, participants will be encouraged to critique—or justify—loaded concepts like hybridity, mestizaje, acculturation, and syncretism, in the ongoing deconstruction of the existence of bounded ‘cultures’.

ABSTRACTS

1 VIKING GRAVES? REGIONAL DIVERSITY IN VIKING AGE BURIAL PRACTICES

Abstract author(s): Norstein, Frida Espolin (Department of archaeology and classical studies, Stockholm univiersity)

Abstract format: Oral

Burial practices of the Viking Age are famously diverse, ranging from rich ship burials in great mounds to small pits with a few grams of cremated human bone. Despite this variation, Viking burial is still often regarded as a meaningful concept. This paper will examine regional variation in Viking Age burial practices, assessing similarities and differences between graves from Britain, Ireland, Iceland, Norway, and Sweden. It will argue that the graves often seem to be defined by what they are not, rather than what they are, either in opposition to local practices, when discovered in a settlement context, or later Christian practices when discovered in Scandinavia. The paper will also focus on how the burial practices are used to construct narratives, especially in connection with identities and beliefs. It aims to highlight how essentially very different practices are used to make similar arguments about conversion and identity construction. It will suggest that the burials have traditionally served an illustrative role where their pagan/Scandinavian nature is the starting point for the analysis, rather than the subject under discussion.

2 THE LONG, STRANGE JOURNEY OF VIKING-AGE RINGED PINS

Abstract author(s): Maldonado, Adrián (National Museums Scotland)

Abstract format: Oral

Ringed pins are the calling card of the Viking Age in Britain and Ireland: small, low-value metal cloak fasteners, found in dressed burials, and frequently encountered as stray finds. They have a complex trajectory, beginning as Irish dress items in the pre-Viking period. From the middle of the ninth century, they began to be mass produced in the newly-founded trading settlements of the Viking Age Irish Sea, particularly in Dublin. For a short period into the tenth century, they are found across the Scandinavian-speaking diaspora, as far as Iceland and L’Anse aux Meadows, Newfoundland, showing that they were worn by a new class of migrant seafarers. However, in Ireland and Scotland, ringed pins continued to be made and evolved into a variety of ringed and unringed styles long after they fell out of fashion in Scandinavia. Reflecting on the afterlife of these dress fasteners as an archaeology of Gaeldom forces us to reassess their role in the funerary rituals of the Viking Age, and revisit the way we apply the term ‘Hiberno-Norse’.

3 COPING WITH CHRISTIANITY: VIKING REACTION TO CHRISTIAN REQUIREMENTS AND BURIAL CUSTOM IN THE ISLE OF MAN

Abstract author(s): Steinforth, Dirk (Independent Researcher)

Abstract format: Oral

When Vikings conquered and settled in the Isle of Man in the later ninth century, they introduced a distinctly pagan burial custom in the Island that would not have been out of place in their Scandinavian homelands, including splendidly furnished mound- and boat graves. In stark contrast, the local Manx were Christian and buried their dead in plain flat graves without any objects at all.

Subsequently, the Viking settlers became more familiar with the Christian faith of their neighbours (and frequently, no doubt, in-laws) and gradually accepted baptism. During this phase of syncretism and spiritual reorientation, furnished burial became diminished until it disappeared entirely from the archaeological record in the 960s.

In the face of the meagre and unpretentious burial custom they were now required to follow, the Manx Vikings adopted a completely new strategy to hold on to the socially efficacious displays the opulent mound graves had offered. Appropriating a local tradition of long standing, they found means to demonstrate the status of their dead in the custom of erecting stone monuments – while at the same time celebrating and promoting Christianity.

This paper investigates the responses the newly Christianised Vikings in the Isle of Man developed in order to cope with the changes in funerary and memorial custom the new faith imposed on them.

4 **UNEARTHING IDENTITY: A STATISTICAL ANALYSIS OF THE VIKING AGE FURNISHED BURIALS OF NORTHERN ENGLAND**

Abstract author(s): Kinirons, Samuel (University College Dublin)

Abstract format: Oral

The causes of the changing of funerary practices across the Viking Age world remain the subject of debate. It is nonetheless clear that the forms, settings and grave-goods associated with these burials represent a series of choices that can be seen as reflexive expressions of identity. Using statistical analysis, this paper seeks to improve the understanding of the evolution of and variation in furnished burials within Viking Age northern England. A delineation of the spatial patterns within the data will lead to a greater understanding of the regional interactions and pressures which moulded of conceptions identity during this period.

The north of England presents an ideal case study with which to approach this complex topic. It has been argued that there exists a regional distinction in the nature of the grave assemblages on either side of the Pennine Hills. Those to the west have been seen as sharing closer affinities with the Isle of Man and Dublin, while those to the east are more broadly comparable to the furnished Viking Age burials of southern England. This study will apply statistical methods such as cluster analysis to test this and provide a tighter definition of the nature of this perceived Irish Sea/North Sea divide. The variables examined will not solely consist of the grave-goods. Where available, grave-form, landscape setting, age, gender, biological sex and isotopic data will also be included. Data relating to the date of the burials (typological or scientific) are of particular interest. This study's statistical approach will aid the identification not only of spatial patterns but also temporal ones. This is significant as the relative chronology of the Viking Age furnished burials of Britain and Ireland remains poorly understood. The paper will conclude by interpreting these results and discussing future directions of research.

5 **TRANSCULTURATION IN ACTION? ASSESSING STASIS AND DYNAMISM IN FUNERARY PRACTICES IN SCANDINAVIA AND AMONG THE SCANDINAVIAN DIASPORA, C.AD750-1050**

Abstract author(s): Ó Ríagáin, Russell (University College Dublin)

Abstract format: Oral

Transculturation occurs both between individuals and groups of individuals, on (g)local and more global levels. This observation helps move away from treating the evidence in terms of binaries such as pagan-Christian, migrant-native, etc., and to acknowledge and embrace the messiness of social interaction. With this in mind, this paper will identify and explore the changes—or lack thereof—in funerary practices and the related phenomena of stone memorials and the deposition of material culture in media such as soil and water in a period characterised by intensified social entanglements in the Afro-Eurasian landmass, focussing principally on Scandinavia and territories associated with the Scandinavian diaspora through a group of representative case studies.

The paper will explore the degree to which we as archaeologists are assigning psycho-social identities from the material remains of a funerary drama involving human remains carried out by agents whose intentions and beliefs we can only guess at based on (often later and decontextualised) texts and comparison to similar practices?

The most important considerations for this paper, though, are whether local and more widespread changes in funerary practices occurred, and how they might be identified and interpreted in light of a critical approach to the evidence. Change is not always as obvious as may seem, as will be outlined. For example, recent radiocarbon-based work on cremation burials in Ireland and northern Britain has demonstrated that what may seem an 'intrusive' practice associated with migration is in many instances a local continuation of practices stretching from the Neolithic well into the early medieval period. Even where change may be identified, the shift from one practice to another (e.g. furnished to unfurnished inhumation) may not have been a stark jump from one practice to another involving a sudden ideological shift or act of settlement.

542 **RECONSTRUCTING BIOLOGICAL RELATEDNESS AND INFERRING HUMAN RELATIONS IN THE PAST**

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Rivollat, Maité (Ghent University; Durham University; Bordeaux University; Max Planck Institute for Evolutionary Anthropology) - Frieman, Catherine (Australian National University) - Haak, Wolfgang (Max Planck Institute for Evolutionary Anthropology)

Session format: Regular session

Kinship is a core element of small-scale societies, but it has not traditionally been a focus of archaeological research since the dynamic social relations that emerge from kinning practices are difficult to access from fragmented archae-

ological data. Funerary sites are among the few contexts that yield some evidence for intimate relations between individuals, but inferring the social practices of living people from the layout of their dead is fraught.

Over the last decade, as ancient DNA methodologies have advanced, we have witnessed the reconstruction of a growing number of genetic pedigrees, from first-degree pairs to massive trees, as well as identity-by-descent analysis giving insight into more distant links. Together, these data can provide a basic genetic framework, on which archaeological and anthropological contexts can build on by means of integration, which then allows inferences on social practices. Yet biological patterns of relatedness may map imperfectly onto complex social relations between individuals, communities, and emic understandings of lineage or descent. For instance, queer relations and others that do not result in children are impossible to discern from genetic results. We think it is time to develop an approach that brings together social and biological data to understand the complexities of past kinship.

This session aims to work across different approaches to kinship in the past, building on data and interpretative frameworks from all involved disciplines to push the discussion further towards a more integrated method for understanding kinship and relatedness among ancient societies as well as to outline the epistemological limitations.

We welcome researchers involved in ancient DNA, archaeology, bioarchaeology, and social anthropology working on any time, period, or data type. We particularly invite new case studies developing interdisciplinary methods to reconstruct biological relatedness and infer social structures in ancient groups or populations as well as re-evaluations of previously published work.

ABSTRACTS

1 GENDER RELATIONS, PATRILOCALITY AND RELATEDNESS AT THE BURIAL GROUND OF NITRA, SLOVAKIA

Abstract author(s): Hofmann, Daniela (University of Bergen) - Bickle, Penny (University of York) - Gelabert, Pere - Cheronet, Olivia (University of Vienna) - Tvrđý, Zdeněk (Moravian Museum) - Fernandes, Daniel (University of Vienna) - Pavúk, Juraj (Comenius University) - Reich, David (Harvard University) - Duffett Carlson, Kellie Sara - Pinhasi, Ron (University of Vienna)

Abstract format: Oral

Neolithisation is generally thought of as a large-scale process taking place over an extended period of time and at a continental scale. In contrast, the increasing availability of high-coverage ancient genomes makes it possible to address micro-scale topics like family and kinship, and how these more personal networks of relatedness change over time. Combining these two scales of analysis remains challenging, as it is often expected that macro-level processes will leave a clear-cut signature in micro-level data, leading to a side-lining of diversity. We use the Linearbandkeramik culture (ca. 5500-4900 cal BC) cemetery at Nitra, Slovakia, as a case study to explore some of these interpretative tensions. The consensus in much recent literature is of patrilineal social formations with a patrilocal residence pattern, in which households consisted of a nuclear family with some dependent relations and property was inherited from father to son. We argue here that the issue is not which of the myriad of different kinship formations is the best fit to the archaeological evidence, but the underlying presumption that such models of relations are static and unchanging. Using paleogenomic data from the cemetery of Nitra (Slovakia), alongside existing isotopic information and the grave good assemblages, we reassess the prevalence of patrilocality, discuss the role of kinship relations in the provision with grave goods and in burial ritual continuity, suggest possible alternatives to the 'nuclear family' as the basic unit of Neolithic society and reflect on the role of personal mobility in forming kin.

2 INFERENCE ON REGIONAL NETWORKS BASED ON LOCAL BIOLOGICAL TREES, THE EXAMPLE OF THE FRENCH NEOLITHIC SITE OF GURGY, LES NOISATS'

Abstract author(s): Rivollat, Maité (University of Ghent; Durham University; University of Bordeaux; Max Planck Institute for Evolutionary Anthropology) - Rottier, Stéphane - Deguilloux, Marie-France (University of Bordeaux) - Haak, Wolfgang (Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

The reconstruction of genetic relatedness in archaeological contexts has rarely been feasible, but thanks to the recent optimization of ancient DNA methods, it is now possible to reliably reconstruct biological relationships. What may sometimes seem anecdotic at the site level can reveal insightful when examining population structure and social behaviors.

The extensive genomic analysis of the French Middle Neolithic site of Gurgy 'les Noisats' in the Paris Basin has allowed us to reconstruct two massive pedigrees, one connecting 63 individuals over seven generations, and another with 10 individuals over four generations. We inferred a patrilocal and patrilineal system, as well as the practice of female exogamy, confirmed by strontium analyses.

We explored the non-local female diversity and their relationships and discovered a striking absence of close genetic affinities between them. Moreover, the overall length of runs of homozygosity in the group suggests a wider regional network. The Paris basin at this period is well known for massive funerary monuments belonging to the Cerny culture, called Passy-type structures. In contrast, Gurgy is characterized by an absence of monuments and therefore of potential selection of individuals buried there according to economic or social hierarchies. Furthermore, the cultural attribution of Gurgy to the Cerny culture remains unclear, with multiple influences from different cultures. While the archaeological data suggests an isolation of the site from the local context, the genetic evidence shows strong regional links with a large biological network over several generations. One plausible hypothesis would be that the site represents the burial practices of the non-elite part of the Cerny population in the region.

Overall, this study provides insights that go beyond immediate genetic relatedness and allows us to explore the group structure, its size, funerary and settlement practices in a much broader social and cultural context.

3 RE-EVALUATING KINSHIP IN NEOLITHIC IRELAND

Abstract author(s): Carlin, Neil (School of Archaeology, University College Dublin) - Smyth, Jessica (School of Archaeology, University College Dublin) - Bickle, Penny (Department of Archaeology, University of York) - Cleary, Kerri (Archaeological Consultancy Services Unit, Drogheda) - Frieman, Catherine (School of Archaeology and Anthropology, Australian National University) - Greaney, Susan (Department of Archaeology and History, University of Exeter) - Hofmann, Daniela (Department of Archaeology, History, Cultural Studies and Religion, University of Bergen) - Pope, Rachel (Department of Archaeology, Classics and Egyptology, University of Liverpool)

Abstract format: Oral

Neolithic Ireland is perhaps most widely recognised for its impressive megalithic monuments, such as the complex of late 4th millennium passage tombs within the UNESCO WHS of Brú na Bóinne, Co. Meath in eastern Ireland. Archaeologists have long been interested in trying to uncover the social relations that brought these diverse monuments into being. Most recently, it has been claimed that dynastic elites drove the construction of passage tombs, based in part on the sequencing of 44 whole human genomes from Irish megalithic monuments (Cassidy et al. 2020). We contend that the available evidence is insufficient to adopt a model of a socially distinct dynastic elite in Neolithic Ireland. We make the case that new scientific approaches to the exploration of kinship necessitate robust and appropriate social modelling and interpretative frameworks. Scientific methods alone are not adequate to reconstruct the complex and contingent social histories which occupy archaeologists, but their results in combination with well-founded social analysis can allow us to imagine alternate and richer pasts.

4 KINNING IN DEATH AT MIDDLE TO LATE BRONZE AGE MEGIDDO

Abstract author(s): Eisenmann, Stefanie (Theological Faculty, Humboldt Universität zu Berlin) - Kalisher, Rachel (Joukowsky Institute for Archaeology and the Ancient World, Brown University) - Waldman, Shamam (Department of Human Evolutionary Biology, Harvard University; Department of Genetics, Harvard Medical School) - Martin, Mario (Institute of Ancient History and Ancient Near Eastern Studies, University of Innsbruck) - Cradic, Melissa (Badè Museum of Biblical Archaeology, Pacific School of Religion; Department of History, University at Albany) - Adams, Matthew (The Center for the Mediterranean World) - Agranat-Tamir, Lily (Department of Genetics, The Alexander Silberman Institute of Life Sciences, Faculty of Science, The Hebrew University of Jerusalem; Department of Statistics and Data Science, The Hebrew University of Jerusalem) - Reich, David (Department of Human Evolutionary Biology, Harvard University; Department of Genetics, Harvard Medical School, Boston) - Stockhammer, Philipp (Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilians University; Max Planck Institute for Evolutionary Anthropology) - Finkelstein, Israel (School of Archaeology and Maritime Cultures, University of Haifa; Department of Archaeology and Ancient Near Eastern Civilizations, Tel Aviv University)

Abstract format: Oral

In 2020, Agranat-Tamir et al. published the largest DNA study to-date on ancient individuals from the southern Levant, featuring 35 individuals from the ancient city of Megiddo. Onto this dataset of 35 we add newly generated full-genome aDNA data of another 24 individuals. Whereas Agranat-Tamir et al. focused mainly on large-scale population genetic dynamics, here we seek to re-integrate the numerous attested cases of close biological relatedness at Megiddo with the respective burial contexts to explore kin-formation practices (i. e., kinning) at the site.

All studied individuals from Megiddo were buried within city limits, in most cases in graves located under the floors of contemporary residential structures. By doing so, the houses' living inhabitants chose to maintain a close physical connection with a select group of deceased. At the same time, a close relationship between the buried individuals is inferred from the arrangement of graves in clusters or from the placement of multiple bodies within single burials. On several occasions, cases of close biological kinship correspond to such close spatial arrangements of skeletal remains.

We interpret these specific burial practices at Megiddo as mechanisms of kinning through creating physical connections between 1) the living and the dead as well as 2) between the dead themselves.

Due to the density of genetic links between individuals buried in connection with one residential structure (Area K courtyard house) and through a comparison of burial contexts, we are able to identify one likely case of kinship in a double burial that was solely based on social relations.

5 ARCHAEOGENOMIC PILOT RESEARCH OF KAMENICE, A PREHISTORIC ALBANIAN TUMULUS (1600-500 BCE)

Abstract author(s): Jia, Xiaowen (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean - MHAAM; Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University of Munich) - Skourtanioti, Eirini (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean - MHAAM) - Bejko, Lorenc - Amore, Maria - Aliu, Skender - Pojani, Iris (Department of Archaeology and Heritage Studies, University of Tirana) - Ringbauer, Harald - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean - MHAAM) - Stockhammer, Philipp (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean - MHAAM; Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University of Munich)

Abstract format: Oral

Situated in southeastern Albania at the interface of the Aegean and the Adriatic, the Tumulus of Kamenice was used for inhumations from 1600 to 500 BCE. In this work, we generated genome-wide SNP data for 25 individuals from Kamenice that span the full time transect, providing the unique and first possibility for insights into biological relatedness and demography of a single tumulus in Late Bronze Age and Iron Age Albania.

We identified a genetically homogeneous population throughout the respective time in contrast to all societal transformations in the wider region. Moreover, we found evidence for a patrilineal society, within which all the males' Y chromosomes belong to two distinct sub-groups of R1b1a1b (M269). We identified the biological relatedness up to 6th degree with IBD analysis. The amount of relatedness raised after 750 BCE. We also detected a signature of a population size decrease around 750 BCE using HapROH, which coincides with the prevalence of Y chromosome lineage R1b1a1b1b3 and a new way of grave construction. Besides, a female individual was biologically related to individuals both before and after 750 BCE. Overall, all the ancient DNA evidence support a local population bottleneck event.

6 INVESTIGATING KINSHIP AT THE IRON AGE CEMETERY OF WETWANG SLACK, EAST YORKSHIRE (UK)

Abstract author(s): Armit, Ian (University of York) - Büster, Lindsey (University of York; Canterbury Christ Church University) - Fischer, Claire-Elise (University of York) - Olalde, Iñigo (University of the Basque Country; Ikerbasque—Basque Foundation of Science; Harvard University) - Booth, Tom (Francis Crick Institute) - Reich, David (Harvard Medical School)

Abstract format: Oral

Ancient DNA analysis of c. 400 individuals from the Iron Age cemetery of Wetwang Slack, East Yorkshire (UK), has recently been undertaken as part of the COMMIOS Project (Communities and Connectivities: Iron Age Britons and their Continental Neighbours). The cemetery belongs to the so-called 'Arras Culture', characterised by individual graves under square barrows and including occasional chariot burials (which are otherwise rare in Britain). As the largest excavated cemetery in Iron Age Britain, the Wetwang Slack assemblage, dating to the 3rd/2nd centuries BC, has enormous potential to inform our understanding of the role of biological relatedness as a structuring principle within Iron Age kinship practices. While several previous aDNA and isotope studies of prehistoric communities in Britain and Continental Europe, principally dealing with Neolithic and Bronze Age populations, have suggested a prevalence of patrilineal descent and female exogamy, the picture emerging from our work at Wetwang Slack offers a contrasting picture. Initial results demonstrate a high degree of biological relatedness among females (and much less among males), suggesting that kinship practices, within this community at least, were quite differently structured. In this paper we examine the implications of this emergent patterning for our understanding of British Iron Age societies.

7 USING ANCIENT DNA AND ISOTOPES TO EXPLORE FEMALE CAPTIVITY AND KINSHIP

Abstract author(s): Sedig, Jakob (Harvard University) - Cameron, Catherine (University of Colorado)

Abstract format: Oral

In the last decade, the exponential growth of ancient DNA and isotopic studies has revealed intriguing discrepancies in the movement and ancestry of males and females, particularly in post Neolithic Eurasia. In this paper we focus on what we argue are two interrelated trends: the significant over-representation of males in the ancient DNA record, and evidence of females being more mobile and having more heterogeneous genetic ancestries than males. While these patterns are often ascribed to exogamous marriage practices—non-local females marrying into male social groups—using a global ethnographic database we argue that many of these mobile, genetically diverse females were initially introduced as captives to their new social groups. We then explore how these patterns can provide new insights into ancient kinship systems, most notably how the dynamic social identities of captive women allowed them to integrate into new social groups in various ways. Though normative assumptions about captivity would seemingly limit a captive female's autonomy, ethnographic studies in small scale societies suggest that some could be integrated into captor kin networks and lived relatively normal lives.

8 FROM KINSHIP TO COMMUNITY: RECONSTRUCTING THE SOCIAL STRUCTURE OF A MEROVINGIAN POPULATION IN NIJMEGEN, THE NETHERLANDS

Abstract author(s): Altena, Eveline (Dept. of Human Genetics, Leiden University Medical Center) - Olalde, Iñigo (BIOMICS Research Group, University of the Basque Country UPV/EHU; Department of Genetics, Harvard Medical School; Ikerbasque—Basque Foundation of Science) - Kootker, Lisette (Geology & Geochemistry cluster, Faculty of Science, Vrije Universiteit Amsterdam; CLUE+, Vrije Universiteit Amsterdam) - van der Linde, Constance (Fysisch antropologisch onderzoeksbureau Tot op het Bot) - Hendriks, Joep (Bureau Archeologie en Bodemkwaliteit, Gemeente Nijmegen) - Theuvs, Frans (Faculty of Archaeology, Leiden University) - Reich, David (Department of Genetics, Harvard Medical School; Broad Institute of MIT and Harvard, Cambridge; Department of Human Evolutionary Biology, Harvard University; Howard Hughes Medical Institute)

Abstract format: Oral

In 2011 and 2015, just north of Nijmegen, in present day Lent, a Merovingian cemetery dated in the 6th century was excavated, uncovering 55 inhumation graves and 24 cremation graves. Nijmegen is one of the oldest cities of the Netherlands, founded during the first century CE by the Romans at the south bank of the river Waal, close to the present-day German border. The Late Roman period (270-470 CE) was characterized by economic, political and social instability, resulting in substantial depopulation of the Netherlands, but Nijmegen and its surrounding area show evidence of at least a minimal level of continuity of occupation into the early medieval Merovingian period. At the same time, however, this cemetery dates in the Migration period, and it can therefore not be excluded that this cemetery was used by new settlers of this area.

To gain fundamental and profound insights into the demography, social structure and origin of the community that used this cemetery, multidisciplinary bioarcheological research (osteology, isotopes and aDNA) on the inhumed individuals was conducted. This paper focusses on the kinship analysis, and how these data enhance our understanding of the inhumed community.

Fifty-one individuals provided sufficient genome wide data to reconstruct close and more distant genetic kinship by inferring kinship ratios, allelic mismatch rate patterns and IBD. Combined with information on genetic sex, age at death, and (absolute) datings pedigrees could be reconstructed.

The preliminary results suggest that the cemetery has been in use by just a few generations and at least nine families, although only half of the studied individuals are related to someone else in the cemetery. Outside the reconstructed families, no one shared mitochondrial DNA and also the Y chromosome shows much diversity, indicating a lack of strong matri- or patrilineal settlement patterns.

9 KINSHIP AND SOCIAL STRUCTURE OF AVAR PERIOD DESCENDANTS OF STEPPE COMMUNITIES INFERRED FROM ANCIENT DNA BASED PEDIGREES

Abstract author(s): Gnechchi Ruscone, Guido Alberto (Max Planck Institute for Evolutionary Anthropology) - Rácz, Zsófia - Samu, Levente (Institute of Archaeological Sciences, Eötvös Loránd University) - Szeniczey, Tamás (Dept of Biological Anthropology, Eötvös Loránd University) - Friedrich, Ronny - Knipper, Corina (Curt Engelhorn Center for Archaeometry gGmbH) - Pohl, Walter (Institute for Medieval Research, Austrian Academy of Sciences; Institute of Austrian Historical Research, University of Vienna) - Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University; Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Hofmanová, Zuzana (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Department of Archaeology and Museology, Faculty of Arts, Masaryk University) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

The Avar period in East-Central Europe saw the appearance of populations carrying culture and genomic components typical of the Eastern Eurasian and Pontic-Caspian Steppe, confirming one of the historical narratives on the origin of the Avar Khaganate. These people and their descendants settled in the Carpathian Basin for around 250-300 years coexisting with populations of different European cultural and biological backgrounds. By studying four entire Avar period cemeteries associated to these communities, with a combination of new ancient genomic data, archaeological, anthropological and historical contextualization we inferred extended multigenerational pedigrees that revealed unique features of their kinship system and patterns of local mobility that were impossible to assess before. We were able to infer clear and strict patterns of genealogical descent such as patrilineality, patrilocality and female exogamy. These patterns are shared between the four sites analyzed were we also observed a complete avoidance of consanguineous unions. We also found multiple instances of a very specific practice that we interpret as levirate marriage, involving closely related males having offspring with the same female. These characteristics can be traced in historical sources as well as in anthropological studies on present-day traditionally nomadic Steppe societies. These extended pedigrees also allowed us to assess important communities shifts involving groups with the same genomic ancestry, that would have gone undetected by standard population genomic tests for ancestry discontinuity. We could therefore test a long-term archaeological hypothesis about population shifts occurred during the Middle Avar period attested by important changes in the material culture and burial rites that could be in the future extended and tested on further sites.

10 INFERRING SOCIAL STRUCTURE AND BIOLOGICAL RELATEDNESS OF EARLY MEDIEVAL POPULATION IN MORAVIA USING ANCIENT DNA

Abstract author(s): Zlámalová, Denisa - Macháček, Jiří - Dresler, Petr - Přichystalová, Renáta (Department of Archaeology and Museology, Masaryk University) - Poláček, Lumír (Institute of Archaeology, Czech Academy of Sciences) - Samu, Levente (Institute of Archaeological Sciences, Eötvös Loránd University) - Velemínský, Petr (Department of Anthropology, National Museum, Prague) - Krupičková, Šárka (Institute of Archaeology, Czech Academy of Sciences) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology; Department of Archaeology and Museology, Masaryk University)

Abstract format: Oral

We investigate the period of formation of one of the first Slavic states in the region of Moravia and its impact on societies that inhabited the territory. Due to a limited amount of historical record from this region in Early Middle Ages, various characteristics of the organization of society are still debated, especially the rise of Early Mediaeval elite groups. With archaeogenetic approach, we are able to infer certain aspects of social structure, kinship and marital practices from biological relatedness and archaeologically defined social status of studied individuals.

To look into these patterns, we have archaeogenetically analyzed whole burial groups from several well-known and well-investigated sites that have been strongly associated with elites via archaeological and historical research. Thanks to good DNA preservation at the sites, we have obtained new ancient genomic data from almost all individuals selected. We observe networks of biologically related individuals that, put together with findings from related disciplines, shed light on what the population in Early Medieval Slavic state looked like, what kind of connections they had and how the society was organized. The archaeogenetic data brings the opportunity to observe not only genetic relatedness, but also social kinship and its meaning relative to belonging to the Early Medieval elite.

PREVIOUSLY UNOBSERVED SOCIAL STRUCTURE IN AN ANCIENT POPULATION: THE CASE STUDY OF A POLYNESIAN OUTLIER COMMUNITY

Abstract author(s): R Arauna, Lara (Archaeo- and Palaeogenetics Group, Institute for Archaeological Sciences, University of Tübingen) - Feldman, Michal (Archaeo- and Palaeogenetics Group, Institute for Archaeological Sciences, University of Tübingen; Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Carlhoff, Selina - Naegele, Kathrin (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Powell, Adam (Department of Human Behavior, Ecology and Culture, Max Planck Institute for Evolutionary Anthropology) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Kiko, Lawrence (The Solomon Islands National Museum) - Buckley, Hallie (Department of Anatomy, Otago School of Biomedical Sciences, University of Otago) - Kinaston, Rebecca (Department of Anatomy, Otago School of Biomedical Sciences, University of Otago; Centre for Social and Cultural Research, Griffith University; BioArch South) - Posth, Cosimo (Archaeo- and Palaeogenetics Group, Institute for Archaeological Sciences, University of Tübingen; Senckenberg Centre for Human Evolution and Palaeoenvironment, University of Tübingen; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

Oceanians are descendants of two main dispersal waves: an early expansion of modern humans out-of-Africa more than 50,000 years ago (ya), extending as far as the Solomon Islands; and the Austronesian expansion, that started around 5,000 ya in Taiwan and peopled the remaining unexplored territories of Oceania up to Polynesia. Subsequent movements within the region created a complex cultural and genetic landscape, including the expansion of Polynesian-speaking groups westward, outside the Polynesian triangle, giving rise to the so-called Polynesian Outlier communities after ~1,000 ya. These recent population movements created a highly differentiated genetic background among present-day Oceanians, and an array of sociocultural systems. The formation process of these systems remains poorly understood.

Here, we study genomic data of more than 100 ancient individuals from the ancient Polynesian Outlier site of Namu, a large burial ground on the Taumako island (Solomon Islands), dated between 700-300 ya. We infer the genetic-sex for all individuals, showing similar proportions of both male and female burials. We also assess the degree of biological relatedness between individuals and find many indicatives of close relations, including 47 parent-child relationships, 27 siblings and over 400 2nd and 3rd degree relationships. We combine these estimates, runs of homozygosity and uniparental haplogroups inferences with archeological data to reconstruct pedigrees over multiple generations. Furthermore, we attempt to study the socioeconomic stratification of the community following an intersectional approach. We create a set of linear regression models to explain the variation in archeologically estimated wealth by age, sex, ancestry, and biological relatedness. Together, the integration of the genetic analyses with the abundant archeological data available for Namu, provide a new perspective into the social organization of a past community. This study contributes to the understanding of Oceanian social structure and its relationship with the genetic history of the region.

KINSHIP FROM CROSS-CULTURAL PERSPECTIVES: A MIXED METHODS APPROACH TO SEEMINGLY QUANTITATIVE ISSUE

Abstract author(s): Cvecek, Sabina (Austrian Archaeological Institute)

Abstract format: Oral

Interdisciplinarity in archaeology is today taken for granted. Interdisciplinary approaches, however, are often synonymous with collaboration experts from natural sciences, including a broad spectrum of physical, chemical, geological, and biological techniques applied to archaeology. Despite the application of extensive array of methods, techniques, and results of the physical and biological sciences, including the aDNA analysis, archaeology is not a natural science. In Europe, archaeology is widely considered as a standalone discipline. Beyond its ivory tower, such as in the North American four-field approach, archaeology is only one of the four subfields of anthropology, which combines archaeology, physical/biological anthropology, linguistics, and socio-cultural anthropology. Therefore, a continuous collaboration between natural scientists and social scientists, including archaeologists, bioarchaeologists and socio-cultural anthropologists, is vital for the advancement of European archaeology. While digging the evidence from the ground, the persistent problem archaeologists face is how the materiality of dwellings can be best read and interpreted. The spatial organization of dwellings is a kind of code that can be used to reconstruct kinship practices. From early on, socio-cultural anthropologists have understood that dwellings are central correlates of thought and social organization. Therefore, the relevant expertise of a sociocultural anthropologist may lie in informing archaeologists of the diversity of the observed kinship practices from the present and the recent past so that this may fruitfully contribute to our understanding of the distant past. This contribution draws on research history of kinship research in the Anatolian and Balkan prehistory to outline a new mixed methods approach for contextualizing houses, settlements, and biological

signatures in unified analysis. As researchers, we should take advantage of applying mixed methods approaches to tackle complex issues and value qualitative insights to seemingly quantitative issues. These issues include biological relatedness and inferring human relations in the past.

13 MATTERS OF LIFE AND DEATH: KINWORK AT FUNERALS

Abstract author(s): Frieman, Catherine - Schuster, Caroline (Australian National University)

Abstract format: Oral

For decades, archaeologists have acknowledged that funerary contexts are imperfect mirrors of the living societies who assembled them. The dead, we well know, do not bury themselves. The production of funerary sites can be, and often is, an extended, contested, and carefully stage-managed process. These rites may well be designed with as much or more consideration for the future articulations of social relations as for accurately depicting their past conformations. Consequently, reconstructing social relationships—from status hierarchies to marriage patterns or more diffuse kin relations—is fraught. Here, we consider the funerary sphere as a site of kinwork. We argue that kinning practices form a key part of burial rites as the dead person or persons' relationships are reconsidered, renegotiated, transformed, or manipulated. The goal is to develop a more complex model of kin relations within funerary contexts in order to contribute to a more nuanced archaeology of social practice that compliments emerging discussions of family structure, kinship and relatedness.

A. DIETARY BEHAVIOUR OF EARLY BRONZE AGE BIOLOGICAL KINSHIP GROUPS IN MIKULOVICE (CA.2050-1750BC CZECH REPUBLIC)

Abstract author(s): Drtikolová Kaupová, Sylva (National Museum, Prague) - Papac, Luka (Max Planck Institute for Evolutionary Anthropology) - Langová, Michaela (Institute of Archaeology, Czech Academy of Sciences) - Massy, Ken (Ludwig-Maximilian University Munich) - Friedrich, Ronny (Curt-Engelhorn-Zentrum Archäometrie) - Vytlačil, Zdeněk (National Museum, Prague) - Haak, Wolfgang (Max Planck Institute for Evolutionary Anthropology) - Ernée, Michal (Institute of Archaeology, Czech Academy of Sciences)

Abstract format: Poster

The Early Bronze Age cemetery in Mikulovice, eastern Bohemia, Czech Republic, is one of the largest and richest of the Únětice Culture, and therefore a model site for extensive bioarchaeological studies. This paper will present the results of isotopic reconstructions of diet in the context of biological relatedness inferred from aDNA.

Sampling of all buried individuals (N=109) for aDNA, ¹⁴C dating, radiogenic and stable isotope analyses of Sr, O, C and N enabled us to reconstruct various complexly interwoven aspects of lifeways, at the level of single individuals, biological kinship groups, as well as the entire community. Carbon and nitrogen isotopic values were measured in all individuals older than 6 years, from whom aDNA was successfully recovered (N=81). Both carbon and nitrogen isotopic values differed significantly between biological kinship groups, whereas the differences in nitrogen isotopic values between biologically related individuals were significantly lower than those between unrelated individuals. These results are further discussed with respect to the absolute chronology, grave position and the character of the associated grave goods.

Though the research is still ongoing, the current data suggest that close biological/social relationship was the leading factor driving dietary behaviour of the individuals buried at Mikulovice.

This research was supported by the Czech Academy of Sciences Award Praemium Academiae (Dr. Michal Ernée) and by the Ministry of Culture of the Czech Republic (DKRVO 2019-2023/7.l.e, 00023272).

555 ALL THESE FINDS - CHALLENGES AND POSSIBILITIES ON LARGE URBAN ARCHAEOLOGICAL EXCAVATIONS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Haggren, Georg (University of Turku) - Dahlström, Hanna (Museum of Copenhagen) - Wennerg, Tom (Museum of Gothenburg) - Forsblom Ljungdahl, Veronica (The Archaeologists - National Historical Museums)

Session format: Regular session

Large-scale (rescue) excavations are now a common occurrence in urban archaeology today. This is especially the case in North and Western Europe, where more early modern sites are being excavated. These sites often produce large amounts of finds which causes significant challenges but at the same time offers considerable research potential. Additionally, modern contextual excavation methods together with constantly developing documentation methods, produce a growing amount of information. How to approach these large projects from a find's perspective?

The focus of this session is on finds related to large entities and structures in urban contexts (e.g. moats, quay sites, ramparts, whole plots or even quarters, and industrial plants). Our aim is to discuss collection strategies, recording and documentation strategies. What is the potential of (so called) bulk finds? What kinds of special finds strategies are needed? We would also like to gather experiences of systematical metal detecting while excavating these sites. Should we develop on-site sorting and recording or settle for finds analyses during post-excavation? What is the need of on-site conservation? We also welcome discussions of the importance of finds when making interpretations, especially in situations where the excavated areas are filled with redeposited material, such as moats and harbourside land reclamations. What can we obtain from the results, and what will be missing? The focus is especially on the early modern era but papers based on medieval, especially late medieval sites are welcome too.

ABSTRACTS

1 URBAN EXCAVATIONS AND MUSEUM RESEARCH AS A MEAN FOR TRANSMEDIAL COMMUNICATION – PLANNING FOR THE NEW MEDIEVAL MUSEUM IN STOCKHOLM

Abstract author(s): Kjellberg, Joakim - Vidarv, Olle (Medieval Museum in Stockholm)

Abstract format: Oral

The Medieval Museum is the result of a spectacular excavation in 1979-1980 on Helgeandsholmen island. The excavations have been the single largest urban excavation so far in Stockholm, resulting in an on-site museum that opened in 1985 with some of the archaeological features preserved in situ. It is still one of the biggest assemblages of medieval artefacts in Sweden to be scientifically collected and registered, numbering more than 50 000 objects. Given the time, the excavations were of high quality but have hitherto not been fully published. A popular summary of the results and selected artefacts was published shortly after the excavation. This archaeological data is a great resource, but due to lack of funding to continually produce new research, one that still is waiting to be fully utilised.

Moving forward to present day the current museum will close in 2023 and move into a new venue in 2028-2029. The new museum and exhibitions will have a partly different objective, now seeking to be the starting point for exploring all of medieval Stockholm. Although this opens for including other and newer excavations, Helgeandsholmen is still one of the major resources. Over the coming years we plan to revisit the Helgeandsholmen material and recognise that research on this material still has a great potential for renewed perspectives in the new museum.

Without a physical museum the challenge is to make an ongoing archaeological research project a key part of the communication while developing the new museum and to maintain the relationship with our visitors. Through an integrated transmedial approach, using such tools as social media and digitisation, we aspire to find new ways of engaging with our audience. We will present the collection and seek to discuss the pitfalls and potentials, along with some initial ideas and concepts in this paper.

2 DEALING WITH ABUNDANCE- FINDS FROM THE EXCAVATIONS OF THE LATE MEDIEVAL OR EARLY MODERN TOWN OF NYA LÖDÖSE

Abstract author(s): Forsblom Ljungdahl, Veronica (The Archaeologists, National Historical Museums)

Abstract format: Oral

Large-scale excavations were carried out of the late medieval or early modern town of Nya Lödöse between the years 2013-2017. The area excavated included about one-fifth of the town's total area and revealed well preserved layers and structures from about 35 plots, church and cemetery.

Nya Lödöse was a small town situated in present day Gothenburg and existed between 1473 and 1624. The town was Sweden's only port connected to the western sea and had close trading connections with Danish, Dutch, German, Scottish and Flemish towns among others.

Because the town existed for a short period of about 150 years, and its close connections with other European trading hubs, makes it a perfect case for studying changes in material culture between the late medieval and the early modern period. The plots has also been excavated with a similar level of ambition, using contextual methodology, which makes it possible to compare and analyze differences in material culture between different plots and areas of the town.

This paper aims to present the finds process, how we managed to handle such a vast assemblage over many years of excavations. Challenges we faced along the way but also possibilities. How can we use the finds together with osteology and paleobotany as a tool for interpretation already during the process of excavation? What are the limitations and how have we dealt with the fact that even a large excavation like the Nya Lödöse project has its limitations when it comes to budget for conservation. What did we decide to prioritize and what did we not?

3 TWO LARGE GLASS FIND'S ASSEMBLAGES FROM A LATE MEDIEVAL OR EARLY MODERN SCANDINAVIAN TOWN

Abstract author(s): Haggren, Georg (University of Turku)

Abstract format: Oral

Nya Lödöse was a small Swedish medieval town which was founded in 1473 and deserted in the early 1620s. Located on the estuary of the River Götaälv it was Sweden's gate to the west, and a lively port with close connections to Dutch, Flemish, German and Scottish towns. It was also a predecessor of the later city of Gothenburg founded in 1621.

While the rest of the world was focused on the Great War, later known as the World War I, in 1915–1918 large scale excavations took place in Nya Lödöse. These early excavations resulted lots of finds, including about 800 glass fragments. In contrary to many other early excavations here the glass finds were collected and preserved for future research too. Even if the information of their contexts is far from accurate they offer an overview on vessel glass used by the towns people of Nya Lödöse.

In the 2010s new large scale excavations were made in a suburb of Gothenburg called Gamlestaden, i.e. the site of Nya Lödöse. During this project "Staden Nya Lödöse" dozens of plots were excavated by modern contextual methods. Similar to the excavations a century earlier, lots of glass was found. However, this time the stratigraphical context of each fragment is well known and it is possible to get an overview of the glass assemblage in each individual plot.

The aim of this paper is to discuss of two large assemblages from a single town. Here we have a chance to compare the potential of finds material from the same site but excavated by completely different methods. Together these two assemblages give us an overview over the role of the glass vessels, dining culture and trade's contacts in a small Northwest European town.

4 IN SEARCH OF LOST TIME - 50 YEARS OF LARGE-SCALE EXCAVATIONS IN GOTHENBURG

Abstract author(s): Wennberg, Tom (Museum of Gothenburg)

Abstract format: Oral

Large scale excavations in Gothenburg begun in 1975. While urban archaeology in other parts of Sweden focused on the medieval period the archaeology in Gothenburg focused on early modern times. This was partly due to that the founding date of Gothenburg was 1621.

These large-scale excavations yielded large amounts of finds. This paper will discuss the difference in collecting methods during this time period and the possibilities with older store material. Different materials have been treated different over this period and collecting strategies clearly varies over time.

The stores of the Museum of Gothenburg have large assemblages and though a lot of different types of finds in different materials the lion's share consists of ceramics. There are also almost only materials from the 17th and 18th century and only fragments from later periods.

This paper will also discuss what type of materials that are missing and how methods regarding large materials in large features could be applied in future excavations.

5 EARLY MODERN URBAN ARCHAEOLOGY FINDS FROM THE LARGEST EXCAVATION IN FINLAND

Abstract author(s): Uotila, Kari (Muuritutkimus Oy; University of Helsinki; University of Turku) - Helamaa, Maija (Muuritutkimus Oy)

Abstract format: Oral

Large-scale excavations were carried out in the current Market Square in Turku, SW Finland, in 2018–2022. The area was settled around mid-17th Century and destroyed in the Great Fire of Turku in 1827. By the 1830's, the area had been covered and turned in to a marketplace which was now under reconstruction. The excavations revealed well preserved layers and structures from about 20 different town plots inhabited by merchants, military officers, and craftsmen.

The main excavation area, covering about 1.5 hectares, produced over 3700 kg of finds material with pottery and glass forming the major find groups. The number of single sherds, pieces and objects rises above 200.000. The organic material, especially leather, but also wood and bone objects, were much better preserved than anticipated. All finds were collected in the field and handled (cleaned & catalogued) during the post-excavation process.

But even the large-scale excavation has limited budget. This especially is the case when we deal with materials which need to be conserved before entering the museum collections. Only selected finds of these materials were archived. This causes inequality between different finds and their future research. Decisions must be made, and they are not always easy.

This paper presents the finds processing during the Market Square excavation. How this vast material was handled. Also, how this experience affected and affects for future excavation projects in Turku and around Finland.

6 FROM THE MOATS OF COPENHAGEN

Abstract author(s): Simonsen, Rikke (Museum of Copenhagen)

Abstract format: Oral

Copenhagen, the capital of Denmark, has been surrounded by walls and moats since the Middle Ages. Over time, the city's boundaries have been moved several times and replaced by mighty ramparts, bastions, and deep moats. New parts of the city have risen on the filled moats. Over the years, the Museum of Copenhagen has excavated a number of times in the old moats, which were partly filled in with the rubbish of the Copenhageners.

In general, the humid environment of the moats has ensured very good preservation conditions for the artifacts. However, in some places the number of finds is overwhelming, while in others archaeologists find only a few objects. And why are hats, trousers and large pieces of pots and plates found in one part of the city, but only small fragments of fabric and pottery in another? This presentation will focus on the varied pattern of finds in Copenhagen's post-medieval filled-in moats across time and space, looking at the finds, the museum's strategies for the excavations and contemporary written sources.

7 ALL THE FINDS WERE THROWN AWAY...

Abstract author(s): Ravnholt, Gerd (Museum of Copenhagen)

Abstract format: Oral

In 2019/20 Museum of Copenhagen conducted a rescue excavation of an island in the city harbour, entirely constructed by land reclamation from 1696 and onwards. The excavation covered approximately 19.000m². With an estimated average depth of 3,5 m of land fill layers, more than 66.000m³ of soil, with the potential of containing artefacts, was removed.

A lot of finds were simply ignored during excavation, and a lot were discarded after a simple registration post-excavation. There are 534 individual records of finds, of which only 101 are kept (some records contain more than one artefact). This decision is controversial and did not pass without discussion.

The research potential of the finds was considered low; hence a very restricted collection strategy was chosen. The trial excavation revealed finds from over a very long timespan, with no possible way to determine origin.

Collection of finds was limited to sampling in bigbags, followed by sieving, with the aim of determining whether it was possible to distinguish between the top and the bottom deposits, and possibly find the harbour bed, with the potential of well-preserved medieval artefacts dropped from ships before the reclamation of the area.

With sampling and sieving a more complete assemblage was obtained. No finds were left behind because they were small, dirty, or looked boring.

Clay pipes were an exception from the restricted strategy, in that all pipes were collected. The pipes can be seen as a representation of the entire find assemblage showing the timespan, the preservation and the fragmentation. The clay pipes were subjected to further analysis to examine if it was possible to detect residues of opium or cannabis in the pipes. No cannabis or opium was detected, but a method for analysing the former contents of the pipes was developed.

8 OPPORTUNITIES, CHALLENGES AND PERSPECTIVES. MASS COLLECTIONS OF FINDS FROM ARCHAEOLOGICAL RESEARCH IN POMERELIAN TOWNS

Abstract author(s): Starski, Michal (Faculty of Archaeology University of Warsaw)

Abstract format: Oral

The paper aims to present the results of selected archaeological investigations in Pomerelian towns (Gdańsk Pomerania) and the related problem of elaborating and caring for mass collections of movable finds. The issues of methods of obtaining finds, conservation of monuments, and processing and storage of collections will be discussed. Examples from smaller and larger towns of the region (i. e. Gdańsk, Człuchów, Chojnice, Lębork, Puck, Skarszewy) will be contrasted to present differences in the approach to the elaboration of monuments. The paper will also discuss both collections from the early and late Middle Ages but, above all, modern and contemporary finds, which are definitely more numerous and often obtained from accidental contexts. On this basis, the problem of the suitability of the collections for research on material culture and the issue of storing finds will be discussed. The paper will be presented based on more than 20 years of experience in archaeological research in Pomeranian towns.

9 INTERDISCIPLINARY RESEARCH IN A LARGE-SCALE URBAN SITE: THE ANDALUSI NEIGHBORHOOD IN SAN ESTEBAN ARCHAEOLOGICAL SITE (MURCIA, SPAIN)

Abstract author(s): Hernández Robles, Alicia - Eiroa Rodríguez, Jorge A. (University of Murcia) - González Ballesteros, José Ángel - Celma Martínez, Mireia (ARHIS, University of Murcia) - Haber Uriarte, María (University of Murcia)

Abstract format: Oral

In 2009, an archaeological rescue intervention in the city center of Murcia (Spain) partly brought to light the medieval urbanism of the Arrixaca neighborhood, a suburb outside the city walls from the 11th and the 13th centuries, the most extensive medieval site discovered in Europe –about 10.000 sqm.

San Esteban Project (<https://sanesteban.um.es/>) aims to understand the daily life of this Andalusí suburb through an interdisciplinary research team coordinated by the University of Murcia in agreement with the City Council, where the specialists in Bioarchaeology, Archaeozoology, Archaeobotany, ORA, Paleoparasitology, DNA, isotope analysis, and the more traditional record (ceramics, glass, metals) provide an accurate recovery methodology to retrieve the whole materiality, both the visible and the invisible during the digging process.

This paper is to display the experiences, protocols, sampling, and results in thanks to the effort, and the most recent archaeological techniques. Specific areas of the site will be taken as an example (e.g. rooms, burials, pipes) to analyze the different sampling strategies carried out (hand-picking, random or specific sampling, water sieving, flotation samples, etc.), and how they have affected the types and amount of finds recovered.

In addition, the archaeological site provides the ideal training scenario for undergraduate and master's students, those who acquire the protocols and streamline sampling decision-making according to the research assumptions as a live accompaniment process.

The experience of the project since 2018 concludes as indispensable a diversified sampling and constantly evaluated from the data provided by each of the disciplines according to the procedures carried out. The continuous exploration of new research hypotheses and the constant incorporation of new disciplines have determined the indispensable on-site sorting and sample reserve for analysis to come in this case.

A. BEYOND JEWELRY: ORNAMENTS FROM THE MEDIEVAL CEMETERY OF PERMET, AS AN EXPRESSION OF CULTURAL IDENTITY

Abstract author(s): Meshini, Mariglen (IKTK - National Institute of Cultural Heritage, DSHA - Archaeological Service D) - Xhelili, Kiara (author) - Cako, Rigert (author) - Papathimiu, Edmond (author) - Porja, Arjol (author)

Abstract format: Poster

In 2021, the medieval cemetery of Përmet was identified during work for the “Urban integrated and development project of Berat-Përmet”, a project founded by the “Albanian Development Fund”.

The cemetery was positioned on the southern side of the Vjosa river, in urban area, which is known as the “New Neighborhood” of Përmet. Even though the Vjosa valley is known in the archaeological record for its medieval cemeteries, there was no indication of the existence of the recently discovered medieval burial ground.

The rescue excavation was organized in two equal sectors, and it enabled the identification of 25 graves. Both sectors had the same grave construction typology. The graves had a rectangular box shape, which usually narrowed at the end.

Inside the grave context we observed that half of the graves contained grave goods and half of them were not associated with any artifacts along with the human remains. The grave goods consisted mainly of objects associated directly with the body, such as necklaces, earrings, and rings.

The study of the archaeological materials, especially the earrings and rings, indicate that the cemetery dates to the 8th-9th centuries AD. This area of the Përmet cemetery is probably the earliest phase of its function as such. Based on the burial rite and grave goods, the cemetery can be dated to beyond the 9th century AD, and likely used until at least the 12th century.

The discovery of the medieval cemetery of Përmet provides important scientific data for the Early Middle Ages in the Albanian territory. It also unravels information about the cultural exchanges between societies from the 8th century to the Late Middle Ages.

THE SEDIMENT AS AN ARTEFACT: INTERPRETING HUMAN BEHAVIOUR AND ACTIVITIES THROUGH GEOARCHAEOLOGICAL ANALYSIS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Fernández-Palacios, Enrique - Dinckal, Ada (Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica “Antonio González”, Universidad de La Laguna; Departamento de Geografía e Historia, UDI Prehistoria, Arqueología e Historia Antigua, Facultad de Humanidades, Universidad de La Laguna) - Cooper, Aspen (Institute for Archaeological Sciences, University of Tübingen; Anthropology Department, University of Minnesota) - Marcazzan, Diana (Institute for Archaeological Sciences, University of Tübingen) - García-López, Zaira (CRETUS, EcoPast - GI-1553, Universidade de Santiago de Compostela)

Session format: Regular session

To obtain well-grounded interpretations of anthropogenic sediments as artefacts, recent geoarchaeological research calls for robust integration of different analytical methods exploring the archaeological context. These methods range from the geomorphological, geochemical, mineralogical, archaeometric and chronological methods at micro-, meso- and landscape scales.

This session explores the geoarchaeological approach to analysing sediments as artefacts. In addition to producing tools and refuse, humans produce, alter, and deposit sediments, acting as geological agents themselves. Thus, sediments can be viewed as unique artefacts which reflect past behaviours. This conception of archaeological sediments as artefacts has been previously proposed and is applied to a diversity of archaeological sedimentary features from different time periods and regions. Recent research highlights the benefit of integrating multi-scale geoarchaeological data with other related sources of behavioural information, such as data obtained through the technological, spatial, experimental, and archaeostratigraphic analysis of tools and refuse.

This session promotes a multiproxy, multiscale geoarchaeological analysis as a powerful tool investigating past human behavioural processes. The core theme is in the exploration of a wide variety of human activities and behaviours as they have been imprinted into the sediment itself. These processes need not be limited to a single time period or aspect of human behaviour but can reflect a wide variety of past human activities; such as the dynamics of human-environmental interaction, the socio-cultural pressures of class and gender, the development of pastoralism, the impact of colonialism, and how changing technologies can be reflected in the sediment.

ABSTRACTS

1 DR. STRANGEMUD; OR HOW I GOT A MICROSCOPE AND STOPPED THROWING AWAY MY DIRT

Abstract author(s): Cooper, Aspen (Anthropology Department, University of Minnesota; Institute for Archaeological Sciences, University of Tübingen) - Dinckal, Ada (Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica “Antonio González”, Universidad de La Laguna; Departamento de Geografía e Historia, UDI Prehistoria, Arqueología e Historia Antigua, Facultad de Humanidades, Universidad de La Laguna)

Abstract format: Oral

The integration of the Natural Sciences with Archaeology has enhanced our ability to study an invaluable index of human interaction. With the micro-contextual toolkit, we can now understand human activities through signatures imposed on the sedimentary matrix. The inherently destructive nature of an archaeological excavation destroys the sedimentary context and any information contained therein unless it is adequately recorded and sampled. This highlights an epistemological and ethical need to record and research as much of the sedimentary context as possible. Therefore, it becomes important that through the archaeological investigation, a geoarchaeologist can prioritize their resource and integrate it with other “extracted” data for a more holistic understanding of how humans actually interact in the temporal confines of that space.

In this presentation, we will explore the assortment of tools that archaeology now possesses to explore the sediment as an artifact of activity, while emphasizing the theoretical importance of having geoarchaeology as an essential collaborator in any archaeological investigation. We discuss observed pyrotechnology in the Middle Paleolithic of Montenegro and Spain to investigate the strength of these tools while exploring tangible human actions which have turned sediment into an artifact.

2 THE NEOLITHIC SITE OF QAZANCHI IN THE ZAGROS MOUNTAINS IN IRAN: A GEOARCHAEOLOGICAL APPROACH

Abstract author(s): Mylona, Pantelitsa (Department of Antiquities, Republic of Cyprus; MNHN- CNRS-UMR7209 Archéozoologie Archéobotanique : Sociétés, Pratiques, Environnements) - Khormali, Farhad (Gorgan University of Agricultural Sciences and Natural Resources) - Djamali, Morteza (IMBE - UMR Aix Marseille Université, CNRS, IRD, Avignon Université) - Davoudi, Hossein (Bioarchaeology Laboratory, Central Laboratory, University of Tehran) - Mashkour, Marjan (MNHN- CNRS-UMR7209 Archéozoologie Archéobotanique : Sociétés, Pratiques, Environnements; Bioarchaeology Laboratory, Central Laboratory, University of Tehran)

Abstract format: Oral

The Neolithic site of Qazanchi is located on Zagros Mountains in Iran. Archaeological excavations provided important information for understanding the Early Neolithic period of the area. Among different analytical approaches, a stratigraphy section was examined through soil micromorphology. The stratigraphic sections displayed several superimposed grey and brown ashy layers that raised questions related to the formation processes and the anthropogenic activities linked to those deposits. In order to answer these questions, a collaborative micromorphological study was designed. Micromorphological oriented blocks have been taken in 2019 from all the layers and analysed under optical microscope. The micromorphological approach consists of the identification of sedimentary facies based on microstructure, matrix and inclusions. The observation of thin sections showed that the stratigraphy was formed by hearth wastes: they are rich in dung and microcharcoals. The homogeneous type of deposits points to a same type of activities along the occupation. Biological activity indicated irregular deposit rhythm link to seasons and fluctuations of water table.

3 HAUNTED GROUND! THE IDENTIFICATION OF LARGE ANTHROPOGENIC GEOCHEMICAL ANOMALIES AND THEIR IMPLICATIONS FOR ARCHAEOLOGY

Abstract author(s): Pattillo, Kath - Doonan, Roger - Goodchild, Joel (Archaeological Research Services Ltd)

Abstract format: Oral

New ways of sensing the environment provide new ways of seeing the world. Recent innovations in portable analytical equipment and how it is deployed, i.e. geochemical survey and HH-pXRF, has meant that archaeological sites have been subjected to an unprecedented intensity of geochemical survey. While geochemical survey is now an established method for the prospection and characterisation of archaeological sites, including the verification of geophysical blank areas, the extensive use of the technique has highlighted the presence of significant geochemical anomalies that can, in some instances, extend across large areas. These structured anomalies are the results of past human practices and can be considered to be “signatures” of past practices. These signatures manifest as elemental patterns that have a defined spatial structure. The existence and extent of these signatures have only been fully realised in light of the extensive nature of geochemical survey when conducted by HH-pXRF, prior lab-based surveys often being undertaken at a coarse resolution and reliant on relatively few samples.

Using case studies from across the UK and overseas, this paper seeks to highlight the existence and character of these signatures and comment on their value. Issues surrounding their documentation and challenges regarding their future curation are also discussed.

4 NECROSOL TO APPROACH PAST FUNERARY PRACTICES AND SPACES

Abstract author(s): García-López, Zaira (Cretus, EcoPast - GI-1553, Universidade de Santiago de Compostela) - Martínez Cortizas, Antonio (Cretus, EcoPast - GI-1553, Universidade de Santiago de Compostela; Bolin Center for Climate Research, Stockholm University) - López-Costas, Olalla (Cretus, EcoPast - GI-1553, Archaeology, Faculdade de Xeografia e Historia, Universidade de Santiago de Compostela; Department of Archaeology and Classical Studies, Stockholm University)

Abstract format: Oral

Necropolises are important spaces of ancient societies. Their location and relationship with other structures is extremely informative for reconstructing the distribution of space and funerary practices. However, many times the memory of where they were located is lost or there are doubts about the funerary use or not of a given structure. When the memory of an inactive necropolis is lost an archaeological excavation can recover it through the discovery of structures or skeletons. In the absence of archeological artefacts, historical sources can help us to locate a cemetery in an area, but they can hardly provide an exact location.

The interaction between human remains and sediments starts right after burial, leading to bidirectional physico-chemical changes, and as a result the Necrosol (i.e., burial soil) is formed. Knowledge on the processes by which the burial soil is formed and the characteristics it acquires when interacting with the skeletal remains, can help to identify the Necrosol and thus establish and describe with certainty the burial areas. We provide here key information about the

Necrosol properties that help to determine the funerary use or not of an archaeological context, in the absence of skeletons or other more obvious artefacts. To reach this goal we describe the main biogeochemical properties and pedogenetic processes identified in three case studies of burial soils of the Iberian Peninsula. Despite the chronological and geographical distance between them, our results suggest that they share common processes that seem to be related to the decomposition of bodies and early bone diagenesis. Small differences are linked to soil parent material, but also to the type of burial: simple fossa, wood coffin, amphora burial, etc. In the future, Necrosol could be a tool to unveil the memory of present-day invisible necropolises and to describe the steps followed in the burial ritual.

5 SEDIMENTS AS (RITUAL) ARTEFACTS: A MICROSTRATIGRAPHIC APPROACH TO PROTOHISTORIC IBERIAN RITUAL SITES

Abstract author(s): Gutiérrez-Rodríguez, Mario - Rueda Galán, Carmen - Quiles Morales, Míriam (University of Jaén)

Abstract format: Oral

Geoarchaeological research carried out internationally in recent decades has shown how archaeological sediments, beyond being mere containers of the materiality of the past, are the result of human behaviour and can even be considered artefacts and part of the material culture. This approach has been developed, among others, in ritual sites from diverse chrono-cultural contexts, where the application of high-resolution analytical methods from Earth Sciences has allowed a better understanding of ritual behaviour. Thus, geoarchaeological analysis has proven to be useful in unravelling specific habits and actions within particular rituals, some of which were invisible at the macroscopic scale. Besides, this approach is especially relevant for unravelling the site formation processes and the many agencies involved in the genesis of the archaeological record. In this presentation, we focus on the archaeological analysis of Iberian Protohistoric societies, in a specific field of application: their places of worship. Our case studies cover from open-air ritual sites to urban and cave-sanctuaries, in a chronological frame from the 5th c. BC to the 1st c. AD. The high-resolution geoarchaeological methods applied range from archaeological soil micromorphology, and physical-chemical analyses, to FTIR and μ -XRF, following an integrated, multianalytical microstratigraphic approach. Specifically, our results have shed light on: 1) determining the impact of the ritual practices in terms of site formation processes in sanctuaries of diverse typologies by identifying specific organic and inorganic markers of human behaviour in archaeological sediments at microstratigraphic and molecular scales; 2) determining activity areas in Iberian sanctuaries; 3) identifying structured sedimentary deposits formed as a result of ritual behaviour; and 4) characterising the natural framework where the rituals took place through a palaeoenvironmental reconstruction. Altogether, and when combine with the rest of the material evidence, these new data provide a better understanding of ritual behaviour, Iberian sanctuaries and their spatial organisation.

6 MULTISCALE (GEO-)ARCHAEOLOGICAL INVESTIGATIONS AT TWO PREHISTORIC SETTLEMENT SITES IN THE UPLANDS OF NORTHERN BAVARIA, GERMANY

Abstract author(s): Kothieringer, Katja - Seregély, Timo (University of Bamberg)

Abstract format: Oral

In this paper, we present some results of an interdisciplinary, multi-year research project on prehistoric rural settlement and landscape dynamics in the uplands of northern Bavaria (Germany), a karst region largely considered unsuitable for ancient settlement, primarily because of its lack of water. While the first part of the project aimed at detecting settlement sites and sinks with sediments triggered by past human activities, we have recently focused on two plateau sites (Göräuer Anger, Weiden) to obtain fine chronologies and gain insights into the nature of past land use. This has been requiring a combined (geo-)archaeological and palaeoecological approach, including predictive modelling and geophysics prior to invasive fieldwork, corings and test pits, comprehensive dating (^{14}C and OSL), and further micro- and molecular-level analyses.

The two sites have in common that they show an approximate contemporaneous settlement continuity from the younger Middle Bronze Age to the Early LaTène period (1350 – 350 BCE). We found temporally matching colluvial deposits at expected sinks and footslope positions, with some exceptions worth discussing. At Weiden, we also see a notable medieval overprint of the site, which severely hampered the preservation and detection of older features and sediments. Some of the prehistoric deposits show traces of long-term water influence. Pending results from micromorphological and biomarker analysis, some of which will be presented at the conference, may support the hypothesis that they were water reservoirs. Palaeoecological analyses have shown that past land use activities must have had a strong influence on the woodland composition at certain times, as reflected in charcoals of pioneer trees and shrubs (e.g. ash, hazel, or Maloideae), which we interpret as post-clearing successional indicators that suggest an opening of the landscape from the younger Middle Bronze Age onwards.

HOW THE LANDSCAPE CAME TO BE: INVESTIGATING SEDIMENTS AS KEY ARTEFACTS FOR UNDERSTANDING LANDSCAPE EVOLUTION IN THE KREUTTAL MICROREGION

Abstract author(s): Jetzinger, Doris (Department of Prehistoric and Historical Archaeology, University of Vienna; HEAS Human Evolution and Archaeological Sciences Research Network, University of Vienna)

Abstract format: Oral

Sediments arguably constitute the largest known archive of past human activities in the world, offering a vast spectrum of information that may evade us when studying other sources. A complementary analysis of sediments is therefore crucial in many archaeological research areas to enhance our understanding of human actions and behaviour. This is especially true for the field of landscape archaeology where the majority of the available study material consists of sediments. The research into and analysis of sediments is essential for reconstructing landscape evolution as well as detecting anthropogenic and natural formation processes that generate changes in the landscape.

An effort towards studying sediments as the main artefacts in landscape archaeological research is currently being undertaken in the Kreuttal microregion in Lower Austria. The area is characterised by evidence of a strong presence of human activity from at least the Middle Neolithic (ca. 4800 BCE) onwards. Implementing a diachronic approach, an archaeological landscape biography of the microregion is being created, reconstructing the area's landscape history and the formation processes involved in the landscape's evolution. The sedimentary archives constitute the main body of studied research material. A multi-method approach combining targeted coring, test pitting, and large-scale geoarchaeological prospection is applied for their analysis. Sedimentary analysis is complemented by the interpretation of remote sensing and archival map data as well as excavation results. The research project offers insights into the stratigraphic sequences, depositional changes, and subsurface formation processes in the Kreuttal microregion. Data generated in the course of the project shed a light on past human activities in the research area and on peoples' use of and adaptation to their surroundings, as well as their short- and long-term impact on the landscape.

DUNG ASH OR WOOD ASH? LOOKING BACK INTO MICROARCHAEOLOGICAL APPROACHES TO DETERMINE ASH COMPOSITION IN FUMIER DEPOSITS

Abstract author(s): Fernández-Palacios, Enrique (Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica "Antonio González", Universidad de La Laguna; Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna) - Gur-Arieh, Shira (Institut für Vor- und Frühgeschichtliche Archäologie und Provinzialrömische Archäologie, Ludwig-Maximilians-Universität) - Castilla-Beltrán, Alvaro (Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica "Antonio González", Universidad de La Laguna; Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna) - Jambrina-Enríquez, Margarita (Departamento de Biología Animal, Edafología y Geología, Facultad de Ciencias, Universidad de La Laguna; Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica "Antonio González", Universidad de La Laguna) - Friesem, David (Department of Maritime Civilizations, School of Archaeology and Maritime Cultures, University of Haifa; Haifa Center for Mediterranean History, University of Haifa) - Mallol, Carolina (Archaeological Micromorphology and Biomarkers Laboratory - AMBI Lab, Instituto Universitario de Bio-Orgánica "Antonio González", Universidad de La Laguna; Departamento de Geografía e Historia, Facultad de Humanidades, Universidad de La Laguna)

Abstract format: Oral

Rockshelters and caves are commonly used by prehistoric shepherds as shelter for their livestock. When the deposited dung and the plant material used as fuel, fodder or bedding were periodically burned by shepherds as a way to reuse the shelter over time, the stratigraphic result is a fumier deposit. Fumiers are characterized by a series of facies that have been documented macro- and microscopically in different settings and time periods. From bottom to top, these facies correspond to: brown layers or low thermally altered dung; black layers or carbonised material; and grey/white layers or ashy layers. The latter usually represents the end of the stabling episode. Determining the composition of the ashy layer is key to understand how the excrements were burned, to explore use of plant resources, and to address residue management practices among prehistoric pastoralist communities. In this presentation, we review micro- and geoarchaeological methods that have been used to study ash layers in fumiers. These proxies include soil micromorphology, and bulk analyses of faecal spherulites, ash pseudomorphs and phytoliths. Furthermore, we present new data coming from two prehispanic fumier sequences in the island of La Palma (Canary Islands).

9 BURNED OR JUST DARK SOIL? MAGNETIC PROPERTIES AS INDICATORS OF PEDOGENESIS AND PYROGENESIS AT THE UPPER PALEOLITHIC SITE KOSTENKI 14

Abstract author(s): Kurgaeva, Anastasiia (Cluster of Excellence ROOTS, Christian-Albrechts-Universität zu Kiel) - Sedov, Sergey - Moreno-Roso, Sol (Instituto de Geología, Universidad Nacional Autónoma de México) - Barceinas Cruz, Hermenegildo - Ortega Guerrero, Beatriz (Instituto de Geofísica, Universidad Nacional Autónoma de México) - Sinitsyn, Andrey (-) - Eckmeier, Eileen (Cluster of Excellence ROOTS, Christian-Albrechts-Universität zu Kiel; Institute for Ecosystem Research, Christian-Albrechts-Universität zu Kiel)

Abstract format: Oral

At Palaeolithic sites an issue of distinguishing anthropogenic and natural signals often arises. Within a cultural layer, the most prominent anthropogenic indicator is pyrogenesis, while the natural processes are represented by pedogenesis, namely humus accumulation. Pyrogenesis and pedogenesis are nearly impossible to differentiate within topsoil: both are characterised by dark colour, dispersed organic matter, and high values of magnetic susceptibility. This is exactly the challenge that we faced at the Upper Palaeolithic site of Kostenki 14. At this site, we addressed this issue by analysing the magnetic parameters based on the method suggested by Oldfield and Crowther (2007), which was accompanied by micromorphological observations. Even though both processes result in significant magnetic enhancement, it was experimentally shown that pyrogenesis forms smaller magnetic particles indicated by the calculated quotients in comparison to pedogenesis. Based on the parameters of the original experiment, this method distinguishes the signal of an intense fire event from a fire of moderate/low intensity as well as the absence of burning.

Most of the humic samples were shown to be of a pedogenic nature, but two samples (a Paleolithic hearth sample and a sample from paleosol IIc) had features of intensely burnt material. Intense burning is more typical for a human-controlled hearth than for a large-scale fire. A large-scale fire, both natural and human-induced, rarely results in intensely burnt lenses of substrate in the forested area, while these lenses are nearly improbable in the open landscape. The difference in the typical intensity of large-scale and local-scale human-controlled fire events and micromorphological observations of microartefacts in close proximity of the intensely burnt lens allowed for suggesting that the magnetic properties of the burnt sample were the result of a human-controlled fire event, i.e., a hearth. However, the effect of a large-scale fire could not be entirely rejected.

10 SLAVERY, COLONIALISM, AND ENVIRONMENTAL CHANGES: THE SADO (PORTUGAL) AND CACHEU (GUINEA-BISSAU) ESTUARIES BETWEEN THE 15TH-20TH CENTURIES

Abstract author(s): Costa, Ana Maria (Laboratório de Arqueociências - LARC - DGPC; IDL - Instituto Dom Luiz, Faculdade de Ciências, Universidade de Lisboa; CIBIO - Centro de Investigação em Biodiversidade e Recursos Genéticos | InBIO Laboratório Associado | BIOPOLIS - Programme in genomics, biodiversity and land planning) - Freitas, Maria da Conceição (IDL - Instituto Dom Luiz, Faculdade de Ciências, Universidade de Lisboa; Departamento de Geologia, Faculdade de Ciências, Universidade de Lisboa) - Gomes Coelho, Rui (UNIARQ, Centro de Arqueologia, Faculdade de Letras, Universidade de Lisboa; Archaeology department, Durham University)

Abstract format: Oral

Between the 15th and the 19th centuries, more than 12 million persons were enslaved, forced to leave their homelands and sent across the Atlantic to Europe and the Americas. The environmental conditions of estuarine areas across the Atlantic world were significantly affected by forced displacement or the development of plantation economies, and shaped throughout these processes. This paper focuses on the environmental changes that occurred along the margins of the Cacheu (Guinea-Bissau) and the Sado (Portugal) estuaries during the last 500 years. While Cacheu was a prominent port in the trade of enslaved Africans, the Sado basin hosted communities of African-descent that were likely responsible for the introduction of rice crops in this part of Europe.

To accomplish our aim, we collected five long sediment cores from the studied areas: three on the left margin of Cacheu's estuary, near rice paddies cultivated by people from the eponymous town or in intertidal areas with development of mangrove; two in the alluvial plain of the Sado estuary, between 50 and 65 km upriver, an area that is still known for rice production.

Sediments will be analysed for different environmental proxies (texture, organic matter and calcium carbonate content, and organic matter typology using organic chemistry approaches) and, particularly for evidence of rice (characterisation of macro plant remains and pollen, among others).

Preliminary data from the Sado cores already provide indications of rice production prior to the 18th century. New data is being produced to enlighten the paper of enslaved people and their descendants in the morphology and environmental conditions of African and European estuarine areas.

SEDIMENTARY ADNA SAMPLING AND SEQUENCING: DEVELOPING PROTOCOLS FOR USE IN NORWEGIAN ARCHAEOLOGICAL SITES

Abstract author(s): Breivik, Heidi Mjelva- Martin, Sarah (NTNU University Museum, Department of Natural History)

Abstract format: Oral

The Norwegian Stone Age spans from c. 9500-1800 BC. Although Stone Age settlement remains are not visible above ground, thousands of settlements are known among archaeologists throughout the country, due to systematic surveys and rescue excavations. The settlements are commonly recognized by aggregations of chipped flint or other lithic material, and occasionally fireplaces and/or subtle dwelling remains. Organic remains, predominantly plant and animal, however, are scarcely found due to poor preservation conditions. In recent years it has been shown that sediments can contain ancient biomolecules, including DNA. Owing to recent advances in sequencing technology and genetics techniques, one small sediment sample can yield a broad snapshot of a past ecosystem. Such sedimentary ancient DNA (sedaDNA) analyses allow us to identify species that were present at the archaeological site, information that would otherwise remain elusive. For instance, identification of animal species could provide information about food staples, hunting strategies and mobility patterns related to annual cycles. Similarly, plant species identification can provide useful knowledge on how they played an integral part in human life, as fuel, medicine, food and other uses.

Environmental conditions vary geographically and temporally, thus sedaDNA quality will differ in archaeological sites from different regions. Therefore, there is a need to systematically survey the potential and feasibility for sedaDNA in archaeological contexts. We aim to do systematic sampling for sedaDNA from archaeological sites in Central Norway, and test the quality of the DNA we obtain. This will also involve the development of laboratory protocols for sedaDNA extraction, amplification and library preparation for next-generation sequencing (NGS).

Our project is in its very beginning, and we present some preliminary studies and ideas how to approach archaeological Stone Age sites with molecular methods.

A. EXPLORING PAST BIODIVERSITY AT ARCHAEOLOGICAL SITES FROM SCOTLAND USING ENVIRONMENTAL ANCIENT DNA

Abstract author(s): Allan-Jones, Amy (School of Geosciences, University of Aberdeen) - Girdland Flink, Linus (School of Geosciences, University of Aberdeen; School of Biological and Environmental Sciences, Liverpool John Moores University)

Abstract format: Poster

Sedimentary ancient DNA (sedaDNA) has become a valuable tool to archaeologists in recent years, with sediments yielding high quality DNA from sheltered, relatively undisturbed contexts such as caves and lakebeds. However, very little research has focussed on sedimentary samples from open-air archaeological sites due to their unsheltered nature, and the expectation that these conditions will negatively affect DNA preservation and contamination. This PhD project tests these assumptions through the extraction, sequencing, and analysis of ancient DNA from soil samples retrieved from archaeological sites across Scotland. The focus of this research is to interpret past local biodiversity, and how animal and plant DNA may have accumulated at archaeological sites due to anthropogenic activity, thereby providing a fine-scale, site specific understanding of human-environment interactions. In combination with other environmental proxies such as palynology, aDNA will provide environmental context to archaeologists seeking to understand past human activity and impact on their immediate surrounding landscape.

560 INVESTIGATING PAST HUMAN MOBILITIES THROUGH NATURAL RESOURCES EXPLOITATION: LATEST RESULTS AND DEVELOPMENTS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Orange, Marie (Université de Bordeaux / Archéosciences Bordeaux UMR 6034; Archéorient UMR 5133; University of New England) - Vautrin, Adeline (Muséum National d'Histoire Naturelle) - Bellat, Mathias (CRC 170 ResourceCultures, University of Tübingen)

Session format: Regular session

The study of spatial mobility, a central component of human behaviour, has recently gained a lot of interest within the archaeological community with the rise of isotopes and trace elements ratio analyses, but also and especially with the development of new methods in genetics research for the study of ancient DNA. Whilst this approach indubitably provides the archaeological community with invaluable information on population movements such as large-scale migrations, not only does it rely on the availability of well-preserved human remains – which can be problematic in

numerous archaeological contexts, but its resolution can also be limited to larger scales. Considering this, what other approaches based on more ubiquitous remains can help us recover patterns of human mobility? And how can we best leverage the information drawn from these materials to study mobility at a local, regional, or interregional scale?

This session will welcome oral and poster communications presenting the results from research projects focusing on the investigation of past human mobility through the reconstruction of the exploitation patterns of natural resources – whether they are inorganic (clay, rocks, metals, etc.) or organic (bitumen, pasturelands, etc.), depending on the study methods/proxy/multi-proxy: destructive or non-destructive (trace element ratios, isotopes ratios, geochemical sourcing, etc.). The aim of the session is to showcase the latest research on the topic as well as to generate a discussion around the different approaches in use nowadays. Study cases, methodological topics, and contributions on any geographical and chronological frameworks are welcome.

ABSTRACTS

1 INVESTIGATING AGROPASTORAL MOBILITIES IN THE SOUTH CAUCASUS THROUGH CARBONATE ISOTOPES ANALYSIS OF DOMESTIC BOVIDS (CHALCOLITHIC AND EARLY BRONZE AGE)

Abstract author(s): Vautrin, Adeline (AASPE UMR 7209, Muséum national d'Histoire naturelle) - Bosch, Delphine (Géosciences Montpellier UMR 34095, Université Montpellier II) - Chauvel, Catherine (Université de Paris, Institut de Physique du Globe de Paris,) - Fiorillo, Denis (AASPE UMR 7209, Muséum national d'Histoire naturelle) - Bruguier, Olivier (Géosciences Montpellier UMR 34095, Université Montpellier II) - Gutiérrez, Pamela (Université de Paris, Institut de Physique du Globe de Paris) - Jansen, Moritz (Deutsches Bergbau-Museum) - Stöllner, Thomas (Deutsches Bergbau-Museum, Bochum; Ruhr-Universität) - Mashkour, Marjan (AASPE UMR 7209, Muséum national d'Histoire naturelle; University of Tehran) - Berthon, Rémi (AASPE UMR 7209, Muséum national d'Histoire naturelle)

Abstract format: Oral

In the South Caucasus, a mountainous region with a rich tradition of cattle and caprines breeding, breeders employ a variety of strategies for raising their herds. While some practice transhumance moving their herds between high and low elevations depending on the seasons, others remain in either the mountains or the plains throughout the year. However, the challenges of winter in the mountains (herding and access to pastures) raise questions about winter occupations at high altitude in prehistoric times. From an archaeological perspective, the mountains appear to have been utilized as summer pastures by herders from the Neolithic until the establishment of the first village settlements in the Early Bronze Age. To better understand the occupation of territories by these agropastoral societies during the Chalcolithic and Early Bronze Age, this study will analyze faunal remains and oxygen ($\delta^{18}\text{O}$), carbon ($\delta^{13}\text{C}$), and strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) isotopes recorded in the dental enamel (carbonates) of domestic bovids from Georgian sites at different elevations. This cross-disciplinary approach will shed light on the seasonal occupation of the site, mobility, frequency, and the diet of the herds of these societies and provide a more complete picture of their relationship with the South Caucasus environments.

2 CROSSING HINTERLANDS? ISOTOPIC AND ZOOARCHAEOLOGICAL EVIDENCE FOR ENVIRONMENTAL EXPLOITATION AND MOBILITY IN ARCHAIC ITALY

Abstract author(s): Trentacoste, Angela (University of Kiel; University of Oxford) - Stoddart, Simon (University of Cambridge) - Marzullo, Matilde (University of Milan) - Curci, Antonio (University of Bologna) - Bizzarri, Claudio (Parco archeologico ed ambientale dell'Orvietano) - Bagnasco Gianni, Giovanna (University of Milan) - Govi, Elisabetta (University of Bologna) - Makarewicz, Cheryl (University of Kiel)

Abstract format: Oral

Increased plant and animal production was essential for the development and expansion of towns and cities in first-millennium BC Italy. Yet, archaeological research has only begun to explore the impact that these settlements had on rural production. Consequently, little is known about how some of Western Europe's earliest cities marshalled the resources needed to support urban life. In the diverse cultural and environmental landscape of protohistoric Italy, many strategies were likely employed, shaped by differences in connectivity and mobility regimes, land use, economic focus, and social organisation.

This talk presents new results from UrbanHerds, a Humboldt Foundation-funded research project investigating urban supply and environmental exploitation in Archaic Italian cities (c. 600–400 BC). This talk compares isotopic and zooarchaeological evidence for pastoral strategies across a suite of Archaic central Italian urban sites, in order to explore the types of environments exploited and the role of mobility (e.g. transhumance): the tessellated landscape of central Italy offered a diverse array of eco-zones that could be exploited for animal production, but only if urban

centres did not curtail access to their hinterlands through heightened territorial control. In this context, a better understanding of pastoral strategies provides new insight into human use of and movement through urban hinterlands.

3 NATURAL RESOURCES AND LAND-USE IN TRANSYLVANIA DURING IRON AGE. THE IMPACT OF HUMAN MOBILITY

Abstract author(s): Rustoiu, Aurel (Institute of Archaeology and History of Arts Romanian Academy Cluj-Napoca)

Abstract format: Oral

In terms of landscape, Transylvania is part of a larger area known as the eastern Carpathian Basin. The Transylvanian plateau is characterised by the presence of important mineral resources. Several deposits of rock salt spread out close to the surface and surround the plateau, being accompanied by many salty springs. The resources of non-ferrous ores were also important. The western Carpathians contain rich deposits of complex ore (copper, silver and gold). The Latin name of the region, Transylvania, means the land over the forests. Accordingly, timber was another important resource, being transported from Transylvania to the lowlands of the Great Hungarian Plain on the rivers.

The characteristic landscape, as well as the geographic distribution of natural resources, influenced the nature of human habitation, the social structure of the local communities and the strategies of control and distribution of these resources. The Great Hungarian Plain and the Transylvanian plateau were continuously connected and inter-dependent. On the other hand, communities from the northern Pontic steppes or those from the northern Balkans were sometimes also attracted by the Transylvanian riches. As a consequence, the archaeologists are able to observe numerous connections with the areas outside the Carpathians range. These included long-distance cultural exchanges often mediated by the mobility of certain social groups.

Therefore, the paper is going to discuss the manner in which human mobility influenced the strategies of exploitation of natural resources and transformation of the landscape throughout the Early and Late Iron Age, based on the analysis of the economic, social and ritual practices of different communities. The analysis is based on a range of archaeological, aero-photographic, archaeozoological, anthropological and palynological data.

This work is supported by the grant "Lived lands", CNCS - UEFISCDI, project number PN-III-P4-ID-PCE-2020-0566.

4 LITHIC SOURCING IN THE NORWEGIAN MESOLITHIC - PRESENTING RESEARCH HISTORY AND AN ONGOING PHD-PROJECT AT NTNU, NORWAY

Abstract author(s): Spjelkavik, Skule (NTNU University Museum, Trondheim)

Abstract format: Oral

In my presentation I wish to present a newly initiated PhD-project at the University Museum of the Norwegian University of Science and Technology (NTNU) in Norway. The project revolves around middle to late Mesolithic (8000-4000 cal. BC) mobility patterns and ecological adaptations in Central Norway, focusing on lithic raw materials and possible provenance areas. As the project is in its initial phase, the current focus is on reviewing relevant literature, data collection and research design, but some preliminary observations will be covered in the paper.

As a starting point for discussing mobility patterns and increasing regionalization in the study area, a closer examination of selected non-flint lithic artefacts, such as chubby adzes, bifacial axes and chisels, will be conducted through geochemical analysis using pXRF. The dispersal of certain lithic raw materials is often seen as a proxy for mobility and social boundaries, and so this study will attempt to establish a foundation for further explorations of landscape-embedded practices and social interactions in the Norwegian Mesolithic. A similar study has recently been conducted on Mesolithic greenstone adzes from Rogaland, in Southwestern Norway. The results from this study will be of importance for future analyses and we are hopefully approaching the possibility of establishing reference databases for inter-regional comparisons of non-flint lithic raw materials in Norway. In this paper I wish to present a short review of previously conducted lithic sourcing studies in Norwegian Stone Age research, particularly the Mesolithic, source critical issues and an outline of my own research project.

5 THE ART OF ADAPTING: INVESTIGATING RESOURCE EXPLOITATION AND PALEOLITHIC HUMAN MOBILITIES IN THE NORTH-CENTRAL CAUCASUS

Abstract author(s): Doronicheva, Ekaterina (-)

Abstract format: Oral

The study of past human mobility has received increasing attention in the course of recent studies dating from the Paleolithic to the Neolithic and beyond and the rise of new analyses, attracted for these researches.

I would like to present out latest results of trace element analyses and isotopes application to the study of mobility and adaptations, dating from the Late Pleistocene to the early Holocene, in changing environments in the North-Central Caucasus.

Our preliminary research shows how dependent to the natural environment and at the same time, how highly adaptive were Paleolithic collectives. This is reflected in complex strategies for mobility and resource extraction, raw material strategies (e.g., various lithic raw materials, bitumen, etc.), and the organization of various types of settlements.

6 RETRACING PAST POPULATIONS MOBILITY THROUGH THE LENS OF OBSIDIAN: SOME INSIGHTS FROM THE SOUTHERN CAUCASUS DURING LATE PREHISTORY

Abstract author(s): Orange, Marie (Université de Bordeaux / Archéosciences Bordeaux UMR 6034; Department of Archaeology, Classics and History, School of Humanities, Arts and Social Sciences, University of New England; Archéorient—Environnements et Sociétés de l’Orient Ancien, CNRS UMR 5133, Maison de l’Orient et de la Méditerranée)

Abstract format: Oral

In the Southern Caucasus, mobile pastoralist groups have long been seen as key actors in the diffusion of obsidian, which they would have acquired and circulated over short to long distances, depending on their seasonal movements to and from the summer pastures. Uncovering the obsidian procurement and exploitation strategies of these groups is thus critical to reconstruct the regional and supra-regional obsidian networks between the Chalcolithic and the Early Bronze Age and to provide key insights into the role of mobility as a vector for socio-cultural and economic change on a larger scale.

Obsidian is a powerful proxy to study prehistoric trade and exchange networks as well as human mobility patterns: each obsidian source has indeed a unique chemical fingerprint, which allows us to trace the origin of obsidian artefacts found on archaeological sites. However, inferring past human mobility patterns from obsidian sourcing studies is not without its limitations. While knowing the source of an obsidian artefact found on a site informs us on its own trajectory, it does not necessarily reflect the movements of the population that frequented this site: depending on the adopted procurement strategy (i.e., direct or indirect), one or several interactions may have been needed to acquire it. Furthermore, although we can match an artefact’s geochemical fingerprint to that of a specific obsidian source, that origin may represent a completely different reality on the field, where obsidian blocks can be transported over long distances from their point of origin through natural processes (gravity, water), and therefore be available at lower altitudes, easier to access.

In this communication, I propose to review how obsidian analyses can be used to deepen our understanding of prehistoric population mobilities but also to illustrate through recent research some of the pitfalls and limitations of these studies.

7 METABASITE FROM THE JIZERA MOUNTAINS AS IMPORTANT PLAYER DURING EARLY NEOLITHIC IN CENTRAL EUROPE AND BEYOND

Abstract author(s): Trampota, Frantisek - Burgert, Pavel (Institute of Archaeology of the Czech Academy of Sciences) - Kachlík, Václav (Institute of Geology and Palaeontology, Faculty of Science, Charles University) - Šída, Petr (Department of Archaeology, University of Hradec Králové) - Přichystal, Antonín (Department of Geological Sciences, Faculty of Science, Masaryk University)

Abstract format: Oral

Early Neolithic populations reached central Europe in the form of gradual migration from the Balkans and Anatolia. While some social and technological phenomena have a southeastern origin, others only develop in the context of the beginnings of the Neolithic in Central Europe. These are long wooden houses, and the building is connected with polished stone tools intended for processing wood. These were mostly made of metabasite originally from the Jizera Mountains. The source of metabasite, which was rarely used already in the Mesolithic, became a central territory of several hundred kilometers and its distribution reached most of the populated regions in Central Europe, which is an important factor for understanding the social structure of Early Neolithic populations. The paper focuses on the current state of knowledge about the distribution of Jizera Mountains-type metabasite, on three levels. The first areas are the mining areas themselves which are also related to the primary processing of semi-finished products. The second area is the wider region around the Jizera Mountains, in which there are hoards of ground tools or extremely large artefacts. The third level is the supra-regional distribution on a European scale.

UNDERSTANDING THE DEVELOPMENT AND EXPANSION OF RESOURCE USES AND ACCESS THROUGH TIME WITH THE RESOURCECULTURES CONCEPT APPLIED IN TWO STUDY-CASES

Abstract author(s): Bellat, Mathias (CRC 1070 ResourceCultures; Department of Geosciences, Chair of Soil Science and Geomorphology) - Litzenberg, Ria - Rebentisch, Annika - Floss, Harald - Conard, Nicholas (CRC 1070 ResourceCultures; Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters Abteilung für Ältere Urgeschichte und Quartärökologie) - Scholten, Thomas (CRC 1070 ResourcesCultures; Department of Geosciences, Chair of Soil Science and Geomorphology; DFG Cluster of Excellence “Machine Learning: New Perspectives for Science”)

Abstract format: Oral

Anthropologists or archaeologists try to grasp the complexity and organization of past societies via many tools or strategies. They can build models or construct tools, like “chaîne opératoire”, to understand how resources are used and where they come from. However, it can be challenging to follow the implication of every parameter of dense systems when tackling old civilizations and group lifestyles or ways of life. Indeed, many clues are missing due to remote time study or misinterpretation of old social systems and cultural habits.

Therefore, the CRC 1070 project developed the concept of “ResoureCultures”, a powerful tool that helps divide archaeological or anthropological study-case into more comprehensive categories and sub-categories to understand the complexity of the systems. This presentation aims to detail this new concept and its specificities, such as ResourceAsemblage or ResourceComplex, with two study cases. The first is on the Neolithic architectural and construction techniques in the Southern Caucasus (Mentesh Tepe, Azerbaijan), and the second is the study of Upper Paleolithic art in two different regions, Swabian Jura and Eastern France.

We will treat the issue of provenance of the material and their transformation in which context people use them. After this, we will discuss the interpretation we can draw from this observation on past societies’ organization, mobilities or lifestyle.

RESPONSIBLE “SITE” SEEING: A DISCUSSION ABOUT SUSTAINABLE ARCHAEOLOGICAL TOURISM THAT ENHANCES THE VISITORS’ EXPERIENCE WHILE MINIMIZING THE NEGATIVE IMPACTS OF VISITATION [HERITAGE AND TOURISM COMMUNITY]

Session theme: 3. Heritage Narratives and Representations

Session organisers: Thomas, Ben (Society of Architectural Historians) - Fonseca, Sofia (Teiduma, Consultancy on Heritage and Culture; German Archaeological Institute)

Session format: Discussion session

Join us for a roundtable discussion on archaeological tourism, sponsored by the Community Integrating the Management of Archaeological Heritage and Tourism.

Archaeological tourism includes the management and presentation of archaeological sites and is concerned both with the visitor’s experience and with the impact of tourism on sites. As heritage tourism increases in the coming years, it is essential to consider tourism’s impact on archaeological sites. The roundtable will examine several critical issues, including but not limited to, preparing sites for increased tourism; addressing visitors’ desire for “meaningful” interactions and “authentic” experiences; creating presentations that address the needs of diverse groups of visitors; and evaluating people’s experiences and their learning. We will also explore the role of technologies like virtual and augmented reality in the presentation and interpretation of sites.

Just as importantly, we will consider how visitors’ experiences can be enhanced while minimizing negative impacts on the site. How do we assess the factors that affect archaeological sites and put heritage at risk? Are archaeologists and site managers aware of the Sustainable Development Goals and do their tourism strategies integrate these goals? How do we educate and raise public awareness of the impact of factors like climate change on archaeological sites and of the role the public can play in mitigating negative impacts on sites? It is essential to get archaeologists, site managers, and tourists to participate in actions that promote sustainable tourism.

We invite professionals connected to the topic worldwide, including archaeologists, site managers, museum professionals, tourism professionals, and heritage educators, to participate in the discussion and provide examples, ideas, and questions to enrich the conversation. Collectively, we can ensure that archaeological tourism contributes to the preservation and sustainable management of archaeological sites.

1 DEVELOPING CLIMATE VULNERABILITY ASSESSMENTS FOR CULTURAL WORLD HERITAGE PROPERTIES

Abstract author(s): Davies, Mairi (HES Historic Environment Scotland) - Jones, Rebecca (Heriot-Watt University) - Hyslop, Ewan (Historic Environment Scotland) - Megarry, William (Queen's University Belfast) - Day, Jon - Heron, Scott (James Cook University)

Abstract format: Oral

UNESCO recognises that the continued preservation of World Heritage (WH) properties necessitates understanding current and future climate change impacts and developing suitable adaptation strategies. ICOMOS has highlighted the need to promote open access tools and approaches to vulnerability assessment.

The Climate Vulnerability Index (CVI) was first developed to assess vulnerability of natural WH properties. A pilot to evaluate transferability to cultural WH properties was hosted by Historic Environment Scotland (HES) at the Heart of Neolithic Orkney. Following this successful pilot, HES made a commitment to rolling out CVI assessment to Scotland's remaining five WH properties.

HES obtained funding to develop more CVI applications starting with the Old and New Towns of Edinburgh (ONTE). In response to the ongoing pandemic, CVI workshops for ONTE and Frontiers of the Roman Empire: Antonine Wall took place virtually, with St Kilda being delivered as a hybrid.

CVI provides a methodology to assess climate risk and vulnerability at all types of WH; it is rapid, systematic, repeatable and flexible. Crucially, the CVI assesses both the vulnerability of the WH property's key values and hence its Outstanding Universal Value, and its community vulnerability, as well as its adaptive capacity. This allows an assessment of the economic, social and cultural impacts of a changing climate on a WH property.

We will report on the CVI results for the first four WH properties and discuss how we propose to mainstream the results in the on-going adaptive management of the sites. We will also discuss CVI Africa, a collaborative project, consisting of capacity building and training for African heritage professionals and CVI workshops at the WH properties the Sukur Cultural Landscape, Nigeria and the Ruins of Kilwa Kisiwani and the Ruins of Songo Mnara, Tanzania. This project focused on testing CVI's utility and long-term value in an African context.

2 CREATING CLIMATE RESISTANT AND SUSTAINABLE PRESENTATION OF ARCHAEOLOGICAL SITES

Abstract author(s): Lukacevic, Marijana (Regional Development Coordinator of Pozega-Slavonia County) - Jozic, Antonija (Prefect of Pozega Slavonia County)

Abstract format: Oral

The European Commission has adopted a set of proposals to make the EU's climate, energy, transport and taxation policies fit for reducing net greenhouse gas emissions by at least 55% by 2030, compared to 1990 levels. The more tourism turns to sustainability in its entirety and the application of green building, principles of planning, designing, management, etc., will be in the function of man and nature. The EU Taxonomy is one of the tools that can be used to significantly contribute to the sustainability of the investment project and the sustainability of space and society as a whole. This presentation will present the infrastructural project of the Interpretation Center of Hallstatt Culture. The main goal of the project "The Interpretation Center of the Hallstatt Culture" is to develop a touristic undeveloped area, creating sustainable archaeological tourism resistant to climate change. But, what does climate resistance of a building and presented area mean? How to achieve and keep it? The project "The Interpretation Center Of Hallstatt Culture" has all the predispositions to improve the tourist offer of the Pozega Slavonia County. Furthermore, the project will improve the economic value of the narrow and wider location. Supporting the idea of green and digital transition while preserving cultural heritage and nature, it will contribute to increasing of employment and serve as an example of good practice in the development of continental tourism in Croatia. The project follows the instructions of the DNSH principle to implement the minimum criteria and fulfill six environmental goals and several UN Sustainable Development Goals. However, in order to make the project Interpretation center of Hallstatt Culture" sustainable it is necessary to apply the principles of sustainability during planning, designing, implementation, and during the management of the building, which requires an interdisciplinary approach to the project.

3 ICOMOS INTERNATIONAL CHARTER FOR CULTURAL HERITAGE TOURISM (2022)

Abstract author(s): Gowen Larsen, Margaret (University College Dublin; ICOMOS ICTC; ICOMOS ICAHM)

Abstract format: Oral

In November 2022 the ICOMOS International Charter for Cultural Heritage Tourism was adopted by the ICOMOS Annual General Assembly in Bangkok. The newly adopted charter, presented by the International Scientific Committee on Cultural Tourism (ICTC) is not a revision of its 1999 Charter. A decision was taken in 2019 that an entirely new approach was required that would reinforce cultural heritage protection and community resilience through responsible and sustainable tourism management, while integrating current cross-cutting global policy orientations including the Paris Agreement and the 2030 SDGs Agenda and a focus on responsible tourism management. The impacts of the Covid 19 pandemic, further justified the approach taken and the extent of consultation involved in the preparation of the text.

This paper will introduce the charter, present its objectives for responsible tourism planning and management, and identify the relevance of the charter's principles and guidance for the archaeological heritage tourism in the context of climate change. It will outline the charter's emphasis on the creation of stakeholder opportunities for participatory governance and the integration of climate action and climate adaptation in sustainable management approaches that also prioritize community resilience.

4 RESPONSIBLE HERITAGE TOURISM IN SCOTLAND: A TRANSFORMATIONAL FRAMEWORK FOR CLIMATE ACTION IN TOURISM

Abstract author(s): Glindmeier, Vanessa - Davies, Mairi (HES Historic Environment Scotland)

Abstract format: Oral

As a large public body, Historic Environment Scotland (HES) has duties under the Climate Change (Scotland) Act 2009 that require it to contribute to climate change mitigation and adaptation, and to act sustainably. During the Covid-19 pandemic, HES, Scotland's largest operator of paid-for visitor attractions, has developed a Responsible Tourism Framework (RTF). The RTF positions HES as a leader in the adoption of responsible tourism principles, strengthening heritage tourism's contribution to better quality of life and meaningful experiences for all, now and in the future, while contributing to the delivery of national climate action ambitions, including the Scottish Government's 2045 Net Zero target. It will ensure HES provide visitors with the infrastructure, facilities, and information they need to make their visit as sustainable and responsible as possible, not only in economic terms, but by maximising wellbeing benefits to local communities, adapting our sites to the changing climate and reducing greenhouse gas emissions associated with tourism. The RTF has been informed by extensive internal, cross-organisational, and external consultation, as well as live on-site projects. One such project was the Doune Sustainable Tourism Project (STP), an exemplar demonstrating how the historic environment and heritage assets can make better places for people to live in and better places for people to visit. An invaluable pilot for the RTF development, the STP at Doune provided a model of how HES might address key challenges such as the reduction of the carbon footprint of tourism operations, encouraging social and cultural diversity, as well as maximising benefits of tourism for communities. The project looked beyond the boundaries of the recognised tourist attraction, Doune Castle, a scheduled monument, taking a regional destination approach working with local organisations, local authorities, and national agencies, demonstrating how site managers and visitors alike can participate in climate actions promoting responsible tourism.

563 SHAPING ARCHAEOLOGY THROUGH ETHICAL AND COMMUNITY-LED ACTIVIST PRACTICES

Session theme: 3. Heritage Narratives and Representations

Session organisers: Orlandi, Francesco (University of Bologna) - Lo Monaco, Viviana (São Paulo State University - UNESP) - Dolcetti, Francesca (University of Venice) - Montgomery Ramirez, Paul Edward (Cleveland State University) - Figueira da Hora, Juliana (Universidade de Santo Amaro - UNISA)

Session format: Regular session

The session focuses on the craft of archaeological knowledge in collaboration and tension with its contemporary socio-political circumstances. We are interested in delving into the intermediate spaces of interaction and politics that gravitate around sites of memory and contention, either enlisted or not in authorised heritage categories. Recurrent calls to democratise and decolonise knowledge about the past propitiated community engagement and collaborative methodologies, bringing to the fore the importance of co-creation of heritage interpretations and narratives in partnership with historically excluded or marginalised communities and stakeholders. Sparking reflection and reflexivity on the values, practices and modes of representation of archaeology also raises the question of epistemic authority at a time of surging populism and nationalism in Europe and beyond. This session invites papers discussing experiences,

challenges and lessons learned on what concepts and tools can be mobilised to tackle the uses of archaeological evidence and heritage politics for the sake of exclusionary political agendas, extractive-based research and contested development projects affecting local histories and territories.

Reinstating the political role of archaeological and heritage practice in the present, we encourage contributions dealing with all geographies and temporalities of analysis, and oriented toward a diverse array of topics, such as but not limited to:

- Misappropriation and misrecognition in public archaeology
- Multivocal, inclusive and decolonised formats of archaeological knowledge production, sharing and communication
- Decolonising archives and data governance in community-based practices
- Community-driven and values-led practices in archaeology and heritage
- Indigenous cosmologies, territories and political ontologies of heritage studies

ABSTRACTS

1 THE GOOD CREDIT INDIANS - ARCHAEOLOGY FROM AN INDIGENOUS PERSPECTIVE

Abstract author(s): Jamieson, Jordan (Mississauga of the New Credit)

Abstract format: Oral

I look to share from personal experience the difficulties and obstacles of becoming involved in the archaeological process, as well as the benefits and tremendous upsides it brings. For many indigenous communities there is an unseen cost of entry when trying to become involved in their cultural materials, and it comes in the form of compromising on their values from a cultural perspective.

To begin I will outline some of the foundational differences between the indigenous perspective and the western perspective. I examine how heavily influenced the outlook on cultural materials are viewed through that western lens, supported by legislation that stems from colonialism. Next, the importance of building relationships to the descendant communities, in whose cultural materials we work in. Not only that but pushing to evolve the relationships into meaningful change and building the capacity in which communities can become in control of their cultural materials.

As we look to better understand the past through archaeological materials, it's imperative that we begin to recognize the disparity and open the conversation of how we view, curate and interpret those cultural materials and remains.

2 STORIES WRITTEN IN THE TREES: COLLABORATIVE RESEARCH AND PRELIMINARY ANALYSIS OF ANCESTRAL TREES NEAR ANCHORAGE, ALASKA

Abstract author(s): Johnson, Norma (Chickaloon Village Traditional Council) - Ortiz, Liz (Department of Defense)

Abstract format: Oral

Many Ancestral trees, or culturally modified trees (CMTs) by Western terminology, have been identified by Tribal people on federally managed land just outside Anchorage, Alaska but had not been recognized or documented by formally trained researchers. The land in question is a unique study area that has been closed to public and Indigenous use for 80 years. Through proper consultation and partnership on archaeological investigations, Tribal and agency archaeologists have developed methods to recognize and record ancestral trees to be impacted by an upcoming project. This paper discusses how Indigenous knowledge assists Federal research and projects. Collecting data lost to Tribes because of the 20th century cultural erasure practices, data will contribute to the knowledge of the land use of the Dene between 1800 and 1940 when the access became restricted. These new methods can be applied to document Ancestral trees throughout the Upper Cook Inlet in South Central Alaska.

3 CHANGING DAILY PRACTICES THROUGH DESCENDANT COMMUNITY-INFORMED INSTITUTIONAL INTEGRITY

Abstract author(s): Thompson, Amanda D. - Thompson, Victor (University of Georgia, Laboratory of Archaeology) - Butler, Raelynn (Muscogee Nation, Historic and Cultural Preservation Department) - deBeaubien, Domonique (Seminole Tribe of Florida, Tribal Historic Preservation Office) - Panther, Miranda (Eastern Band of Cherokee Indians, Tribal Historic Preservation Office) - Fontenor, Raynella (Coushatta Tribe of Louisiana, Department of Cultural, Historical, and Natural Resources) - Hunt, Turner - Wendt, LeeAnne (Muscogee Nation, Department of Historic and Cultural Preservation) - Garland, Carey (University of Georgia, Laboratory of Archaeology)

Abstract format: Oral

While activists, researchers, and affected communities have called for efforts to decolonize institutions for some time now, recent political and social events have certainly spurred rapid calls to action. And while in some regions of the

world there has been a long history of collaboration, others, such as in the American Southeast, have lagged behind largely due to deeper histories of genocide and removal of the region's Indigenous people. We believe that the tide is changing towards practices beyond compliance, ones that are truly collaborative where tribal partners and archaeologists are equal partners in research endeavors. While individual researchers can and should engage descendant communities in partnered work, it is more difficult for an institution, particularly public academic institutions, to do this in a rapid fashion. The difference is related to both scale and complexity in the endeavor. One way forward, particularly for institutions of higher education, is through descendant community-informed institutional integrity (DCIII). DCIII can be thought of as a series of formalized dimensions. These dimensions- shared stewardship, multi-vocal approaches, bi-directional communication, trust, capacity building, equitable partnerships, knowledge sharing, transparency, and joint decision-making, guide descendant community engagement in policies and procedures within a research integrity program. This paper outlines some specific daily practices, as well as policies rooted in DCIII and enacted by the University of Georgia, Laboratory of Archaeology in the United States.

4 I'M NOT INDIGENOUS, I'M JUST CURIOUS AS YOU! EXPERIENCES OF RESETTLING COMMUNITIES AND SEARCHING FOR OTHER PEOPLE'S ANCESTORS IN MOZAMBIQUE

Abstract author(s): Gota, Pascoal (Department of Archaeology and Ancient History, Uppsala University)

Abstract format: Oral

Owing to centuries of colonialism and the political appropriation of the concept indigenous by the colonial regime, in Mozambique being called indigenous is not a good thing. By pointing to the challenges of addressing indigenous archaeology in Mozambique, in this paper I bring to discussion my experiences as an intern that was actively engaged in resettling communities outside of Limpopo National Park (LNP), and to later become a researcher interested in recording the places of other people's ancestors in locally protected forest patches in Inhambane province. Imagining futures memories characterised by being far from the homeland and the lost of connection with the land and ancestral places, I question how a one-sided knowledge about environmental conservation and without taking in account the wishes of local people might contribute to erase the 'emotional topography' and creating memories of displacements. In this context, the notion of indigenous archaeology is quite different from the way archaeological research is carried out in Mozambique and how local people are open-minded to share and have a mutual understanding of their past with outsiders. Taking in account local epistemologies and ontologies, I propose a theoretical framework that serves as a gateway for a more balanced engagement with local people in the context of writing their pasts and research beyond indigenous archaeology. From the theoretical framework I widen the discussion by suggesting a more open and inclusive approach of researching the past by conceptualising the notion of local archaeology or archaeology with the locals. Combining the experiences of being part of resettling local people and now documenting royal family lineages and local heritage sites in Inhambane province I conclude by giving some examples on how local communities can formally have the chance to secure their lands and recognised stewards of tangible and intangible heritage in locally protected forests.

5 PUBLIC ARCHEOLOGY AND URBANIZATION IN SÃO PAULO, BRAZIL (18TH AND 19TH CENTURIES): THE CASE OF THE CEMITÉRIO DOS AFLITOS

Abstract author(s): da Hora, Juliana (University of Santo Amaro - UNISA) - Porto, Vagner (University of Sao Paulo - USP)

Abstract format: Oral

This presentation aims to discuss the intentional social erasure of enslaved and freed black people in São Paulo at the turn of the 19th century. Recent archaeological work at São Paulo's city center, more precisely at Liberdade neighborhood, has made this discussion come to light. During the above mentioned archaeological works, an old cemetery, called Cemitério dos Aflitos (Cemetery of the Afflicted) was unveiled. This was the first public cemetery in the city of São Paulo, a place where slaves, indigents, and condemned people of the city were buried. This black memory of the neighborhood was, throughout the 20th century, completely erased, as the presence of Japanese immigrants began to strengthen in the area. Today the Japanese memory in the neighborhood is consolidated. The theme of urban cemeteries in slave-owning Brazil between the 18th and 19th centuries is inserted in a logic of erasures, violence, and the jettisoning of the underprivileged in the city. The location of the Cemitério dos Aflitos, considered "extramural" in this period, was surrounded by a hygienist aesthetics discourse in vogue between the end of the 19th century regarding the central areas of the city. In the formalization of the territory, the Cemitério dos Aflitos is extinguished and buildings and streets are built on the site, undermining the place where an incalculable number of people had been buried violating the bodies and memory of the victims and excluding them from the social history of the city. Because of these archaeological finds, with the search for the preservation of the archaeological collection and memory of the Africans who lived in the Liberdade neighborhood during the period of slavery, there is an effort to make this space heritage, creating the Memorial dos Aflitos (Memorial of the Afflicted).

6 PACHAMAMA IN THE POLITICAL: INTERCULTURAL WORK AND TRANSGRESSIVE INDIGENEITY FOR THE COMMUNITY HERITAGE OF AMAICHA DEL VALLE (NORTHWEST ARGENTINA)

Abstract author(s): Orlandi, Francesco (University of Bologna)

Abstract format: Oral

The paper presents insights stemming from an accidental collaborative research in which I was invited to participate during my doctoral fieldwork in the Indigenous Community of Amaicha del Valle (CIAV, Tucumán, Argentina) that led to the creation of the bespoke category of “community heritage” within the current heritage legislation of the Province of Tucumán. The fading dream of a solar power plant triggered the recognition of the community heritage values embedded in a petroglyph that was found in the same area. This is part of a larger archaeological surface that had been studied many years before the planned development project but was dismissed during the mandatory impact assessment and consultation process with the CIAV authorities and the general assembly because the majority was persuaded by promises of job opportunities and reduced energy costs. The Council of Elders of the CIAV and the cacique, the Indigenous rights lawyer Eduardo Nieva, claimed that the community’s denial of the heritage significance of the petroglyph was due to the misinterpretation of the motif engraved on the stone block by the archaeologists who first studied it. The Indigenous authorities associated the drawing with the oral history linking the Andean figure of the fox with a devil-like figure, known as chiqui. The figure-concept of chiqui offered a cue to expose the regulatory regimes of indigenous heritage in multicultural policies and international development interventions, thus revealing the cosmopolitical dimension of indigenous peoples’ struggles for heritage and territory. Its appearance and concealment, in contrast to the much better-known figure of Pachamama and in relation to the ethnodelopment interventions implemented in the recent past in the Calchaquí valleys, allow for the emergence of a composite political assemblage that questions the compartmentalisation of heritage categories and, at the same time, foregrounds the space of friction in which Indigenous self-determination unravels.

564 YESTERDAY’S YARNS AND TOMORROW’S TALES? THE RELEVANCE OF RESEARCH FRAMEWORKS FOR A SUSTAINABLE ARCHAEOLOGY

Session theme: 3. Heritage Narratives and Representations

Session organisers: Spencer, Helen (Society of Antiquaries of Scotland) - Miles, Daniel (Historic England) - Rennell, Rebecca (University of the Highlands and Islands) - O’Keeffe, John (Discovery Programme) - van der Jagt, Inge (Cultural Heritage Agency of the Netherlands)

Session format: Regular session

The creation, development and use of Research Frameworks and Agendas can be key in weaving the narratives of past, present and future archaeological research. Research Frameworks and Agendas are no longer considered to be static and there is a need to continually update and evaluate them. While many research agendas are now online and widely available to all users, the question of how they can be managed, linked together, used more widely, and be updated in a sustainable manner is becoming more prevalent. Five years since the Session on developing a European Network of Linked Research Agendas at the 2018 EAA in Barcelona, this session will invite papers from across Europe to share how they have approached the ongoing development of national, regional and thematic frameworks. How are research frameworks being established? Once established, how are research frameworks and agendas better used and incorporated into archaeological practice? Do research frameworks only relate to the work of professional archaeologists, or are they being used by the wider public? How is the public involved in the creation of research frameworks and what are the benefits? How are research frameworks used to communicate archaeology to a wider audience? How might the processes to create, share and update frameworks become more sustainable?

ABSTRACTS

1 CREATING EAC GUIDANCE TO DEVELOP AND SUPPORT MORE SUSTAINABLE AND INCLUSIVE RESEARCH FRAMEWORKS

Abstract author(s): van der Jagt, Inge (Cultural Heritage Agency of the Netherlands) - Miles, Daniel (Historic England)

Abstract format: Oral

This presentation will highlight the work undertaken so far to create a suite of guidance to support people who are considering developing national research frameworks. This has included analyzing existing research frameworks and consulting our working group to understand the drivers for and processes behind their creation. This has shown that there is no standard way for their creation and factors including the audience and their user needs determines to a large extent the approach undertaken to create a framework in terms of its content, scope and format. This is framed

within the political, legislative, economic and social context of the state developing the research framework. There is also an important requirement to enable the frameworks to become sustainable in terms of their future development and management, to move them from a static point in time to a live entity that can adapt and reflect change, innovation and different socio-cultural drivers that may need to be considered when making future choices.

With our paper we would like to give you an insight into the various choices you can make when making or renewing a research framework.

2 PAST, PRESENT AND FUTURE - THE NEXT 10 YEARS OF THE SCARF

Abstract author(s): Allison, Jennifer - Spencer, Helen (Society of Antiquaries of Scotland)

Abstract format: Oral

The Scottish Archaeological Research Framework (ScARF) recently celebrated 10 years since it was launched as one of the first web-based, updateable research frameworks. This talk will briefly look back at the origins of the project highlighting the successes and challenges since it was first created. The talk will then discuss plans for the future of the ScARF project, and how it has now become a key objective of Scotland's Archaeology Strategy. Over the years the priorities of the project have evolved from being a primarily academic exercise to inform research to becoming an essential resource for applied and community archaeologists. As we look to the next 10 years, the talk will consider how we aim to maintain the high quality of ScARF while making it more easily updateable, sustainable and more useful to professional archaeological practice by incorporating research questions into OASIS V. We will also show the importance of increasing its value, relevance and useability to the wider public with examples from recent – and future – regional projects to show how our approach is changing.

3 RESEARCH FRAMEWORKS AND WORLD HERITAGE: SUSTAINING ARCHAEOLOGICAL RESEARCH IN THE DERWENT VALLEY MILLS WORLD HERITAGE SITE, DERBYSHIRE, UK

Abstract author(s): Knight, David (York Archaeology; Derwent Valley Mills Partnership) - Owen, Vicky (York Archaeology)

Abstract format: Oral

We focus in this presentation upon the strategies employed in developing, maintaining and enhancing a Research Agenda and Strategy for the Derwent Valley Mills World Heritage Site: a 24km stretch of the Derwent Valley that was inscribed on UNESCO's World Heritage List in 2001 in recognition of its pivotal role in the Industrial Revolution. This micro-framework falls within the area covered by the East Midlands Historic Environment Research Framework, with which it is closely linked, and has been transformed from a paper publication to an interactive digital resource that it is hoped will be used and added to by stakeholders from across the historic environment spectrum. Development of this interactive resource has raised in microcosm many issues that will be familiar to those striving to develop publicly accessible research frameworks. In particular, how can we ensure sustainable management of the framework and updating of the content as research evolves and as research priorities change? How can we encourage use of the framework by archaeological contractors and consultants, planners, academics, independent researchers, community archaeology groups and the wider public? With these questions in mind, we will focus upon the methods used to encourage stakeholder engagement during compilation of this framework; the strategies devised for involving stakeholders in longer term maintenance and updating of the resource; measures for encouraging research by stakeholders across the historic environment spectrum; communication of that research; and integration of this resource into the Research Framework for the wider East Midlands region.

4 BEYOND THE WATER'S EDGE - CONNECTING RESEARCH AND RESEARCH FRAMEWORKS. A PERSPECTIVE FROM SCOTLAND'S ISLANDS

Abstract author(s): Rennell, Rebecca (UHI Archaeology Institute)

Abstract format: Oral

For regional research frameworks in archaeology to be effective and efficient they need to be geographically focused. However, if our frameworks are to be meaningful, they also need to acknowledge and incorporate shared research gaps beyond the geographic remit. Finding the right balance between regional boundaries and wider links is challenging. This dynamic is particularly acute in an island-context where the sea both bounds and connects places – a theme that island archaeologists have long debated and explored in their research.

In this paper I reflect on some of the ways we've navigated boundaries and connections within the development of the regional research framework for Scotland's islands - SIRFA. Our approach is essentially multi-scalar – moving between archipelagos, individual islands and even islands within islands. We also recognize a tendency amongst some archaeologists to make 'islands' of themselves and their work, leading to isolated narratives and siloed research agendas. Exploring themes of connection and isolation in the archaeological past and research-present is a key aim. In this

paper I explore some of the implications of island-based geographical and political boundaries in the development of research frameworks and reflect on the conceptual and methodological challenges and opportunities we've encountered via our multi-scalar, island-based approach. More specifically - and with reference to Article 174 of the Treaty on the Functioning of the EU (TFEU) and UNESCO Small Islands Developing States (SIDS) - I argue that the island context invokes important questions about the relationship between 'core' and 'periphery', both for our understanding of archaeological resources and their research potential, and the role of heritage and heritage management within a modern European setting. The aim is that this paper will stimulate discussion on the wider articulation of regional, national and international research frameworks and the value and validity of a specific island approach.

5 HILLS AND VALLEYS - DOING THINGS DIFFERENTLY IN THE CLYDE VALLEY

Abstract author(s): Spencer, Helen (Society of Antiquaries of Scotland) - MacGregor, Gavin (Archaeology Scotland) - Brophy, Kenny (University of Glasgow)

Abstract format: Oral

The 'Clyde Valley' research framework is the latest regional framework to get underway as part of the Scottish Archaeological Research Framework family. It will concentrate on the archaeology of 8 local authority areas in west-central Scotland. While this area only covers c. 4% of Scotland's land mass it is home to around 30 % of its population and has the potential to reach a large number of people unfamiliar with the heritage of the region. The Clyde Valley region has suffered over many years from relative heritage underfunding per capita compared to other regions of Scotland. The region also has some of the greatest social and economic challenges in Scotland and as such, the value of archaeological research outcomes with a wider public benefit is potentially particularly significant. This talk will discuss how this new regional research framework project has the opportunity to increase understanding and engagement with the past, enhance communities' use of the historic environment as well as strengthen the resilience of the historic environment in the region.

6 JOINED-UP THINKING, JOINED-UP PRACTICE: DEVELOPING A STRATEGIC ARCHAEOLOGICAL RESEARCH FRAMEWORK FOR THE ISLAND OF IRELAND

Abstract author(s): Meegan, Eimear - O'Keeffe, John - Soverino, Tiziana (The Discovery Programme)

Abstract format: Oral

In 2017, the Royal Irish Academy published *Archaeology 2025: Strategic Pathways for Archaeology in Ireland*, which recommended the development of an Irish archaeological research framework as a means of targeting gaps in knowledge and supporting focused collaboration in a way that would ensure effective use of resources. More recently, both *Heritage Ireland 2030* and *Northern Ireland's Archaeology 2030: A Strategic Approach* have provided fresh impetus for progress in this area. They present an opportunity to consider the development of a Strategic Archaeological Research Framework for the island of Ireland, working across the two jurisdictions and connecting with the ongoing use of research frameworks by neighbouring jurisdictions. In this context, the Discovery Programme: Centre for Archaeology and Innovation Ireland has embarked on a multi-year project to develop such a framework, working closely with their primary funder, the Heritage Council, and with the National Monuments Service.

Through co-design and constructive debate, this project seeks to establish a framework that is held in common by archaeological practitioners and is used to facilitate closer working across disciplines and specialisms in archaeology. It further seeks to use this framework to encourage greater collaboration with established and new stakeholders whose work, knowledge and interest is both relevant to and would benefit from application in archaeological research. This will include the wider public alongside specialist industry, commercial and sectoral groups outside of 'mainstream' archaeology. Rather than constraining the wider archaeological/heritage community, it will embrace external drivers of activity, such as development and land use change, as well as the more traditional spurs of the archaeological endeavour, including curiosity, opportunity and 'blue skies thinking'.

The proposed paper is concerned with the preliminary stages of the framework's development, providing an update on current progress as well as offering some thoughts on the key challenges and opportunities facing the project.

ANIMALS MAKE IDENTITIES: HOW PEOPLE EXPRESSED THEIR SOCIAL AFFINITIES IN THE STONE AGE? [PAM]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Macane, Aija (University of Helsinki; University of Latvia, Institute of Latvian History) - Živaljević, Ivana (University of Novi Sad) - Mannermaa, Kristiina (University of Helsinki)

Session format: Regular session

Animals were the main companions, both in a material and a cosmological sense, inhabiting the Stone Age environments together with humans. Human-animal relationships were forged through the interactions and engagements in daily life, which in different forms continued to be present also after the death of animals and humans.

Burials are considered as one of the most vivid representations of human identities. Animal remains, particularly tooth pendants, comprise a significant part of hunter-gatherer grave inventories. Animal remains and artefacts made from animal body parts have been assigned as having active agency of shaping and transforming human identities. Animal derived objects (e.g., tools and various details of the costume) and their manufacture technology can represent the attitudes relating to identity, origin, kinship, family, and social roles.

The ecology of animal species, such as their behaviour and feeding habits, afford particular interspecies relations and affects how they were perceived by humans. Animals have had various roles in human societies, but certain species were more essential ideologically and symbolically, while others were more vital for subsistence. Nevertheless, only certain animal species or body parts were chosen to follow in the grave with the deceased.

With this session we aim to bring together zooarchaeological, bioarchaeological and artefact research in order to understand how animals and animal-derived artefacts contributed in making and showing identities of humans in Stone Age. The focus is in hunter-gatherer societies but we welcome also studies focusing in pastoral and early farming communities. We especially call for interdisciplinary and interpretative studies on the active social roles of animals, their body parts, and artefacts made from animal materials among prehistoric populations. We welcome contributions dealing with all archaeological contexts, not solely burials.

ABSTRACTS

1 WHERE DO ARTEFACTS BEGIN? ANIMAL BODIES IN THE DANUBE GORGES MESOLITHIC

Abstract author(s): Živaljevic, Ivana (Department of History, Faculty of Philosophy, University of Novi Sad)

Abstract format: Oral

The Modernist Project of separating Culture and Nature has had a profound effect on archaeology, namely by firmly placing objects made by human hands (artefacts) on one side, and the material world of the landscape, including human, animal and plant physical remains on the other side of this divide. The reverberations of this heritage are especially relevant when considering objects made from animal materials – bone, antler and teeth, ‘becoming’ artefacts through human intervention. But where is, then, that artefacts begin? At what point do animal body parts in their ‘natural’ state become ‘artificial’? I explore these issues by looking into the Mesolithic bodily decoration practices in the Danube Gorges, which included ornaments made from cyprinid (*Rutilus frisii* or pearlfish) pharyngeal teeth. Apart from ornaments, caches of pearlfish pharyngeal bones with teeth were also found. They were collected during the seasonal run of pearlfish, migrating to the Danube from the Black Sea. The annual arrival of the fish was expected, and the fishing carefully planned. Thus, the ornament production chaîne opératoire included a number of mental preconceptions, emerging from lived experiences with other nonhuman beings, and further blurring the boundary between the ‘natural’ and the ‘artificial’ world. Apart from pearlfish teeth ornaments, I also extend this argument to include other animal body parts occurring in human burials in this particular context. I draw from Tim Ingold’s notions of blurry “scales of artificiality”, focusing on the histories of beings and materials, rather than on fixed attributes.

2 TRACING HUMAN AND ANIMAL IDENTITIES AT THE ZVEJNIEKI CEMETERY (LATVIA)

Abstract author(s): Macane, Aija (University of Helsinki; University of Latvia, Institute of Latvian History)

Abstract format: Oral

Artefacts found in burials have generally been considered to reflect the life history of the buried person. However, to what extent this can be ascribed to all artefacts found in the burial is still debatable. Hunter-gatherer burials in north-eastern Europe contain an abundance of animal remains along with objects made from other raw materials such as amber, various stones, copper, fossils.

The diversity of animal remains found in grave inventories at the Zvejnieki cemetery (Latvia) provide an excellent material to discuss human-animal relationships and the roles animals played for the prehistoric hunter-gatherer groups.

Animal materials have been found in different parts of the burial, associated directly with the human body or other objects in the grave. Some of them are worked into artefacts, while others can be found in their natural state. They may have been used as a means of personal or group identification, to decorate oneself, or for other purposes. The Zvejnieki material gives the opportunity not only to discuss expressions of human identities, but also to approach identities and life histories of animals. In addition, the chronological framework of Zvejnieki spans five millennia (8th to the 3rd millennium cal BC), making it possible to discuss the dynamics of the relationship between humans and animals, and the changing attitudes towards different animal species. Through several case studies from the Zvejnieki cemetery, this presentation explores identities of humans and animals and how they were mediated in hunter-gatherer burials.

3 INTRODUCING ELKS: FINAL PALAEOLITHIC AND THE EARLIEST MESOLITHIC EURASIAN ELKS AND THEIR SIGNIFICANCE IN THE EASTERN BALTIC HUNTER-GATHERER SOCIETIES

Abstract author(s): Rimkus, Tomas (Centre for Baltic and Scandinavian Archaeology - ZBSA; Institute of Baltic Region History and Archaeology, Klaipėda University; Vilnius Academy of Arts; University of Latvia) - Iršėnas, Marius - Butrimas, Adomas (Vilnius Academy of Arts) - Mannermaa, Kristiina (University of Helsinki; Vilnius Academy of Arts) - Zagorska, Ilga (University of Latvia)

Abstract format: Oral

Late Glacial archaeozoological evidence of animal remains in the eastern Baltic indicate that one of the main animal species that lived and was hunted by the hunter-gatherers was reindeer (*Rangifer tarandus*). However, no evidence of other animal species that was hunted by humans and the use of its skeletal remains for tools processing is available, therefore, for many years reindeer was described as the most important animal for human societies during the Late Glacial.

Recent AMS 14C and species identification (ZooMS) analyses gave the first evidence of the Late Glacial Eurasian elk (*Alces alces*) in the territories of Latvia and Lithuania. Not only their shed antlers but also tools made of their bones were identified. With scarce archaeozoological data at the moment, we observe that elk became already important for human needs in the Final Palaeolithic. More data emerges in the early Preboreal, when gradual changes in cultural and environment happened. Our data suggest the intensification of elks hunting and the use of their bones and antlers for various implements manufacturing. Within this paper we will focus on observing the chronology of elk remains in the Final Palaeolithic and the earliest Mesolithic archaeozoological data, however, with these results we will seek one of our main goals – to track the changes and inventions in hunter-gatherer elk skeletal-based technologies, when people adapted to new raw materials and learned to process them. In the later stages of the Holocene, we observe elk becoming one of the key animals in northern hunter-gatherers' worldview. Tooth pendants and elk-shaped figurines indicate how significant it became in many ways; however, current data allows us to confirm that the very beginning of it already happened at the end of the Late Glacial.

4 WOODPECKER FEATHERS AND CERVID HAIRS – MICROSCOPIC RESIDUES REFLECT HUMAN-ANIMAL RELATIONS AT THE MESOLITHIC SKATEHOLM I AND II CEMETERIES, SWEDEN

Abstract author(s): Kirkinen, Tuija (University of Helsinki)

Abstract format: Oral

Skateholm I and II cemeteries, located in the southernmost Sweden at the shore of the Baltic Sea, date to the 6th-5th millennium BCE. They were excavated in 1980-1984 by Lars Larsson and since then, the site has provided research themes for several investigations and PhD thesis. Skateholm I was re-visited in 2022, when the University of Lund organized its training excavations at the adjacent Ertebølle culture settlement site.

In this paper, the aim is to study the use of soft organic materials such as skins, fur and feathers at Skateholm. Our knowledge of these materials is rather limited because they usually decompose almost totally. However, this issue is possible to study by searching soil samples for microscopic residues. In this study, the results of soil analysis from Skateholm I and II as well as from the recent settlement site excavation are presented. The total number of the samples is about 200, and especially the graves in which several samples have been taken provide a unique material for the research on microscopic particles such as hairs, feather fragments and plant fibres. The research on materials, which served in wrapping and covering the dead, in furnishing the grave, for clothes and accessories, and for grave goods, can help us to understand deeper the material culture and human-animal relations during the Late Mesolithic Era in Scandinavia.

This research is part of Animals Make Identities (AMI) project funded by ERC (PI Kristiina Mannermaa). The project investigates social links between humans and animals in hunter-gatherer burial sites in North-East Europe, c. 9000–7500 years ago.

5 ADORNMENTS MADE FROM ANIMAL MATERIALS OF THE NEOLITHIC MARIUPOL TYPE CEMETERIES

Abstract author(s): Mykhailova, Nataliia (Institute of Archaeology of National Academy of Sciences of Ukraine)

Abstract format: Oral

The Lower Dnieper region was an outstanding landscape phenomenon in prehistoric times. During the Stone Age, the area had great economic and sacral significance. About 30 cemeteries of the so-called Mariupol type (late Mesolithic – Neolithic) are known. They are located from the Dniester River to the Don River, mainly on the Dnieper rapids and the Lower Dnipro. Many of the dead were accompanied by rich grave goods: adornments made from bone, stone, pearl, carp teeth, deer canines and boar tusks. The most commonly animal materials were used. Pendants made of deer canines were the most numerous. Numerous carp teeth, particularly, *Cyprinus carpio* and *Rutilus frisii* are the second important feature of the Mariupol type burial inventory.

The late burial complexes, in particular, the Mariupol cemetery, are characterized by a variety of adornments which are unknown in other areas. The most impressive personal ornaments are the perforated boar tusks. These ornaments are exclusively abundant at the Mariupol cemetery; they are inherent to male, female and children burials. Plates, made of boar tusks of various shapes, are the most intriguing feature of the Mariupol type grave offerings. They are elaborately worked. Their edges sometimes bear enigmatic incisions.

The study of these grave goods provides information on the rites of the life cycle, and among others, the ceremonies marking the change of age and social status, gender identification and marital status.

6 ANIMALS AS TOTEMS: THE POSSIBLE REFLECTION OF THIS PHENOMENON IN SCULPTED PENDANTS OF THE EAST EUROPEAN FOREST NEOLITHIC COMMUNITIES

Abstract author(s): Kashina, Ekaterina (-)

Abstract format: Oral

In this talk, the interpretation of multiple bone, amber and flint pendants representing animals and humans, is given based on the recognition of the East European Late Neolithic forest hunter-gatherer-fishers' totemic worldview. This assumption is based on proven conclusions about developed support networks over this large territory, connecting communities by marriage and exchange of goods. This state of affairs can be compared with ethnographical data for Australian foragers. Australian communities featured a highly developed and diverse totemic worldview based on notions of universal kinship and an enduring connection with the certain territory, while their totemic animals were represented by edible species, mostly birds. Also, care for totemic animal survival played a significant role in communities' ethics (Tokarev 1956; Artemova 2009).

Pendants of bone, antler, amber and flint, representing a variety of bird species, snakes, beaver, otter, fish, as well as anthropomorphs, were apparently sewn onto clothes and headwear, and worn in lifetime. They could depict totemic animal (and human) ancestors. This conclusion was made considering the results of pendants' mapping, which show that identical animal species are usually grouped within one or two large rivers basins, possibly marking certain communities' territory, whose inhabitants revered a certain ancestor. Among these images were capercaillie, snake, swan, ducks, beaver, and fish. Otter, heron, hazel grouse, and crane are known from single cases. Finds of different bird species pendants in some dwellings and burials of the Volosovo culture could reflect the marital ties of different totemic image possessors, while only the beaver pendants from the Valma (Estonia) double burial might witness blood relatives buried together.

7 OF PIGS AND THEIR HUMANS, OF EVERYDAY AND OTHERWORLDLY CONNECTIONS

Abstract author(s): Pasaric, Maja (Institute of Ethnology and Folklore Research, Zagreb)

Abstract format: Oral

Disarticulated and fragmented or intact remains of pigs have been unearthed in layers, in pits and burials within Neolithic settlements of eastern Croatia. Pigs were buried complete or almost complete, alone or in the company of humans. Especially interesting burial is the one from the settlement Đakovo-Franjevac where two pigs were placed next to an adult man, yet their complete bodies were arranged in different manners. In the vicinity of this find another pit containing a single, well preserved and complete skeleton of a pig was also unearthed. The contribution explores what kind of communication was possibly exchanged between humans, pigs and the rest of their shared environment and how pigs and humans might have affected each other bodily and emotionally. Encounters between pigs and humans and their shared embodied experiences and might have created powerful affects for individuals of both species and even generated affective atmospheres, which could have been explored, negotiated and acknowledged through material culture and ritual communication.

BEYOND BEAN COUNTING: CURRENT, EMERGING AND ANTICIPATED APPROACHES TO BENEFITTING PEOPLE AND PLACES THROUGH ARCHAEOLOGY [EAA PUBLIC BENEFITS ADVISORY COMMITTEE]

Session theme: 3. Heritage Narratives and Representations

Session organisers: Lewis, Carenza (University of Lincoln) - Schülke, Almut (University of Oslo) - Rummel, Christoph (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts)

Session format: Discussion session

The benefits of archaeology to people and places are most easily (and therefore most often) measured in 'bean counting' financial terms, but this in no way represents their full range, actual and potential. Effective understanding, delivery, recognition, dissemination and nurture of the myriad benefits of archaeology is essential to sustaining a virtuous spiral in which these benefits can be ever more widely experienced, valued and increased.

The new EAA Public Benefits Advisory Committee aims to help archaeologists (1) respectfully, helpfully and constructively share archaeological knowledge and opportunities with wider publics; (2) advance knowledge and understanding of the ways and means by which archaeology benefits people and places; (3) share data, information and insights demonstrating the benefits of archaeology, so their multifaceted values can be recognised; (4) be alert and open to new opportunities to achieve, capture and understand the public benefit of archaeology in the future.

In order to help us achieve the above aims, we would like this session to review current work and ideas for the future, inviting contributions from EAA members across Europe providing insight and opinion on the following topics:

1. In what ways does archaeology currently benefit wider society in Europe and beyond and how are these benefits measured?
2. What are the commonalities and differences across Europe in (a) conceptualising and (b) delivering public benefit through archaeology?
3. In what ways has the capacity of archaeology to benefit people and places been affected by changing social, political and economic conditions in the 2020s?
4. What future problems, challenges and opportunities can be anticipated for those seeking to enable archaeology to be of greater benefit to society.
5. How can information about archaeology as a public benefit best be disseminated to archaeologists and policy-makers within in and beyond the heritage sector?

ABSTRACTS

1 THE FUTURE OF THE PAST: THE EAA ADVISORY GROUP HELPING ARCHAEOLOGY, PEOPLE AND PLACES NOW AND INTO THE FUTURE

Abstract author(s): Lewis, Carenza (University of Lincoln) - Darvill, Timothy (University of Bournemouth) - Rummel, Christoph (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts) - Schülke, Almut (University of Oslo) - Fernández Fernández, Jesús (Universidad de Oviedo)

Abstract format: Oral

The importance of increasing the range and reach of archaeology's benefit to wider society, and of raising awareness of these benefits across and beyond the archaeological sector, was demonstrated in 2022 by the creation of a new EAA Advisory Group. This is a small group with a big remit, and this paper aims to draw the wider EAA membership into discussion into how it can best nurture archaeology in Europe as a practice which benefits people and places across the continent, now and into the future.

This paper will outline the current aims and objectives of the new Public Benefits Advisory Group as stated in its Terms of Reference, as a stimulus to wider discussion. The overarching aim of the Advisory Group to ensure archaeology and archaeologists in Europe are best equipped to achieve and promote the public benefits of archaeology. This aim is underpinned by five subsidiary aims relating to the range of current activity through which archaeology delivers wider benefits across Europe, its variation in different states, changes over time in attitudes to archaeology as a 'public good', emerging opportunities and threats to current practice, and dissemination. To achieve these aims the Advisory Group has identified eight specific objectives.

We hope this paper will stimulate discussion and engagement which will increase the Group's capacity to nurture archaeology as a 'public good' to benefit from the 'hive mind' of the EAA community, as we move forward.

2 ARCHAEOLOGY 2030: A STRATEGIC APPROACH FOR NORTHERN IRELAND, AN UPDATE

Abstract author(s): Murray, Bronagh (Historic Environment Division)

Abstract format: Oral

Northern Ireland has a rich archaeological heritage, consisting of over 17000 Monuments recorded in the Northern Ireland Sites and Monuments Record, with an additional 4000 Defence Heritage sites recorded on a separate register. Archaeology 2030 is a ten-year project to develop a strategic approach for archaeology in Northern Ireland. The strategic vision of Archaeology 2030 is for archaeology to be accessed and valued by as many people as possible, led by a sector which is healthy, resilient and connected. The Strategic Vision has five aims: Archaeology on the ground; Understanding the past; Sustaining the Historic environment; Engaging and enriching lives; Innovation, understanding and skills. Archaeology 2030: A Strategic Approach for Northern Ireland, sets out how Northern Ireland as a society can develop our engagement with, and understanding of, our archaeology.

The project is currently in its strategic delivery phase, establishing a Project Board which is led by a cross-sectoral membership that represents different groups within the archaeological community of Northern Ireland. Eight strategic Working Groups chaired by Project Board members actively contribute to the development and delivery of the key objectives of the Archaeology 2030 strategy.

This paper aims to present an updated account of the development, aims and key milestones of Archaeology 2030: A Strategic Approach for Northern Ireland.

3 CARE FOR THE FUTURE - COMPARING APPROACHES TO CAPTURING THE PUBLIC BENEFITS OF PARTICIPATIVE ARCHAEOLOGY

Abstract author(s): Vareka, Pavel (University of West Bohemia) - Lewis, Carena (University of Lincoln) - van Londen, Heleen (University of Amsterdam) - Marciniak, Arkadiusz (Poznan University) - Verspay, Johan (University of Amsterdam)

Abstract format: Oral

This paper will compare and contrast two different approaches, one qualitative, one quantitative, used to capture the impacts of participation in community archaeology in the CARE project (Community Archaeology in Rural Environments Meeting Societal Challenges) between 2019 and 2022.

CARE began in February 2019, aiming to explore the impact of involving rural residents in archaeological excavations investigating the long-term development of the places where they live. In the first year more than 200 people of all ages and backgrounds took part in the Netherlands, Czech Republic, Poland and UK. More than 1000 residents of local communities have taken part, with impact data capture from around a third of these. One aim of the project was to develop effective ways to capture impact data. This paper will compare two of these, one quantitative, one qualitative. Firstly it will present the methods and insights gained from a quantitative quasi-experimental survey taken at two time points by psychologists which allowed changes in responses from participants and compared these with a control group or non-participants. Secondly we will review the methods and insights from post-participation survey capturing qualitative data from participants into their attitudes to their experience.

We will conclude by considering how emerging insights from CARE project evaluation of the impact of participation in community archaeology may enable the archaeology sector to better support people and places in the future

4 WHAT ARE THE APPLICATIONS OF ARCHAEOLOGY IN EVERYDAY LIFE?

Abstract author(s): Gransard-Desmond, Jean-Olivier (ArkéoTopia, une autre voie pour l'archéologie)

Abstract format: Oral

Like any scientific discipline, the goal of archaeology is to produce knowledge based on data. So how can archaeology already benefit society? Aside from a specialized community publishing for itself, what are those benefits to society? In fact, everyone uses the results of archaeology, but without knowing it. Like Mr. Jourdain in Molière's comédie-ballet, everyone uses archaeology from school to adulthood in our interactions with others without realizing that it is thanks to archaeology that we can do so. From school to diplomatic relations, from the economy to the protection of cultural heritage, we will show how much archaeology is present in our daily life. This reality is not sufficiently recognized inside our archaeological community, which explains why we still wonder about our place in society. This is why this issue of the applications of archaeology, whether beneficial or harmful, represents a challenge for those who seek to make archaeology even more useful to society. How do we communicate this reality to archaeologists and policy-makers within and beyond the heritage sector? How can we encourage new forms of public service? Through this presentation, these questions will open the debate.

A TWIST IN THE TALE: COILED, SPUN AND ROLLED STORIES FROM ARTEFACT STUDIES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Adams, Sophia (British Museum) - Giles, Melanie (University of Manchester) - Brück, Joanna (University College Dublin) - Miller Bonney, Emily (California State University Fullerton)

Session format: Regular session

Current research on artefacts is highlighting more and more often the sharing of skills, techniques and designs across media, either intentionally or accidentally. One particular form that appears in metals, organic fibres, ceramics and more, is the twist. From spun yarn to twisted torcs, from lime bast cord to cord decorated pottery, the study of all these artefacts tells us stories about physical dexterity, created strength, tactile qualities and visual effects. In this session we invite speakers to share the stories of their twisted artefacts. These may be stories of the processes of studying and interpreting the artefact, design, form and composition. Or stories of the past told through twisted artefacts. Perhaps stories where the study has revealed an unexpected twist. Or stories in the sense of oral storytelling, poems, narrative artworks and stories created from the study of artefacts that contain a twist. Biographical, autobiographical, non-fiction and consciously fictional are all invited. We welcome papers that focus on the presentation of stories as well as papers that focus on the content of the story. Through these stories we aim to investigate the role and value of creativity, the benefits and function of twisting different materials and the relationship between storytelling and artefact making in the past and present. Presenters and the audience might be heritage communicators, archaeological scientists, artefact specialists, makers, artists, curators, researchers, analysts and anyone who enjoys a good yarn. Artefacts might be cord bound items, spiral forms, plaited shapes or decorated with rolled wires. We encourage papers from across the globe and from all periods.

ABSTRACTS

1 A TWIST IN THE TAIL: CATTLE HAIR AND OTHER TWISTED, WOVEN AND BRAIDED ORGANICS FROM BRITISH EARLY BRONZE AGE BURIALS

Abstract author(s): Bruck, Joanna (University College Dublin)

Abstract format: Oral

In 2011, a cremation burial accompanied by an extraordinary array of organic artefacts was found in an Early Bronze Age cist at Whitehorse Hill in Devon. Amongst these was a finely-braided armband made from cattle tail hair and decorated with tin studs, as well as a coiled basket of lime bast, a fragment of nettle fibre textile, and a selection of other objects including a composite necklace of amber, shale, clay and tin beads and part of a bear pelt. Building on the excellent published analyses of the braided armband and the other coiled, woven and twisted organics from Whitehorse Hill, as well as artefacts from other Early Bronze Age burials, this paper will consider how such ways of making created embodied links between people and the plant and animal worlds in which they lived. The act of twisting and braiding made connections more visible, emphasizing the strength, beauty and significance of those links.

2 AN EXPERIMENTAL APPROACH TO THE PRODUCTION AND EFFECTIVENESS OF NEOLITHIC BOWSTRINGS

Abstract author(s): Romero-Brugués, Susagna - Herrero-Otal, Maria (Universitat Autònoma de Barcelona - UAB) - Homs, Anna (Independent Researcher) - Martínez-Sevilla, Francisco (Universidad de Alcalá - UAH) - Junkmanns, Jürgen (Independent Researcher) - Palomo, Antoni - Piqué, Raquel (Universitat Autònoma de Barcelona - UAB)

Abstract format: Oral

The number of neolithic bows recovered in Europe has allowed remarkable knowledge about their production process and effectiveness. In contrast, very few examples of possible bowstrings are known. The bowstring is the part of the bow which transmits the force from the archer to the arrow, but our knowledge about its production, properties, efficiency and effectiveness in the Neolithic is scarce.

One outstanding example is the possible bowstring recovered in the Early Neolithic site of La Draga (Northeast Iberia, 5300-4900 cal BC). The site is located on the shore of Lake Banyoles, which has favoured the preservation of organic remains, including three bow fragments and a thin cord of nearly 2 m long potentially related to archery. This possible bowstring is a 2-ply cord made of twisted plant fibres. Cords of similar characteristics have been identified in other prehistoric sites, like Cueva de los Murciélagos (South Iberia, 5300-4500 cal BC), preserved in dry conditions. In this case, the state of fragmentation does not allow to confirm its relation to archery, but the site has also provided some examples of arrows which suggest archery was practiced by the people that used the cave.

The aim of this work is to present the experimental study of these two cords to determine their potential use as bowstrings. In this sense, we have replicated the bowstring considering the raw materials used, size, and production technique and have tested its elasticity, weight, thickness, and resistance.

3 WICKER AND THE SHIELD: A TALE OF A RARE IRON AGE FIND

Abstract author(s): Adams, Sophia (British Museum) - Beamish, Matthew (University of Leicester Archaeological Services)

Abstract format: Oral

Forget your shiny bronze covered Battersea shield, put away your edge trimmed hide shields, lay down your plywood Scutum, there's a new boss in town and it's made of wicker.

2300 years ago a shield was made from the bark of a willow tree. It ended up face down in the bottom of a wet pit where it remained until discovery by archaeologists in 2015. Only when the wicker boss was revealed did the purpose of this object become clear. This is a tale of learning through looking and creating through testing. Through the expertise, patience and dedication of many people we have come to know this unique find and question whether this single item is the representative of many. Could this be an effective shield? Did it see action? How difficult is it to make? How accessible were the materials? Was this the kind of shield available to most people?

As we followed the twists and turns in the bast cord stitches, untangled the repairs from the original features and separated the ancient damage from the degradation in the ground, we have formed a small community of shield bearers. Combining knowledge of ancient wood with skills in manipulating plant materials and obsessive attention to detail, we have experimented, recreated and re-recreated this bark shield. Features found on metal shields are here rendered in hazel, willow and lime. A poplar handle defined the curvature of the body and scored lines arranged the decoration. In preparing this incomplete object for display at the British Museum we have sought to fill in the gaps through our research and experiments. By telling this story we aim to make tangible the gestures and motions of the hands that created and carried this shield all those thousands of years ago.

4 THE RED MAN OF KILBERG. AN ANGERED GODDESS

Abstract author(s): Griffiths, Mark (Freelance)

Abstract format: Oral

The Red Man, an anthropomorphic figure dating from 1740 – 1531 BC, was discovered in 2003 in Kilberg, Co. Offaly after being shaved in half by a peat cutter. Seeing the Red Man for the first time my eye was immediately drawn to its beautiful serpentine twists. Three thousand years and the wounds inflicted by the peat cutters blade, hadn't dulled the figures sense of movement and grace. Categorized as male, I see in the Red Man's form far more likely to represent a woman.

Weeks later I found myself in Cork's Meitheal Mara boat yard looking upon a rod straight section of timber which had been selected, on my behalf, to remake the Red Man. As we, the Pallasboy Project, have found with so many of our creations sourcing wood with the correct character is a challenge. Timber today is cut straight and square from managed woodlands, twisted wood being commercially undesirable. For the next two days I battled with bronze axes to carve the same flow and life I'd seen in the original into this bland telegraph pole of timber. I failed miserably.

Many of these mysterious figures from prehistory are attributed to deities. If so, then I see the Red Woman as a goddess dancing, the twisted timber following her swaying movements in a celebration of what it is to be alive.

And as for my reproduction of this figure? Maybe it was just chance that one wild night a terrible storm whipped the river Lee into a boiling rage and tore our Red Man from the lashings that held it to the quayside, and dragged it deep into the Celtic Sea. Chance? or was the storm created by the indignation of a bronze age dancing goddess, affronted by this lifeless figure?

5 ENCHANTED GARMENTS: SPINNING TALES OF BOG BODIES

Abstract author(s): Giles, Melanie (Archaeology, School of Arts, Languages and Cultures) - Harvey, Isobel (University of Manchester)

Abstract format: Oral

In this paper, I will present the story of two Roman bog bodies – the man from Grewelthorpe moor (North Yorkshire, UK) and the woman from Amcotts moss (Lincolnshire, UK) – known largely through their footwear and associated textiles. I will explore the contrastive spun or twisted textiles associated with each, from the impressive 'insole' of the former, to the minute thread caught on the shoe of the latter. I will then explore what this can tell us about these the lives of these individuals and the world from which they came, before studying the curious power of the bog upon these textiles, and how it gave them new importance and even supernatural power, in the eyes of those who brought them back to light. Using an object itinerary approach, I will examine the contrastive history of human remains, shoes

and textiles, as a way of thinking critically about the relative value of these threads; from craft insight to forensic evidence to the particular aura of fragile substances whose preservation appears to defy time.

6 TWISTED REFLECTIONS OF LIFE: CREATING COMMUNITIES OF DEATH THROUGH IRON AGE ITALIC FUNERARY DRESS

Abstract author(s): Prew, George (National Museums Scotland; University of Glasgow)

Abstract format: Oral

The early Iron Age communities of Italy are known mainly through their funerary records. This paper is a reflection on my PhD research analysing Iron Age Italic communities through their funerary dress, applying material and sensory analyses to the evidence for published funerary dress assemblages from the cemeteries of Bazzano, Fossa, and Osteria dell'Osa to present new understandings of how the

dressed body was constructed and perceived in its mortuary setting. This paper discusses the merits and difficulties of an approach in which objects are classified in multiple ways to reconstruct how the dress might have been perceived and what that perception might have meant for the communities to which these individuals belonged, considering the utility of constructing a community from its perceptions of itself, as materialised in their creation of the corpse.

Osteological estimations of sex and age provide footholds by which to understand the people and the communities which the cemeteries served, but funerals are not simple events, they are multifaceted performances. The performance, appearance, and investiture of corpses provide multiple lenses through which to build a composite picture of the deceased, their constructed identity in the grave,

and the communities in which they lived, but what relation did these bear to the reality of these communities? This paper explores this question and presents findings from this approach to funerary study.

7 THE LIVED EXPERIENCE OF TEXTILE MAKING IN EARLY IRON AGE ITALY: CREATIVITY, CRAFT AND EMOTION

Abstract author(s): Toms, Judith (None)

Abstract format: Oral

This paper is an imaginative telling of the lived experience of textile making in Early Iron Age Italy, drawing on personal experience of spinning and weaving, creativity, the archaeological data, ethnography, and psychology. One of the twists in this tale is that textiles would have been ubiquitous but barely survive in the archaeological record. However, we do have textile tools buried in many tombs.

A picture emerges of a craft practiced daily by many women and children in the home. Everyone would have grown up with the sights, sounds and smells of textile making around them, as well as the textiles themselves - literally and metaphorically part of the fabric of their daily lives. The surviving textile tools help us imagine what the physical paraphernalia of the craft would have been, and how it would have been practiced.

There are many skills to be learned and this takes aptitude, focus and patience. When I was a young art student I immersed myself in spinning and weaving. The physical actions became engraved in my muscles and memories by long hours of attentive work and decades later are still vividly with me.

Much of the work could be communal, maybe aided and accompanied by chants, songs, stories. These could help remember and pass on the processes of making - setting up looms, weaving certain patterns. It is also a space to share myths and personal stories.

Skill and practice may confer some soft power on the textile makers, and must contribute to their sense of identity and membership of the community. There is also textile making as metaphor: continuously spinning and weaving the fabric of society into being. Holding society together by the creative act.

8 CRYSTAL MAZE: A TWISTY-TURNY JOURNEY THROUGH THE HISTORY OF AN UNUSUAL EARLY MEDIEVAL JAR

Abstract author(s): Davis, Mary - Goldberg, Martin (National Museums Scotland)

Abstract format: Oral

The Galloway Hoard, dating to c. AD 900, was found by metal detectorists in 2014 in Southwest Scotland. It is made up of a large number of Viking age arm rings and ingots, as well as many Anglo-Saxon objects. The majority of the Anglo-Saxon artefacts were contained within a lidded vessel and included brooches, beads, heirlooms and curios, some of which were several hundred years old when buried. There were also two textile bundles containing elaborate gold objects. One of these bundles - composed of leather, samite silk and linen contained a carved rock crystal jar, highly decorated with gold sheet, wire and filigree. The object is unique, and presents an interesting history of use, change

and elaboration dating back to the Roman period. This paper aims to tell the story of unravelling the origins of the object as well as examining the unusual intricately applied wound and twisted gold decoration.

9 RE-DISCOVERING HALLSTATT: SIR JOHN EVANS (1823-1908) AND THE HALLSTATT COLLECTION AT THE ASHMOLEAN MUSEUM

Abstract author(s): Nimura, Courtney (Ashmolean Museum of Art and Archaeology, University of Oxford) - Geitlinger, Timo (University of Zurich) - Foster, Jennifer (University of Oxford) - Roberts, Alison (Ashmolean Museum of Art and Archaeology, University of Oxford)

Abstract format: Oral

Just south of Salzburg in the salt-rich region of Austria lies the Late Bronze Age and Early Iron Age site at Hallstatt. The extensive cemetery of cremations and inhumations and the related salt mines form one of the most iconic archaeological sites in Europe, so much so that an entire period of later prehistory was named after it. The incredible collections of grave goods are mainly held in Austria, but a small group of just over a hundred objects can be found in the Ashmolean Museum of Art and Archaeology at the University of Oxford. This was due to the interest of avid collector and antiquarian Sir John Evans, who visited Hallstatt in 1866 and for a few years after helped fund the excavation in exchange for artefacts. A recent research project cataloguing and studying this assemblage has been ongoing for about two years, which also included two Masters projects. In this talk, we will tell the story of how these objects came to the Ashmolean through a series of letters by Evans, his friends, and colleagues. We will present the results of the Hallstatt research project, and one of the Masters projects specifically, including new scientific analyses, drawings, and ultra-high-resolution photographs.

572 THERE IS MORE THAT UNITES US, THAN DIVIDES US. TAKING STRATEGIC, COLLABORATIVE APPROACHES TO MANAGING AND DELIVERING ARCHAEOLOGY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Jones, Cara - Geary, Kate (Chartered Institute for Archaeologists) - Enlander, Rebecca (Historic Environment Division | Department for Communities) - Deevy, Mary (Transport Infrastructure Ireland) - Taloni, Maria (Ministry of Culture)

Session format: Round table

We know the results and outputs that we want – can strategic approaches help us get there?

Within the UK, the last decade has seen an increase in nationally co-ordinated archaeology and heritage themed strategies designed to take collaborative approaches to addressing long established pressures or problems. These initiatives have aimed to bring different sub-sectors together to develop innovative approaches to how we deliver archaeology and maximise the potential for public benefit, all while working with limited resources.

This discussion will draw on examples from Scotland, which has had an archaeology strategy in place since 2015, from Ireland where ‘Archaeology 2025’ was launched in 2017, from Northern Ireland, where work has commenced with ‘Archaeology 2030’ and the ‘21st Century Challenges’ initiative in England. We welcome other contributors to share additional thoughts or examples.

During this roundtable, we would like to explore

- Successful examples of strategy based archaeological work
- The mechanisms required to make strategic approaches a success
- The challenges of developing and delivering this work
- The sustainability and long-term outcomes of this work

This roundtable invites participants to give a short presentation on examples of strategy-based archaeology work which highlight how collaborative approaches to long term outcomes can enhance the outputs of our work. The presentations will be followed by a roundtable discussion which will explore the key questions highlighted above.

573 INTERDISCIPLINARY COPROLITE ANALYSIS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Dunseth, Zachary (Joukowsky Institute for Archaeology and the Ancient World, Brown University) - Fuks, Daniel (McDonald Institute for Archaeological Research, University of Cambridge) - Gur-Arieh, Shira (Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University Munich; The Leon Recanati Institute for Maritime Studies, Haifa University)

Session format: Regular session

Intact paleofeces, or coprolites, constitute a unique type of archaeological micro-context as short-lived time capsules of past animal or human diet and gut microbiomes. Analyses of their components may generate proxies for reconstructing paleoenvironment and paleoecologies, pastoral and agricultural activity, seasonality and mobility, foodways and health, among others. Coprolite studies are now conducted using a wide variety of methods, among them geoarchaeological (micromorphological, mineralogical, sedimentological), archaeobotanical (including palynological, carpological, phytolith), parasitological, spectroscopic (Raman, NIR, FTIR), biomolecular (genomic, proteomic, lipidomic), and isotopic (^{14}C , $\delta^{13}\text{C}$, $\delta^{15}\text{N}$). The aim of this session is to present both novel analytical techniques and combinations of traditional techniques in identifying and analyzing intact coprolites. Papers may concern feces of any animal and should ultimately relate to research questions relevant to archaeology. While all papers should have a strong methodological component, case studies demonstrating the value of multi-proxy and interdisciplinary approaches to coprolite analysis are very much encouraged.

ABSTRACTS

1 COMPOUND-SPECIFIC RADIOCARBON DATING OF FAECAL BIOMARKERS

Abstract author(s): Whelton, Helen - Knowles, Timothy (University of Bristol) - Shillito, Lisa-Marie (Newcastle University) - Blong, John (Washington State University) - Bull, Ian (University of Bristol)

Abstract format: Oral

Coprolites, or semi-fossilised faecal matter are archives of ancient lifestyles and are often utilised to provide a direct indication of when the producer of the faeces was in place at a particular time. Thus, radiocarbon dating of coprolites is a valuable tool in determining its age.

Most commonly, radiocarbon dating of coprolites is conducted using bulk analyses of the dried coprolite matter or macrofossils, such as plant or bone, extracted from within the coprolite matrix. Identification and characterisation of coprolites is then typically achieved through aDNA, lipid biomarkers, macrofossil, thin-section and microfossil analyses. Alternatively, its age is determined using material from within the same stratigraphic layer to establish an associated date. The main problem with this approach is possible movement of sediments and uncertainties in the differences of when the material was deposited which can lead to incorrect dating of coprolites.

More recently, the adoption of a compound-specific approach to radiocarbon dating has been developed to overcome the challenges faced with bulk ^{14}C analyses which occur from post-burial contamination and the complexity which arises from the analyses of chemically heterogeneous samples.

Herein, a compound-specific approach has been applied using preparative-GC to date well-established organic biomarkers, 5β -stanols. Results from the bulk ^{14}C analyses of macrofossils recovered from within the coprolite matrix fit within the expected age of the coprolite. Similarly, compound-specific ^{14}C dating for both standard (200 $\mu\text{g C}$) and small (50 $\mu\text{g C}$) sample sizes have ^{14}C dates consistent with those of the expected age. Consequently, compound-specific radiocarbon dating of 5β -stanols has been shown to provide an unequivocal link between the target compound and their source and importantly, the results have shown that smaller amount of C can reliably be used to determine the ^{14}C date of a coprolite.

2 UNVEILING THE SECRETS OF NEOLITHIC DIET AND HEALTH THROUGH ANALYSIS OF COPROLITES FROM SWIFTERBANT CULTURE SITES IN THE NETHERLANDS

Abstract author(s): Kubiak-Martens, Lucy - van der Linden, Marjolein (Biological Archaeology & Environmental Reconstruction, BIAx Consult) - Ngan-Tillard, Dominique (Faculty of Civil Engineering and Geosciences, Delft University of Technology) - Mackay, Helen (Department of Geography, Durham University) - Shillito, Lisa-Marie (School of History, Classics and Archaeology, Newcastle University) - Hardy, Karen (Department of Archaeology University of Glasgow) - J.T. Zeiler, Jørn (ArchaeoBone)

Abstract format: Oral

The study of coprolites from Early Neolithic (Swifterbant Culture) sites in the Netherlands was conducted to assess the diet and health of the Swifterbant Culture populations. The primary focus of the study was on the sites Swift-

erbant-S3 and -S4 dated to c. 4300-4000 cal BC. The analysis of coprolites was performed using diverse (some innovative) techniques, including faecal steroids, micro-CT scans, SEM images, animal bone, phytoliths, pollen, intestinal parasites, and starch granules. The results of the study highlighted dietary trends in food preparation in the Swifterbant culinary tradition, revealing a highly variable diet. The living conditions of the people, their dogs, and pigs, who shared a similar diet, were found to have resulted in intestinal parasite infections that affected their health. This interdisciplinary study, part of the Pre-Malta research series (based on sites excavated before 2007), provides a reconstruction of the Swifterbant community diet and sheds light on the health and lifestyle of the Swifterbant Culture populations.

3 **A COMPARISON OF DNA METABARCODING AND MACROREMAINS ANALYSIS FOR DIETARY RECONSTRUCTION USING COPROLITES FROM BONNEVILLE ESTATES ROCKSHELTER, NEVADA**

Abstract author(s): Johnson, Taryn (Texas A&M University) - Hockett, Bryan (Bureau of Land Management, Nevada State Office, Reno; University of Nevada) - Linderholm, Anna (Stockholm University; Texas A&M University)

Abstract format: Oral

This study compares DNA metabarcoding and macroremains analyses performed on ten coprolites from Bonneville Estates Rockshelter, Nevada (USA). While the dietary information from both the genetic and macroscopic remains conform to previous knowledge about subsistence practices from the site, the two methods show minimal overlap in identified floral and faunal taxa. The findings suggest that if genetic data are bolstered with a targeted comparative library, they may detect more digestible foods and medicinal floras than macroremains analysis, while macroremains are likely to include less digestible but identifiable dietary taxa along with evidence of food processing methods. The two methods can further be used in conjunction to aid identifications and interpretation of their combined data. Overall, the lack of overlap and different types of data gained from DNA metabarcoding and macroremains analysis show the methods are best done together whenever possible, and coprolite analysis should be approached with multiproxy analyses in mind to ensure that large amounts of data are not lost.

4 **POO-DUNNIT? TESTING THE LIMITS OF MULTIPROXY ANALYSES OF WATERLOGGED COPROLITES**

Abstract author(s): Green, Eleanor (University of York; Natural History Museum) - Pressless, Sam - Lisowski, Mik - Beckett, Lydia - Fogarty, George - González Carretero, Lara - Hagan, Richard - Hendy, Jessica (University of York) - Speller, Camilla (University of British Columbia) - Wales, Nathan (University of York)

Abstract format: Oral

Mechanisms of faecal preservation vary based on geography and environment. Many coprolites recovered from Northern Europe are found in waterlogged sediments and have been preserved via partial mineralisation. Compared to the desiccated coprolites more commonly recovered in the Americas, few biomolecular investigations have been undertaken on partially mineralised coprolites. Here, the preservation of DNA, proteins and amino acids within coprolites recovered primarily from two early medieval waterlogged sites (Coppergate, England (York Archaeological Trust) and Moynagh Lough, Ireland (Dr. Michael Potterton) is investigated in order to determine the source of the coprolites at these sites.

Upon their initial excavation, these samples were assumed to be human-derived, but a macroscopic inspection of the samples suggested deposition by a carnivore. To investigate this further the coprolites were halved and dissected. A sample of the coprolite matrix was taken from one half, homogenised, and separated into subsamples for DNA and proteomic analyses. The extracted DNA confirms that the depositing species in most cases was *Canis familiaris*. Whilst DNA is preserved in the coprolite samples, accessing the protein preserved in this matrix is proving more challenging. Nonetheless, ZooMS analysis undertaken on bone fragments embedded within the coprolites has demonstrated that collagen is preserved and the fragments have been molecularly identified mainly as large mammals. The dissected bones were also examined using zooarchaeological methods. This evidence shows that some bone fragments can be refit, suggesting dogs were eating butchered cuts of meat that contained large pieces of bones - perhaps bony cuts considered unsuitable for human consumption. These investigations demonstrate how biomolecular analyses combined with macroscopic and microscopic techniques can be used to successfully investigate the dietary resources consumed by coprolite depositors at waterlogged sites in Northern Europe.

5 MULTI-PROXY ARCHAEOBOTANICAL AND GEOARCHAEOLOGICAL ANALYSIS OF SHEEP/GOAT DUNG PELLETS FROM THE NEGEV DESERT

Abstract author(s): Fuks, Daniel (McDonald Institute for Archaeological Research, University of Cambridge) - Langgut, Dafna (Department of Archaeology and Ancient Near Eastern Cultures, Laboratory of Archaeobotany and Ancient Environments, Institute of Archaeology & The Steinhardt Museum of Natural History, Tel Aviv University) - Dunseth, Zachary (Joukowsky Institute for Archaeology and the Ancient World, Brown University)

Abstract format: Oral

Recent multi-proxy archaeobotanical and geoarchaeological research on sheep/goat dung pellets from an Early Islamic period midden at the site of Shivta in the Negev Highlands desert, Israel, identified seasonality, grazing range and foddering. Continued research on the same context offers further insights into the species used for foddering. Expanding the multi-proxy analysis of dung pellets to include preservation by desiccation at other Early Islamic Negev sites (Nahal Omer, Avdat), we present preliminary results from analyses of pollen, phytoliths, seeds, and mineralogy. We discuss their potential for seasonal reconstruction and livestock diet, as well as possibilities for integrating spectroscopic, isotopic and biomolecular analyses. Data thus retrieved may be collated into a multi-site and multi-period database of archaeological dung pellets containing information on herbivore diets, local vegetation, seasonality, herbivore species/sex and microbiomes. An approach that maximizes information encapsulated in archaeological dung can significantly improve understandings of ancient agropastoral economy, ecology and environment.

6 BENEFITS AND CHALLENGES OF INTEGRATING DUNG SPHERULITE, COPROLITE, AND ARCHAEOBOTANICAL ANALYSES: EXAMPLES FROM SW ASIA

Abstract author(s): Smith, Alexia (University of Connecticut)

Abstract format: Oral

Over the past decade, the number of studies examining ancient faeces has grown tremendously, exploring a diverse range of topics including animal and human diet, landscape use, construction methods, fuel economies and more. Many of these issues overlap with questions asked by archaeobotanists, suggesting that studies of ancient plants and faeces are highly complementary. Seeds consumed by many domesticated animals can be excreted intact and become preserved and deposited on archaeological sites when dung fuel is burned. Archaeobotanists working in SW Asia have long debated whether dung fuel (reflecting fuel use and animal diet) or crop-processing debris (associated with human diet) represent the dominant depositional pathway for ancient plant remains on sites. This difference of opinion can sometimes result in very different interpretations of the same set of remains. Both models rely largely on complex ecological models, making it difficult to resolve the disagreement using plant data alone. Analyses of dung spherulites within flotation dust can help provide empirical information on the presence of dung on a sample-by-sample basis, informing our understanding of sample origin with greater resolution, thereby placing interpretations of both food and fuel on a firmer footing. This paper considers the potential for dung studies within archaeobotany through a series of studies integrating plant and spherulite data from Abu Hureyra (Epipalaeolithic/Neolithic), Tell Zeidan (Ubaid/Late Chalcolithic), and Tell Leilan (Bronze Age) in Syria. Both the benefits and challenges of such an approach are considered. The technique can easily be applied to archival collections, providing a broad scale view of dung deposition across sites, but should be applied critically.

A. MINIMALLY DESTRUCTIVE RADIOCARBON DATING OF CAPRINE DUNG

Abstract author(s): O'Neill-Munro, Niamh (Queen's University Belfast) - Fuks, Daniel (University of Cambridge) - Reimer, Paula (Queen's University Belfast)

Abstract format: Poster

Archaeological dung pellets are time capsules of ancient herbivore diets and gut flora, informing on past agropastoral activity, ecology and animal health. Improving multi-proxy approaches is key to maximizing this finite archaeological resource. Through experiments with standard pre-treatments used in radiocarbon dating, we address a fundamental problem in maximal multi-proxy analysis: How to chronometrically date individual caprine pellets while conserving as much as possible for additional analyses? We applied acid-alkali-acid (AAA) or acid-only pre-treatments to thirty-six samples of ancient and recent sheep/goat dung pellets from sites in the Negev desert, Israel, measuring weight-loss due to pre-treatment. Shavings of outer surfaces and remaining inner pellets of four pairs were dated and compared. We found that (i) sample-specific factors affect pre-treatment survivability, including preservation quality and initial sample size; (ii) given sufficient start weight, AAA can be used to pre-treat sheep/goat coprolites; (iii) 100mg appeared a desirable minimum sample weight before pre-treatment; and (iv) shavings of coprolites' outer surface produced radiocarbon dates equivalent to dates obtained from inner coprolites. Whereas standard coprolite analysis protocols discard shavings removed from outer surfaces to avoid contamination, our findings indicate their efficacy for radiocarbon dating. This offers an important addition to workflows for multi-proxy coprolite analysis.

IT TAKES A VILLAGE: INTERDISCIPLINARY BIOARCHAEOLOGICAL RESEARCH ON THE ROLE OF CHILDREN IN THE PAST

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Saupe, Tina (Estonian Biocentre, Institute of Genomics, University of Tartu) - Fulminante, Francesca (Bristol University; Oxford University; University Roma Tre; Hanse-WissenschaftsKolleg 2022-23) - Mittnik, Alissa (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Morrone, Alessandra (Institute of History and Archaeology, Department of Archaeology, University of Tartu)

Session format: Regular session

In the last decades, the advances of the so-called Third Science Revolution in Archaeology have brought forth numerous studies which provided a new understanding of how people lived in the past. Continued technological improvements and an increased effort to integrate the different methods derived from the natural sciences with a careful archaeological contextualization shifted the focus from broader questions of human mobility and cultural transitions towards high-resolution studies of the local connectedness of people within one group or between groups.

The development of methodologies to detect fine-grained genetic relatedness has given new impetus to the study of kinship, supplementing information on biological aspects to come to a holistic interpretation of how social belonging was constructed by past communities and shaped their social dynamics and organisation. In bioarchaeological investigations into the sociobiological and demographic characteristics of past societies, children have often received special attention as research on the communities' youngest members allows scientists insights, e.g. into the past communities' health status, (breast)-feeding practices and diet, post-marital residence patterns, as well as kinship ties. Moreover, rather than just being considered unformed adults, their life stage might situate children within specific roles in their community, which can be further modulated by gender, status, health and geographic or ancestral origin.

We invite papers that examine the role(s) children occupied within their communities and wider society which can be indirectly inferred through burial treatment, cross-sectional and incremental stable isotope analysis, biological relatedness, individual mobility, pathologies, etc. through a variety of disciplines. Contributions covering any time period or geographic region are welcome, but we encourage studies that take an interdisciplinary lens to questions of childhood in the past and specifically interrogate the attitudes towards and treatment of children within communities of defined archaeological cultures, and contrast and compare these between life stages and cultures.

ABSTRACTS

1 THE BALTIC KINDERGARTEN: BREASTFEEDING AND WEANING IN MEDIEVAL AND EARLY MODERN ESTONIA THROUGH THE LENS OF STABLE ISOTOPE ANALYSIS

Abstract author(s): Morrone, Alessandra (University of Tartu)

Abstract format: Oral

Investigating infant diet and stress through stable isotope analysis provides direct insights into the lives of vulnerable population groups in the past. Little is known about childhood diet in medieval and early modern Livonia, and even less regarding the effects of the numerous famines, wars, and epidemics of the time on the non-adult population.

This presentation introduces a new research project aimed at exploring non-adult diet in urban/rural Estonian communities during the 12th-18th centuries AD, focusing on feeding practices and physiological stress. The impact of socio-economic circumstances on early childhood nutrition, affecting the development and overall survival of young children, represents the core of this research.

In our recently published study, cross-sectional analysis was carried out on bone collagen from 176 individuals between the fetal and the 7-15 age categories from four urban/rural South-Estonian cemeteries via EA-IRMS for $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$. Results indicated that South-Estonian children had a staple terrestrial C3 diet integrated with animal proteins. Significant divergences were observed between urban and rural sites and among rural subgroups. Breastfeeding was likely practiced for 1-2 years, introducing supplementary foods at around 1 year of age. The weaning process was probably concluded around the age of 3. The isotopic values of older children were comparable to the adults, indicating their diets became similar after weaning, when they started working and obtained a more mature status. Furthermore, the large number of perinates allowed exploring the impact of maternal physiological stress, malnutrition and metabolic disease on their isotopic values.

In addition to this preliminary data, results of the ongoing research on seven further Estonian sites will be revealed, adding to the picture the first incremental data regarding infant feeding practices in medieval and early modern Livonia.

2 THE “PLACE” OF CHILDREN IN AN ITALIAN COPPER AGE COMMUNITY: AN INTERDISCIPLINARY APPROACH

Abstract author(s): Bernardini, Sara (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA; Department of Environmental Biology, Sapienza University of Rome) - Goude, Gwenaëlle (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA) - Sayle, Kerry (Scottish Universities Environmental Research Centre, Scottish Enterprise Technology Park) - Gauthier, Caroline - Douville, Eric (Laboratoire des Sciences du Climat et de l'Environnement, LSCE/IPSL, UMR CEA-CNRS-UVSQ, Université Paris-Saclay) - Aranguren, Biancamaria (Soprintendenza Archeologica, Belle Arti e Paesaggio della Toscana) - Del Bove, Antonietta (Universitat Rovira i Virgili, Departament d'Història de l'Art; Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA) - Tafuri, Mary Anne (Department of Environmental Biology, Sapienza University of Rome)

Abstract format: Oral

The study of childhood and its aspects in past communities could be overlooked due to the limited archaeological and biological information usually available. Here we present the results of an investigation into the role of children within an Italian Copper Age (4th – 3rd millennia BCE) population by undertaking an interdisciplinary study on adult human remains from a funerary cave, Grotta Spinosa, in Central Italy. Multi-isotope ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $\delta^{34}\text{S}$ and $87\text{Sr}/86\text{Sr}$) and multi-tissue analysis (dentine, enamel, and bone) has been carried out on two adult individuals to investigate their life-histories. High-resolution sampling allowed us to take a look at specific events that occurred during their early life. Notably, the frequentation of different places during childhood emerged. The intra-life isotopic reconstruction, together with data from the rest of the group analysed, and from existing literature, has been contextualised with the archaeological and biological data available. The interdisciplinary approach enabled us to propose an age interval (ca. 10–12 y. o.) in which the children of these communities may have been introduced to everyday adult life (i.e. displacements and tasks). The application of this exploratory study on a wider sample broadens the possibility to trace back specific social and cultural practices of past populations.

3 EXPLORING THE RELATIONSHIP BETWEEN BREASTFEEDING DURATION, LIFE EXPECTANCY, AND DEGREE OF URBANIZATION THROUGH MORTAAR AND WARN MODELLING

Abstract author(s): Fulminante, Francesca (Hanse-WissenschaftsKolleg 2022-23; Bristol and Oxford University; University Roma Tre) - Müller Schessel, Nils (Kiel University) - Salesse, Kevin (Department of Anthropology, Faculty of Science, Masaryk University) - Tsutaya, Takumi (The Graduate University for Advanced Studies, Kanagawa) - Miller, Katherine (Independent Researcher) - Alt, Kurt W. (Center of Natural and Cultural Human History, Danube Private University; Integrative Prähistorische und Naturwissenschaftliche Archäologie, Basel University) - Meller, Harald (Landesamt für Denkmalpflege und Archäologie Sachsen-Anhalt) - Nicklisch, Nicole (Integrative Prähistorische und Naturwissenschaftliche Archäologie, Basel University) - Oelze, Vicky M. (Anthropology Department, University of California)

Abstract format: Oral

Recent research suggests that breastfeeding can have significant impacts on the wellbeing and prosperity of individuals and communities. In modern societies, a strong correlation has been shown between breastfeeding and healthier growth and more effective cognitive development, which ultimately results in higher levels of education and socio-economic status.

In this study, we test the correlations of breastfeeding duration with life expectancy at birth and degree of urbanization in different archaeological populations (Çayönü Tepesi = Neolithic, Early Urban; Derenburg and Karsdorf = Neolithic, Pre-urban; Newark Bay = multi-period, proto-urban/urban) to explore the impact of breastfeeding on adults' health and assess the economic benefits of breastfeeding in the past. Our aim is to, first, determine precise estimates for life expectancy at birth and breastfeeding duration through the R packages *mortar* (a programme to build lifetables tailored for archaeological populations) and *WARN* (a model to assess more precise breastfeeding and weaning times, taking into account previous studies of isotopes turnover rates in sub-adult), respectively, and second, investigate the relationship between life expectancy at birth, breastfeeding duration, and the degree of urbanisation.

Our findings suggest a possible correlation between prolonged breastfeeding (within a threshold of maximum about 2/4 yrs), increased life expectancy, and more advanced urbanization. We can associate longer breastfeeding duration within the urban setting and higher life expectancy at birth. This would suggest that once surviving childhood, individuals who were breastfed longer in urban environments may have had longer lifespans. Further exploration into using the *mortAAR* and *WARN* analytical approaches in more archaeological contexts will shed more light on our preliminary observations.

4 **A SHORT AND SICKLY LIFE. MULTI-INDICATORS ANALYSIS OF AN INFANT FROM A LATE ANTIQUE ITALIAN BURIAL (ARTENA, 5TH CENT. CE)**

Abstract author(s): Cecconi, Viola (Alma Mater Studiorum, Università di Bologna) - Nava, Alessia (Geochronology and Isotope Geochemistry Laboratory, Institute of Geological Sciences, Polish Academy of Science) - Lugli, Federico (Geochemistry Lab, Università di Modena e Reggio Emilia) - Mittnik, Alissa (Department of Human Evolutionary Biology, Harvard University; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Sawyer, Susanna (Department of Evolutionary Anthropology, University of Vienna; Human Evolution and Archaeological Sciences - HEAS, University of Vienna) - Gadeyne, Jan (Temple University Rome Campus) - Brouillard, Cécile (INRAP Hauts-de-France) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna) - Reich, David (Department of Human Evolutionary Biology, Harvard University; Department of Genetics, Harvard Medical School; Broad Institute of Harvard and MIT; Max Planck-Harvard Research Center for the Archaeoscience of the Ancient Mediterranean) - Sperduti, Alessandra (io di Bioarcheologia, Museo delle Civiltà; Dip. Asia, Africa e Mediterraneo, Università degli Studi di Napoli "L'Orientale")

Abstract format: Oral

The use of advanced technologies in the study of children from archaeological contexts provides information that can shed light on their social role, life-course, mortality, and funerary treatment. Early life stress events and pathological conditions can also inform on maternal-infant life histories during pregnancy and breastfeeding. Among acquired diseases, neonatal/infant scurvy, caused by a prolonged dietary deficiency of vitamin C, may open a window into the mother's nutritional condition or indicate cases of compelled early weaning associated with inadequate alternative food sources.

The late antique burials from "Piano della Civita di Artena" provide evidence regarding several aspects concerning the living conditions and funeral treatment of children, as reflected in the fact that those who died within their first year of life were buried in a separate cluster from the rest of the individuals. The ongoing aDNA analysis is exploring the genetic compositions and biological ties between adult and non-adult burials.

Here we focus on the case of a well-preserved infant (04.Ar.60004) showing diffuse abnormal cortical porosity and subperiosteal new bone formation, consistent with a diagnosis of neonatal scurvy. Macroscopic examination of bones was integrated by enamel peptide analysis for sex determination and dental histomorphometry for age at death determination and detection and timing of stressful events.

5 **THE ROLE OF CHILDCARE IN GENETIC TRANSFORMATIONS AND MARITAL PRACTICES IN THE CENTRAL EUROPEAN EARLY BRONZE AGE**

Abstract author(s): Stockhammer, Philipp (LMU Munich; MPI for Evolutionary Anthropology, Leipzig)

Abstract format: Oral

Within the last decade, archaeogenetic analyses have unraveled several major transformations of the Early Bronze Age European gene pools and enabled us to understand the biological dimension behind collective burials or whole cemeteries shedding light on marital practices and residential rules. In my lecture, I will ask about the social dimension which enabled the successful spread of the "Steppe signature" during the 3rd millennium and the reason for the enormous genetic impact these migrants had on the local gene pools in many parts of Europe. Therefore, I will compare different co-existing systems of social organization, marital practices and child raising during the 3rd millennium and early 2nd millennium in Central Europe and their correlation with and relevance for genetic transformations. I will argue that practices of child raising had a crucial impact on survival rates of children which again was decisive for long-term genetic transformations. In this context, I will differentiate between kin-group and network-based systems in the social organization of childcare and their respective potentials to show resilience in times of changes.

6 **EXPLORING FOSTERAGE AS METHOD FOR KINSHIP BUILDING: A CASE STUDY OF THE NORDIC BRONZE AGE GINDERUP WOMAN FROM THISTED, DENMARK**

Abstract author(s): Reiter, Samantha - Frei, Karin (National Museum of Denmark)

Abstract format: Oral

We present new data obtained from our case study of the Ginderup Woman, a Nordic Bronze Age female interred in Thisted, Denmark who was found wearing what seems to have been a corded skirt.

In recent years, studies of the mobility/ies of young persons (particularly women) in Bronze Age Europe have provided a large amount of comparative data. Nevertheless, traditional interpretations revolve around marriage alliances as the cause for female mobility (and, conversely, raiding/trading as a cause for male mobility). In this paper, we juxtapose the new data from Ginderup Woman with that of other mobility studies conducted on contemporaneous young persons.

In so doing, we explore the possibility that the movements of young male and female individuals may also have been linked to kinship building through fosterage.

We conducted strontium isotope analyses of the enamel from the second and third molars from Ginderup elite female grave (Grave A). Our results revealed that the strontium isotope ratios obtained from the young female yielded a ratio that falls within the local baseline (M2) and one that falls outside the baseline (M3). Our results suggest that the Ginderup Woman was probably of local origin, but that she also was mobile during her life. The strontium isotope ratio of the M3 suggests that, at least at some point in her later adolescence early adulthood, she might have spent a significant amount of time outside the boundaries of modern day Denmark (excluding the island of Bornholm).

We tie the sum of these data together by reflecting on historical and prehistorical examples of fosterage practices and new thinking regarding developmental psychology and the influence of life stage and environment on the formation of kinship bonds.

7 GENETIC ANALYSIS OF EARLY BRONZE AGE CHILD BURIALS IN LOWER AUSTRIA

Abstract author(s): Furtwängler, Anja (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Rebay-Salisbury, Katharina (Austrian Archaeological Institute, Austrian Academy of Sciences; Department of Prehistoric and Historical Archaeology, University of Vienna) - Kanz, Fabian (Department of Forensic Medicine, Medical University Vienna) - Ringbauer, Harald (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Department of Human Evolutionary Biology, Harvard University) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Stockhammer, Philipp (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University) - Mittnik, Alissa (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Department of Human Evolutionary Biology, Harvard University)

Abstract format: Oral

The burial features of the neighboring Early Bronze Age Únětice and Unterwölbling groups in Lower Austria provide great opportunities to study prehistoric kinship structures. The numerous burials at the Únětice sites of Drasenhofen, Schleinbach, Unterhautzthal, and the Unterwölbling site of Pottenbrunn contain female and male individuals of all age classes, including a high number of children.

It is therefore no surprise that we find many 1st and 2nd-degree relations between the individuals in the dataset of genomic data generated by genome-wide targeted enrichment and were able to reconstruct biological family trees spanning three generations. Of special interest are burials in which young children are buried with one or more adult individuals. Despite the placement of the bodies suggesting close familiarity, the children are not biologically related to the adults from the same grave in the majority of these cases. This fact can be used for considerations about the value of children to society at that time in this region.

At the sites of Schleinbach and Unterhautzthal, some individuals, including children, were placed in pits instead of regular graves. Comparing the patterns of family connections expressed in the way people were buried together with genetic data, as well as biological connections of the remains from the pits to the ones from regular graves provides the opportunity to investigate social stratification and its implications for the children in these groups.

Overall, the examples of the Early Bronze Age graves from Lower Austria add to our understanding of social practices and the role of biology for social belonging in prehistory.

8 GENETIC SEX DETERMINATION AS AN INSTRUMENT FOR THE STUDY OF NON-ADULTS IN BIOARCHAEOLOGY

Abstract author(s): Saupe, Tina (Jakobsson Lab, Human Evolution, Department of Organismal Biology, Evolutionary Biology Centre, Uppsala University; Estonian Biocentre, Institute of Genomics, University of Tartu) - Thompson, Jess (McDonald Institute for Archaeological Research, University of Cambridge) - Bonucci, Biancamaria (Estonian Biocentre, Institute of Genomics, University of Tartu) - Panella, Sofia (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances - MAReA - centre, Sapienza University of Rome) - Morrone, Alessandra (Department of Archaeology, Institute of History and Archaeology, University of Tartu) - Tafuri, Mary Anne (Department of Environmental Biology and Mediterranean bioArchaeological Research Advances - MAReA - centre, Sapienza University of Rome) - Scheib, Christiana (Estonian Biocentre, Institute of Genomics, University of Tartu; St John's College) - Robb, John (Department of Archaeology, University of Cambridge)

Abstract format: Oral

Recent works have focused on multidisciplinary approaches combining bioarchaeology and genetics to investigate the human past. For example, some studies have linked the migration patterns of non-local females with those of local individuals, as established through stable isotope analysis, and have shown that their estimated ancestral components

differ in some cases respectively. These works infer a male sex bias, or social practices of exogamy and patrilocality, in some prehistoric European societies. Often, however, the origins and ancestry of non-adult individuals are overlooked. Here, we explore the need for multidisciplinary studies to better understand past societies and explain why the rapidly expanding field of ancient human genetics must incorporate non-adults to a greater degree.

We collected bioarchaeological (osteological sex and age-at-death) and genetic data of ~50 possible individuals from three archaeological sites in the Italian Peninsula dating to the Chalcolithic-Bronze Age transition. We extracted DNA from human skeletal elements (mostly petrous bones and teeth) and built double-index libraries at the dedicated ancient DNA laboratory at the Institute of Genomics, Tartu (Estonia). After raw data processing of the sequenced libraries, we determined the genetic sex using published available tools and compared the results to the bioarchaeological records.

In many cases, the bioarchaeological data were insufficient to estimate sex, as the human remains at two sites were often found to be disarticulated. In combination, the genetic and bioarchaeological data, alongside archaeological context and social interpretations of these periods, allow us to refine our interpretations of the construction of past societies. This is especially the case for assessing the representation of male and female individuals and the social value of children in the past.

9 ARCHAEOGENETIC INSIGHTS INTO MARITAL PRACTICES AND FAMILY STRUCTURES OF THE BRONZE AGE AEGEAN

Abstract author(s): Mittnik, Alissa (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Driessen, Jan (Aegis/CEMA/INCAL, UCLouvain) - Schmitt, Aurore (Archéologie des Sociétés Méditerranéennes, UMR 5140, Université Paul-Valéry) - Tiliakou, Anthi - Skourtanioti, Eirini - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Stockhammer, Philipp (Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, Ludwig Maximilian University; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

The Bronze Age was a time of cultural, technological and demographic transformation in the Aegean, characterized by increased interconnectivity within a Mediterranean network of exchange. Utilizing ancient DNA data allows us to examine how changes and deviations in the material culture correspond with shifts in genetic ancestry, thus tracing cultural contacts with instances of large-scale and individual mobility and admixture. At a social level, estimating relatedness between individuals sheds light on family structures, household composition, burial practices and inheritance and marriage conventions.

Skourtanioti et al. have recently shown that despite the genetic flux and diversity seen across the Bronze Age Aegean, a possible common shared practice in the region was cousin marriage, which emphasizes the importance these societies placed on biological relatedness, and demonstrates one way in which cultural norms could shape life courses from a young age. The significance of biological kin is also evident from the finding of close relatives within burial contexts. While funerary practices in the Aegean were strikingly diverse, it was long assumed that children were commonly not buried alongside the adults of the community. However, a meticulous archaeoethanological approach suggests that this observation could partially be due to taphonomic processes and past excavation methods rather than ancient cultural practices and promises a more consistent inclusion of this important group in future studies.

In this paper we present case studies, such as Mygdalia in the Peloponnese and Sissi in Crete, in which the study of infants and children, in particular, provides deeper insight into the construction of social belonging, marital and mortuary customs, and the attitudes and beliefs surrounding birth, infancy, and death.

10 INFANT SKELETAL REMAINS FROM IBERIAN SETTLEMENTS: AN APPROACH TO BIRTH MORTALITY IN ANTIQUITY

Abstract author(s): Sandoval Ávila, Carolina - Martirosyan, Ani - Cuesta-Aguirre, Daniel - Jordana, Xavier - Nociarová, Dominika - Santos, Cristina - Malgosa, Assumpció (Grup de Recerca en Antropologia Biològica; Departament de Biologia Animal, Biologia Vegetal i Ecologia; Universitat Autònoma de Barcelona)

Abstract format: Oral

The Iberian peoples lived in the Mediterranean region of the Iberian Peninsula between the 7th and 1st centuries BC. Their funerary practice was cremation, but inhumations of perinatal individuals have been found in domestic and production areas, reflecting a differential ritual pattern. Forehead with the possibility of natural death, infanticide has often been considered a response to such findings, as has the hypothesis of sacrifice, considering the existence of a

possible selection of sex, specifically of female individuals. However, these theories have yet to be proven. The main objective of this work is to determine, through an integrated approach of methodologies, if there is a specific pattern of child mortality that can explain these burials.

The skeletal remains come from 6 sites of Iberian culture in Catalonia (Spain). A total of 73 children were analyzed from different morphological perspectives combined with approaches based on dental histology and paleogenetics, which allowed us to establish the biological profile of the individuals.

Age estimation results from morphological studies showed 4 extremely preterm (<28 weeks of gestation), 40 perinatal (from 28 to 40 weeks of gestation), 7 neonatal (delivery up to 28 postnatal days), 21 post-neonatal (>28 postnatal days), and 1 undiagnosed individual. In addition, the presence of the neonatal line in the teeth of 39 infants indicated that 20 individuals survived birth and 15 did not, while four cannot be determined. Regarding sex determination from genetic data, the results show 31 males, 37 females, and two indeterminate individuals. These results do not indicate age or sex selection and are congruent with a natural mortality pattern.

These findings provide scientific data supporting the hypothesis of family rituals for the natural death of the youngest children while discarding the hypotheses of infanticide or sacrifice as usual practices of the Iberian peoples.

11 UNITED IN GRIEF. FAMILY TIES AND FUNERARY BEHAVIOR IN LATE ANTIQUE PELTUINUM (ITALY)

Abstract author(s): Sperduti, Alessandra (Servizio di Bioarcheologia, Museo delle Civiltà; Dip. Asia, Africa e Mediterraneo, Università degli Studi di Napoli “L’Orientale”) - Mittnik, Alissa (Department of Human Evolutionary Biology, Harvard University; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Migliorati, Luisa (Dip. di Scienze dell’Antichità, Università di Roma Sapienza) - Fiore, Ivana (Dip. di Scienze Ambientali, Università di Roma Sapienza; Servizio di Bioarcheologia, Museo delle Civiltà) - Sgrulloni, Tiziana (Independent researcher) - Lubritto, Carmine (Università degli Studi della Campania “Luigi Vanvitelli”) - Ringbauer, Harald (Department of Human Evolutionary Biology, Harvard University; Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna) - Reich, David (Department of Human Evolutionary Biology, Harvard University; Department of Genetics, Harvard Medical School; Broad Institute of Harvard and MIT; Max Planck–Harvard Research Center for the Archaeoscience of the Ancient Mediterranean)

Abstract format: Oral

In the complex and diversified phenomenon of associated burials of dogs and humans across time and space, the city of Peltuinum provides two relevant funerary contexts. Two disused structures in the city (seven shafts in the theater and a partially destroyed tower) yielded distinct funerary evidence suggesting different interpretative scenarios. The osteological analyses led to the recognition of at least 84 human fetuses and newborns, and three older children in the theater. In addition, the faunal remains indicate the presence of 68 dogs and dozens of other domestic animals, including horses as signifying elements of the atypical funerary ritual. Conversely, the tower yielded highly commingled and fragmented remains of at least 35 individuals of all ages in secondary deposition, associated with 12 dogs and one wolf.

In order to better understand the atypical funerary behavior and demographic dynamics of the Peltuinum community we carried out an interdisciplinary analysis integrating archeological and osteological data with radiocarbon and aDNA analysis. The paleogenetic study included 46 petrous bones from the theater and 10 petrous bones from the tower.

The results for the theater indicate a non-significant difference in the number of buried males and females. We also detect the presence of 4 pairs of full siblings as well as many more distantly related pairs, the largest kinship complex encompassing 19 individuals. Related individuals are not gathered together within shafts, suggesting a time-spaced use of the site, perceived as a common space of burial and remembrance shared by local families. In addition, we find a case of Trisomy 21 and evidence of sporadic consanguinity within the community. Genetic relationships also extend to the tower that includes five individuals who are probable ancestors of the infants of the theater, suggesting Peltuinum was a close-knit community.

UNCOVERING THE LIVES OF THE NONADULT POPULATION AT THE LATE AVAR BURIAL SITE IN NUŠTAR, CROATIA: AN INTERDISCIPLINARY APPROACH

Abstract author(s): Zagorc, Brina - Blanz, Magdalena (Vienna Institute for Archaeological Science - VIAS, University of Vienna; Human Evolution and Archaeological Sciences - HEAS, University of Vienna) - Rapan Papeša, Anita - Vulić, Hrvoje (Municipal Museum Vinkovci) - Premužić, Zrinka (Independent researcher) - Trbojević Vukičević, Tajana (Faculty of Veterinary Medicine, University of Zagreb) - Reich, David (Department of Human Evolutionary Biology, Harvard University; Howard Hughes Medical Institute, Harvard Medical School; Broad Institute of Harvard and MIT) - Ivanova Bieg, Maria (Vienna Institute for Archaeological Science - VIAS, University of Vienna; Human Evolution and Archaeological Sciences - HEAS, University of Vienna) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna; Human Evolution and Archaeological Sciences - HEAS, University of Vienna)

Abstract format: Oral

Excavations at the archaeological site of Nuštar, Eastern Croatia, have revealed 196 skeletal graves from the Late Avar period (710-810 AD), offering valuable insights into the lives of the buried population. This paper focuses on the study of the nonadults, combining a wide range of methods, including paleogenetic and palaeodietary analyses, in order to obtain a comprehensive understanding of their lives. Next Generation DNA sequencing allows us to accurately determine the biological sex of the individuals, explore ancestry and different degrees of kinship, while carbon and nitrogen stable isotope ratio analyses provide information on their diets and weaning ages. By combining these data with osteological and paleopathological findings, we can study the relationships between diet, disease, preferential sex-related treatment, and mortality rates and gain a deeper understanding of the lives of these individuals.

We analysed twenty female and sixteen male nonadults and adults through Next Generation Sequencing data with established ancient DNA pipelines and protocols, and fifty-five nonadults and adults using stable isotope ratios (bone collagen $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$, including animal bones for the baseline reference) to examine questions of kinship, ancestry, and molecular sex, and dietary patterns, providing a comprehensive picture of the upbringing and overall health of the buried population. This interdisciplinary approach provides a unique and unparalleled glimpse into the past, shedding light on the lives of the nonadult and subsequently adult population at Nuštar.

575 RADIOCARBON DATING AND ARCHAEOLOGY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Blaauw, Maarten (Queen's University Belfast) - Heaton, Tim (University of Leeds) - Manning, Sturt (Cornell University)

Session format: Regular session

Chronologies are essential for most archaeological studies, and over the past seven decades radiocarbon dating has become one of the most popular dating tools in the archaeological research. From the first archaeological radiocarbon dates in the 1950s, radiocarbon dating techniques and methods have undergone huge changes, including the development of radiocarbon dating of ever smaller samples using accelerator mass spectrometry, advances in radiocarbon dating and calibration, and numerical techniques to incorporate multiple dates together with additional information such as stratigraphical ordering within archaeological excavations, or additional types of relative or absolute dating information such as dendrochronology, tephra layers or archaeological information. This session will invite talks and posters on the history of radiocarbon dating and calibration (including single-year calibration data), method development including pretreatment and dating of a range of materials, quality control, lab intercomparisons, treatment of multiple dating sources, and environmental or archaeological case studies with a focus on radiocarbon dating.

ABSTRACTS

1 40 YEARS OF RADIOCARBON IN ARCHAEOLOGY – A VIEW FROM DANEBURY HILLFORT

Abstract author(s): Hamilton, Derek (SUERC, University of Glasgow)

Abstract format: Oral

The application of radiocarbon dating to archaeological problems has undergone many developments in the past four decades. In these decades, a technological shift in how radiocarbon is measured was also taking place, with accelerator mass spectrometry (AMS) becoming more commonplace and affordable moving into the 90s, and the dominant technique by the close of the 20th century. Also, as computing moved from the mainframe to the desktop, archaeologists began to be able to calibrate their dates (and others) using the program known as CALIB. This program not only produced date ranges, but also introduced archaeologists to the complex probability density functions that underlie their dates, and which would come to form the 'standardized likelihoods' in today's Bayesian chronological models.

Finally, with the advent of radiocarbon dating by AMS, archaeologists no longer needed to rely on bulk samples for their dates, which enabled them much greater choice across the site.

The Iron Age Danebury hillfort, in central southern Britain, was excavated over a 20-year period (1969–88) and then reinvestigated in the 2010s. The archaeological remains from this site have been: subjected to sampling strategies using bulk remains and single-entities; dated via radiometric (70 dates) and AMS methods (120 dates); and had the dates interpreted following methods that predate the introduction of Bayesian statistics to chronology building as well as multiple times since ‘Bayesian modeling’ in archaeology began. This talk will discuss the 40 years of change and their implications for how we understand this archaeological site.

2 STABLE ISOTOPE AND 14C ANALYSES OF THE NOMADIC POPULATIONS OF ALTAI IN THE 1ST MIL. BC – 1ST MIL. AD

Abstract author(s): Svyatko, Svetlana - Reimer, Paula (Queens University Belfast) - Seregin, Nikolai (-) - Papin, Dmitriy (-)

Abstract format: Oral

Located at the ancient crossroads between Central and North Asia, Altai was the principal region through which pre-historic Eurasian steppe populations and cultures contacted and exchanged with China. This small and isolated area was the centre of intensive cultural development, including the emergence of nomadic economies in the LBA/EIA. Pastoral “nomadic” communities actually had mixed and diverse economies, herding strategies, social complexity and mobility. In this context, Altai is a unique land in the Eurasian steppe for studying the variability of the economies and adaptations, as the area encompasses a patchwork of diverse environments (steppe, forest-steppe, lowland plains, mountains and foothills), which have different potentials for stockbreeding, crop cultivation etc. Due to the harsh continental climate and altitudinal zonation, migrants into Altai had to seriously restructure their lifestyles to be able to adapt. This resulted in people of the same cultural traditions living in a variety of geographical and environmental conditions, which is particularly useful when exploring adaptations. During the entire EIA, Altai demonstrated several co-existing types of nomadic economies, specific to ecological niches: steppe, forest-steppe and mountains.

We aim to explore the emergence of nomadism and the dynamics of development of its various forms. Through 14C dating and stable carbon, nitrogen, sulphur, oxygen and hydrogen isotope analysis of human and animal remains, we attempt to reconstruct the ancient economies, in particular the consumption of millet and fish, and to detect possible first generation migrants in the region. The research will allow more accurate interpretations on the emergence and development of different cultures and economies in various geographical zones (steppe, forest-steppe, mountains), as well as verify the general sequence of the cultures.

3 ESTABLISHING AN ABSOLUTE CHRONOLOGY FOR AYIOS VASILEIOS NORTH CEMETERY

Abstract author(s): Erdil, Pinar (Groningen Institute of Archaeology, University of Groningen; Centre for Isotope Research, University of Groningen) - Dee, Michael - Kuitens, Margot (Centre for Isotope Research, University of Groningen) - Moutafi, Ioanna (The M.H. Wiener Laboratory for Archaeological Science, American School of Classical Studies at Athens) - Hachtmann, Vasco (Institute of Prehistory, Protohistory and Near-Eastern Archaeology, University of Heidelberg) - Voutsaki, Sofia (Groningen Institute of Archaeology, University of Groningen)

Abstract format: Oral

The North Cemetery is the early Mycenaean cemetery on the site of Ayios Vasileios, which later develops into the palatial centre of Laconia, southern Greece. The scarcity of material culture and the limited stratigraphic information has affected the establishment of a spatiotemporal framework between different graves and burials. For this reason, we applied various statistical models to the available data in order to get a more detailed view of the chronology of this important cemetery. The approach to our analysis comprised two steps. First, we created a radiocarbon-based chronology for southern Greece by collating data from archaeological sites across the region. In all, a large set of legacy radiocarbon data covering the Middle Helladic and the Late Helladic periods was collected from a total of 18 different sites. We then built a simple Bayesian model to obtain approximate start dates for the ceramic-based phases conventionally employed in this region. Second, we present 56 new radiocarbon dates on samples from 24 different graves at Ayios Vasileios North Cemetery. We compared the distribution of these new dates to the aforementioned regional model. Our analysis independently confirms the conclusions reached by the study of the pottery and the mortuary practices, that the cemetery was in use continuously from MH III to LH IIB, then later sporadically from LH IIIA to LH IIIB for infant burials only.

4 THE CHRONO-STRATIGRAPHY OF NERJA CAVE IN LIGHT OF BAYESIAN MODELLING

Abstract author(s): Extrem Membrado, Vanessa - Garcia Puchol, Oreto (PREMEDOC Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València) - Pardo-Gordó, Salvador (Departamento de Geografía e Historia, Universidad de La Laguna) - Jordá Pardo, Jesús F. (Departamento de Prehistoria y Arqueología, Universidad Nacional de Educación a Distancia - UNED) - Aura Tortosa, J. Emili (PREMEDOC Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València)

Abstract format: Oral

The Nerja Cave Malaga (Spain) is an important archaeological site with a prehistoric stratigraphic sequence that ranges from the Upper Palaeolithic to the Chalcolithic. Its stratigraphy constitutes one of the western Mediterranean's most important archaeological and palaeobiological sequences, and the research has provided more than 200 radiocarbon datings. In this work, we will review and discuss the methodological requirements (technical, chemical-physical, and archaeological) of the radiocarbon corpus of Nerja. Thus, the analytical method, including pre-treatment and quality control, lab intercomparisons, and multiple dating sources treatment, among other questions will be reviewed because it is essential to build an accurate chrono-stratigraphy model.

Bayesian statistics have been applied using the OxCal v4.4 software and Chronomodel 2.0 software according to a phases model. Likewise, we have been able to determine the differences between programs and if the choice of software can condition the model. This has allowed us to improve the chronological resolution from the end of the Upper Palaeolithic until the beginning of the Holocene. In a nutshell, this corresponds to the technocomplexes of the Gravettian, Solutrean, Magdalenian, Epipaleolithic, Mesolithic, and early Neolithic.

5 FIRST ABSOLUTE DATING OF A NEOLITHIC SITE IN THE BALKANS: ANNUAL RADIOCARBON AND THE TREE-RING CHRONOLOGIES FROM DISPILIO (GREECE)

Abstract author(s): Maczkowski, Andrej (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Francuz, John (Institute of Archaeological Sciences, University of Bern) - Giagkoulis, Tryfon - Kotsakis, Kostas (History and Archaeology, Aristotle University of Thessaloniki) - Ballmer, Ariane (-) - Bolliger, Matthias - Reich, Johannes (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern; Archaeological Service of the Canton of Bern) - Hostettler, Marco (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Szidat, Sönke (Department of Chemistry, Biochemistry and Pharmaceutical Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Hafner, Albert (Institute of Archaeological Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern)

Abstract format: Oral

In some regions of Europe, dendrochronology has played a central role in the absolute dating of prehistoric periods. The absolute dating of several-millennia-old prehistoric sites has been possible thanks to the decades-long efforts for collecting, measuring, and cross-dating large amounts of archaeological and subfossil wood samples.

On the other hand, although there are tree-ring chronologies covering the last two millennia, no tree-ring chronologies from the Balkans extend deep into prehistory. Recent systematic sampling of archaeological wood in the region enabled the construction of centuries-long "floating" tree-ring chronologies for several wetland sites, among them the Mid/Late Neolithic phase of the waterlogged site of Dispilio, Greece. The main tree-ring chronologies, based on oak and juniper wood, are more than 300 years-long and were wiggle-matched to the second half of the 6th millennium BC. Over 220 vertical construction wood elements were cross-dated, which uncovered the intra-site spatio-temporal development of the settlement with an annual resolution.

A recently discovered radiocarbon (Miyake) event in absolutely dated tree-ring chronologies from different parts of the world revealed a sharp spike of atmospheric radiocarbon level in 5259 BC. Annual radiocarbon measurements of the Dispilio tree-ring chronologies could be matched against the reference data of this new Miyake event. It was therefore possible to absolutely date the site without millennia-long tree-ring chronologies extending to the present. Dispilio represents the first absolutely dated Neolithic site in the wider Eastern Mediterranean region.

6 WHERE ARE THE PROBLEMS? THE MISMATCH BETWEEN RADIOCARBON DATES AND ARCHAEOLOGICAL DATA BASED ON CASE STUDIES FROM SLOVENIA

Abstract author(s): Kramberger, Bine (Institute for the protection of cultural heritage of Slovenia)

Abstract format: Oral

In this paper I discuss several archaeological case studies in which the results of radiocarbon dating are incompatible with the archaeological data. The selected cases range from Prehistory to the Mediaeval period and originate from different contexts, such as Late Neolithic and Early Copper age settlements, a Late Bronze Age cemetery, and Early

Medieval pits. They include analyses of samples from various materials: charred human bones, charcoal, food residues, animal bones, charred seeds etc. The 14C analyses were performed by different laboratories using AMS.

The vast majority of radiocarbon dates for Slovenia have been obtained and published in the last 20 years. In most cases, the analysed samples consisted (unfortunately) of charcoal, and were obtained from excavations that were part of the National Motorway Construction Programme, which covers the entire country. The results of the associated excavations have been published systematically by the Institute for the Protection of Cultural Heritage of Slovenia.

The results of this study indicate that the use of radiocarbon dating would need to be approached more carefully in Slovenian archaeology. Issues such as the possibility of “old wood effect”, “uncorrected reservoir effect”, as well as several contextual aspects need to be taken into more serious consideration when selecting samples for dating and interpreting the results. Last but not least, cross-comparisons of different data sources (radiocarbon dating, dendro-chronology, stratigraphy, typo-chronology) have yielded useful results, and having multiple dates for a single-event feature enables us on the one hand to recognise obvious outliers and on the other to obtain more precise dates.

7 PROJECT RADIOCARBON DIGITAL REPOSITORY: SAFEGUARDING ARCHAEOLOGICAL RADIOCARBON DATA FROM THE ISLANDS OF IRELAND AND BRITAIN

Abstract author(s): Hannah, Emma - Carlin, Neil (University College Dublin) - Griffiths, Seren - Gaydarska, Biserka (Manchester Metropolitan University) - Evans, Tim (Archaeology Data Service)

Abstract format: Oral

The preservation of archaeological sites and cultural materials is a central tenet of the archaeological discipline. The radiocarbon (14C) measurements derived from these are of immense intellectual value and it is vital that they too are curated and safeguarded. These data help order the events of the human past, whether at single-site level or through big-data-style, data-driven analyses from multiple sites.

Project Radiocarbon is a new open access, transnational digital repository which aims to safeguard the value of the vast numbers of 14C dates from across the islands of Ireland and Britain. This project aims to ensure that measurements are recorded in a single, searchable repository; but also that data are interoperable and findable across international research traditions. The project team, based in Manchester Metropolitan University and University College Dublin, is working in partnership with archaeologists, historic environment experts, data management, and 14C specialists across six different historic environment jurisdictions in the Republic of Ireland and the United Kingdom.

This paper discusses the challenges we have encountered, particularly those related to classifying archaeological data and accommodating divergences in different classification systems, and the methods used to overcome these. It also presents the results of a preliminary big-data analysis on dating practices in the Republic of Ireland, specifically the patterning associated with dating strategies used on national road schemes in recent decades.

8 RADIOCARBON DATING, CALIBRATION AND AGE-MODELLING USING R

Abstract author(s): Blaauw, Maarten (Queen's University Belfast)

Abstract format: Oral

Over the past decades, the open-source statistical software R has become popular in many research communities, including among archaeologists. One of the advantages of free, open-source approaches, is that users are allowed to look ‘under the hood’, for example to check in detail how radiocarbon dates are calibrated and subsequently used to produce chronologies for archaeological sites. Users can also propose enhancements to methods, which can then be incorporated in the software. Additionally, many types of data analysis can be performed all within one single software package.

A range of R packages related to radiocarbon dating will be shown, including 1) ‘rintcal’ for radiocarbon calibration, translations between different radiocarbon-related scales (e.g., 14C age, cal BP, BC/AD, F14C, pMC), calculating impacts of contamination on observed radiocarbon ages, visualisation of the IntCal and other calibration curves and their underlying data, 2) ‘coffee’ for radiocarbon-dated trees or sedimentary/archaeological sequences, 3) ‘clam’ for classical age-depth models, 4) ‘rbacon’ for Bayesian age-depth models and 5) ‘rplum’ for 210Pb-based chronologies.

9 FROM ORDER TO NARRATIVE: CHALLENGING LINEARITY WITH BAYESIAN CHRONOLOGIES

Abstract author(s): Passerini, Annapaola (Cornell University)

Abstract format: Oral

Radiocarbon dating has profoundly changed archaeological practice by re-introducing absolute time well beyond periods documented by written history. Following advances in calibration, AMS technology, and statistical modeling, radiocarbon dating has reached levels of accuracy and precision that have fundamentally revolutionized not just the quality of “hard” temporal data, but also the kinds of stories that archaeologists may be able to tell. Despite the po-

tential of radiocarbon to render more complex narratives of the deep past, its application in archaeology is often subordinated to the justification of predetermined chrono-typological paradigms. This results in circular reasoning that exacerbates the hyper-linearity of traditional archaeological chronologies, which may distort our sense of cultural and social change by conflating the speed and quality of human temporality with the duration of constructed typologies. This paper leverages the theoretical and methodological possibilities of Bayesian chronological modeling to investigate social temporality during the Early Bronze Age in the South Caucasus. In this approach, chrono-typologies are not maintained as the ultimate temporal unit to be dated, but rather as an inherited temporal dimension (i.e. past in the past) that intersects with radiocarbon-based events. By combining multiple lines of evidence, the paper brings the organic life dated by radiocarbon back into the center of the chronological picture to reshape narratives of the Early Bronze Age.

10 **OBTAINING ROBUST “DATES-AS-DATA” INFERENCE FROM THE CALIBRATION OF MULTIPLE RADIOCARBON DETERMINATIONS: A STATISTICALLY RIGOROUS ALTERNATIVE TO SPDS**

Abstract author(s): Heaton, Tim - Al-assam, Sara (University of Leeds) - Bronk Ramsey, Christopher (University of Oxford)

Abstract format: Oral

The recent explosion in the availability of dates within archaeological science has ushered in a data science revolution. Computational analyses of large collated sets of dates have the potential to provide unprecedented inference on our past, on rates of change, and on population dynamics. It is essential however that the methods underpinning these “big-data” analyses are rigorous and robust.

This concern is particularly relevant for radiocarbon dating, the archaeological method of choice for dating the last 55,000 years. Here,

the density of dates is frequently used as a proxy to reflect patterns of occupation across time (Rick, 1987). The popularity of this approach is driven by recent advances in measurement techniques that have increased the number of potentially dateable radiocarbon samples on any archaeological site into the thousands. However, their need for calibration introduces considerable, and complex, uncertainties in our dates that must be incorporated into any inference.

In this talk we will describe a novel and statistically rigorous tool for the analysis and summarisation of calendar age information provided by multiple radiocarbon determinations. This provides an essential alternative to the incoherent method of summed probability distributions (SPDs) currently widely used by the community.

11 **PROBLEMATIC CHRONOLOGIES - OFFSETS, CONTAMINATION, AND DIFFICULT MATERIAL**

Abstract author(s): Keaveney, Evelyn - Barrett, Gerard - Allen, Kerry (Queen’s University Belfast)

Abstract format: Oral

The Ramped Pyrooxidation (RPO) lab at the 14CHRONO Centre at Queen’s has been in operation since 2019. RPO allows separation of multiple fractions for carbon source attribution, and can provide more accurate chronologies. RPO incrementally heats bulk material in the absence of O₂. Gas evolved during RPO is oxidised to CO₂ and cryogenically isolated for graphitisation. As such it can be used for a myriad of material with problematic chronologies.

Radiocarbon analyses can often be limited based on the sample character, source, context of retrieval, and potential conservation. For example, radiocarbon measurements of the consumers of a freshwater diet may be impacted by the Freshwater Reservoir Offset. The magnitude of the age offset, which can be hundreds of years, is related to alkalinity, variability (spatial and temporal) is evident due to terrestrial inputs and the volume of terrestrial inputs are sometimes related to trophic status.

Chronology of aquatic material can also be impacted by this offset – how do you date a bulk material with no terrestrial macrofossils? Some material may have intrusive contamination from its burial environment – what material is being dated? What about contamination from museum conservation – how can we be sure we are dating the artefact and not the preservative? What about dating unusual material – how can we be sure that the date is accurate? This presentation will give an overview of the results from this lab and discuss the potential solutions provided by RPO.

A. RADIOCARBON DATING OF AN EARLY MEDIEVAL SETTLEMENT FROM THE LOWER DANUBE AREA (TÂRGȘORU VECHI, PRAHOVA COUNTY, ROMANIA)

Abstract author(s): Hila, Tudor - Ciupercă, Bogdan - Ȑiscă, Cătălin - Anton, Alin (Prahova District Museum of History and Archaeology)

Abstract format: Poster

Into Romanian Plain, west of Târgșoru Vechi village and close to the Prahova River the investigations carried out between the years 2019-2022, revealed an archaeological site extending over several hectares, generally dated between the eight and tenth centuries A.D.

It should be mentioned that this site (Târgșoru Vechi – Balastieră), is one of the largest settlements dating from the end of the first millennium A.D. investigated so far in Wallachia, being identified a number of 53 dwellings, 18 possible annexes, five freestanding fireplaces, three hoards of iron implements and weapons, six possible water wells, 16 burials, ten ceramic kilns, and tens of other archaeological features with various purposes.

Considering that radiocarbon dating is almost non-existent for the early medieval period in the area north of the Lower Danube, was decided to send for analyses a large number of samples (animal and human bones) collected from different archaeological features. The analyses were carried out at 1 MV Tandetron™ accelerator from “Horia Hulubei” National Institute for Physics and Nuclear Engineering (IFIN-HH).

After calendar ages were obtained, using the IntCal20 calibration curve, it is possible now, corroborating radiocarbon dates with the typology of pottery and other types of artefacts to highlight the following issues: 1) the chronological phases of the site; 2) to trace the settlement/ settlements mobility in time; 3) to relate the inhumation graves (otherwise impossible to date since they had no funerary inventory) with the early medieval settlement.

Finally, it is worth mentioning that for the scrutinized area and period the radiocarbon dating is one of the few techniques that can be employed to refine the sites chronological framework. Without any absolute dates, almost no written sources and scarce other artefacts than pottery one can only to assign the sites largely between the 8th and 10th century A.D.

B. CHRONOLOGY OF THE FINAL ENEOLITHIC IN CENTRAL EUROPE – REGIONAL DIFFERENCES

Abstract author(s): Jarosz, Pawel (Institute of Archaeology and Ethnology Polish Academy of Sciences) - Szczepanek, Anita (Institute of Archaeology and Ethnology Polish Academy of Sciences; Department of Anatomy Collegium Medicum Jagiellonian University) - Horváthová, Eva (Archeologický ústav SAV) - Włodarczak, Piotr (Institute of Archaeology and Ethnology Polish Academy of Sciences)

Abstract format: Poster

The aim of the study is to demonstrate the regional differences in radiocarbon dating of selected communities of the Corded Ware Culture in Central Europe. This culture played a crucial role in shaping the cultural picture in the 3rd millennium BC. In our study we made an attempt to arrange the chronometry based on a larger series of available age determinations. Of particular importance for chronometric studies of the Corded Ware culture are the dates obtained in recent years using AMS technology, allowing for a standard error of ± 30 to 35 years. The comparative analysis concerns selected macroregions with this culture settlement: the Małopolska Upland, the Carpathian Foothills, the Subcarpathian area, the Sokal Ridge and Eastern Slovakia Uplands as well as Lowlands. The conducted chronometric analysis, and especially the synchronization of cultural phenomena in the distinguished macroregions, demonstrates that despite their notable homogeneity, the Final Eneolithic Corded Ware culture communities exhibit a number of local differences. They are visible especially in elements of the funeral rite. Generally the first evidences of this culture barrows occurred in the range 2900–2300 BC then around 2550 BC the funeral rite changed and niche graves dominated near in all these microregions until 2300 BC i.e., to the early phase of the Mierzanowice culture.

The presented investigations were financed by National Science Centre Poland, NCN 2015/19/B/HS3/02149 and NCN 2020/37/B/HS3/03816.

578 BETWEEN THE EAST AND THE WEST. ÇATALHÖYÜK' CONTRIBUTION TO THE EUROPEAN NEOLITHIC AND EUROPEAN ARCHAEOLOGICAL THOUGHT

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Türkcan, Ali Umut (Anadolu University; Çatalhöyük Research Project) - Marciniak, Arkadiusz (Adam Mickiewicz University; Çatalhöyük Research Project)

Session format: Discussion session

60 years of research at Neolithic Period Anatolian Site Çatalhöyük have had an unprecedented impact on European archaeology, probably on World archaeology. The early years of Mellaart Era yielded spectacular discoveries

that have yet to be surpassed as the iconic Fat Lady figurines, paintings, and reliefs on the walls of elaborated shrines showed a different and more developed phase of the Neolithic universe and triggered the development of different theories pertaining to egalitarian and urban society. These included the birth of matriarchy proposed by Gimbutas and Mellaart, “Obsidian Theory” advocated by Jacobsen, and the birth of Indoeuropean language systems pursued by Renfrew, to mention a few. The Çatalhöyük Research Project through time marked the transition in a way from modernism to postmodernism theories in many debates. It is manifested by numerous theoretical and epistemic underpinnings explicitly laid down by Ian Hodder, including theory of domus and history houses, the idea of microhistory, the role of religion, as well as the reflexivity and multivocality of contextual archaeology.

The purpose of this session is aiming to examine many questions and debate on research agenda as the impact of distinct and influential schools of thought on European archaeology by Çatalhöyük studies. How has it progressed beyond the simple collection of a wide range of rich data or periodical documentation via Internet and databases so far? How far has the Çatalhöyük settlement influenced the character of European Neolithic? The session will also present current work at Çatalhöyük, which is deeply rooted in the history of settlement research and the rapidly changing modes of archaeology practice today.

ABSTRACTS

1 ÇATALHÖYÜK AND THE BALKAN NEOLITHIC: WHY SO DIFFERENT?

Abstract author(s): Demoule, Jean Paul (Université de Paris I - Sorbonne)

Abstract format: Oral

The major difference between the wealth of material culture (and of interpretations) uncovered at Çatalhöyük by various archaeological projects and the more modest traits of the Balkan peninsular Neolithic calls for much thought. The reality of migration from the Near East, clearly shown by pottery decoration and figurines, has been confirmed by genetics. On the other hand, the differences still require explanation, particularly as material culture, notably pottery shape and decoration, becomes increasingly impoverished as one moves westwards across Europe. While the primitive matriarchy of Marija Gimbutas can hardly be defended, the fact that European Neolithic communities strove to remain small until they were blocked by the Atlantic ocean is certainly an aspect that needs to be taken into consideration. The role of the indigenous European population is also to take in consideration, not only from a genetic point of view, but also looking at the quite irregular progression of the colonization process.

2 THE ÇATALHÖYÜK AND THE NEOLITHIC IN THE BALKANS AND CENTRAL EUROPE. PREHISTORIC PAST AND ARCHAEOLOGICAL PRESENT

Abstract author(s): Nowak, Marek (Jagiellonian University in Kraków)

Abstract format: Oral

The many years of research at the Çatalhöyük site have resulted in a series of data, interpretations, theories, and debates that have fundamentally shaped our perception of early Neolithic communities not only in central Anatolia but, without much exaggeration, in the western part of the Old World. These studies and their results not only have contributed to the knowledge of the crystallisation and early development of Neolithic groupings but have also had a considerable impact on the agenda of archaeological investigations. These dual influences become less and less significant as one moves away from central Anatolia, which is not necessarily justified. This presentation will analyse the issue in relation to the Balkan zone and, especially, central Europe. Of interest will be the confrontation of the real and the potential relevance of data, interpretations and theories related to Çatalhöyük (e.g., the fusion-fission settlement model; collective vs. autonomous social and ritual structures; history and social houses) for the state of knowledge and the way in which Neolithic archaeology has been practised in these territories. The cultural transformations suggested from the data, interpretations, and theories will be the subject of special attention. Such transformations are evident throughout the history of the Çatalhöyük settlement, especially those that occurred after the mid-seventh millennium BC. Thanks to the exceptional level of interdisciplinarity of more recent investigations and the painstaking assembling of their results, it has been possible to generate a narrative depicting these changes that is close to real life. It will be considered whether their regularities, which may also have resulted in the spread of Neolithic formation, can also be seen in the Early Neolithic of the aforementioned European territories, and - using analogies from Çatalhöyük - better understood.

3 THE ARRHYTHMIC NEOLITHIC. THE ÇATALHÖYÜK TRAJECTORY OF DEVELOPMENT AND ITS RECURRENCE IN SOUTHEASTERN AND CENTRAL EUROPE

Abstract author(s): Marciniak, Arkadiusz (Adam Mickiewicz University)

Abstract format: Oral

The emergence of the Neolithic and its subsequent progression has an arrhythmic form. It involved a sequence of short bursts of intense developments followed by lengthy periods of stabilization. It was followed by the rapid standstill of these highly developed communities, their abrupt disappearance and subsequent transformation into new forms of considerably lower potential.

The objectives of the paper are threefold: (1) to outline the trajectory of the development of Çatalhöyük and the region as the primal manifestation of the arrhythmic progression of the Neolithic, (2) to draw parallels between the Çatalhöyük sequence and the mode of emergence and subsequent development of the incipient Neolithic of southwestern Asia as well as southeastern and central Europe, and (3) to scrutinize the causes and mechanisms of the demise of the incipient form of Neolithic in all three regions and determine the nature of the vulnerability of this first burst of development.

4 THE END OF ÇATALHÖYÜK AND THE EUROPEAN NEOLITHIC

Abstract author(s): Biehl, Peter F (University of California Santa Cruz) - Anvari, Jana (Cologne University) - Rosenstock, Eva (Bonn University)

Abstract format: Oral

This paper links the settlement at the Çatalhöyük West Mound (ca. 6,100 cal BC – 5,500 cal BC) – attributed to the so-called Early Chalcolithic in Anatolian periodization – to the well-established stratigraphy of its Early Neolithic and Late Neolithic predecessor the Çatalhöyük East Mound (ca. 7,000 cal BC – 5,900 cal BC). It scrutinizes the process of cultural, social, economic and symbolic transition between the 7th and 6th millennia in Central Anatolia as well as the palaeo-environmental changes in Anatolia and Europe, in order to examine, for example, how humans responded to the climate change that occurred during the “8.2k cal BP climate event.” The time from around 6,100 cal BC to the end of Çatalhöyük around 5,500 cal offers a microcosm that helps us unlock some of the key questions surrounding this time period. Coinciding with a major leap in the expansion of the Neolithic, the shift from the East to the West Mound provides an exceptional opportunity to compare human responses to cultural and environmental change on both a micro- and a macro-scale.

600 INTERPRETING CERAMIC TECHNICAL DATA: CHALLENGES IN APPROACHING AND DECIPHERING PREHISTORIC SOCIETIES THROUGH THEIR POTTERY PRODUCTION

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Derenne, Eve (Vienna Institute for Archaeological Science, University of Vienna) - Dubois, Roxane (Aegean Interdisciplinary Studies - AEGIS, UCLouvain)

Session format: Regular session

Ceramic technology has proven to be an excellent means of making communities and their traditions visible. Yet, literature on pottery technology mainly focuses on methodological aspects and study protocols that allow the collection of technical data on archaeological pottery. Interpretations regarding the social and cultural spheres are often based solely on stylistic and consumption aspects, completely leaving aside manufacturing processes.

Following this observation, this session aims to gather contributions on the prehistory of any geographic area that include a broader reflection on the challenges of interpreting pottery technology in social terms. Regional studies with a diachronic framework are particularly encouraged.

Therefore, we welcome contributions that offer:

- (1) case studies at regional or supra-regional scales that focus on questions pertaining to broader interpretations: mobility-induced shifts, local evolution of traditions, technical transfers and cultural contacts, continuity of practice, etc.
- (2) methodological reflections on interpreting ceramic technical data, answering questions such as: what is the “bare minimum” for technical pottery studies? At which point is the data insufficient for arriving at coherent interpretations? How can we collect, homogenize, and interpret uneven technical data, e.g., when working with a mix of published and newly produced data, with varied technical criteria, the study of different parts of the chaîne opératoire, and widely different analytical tools (from the simple macroscopic observation to the archaeometric analysis)? What is the future of pottery technology? What innovative ways could we develop to combine and interpret different datasets?

(3) theoretical reflections: what are the advantages and drawbacks of applying concepts stemming from other scientific fields to interpret technical data, such as (but not limited to) situated learning theory (e.g., communities, constellations, and genealogies of practice), or network theory (e.g., connectivity, mobility, and interaction).

ABSTRACTS

1 BRIDGING PREHISTORIC POTTERY TRADITIONS AND SOCIO-CULTURAL NARRATIVES: LAUNCHING A DISCUSSION ON CERAMIC TECHNOLOGICAL STUDIES

Abstract author(s): Dubois, Roxane (Aegean Interdisciplinary Studies - AEGIS - UCLouvain) - Derenne, Eve (Vienna Institute for Archaeological Science - University of Vienna)

Abstract format: Oral

This introductory talk aims at provoking a discussion on several themes related to the technological study of prehistoric ceramic assemblages. It stems from a realisation that proposing a complete pottery study inevitably involves dealing with technology. This recording of technical data can be done at different levels of the chaîne opératoire (sources, recipes, forming, decoration, firing) with different goals in mind (provenance, development and dissemination of technologies, technical functionalities, use) and using different methods (macro- and microscopic observations, archaeometric analysis, experimentation).

Nonetheless, this selective approach is not as straightforward as presented in pottery analysis manuals, making it even more difficult to produce comparative studies and to reach coherent interpretations. However, does this mean that collecting technical data on 'not ideal', highly fragmented, and/or uneven assemblages is useless?

We aim to discuss the choice and adaptation of protocols/methods and their adequation to the objectives and the possibilities offered by each assemblage.

- What is the 'bare minimum' for technical pottery studies? At which point is the data insufficient for arriving at coherent interpretations?
- How can we collect, homogenize, and interpret uneven technical data, e.g., when working with a mix of published and newly produced data, with varied criteria, the study of different parts of the chaîne opératoire, and widely different analytical tools?
- How to ensure the produced data can be easily compared and combined in future studies?
- How can we reconcile the lack of chronological resolution often associated with prehistoric periods and the rapid evolution of techniques and traditions at the scale of the human group?

On a theoretical level, the challenges are equally as complex: how can we move from observations to their interpretation in terms of social significance? What interpretative tools can make sense of technological choices in the development of narratives about prehistoric societies?

2 TOWARDS A HISTORY OF KNOWLEDGE: OUTLINING A NEW PERSPECTIVE ON PREHISTORIC CERAMIC TECHNOLOGY

Abstract author(s): Kroon, Erik (Leiden University, Faculty of Archaeology)

Abstract format: Oral

Studies of prehistoric ceramic technology find themselves between Scylla and Charybdis. On the one hand, ethnography shows ceramic technology relates to flexible, individual learning trajectories, and not the social groups archaeologists attempt to reconstruct. On the other hand, the coarse resolution of the archaeological record does not allow us to discern anything beyond group level. How to navigate between these two extremes?

This paper outlines an approach to ceramic technology which looks at long-term patterns in the transmission of knowledge. The basis of the approach is a novel method to compare ceramic technology. This method combines network analysis and probability theory. Rather than asking whether the ceramic technology of two groups differs, the comparison checks whether the variability in chaînes opératoires associated with one group might also give rise to that seen in another group. As such, it enables archaeologists to work with ceramic assemblages as the aggregate effect of countless individual learning trajectories in the past.

The paper showcases the method by applying it to the interaction between indigenous Funnel Beaker West and migrating Corded Ware communities in the Netherlands during the third millennium BC. Is there a radical break in ceramic technology between these communities, as some predict on the basis of aDNA evidence? Or, as others have argued, a more gradual transition? The case study illustrates the unique contribution a long-term perspective on knowledge transmission can make to larger debates in Prehistory, and beyond.

3 UNDERSTANDING THE PRODUCTION PROCESS OF PREHISTORIC POTTERY THROUGH ARCHAEOLOGICAL EXPERIMENTATION: A METHODOLOGICAL APPROACH TO THE STUDY OF SURFACE TRACES

Abstract author(s): Díaz-Bonilla, Sara (Universitat Autònoma de Barcelona) - Clemente-Conte, Ignacio (IMF-CSIC) - Gassiot-Ballbè, Ermengol (Universitat Autònoma de Barcelona) - Ibañez-Estévez, Juan José (IMF-CSIC) - Mazzucco, Niccolò (Dipartimento di Civiltà e Forme del Sapere Dipartimento di Civiltà e Forme del Sapere, Pisa University)

Abstract format: Oral

The creation of experimental programmes in archaeology makes it possible to better understand the production process of prehistoric pottery. It is an excellent way to obtain information about the economic activities of ancient societies. At the same time, it also contributes to the development of new ways of analysing pottery at the macro- and microscopical level.

Surface production traces have rarely been approached from a global and experimental perspective. Therefore, I propose an experimental program about surface treatment on pottery and the used toolkit (pebble, flint spatula, pottery spatula, shell spatula, linen rag, grass, leather, etc.), where the main variable being explored is the category of pottery: different tools generate differentiable traces.

The catalogue is composed of visual information and qualitative data about traces and surface appearance. Likewise, to test whether the visual differences observed between the various surface treatments can be quantitatively measured, confocal microscopy has been tested. This method has proved to be an accurate and feasible technique for surface microtexture measurement.

The potential of the proposed methodology for traceological and textural analysis of surface treatment is highlighted. The possibility of discriminating different production techniques through surface traces opens new perspectives for the study of prehistoric pottery.

4 BEYOND QUANTIFICATION FOR QUANTIFICATION'S SAKE: EXPLORING SOCIOCULTURAL INTERPRETATIONS OF CERAMIC STANDARDIZATION IN THE JAPANESE ARCHIPELAGO

Abstract author(s): Loftus, James (Japan Society for the Promotion of Science - JSPS; Faculty of Social and Cultural Studies, Kyushu University)

Abstract format: Oral

Japanese archaeology has an unfortunate reputation for fixating on finely-tuned ceramic chronologies based on visually assessed, irreproducible methods. On the other hand, recent trends in big-data quantification have some archaeologists scratching their heads, asking, “Where’s the archaeology?” This perceived fissure between “traditional” and “modern” exposes a deeper problem: the entrenchment of outdated notions of what it means to be a “data” scholar or a “theory” scholar with little room in-between. However, improvements in quantified shape analysis, combined with an increase in the availability of ethnoarchaeological case studies, allow us to move past binaries into holistic, sociocultural interpretations based on reproducible methods. This study seeks to utilize data about pottery shape, based on modern geometric morphometric and 3D technologies, to explore changes in social learning strategies and idiosyncratic style during a period of agricultural transition. The agricultural transition period in the Japanese archipelago, the “Yayoi Period” (~900/800 BC–300 BC) was a lynchpin period in ceramic manufacturing, during which roots of craft specialization took hold against a backdrop of cultural hybridization. Tentative results allow us to trace paths of acceptance, rejection and standardization in ceramics, establishing the foundations for an increasingly stratified society and state formation in later periods.

5 TO WHEEL OR NOT TO WHEEL? POTTING PRACTICES IN THE WESTERN CATALAN PLAIN (CATALONIA, SPAIN) DURING THE VITH CENTURY BC

Abstract author(s): Castellano Aragonés, Alba (Universitat de Lleida; Grup d’Investigació Prehistòrica)

Abstract format: Oral

In our proposal, we examine the role of pottery production and the spread of the potter’s Wheel during the Early Iberian period (VI BC) in the Catalan Western Plain of the Iberian Peninsula. There are no studies that have examined this process in that geographical area. Through a combined approach based on macroscopic and petrographic analyses, we reconstruct the chaînes opératoires and determine the technological styles in the first wheel-made pottery productions that were found in the sites of the Fortress of Vilars, the oppidum of Gebut, Tossal del Molinet and Castellot de la Roca Roja. The results may demonstrate that potters or groups of potters who adapt the wheel-made process shared substantial technological choices. At the same time, they followed their own savoir-faire of producing ceramics, expressed in fundamental technological variability. This evidence suggests that wheel-forming techniques

can be more variable than one would have traditionally thought and that the adoption process of that new technology was according to the modalities of the different social contexts.

6 TECHNOLOGICAL ASPECTS AND PROVENANCE OF MIDDLE AND LATE NEOLITHIC COASTAL POTTERY: A CASE STUDY OF SILIŅUPE AND SLOCENE SETTLEMENTS

Abstract author(s): Visocka, Vanda - Bērziņš, Valdis (University of Latvia Institute of Latvian History) - Kons, Artis (University of Latvia Faculty of Chemistry)

Abstract format: Oral

The Siliņupe and Slocene Middle–Late Neolithic (4100–1800 cal BC) settlements, which have yielded large assemblages of artefacts, including pottery, are located near the seacoast of present-day Latvia. Although the pottery has been studied previously, little attention has been given to the technological aspects, provenance, or social interpretations. This paper applies a suite of methods, including macroscopic and microscopic observations, ceramic petrography and WD-XRF analysis.

With regard to the techno-typology of the ceramics, it can be assumed that the majority of the vessels were produced as pots for cooking. Four types of tempering material were distinguished: shell from freshwater mussels and clams (*Cerastoderma* sp.) as well as granitic rock and grog. Ornamentation is seen on most vessels, taking the form of pits, lines and impressions of harbour porpoise (*Phocoena phocoena*) teeth.

Diverse potting practices indicate different social groups and transfer of technological knowledge within the coastal hunter-fisher communities, reflected especially in the use of grog temper and porpoise tooth ornamentation. The distinctive decoration has analogies in pottery from sites in Estonia as well as inland Latvia – in the areas of lake Lubāns and Burtnieks. This possibly indicates the practice of exogamy or else pottery transfer within the highly developed exchange system. Grog, on the other hand, has no known analogies in the pottery of this period in Latvia. Moreover, the characteristics of the grog indicate that it originates from a shell-tempered vessel but has been incorporated into a vessel with mineral temper. This could relate to the particular social and/or symbolic context, such as change of identity and cultural affiliation, or may reflect processes of exogamy.

7 THE USE OF THE PETROGRAPHIC METHOD AND LASER ABLATION INDUCTIVELY COUPLED PLASMA MASS SPECTROMETRY (LA-ICP-MS) IN THE STUDY OF CERAMICS

Abstract author(s): Przybysz, Anita - Szczepaniak, Małgorzata - Sobkowiak-Tabaka, Iwona (Adam Mickiewicz University in Poznań)

Abstract format: Oral

Pottery is one of the most frequently discovered materials in archaeological sites. Our presentation focuses on applying petrographic, and Laser Ablation Inductively Coupled Plasma Mass Spectrometry (LA-ICP-MS) to the Middle Neolithic (3900/3800 – 3450/3400 BC) pottery set. Both methods are destructive, meaning all or part of the sample is irretrievably destroyed. However, they are very accurate and allow us to recognize different compositions of the ceramic body of individual vessels over time and other arrangements for a given pottery workshop.

An example of using the previous research is the analysis of the composition of clay bodies used to make vessels from the archaeological site in Kiełczewo (western Poland), related to the Funnel Beaker culture. A total of 27 fragments of pottery were selected, thin sections were prepared and examined under a polarizing microscope, and the same fragments were analyzed with an LA-ICP-MS. Preliminary interpretations show significant differences in the content of such elements as Rb, Sr, Zr, and Ba in selected samples.

Thanks to the analyzed admixture, an attempt can be made to identify the place of origin of the discussed ceramics, as well as traces indicating the presence of specific archaeological cultures on the territory of Greater Poland and the rest of the country. In addition, the characteristics of admixtures may allow for deductive reconstruction of the technological process of making vessels and indicate preferences determining the use of a specific admixture to obtain the assumed result. Conclusions from research on the collected materials can be used for comparative analysis of local ceramic production with other archaeological sites within one cultural circle.

The conducted studies displayed detailed information on the way of pottery making, the composition of the clay body, admixtures, firing, and the origin of the raw material.

8 REST IN CLAY: CERAMIC TECHNOLOGICAL ANALYSIS OF A BRONZE AGE CREMATION CEMETERY AT MAKLÁR-KOSZPÉRIUM (NE HUNGARY)

Abstract author(s): Mengyán, Ákos (Hungarian National Museum; University of Miskolc)

Abstract format: Oral

Around the middle of the 2nd millennium BC, a new pan-European phenomenon emerged in Central Europe, the Tumulus culture, which spread from eastern France to eastern Hungary. The origin of this cultural complex is a debated subject, but it was probably accompanied by socio-political and ideological changes in the local population, and researchers assume a small amount of migration from the direction of its core area (namely the Upper Danube and Upper Rhine regions). Based on ceramic typology, territorial groups can be separated, which might have their roots in the preceding regional cultures.

The analysed site, Maklár-Kospérium is located on the northern fringes of the Great Hungarian Plain, where 121 cremation burials were found in 1960 and 1962. The site can be linked to the Tumulus culture and could be dated by relative chronology between 1500–1300 BC. In the cemetery, four grave groups could be distinguished that might be connected to specific familial and/or tribal groups of this community. In this region, the Tumulus culture (1500–1300 BC) was preceded by the Füzesabony culture (2000–1500 BC) which might have strongly contributed to the development of the local variant of the Tumulus culture.

Besides typological and stylistic analyses, this regional case study focuses on various aspects of ceramic manufacturing to detect the methods of raw material preparation and firing. Macro- and microscopic analyses, thin section petrography, and X-ray powder diffraction (XRPD) have been applied to investigate these issues. Furthermore, the results were compared with other ceramic technological data from Füzesabony and Tumulus culture sites in order to identify local and non-local components and local evolution or continuity of tradition.

9 POTTERY TRADITIONS DURING THE FIRST STATES' EMERGENCE. ANALYSIS OF LATE CHALCOLITHIC 3-5 POTTERY FROM THE EASTERN HĀBUR REGION, IRAQI KURDISTAN

Abstract author(s): Koutouvaki, Eirini (Department of Cultural Heritage: Archaeology and History of Art, Cinema and Music, University of Padua) - Amicone, Silvia (Archaeometry Research Group, Eberhard Karls University of Tübingen; Institute of Archaeology, University College London) - Gilstrap, William (Center for Materials Research in Archaeology and Ethnology, Massachusetts Institute of Technology; Harvard Museum of the Ancient Near East, Harvard University) - Sconzo, Paola (Dipartimento Culture e Società, University of Palermo; Institut für die Kulturen des Alten Orients - IANES, Eberhard Karls University of Tübingen)

Abstract format: Oral

A crucial moment in the development of ancient Mesopotamia, the Late Chalcolithic (c. 4500–3100 BCE) is associated with the emergence and spread of its first urban societies. Expansion of south-Mesopotamian cultural traits into northern Mesopotamia and more distant areas around 3800–3100 BCE (LC3–5), or the 'Uruk phenomenon', is considered the acme of this phase. The ubiquity of pottery use and diversity of ceramic technological traits during this period make this material an advantageous proxy for human behaviors including mobility patterns and the transfer of technical knowledge.

This presentation provides the preliminary results of a study into the technological landscape of a selection of LC3–5 pottery assemblages from archaeological investigations in the frame of a large-scale survey (EHAS) and an excavation (KUGAMID) of the University of Tübingen at the foothills of the Zagros mountains in the autonomous Kurdistan region in Iraq. The typological examination of pottery with the now revealed network of sites hints at the co-existence of local and southern Uruk style productions. Our study integrates the results from a typological study with compositional data derived through ceramic petrography and neutron activation analysis (NAA). The results shed new light on relationships between the study area and southern Mesopotamia and further demonstrate presence of a local, long-lasting pottery tradition which, as in other northern Mesopotamia regions, integrates southern Uruk characteristics.

A. THE MANUFACTURING PROCESS AND SOCIAL PRACTICE: THE STORY OF WHITE PASTE INLAY

Abstract author(s): Miloglav, Ina (Faculty of Humanities and Social Sciences, University of Zagreb) - Kudelić, Andreja - Neral, Natali (Institute of archaeology, Zagreb)

Abstract format: Poster

White paste or incrustation is a very characteristic and widespread technique of decorating prehistoric ceramic vessels, especially within the pottery traditions in the Carpathian Valley and the Balkans. To this date, several scientific papers have been written about the mineral and chemical composition of the white paste material and its origin. The results showed that the basic component of various recipes consists of calcite or hydroxyapatite – the bone material, and aragonite – carbonate polymorph, found in bivalves and mollusc shells. However, the process of making a paste,

especially regarding the binding agents, remained unexplored. Therefore, the initial research objective was to determine paste composition, how it was prepared and the application procedure.

This paper presents the results of compositional analysis of a white paste inlay used for decorating Copper Age (2880-2470 BC) and Bronze Age (1900-1700 BC; 900 BC) pottery in continental Croatia, applying optical microscopy and FTIR spectroscopy analytical methods. However, critical new knowledge has been established through archaeological experiments conducted in controlled and real conditions using raw materials (animal bones, deer antlers and river Mollusc shells) found by analytical methods. The result showed that no special binder is needed and that the material's homogenisation and strength resulted from applying one of the oldest chemical processes known to man – slaking of quicklime.

Additionally, a social mark is reflected in the physical properties of specific raw materials used to make different inlay recipes, emphasising the traditional practices and cultural identity specific to a particular community. Moreover, the conditions in which such paste could have been prepared indicate the cross-craft interactions linking these and other activities open up new possibilities for interpreting and understanding past communities.

B. CERAMICS DECORATED WITH RED PIGMENTS DURING THE NEOLITHIC: NEW CONTRIBUTIONS FROM THE ARCHAEOLOGICAL SITE OF LOS CASTILLEJOS (MONTEFRÍO, GRANADA, SPAIN)

Abstract author(s): Vico Triguero, Laura (Department of Prehistory and Archaeology, University of Granada) - López Tuñón, José - Sánchez Vizcaíno, Alberto (University Institute for Research in Iberian Archeology, University of Jaén) - Cámara Serrano, Juan (Department of Prehistory and Archaeology, University of Granada) - Montejo Gámez, Manuel (University Research Institute for Iberian Archaeology, Physical and Analytical Chemistry Department, University of Jaén) - Caro, Jesús (Department of Prehistory and Archaeology, University of Granada) - Cámara Linares, María (Physical and Analytical Chemistry Department, University of Jaén)

Abstract format: Poster

This research shows the archaeometric results (μ EDFRX and MRS) obtained from the red paintings and red inlays of the incised and impressed decorations of the Neolithic ceramics from the archaeological site of Los Castillejos in Las Peñas de los Gitanos (Montefrío, Granada). This open-air site, located in the southeastern quadrant of the Iberian Peninsula, shows a stratigraphic sequence which spans from the Early Neolithic to the Bronze Age (5400-1750 cal B.C. approximately). Specifically, for the 16 Neolithic phases, a total of 31 radiocarbon dates are available, which have made it possible to reconstruct the evolution of the production of this type of pigments throughout the occupation of this period. Likewise, the connection of the characterized pigments with the ceramic forms and the other decorative techniques which are associated, in combination with the specific determination of these pigments, has allowed us to obtain information about the different areas of supply of the minerals from which they were obtained and to evaluate if these productions were native or, on the opposite, if they came from other far areas.

601 WEAVING ARCHAEOLOGY, ART AND LITERATURE: NARRATIVES & REPRESENTATIONS

Session theme: 3. Heritage Narratives and Representations

Session organisers: Martins, Ana Cristina (IHC - Polo da Universidade de Évora; IN2PAST; UNIARQ-Universidade de Lisboa) - Casimiro, Tânia (Universidade NOVA de Lisboa) - Mouriño Schick, Andrea (Universidad de Vigo) - Crutcher, Megan (Texas A&M University)

Session format: Regular session

Archaeology has always used art and literature in several ways: as a source of information, ways of building, setting, and wide spreading narratives and representations. These narratives and representations change according to the development of archaeological knowledge and heritage. But they change in accordance with the space and time in which they are produced, becoming(re)constructed, destroyed, replaced, adapted, or confronted, depending on prevailing or emerging agendas, be they ideological, political, social, economic, cultural, ethnic, gender, or religious.

But are we, the ones engaged with different forms of archaeology fully aware of this reality?

To what extent do different literary and artistic contexts influence the construction of archaeological narratives and representations, throughout time? In what ways do these same narratives and representations contribute to underpin agendas (including scientific, personal, and institutional), while breaking paradigms and prejudices (namely sexual, gender, ethnic, class and age)? What is the nature and extent of this ongoing dialogue between archaeology, art, and literature? How does this constant interweaving (i)materialize? Who dictates, nurtures, and manages it? For what purpose(s)?

And what about the creative freedom of the author, whether artistic or literary? How are the discourses - written and iconographic - constructed from archaeology? How to make scientific knowledge reach different types of audienc-

es? And what space do the new social realities – migratory, nomadic, etc. - occupy in this increasingly interwoven complex?

This is a vast set of questions to which we seek to answer during this session. We therefore invite archaeologists from different fields and geographies, illustrators, historians of archaeology, women and gender historians, art and audio-visual historians, anthropologists, and all those who are dedicated to the relationship between archaeology, art and literature embodied in different media, education, and instruction, from textbooks to museums, through social networks, to join us.

ABSTRACTS

1 CLOSE ENCOUNTERS OF A HUMAN KIND, DISTINCTION VERSUS CONNECTEDNESS IN NEANDERTHAL – HOMO SAPIENS ENCOUNTERS IN SCIENCE FICTION

Abstract author(s): Peeters, Susan (Erasmus School of Philosophy, Erasmus University) - Soressi, Marie (Faculty of Archaeology, Leiden University) - Jensen, Stine - Zwart, Hub (Erasmus School of Philosophy, Erasmus University)

Abstract format: Oral

Recently, our image of Neanderthals, long considered as dumb brutes, has changed dramatically, and this has repercussions for long-standing views about ourselves as well. Neanderthals provided food for science fiction, and novels reveal the shifts that have occurred in our views on Neanderthals in terms of different or similar, deficient or superior, strange or familiar. Whereas archaeological findings often raise more questions than they answer, novels can be considered laboratories of the imagination, allowing authors to explore possible scenarios. They can function as spotlights, conveying and amplifying stereotypes and ideologies which are also at work in scholarly discourse more explicitly. With the expert Neanderthal discourse as a backdrop and frame of reference, I will focus on novels that deal with Neanderthal – Homo sapiens encounters. We try to understand Neanderthals in terms of their humanity, but establish identity by the difference between us and them. What happens when humans and Neanderthals meet? What differences or similarities are highlighted, which characteristics are valued, what is silenced? How do writers in comparison with scientists deal with the ambiguity of Neanderthals, being strange and familiar at the same time, human, but not-us? Explicit attention will be given to literary archetypes such as the role of the (exploring, conquering) Hero and the opposite side of the archetypal coin, the Orphan, who desires to become connected. This captures a basic ambivalence: the desire to distinguish ourselves versus the need for connectedness. By stepping out of the current social configuration, fiction can reflect and reveal current anxieties and preoccupations as well as implicit biases underlying our ideas and ideals of human and humanness, that should be acknowledged and addressed. By emphasising the importance of connectedness, the figure of the Orphan may function as a counterbalance to an inflated heroic view of early human history.

2 REPRESENTATIONS AND NARRATIVES OF FINNISH STONE AGE

Abstract author(s): Kunnas, Liisa (University of Helsinki)

Abstract format: Oral

There are persisting myths, beloved “master narratives”, and widely-recognized artistic representations included in the perceptions of the past of every nation. Often their beginning can be traced to times of constructing national (or ethnonationalistic) identities. In political and ideological use of history and archaeology, creating popular narratives and images is an important tool. Later on, these representations get represented over and over again in art, literature, and archaeology as well.

In my study, I analysed late 19th – early 20th century depictions and representations of Stone Age in some iconic and well-known Finnish artistic and literal works, as well as in archaeological literature. Through the application of methods of literary analysis, some narratives aiming at making the Stone Age more included in the nationalistic, teleological story of “Finnishness” emerged. This contradicts previous views of the Stone Age having been excluded from the construction of national past due to its temporal distance and ethnic otherness. Moreover, these images and narratives are still included in, and affecting the concept of Stone Age today.

3 NARRATIVES AROUND THE CONCEPT OF ‘ROCK ART’: DECONSTRUCTING THE TERMINOLOGY?

Abstract author(s): García García, Estrela (University of Santiago de Compostela; GEPN-AAT)

Abstract format: Oral

Since the early days of archaeological studies on prehistory in the West and, in particular, rock art, there have been different approaches to interpreting and perceiving these graphic representations of prehistory, but the term “rock art” has always been the general way of referring to them.

The main focus is on the nature of the nomenclature of such cultural and graphic expressions, and the extent to which current ideas and social conventions about art, history and heritage influence the way we perceive them, with a particular emphasis on the way in which prehistoric rock art is referred to as art rather than language.

The debate is centred on questioning the very nomenclature of art when referring to prehistoric art, and looking for evidence to show that, despite our current approach, there are other ways of interpreting rock art.

This is done through the study of how sites with rock art are managed and related to sites with rock art in two types of contexts: on the one hand, examples of the Western approach, mainly cases in Europe; and on the other hand, contexts with rock art made by indigenous communities or population groups far removed from the Western standard. This comparison will serve to explore this issue and to raise answers to these questions.

4 THE CONSTRUCTION OF GENDER IN HERITAGE NARRATIVES: THE CASE OF PREHISTORY.

Abstract author(s): Mouriño-Schick, Andrea (University of Vigo)

Abstract format: Oral

We present a synthesis of the results of an academic research that addresses the discursive construction of a specific past, prehistory, and of a specific territory, Galicia, in the field of heritage dissemination between 1980 and 2020 from a critical, reflexive and feminist perspective. We designed a systematic methodology based on the strategies and tools of analysis of Critical Discourse Studies, specifically content analysis.

The objective was to identify the prevailing discursive patterns in the different spaces, channels and media of heritage dissemination from a gender perspective as a diagnosis. And likewise, to define the historical situations and the objects that make up the discourse, both in its textual and visual aspects. In other words, to find out how scientific knowledge generated in the academic sphere is constructed, produced and communicated to society, especially to non-specialist audiences. Therefore, we will not focus on historiographical debates, nor on the veracity of the facts, but rather on examining and abstracting the messages and ideas generated around the representation of prehistoric humanity that take shape and become relevant in today's society by leading to dynamics that legitimise the gender inequalities of the present.

We will attend to the processes of exclusion that arise from the patrimonial construction of gender in heritage spaces and their narratives at different levels.

5 GENDER PERFORMATIVITY AND HERITAGE DISCOURSE: THE TANGIBLE/INTANGIBLE DISTINCTION REVISITED

Abstract author(s): Voulgareli, Isavella (Cambridge Heritage Research Centre, Department of Archaeology, University of Cambridge)

Abstract format: Oral

The 2003 UNESCO Convention for the Safeguarding of Intangible Cultural Heritage directed attention to a different approach required to protect and safeguard Intangible Cultural Heritage (ICH) as opposed to Tangible Cultural Heritage (TCH). However, definitional differences between TCH and ICH led the tangible/intangible heritage distinction. Relevant literature has not moved beyond the tangible/intangible divide to an all-encompassing approach to heritage, although formal separation between TCH and ICH has resulted in a binary construction that overvalues one pole while disparaging the other. In my paper, I explore a research question that has been overlooked: how does gender help us reassess the heritage-making process to reframe the tangible/intangible heritage distinction? I intend to discuss how the concept of gender provides a critical interpretative framework to theorise the relationship between TCH and ICH and hence to reframe the tangible/intangible heritage distinction. The study is concerned with Judith Butler's work on performativity (1988, 1990, 1993); it examines the potential of gender to effect change through the process of heritage-making. For the purposes of this research, I am focusing on the case of marble craftsmanship at the Cycladic Island of Tinos in Greece. In Tinos, marble sculpture has always been transmitted from fathers to sons, or kinsmen. It is structured on a familial basis through male lines. As such, the official narratives about Tinian marble craftsmanship are based on a male norm that defines an individual's practical knowledge of marble and the (re)construction of identities. The study examines whether a critical feminist approach can negotiate the relational power dynamics which establish a stable perspective on Tinian marble craftsmanship, and thus 'trouble' how TCH and ICH are (re)formed and (inter)act to (re)create meaning for heritage. To do so, it employs reflexive ethnographic methods and brings together insights from the marble-carving community on the island of Tinos.

6 ACTS OF ART(E)FACTS: THE SNARTEMO CASE. NATIONAL HERITAGE AGENDA OR GLOBAL ART AFFILIATION

Abstract author(s): Larsson, Annika (The Society for Textile Archaeology & Culture Studies; Uppsala University) - Guennoun, Mohammed (The Society for Textile Archaeology & Culture Studies) - Lind, Kerstin (The Society for Textile Archaeology & Culture Studies; Linköping University) - Pallin, Karolina (The Society for Textile Archaeology & Culture Studies; Uppsala University)

Abstract format: Oral

This lecture deals with archaeologically accepted biases based on ideological agendas within the Scandinavian historiography. The current case focuses on a textile find attributed to the Norwegian Iron Age gravefield at Snartemo, and highlights still living nationalist constructions within the history writing. We propose a change.

The Snartemo gravefinds were first published in 1935. When submitted into museum, a band enriched with colorful geometric patterns seems to have already been in the collections. An Oriental cultural sphere was discussed. During the Nazi occupation of Norway, however, the swastika band patterns were reinterpreted to fit a genuine Germanic heritage. Attributed to a magnificent sword in chamber grave Snartemo V, copies were produced as ideological symbols for the Nazi elite.

Although critical of Nazism, and despite neither taking into account the art-historical affiliation nor the lack of a specific archaeological context, the ideas of a genuine ancient Scandinavian identity fit well within the framework of the national historiography. Aspects about confusions have been addressed (2003, 2012). But, in a 20-page article published in the “Swedish history teachers’ yearbook” (2019), the nationalist agenda is reinforced by images where the author has cut and pasted among the band patterns to fit. The conspiratorial idea of “political historical revisionism” regarding the scientific facts, worldwide spread, is scary.

In conclusion, we present another example on the visually spread idea of an isolated Scandinavian cultural heritage to the next generation, globally implemented already to young children. In a new interpretation (an animated film from Japan) of the world-famous Swedish children’s story about “Ronja, the Robber’s Daughter” – Ronja becomes, through symbolic textiles and clothing, a Scandinavian Viking daughter.

This lecture is part of an extensive international research project entitled “Acts of Art(e)Facts”. Additional partial studies within the project are presented in session #498 and #696 respectively.

7 THE TRUTH IN FAKES: PERUVIAN NEO-ANTIQUITIES AS A SIGN OF THEIR TIMES

Abstract author(s): Boza Cuadros, Maria Fernanda (University of Amsterdam)

Abstract format: Oral

European ethnographic museums are riddled with non-authentic pre-colonial Peruvian objects among the Andean archaeological collections they house. These holdings have often been relegated to the back of storage rooms, and their study has commonly emphasized that which they are not: not “original”, not created by a temporal and ethnographic Other, and not of great value. Furthermore, curatorial practices in museums have reinforced their lack of importance, thus erasing their meanings and scholarly potential. These stances, however, erase that which these objects can say about the time they were made, the people who manufactured them, and why they were collected.

I focus here on a set of objects made in Peru in the late nineteenth century that I call neo-antiquities. Neo-antiquities were traded within the antiquities market in the late nineteenth and early twentieth centuries, and are currently found in at least 28 ethnographic museums across 12 European countries. Through formal, technological and iconographic analyses, and drawing on contemporary historiographic and artistic trends, I demonstrate that neo-antiquities’ materialities embed complex understandings of the material culture before the sixteenth century Spanish invasion. They further speak to contemporary narratives of Peruvianness that emerged in a context of post-war nation-making. Importantly, neo-antiquities show that scholarly knowledge of pre-Spanish invasion objects was not limited to the elite academic circles, but were also part and parcel of broader imaginations and practices.

8 THE CURSE OF THE MUMMY STUDIES: USING ART AND LITERATURE TO CHALLENGE PRECONCEIVED NOTIONS ON MUMMIFIED REMAINS

Abstract author(s): Doherty, Alia (University of Manchester)

Abstract format: Oral

Archaeologists have long attempted to escape their modern biases when reconstructing the dynamics of the past. Often unconsciously, preconceived notions of Egypt’s religious and magical beliefs have heavily shifted the perception and interpretation of biological remains. A consequence of Victorian interpretations, public perceptions fuelled by the media, and contemporary religious/ethical ideals. As a result, modern studies of biological remains are often conducted in isolation to the magico-religious beliefs conveyed through Egyptian art and literature, which were a key

aspect in funerary practice. The aim of this presentation is, therefore, to present all the connecting elements between the physical and spiritual while also highlighting the biases which arise from earlier studies. Both Egyptian art and literature strongly suggest a symbiotic relationship between the body, the soul, and the living which should be taken into consideration when examining funerary practices. Furthermore, this presentation aims to tackle ethical issues which arise when dealing with human remains, by drawing from beliefs outlined in Egyptian evidence.

9 WHEN THE SHIFT'S OVER: AN ARTISTIC AND LITERARY GENDER REPRESENTATION IN PORTUGUESE WORKING-CLASS NEIGHBOURHOODS

Abstract author(s): Pacheco, Susana - Leão, Afonso (CFE-HTC Nova University of Lisbon) - Sequeira, João (CICS-NOVA - Minho University/IHC)

Abstract format: Oral

Since the 19th century, with the advent of industry, new types of domestic behaviours started to appear all over the western world. Working-class neighbourhoods exist because of that development. In fact, they were often built as a strategy by the factories' owners to better control their employees. These neighbourhoods housed entire families that often, besides sharing a house, also shared a workplace among themselves and with their neighbours. Often in these communities existed shared places that were people who lived in the neighbourhood hang around, and consequently worked there. Among those places, we can count schools, grocery stores, public washing facilities, and so many other "establishments" where people would voluntarily or not create relationships with their neighbours. Would they gradually become a community? And beget a shared identity among them? Among those working-class people that inhabited these neighbourhoods, there were also several different women who, after their work shifts (and sometimes even during those) still had to take care of the household chores, their children, and their husbands (when they were mothers and/or married) regularly on their own, in other cases, help their mothers (who quite often were also their working colleagues) with those tasks. We know little or almost nothing about the role and presence of these women in those Portuguese neighbourhoods, however literature, paintings and photographs, conciliated with gender theory, allow us to build a perception of what was their social roles and how others perceived them. This paper is our attempt to contribute to changing that scenario in Portugal.

10 NARRATIVES OF AFRICAN MARITIMITY: EARLY MODERN IMAGES OF AFRICANS AND THEIR WATERCRAFT

Abstract author(s): Crutcher, Megan (Texas A&M University) - Rooney, Kelsey (University of Chicago)

Abstract format: Oral

This paper interrogates historical images of African mariners and their watercraft to ask what these artistic depictions reveal about African maritimetry. African canoemen, pilots, and boatsmen were critical to European engagement with the West African coast, as evinced by their descriptions and portrayals in archival records. What details are attested to, and what is omitted? This paper also contrasts how authors of different times and nationalities represented African mariners, especially with respect to the epochs of exploration, revolution, and abolition. The choices made by the artist—what aspects are emphasized in these depictions and what is minimized, their stylistic decisions, and changing symbolic imagery—can illuminate the power dynamics between Europeans and Africans during these conflict-laden times. As these images of African mariners were produced and reproduced through European markets, they reflected the changing European attitude towards race and racialization, concepts of colonialism and empire, and gendered or racialized labor. Besides watercraft, images also display material culture, giving archaeologists clues to what may be available in the archaeological record. European-created imagery of African maritimetry blurs the lines between art, archaeology, and history, and are a vital source for historical archaeological study.

11 ARCHAEOLOGY, ARCHAEOLOGISTS, AND BOOKPLATES: THE PORTUGUESE CONTEXT

Abstract author(s): Martins, Ana Cristina (IHC - Polo da Universidade de Évora)

Abstract format: Oral

The relationship between archaeology, art, and literature is relatively well-known. At least, in general. Furthermore, as far as artistic production is concerned, this connection has been worked on mainly in the fields of painting, drawing, sculpture, and cinema. Still, the necessary attention has not been given to different typologies of the so-called 'Miniatural Art'.

This is the case of bookplates, despite the much-diversified information contained in each of its specimens, true marks of possession, in the specific case of books. Looking over its surface often becomes an authentic iconographic and iconological reading exercise that allows us to penetrate details (sometimes unmentionable) of the life and work of its holders.

We propose, therefore, to demonstrate how, like any other work of art, the bookplates allow a stratigraphic analysis of the person who owns it, using, for this purpose, Portuguese examples, namely from archaeologists. This exercise will allow us to unveil a little more about the scientific path of each author, including personal networks while establishing parallels with the presence of archaeology in other artistic categories and typologies.

12 IT IS ALL ABOUT THE JOURNEY: TRAVELLING LOGS IN A MOVABLE CONTEMPORARY ARCHAEOLOGICAL SITE

Abstract author(s): Santos, Joel (University of Leicester) - Casimiro, Tania - Pacheco, Susana - Leão, Afonso (CFE-HTC Nova University of Lisbon)

Abstract format: Oral

In August 1998, a 1964 Volkswagen van was parked in its usual garage after another month of traveling around Europe. It was her last journey. Almost 25 years later, in 2022, the van is still parked in a garage in Portalegre (Portugal), prepared for the next travel that never happened. In October of that year, this group “excavated” that van trying to recognize all that happened during the 58 years it existed. The result may have been just a description of that context, what was inside trying to interpret what it was used for and by who... however why not try a different interpretation? Based on the van life novels written by Ken Ilgunas, *Walden on Wheels: On the Open Road from Debt to Freedom* (2013), and Kristine Hudson, *How to Live the Dream: Things Every Van Lifer Needs to Know* (2020) the purpose of this paper is to analyze the social, economic and cultural behaviours of the occupants of this van accordingly to the tales narrated by authors that make life van their living style, and on the other hand to answer archaeological questions such as economic organization, social complexity, power relations, identities, ideologies, and the study of conflict. This context will also allow discussions about the forces of globalization, and the way these influenced the van travelers, even from places such as Australia, in the antipodes of Portugal.

13 CAIMAN’S LAND: THE ORINOCO ILLUSTRATED TRAVEL NOVELS IN FRANCE IN THE LATE 19TH CENTURY AND THEIR ARCHAEOLOGICAL DISCOURSE

Abstract author(s): Lozada-Mendieta, Natalia (Universidad de Los Andes)

Abstract format: Oral

During the Third Republic, France used geography, and particularly travel novels, as political propaganda to promote the expansion of commerce and the exploitation of new territories. The Orinoco novels were inspired by the travels of two key French government figures: Jules Crevaux (1883) and Jean Chaffanjon (1889). The texts supported the idea of French (European) supremacy by presenting the relatively unknown region of the Orinoco as pristine nature with savage animals and indigenous populations. Their novels, with more than 153 richly engraved illustrations, became very popular through the press and mass media, also inspiring the publication of Jules Verne’s *Le Superbe Orenoque* (1896). All three authors use archaeological sites in the area, including burials and rock art, as evidence of a degeneration among indigenous communities. Unpublished photographs and sketches of both the Crevaux and Chaffanjon expeditions show how the images were intentionally edited to appear less “civilized”, for example, by omitting the western clothes used by indigenous populations. This paper discusses how the archaeological narrative and visual discourse was used in the novels to persuade the French and European public in favor of the exploitation of the Orinoco based on a representation of their inhabitants as savage and without memory, ultimately denying them their own history.

14 TRAVEL LITERATURE NARRATING ARCHAEOLOGY: THE GRAND TOUR EXPERIENCE

Abstract author(s): Manzetti, Maria Cristina (University of Cyprus)

Abstract format: Oral

With the arrival of the Grand Tour phenomenon in the late XVII century, the production of travel literature increased substantially. The craving for classical antiquities spread in the Mediterranean area was one of the reasons which moved numerous Northern and Western Europeans to undertake adventurous journeys. Some of these trips, which often resembled modern archaeological expeditions, are witnessed in detailed travel journals equipped with descriptions and drawings. However, they are clearly different from the archaeological reports as we know them today. Indeed, one of the most fascinating aspects of these diaries is the subjectivity that emerges from the narration. The admiration of famous monuments which populate lands protagonists of determinant historical facts provoked deep feelings in the travellers coming from far away. What these emotional journeys can tell us about past archaeological experiences? Did such kind of narration of emotions influence the way classical culture has been understood and adopted by the European countries?

The aim of this paper is to present a deep mapping methodology in order to investigate this kind of question. A deep map differentiates from geographical and thematic maps because it represents subjectivity, rather than objectivity. Experiences, feelings and opinions are the main characters of deep maps. The case study is the island of Sicily (Italy),

rich in Greek and Roman witnesses, and how it is described by 11 different European travellers in the XVIII century. By means of GIS, a geo-database was built, which links the different emotions of several travellers to the places and monuments visited during the Grand Tour. The adjectives describing sensations related to antiquities found in the diaries were coded and inserted in the geo-database. The final map shows all the itineraries of the travellers and the results of the analyses based on the information contained in the geo-database.

602 RUNES, MONUMENTS AND MEMORIAL CARVINGS NETWORK

Session theme: 3. Heritage Narratives and Representations

Session organisers: Busset, Anouk (Université de Lausanne) - Ljung, Cecilia (Stockholm University) - Forsyth, Katherine (University of Glasgow)

Session format: Round table

It is more than a decade since Dr Cecilia Ljung and Dr Marjolein Stern founded the International Research Network Runes, Monuments and Memorial Carvings to build up and strengthen an interdisciplinary research environment for researchers working with different aspects of carved stone monuments from the Viking Age and the early Middle Ages in Scandinavia, the British Isles, Ireland and Northern Europe. The focus on stone monuments, preferably with a commemorative function, provides coherency within the network, which encompasses a variety of research topics along a broad chronological and geographical spectrum. It is an important characteristic of the network that the participants have an interest in approaching the research material from a cross-disciplinary angle. The Network was aimed initially at postgraduate students and early career researchers, but it received a large interest among scholars beyond this stage, and welcomes researchers at any stage of their career, although young academics remain an important target audience. The Network has in the past arranged three successful thematic workshops, and is seeking to organise new productive encounters in the future. The Roundtable will provide an opportunity for current or prospective members of the network, and anyone interested in Runes, Monuments and Memorial Carvings of this period, to come together for the first time in a number of years, to discuss recent developments in the field and to identify potentially fruitful avenues of research and future collaboration.

603 REPLICABLE ARCHAEOLOGY: LOOKING FOR WORKFLOWS AND DATA MANAGEMENT STRATEGIES FOSTERING DATA REUSE AND METHODOLOGICAL TRANSFERABILITY IN ARCHAEOLOGICAL SCIENCE

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Lombao, Diego (GEPN-AAT, Dpto. Historia I, University of Santiago de Compostela; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Rabuñal, José Ramón (Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico - INAPH, University of Alicante; Department of Archaeology and Heritage Studies, Aarhus University) - Falcucci, Armando (Department of Geosciences, Prehistory and Archaeological Sciences Research Unit, Eberhard Karls University of Tübingen) - Leuret, Jean-Baptiste (Archéologie des sociétés Méditerranéennes - ASM - CNRS) - Tobalina-Pulido, Leticia (Institute of Heritage Sciences - Incipit - CSIC)

Session format: Regular session

The application of quantitative methods in archaeology has grown exponentially over the past decades. This tendency towards quantification is mainly driven by the need to build more robust interpretations about the past, limiting the subjective factors of qualitative analyses. Quantification has gone hand in hand with the development and spread of digital tools, whose generalization has facilitated the replicability and reproducibility of archaeological studies. Besides, the application of quantitative and computational methods has allowed to address broader and more complex research questions and to handle far larger datasets.

Even though over the past years there has been an increased emphasis on transparency and reproducibility in archaeological sciences, such efforts have often ended up in making available datasets with either raw data or extended information about the processed data, using either open repositories or papers' supplementary information. However, critical issues such as replicability and transferability of research methods are often left in the background. As a result, there has also been a proliferation of custom methodological protocols designed for and applied to a specific case-study. We argue that this "methodological atomization" hinders our ability to compare results on a broader scale. Are we making the most effective use of the promising potentials of these digital and quantitative tools?

This session seeks to bring together scholars from different disciplines (from paleoanthropology or lithics to ceramology or architecture) working on different periods (prehistoric and historic archaeology) who use well-defined workflows for data collection, analysis, and visualization. These practices should not only be conceived to allow research reproducibility, but also replicability, reuse of data and methods, and facilitation of methodological transfer across

disciplines. We encourage presentations about specific case studies from different disciplines and periods, and dealing with questions at different scales, as well as formal strategies from research groups, projects, or institutions.

ABSTRACTS

1 TOWARDS A COMPARATIVE APPROACH TO CORE REDUCTION INTENSITY IN ARCHAEOLOGY

Abstract author(s): Lombao, Diego (GEPN-AAT, Departamento Historia, Facultade de Xeografía e Historia, USC; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Rabuñal, José Ramón (Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico - INAPH), Universidad de Alicante; Department of Archaeology and Heritage Studies, Aarhus University) - Morales, Juan Ignacio (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art)

Abstract format: Oral

In the last three decades, the proliferation of studies approaching the use-life or reduction intensity of retouched tools and cores has allowed new perspectives on the in-depth study on aspects of human behaviour such as technological organization, economic management of abiotic resources, occupations dynamics, transport and mobility patterns, and formation processes of archaeological assemblages, among many others.

However, depending on their theoretical or empirical basis, reduction intensity proxies are often expressed in different scales of values, hindering an easy correlation of the results with the real reduction intensity. Likewise, the need to adapt the methods to different types of tools or to specific research questions, has translated into the development of many methodological proposals, some of them quite sophisticated, but whose application often is limited to specific case studies or archaeological sites.

Therefore, researchers should aim beyond the design of custom indexes adapted to specific artifact types by fostering analytical tools allowing the comparison between different proxies and exploiting their complementarity.

In this paper we present an evaluation of some of the more widespread methods used on core reduction intensity studies by means of Weibull distributions. Finally, we propose a transferable workflow for approaching reduction intensity in archaeological assemblages by integrating different core reduction intensity estimation methods.

2 ADVANCING FUNCTIONAL ANALYSIS THROUGH TRANSPARENT AND REPRODUCIBLE EXPERIMENTAL RESEARCH: BUILDING A SOLID FRAMEWORK FOR THE IDENTIFICATION OF ROCK CRYSTAL PROJECTILES

Abstract author(s): Rabuñal, José Ramón (Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico - INAPH, Universidad de Alicante; Department of Archaeology and Heritage Studies, Aarhus University) - Fernández-Marchena, Juan Luis (SERP, Seminari d'Estudis i Recerques Prehistòriques. Secció de Prehistòria i Arqueologia, Departament d'Història i Arqueologia, Facultat de Geografia i Història, Universitat de Barcelona; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Mateo-Lomba, Paula (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art) - Lombao, Diego (GEPN-AAT, Dpto. Historia I, Facultade de Xeografía e Historia, USC; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Cueva-Temprana, Arturo (Department of Archaeology, Max Planck Institute for Geoanthropology) - Cazalla, Irene (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili, Departament d'Història i Història de l'Art)

Abstract format: Oral

Experimental archaeology is an essential discipline for hypothesis testing and the production of empirical reference models. However, for the findings of experimental studies to be reliable and become a benchmark in their fields of study, transparent and reproducible experimental practices and analytical procedures are crucial.

In this talk, we present a large-scale experiment analyzing wear features in rock crystal pieces used as projectiles. We documented different macroscopic and microscopic impact features, some of which had not been previously described. These features had a considerable variability in their attributes and diagnostic capacity. Based on our results, we suggest that the identification of projectile use should rely on the identification of a suite of features, at different scales of analysis, which do not necessarily follow recurrent patterns of association.

Thus, to construct a reliable reference collection of macroscopic and microscopic projectile impact traces on rock crystal, that can be transferable for functional analysis on archaeological materials or further experimental works, we invested on a twofold effort. Firstly, we emphasized a thorough report of the experimental procedure, precise definition of the analyzed variables and attributes, and detailed descriptions of the observed wear features in the published paper (Fernández-Marchena, et al., 2020). Secondly, we built a comprehensive repository with publicly accessible

documentation of the complete experimental and analytical procedures and the raw data of the wear features analysis, enabling the re-evaluation of our analysis and conclusions.

To frame this approach on the occasion of this presentation, we conducted a literature review to evaluate the state of replicability and open data practices in published experimental functional works. Our study highlights the importance of open data practices for building robust reference collections that set the bases for functional interpretations. Additionally, it showcases the potential of transparency and reproducibility standards in experimental archaeology research.

3 AN EFFICIENT WORKFLOW IN THE R PROGRAMMING LANGUAGE FOR REPLICABLE LITHIC QUANTITATIVE ANALYSIS

Abstract author(s): Falcucci, Armando (University of Tübingen) - Pargeter, Justin (New York University)

Abstract format: Oral

Stone tools (from now on lithics) dominate the prehistoric archaeological record and are pivotal to understanding cultural evolution as their production relies heavily on learned behaviors. Lithics are frequently described using attribute analysis, which is a powerful method for conducting intra- and inter-site comparisons as it builds upon a set of discrete and metric traits that can be statistically treated. Despite recent attempts to tune recording systems and increase interobserver reliability, lithic analysis is seldom replicable because of the infrequent sharing of datasets and workflows for data recording and statistical analysis. The latter do in fact frequently rely on proprietary software that does not permit sharing all coding steps conducted for reaching a certain conclusion. The software environment of R, which is the most used programming language in archaeology, can be a powerful ally to make lithic analysis open and fully replicable. In this talk, we will present an ongoing discussion surrounding the use of R in lithic quantitative analysis that aims at increasing transparency and interoperability by developing a system for data manipulation, visualization, and statistical treatment using several packages available in CRAN. Furthermore, we will show how R Markdown and Quarto are ideal for fostering data replicability by allowing embedding codes alongside observations and visual outputs. We will quantify differences between the MIS3 assemblage from Pinnacle Point 5–6 in South Africa and the Italian Protoaurignacian as an example of efficient and smooth inter-site comparison. Overall, we hope to generate a crucial discussion and stimulate new collaborative projects to foster research replicability and data reuse with the final goal of facilitating cross-regional studies of human cultural evolution.

4 A 3D FUTURE: LOOKING FOR REPEATABLE AND REPLICABLE 3D MODELLING METHODOLOGIES IN ARCHAEOLOGY AND BEYOND

Abstract author(s): Skole, John (Arkeologerna)

Abstract format: Oral

Content

This presentation will look at how 3D documentation has been employed to record and analyze landbound shipwrecks from the west coast of Sweden. The methodology attempts to utilize both objective and subjective observations of wrecks in situ, as well as timber for timber. 3D models are created, and then qualitative observations are annotated directly on to the geometry of the model. This allows for organic artifacts that will not be conserved to nevertheless have their forms and exact measurements preserved for posterity, all the while including the insights of the archaeologist that examined the physical object.

This method has proven useful not only for wreck documentation, but also for general field documentation. Versatile and replicable, the concept of using 3D modelling to preserve objective data followed by the digital annotation of those models in order to preserve subjective expertise shows promise for applications beyond the realm of artifact documentation, marine archaeology and even field archaeology.

Our expansion of methodologies benefiting from 3D technology is not without issue, however. The creation of models for documentation and study creates huge amounts of digital data that demands huge amounts of digital storage space. Instead of being a fleeting issue that will be forgotten as technology develops and disk space along with it, the ever-advancing field of 3D modelling is sure to continue to push data storage to the limit. Similarly, the constant development of the technology means that new file types are common, and there is no guarantee that the 3D model files we make today will be accessible in the future. Where will the files be stored? Who will maintain and update them? What long-term solutions are being pursued for the archiving of 3D models in an accessible and public fashion?

5 FAIR ASSESSMENT TO FAIR IMPLEMENTATION FOR REPRODUCIBILITY AND REPLICABILITY IN PHYTOLITH RESEARCH

Abstract author(s): Karoune, Emma (The Alan Turing Institute; Historic England) - Lancelotti, Carla (Universitat Pompeu Fabra) - Ruiz-Pérez, Javier (Texas A&M University) - García-Granero, Juan José (Spanish National Research Council) - Kerfant, Celine - Madella, Marco (Universitat Pompeu Fabra)

Abstract format: Oral

Our project ‘Increasing the FAIRness of phytolith data’, funded by EOSC-Life, is striving to set the basis for implementing the FAIR (Findable, Accessible, Interoperable and Reusable) data principles within the phytolith research community. Phytoliths are micro-botanical remains that are formed within the cells and intercellular spaces of living plants. They can be used to for example address archaeological questions concerning anthropogenic plant exploitation and landscape changes.

The phytolith community has been making efforts to standardise data through the development of a common nomenclature and other guidelines. However, the routine adoption of these standards has not been straightforward. Data sharing is minimal and data is often exclusively within paywalled published articles rather than in open repositories.

We have engaged with our community to find shared views on opening up research. We have also conducted an assessment of publications containing primary phytolith data and associated methods to fully investigate the key variables needed to improve data sharing in line with the FAIR principles.

This presentation will share the results of this work and how we have moved towards community-led FAIR guidelines that will help to share data, and metadata, more sustainably and more transparently to enable better communication of research. We will also discuss the Open Phytolith Community initiative that is developing the next steps of our work such as ontologies, an open publishing guide, and training in open research skills.

We will discuss what our work means for future phytolith research in terms of the increased quality of research and ultimately reproducible and replicable research. We will reflect on the wider learnings that can be taken from this project for the archaeological community.

6 FOSTERING FIELD DATA PUBLICATION THROUGH AGILE WEB VISUALISATION: THE ARCHEOVIZ R PACKAGE AND ITS WEB PORTAL

Abstract author(s): Plutniak, Sébastien (Laboratoire CITERES-LAT) - Vignoles, Anaïs (Laboratoire TEMPS)

Abstract format: Oral

A recent ARIADNE survey revealed that (1) lack of handy tools, (2) lack of training in data management, (3) lack of time to prepare data for publication, and (4) lack of recognition related to it are factors explaining the insufficient publication of field archaeological data.

There is a persistent imbalance between the time-consuming field data recording work and subsequent analysis and re-analysis work: the generated datasets are usually kept in the excavation’s documentation (in notebooks at first, in hard drives since the modernization of field recording methods), limiting their accessibility and reusability.

In this context, the “archeoViz” application was developed to contribute to removing these barriers. Embedded in an R package, this Shiny application makes it possible to visualise, interactively explore, and communicate archaeological field data on the web.

It generates interactive 3D and 2D plots, cross sections and maps of the remains and their refitting relationships, computes basic spatial analysis methods (convex hull, regression surfaces, 2D kernel density estimation), and displays excavation timelines.

archeoViz’s minimal interface (viz. issue 1) and the simple data structure it requires (csv files with five mandatory variables) (viz. issues 2, 3) make it handy, easy and fast to use. The app has been conceived as the building brick of a decentralised web system: users can deploy “archeoViz” instances specific to their data on the server of their choice. The “archeoViz portal” (<https://analytics.huma-num.fr/archeoviz/home>) is intended to index the datasets deployed with the app, increasing their discoverability and audience on the web (viz. issue 4).

archeoViz” is not a data repository (the datasets cannot be downloaded) but a covering tool making published or unpublished data visible, thus indirectly contributing to fostering data publication and reuse by archaeologists.

7 SHARING DATES. ACHIEVE REPRODUCIBLE RESEARCH FOR THE MIDDLE-UPPER PALAEOLOGIC TRANSITION IN THE CANTABRIAN REGION

Abstract author(s): Díaz-Rodríguez, Mikel (Grupo de Estudos para a Prehistoria do Noroeste Ibérico. Arqueoloxía, Antigüidade e Territorio - GEPN-AAT, Dpto. de Historia, Universidade de Santiago de Compostela; Department of Archaeology and Heritage Studies. Aarhus University; BIOCHANGE – Center for Biodiversity Dynamics in a Changing World, Aarhus University; CISPAC – Centro de Investigación Interuniversitario das Paisaxes Atlánticas) - Riede, Felix (Department of Archaeology and Heritage Studies. Aarhus University; BIOCHANGE – Center for Biodiversity Dynamics in a Changing World, Aarhus University) - Kellberg Nielsen, Trine (Department of Archaeology and Heritage Studies. Aarhus University; BIOCHANGE – Center for Biodiversity Dynamics in a Changing World, Aarhus University)

Abstract format: Oral

Interest in Open Science has grown significantly in recent years, particularly within Archaeology where the practice of sharing data and code has become more widespread. In this discipline, the analysis of evidence is crucial, but the nature of the evidence can lead to it being lost or destroyed. To mitigate this, preserving as much information as possible is key. Additionally, sharing the information with the scientific community can help foster new research and advancements. However, prior to sharing, the data may need to be cleaned and processed to ensure its quality. In this paper, we present a case study focused on a key episode in early prehistory – the transition from Neanderthals to *Homo sapiens* (45-30 ka BP), with particular focus on the Cantabrian region. We use this case study to present a workflow designed to make the data reproducible, from collection, via review and to sharing. All the archaeological sites inhabited by late Neanderthals and *Homo sapiens* have been logged in order to interrogate the disappearance of the former. Long-term demographic trends are accessed through summed probability density curves, which in turn are contextualised with reference to available stratigraphic and artefactual evidence. This case study promotes, we hope, reproducible research into palaeodemographic trends across this major transition period, and offers insights into the potential challenges associated with data and code sharing.

8 UNDERSTANDING THE UNWANTED: A DATABASE PROJECT ON ROMAN SEWERS

Abstract author(s): Le Bret, Jean-Baptiste (UMR5140 - Archéologie des Sociétés Méditerranéennes)

Abstract format: Oral

Water drainage structures are ubiquitous in Roman archaeological levels. Despite the increasing amount of research devoted to them, their analysis often takes the form of simple case studies of an archaeological site, or at most a city. The fragmentary nature of these studies makes it difficult to compare the networks observed, and accentuates the false impression that these installations are too heterogeneous to be the subject of a large-scale comparative study.

To address this problem, we are currently designing a participatory, open and scalable database on the Heurist programme. The project is in its early stages, but the body of the database has been completed, and over 500 Roman installations have already been included. Two distinct parts structure the data. The most important one includes objective and factual information, the other one includes information related to the typology of the Roman evacuations, which is under construction.

In this paper, I will focus on the importance of the preparation of the database project before its realisation, the choice of software for the creation of the database, and our ability to design datasets that are reusable by scientists and the general public

9 RECORDING AND EXPLOITATION OF CERAMIC DATA WITH SYSLAT

Abstract author(s): Munos, Sébastien (INRAP - Institut national de recherches archéologiques préventives; UMR5140 - Archéologie des Sociétés Méditerranéennes) - Manseri, Hakima (CNRS; UMR5140 - Archéologie des Sociétés Méditerranéennes) - Roure, Réjane (Université Paul-Valéry Montpellier 3; UMR5140 - Archéologie des Sociétés Méditerranéennes)

Abstract format: Oral

Syslat is a family of software applications dedicated to the recording, exploitation and analysis of archaeological excavation data. Developed since the 1980s within the ASM laboratory, Syslat promotes the standardisation of recorded data through the use of descriptive vocabularies shared by the various parties involved. Thus, the data recording and exploitation software is accompanied by reference dictionaries, developed in the framework of various programmes parallel to Syslat, at different times. The oldest of these tools is the DICOCER, “Dictionnaire en ligne des céramiques en Méditerranée nord-occidentale du VIIe s. av. J.-C. au VIIe s. ap. J.-C.”, whose updated version is available online (www.dicocer.cnrs.fr). Since its publication in 1993, it has enabled numerous research teams to record in a standardised manner the ceramic material discovered during excavations in the geographical area covered by this dictionary.

In this presentation, we will show the possibilities opened up by the standardised recording of ceramic data through the study of several archaeological sites excavated recently or in the past years, for which the ceramics have been processed and recorded according to the protocols of the DICOCER project. The secure hosting of the data on the Huma-Num infrastructure facilitates the collaborative work of archaeologists over time and makes it possible to propose research work involving several research teams and several archaeological sites. This presentation will also show the different tools offered by Syslat for the cross-referencing, comparison and analysis of ceramic data (CER, TYPOCER, COURBECER). We will also talk about the ongoing projects to update DICOCER, including the interoperability of DICOCER records with other platforms. The Syslat team is also considering the possibility of using other standardised reference typologies.

10 PRESERVING MEMORIES, PROTECTING HERITAGE: THE USE OF DATASETS TO ENHANCE LOCAL SHIPBUILDING TRADITIONS

Abstract author(s): Silveira Martins, Adolfo António (C.E.U.-Cooperativa de Ensino Universitário) - Martins, Adolfo (História, Territórios e Comunidades - CFE, Centre for Functional Ecology – Science for People & the Planet, Department of Life Sciences, University of Coimbra, at the NOVA University)

Abstract format: Oral

During the Iberian Discoveries (15th to the 17th-centuries), ships were agents of knowledge transfer between distant communities, and the analysis of their remains empowers the requisite of an efficient implementation of quantitative methods to build a more robust interpretation of the evidence and across disciplines.

Along with the archaeological study of these archaeological structures it implies the analysis from a multidisciplinary group of researchers. Focusing their attention on the immense collection of artefacts and consequentially producing of a large amount of data. In a substantial number of investigations this data is then reanalysed, stored and disseminated within different field of science to be used to identify parallels or gaps in knowledge. Therefore, it is imperative on each investigation to establish a workflow and a methodological criterion compliant with well established methods, to facilitate the knowledge transfer across disciplines.

In this presentation we will discuss the improvements on the general adopted criterion and the mechanisms to improve it by aiming to: reduce language accessing limitations, widening the data access across the communities and, especially to enhance the understanding of local / traditional nautical terminology. Thus, resulting on an alternative data dissemination approach, the rise of new scientific discussions, triggered the revisitation of past excavation and a better understanding of local shipbuilding traditions.

11 3D LASER SCANNING, A CONTRIBUTION TO THE PRESERVATION OF A 16TH CENTURY FORTIFIED TOWER IN MAASTRICHT, THE NETHERLANDS

Abstract author(s): de Jongh, Ineke - Knapen, Dirk (Arcadis)

Abstract format: Oral

In March 2019 a part of the 16th century city wall in Maastricht collapsed. The fortified tower near this part of the wall faced the same risk. To prevent the collapse of the tower the filling inside had to be removed to release pressure and strengthen the construction from the inside. The deformation of the tower had to be monitored.

We used a laser scanner aligned to fixed points near the tower to periodically create a 3D-scan of the site. By comparing these scans, the growing deformation could be monitored and located. To release pressure, the filling of the tower was excavated archaeologically. The research was interdisciplinary as an architectural historian also collected information. This information became useful to create a construction and restauration plan.

The excavation was carried out in several steps and exposed the inner construction of the tower. After every part of the excavation, we discovered unexpected walls and graffiti. The interior of the tower was also documented with 3D scanning technology. The excavation and 3D documentation resulted in new insights about the historical construction. The different fillings inside the tower were used to date different construction phases.

With 3D modelling we discovered that the deformation decreased. By removing the filling of the tower pressure decreased and it became possible to strengthen the structure from the inside. Together archaeology, architectural history and 3D scanning contributed to the preservation of the fortified tower. Finally, the obtained results and 3D-scans are going to be used to restore the collapsed wall and excavated tower. In this session we like to share our experience and bottlenecks we encountered.

DIGITALLY DIGGING DHASKALIO: PAYOFFS AND PITFALLS IN 3D GIS AS AN INTERACTIVE DATABASE

Abstract author(s): Campbell, Rosie (McDonald Institute for Archaeological Research, University of Cambridge) - Indgjerd, Hallvard (Museum of Cultural History, University of Oslo) - Boyd, Michael (Science and Technology in Archaeology and Culture Research Center, The Cyprus Institute; McDonald Institute for Archaeological Research, University of Cambridge) - Meyer, Nathan (University of California) - Moutafi, Ioanna (Wiener Laboratory, American School of Classical Studies at Athens) - Renfrew, Colin (McDonald Institute for Archaeological Research, University of Cambridge) - Herbst, James (American School of Classical Studies at Athens)

Abstract format: Oral

This paper presents an example of a 3D GIS environment that incorporates site data in synthesis with image-based 3D models of each excavated stratigraphic context and built structures. The data were acquired during the 2016 – 2018 excavations of the Early Bronze Age (EBA) site of Dhaskalio, Cyclades, Greece. The recording strategy employed in the field included an extensive photogrammetry programme, which created the basis for this project. Both intra-site and micro-level recordings were made of the architecture, stratigraphic units and layers, and other features, giving a three-dimensional representation of each taphonomic event. Finds and samples, including structured chemical sampling of all surfaces, were also recorded in three dimensions.

Such a ‘true 3D GIS system’, encapsulating all the abilities of a traditional GIS, including data entry, database management, analysis and manipulation, gives access to all excavation data within a single platform, making the tool data-driven and research-oriented. This is built as an interface for running comparative queries across the trenches and aiding site interpretation by way of spatial analysis. Furthermore, it acts as an interactive database, where site photographs, specialist data and interpretations can be accessed in a single environment by multiple users. The overarching goal is to improve the integration of separate classes of archaeological data – 3D, 2D GIS, specialist finds data, photographs, descriptions, and legacy data – through the creation of a unified system that streamlines interpretation and analysis into a single project centred around 3D models.

The authors will discuss the experiences and challenges encountered when implementing the system and opening it for use by multiple project participants in the post excavation analysis and write-up phase. We aim to highlight the areas where the system added analytical value, but also pinpoint pitfalls and propose workarounds for future implementations.

A. FROM THE PREHISTORIC SITE TO THE CLOUD: THE IPHES-CERCA OPEN DATA APPROACH

Abstract author(s): Fontanals, Marta (Universitat Rovira i Virgili - URV; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Sopesens, Javier - Bargalló, Amèlia (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV) - Del Bove, Antonia (Universitat Rovira i Virgili - URV; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) - Gómez de Soler, Bruno - Revelles, Jordi - Rodríguez, Antonio - Pastó, Ignasi (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV)

Abstract format: Poster

The Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA, is a CERCA research centre of the Catalan Government on Prehistory and Human Evolution, had already done some steps on Open Science, according to the science policy trends. However, since the beginning of 2022, in the context of its accreditation as Maria de Maeztu Unit (Spanish Program of Centres of Excellence), an Open Data implementation plan is being implemented to improve open access and reuse of research outcomes and data generated by the IPHES-CERCA projects.

Being aware that drafting institutional policies are not enough for the real implementation of the Open Data, the IPHES-CERCA Open Data approach seeks the involvement of their researchers and technicians, in a bottom-up implementation process oriented to create specific resources for action.

This is based on the creation of an Open Science Working Group (OSWG) (www.iphes.cat/rri-committee), composed by representatives of all IPHES-CERCA Research Groups and a specific hired data steward. The OSWG boost open science and open data practices by providing the development of specific processes and tools for the IPHES-CERCA research data management under FAIR requirements, which have led us to develop concatenately: (1) drafting and setting up Data Management Plans (DMP) of specific projects through a specific DMP template based on the EU forms; (2) promoting the creation and fostering the deposit of datasets of funded projects in the IPHES-CERCA institutional repository CORA-RDR hosted by the CSUC (<https://dataverse.csuc.cat/>); (3) developing an own disciplinary Thesaurus and (4) creating an IPHES-CERCA Open Data Management policy, in accordance with our fields and our funding agencies.

The aim of this paper is to present the basis of the Open Data strategy that IPHES-CERCA wants to implement in order to discuss with the rest of our scientific community this process, still ongoing.

STAGING MARGINALITY: LINKING MARGINAL LANDSCAPE, SOCIAL POWER, AND SUBALTERN MATERIALITY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Jankovic, Marko (University of Belgrade) - Puddu, Mauro (University of Venice) - Gardner, Andrew (University College London) - Kamash, Zena (Royal Holloway, University of London) - Vanni, Edoardo (University of Siena)

Session format: Discussion session

The session focuses on the groups and individuals that were outside the privileged parts of society, in the position of systemic limitation of social power and agency. The character of the material traces left by the socially marginalized additionally hampers insight into their existences. While elites regularly articulated their power and positions also through monumentality, luxury and rare items, conspicuous modes of consumption, and highly visible performative behaviour, the underprivileged ones did not leave such easily recognized and publicly codified material traces of their actions. This perpetuates insufficient professional and public interest in and knowledge of marginalized social categories, in turn creating a flawed and incomplete perception of the past.

The processes of accretion and disaggregation around the emergence and collapse of power structures across Europe (such as the Roman Empire), can be observed well through the lens of marginality. Marginal structures – and landscapes – change rapidly, collapse but just as quickly reconstitute themselves in a new relational conformation, or disappear completely, in a continuous discontinuity.

Paradoxically, it is through the monopoly of marginality that societies guarantee for themselves the economic or military control of a socio-economic conformation. And it is only by understanding these peripheral spaces and the practices and choices taken by the communities that occupied them that one can understand the complex structuring of social places.

To recompose the brokenness between those marginal landscapes and contemporary societies, this call for papers aims to stimulate a debate around the social dynamics of the construction of significant marginalised spaces in the context of strong power relationships. In this session, we welcome all scholars interested in tackling marginality between Iron Age and late antique Europe from the following perspectives: ecology and ecofacts, gender, power and materiality, spaces control, centralization and peripheralization of places, monopoly, mobility, violence, vanishing historical landscapes.

ABSTRACTS

1 REDESIGNING MONTI AURUNCI BETWEEN LANDSCAPES OF UN-MARGINAL MARGINALITY

Abstract author(s): Saccoccio, Federico (University of Pisa) - De Pieri, Francesca - Zocco, Simone (Sapienza University of Rome)

Abstract format: Oral

The Monti Aurunci is a mountain range located in Southern Latium, and it overlooks the Liri-Garigliano Valley, a major joint area between Lazio and Campania. The range proved to be fundamental for contacts between different cultures in pre-roman times and a focal point during the first phases of the Roman expansion towards the South of Italy in the 4th and 3rd centuries BC. The historical importance of the surrounding region has gradually overshadowed the relevance of the Monti Aurunci, often therefore perceived as geographically and economically marginal.

In virtue of their central position, the Monti Aurunci might instead have played a pivotal role in testing and defining strategies for land assimilation and their transfer from the Italic peoples to Rome. Additionally, the Aurunci range have been cardinal in the definition of the roman colonial space during the 4th and early-3rd century BC, especially concerning the economy of these colonies.

Recent considerations allow us to redesign the perspectives on the Monti Aurunci, overturning them from being virtually empty and marginal to a 'diaphragm' of the activity on the broader region. Through this presentation, we will provide elements suggesting the presence of a large portion of ager publicus in the Monti Aurunci. We will also discuss the hypothesis that this was divided into a few functional districts, likely marked by sacred areas, strictly linked to the region's mobility.

Starting from this hypothesis, we will also try to sketch the general evolution of the lands at issue: from ager publicus to the imperial properties and the creation of the saltus until the final assimilation as part of the Popes' patrimonia in the Middle Ages.

2 THE MATERIAL AND IMMATERIAL CULTURE OF THE SUBALTERN CLASSES THROUGH THE STUDY OF LATE REPUBLICAN UNDERWATER CONTEXTS

Abstract author(s): Barthélemy, Filippo (University of Siena)

Abstract format: Oral

The Mediterranean has always represented a multifaceted and multidimensional space, where man and environment have related to each other. Through this space, societies, economies, cultures, and symbols have interacted over time. Its role as a connector and as a network linking different tangible and intangible artifacts has made of it an instrument of the socio-economic expansionist ambitions of power holders. Shipwrecks provide pivotal traces of the rise in Roman control of the sea during the late second century BC. They are silent testimonies of trades, exchanges, and movements of people and products, which would remain otherwise unknown. Indeed, these enclosed contexts provide valuable traces concerning the ship's equipment and the goods carried by vessels before their defunctionalization. Furthermore, they give us the possibility to look into the realities of the subordinate classes that were active in the trade routes and produced goods for economic exchanges. The different types of amphorae found in the Late Republican wrecks bring to light transformations in market needs that are reflected by material culture. The latter shows several processes of hybridization in shapes that can be connected to transformations concerning commercial needs and aims; a connection that can be built by analyzing the updated features and their new functions. Such an analysis, moreover, opens the way to further hypothesis, regarding the causes that have determined morphological changes. Using written sources and case-studies, the paper wants to investigate the transformations in the material culture of the subaltern working classes that produced the goods for commerce. It tries also to investigate the reasons of these transformations, and hence some processes of social change they have taken place in the Mediterranean landscape.

3 MARGINAL IN DEATH: CHILDREN BURIALS IN REMESIANA EASTERN NECROPOLIS (SERBIA)

Abstract author(s): Jankovic, Marko (University of Belgrade - Faculty of Philosophy)

Abstract format: Oral

The Remesiana eastern necropolis is a subject of an ongoing archaeological investigation since 2018, although some sporadic finds were noted in previous decades. The necropolis is dated by using coinage and analogies in the 4th century AD, which puts it right at the period of early stages of Christianity in this area. Unlike some other necropolis in the vicinity, this one is specific not only because a great number of luxurious and rare items were discovered in a great number of graves (gilded and silver fibulae, silver buckles, heavy miliaria coin, golden pins...) but also because of its unique burials' architecture. A several of mensa type graves and a memoria were discovered so far, all indicating a great effort, time consumption and care for the dead. The most of the rest of the graves were actually gravitating towards them, some literally just beside its outer walls.

Most of the deceased, so far, are children or adolescents, and there are at least 8 burials of newborn or stillborn children at the necropolis. Unlike the other burials from the necropolis, these are pretty specific since there is no evidence that they had the same attention. They are buried in shallow graves that most likely had no visible markings, since a few of them were seriously damaged by other graves. Also, there were no single object found in any of these burials, and so far, it looks like they were all buried close to each other.

Since there are evidence that this necropolis was simultaneously used by Christians and pagans, the interpretation could be harder than usually. These children were marginalized within their society and treated differently than most of the deceased, so this paper aims to give some of the answers to that issue.

4 „WHERE ANYTHING GOES“: PROSTITUTION AND SEXUALITY IN 19TH-20TH CENTURY LISBON

Abstract author(s): Leão, Afonso - Pacheco, Susana (CFE-HTC NOVA University of Lisbon)

Abstract format: Oral

In 1858, Portugal legalized prostitution in Lisbon and required sex workers to register as such, earning them the label of “tolerated”. Despite society considering the practice a “necessary evil”, sex workers faced moral judgment and a series of regulations aimed at promoting public health. These regulations remained in place for over a hundred years, ending only during the fascist regime in 1963. However, due to the shame surrounding the matter, many records were destroyed in an effort to erase these women from recent history.

But not all is lost. Some records still remain, providing valuable information that has allowed us to pinpoint the locations of houses and brothels. In Lisbon, hundreds of archaeological excavations are conducted each year, but unfortunately, Portuguese academia has neglected the importance of preserving contexts from the 19th and 20th centuries. Without much safeguarded archaeological information one can only wonder about the life these women had inside

these houses, begging the question: What can the archaeological record tell us about the daily life of these women and what can the written records tell us about their living conditions, and how were these women perceived by society?

The present study sheds a light on a site in Lisbon where the evidence of prostitution was uncovered through the examination of archaeological and anthropological remains. This new evidence has provided us with a fresh perspective on the lives of these women and a deeper understanding of the regulations imposed on them and the impact they had and how and where they lived. The material culture discovered at the site allows us to reconstruct the history of these women and raises important questions about the complex nature of prostitution and its continued existence today.

605 MULTI-SCALAR LIVES IN THE EARLY MEDIEVAL NORTH ATLANTIC

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Cartwright, Rachel (University of Minnesota) - Leggett, Sam (University of Edinburgh)

Session format: Regular session

Often the North Atlantic world is seen as the periphery – with the Mediterranean and Continental Europe at the centre during the first millennium AD. This session seeks to re-centre the Early Medieval North Atlantic, and the everyday lives of people around the North and Irish Seas using an interdisciplinary and multi-scalar framework. We ask how did the major socio-environmental shifts of c. 400-1100 (e.g. the decline of the Western Roman Empire, migrations and mobility, Medieval Climate Anomaly etc.) impact communities living in the region? For instance, how does evidence for migration in this region bear out in terms of localized lived experiences? Are there signs of resilience to climatic shifts? How did the development of long-distance trade and cross-cultural contact shape North Atlantic communities? How did people cope with raiding activity and diasporic settlements?

These questions (amongst others) require a truly multi-scalar and multi-disciplinary approach to weave together narratives strands of lived experiences in the Early Medieval North Atlantic. Therefore we welcome papers utilizing (but not limited to) biomolecular archaeology, computational approaches, landscape studies, and funerary archaeology on both local and large-scales to (re-)people the past of these seemingly liminal zones and networks and stimulate important discussions on future research directions for the region.

ABSTRACTS

1 TEACH A MAN TO FISH: BIOARCHAEOLOGY AND LIVED EXPERIENCES IN THE EARLY MEDIEVAL NORTH ATLANTIC

Abstract author(s): Leggett, Samantha (University of Edinburgh)

Abstract format: Oral

This paper presents preliminary findings from the ArchaeoFINS (medieval Archaeology of Fishing around the Irish and North Seas) project which is focused on human mobility, cross-cultural contact, and the re-introduction of marine fish consumption at scale in early medieval Europe. Scotland and its islands have been identified as a watershed region for the re-introduction of marine consumption in Britain, and often the “Viking Age” and Christianization are credited with this shift in foodways. In this paper the link between Scandinavian settlement and marine consumption are interrogated using multi-scalar data and interdisciplinary approaches.

The project asks:

- When do fish re-enter diets in Scotland at a scale detectable by biomolecular techniques?
- Does this differ regionally within Scotland and how does this compare with Ireland, Wales and England?
- Do shifts in fish consumption correlate with Christianisation or large-scale migration events (e.g. Scandinavian settlement)?

Bioarchaeological “Big Data” from across the early medieval North Atlantic are combined with new isotopic data from sites in Scotland to show the nature and speed of change in fish consumption around the Irish and North Seas, and how this impacted communities.

2 THE MEDIEVAL WAY OF CREMATION: INVESTIGATING THE CREMATION CONDITIONS USING FTIR-ATR AND CARBON AND OXYGEN ISOTOPE ANALYSIS ON CREMATED BONES

Abstract author(s): Stamataki, Elisavet - Veselka, Barbara (Vrije Universiteit Brussel) - Salesse, Kevin (Masaryk University) - Kontopoulos, Ioannis (University of Copenhagen) - Capuzzo, Giacomo (Université Libre de Bruxelles) - Hlad, Marta (Vrije Universiteit Brussel) - Dalle, Sarah (Ghent University) - Sengeløv, Amanda (Université Libre de Bruxelles) - De Mulder, Guy (Ghent University) - Snoeck, Christophe (Vrije Universiteit Brussel)

Abstract format: Oral

While cremation was the dominant funerary practice in Belgium during the Bronze and Iron Age (ca. 2100-52 BCE) through to the Roman period (ca. 52 BCE- 406 AD) only a few cremation cemeteries (up to 700 AD) have been discovered from the Early Medieval period. During the Early Medieval period, inhumation was the main funerary rite, and cremation was used to a lesser extent from the fifth to seventh centuries. Recent developments in Infrared Spectroscopy and carbon and oxygen isotope analysis indicate that the study of cremated bones provides important information regarding pyre technology and body management in past societies.

The aim of this study is to assess the intra- and inter-site variability in cremation conditions during the Medieval period, using Attenuated Total Reflectance-Fourier Transform Infrared Spectroscopy (ATR-FTIR) and carbon and oxygen isotope analysis on burnt human remains from Belgium. For this reason, three cemeteries from the Early Middle Ages were selected and over 300 samples were analysed. The spectroscopic and isotopic results of the cremated remains indicate that there is a high degree of homogeneity in cremation conditions during the Medieval period. However, statistically, significant differences can be observed when comparing the data of the Early Medieval period to the Roman period (ca. 52 BCE-406 AD), indicating that the way cremation was performed changed between the two chronological periods from the same area. This inter- and intra-site variability adds to our understanding regarding the pyre technology, body treatment, and pyre management at the studied sites and the use of fire in funerary rituals.

3 PEOPLE, PLANTS, AND ALGAE: UNDERSTANDING PICTISH LIFEWAYS THROUGH MICROBOTANICAL AND MICROALGAE ANALYSES

Abstract author(s): Prado, Shalen (McMaster University)

Abstract format: Oral

Historical and archaeological research on the Picts, the inhabitants of Scotland during the first millennium AD, has steadily grown in recent decades and significant contributions have been made to our understanding of Pictish settlement traditions and overall chronology of the Pictish period. Research focused on how the Picts related to their environment, however, is rare (e.g., Jones et al. 2021). This is partially influenced by taphonomic challenges within Scotland's environment which often inhibits the preservation of organic residues (e.g., plant matter) and has limited our understanding of Pictish plant use. Microbotanical residues (e.g., phytoliths and starch grains) offer more robust proxies to understand Pictish-environment relationships and in this paper, I present microbotanical and microalgae (e.g., diatom frustules) evidence from several prominent Pictish sites (e.g., Burghead & Tap o'Noth). The microbotanical and microalgae residues are used to understand use of space (e.g., activity areas) and land use (e.g., agricultural regimes) at Pictish sites, allowing us to investigate the lifeways of the Picts and discuss more broadly how people in the Early Medieval North Atlantic world lived. This fills a substantial lacuna in our knowledge of everyday lifeways of the Picts, and I examine this data at the regional (inter-site) and community (site) scales to tease out architectural preferences, crop processing, and pastoral regimes throughout Pictland. Overall, I investigate human-environment relationships in Pictland and ask how the Picts established, maintained, and concluded relationships with various plant and algae communities across Pictland.

4 AGRICULTURAL ADAPTATION IN EARLY MEDIEVAL NORTHUMBRIA

Abstract author(s): Wolff, Alice (Cornell University)

Abstract format: Oral

This paper presents in-progress results of an archaeobotanical study conducted at Bamburgh Castle, Northumberland, UK. The site functioned as the capital first of the early medieval kingdom of Bernicia and then of Northumbria. This paper considers environmental evidence for climate change in northern England during the early medieval period alongside archaeobotanical evidence for agricultural adaptation. Preliminary archaeobotanical results from this site suggest a dramatic shift in cereal cultivation strategies in the 6th century CE, possibly as a response to the effects of the Late Antique Little Ice Age. While late Roman and post-Roman samples at the site show evidence for primarily wheat production, 6th to 8th century samples show increases in barley and oat and a decrease in wheat. Preliminary results of archaeobotanical analysis of the numerous weed species found in these samples will also be considered as evidence for changing agricultural strategies in northern England in this time period.

5 REGIONAL AND FAR-REACHING MOBILITY AND SIGNS OF LOCAL INTER - OR INTRACOMMUNAL VIOLENCE IN NORWAY DURING THE VIKING AGE

Abstract author(s): Strand, Lisa (NTNU)

Abstract format: Oral

Prior archaeological research has revealed that there were migration and mobility from Norway towards the Insular world, Britain and Ireland and the continent during the Viking Age, however, such singular focus masks communal or regional features that is only revealed through the juxtaposition of results from biomolecular, osteological and archaeological studies.

In recent years, the interdisciplinary approach has been applied when analyzing human remains from the Viking Age, and results from these studies, from a Norwegian perspective, has revealed not only a high level of individual mobility, especially identified from the coastal regions, but also tentatively intra and/or intercommunal social complexities regarding agency and ethnicity during this period. Similarly, the identification of high degrees of interpersonal violence on both women and men, and its implication on the degrees of steepness in the social pyramid – or its indication of the level of representation of central authorities in Norway during this period could well be a result of, or be connected to the overall level of mobility identified during this period.

This paper will, through the osteobiographical approach, deduce results from biomolecular, osteological as well as through archaeological context, and discuss how impact of far-distance as well as regional mobility may have had in shaping communities in Viking Age Norway.

6 SETTLING DOWN IN THE NORTH ATLANTIC: EVERYDAY LIFE IN VIKING AGE ICELAND

Abstract author(s): Cartwright, Rachel (University of Minnesota)

Abstract format: Oral

As one of the last landmasses to be settled in the world, Iceland represents a unique opportunity to study the establishment of a society in a territory previously devoid of cultural remains. This paper will explore various aspects of everyday life in the first hundred or so years after Iceland was settled during the Viking Age. The things people do and create in their everyday lives, while seemingly mundane, can have an extraordinary effect on individuals and society. Within everyday life, fundamental aspects of identities are produced, represented, or transformed. Whether through the use of personal ornamentation, the production of textiles, or the shaping of domestic spaces, aspects of identity can be seen through the material culture that people create and are created by, conditioning the way in which reality is experienced on a daily basis. This paper will examine Viking Age houses, burials, and their material assemblages for what they can say about the way people perceived themselves and the identities they portrayed. This paper takes a multi-scalar approach to the study of the early Icelanders, moving from the small scale of individual items (e.g. brooches, textile equipment, tools) or specific sites to the larger-scale of the region known as the Southern Quarter. Drawing on several aspects of daily and ritual experiences, this paper draws broader conclusions about life in early Iceland.

7 A SETTLEMENT-HISTORICAL REVIEW OF COMMENSALITY IN SCOTIA SCANDINAVICA

Abstract author(s): Macniven, Alan (The University of Edinburgh)

Abstract format: Oral

The economy of the medieval Norse world remained socially embedded long after the nominal introduction of coinage. This appears to have been the case in both the Scandinavian homelands and more distant parts of the diaspora. Excavations at 'central places' like Orphir in Orkney illustrate the continued importance of commensality in the centuries after the Viking Age, with rents and other payments rendered largely in kind for conspicuous consumption by the resident jarls and their guests. While the archaeological material suggests that much of this produce was sourced locally, there has been relatively little study of the environmental-historical impact of these cultural practices on the cognitive landscapes of Scotia Scandinavica.

This presentation aims to contextualise the traces of agricultural production, industrial activity and landscape management preserved in the assemblages from high-status sites such as Orphir, Birsay, and Kirkwall, by reviewing how they are reflected in the Old Norse components of the surrounding namespaces. Particular attention will be given to how Scandinavian innovations have embedded and survived compared to more longstanding staples. In so doing, it will also explore how information from archaeological site reports can be reconciled with other source materials ranging from Old Norse literature to rentals, maps and satellite imagery.

8 CONNECTIONS AND DIVISIONS IN EARLY MEDIEVAL GALLOWAY

Abstract author(s): Craig, Orla (University of Glasgow)

Abstract format: Oral

The early medieval period in Galloway in South-West Scotland sees the region undergo a radical transformation. Shortly after the last known record in 837 CE, Galloway falls out of the control of the Northumbrian kingdom, giving way to activity from the Britons, Vikings and the Gall-Gaidhil. By the time Galloway reappears on the historical record in 1126 CE, each of these communities have coalesced into the Lordship of Galloway. In the middle of this undocumented period, around the year 900 CE, a massive hoard of gold and silver is deposited. The 2014 discovery of this, the Galloway Hoard, has prompted fresh investigation into this little-understood period in this part of Scotland. This paper will present some of the results of an interdisciplinary landscape PhD project on The Archaeological, Landscape and Historical Context of the Galloway Hoard. This project brings together archaeological, place name and antiquarian evidence to show that this area on the periphery of the Irish Sea Region was a place of cross-cultural negotiation, evolving political boundaries and the formation of new communities.

9 HIGHLY FRAGMENTED, INTENSELY CONNECTED: DEVELOPING PARADIGMATIC APPROACHES TO THE ARCHAEOLOGY OF THE EARLY MEDIEVAL NORTH CHANNEL, C. 500-800 CE

Abstract author(s): Kniaz, Sophia (University of St Andrews)

Abstract format: Oral

Studies of the Early Medieval North Atlantic are often characterised by divisions, both between disciplines (i.e. archaeology, history, and landscape studies) and in research conventions (e.g. regionalised typologies), such that archaeological investigations can become confined within modern political and/or terrestrial boundaries which their historical subjects exceeded. This is especially evident in relation to the early medieval North Channel; although the seascape and its medieval communities were intimately inter-connected (at its narrowest, the strait is only 19km wide between Torr Head and the Mull of Kintyre), scholarship of the region has become compartmentalised according to the distinct archaeological programmes of Scotland, Northern Ireland, and the Republic of Ireland.

Numerous investigations of early medieval communities which spanned the North Channel, such as Dál Riata and the Columban monastic network, have highlighted the need for shared archaeological typologies and investigations which facilitate discussions across the region (Armit 2008; Werner 2007). In response, this paper proposes the development of an interdisciplinary, multi-scalar, and holistic “North Channel paradigm” within early medieval North Atlantic scholarship. Taking inspiration from the flowering of methodologies, theoretical frameworks, and new research directions within scholarship on the ancient Mediterranean (especially in the two decades following Horden and Purcell’s “The Corrupting Sea”), this paper explores the value of developing similar maritime paradigms for the North Channel, emphasising the fluidity and “borderless-ness” such approaches bring.

The paper employs an interdisciplinary methodology and post-processual archaeological framework to explore everyday lives across the North Channel, examining case studies including early medieval Iona, settlement forms, and material culture (e.g. Continental E-ware ceramics) in south-western Scotland and north-eastern Ireland. It offers a dynamic and theoretically-engaged [re]centering of the North Channel, and sheds light on the complexities of past lived experience in a highly fragmented and intensely connected North Atlantic landscape.

10 KNIFE ASSEMBLAGES: UNEARTHING THE INTRICATE COMPLEXITIES OF ANGLO-SAXON INHUMATION BURIAL AND VARIED EXPRESSIONS OF PERSONAL IDENTITIES

Abstract author(s): Górkiewicz Downer, Abigail (University of Chester)

Abstract format: Oral

Knives are ubiquitous inclusions in early medieval inhumation burials throughout north-western and west central Europe and are even found in many burials as the sole offering; however, little has been done to explore the significance of their inclusion in inhumation graves. Previous studies on early Anglo-Saxon burial practice have provided evidence of a more complex story behind funerary rites, implying that knives were destroyed prior to burial, often with broken blades or complete fragmentation. My dissertation examining the spatial context of objects within inhumation burials across Alsace, Kent, and East Anglia has also suggested that knife-destruction/damage may not be so uncommon. However, meaning behind not only knife-destruction, but knife-meaning within early medieval inhumation graves is still not well understood.

This presentation applies my recently developed methodology seeking to understand the diverse meanings behind objects regularly interpreted as amulets by archaeologists to a subset of 254 knives from 6th- to 7th-century inhumation graves from Dover Buckland (Kent). While knives are not often considered amuletic, this paper highlights the efficacy of this approach when applying to any object type. Furthermore, this paper illustrates that this approach can not only be useful in understanding complexities of early medieval funerary rites in Kent, but it also provides a base to

further exploring intentionality behind the deposition of knives in burial, their purpose, and potential connections to early medieval cosmologies, and more importantly, as multifaceted expressions of identity.

606 HEARTH AND HOME: DIACHRONIC APPROACHES TO THE ARCHAEOLOGICAL RECORD

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Dobos, Adrian (Institute of Archaeology “Vasile Parvan”) - Chu, Wei (Faculty of Archaeology, Leiden University) - Ciornei, Alexandru (Institute of Archaeology “Vasile Parvan”)

Session format: Discussion session

Hearths and other fire-related activity areas are among the main features of archaeological research as they are often easily observable and supposed as focal points of structures, spatial organization, and associated domestic activities such as workshops or butchering zones. They are also intimately intertwined with technological systems. However, despite their visibility, the relationship of hearths and other heating activity areas to fossilized behavior and technology is often ambiguous across space and time. This is partly because archaeological perspectives are often segregated according to subdiscipline.

Our aim is to create a venue to obtain and share diachronic evidences of how fire is examined within the archaeological record in order to understand the role that fire has played in changing technologies and social organization. We welcome submissions related to excavations and experimental archaeology, particularly those that reconstruct taphonomic disturbances and the contextual aspects of fire but also theoretical contributions.

Our undertaking builds on a research project (TE99 FIRE: Experimental investigations of stone artifact burning)

ABSTRACTS

1 WHAT CAN BURNED FLINT TELL US ABOUT FIRE USE? A CASE STUDY ON THE UPPER PALEOLITHIC OF ROMANIA

Abstract author(s): Dobos, Adrian - Ciornei, Alexandru (Institute of Archaeology “Vasile Parvan”) - Chu, Wei (Leiden University) - Cordos, Cristina (Institute of Archaeology, Iasi)

Abstract format: Oral

Humans likely manipulated fire long before they had full control over it. Paleolithic fire residues have been reported in sites as early as the Middle Pleistocene, and have been investigated using a variety of techniques: fuel analysis, micromorphology, infrared spectroscopy. However, the research on fire in the Paleolithic remains a field with numerous still unanswered questions.

We report here on the results of a non-destructive method aimed at determining the fire particularities through the study of burned lithics. We selected assemblages with burned lithics from two Upper Paleolithic sites from Romania and knapped the same raw materials in the laboratory. The blanks produced were exposed to different temperatures and for various time intervals in a furnace, in the attempt to replicate different types of fire (i.e. cooking, overnight).

The parameters of the lithics were recorded before and after the controlled heating following several criteria: density, color, surface, and piece integrity, to identify the temperature thresholds when changes occur. Coloration is a poor predictor of firing temperature, as it appears at low temperatures, whereas surface cracks and density loss can be better correlated to higher temperatures.

Our research has implications on fuel economy research in the Upper Paleolithic, as well as on the behavior related to the fire. Aside from determining the fire temperatures and duration, additional activities can be identified: hearth re-use, throwing lithics into the fire.

2 AN OVERVIEW OF UPPER PALEOLITHIC COMBUSTION FEATURES IN EASTERN ROMANIA

Abstract author(s): Cordos, Elena (Iasi Institute of Archaeology, Romanian Academy) - Anghelinu, Mircea (Valahia University) - Händel, Marc (Austrian Archaeological Institute, Austrian Academy of Sciences) - Niță, Loredana (Valahia University) - Buchinger, Norbert (Austrian Archaeological Institute, Austrian Academy of Sciences)

Abstract format: Oral

The macro- and microscopic study of hearths in archaeology has long proven as a productive pursuit, as it provides insights in both multiple aspects of past behaviors, as well as the environmental settings in which they took place. Combustion features are often easy to recognize in archaeological archives due to the alternating effect of the flame and/or high temperatures on different organic and inorganic materials. Unambiguous evidence includes spatially constrained patches of burnt, i.e. oxidized, sediment, in the best case with preserved concentrations of burnt objects,

or obvious constructions including pits and stone arrangements in connection with burnt interfaces and material. For Paleolithic sites, however, which have often been exposed to a myriad of post-depositional processes over long periods of time, the former presence of such features is sometimes only indicated by amorphous scatters of burnt objects, such as charcoal, ash, burnt artifacts, or burnt faunal remains. Yet, in many cases well-preserved hearths were discovered and documented.

Our contribution aims at reviewing the existing data regarding combustion features at Upper Paleolithic sites in east Romania. The area is well-known for the relatively high number of sites assigned to this period. We focus on recently excavated multilayered sites such as Bistricioara-Lutarie III in the Eastern Carpathians and Cotu Miculinti in the Middle Prut valley, which provide valuable insights in the local variability of Upper Paleolithic hearths, as well as in preservation and formation aspects. The aim is a standardization of available field descriptions to enable consideration of other sites in order to reveal potential diachronic trends of the various types of combustion features.

3 SOME REMARKS ON HEARTHES AND HOMES IN CRETE

Abstract author(s): Di Biase, Federica (Università degli Studi di Salerno)

Abstract format: Oral

The purpose of this paper is to shed light on the role of fire in domestic contexts from Crete during the late Classical and Hellenistic periods. In particular, I want to highlight which information on hearths is possible to gain from the study of the current bibliography, which questions remain unanswered and which paths can be followed to approach this topic. By focusing on some key case studies my aim is to suggest possible uses of fireplaces and the multiple destinations of rooms equipped with fixed hearths. Findings from houses in Crete testify, indeed, that several typologies of indoor fixed hearths were highly widespread on the western, central and eastern regions of the island. Although the well-known general absence of stratigraphic excavations makes it hard to analyse the function of the fixed hearths in detail, I want to point out that several remarks are possible considering their morphology (shapes, sizes, materials) and the different strategic locations inside the room. A quite consistent homogeneity in terms of fireplace typology choices occurs at site level, while on a Cretan scale regional identities raise several problems.

4 INVESTIGATING A GREEK KITCHEN FROM THE LATE ARCHAIC OCCUPATION AT EMPORION (EMPÚRIES, L'ESCALA, NORTH-EASTERN SPAIN) THROUGH INTERDISCIPLINARY ANALYSES

Abstract author(s): Belarte, Maria Carme (ICREA and ICAC) - Mateu, Marta (ICAC) - Portillo, Marta (IMF - CSIC) - Saorin, Carme (University of Barcelona) - Pecci, Alessandra (ERAAUB, IAUB, INSA-UB) - Gomar, Ada (IMF - CSIC) - Santos, Marta - Castanyer, Pere (MAC-Empúries) - Marzoli, Dirce (DAI. Abt. Madrid) - Tremoleda, Joaquim (MAC-Empúries)

Abstract format: Oral

Fire installations, related implements and food processing remains are widely used to define domestic activities and organization of space in any period. In some specific cases, cooking facilities are also used to define cultural traits. This is the case of a peculiar type of ancient Greek kitchens, composed by a specific set of structures that are well defined. However, these are not frequently attested in ancient Greek settlements.

At the Neapolis sector of the Empúries archaeological site, a set of earthen cooking installations composed by a small oven and a stove, dating from the last quarter of the 6th century / beginning of the 5th century BC, has been recently attested. Its location as well as the related archaeological remains suggest a possible use devoted to ritual or commensal activities. The function of this space would be related to a sanctuary area that the excavations allow to locate in the northern sector of the nucleus, in the vicinity of the access to the ancient natural port. A systematic sampling for interdisciplinary analyses (phytoliths and calcitic microremains, thin section micromorphology, Fourier Transform Infrared Spectroscopy and chemical analyses) has been carried out to obtain more information on the construction process, uses and functions of these structures and the building where they are located. The first results of the present study and their archaeological significance are presented and discussed here.

LINKING DATABASES FOR COMPARING RESEARCH: SHOW YOUR FORTIFICATION INFORMATION SYSTEM [COMFORT]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Loy, Anna (Christian-Albrechts-Universität zu Kiel - CAU) - Ibsen, Timo (Centre for Baltic and Scandinavian Archaeology - ZBSA) - Bernard, Loup (Université de Strasbourg; CNRS UMR7044) - Nakoinz, Oliver (Christian-Albrechts-Universität zu Kiel - CAU)

Session format: Regular session

The proliferation of web-based geographic interfaces for the investigation of archaeological phenomena naturally leads to the conclusion that super-regional perspectives can now be assembled for numerous archaeological phenomena. Hillforts or fortifications are one of the clearest examples of this trend with many regional and national scale compilations being made available. The focus of these databases varies from heritage management catalogues to curated academic and scientific collections and touristic information. At a round table organized at the EAA's annual meeting in Budapest 2022 we sought to discuss the possibilities for a pan-European database, metadatabase or unified access point, in terms of both theory and practicality; as well as how such a system might be used to shape future research.

In this session now we would like to get to know your database, collection, GIS, or other catalogued data on fortifications. Which technology are you using? Which information is considered and how are the data structured? What reasons lead you to your decisions? How is your database embedded in scientific workflows and in institutional architectures? Do you think it might be amendable for use in a European-wide system? Which challenges are you facing?

The session aims to connect specialists and interested scholars who use and moderate hillfort- or fortification-specific databases. Presenters are requested to give a general overview of their system and data and elaborate more detailed on the structure the data is processed in.

ABSTRACTS

1 FAIR DATA FOR FORTIFICATIONS: ANCHORING BUILDING GUIDES IN PAST AND FUTURE

Abstract author(s): Turner, Daniel (KNAW-DANS; Leiden University) - Horik, Rene (KNAW-DANS) - Brysbaert, Ann (Leiden University; Netherlands Institute at Athens)

Abstract format: Oral

This paper addresses the need for an efficient unified platform for linking databases and practical protocols for digitising archaeological features through a series of limited-use concept episodes (LUCes, pronounced “luckies”). LUCes describe from start to finish the process of digitising features commonly encountered by field archaeologists under time and budget constraints. ‘Limited’ and ‘episodic’ are used deliberately to signify all-in-one guideline packets that are digestible (i.e., not needlessly complicated) and convertible (i.e., relatable to the most common scenarios encountered in cultural resource management). Legacy data from a desktop survey of early Aegean fortifications conducted at the height of the COVID-19 pandemic will serve as the first of these LUCes. The grand intent behind this and similar initiatives is to offer viable solutions to protect, record, store, and disseminate rapidly diminishing and at-risk cultural heritage, namely built-stone, rock-cut, and earthen architecture that cannot be sustainably studied without digital methods. On a practical level, LUCes—or any guide, manual, or other instruction kit for field archaeologists for that matter—need not be exhaustive or perfect. They must, however, be durable and viable. In other words, we must detail affordable, readily available, teachable solutions that can be deployed with technology and training that is already in use within the majority of training spaces for cultural heritage managers: academic, professional, and avocational. Citizen science is a powerful tool while we await advances in artificial intelligence, and the much sought after push for FAIR and Open Science data has never been more crucial for sustainable cultural heritage management in a rapidly changing world.

2 LINKED OPEN ARCHAEOLOGY FROM FRANCE: ARKEOGIS, ARKEOPEN, OPENARCHAEO AND THE MASA+ CONSORTIUM

Abstract author(s): Bernard, Loup (Université de Strasbourg; CNRS UMR 7044; Consortium MASA+)

Abstract format: Oral

This paper will emphasise on the ArkeoGIS online WebGIS and its open version ArkeOPEN and will also present the consortium of French Archaeologists and Archivists MASA+, insisting on the possibilities offered by OpenArchaeo and Nakala in order to link existing projects.

As in many countries, databases about hillforts -and oppida- began to exist with punch cards and have been implemented and rewritten several times since then. Nowadays, several tools offer access to basic data (where/when/what) but also to more detailed data (pictures, plans but also typologies). Semantic web tools help to link these different online solutions, and to create powerful queries online. The paper will present some of those tools and extend the discussion to other problems.

So far, France has an excellent infrastructure (Huma-Num IR*) that hosts those data and make it possible to share without the risk of losing the work and archives at the end of the founded project. All presented tools are FAIR if not Open and sustainable for the near future, interoperating with other European projects is already possible.

3 **A MULTI-USER ONLINE DATABASE FOR HILLFORT STUDIES: THE EXAMPLE OF THE HILLFORTS ON THE DAUGAVA RIVER (INHILLDAUGAR)**

Abstract author(s): Vyazov, Leonid (University of Ostrava; Centre for Baltic and Scandinavian Archaeology - ZBSA) - Schneeweiß, Jens - Ibsen, Timo (Centre for Baltic and Scandinavian Archaeology - ZBSA)

Abstract format: Oral

Contemporary hillfort research uses a large amount of multidisciplinary data from various sources, including archival information, records of archaeological excavations, remote sensing, palaeoenvironmental studies, etc. The management and integration of this diverse data require a flexible tool that is also suitable for analysis. Varying degrees of data accuracy as well as the frequent use of subjective and interpretative cultural and chronological attributions in archaeological contexts increase the challenges for such a data management system.

In our presentation, we present a web-based and GIS-supported database for multiple users that contains cultural and typological interpretations and relative chronological sequences as well as absolute dates and geodata. It is our solution for an international cross-disciplinary system for the integration of data extracted from hillforts. It is based on the use of a graph database (Neo4j) that allows us to store, analyse and manage complex relationships between archaeological features, their context, and interpretations in an intuitive but sophisticated way. The graph structure of our database corresponds ideally to the complicated structure of archaeological records. It allows different assemblages (sites, occupation layers, artefacts, archaeological cultures, etc.) to be treated separately, taking into account data with different levels of accuracy. Newer data enhance the older ones instead of replacing them. The functionality of our multi-user system includes data mapping, visualization, selection, and processing of archaeological data and their relationships; furthermore, the analysis tools offer a clustering according to the attributes of the registered objects as well as the calculation of chronology curves based on the summed probability distribution of the 14C data. Our database is being tested on hillforts along the Daugava River in Latvia that are currently being studied in an international research project („Interdisciplinary Hillfort Studies at the Daugava River: Merging and Decoding Archaeological, Environmental and Linguistic Data“ - INHILLDAUGAR).

4 **LATE BRONZE AGE ENCLOSURES IN SERBIAN BANAT, SOUTHERN CARPATHIAN BASIN: CONNECTING THE DOTS**

Abstract author(s): Estanqueiro, Marta (University College Dublin; CEACCP- University of Coimbra)

Abstract format: Oral

In recent years several Late Bronze Age settlements have been discovered in the Serbian Banat region, southern Carpathian Basin. These are spread along the eastern region of the Tisza River and vary in size and shape, with some achieving considerable areas.

Sharing general characteristics such as the presence of ditches, clusters of subcircular pale soil marks (visible in aerial photographs or satellite imagery), and the common use of Belegiš pottery, they were designated Tisza Site Group (TSG) (Molloy et al., 2020).

By combining published databases with data from regional bibliography, historical maps and results of satellite imagery analyses, a more comprehensive database was built, seeking to unite historical data with more modern methodologies, gathering as much information possible for future research and comparative studies regarding LBA communities.

This presentation will focus on the construction of the database, from the choice of fields to be included, to the methods used, and how the results obtained were applied in several analyses, during my doctoral thesis, regarding settlement dynamics during the LBA. Future use by other researchers will also be addressed.

5 REGISTERING HILLFORTS IN THE CZECH REPUBLIC: A SIMPLE TOPIC WITH COMPLEX ISSUES TO SOLVE

Abstract author(s): Novak, David (Institute of Archaeology of the CAS, Prague)

Abstract format: Oral

Czech archaeology has a number of published inventories of hillforts and related sites. Although these are undoubtedly important works, they are collections of inconsistently structured information whose value for recording and research is limited. Even relatively new inventory works suffer from shortcomings, in particular incompleteness, problematic geographical delimitation of sites, confusions or issues on the theoretical level.

A few years ago, a comprehensive register began to be created within the framework of the Archaeological Map of the Czech Republic, which aims to offer an authoritative database of Czech prehistoric enclosures. There were included all archaeological sites that were at any point in the past (whether true or false) considered to be the remains of any type of prehistoric or early medieval hillfort or similar type of enclosure. This evidence thus includes a variety of site types ranging from Neolithic rondels, through Eneolithic ditch enclosures, Bronze Age and Iron Age hillforts or fortified upland settlements, to early medieval enclosures. It also includes objects that are mistakenly identified with hillforts (remains of field systems, vanished roads or mining traces, etc.), but which still appear in the literature and their existence has not been disputed.

All enclosures have been located with the greatest possible precision, delineated in GIS as polygons based on available data, incl. LiDAR, geophysics or aerial images, described in terms of recorded activity area types for specific archaeological periods and linked with references to sources. The database also includes information on the likelihood of the accuracy of the interpretation as a prehistoric enclosure and the state of preservation of above-ground relics. Each enclosure is given a unique identifier and the dataset is openly published in the AMCR Digital Archive (<https://digiar-chiv.aiscr.cz/>). The paper summarizes our approach, gives an overview of the contained data and points out theoretical and methodological pitfalls.

6 DATABASES ON PREHISTORIC AND MEDIEVAL FORTIFICATIONS OF ESTONIA

Abstract author(s): Valk, Heiki (University of Tartu)

Abstract format: Oral

Data on prehistoric and medieval fortifications of Estonia are presently stored in three different databases.

1. National Register of Monuments (National Heritage Board) – contains information on state protected sites: location, owner, legislative acts, monitoring, photos, digitized documentation.
2. Archaeological sites and place lore information system (ASPIS; Tartu University) – includes general archaeological information on all, also non-protected sites, both prehistoric hill forts (ca. 140) and medieval castles (ca. 40), and is presently linked to the National Register of Monuments. Its strengths are:
 - a) the map application which can present information based on selected criteria both on modern and historical maps, and
 - b) access to folkloric data (original texts in folklore archives).
3. Database of prehistoric hill forts (Tartu University) – contains detailed archaeological information on the sites (external features, fortifications, research history, bibliography, results, radiocarbon dates etc.).

In addition, data on excavation reports can be found in the databases of archaeological archives of Tallinn and Tartu universities and the National Heritage Board.

Trusting in co-operation with the National Register of Monuments has turned out to be a failure for ASPIS, because the status of sub-database within a poorly working bigger system does not enable any developments. The future task is to separate ASPIS from the register and to re-write it on an up-to-date and sustainable basis which would make it possible to communicate with other databases

7 KFD (KIEL FORTIFICATION DATABASE)

Abstract author(s): Nakoinz, Oliver (Johanna-Mestorf Academy)

Abstract format: Oral

In collaboration with external colleagues, The excellence cluster ROOTS (https://www.cluster-roots.uni-kiel.de/en?-set_language=en) works on a fortification database with a European scope. The database was started with the sites of the metal ages in South Scandinavia and North Germany and will be expanded in three directions: time, space information depth. This paper will describe the structure of the database and the reasons for choosing this particular solution.

The planning of the database takes into account the following requirements:

- simplicity
- low-maintenance
- openness.

The database needs to be rather simple in order to enable people to use the database. This requirement has to be balanced with the wish to include as much information as possible. The database is intended to survive the current excellence cluster and hence to work with low resources in an interoperable format. Low maintenance is mandatory for the project. Finally, the database is intended to fit reproducible workflows. This requires a certain openness and some specific technical features that must be identified.

The experience with several other archaeological databases led to the decision to shape this one differently from many others ones. First, we dispense with traditional database management systems in order to reduce the workload for maintenance and simplify long-term availability. This led to a git-based approach. Second, we concentrate on the denormalization of the database in order to increase the usability and reusability -in a FAIR approach- of the system. A system of a few very simple tables in combination with specific text-based data types allows a powerful application that requires minimal resources and is expandable.

609 MULTIDISCIPLINARY APPROACHES TO METALS: FROM ORE MINING AND METAL PRODUCTION TO THEIR IMPACTS IN HUMAN LIFE AND ENVIRONMENT

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Silva-Sánchez, Noemí - Armada, Xose-Lois (Institute of Heritage Sciences - Incipit, CSIC) - Meunier, Emmanuelle (CRBC, Université de Bretagne Occidentale; CReAAH, Université de Rennes) - López-Costas, Olalla (Ecopast, Cretus, Universidade de Santiago de Compostela) - Mighall, Tim (School of Geosciences, University of Aberdeen)

Session format: Regular session

The investigation of metals, from ore extraction to object production, has always been multidisciplinary. Understanding ore extraction requires knowledge of mining archaeology and geology; metallurgy utilises evidence from material sciences and chemistry, including isotopic analysis to provenance metal sources and to reconstruct technological processes; palaeoenvironmental approaches, through palaeopollution reconstruction, provide diachronic information on past mining and metallurgy and their impact on the landscape, and metal studies on human and animal remains provide a direct link with sociological aspects of metal use, medical treatments or cosmetics. The combination of these approaches enables a better understanding of the metal operational chain and the reconstruction of the human behaviours behind them. It also contributes to answering questions about the social interactions around metal production and exchange, regarding the weight of metal production in ancient economies, and in relation to the environmental and socio-economic imprints on territory, as well of their impact in human lives. Each specialist brings part of the story and articulating them all together can be challenging.

This regular session attempts to build a bridge among all the approaches frequently used for the study of metals. There are no geographical or chronological limits to the contributions although we welcome multidisciplinary approaches that encourage a wider view of the full metal operational chain and a reflection on the strengths and weaknesses of multidisciplinary approaches applied to the study of metals.

The type of questions we want to address in this session are for example: How the aforementioned approaches can be combined to gain a better understanding of the extraction and use of ancient metals? Do palaeoenvironmental and archaeological data share a common narrative? To what extent the information generated for geological surveys is useful for the study of ancient metals? What was the impact of metals on human health and in archaeological soils?

ABSTRACTS

1 MINING AND ORE-PROCESSING BONE TOOLS: KARTAMYSH VS. GREAT ORME

Abstract author(s): Zagorodnia, Olga (The British Museum)

Abstract format: Oral

We present the preliminary results of a comparative analysis of bone tools of Kartamysh (Eastern Ukraine) and the Great Orme (North Wales, UK) copper mines of the Bronze Age.

The Kartamysh archaeological area was exploited during the Late Bronze Age (XVI-XIII BC) according to Eastern European chronology. The peak of active exploitation of the Great Orme copper mines falls within the same period.

The research methodology included, firstly, a visual study of tools in order to reconstruct the technology of their manufacture, and secondly, the observation and microphotography of manufacturing and use-wear traces using mi-

crossscopes. Experiments were carried out to verify the functions of archaeological bone tools using similar replicas in a variety of operations.

The categories of tools considered here were those used for mining and ore-processing.

This research study resulted in the identification of a new, previously undiscovered functional type of bone tool. They are made from ribs, scapulae, and tubular bones. Their use was for stirring and sweeping ore pieces in gravitational processing. Before now, it had been assumed that these tools had been used for leather-processing and ore extraction only.

We also identified a type of peculiar wedge made from tubular bones, and also scoops made from animal scapulae and pelvic bones thought to be used for raking ore.

Similar tools have also been found in the other Bronze Age mining areas in Europe – Kargaly (the Urals, Russia) and Schwaz/Brixlegg (North Tyrol, Austria).

The database on deformation and use-wear traces is now suitable for comparing the tools in general, and their individual parameters with similar ones of other mining complexes in prehistoric Eurasia specifically. The bone industry of Bronze Age miners is distinguished by a special selection of bone blanks. The differences are clear at the level of the totality of different types of tools.

2 IRON PRODUCTION IN BRITTANY (FRANCE): IN SEARCH OF A FORGOTTEN INDUSTRY

Abstract author(s): Le Carlier de Veslud, Cécile (UMR CReAAH / CNRS) - Gandini, Cristina (Centre de Recherche Bretonne et Celtique) - Clouin, Etienne (Université Rennes 2 / CReAAH) - Menier, Emmanuelle (Centre de Recherche Bretonne et Celtique)

Abstract format: Oral

The Armorican Massif is a region particularly rich in iron ores, that have been exploited at least from the 6th century BC, and until the 20th century. This iron production, especially in the pre-industrial stages, is still poorly known and under-estimated. A wide synthesis of existing data, together with new researches on significant areas in Brittany, has been initiated in 2021. The records are integrated in an online collaborative database. This survey allows to investigate different aspects of ancient iron production in this region, thanks to an approach coupling geology, archaeology and archaeometry.

The mapping of metallurgical sites indicates which territories produced iron and points out the major ones, covering different periods. The chemical characterisation of slags and ores aims to provide data about the circulation of iron. Absolute dating, still rare, allows to investigate the evolution of the technical processes and the continuity or ruptures of the production in the main sectors.

The long-term objective is to reconstitute the history of the ironmaking production in Brittany, from the beginning of the Iron Age to the end of the Middle Ages, and to take the results into account when discussing the component of regional economies at these periods.

3 LINKING METAL PRODUCTION AND ENVIRONMENTAL ARCHIVES IN THE ATLANTIC LATE BRONZE AGE

Abstract author(s): Armada, Xose-Lois (Institute of Heritage Sciences - Incipit, Spanish National Research Council - CSIC) - Silva-Sánchez, Noemí - Faro, María G. (Institute of Heritage Sciences - Incipit, CSIC) - Montero-Ruiz, Ignacio (Institute of History, INCIPIT, CSIC)

Abstract format: Oral

The production and circulation of metals have traditionally been an essential element in the analysis of the social processes of recent Prehistory. In recent years, notable advances have been made in fields such as mining archaeology, isotopic geochemistry or the inventory and archaeometric characterization of metal artifacts and other material evidence linked to their production. These approaches contribute to clarify the chronology and scale of metallurgical production and reconstruct metal circulation networks, obtaining a more refined perspective on the role of metallurgy in prehistoric communities.

In this contribution we explore the possibilities of combining these approaches with other proxies that are less common in such integrated perspectives: the hoarding of metals and the palaeopollution linked to mining-metallurgical activities.

The hoarding of metals was a widespread phenomenon in later prehistoric Europe and particularly intense in the Atlantic façade of the continent. The nature and scale of this phenomenon varies depending on chronology and geographic area, but the suitability of hoards for periodisation and quantification offers an opportunity to link the cycles of metal hoarding to the palaeoenvironmental records of atmospheric pollution caused by mining and metallurgical activities. While palaeopollution studies using peats and other environmental archives are making a substantial contribution to

our understanding of the chronology and intensity of ancient mining and metallurgical activities, their connection to the hoarding cycles has never before been explored. In line with a similar study carried out recently for the Roman period (Silva-Sánchez and Armada 2023), this paper offers a critical review of research on prehistoric metal pollution in the Atlantic European Prehistory, exploring to what extent it is possible to combine and refine this information with that offered by mining archaeology, isotopic characterization of mineralizations and the study of metal hoards.

4 TOWARDS THE SOURCES OF TIN AND COPPER OF THE CENTRAL ASIAN BRONZE AGE: NEW EVIDENCE FROM ISOTOPIC AND CHEMICAL ANALYSES

Abstract author(s): Berger, Daniel (Curt-Engelhorn-Zentrum Archäometrie Mannheim) - Kaniuth, Kai (Ludwig-Maximilians-Universität München) - Boroffka, Nikolaus (Deutsches Archäologisches Institut Berlin) - Kraus, Steffen - Wittke, Andreas - Pernicka, Ernst (Curt-Engelhorn-Zentrum Archäometrie Mannheim)

Abstract format: Oral

Comparatively little is known about the copper and tin sources in Central Asia that were exploited by the Andronovo culture and the Oxus civilisation during the Bronze Age to make bronze. To shed light on this aspect, almost 100 bronze artefacts from the Middle Bronze Age to the Early Iron Age were examined through a combined analysis of the chemical and isotopic composition. Trace element patterns and the isotopic compositions of lead, tin and copper were determined from the objects supplemented by tin isotope analysis of Central Asian tin ores. The data shows that the Andronovo and Oxus populations used different mineral resources in the early stages of the Bronze Age, when the Oxus civilisation obtained copper from polymetallic (tin-bearing) deposits in Iran (Deh Hosein, Nakhlak/Bagh Gorogh) and possibly Afghanistan, while the Andronovo culture mainly used copper from the southern and middle Tian Shan Mountains. With the transition to the Late Bronze Age II, a change in the material basis can be recognised, in which the Oxus people increasingly accessed metal deposits in the Andronovo territory. The most important finding in this respect is the evidence of copper and tin from the polymetallic copper-tin deposit at Musiſton. The Musiſton mines supplied both cultures with a “natural” bronze, which accounted for about a third of all objects studied. The artefact data indicates a decline in the exploitation of the Musiſton mines in the course of the Early Iron Age, while other copper and tin sources in the Tian Shan and probably the Hindukush (tin) came into use. This testifies to the intensive use of the rich mineral resources of Central Asia and beyond, as well as to intensifying cultural and trade contacts between Andronovo and the Oxus civilisation. The talk presents the result of the interdisciplinary case study.

5 THE IBERIAN TIN PROJECT: A PLURIDISCIPLINARY APPROACH TO ANCIENT TIN PRODUCTION IN WESTERN IBERIA

Abstract author(s): Meunier, Emmanuelle (CRBC, Université de Bretagne Occidentale) - Fonte, João (Department of Archaeology and History, University of Exeter; CHAM, School of Social Sciences and Humanities, NOVA University of Lisbon) - Rodrigues, Alexandra (VICARTE, School of Sciences and Technology, NOVA University of Lisbon) - Dias, Filipa- Lima, Alexandre (Department of Geosciences, Environment and Spatial Planning, Faculty of Sciences, University of Porto) - Silva, Rui (CENIMAT/i3N, School of Sciences and Technology, NOVA University of Lisbon) - Comendador Rey, Beatriz (GAAAT, Universidade de Vigo) - Figueiredo, Elin (CENIMAT/i3N, School of Sciences and Technology, NOVA University of Lisbon)

Abstract format: Oral

The question of ancient tin production is an old topic, but has recently gained a new impetus by being addressed by several research projects in Europe. The Iberian Tin project (PTDC/HAR-ARQ/32290/2017; PI: Elin Figueiredo) developed a multidisciplinary approach joining archaeological, geological and metallurgical domains aiming to contribute to a comprehensive vision of tin mining and tin-bronze production from Bronze Age to Roman period in Western Iberia. A combination of archaeological and geological surveys, a review of historical documentation, LiDAR and aerial imagery processing, analyses of metals and slags, and excavations were performed.

In the present talk a point of situation will be made based on the knowledge of ancient tin exploitation in Western Iberia before and after the Project, aided by the presentation of some case-studies developed in the last years. Emphasis will be made on the different inputs that each discipline was able to provide to the study, such as the kind of geological resources used for cassiterite exploration, the mining impacts in the landscape, ore smelting and metallurgical technologies to produce tin or bronze, and the (frequently overlapping) chronologies of these activities in some places.

6 DIVINE METAL? SACRAL ASPECTS OF LATE BRONZE AND EARLY IRON AGE SWORDS IN SOUTHERN COAST OF BALTIC SEA

Abstract author(s): Wojtecki, Jakub (Nicolaus Copernicus University in Toruń)

Abstract format: Oral

Bronze metallurgy and bronze artifacts themselves held huge significance in religious life of their users. That includes also weaponry, especially new invention of bronze age - swords. Their presence in hoards on one hand, and finds of swords in rivers, lakes, swamps and peatbogs on other hand suggests that they were important element of religion and rituals.

Assuming, that worldview of southern coast of Baltic sea region connected with Lusatian culture was dominated with religion and mythology we see, that every aspect of human life, including perception of artifacts, was highly sacral. Metallurgy required not only professional skills but also contact with supernatural powers. Process of turning ore, gathered from beneath the ground, transformed to liquid by fire, into hard and shiny item bore the hallmarks of divinity.

Metallurgy, just like other prehistoric crafts held many taboos and rules. Breaking them would make produced item useless and bring wrath of the gods. That's why every aspect of analyzed artifacts such as ornaments, decorative elements, shape and place of deposition is important for their makers and users, and every one of them holds symbolical significance. To understand meaning of metal items in late bronze and early iron age we should focus not only on their utilitarian meaning, but also on their hidden meaning.

To reconstruct some religious aspects of metallurgy and manufacturing of weapons, we need to analyse known indo-european mythological systems and compare them with archaeological sources and their attributes and place of deposition. Together they can build an image of sacral meaning of bronze.

7 THE QUEST FOR METAL SOURCES OF THE NORDIC BRONZE AGE AND THE ORIGINS OF THE EARLIEST BLADES: A MULTI-PROXY APPROACH

Abstract author(s): Cornelis, Bart - Wittke, Andreas - Berger, Daniel (Curt-Engelhorn-Zentrum Archäometrie)

Abstract format: Oral

The early Nordic Bronze Age (NBA period IB; 1600 – 1500 BC) is considered as the breakthrough of bronze metallurgy, which is demonstrated by an increased metal consumption and the appearance of refined bronze artefacts in regional styles. Examples of these artefacts are the blades of the Sögel, Wohlde, Baven and Harburg type, which belong to an independent cultural group in northern Germany and southern Scandinavia during the NBA IB. These blades appear without local precursors, and are often regarded as imports from Central and southeast Europe, but sometimes also as indigenous inventions. However, archaeometric analyses to support such claims are still lacking.

In this talk, we present the first results of an interdisciplinary project that aims to determine the chemical composition and lead isotope ratios as well as for the first time, the tin and copper isotope values of ca. 300 objects of this well-defined group of artefacts. The intention is to examine whether the chemical and isotopic signatures can distinguish between a typology of form and a typology of materials. Moreover, by applying statistical methods and mathematical models, the multi-proxy data should be checked for possible correlations and other systematics. In so doing, metal groups and mixtures of copper types or bronze batches will be identified, which helps to understand the origin of raw materials, relationships between blades and identify potential imports or production centres. Early results of the chemical and lead isotope analyses indicate that the majority of the blades consists of low-impurity copper of chalcopyrite quality that correspond to the Alpine Mitterberg, but there are equally objects that were produced from Slovakian copper ores or mixtures of different ore types. These results provide important insights into trade networks and the provisioning of raw materials, and will be assessed statistically in the future along with further data.

8 TRACING THE EMERGENCE AND EVOLUTION OF IRON TECHNOLOGY IN THE NETHERLANDS DURING THE IRON AGE AND ROMAN PERIOD

Abstract author(s): Valk, Meike (University of Leiden)

Abstract format: Oral

In the present study, the author undertook an investigation into the initial use and production of iron in the Netherlands, with a particular focus on the Iron Age and Roman period. While extensive iron production was observed in the Middle Ages, there remains a dearth of knowledge about earlier iron production in the region. Although evidence of iron use can be traced back to the Middle Bronze Age, there is a lack of conclusive evidence for iron production during the Iron Age, in contrast to other regions in Europe. Scholars have proposed that iron was imported during this period, with smelting only beginning in the Roman period, but little is known about this era too. Given these gaps in the current understanding of iron use and production, this study centered on the use of iron and bronze during the

Iron Age and aimed to trace the development of iron use over time. The study then examined iron production during both the Iron Age and the Roman period, exploring the extant evidence.

The findings of this investigation indicate that, during the Iron Age, while bronze was primarily employed for ornamental purposes, iron was subject to greater experimentation. Regarding iron production, the study revealed that the locations of iron production artifacts and features showed clear alignment with the presence of resources. Ultimately, this study was able to offer a broad reconstruction of the development of iron use and production in the Netherlands during the Iron Age and Roman period.

9 LEARNING FROM ARCHAEOLOGY? THE EUROPEAN GREEN DEAL AND COPPER

Abstract author(s): Civilyte, Agne (Lithuanian institute of History)

Abstract format: Oral

My presentation will undertake a brief review of the methods used in the Material, Natural, Engineering Sciences, and Archaeology to reconstruct the development of technologies and environmental practices, with a focus on ancient metal alloys. The expansion of ancient human industrial activity (including mining, smelting, and synthetic compound creation) has caused an exponential increase in the amounts of heavy metals released into the atmosphere, water, and soil.

This presentation shall follow the idea, that we need to reflect on the many harmful substances people used during the mass production of bronze, what kind of vapors or fumes they inhaled, and how dangerous it was for their health.

I will discuss the toxicity of metals in the Copper and Bronze Age, while also mentioning the effects of other harmful substances on the human body. In this context, I aim to show that new archaeological discoveries allow us to understand more precisely the conditions in which people of the past lived, and to challenge us to understand the solutions they used to cope with these problems.

Last but not least, the identification of ancient technologies can inform modern engineering about how to reduce the quantity of toxic metals in modern mining and metal production.

10 POLLUTEDPAST AND ROMANS

Abstract author(s): López-Costas, Olalla (Area of Archaeology. EcoPast- Universidade de Santiago de Compostela)

Abstract format: Oral

Environmental metal pollution is a threat to human health. Roman times are considered one of the most polluted periods in South Europe preindustrial history. People suffered from this contamination in a way that is difficult to assess today, as well as the legacy that it has left. Many archaeological human remains from the time are notable for their elevated lead levels. It has been said that much of the metal pollution was due to intensive mining and metallurgy. However, other researchers suggest that urban areas, highly dependent on the use of metals, were the most polluted (i.e., due to lead pipes). Much has been written about the heavily lead-contaminated Roman world, but the scientific literature is full of clichés. Reviewing and reflecting on the continuity or disruption with the Iron Age pollution is the objective of this work, as well as the scope of this contamination and its relationship with the power of elites through the exploitation of resources and its cost in health of average people. The target area will be the Iberian Peninsula, which is considered an area with intense mining and metallurgy, and great urbanization at the end of the imperial period. The target people will be skeletons belonging to average people, including children and women. These considerations are part of the start of the PollutedPast (ERC) project, which will try to reveal the impact of metal contamination in Europe in the Roman and medieval periods.

11 A EUROPEAN PERSPECTIVE ON ROMAN METAL POLLUTION AND THEIR LINKS TO THE ARCHAEOLOGICAL EVIDENCE

Abstract author(s): Silva-Sánchez, Noemí - Armada, Xose-Lois (INCIPIT-CSIC)

Abstract format: Oral

One of the major changes related to the expansion of Roman rule across Europe was related to the intensification of the exploitation and use of metals. The scale of this phenomenon was so big that the pollution signal has been recognised to occur even at a hemispherical level. However, establishing the local narratives behind this broad phenomenon is still problematic due to the inherent limitations of mining archaeology and palaeoenvironmental approaches. This paper offers a systematic review of metal palaeopollution records from ice, lake sediment and peat cores located in Europe and Greenland. Of the 89 cores reviewed within this work, 81 showed a discernible characteristic lead peak in Roman times. Of those, 44 were interpreted to reflect a macro-regional (hemispherical) pollution signal, another 22 as resulting from a local pollution source, and 6 showed contrasting evidence pointing towards both regional and local sources. Some of the local signals were identified by a lead isotope match with local ores, but in more uncertain cases the interplay between palaeoenvironmental and archaeological work was essential in order to attribute a local origin to

the detected pollution trend. From this review, we conclude that the principal limitations in mining archaeology (establishing a chronology) and palaeopollution reconstructions (determining a source) can be overcome by considering in conjunction with the information provided by both approaches.

12 PROVENANCE STUDY ON COINS MINTED AT VELIA (ITALY): PB ISOTOPE AND ARCHAOMETALLURGY

Abstract author(s): Ercoles, Isabella (Università degli Studi di Roma LA SAPIENZA; CHNet - Cultural Heritage Network, LNGS-INFN) - Nisi, Stefano - Marchegiani, Francesca (CHNet - Cultural Heritage Network, LNGS-INFN) - Carbone, Federico (Università degli Studi di Salerno, DISPAC) - Trincherini, Pier Renato (LIMS, LNGS-INFN)

Abstract format: Oral

Lead concentration and isotopes of 20 Athena/Tripod bronze coins from Velia, a Greek colony in Italy, have been analyzed by ICP-MS and TIMS at the Laboratori Nazionali del Gran Sasso (INFN).

The coins, dated to the 1st century BC, are part of a broader project promoted by the University of Salerno that won the 2019 Art Bonus Competition.

Determining Lead isotopic ratio of these coin samples (to assign/identify a reliable metal provenance) and investigating the geochemistry of the mining districts, to understand the role played by low-value coins at Velia are the main targets of this research. Lead concentrations range from fractions to tens of percentages. Lead and other trace elements data suggest that the raw materials used for the coins came from different mines. Lead isotopic ratios span from 0.836 to 0.837 and from 2.076 to 2.082 for $^{207}\text{Pb}/^{206}\text{Pb}$ and $^{208}\text{Pb}/^{206}\text{Pb}$, respectively. The lead isotope results were compared with lead isotope data published of ore deposits from Mediterranean areas (Spain, Italy, Greece, and Cyprus) to fingerprint the sources of the Velia bronze coins. Almost half of the coins fall into the clusters of Spain and Tuscany, whereas only a few samples are compatible with Sifnos in Greece (four coins) and Bosa Area in Sardinia and/or Troulli mine in Cyprus (two coins).

At last, six coins cannot be associated with any known source; this suggests the possibility of extensive metal recycling. Regarding the Spanish provenance, Velia coins overlap the cluster of South-East Spain, corresponding to the Cartagena-Mazarron mine. This information, integrated with archaeological and historical ones, helps to reconstruct the trade routes and socio-economic relationship of the city of Velia.

13 SUPER TOTA ARTE RAMIS. A MULTIDISCIPLINARY APPROACH TO THE STUDY OF ANCIENT MINING LANDSCAPES IN THE COLLINE METALLIFERE (TUSCANY, ITALY)

Abstract author(s): Dallai, Luisa - Volpi, Vanessa (University of Siena)

Abstract format: Oral

The Colline Metallifere mining district (Southern Tuscany) has been a privileged study area of Italian mining archaeology for many years. The presence of important polymetallic deposits has strongly oriented the economic, political and social development of the territory, connecting it to wide commercial circuits. During the Middle Ages, these mining resources became a strategic asset controlled by public power, aristocracies, and finally by the municipal authority (Benvenuti et al. 2014). Between 2015 and 2020, thanks to the ERC Advanced nEU-Med project, coordinated by the University of Siena (<https://www.neu-med.unisi.it>), a multidisciplinary approach to the study of the ancient productive landscape has been greatly boosted, through an effective dialogue between environmental sciences (environmental chemistry and geochemistry), archaeology (mining archaeology, archaeometallurgy, landscape archaeology, remote-sensing techniques), and the study of important mining archives. This multidisciplinary approach resulted in a multiscale operational protocol applied in different contexts of analysis, at site and territorial scale, which obtained a significant increase in useful data for the reconstruction of the historical production landscape and its interaction with the present environment (Dallai, Donati, Volpi 2018).

14 SILVER MINING IN THE MIDDLE AGES: TRANSFER OF TECHNOLOGIES, IDEAS AND ORGANIZING STANDARDS ACROSS EUROPE

Abstract author(s): Minvielle Larousse, Nicolas (Ecole française de Rome; Aix-Marseille Université, LA3M, UMR 7298) - Hrubý, Petr (Masaryk University)

Abstract format: Oral

At the turn of the 1300s, European silver production began a long decline. Local crises followed and regional declines were announced after a century of peak production during which the deposits of most European mountains were exploited, their surroundings colonised, techniques proved and regulations stabilised. The gradual depletion of the deposits that had made some areas rich led technicians to innovate in order to process poorer or more scattered ores, and administrators to change their methods of regulating production. From one region to another, solutions were experimented with and sometimes exported with the movement of workers, technicians, investors or the expansion of power. Europe was a vast laboratory.

This paper takes an interdisciplinary and comparative approach between history and archaeology, focusing specifically on two major silver-producing regions in the Central Middle Ages: Iglesias in Sardinia and Jihlava in Bohemia. The objective is to demonstrate how silver companies were structured during times of resource abundance and how they responded to the gradual depletion of deposits. The study will first examine the norms and practices related to mining concessions, including their conception, establishment, and maintenance. It will then explore the choices made in the organization of the production process, including mines, mineralurgical and metallurgical workshops. Finally, it will analyze how these aspects were linked to land occupation, including temporary housing near workshops and urban centers founded by settlement policies.

15 MEDIEVAL SILVER PRODUCTION AND ITS IMPACT ON THE ENVIRONMENT AND SOCIAL STRUCTURES: MULTIDISCIPLINARY APPROACHES

Abstract author(s): Hrubý, Petr - Milo, Peter - Tencer, Tomáš - Vágner, Michal (Masaryk University of Brno)

Abstract format: Oral

Authors: Petr Hrubý, Peter Milo, Karel Malý, Petr Kočár, Libor Petr, Tomáš Tencer and Michal Vágner

The communication will highlight two the most archaeologically visible impacts of medieval production of silver – the essential coinage metal and blood in the veins of economies in the “Old World”. The first was the environmental impact, which was followed by drastic deforestation and contamination of soils with heavy metals. The second was the establishment of settlements of miners and metallurgists by the mines. These settlements, in all respects different from villages or towns, were short-term and temporary, but at the time of the first historically documented boom of silver production in the Kingdom of Bohemia in the 13th century, they represented a not inconsiderable part of cultural landscapes. The topic will be presented on several archaeological examples from the Central Bohemian Highlands (CZ), where multidisciplinary research, containing archaeological excavations followed by large-scale magnetic survey and geochemical as well as archaeobotanical approaches, has been advanced over the last 20 years.

16 MULTIDISCIPLINARY APPROACHE ON A MEDIEVAL ORE MILL: ENERGY MIX AND DIGITAL TWIN

Abstract author(s): Maqueda, Florence (Sorbonne University, UMI 209 UMMISCO; Laboratoire Archéomatériaux et Prévision de l'Altération LAPA - IRAMAT UMR7065, NIMBE UMR3685, CNRS, Université Paris-Saclay) - Florsch, Nicolas (Sorbonne University, UMI 209 UMMISCO; Sorbonne University, UMR 7619 METIS) - Téreygeol, Florian (Laboratoire Archéomatériaux et Prévision de l'Altération LAPA - IRAMAT UMR7065, NIMBE UMR3685, CNRS, Université Paris-Saclay)

Abstract format: Oral

The comminution of ores is an important step in the metal operational chain. The ore mill is used to homogenise the granulometry of the ore. There is an intuitive understanding of how a mill works. However, there is little quantitative data on its performance. Yet, those data provide valuable insight into the technical, social and economic decisions of a mining company.

As described by Agricola in the *De re Metallica* (1556), there are several sources of energy to move an ore mill: human, animal or hydraulic. Within the hydraulic systems themselves, there are a number of different types of wheels: horizontal, overshot and undershot. Each of the only three ore mills excavated in Europe for the Middle Ages had a different type of hydraulic wheel. This suggests that the choice of a type of actuator is not only related to its performance but it has to do with the local energy mix, the environment and social choices.

Using data of one of the three examples in Europe (Castel-Minier, second half of 14th c.), we have been studying energy flows in ore mill through a multidisciplinary approaches. It allowed us to have quantitative data about the system's performance depending on environmental parameters. During this study, we used a combination of physical models,

experimental archaeology and analysis of textual and archaeological sources. A digital twin of the ore mill was created from those data. It is only through the multiplicity of these approaches that we have been able to integrate energy flows into the understanding of a medieval operational chain.

610 NEW WAYS OF TELLING THE HISTORIES. NEW METHODS OF DISSEMINATION OF ARCHAEOLOGY AND HERITAGE

Session theme: 3. Heritage Narratives and Representations

Session organisers: Loy, Aida (Independent Researcher) - Martínez Espinosa, Isaac (Universidad de La Rioja; Instituto de Estudios Riojanos) - Larrauri Redondo, Sergio (Instituto de Estudios Riojanos)

Session format: Regular session

Sharing the different tasks carried out by archaeologists and cultural heritage professionals is one of the most important parts of those works. If something is not shared, it is as good as if it had not been discovered. In light of these ideas that we would like to organize this session, inviting professionals from any field to share their experiences on sharing with stakeholders in non-traditional methods. For us, we think of traditional methods of sharing with stakeholders where the only communication came from the professional rather than keeping an open dialogue among the different groups.

We would like to share and explore different non-traditional methods that have flourished in these past years. From video games, 3D models or social media profiles to less digital ones such as dialogues with stakeholder groups, volunteer days or festivals around the heritage. We think that it is through the use of these new “non-traditional” methods of sharing the heritage that we can bring stakeholders to be involved in the heritage, creating a more protective and informed community around it. Again we would like to invite professionals from any field that is interested in sharing the heritage and the archaeological work in new ways to share their work with us and create a space where new ideas can start.

ABSTRACTS

1 'DO YOU GET PAID FOR EVERYTHING YOU FIND?' - NAVIGATING ARCHAEOLOGY AND SOCIAL MEDIA IN ESTONIA

Abstract author(s): Reppo, Monika (University of Tartu; Estonian Association of Archaeologists)

Abstract format: Oral

What started out as a way of offering COVID-safe tours of archaeological sites to an island community in Estonia during the European Archaeology Days in 2020 via YouTube, grew into an experiment on different social media platforms. With only 1.1 million Estonian speakers, learning about archaeology and heritage through social media in one's native language can be a challenge; even more so from an actual archaeologist or heritage specialist. This paper reflects on my personal experience as a PhD candidate and full-time archaeologist in using social media platforms (YouTube, Twitter, Instagram and TikTok) to share research results and engage with larger and smaller communities to build interest in local history. Am I able to produce informative and captivating content that does not rely solely on sensationalism? What makes or breaks a post's engagement when the goal is to involve the community in a dialogue about the past and heritage? Less digital forms of direct communication, media interest, job shadowing, reactions of the local and scientific community – this paper will address the challenges and outcomes of sharing archaeology on social media in Estonian.

2 TELLING THE TALES: LOOTED PODCAST

Abstract author(s): Kontes, Zoe (Kenyon College)

Abstract format: Oral

Looted, a narrative podcast series, provides context for objects that have been removed from the ground without proper excavation. Each episode uses the story of a specific artifact or group of artifacts from the ancient Mediterranean world to explore a larger topic, such as the looting of archaeological sites; forgeries and the science behind determining the authenticity of classical artifacts; and repatriation of looted objects. Looted also includes interviews with archaeologists and museum curators. The aim of the podcast is to help curtail the plundering of antiquities by contributing to education on these issues. It is a widely accessible means of disseminating scholarly research-based information about antiquities trafficking to an increasingly audiophile public. A story about a gold wreath smuggled internationally inside a watermelon draws listeners in with a formula like that of “true crime”, encouraging them to think more about cultural property, and who “owns” the past. In the continuing battle for the preservation and protection of

the world's cultural heritage, public opinion can make a difference. Informing public opinion can, as history has shown, translate ethical thinking into policy and legislation.

3 MASTERS OF THE ASTURIAN HÓRREO

Abstract author(s): Rodríguez, Fernando (Asociación del Hórreo Asturiano)

Abstract format: Oral

This project was developed with funding from the Ministry of Culture of Spain.

In this communication we will learn about the asturian hórreos, the traditional construction techniques, the work of the artisans who keep the tradition of their restoration and how we developed the project recording the documentary *Maestros del Hórreo Asturiano*.

The dissemination of these techniques and the recognition of this trade, as well as that of the granaries themselves as a traditional structure and as a symbol of a way of life, such as that of the Asturian rural world, is a duty that has not always been fulfilled as it is due, for which we consider the work we have done very necessary, taking a look for the first time at the immaterial wisdom that surrounds these elevated wooden structures that are part of our roots and that have much to contribute to the present of the region.

During the making of the recordings, we delve into the workshops of these wood craftsmen, documenting the traditional techniques and building a part of the Asturian granary with each one of them, from the *pegollos* (supports) to the roof tiles.

Another of the most important things in carrying out this project was also knowing and making visible the traditional trade of the blacksmith. A job that has been passed down for generations and that today reaches the few remaining *horreros*.

Not only did the techniques and the trade itself surprise us, but we also found people of exceptional human quality who resist being the guardians of the construction techniques of the Asturian granaries and *paneras*, and therefore a piece of our history that we do not want to disappear.

4 STEPPING OUTSIDE THE IVORY HALL - LOCAL GUIDES AS RESEARCH DISSEMINATORS

Abstract author(s): Magin, Elisabeth (Kulturhistorisk Museum, UiO)

Abstract format: Oral

Bergen, Norway, can boast a wild and varied history reaching back to the year 1070, when the last Viking king of Norway, Ólafr kyrri, allegedly founded the town. In addition to historical buildings like Håkonshallen (built by Håkon IV Håkonsson between 1247 and 1261), Bergen is also world-famous for the UNESCO world heritage site Bryggen, the single remaining Hanseatic kontor. Bryggen was also the site where one of the largest medieval town excavations took place between 1955 and 1979, yielding hundreds of thousands of finds, now displayed in the Bryggens museum right next to the Church of Saint Mary's.

Håkonshallen, Saint Mary's and Bryggen all make their appearance in written sources from the Middle Ages, most prominently in the Norwegian Kings' sagas, detailing the Civil War kingship struggles ending only with the reign of Håkon IV. Local guides in Bergen are trained up specifically to relay the history of these historical landmarks to the thousands of tourists visiting Bergen each year, and the local tourism industry is one of the major stakeholders in any decisions concerning the cultural heritage sites in the area. However, post-training, further research and reading remains the single guide's responsibility. Especially new guides also struggle with choosing the most relevant and at the same time most interesting aspects of any given site for the groups they guide.

This paper attempts to reflect on roughly 10 years of trying to balance being a guide while also actively conducting research on the Bryggen excavations, and explores the potential of new knowledge exchange networks to facilitate meetings between researchers, university students and local guides and, ultimately, research dissemination.

5 POURBUS TROUBADOUR: LIVING ROOM LECTURES ON LANDSCAPE ARCHAEOLOGY

Abstract author(s): Trachet, Jan (Ghent University)

Abstract format: Oral

The research project *Painting/Mapping the medieval Landscape* used a landscape-archaeological perspective to study the medieval landscape around Bruges as depicted by Pieter Pourbus. The *Map of the Liberty of Bruges* (1561-1571) depicts the urbanised coastal hinterland of Bruges at the end of its late medieval economic heyday. With an unprecedented level of both detail, Pourbus meticulously reproduced the coastal countryside with indication of cities, towns, houses, dikes, roads, waterways, etc. The resulting map is a unique depiction of the late medieval landscape northeast of Bruges before it was radically transformed by the Eighty Years War.

After studying the map from the desktop, I launched for two years in a row ‘Pourbus Troubadour’: a one-week tour combining field observations with science communication. During the day, I cycled over predominantly medieval roads as depicted on the map, and visited already identified archaeological sites. In the evening, I gave living room lectures to local hosts who offered me board and lodging in return. The hosts could invite whoever they wanted: family, friends, neighbors, ... This concept proved to be a very successful way (1) to submerge yourself as a researcher in the map, area and landscape you study; (2) to communicate your research and the regional history to the local communities in which you work; (3) to make use of network/audience you would otherwise have never reached; and (4) to increase the impact of your communication through its small scale and the proximity of your audience. As ‘Pourbus Troubadour’ was awarded internationally and praised for its innovative way of science communication, I will argue that many researchers studying historical maps, landscapes or archaeological sites can and should engage in suchlike projects. Therefore, I will also give an insight in the do’s, don’ts and logistics to organise Living Room Lectures.

6 HOW AUDIO EXPERIENCES MAY ENHANCE VISITOR EXPERIENCE OF HERITAGE SITES

Abstract author(s): Lillak, Anu - Kaldre, Helena (Estonian National Heritage Board; Guidio) - Kurisoo, Tuuli (Tallinn University; Guidio) - Tint, Küllike (Tallinn City Museum; Guidio)

Abstract format: Oral

Archaeological heritage is at risk mostly due to people not recognising either the found archaeology or its value. In May 2022, Heritage Hackathon took place in Viljandi, Estonia. The discussions led to common understanding that archaeology and other heritage sites should be more visible and there should be more information in captivating form – something that would bring people on site, engage and educate the visitors. As the number of archaeologists and historians or their funding does not favour guided tours or placing information boards to every site, it was essential to find a new way to share the information.

In collaboration with archaeologists from different institutions and a history teacher, a form of phygital edutainment was created. We started creating engaging fact-based professionally staged audio experiences enhancing the visit of selected historical sites. The information can be accessed via web application anytime and anywhere. The first experiences are getting feedback and it seems we are on the right track.

In the presentation we are going to share our adventure from hackathon to a functioning service, the feedback and thoughts we have received on the journeys and from interviews with communities closely related to heritage sites.

7 DISSEMINATING THE HERITAGE OF PRE-ROMAN CULTURES IN SCHOOLS: THE SELECT PROJECT

Abstract author(s): Marchesini, Simona - Vizzino, Giacomo (Alteritas)

Abstract format: Oral

In the Erasmus Plus project SELECT – Self-Learning Atlas of Ancient European CulTures (www.selecteplus.it, KA201, 2020-2023), we aimed to bring the history, archaeology and epigraphy of the ancient world, especially the peoples before Rome (in Italy, Spain, France and Eastern Europe), into schools for informal learning about ancient peoples. The reconstruction and identification of a people is always a complex process in which different cultural aspects add up and alternate over time. This is why we thought of creating a multi-structured, interactive Atlas where everyone can build their map according to their curiosity but also according to their educational goals. The Map Generator tool is designed to allow access to navigation by recalling different cultural aspects - marked with different colours and signs - such as archaeological facies, inscriptions, alphabets, languages, mints, and sanctuaries. Teachers and students will be able to use the tool for teaching purposes. Still, the Atlas is designed to allow all citizens informal and entertaining access to knowledge about the ancient world and to question the processes of identifying ancient peoples built from different elements that change over time. The temporal dimension, usually reduced in current historical cartography, will be a crucial element, allowing the user to observe how the history of early Europe changed over the centuries in its features and cultural aspects.

8 NEW AND OLD METHODS OF HERITAGE DISSEMINATION FROM A SMALL REGION

Abstract author(s): Larrauri Redondo, Sergio (Instituto de Estudios Riojanos)

Abstract format: Oral

Archaeology and cultural heritage are undoubtedly a source of knowledge, social, educational, economic, research and tourism development. In this context, the role of archaeologists and cultural heritage professionals not only limited to research but also to the necessary dissemination and social utility of their work.

The arrival of the Internet and the development of Information and Communication Technologies (ICT) are changing our society with the continuous presence of digital technologies in all areas of our lives. Also in our way of accessing

and consuming culture, or of teaching and learning, enabling the creation of a community with greater sensitivity and recognition of its cultural heritage. A window of opportunity for heritage technicians

This proposal presents various initiatives carried out in a small region of Spain (La Rioja), small in size but with important heritage resources, for the dissemination and communication of heritage, where new and traditional methods coexist. For example: the use of different social networks and blogs with general news and content (written and visual) on cultural heritage, or on a specific site or heritage asset; the creation of 3D models; experimental archaeology workshops; guided visits by the technicians themselves during the development of their work; discussion tables; creation of cultural heritage content for children and young people; preparation of digital heritage catalogues for future publication in the network.

A new scenario for dialogue, exchange, scientific knowledge and participation, with other variables such as the possible role of cultural heritage and its new methods of dissemination for rural development.

9 EXPLORE THE HERITAGE OF THE PAST IN INFORMAL ENVIRONMENT. THE XFORMAL PROJECT

Abstract author(s): Michalowski, Andrzej - Sobkowiak-Tabaka, Iwona (Wydział Archeologii Adam Mickiewicz University Poznań) - Marchesini, Simona (Alteritas) - Siri, Anna (University of Genua) - Vizzino, Giacomo - Borghesani, Giuliana (Alteritas)

Abstract format: Oral

In xFORMAL, a MSCA RISE project (Grant Agreement Nr. 101008184, 2021-2025, www.xformal.eu), we have developed a new, informal method, to disseminate the cultural heritage of the past.

The project partner countries (Italy, France, Spain, Portugal, Poland and Finland) have developed real-life experience pathways in the landscape in search of monuments and other objects from the past, most of them contained in museums and archaeological parks. The routes are presented in the form of a game driven by a platform available on the mobile phone or tablet, thanks to which the player moves through the landscape, sees ancient cartography, explores museums and carries out tasks on single archaeological objects. The chronological frame covers the pre-Roman age, involving ancient populations that are usually neglected in the school curricula. The aid material for the game (help) consists of information about the ancient world and specific topics (writing, dead cult, religion) with emphasis on monuments with inscriptions (when available), where one can play with deciphering alphabets, reading some texts, identifying the function of an object or its original location. The framework of this real computer-supported experience is a narrative with a telling character, constructed in such a way that the user/player learns information about ancient culture, the value of artefacts, in a playful and progressive way, almost without realising that they are learning. The methodological background of this project is based on the knowledge that among the various forms of learning, the informal one, not conveyed by institutions or school environments, is responsible for 80% of our knowledge. Citizens of every age can explore not only their local environment and landscape, but also – as tourists – that of other European countries, where other peoples have lived before the Romans.

10 YOURS OR MINE? VIRTUAL TOOLS IN COMMUNICATION WITH DIFFERENT HERITAGE STAKEHOLDERS

Abstract author(s): Loy, Aida (Independent Researcher)

Abstract format: Oral

As heritage professionals we tend to look at heritage from a scientific and researcher point of view. But, heritage is much more to many other people: local communities, regional audience, different governments, tourists, other kind of scholars... The goal of this project is to become a tool (one of many possible) in an open communication between heritage professionals stakeholders and the other groups of stakeholders.

To reach our goals, the project is based in virtual models and reconstructions of several archaeological items and sites. Once created, the models were shared with different stakeholders as a first step on the communication project. After these first steps, the question we try to answer is how to keep that communication open and make it two way.

With this presentation we will show the start of this project and the expected ways to keep it growing, while at the same time, finding better ways to maintain an open communication among the diverse heritage stakeholders.

A. PERFORMING THE PAST: USING ANCIENT CRAFTS TO TELL THE TALES OF ARCHAEOLOGY AT HENGISTBURY HEAD, BOURNEMOUTH, UK

Abstract author(s): Delbarre, Gabrielle (Bournemouth University; Hengistbury Head Visitor Centre) - Scott-Pratt, Hayden (Bournemouth Christchurch Poole Council; Bournemouth University; Hengistbury Head Visitor Centre) - Russell, Megan (Bournemouth University; Hengistbury Head Visitor Centre) - Holloway, Mark (Bournemouth Christchurch Poole Council; Hengistbury Head Visitor Centre)

Abstract format: Poster

With over 12,500 years of continuous human habitation and use and over 1 million visitors annually, Hengistbury Head, Dorset, UK, provides an exceptional base from which to engage members of the public and demonstrate the value of shared heritage. This poster presents a new concept of public participation for the preservation and dissemination of internationally important local heritage through volunteer programmes and public events. The Hengistbury Head Visitor Centre (HHVC) opened its doors to the public in 2014, engaging visitors through traditional dissemination methods e.g., interpretation panels, films, and display cases. Following a 'volunteers and visitors' survey of their experience of HHVC which highlighted the desire for more hands-on activities and contact with archaeological specialists, the Performing the Past (PTP) project was born in 2019.

PTP (2019-2022) is a volunteer-led, reflexive project which has engaged in a 'ground-up' approach to heritage dissemination by enlisting local volunteers, training them in experimental archaeology and then enabling them as heritage communicators. This has been achieved through public, hands-on craft workshops and demonstrations focused on the different ancient crafts practiced at Hengistbury Head from the Upper Palaeolithic to the Iron Age. This has resulted in a legacy of trained volunteers who continue these events as part of museum practice at HHVC. The attendance of over 3,000 members of the public to workshops and events, over 10,000 visitors to a PTP project exhibition alongside testimonials demonstrates the success of this approach in reinforcing awareness, a sense of ownership of and over local heritage and the benefits of inter-generational inclusivity. A new project is being developed at the HHVC, building upon the foundations laid by PTP to explore the less tangible aspects of human life and cultural heritage and to explore the effect of participation in experimental archaeology on mental health.

611 HERITAGE GOES TO SCHOOL. THE IMPORTANCE OF ARCHAEOLOGICAL DISSEMINATION IN EDUCATION

Session theme: 3. Heritage Narratives and Representations

Session organisers: Espinosa, Isaac (Universidad de La Rioja) - Loy, Aida (Independent researcher) - Larrauri Redondo, Sergio (Instituto de Estudios Riojanos)

Session format: Regular session

During the last years archaeology has been widely introduced in schools. The need for a humanistic education and the importance of archaeology to understand the relationships between people, societies and their environment, have allowed a great development of heritage skills at basic educational levels. The main objective of this session is for the participants to expose different projects that are carried out in education for the dissemination of archaeology for schoolchildren and help train teachers in the field of archaeology, its dissemination and teaching it to students. Different points of view are welcome. From presentations based on basic projects in which a site is explained to new ways of exhibiting the many facets that archaeologists, teachers, disseminators and professionals can present to disclose archaeological assets to students. Participants in this session can discuss how they think such technologies can be used differently with different stakeholders. New points of view in the teaching of archaeology in education are welcome.

ABSTRACTS

1 THE DISSEMINATION OF ARCHAEOLOGY AND HERITAGE IN THE SCHOOL. THE EXAMPLE OF THE MENNAISIAN SCHOOL IN SANTO DOMINGO, LA RIOJA

Abstract author(s): Espinosa, Isaac (Universidad de La Rioja & Instituto de Estudios Riojanos)

Abstract format: Oral

Secondary education and high school are very important moments for the creation of synergies and sensitivities with respect to archaeology, sites, heritage and human sciences. Disclosing these aspects in the classroom is reflected in the medium and long term, creating awareness that seeks to care for their closest history, culture, heritage and archaeological assets.

In the case of the Mennaisian school in Santo Domingo de la Calzada, in La Rioja, in the north of Spain, a small school, in a small but important town, not only regionally, but also for the Camino de Santiago, carried out a project that has

its division in all the educational levels of the center. This disclosure will be exposed by approaching the different elements used for this, such as the use of files, new information technologies, visits and talks at sites and reproductions of archaeological tools and techniques. To do this, different techniques are used for cabinet and field work, such as the development of own files or resin reproductions.

All this seeks a better understanding of the objective by the students.

2 COMMUNITY ARCHAEOLOGY: A WAY FORWARD TO PROTECT OUR HERITAGE

Abstract author(s): Thakur, Renu (Panjab University)

Abstract format: Oral

The present paper studies the importance of the community archaeology in protecting our heritage for posterity. 'Community Archaeology' is not a new concept but is a fresh opportunity. We need to adopt it as it enriches archaeology. It helps us to see the past from a different perspective. The role of community is foremost in heritage preservation. The community however has to be trained to own the past created by the archaeologists. No doubt it is time consuming and challenging but this is the only way forward to preserve the past. Communities usually are of different mindsets and hence are unable to own different projects. At all stages of heritage conservation, the community should be actively involved to facilitate collaborations for dialogue and idea exchange between archaeologists and community participants. However, community archaeology has not been a popular approach in India. Through some case studies the author would try to show that how lack of community interaction is endangering our heritage. There is thus an urgent need to find innovative ways to connect to our communities.

3 EDUCATION OF THE PAST, PATH TO THE FUTURE

Abstract author(s): Borgia, Elisabetta - Venditti, Caterina (Ministry of Culture, Italy)

Abstract format: Oral

The social and identity value of cultural heritage is strengthened where communities are deeply aware of its potential as individuals and territories growth factor, and play an active role in the protection, dissemination and regeneration of CH.

Various actors have been working in this field through concrete actions, directed above all towards the youngest, moving progressively from a didactic axis to a wider educational one, with the aim to enhance individual development, reinforcing critical, dialogical, emotional and creative abilities, towards active citizenship skills.

Educational services in our places of culture have committed to connecting heritage, schools and communities, so that they can establish the framework of a social sustainability oriented to the themes of dialogue, accessibility and enhancement of everyone's cultural achievement.

In such a context, archaeological heritage plays a key-role, being the physical proof of the strong network "history-places-people". It discloses influences and contaminations that reconnect communities and inspire other possible narratives, giving soul, nerves and muscles to people who belong to the ancient past in which everyone find both his history and stories.

The most recent revolution of AI and its massive spreading in humanities is going to revolutionise the way we teach and learn, making education more accessible and customised, changing the approach to the research and the study of the ancient times, offering insights previously unavailable. The updated need to rethink and revise educational issues, encouraging critical and ethical reflection, concerns all the stakeholders, from the Government to the communities, passing through schools, teachers and citizens, exchanging views and purposes.

Starting from experiences carried out and looking to future outcomes, we aim to present the polyhedric panorama of educational projects involving archaeology and young people from the point of view of the Direction General for Education, research and cultural institutes of the Italian Ministry of Culture.

4 'THIS IS THE ONLY LEARNING I GET ALL WEEK' THE POWER OF ARCHAEOLOGICAL LEARNING IN (AND OUT OF) THE CLASSROOM

Abstract author(s): Barclay, Rebecca - Miller, Jane (Archaeology Scotland)

Abstract format: Oral

Within the heritage sector the benefits of archaeological learning are relatively well understood. Archaeology can tell stories from our shared past, including those of adaption, resilience, gender, religion and ethnicity, themes correlating with current educational priorities in Scotland - sustainability, diversity and global citizenship. It facilitates place-based outdoor learning and team working, through this improving health and wellbeing and social inclusion. Archaeology supports transferable skills development through inclusive and tactile approaches. Despite these benefits,

archaeology is not widely used in Scottish schools, there are no formal qualifications and teachers do not actively seek out archaeology resources and activities.

As Lead body for Aim 4 of Scotland's Archaeology Strategy – Encouraging Greater Engagement - the Archaeology Scotland learning team are working to change perceptions of archaeology in Scottish education. We do this through our learning programme, which includes keystone projects such as Attainment through Archaeology, a skills-based initiative for young people struggling to engage in mainstream education, and the Heritage Hero Awards, a wider achievement award for history, heritage and archaeology, designed to celebrate achievements in heritage projects and place them in the educational mainstream. Our projects are developed with the learner at their core, not bolted on to larger archaeology fieldwork projects but specifically designed for, and with, young people, creating positive outcomes for individuals and communities.

We oversee the Archaeology and Learning Working Group, a consortium of professionals from archaeology and education. The group work in partnership to promote archaeological learning in Scotland, through research, governance and capacity building with the provision of resources and Career-Long Professional Learning opportunities for teachers.

This presentation will introduce these key elements of our learning programme, and partnerships in turn. Highlighting the benefits, challenges, and potential for these in supporting the use of archaeology in Scottish schools.

5 INCORPORATING ARCHAEOLOGY INTO HISTORY SCHOOL TEXTBOOKS: CHALLENGES AND SOLUTIONS

Abstract author(s): Giovannetti, Chiara (Università di Roma La Sapienza)

Abstract format: Oral

Within the Italian school system, it is important to integrate archaeology into the history curriculum. The question is how to do this effectively. This study examines the representation of archaeology in elementary and middle school history textbooks in Italy, using a sample of books published between 1999 and 2021.

The study analyzed the mentions of archaeological research and findings in each book and analyzed the context in which they were referenced. The images of archaeological objects and sites were also preliminary analyzed to identify any issues.

According to the results, there appears to be both a quantity and quality problem with the representation of archaeology in Italian history textbooks. Archaeology is largely absent, and its presence is often limited to “artistic” and “special” findings or auxiliary content.

This has several negative consequences, such as depriving the history narrative of the material culture perspective, especially with regards to minority groups who produced little written documentation. Archaeology is also often portrayed as a “treasure hunt,” downplaying the need for study and expertise. Additionally, daily life objects are often ignored, making it difficult to discuss the relationship between people and their environment.

To address these issues, it is important to take responsibility for the data produced, as it will eventually appear in school textbooks. Making the data more accessible, not only through sharing it, but also by making it more “teacher-friendly,” is key. We are in need of new solutions that can be effectively integrated into the current school curriculum. One proposal that will be explored is the creation of an archaeological database that is linked to the emotional sphere.

6 HERITAGE EDUCATION – NEW EXPERIENCES FROM THE NETHERLANDS

Abstract author(s): van Oorsouw, Marie-France (Independent) - Schreurs, José (Cultural Heritage Agency of The Netherlands)

Abstract format: Oral

In The Netherlands, archaeology and heritage are not part of the regular curriculum in primary schools. Hunter-gatherers, farmers and Romans come along in history classes, but the way we get familiar with them and with their living world through research doesn't.

Teachers and schools with special interest in archaeology are positive exceptions. They make their own additions to the curriculum, helped by local museums, heritage volunteering groups and/or environmental education centres. Heritage organisations try to seduce more schools and teachers to address this theme by offering educational packages, workshops and guided tours. The initiative for creating such packages traditionally comes from the heritage organisation, though.

Lately, there seems to be a change going on: more and more requests for educational packages or workshops come from the side of the schools. This is a gladdening development, and hopefully incorporation of archaeology and heritage in the formal curriculum will be the next step.

This concerns mainly primary schools, but there is also a trend in disseminating heritage and archaeology to vocational training. Initiatives come from the Cultural Heritage Agency of The Netherlands and universities, preferably in collaboration with the training institutions themselves.

The Cultural Heritage Agency for example develops a course for students that will be involved in nature management, such as foresters. Having general knowledge of archaeology and heritage, they are better prepared for working with these phenomena in the field, and for recognising and protecting them. The University of Groningen shares the results of a research project on early Dutch animal husbandry with future farmers through an educational module. In this way they get aware of the choices that early farmers had to make and how they are similar to their own. In this paper, several examples of archaeology and heritage education in The Netherlands will be discussed.

7 ARCHAEOLOGY LEGACY: DESIGNING A DIGITALLY INNOVATIVE EDUCATIONAL RESOURCE

Abstract author(s): Cooper, Clemency - Elleray, Jessica (Oxford Archaeology)

Abstract format: Oral

In England, new ideas about the past discovered through development-led archaeology are not automatically fed into mainstream education. Opportunities to engage with young people are often constrained by the demands of the national curriculum, the timeline of the archaeological project and a lack of public benefit provision. It is unusual then, to have the opportunity to research, evaluate and consult with educators about the best way to share archaeological information with their young people.

The Archaeology Legacy project is a collaboration between Oxford Archaeology and National Highways, funded through their Designated Funds, which aims to connect children and young people to the potential archaeology offers, to teach them about their local heritage and inform their futures.

In 2022 we completed a feasibility study, engaging with 26,500+ individuals and organisations to understand the needs of various educational settings including schools, youth groups and home education. Significantly, the consultation was conducted post-COVID, giving us a picture of educators' attitudes towards digital resources after the pandemic. We found a deficit of widely accessible and digitally innovative resources, that allowed young people to benefit from development-led archaeology.

This has been a unique opportunity to step back and learn exactly what educators are looking for. The results of the study challenged many of our assumptions and are encouraging us to think differently about resource creation, digital assets and the educational benefits of archaeology. During our presentation we will share our findings and explore how evidence from our consultation has informed the next phase of the project, which proposes to co-create a video game with young people, designed with a supporting suite of resources that can be adapted by educators for use in multiple contexts.

8 MUSEUMS, ARCHAEOLOGY, AND NON-FORMAL EDUCATION IN HUNGARY

Abstract author(s): Pálinkás, Adrienn - Czifra, Szabolcs - Fábíán, Szilvia (Hungarian National Museum)

Abstract format: Oral

Learning History, including archaeology, aims to acquaint students with the most important historical facts, characters, events, and traditions. The subject of History - in line with other school subjects - used to begin with prehistory, but lately, prehistoric and archaeological topics have been largely missing from the school curriculum in Hungary.

This paper presents the Hungarian National Museum's goals to acquaint students and young adults with archaeology using best practice approaches for on-site and online programmes. The role of museums within the archaeological field of activities (exhibitions, programmes, activities, publications) has become even more essential for informal education. Parallely with the modified social expectations, museums are compelled to make their exhibitions even more understandable and playful for students and thus, future adults.

Archaeological heritage constantly faces the challenge of being invisible, even forgotten. Especially underground heritage that was worn down by the passage of time. The Danube's Archaeological eLandscapes EU-funded project provides a good example of how new technologies can help to make archaeological heritage alluring to the masses in a completely new way as well as accessible to the public using innovative and attractive approaches. By incorporating Virtual Reality (VR) and Augmented Reality (AR) technologies, museum visitors are encouraged to learn about the rich archaeological heritage within the museum exhibitions and the context of the landscapes from which it comes from.

Acknowledgement

This abstract is partially based upon work from the COST Action 18110 'Underground Built Heritage as catalyser for Community Valorisation', supported by COST Association. The author gratefully acknowledges the COST association for the financial support.

LIVING AND DYING IN THE MIDDLE AGES: BIOARCHEOLOGICAL APPROACHES TO HEALTH, DISEASE, AND DISABILITY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Dittmar, Jenna (Department of Archaeology, University of Aberdeen) - Oxenham, Marc (School of Archaeology & Anthropology, The Australian National University) - Crozier, Rebecca (Department of Archaeology, University of Aberdeen)

Session format: Regular session

The Middle Ages (5th -16th centuries CE) in Europe were characterised by both extreme and often far-reaching political, economic, social and climactic changes. The development of new methods and techniques within the fields of osteoarchaeology and bioarchaeology has facilitated exciting and innovative avenues of research into the health, lifestyles, origins, movements, and the experiences of those that lived (and died) during this turbulent period in history. By drawing together multi- and interdisciplinary papers, this session aims to explore and contextualise the lived experiences of individuals and communities throughout the medieval world.

We welcome contributions that explore topics including, but not necessarily restricted to: (1) experiences of physical impairment (including the inferred or clear provision of treatment and/or care) whether driven by disease experience, congenital dysplasia(s) or trauma; (2) evidence for and the implications of physiological stress in the context of disease, dietary insufficiencies, socio-economic disparities, social and technological transitions (e.g., changes in the nature and structure of medieval urban and rural settings) or other major socially, environmentally, and climatically mediated events; (3) palaeodemographically mediated and/or visible impacts in health and disease, such as rates of natural population increase, fluctuating fertility, and maternal mortality; (4) mobility broadly construed (assayed by way of traditional osteological investigations, stable isotopic analyses, and/or aDNA approaches) and including migration patterns, relatedness, kinship, and post-marital relocation customs to name a few. Papers that explore aspects of medieval life using a multi- or interdisciplinary approach are particularly welcome.

ABSTRACTS

1 DISTANT CITIES: ASSESSING THE IMPACT OF DUTCH MEDIEVAL DEVELOPMENTS ON URBAN AND RURAL HEALTH USING RESPIRATORY DISEASE AS A PROXY

Abstract author(s): Casna, Maia - Schats, Rachel - Hoogland, Menno - Schrader, Sarah (Leiden University)

Abstract format: Oral

Starting from the 6th century AD onwards, many regions in the area today encompassed by the Netherlands underwent significant economic and societal changes. With the population gradually increasing and trading systems expanding, the first cities began to grow. Alongside urban centers, the demand for agricultural products increased accordingly. All these large scale developments likely had an impact on the daily lives of medieval people. In urban centers, problems such as overcrowding, precarious working conditions, and limited access to resources severely impacted the wellbeing of citizens. In the countryside, on the other hand, intensification of production likely exposed workers to several other hazards (e.g., adverse weather conditions, occupational risks).

In this framework, respiratory diseases have often been studied under the assumption that the general worsening of both living and working conditions would result in increased risk of respiratory stress among populations. To investigate this for the Netherlands, we analyzed patterns of respiratory stress across time, testing the presence of chronic maxillary sinusitis, otitis media, and inflammatory periosteal reaction on ribs on a sample (N=376) from both rural and urban environments, dating from both the early-middle ages (AD 400-1080) and the late-middle ages (AD 1298-1576). Statistically significant associations were found between time periods and settlement type for both sinusitis (rural: $p=0.001$; urban: $p=0.007$) and otitis media (urban: $p=0.001$), indicating that factors such as increased contacts between towns and countryside, augmented population densities, and intensification of agricultural production impacted respiratory health. Our results suggest that historical developments influenced the respiratory health of past Dutch populations both in rural and urban settings. Further research in different contexts is advised in order to continue exploring urbanization and its impact on human health across both time and space.

2 AN EXAMINATION OF OTITIS MEDIA IN MEDIEVAL SCOTLAND AND IRELAND THROUGH THE MEDIEVAL CLIMATE TRANSITION

Abstract author(s): Roshem, Irmine - Dittmar, Jenna (University of Aberdeen) - Carlsson, Stine (Queen's University Belfast) - Crozier, Rebecca (University of Aberdeen) - Oxenham, Marc (Australian National University; University of Aberdeen) - Murphy, Eileen (Queen's University Belfast)

Abstract format: Oral

Otitis media is an infection of the middle ear that is common during childhood. In archaeological human skeletal remains, evidence of chronic otitis media can be identified by the formation of new bone on the promontory surface of the middle ear. Although relatively common today, very few studies have explored the prevalence rates of chronic otitis media in past populations. This research seeks to explore the prevalence rate of otitis media in the medieval populations of Scotland and Ireland, considering the 14th-century climate transition from the Medieval Warm Period to the Little Ice Age. To do this, the middle ears of adult individuals (>18 years of age) from two medieval Irish sites – Ballyhanna (n=273), Ranelagh (n=106) – and three Scottish sites – Aberdeen Carmelite Friary (n=107), Aberdeen Franciscan Friary (n=7), and the Kirk of Saint Nicholas (n=108) – were examined using an endoscope. The results show that the raw prevalence rate of otitis media in Scotland (55%) was greater than in Ireland (34%). The relative risk calculations revealed that people in medieval Scotland were 60% more at risk of developing otitis media than people in Ireland ($p < 0.0001$). Although in Scotland males were 10% more at risk than females ($p = 0.4665$), in Ireland females were 6% more at risk of developing evidence of otitis media than males ($p = 0.6683$). The disparity observed between sexes suggests that men and women experienced different levels of exposure to environmental factors that affect the wider upper respiratory system such as exposure to particles from open fires, crafts or agricultural-related activities. The evolution of this disparity between groups living before and after the medieval climate transition is further investigated to identify the role of climate in the development of chronic otitis media.

3 HEALTH AND STRESS IN MEDIEVAL IRELAND AND SCOTLAND: PRELIMINARY RESULTS OF CRIBRA ORBITALIA ANALYSIS

Abstract author(s): Carlsson, Stine (Queen's University Belfast; University of Aberdeen) - Murphy, Eileen (Queen's University Belfast) - Crozier, Rebecca (University of Aberdeen) - Oxenham, Marc (University of Aberdeen; Australian National University) - Dittmar, Jenna - Roshem, Irmine (University of Aberdeen)

Abstract format: Oral

The presence or absence of skeletal indicators of non-specific stress can be a useful proxy for evaluating health status or stress levels in past populations. Cribra orbitalia (CO) are porotic lesions presenting on the roof of the orbits, usually attributed to various types of anaemia. These can be formed from anaemias due to several nutritional deficiencies, parasitic infections, or genetic conditions. For the purposes of this research, CO has been used as an indicator of non-specific stress, and the prevalence of CO as a proxy for levels of stress in a given population. In this study, the prevalence of cribra orbitalia has been evaluated for three medieval Irish sites (Stacumny House, Ranelagh, and Ballyhanna) and four medieval Scottish sites (The Kirk of St Nicholas, Aberdeen Carmelite Friary, Tullilum Carmelite Friary and Linlithgow Carmelite Friary), in order to examine levels of stress within and between these populations. Stature has also been compared within and between populations, as a further indicator of nutritional and pathological stress. Preliminary results of this research show markedly higher prevalence rates of cribra orbitalia in Ireland than in Scotland. The effects of the underlying geology, environmental changes, cultural, or dietary differences, could all explain these results, which will be evaluated within the temporal, archaeological, environmental, and socioeconomic context in order to examine these significant differences.

4 LIFE IN THE NORTH: AN EXAMINATION OF EARLY-LIFE CONDITIONS, STATURE, AND BODY PROPORTIONS IN MEDIEVAL AND EARLY MODERN SCOTLAND

Abstract author(s): Dittmar, Jenna (University of Aberdeen) - Meneghetti, Francesca (University of the Highlands and Islands) - Crozier, Rebecca (University of Aberdeen) - Oxenham, Marc (Australian National University)

Abstract format: Oral

The medieval and early modern periods (900-1800AD) in Scotland were characterised by drastic political, economic, social and climatic changes. The extent to which an individual was affected by these changes, and how such changes impacted health, was dependent upon many social and biological factors. This research aims to explore the relationship between early-life conditions and skeletal growth outcomes, specifically adult stature and relative limb proportions, throughout this notoriously turbulent period in history. As variation in stature and relative limb proportions can reflect differential exposure to environmental stress during growth, measurements of intact long bones including the femur, tibia, humerus and radius were obtained from 328 individuals from northeast Scotland. The maximum length of the femur was used as a proxy for adult stature and relative limb length proportions (brachial and crural

indices) were calculated. A significant increase in mean stature in males was observed from the medieval to the early modern period ($p=.03$); a trend not found in females. This may suggest improved environmental and/or nutritional conditions which enabled a greater degree of sexual stature difference. However, greater variation in stature in both males and females was also observed during the early modern period, which may indicate an increase in the social and economic disparities experienced by the population during this time. This talk will explore the relationship between osteological indicators of physiological stress and overall growth outcomes within different social groups in order to examine the impact of underlying inequalities in early-life conditions and later life outcomes.

5 DEMOGRAPHIC IMPACTS OF THE PLAGUE AND GREAT POX IN 15TH-17TH CENTURY ABERDEEN

Abstract author(s): Oxenham, Marc - McFadden, Clare (Australian National University) - Dittmar, Jenna - Crozier, Rebecca (University of Aberdeen)

Abstract format: Oral

The population of Aberdeen reportedly suffered from the plague and the Great Pox – widely believed to be syphilis – from the late 15th century onwards. Thanks to the swift action of authorities, both diseases were relatively well controlled for some time. Despite these efforts, Aberdeen was struck by its most significant outbreak of the plague in 1647, suffering substantial loss of life. Less is known about the impacts of syphilis on the population, but due to its comparatively low mortality rate it seems probable that management was largely driven by the undesirable symptoms and stigma of the disease. Syphilis likely had impacts that were less immediately recognisable to health authorities, such as late pregnancy and infant loss, and congenital syphilis. In this paper we take a multi-faceted approach to the study of the plague and syphilis in 15th-17th century Aberdeen, incorporating evidence from bioarchaeology and history, and comparing potential models of the impacts of these diseases on the population with regard to mortality, birth rate, and infant loss. We show how such an approach can help to overcome the punctuated and sparse nature of archaeological and historical sources.

6 LIFE AND DEATH AT LA OLMEDA (SPAIN, 6TH-11TH C. CE): GENETIC TRANSITION AND DISEASE BURDEN DURING THE MIGRATION PERIOD

Abstract author(s): Coppola Bove, Lorenza (Max Planck Institute for Evolutionary Anthropology; University of Granada, Department of Legal Medicine, Toxicology and Physical Anthropology) - Villalba-Mouco, Vanessa (Max Planck Institute for Evolutionary Anthropology) - Kirkpatrick, Casey (Max Planck Institute for Evolutionary Anthropology; University of Western Ontario, Department of Anthropology) - Rohrlach, Adam (Max Planck Institute for Evolutionary Anthropology; School of Computer and Mathematical Sciences, University of Adelaide) - Lamnidis, Thiseas (Max Planck Institute for Evolutionary Anthropology) - Vigil-Escalera Guirado, Alfonso (University Carlos III de Madrid) - Botella López, Miguel (University of Granada, Department of Legal Medicine, Toxicology and Physical Anthropology) - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology; Friedrich Schiller University) - Bos, Kirsten (Max Planck Institute for Evolutionary Anthropology)

Abstract format: Oral

The transition from Late Antiquity to the Early Middle Ages in the Iberian Peninsula encompassed a dynamic period of population change due to the displacement of local people, migrations from neighboring regions, and epidemic outbreaks. Infectious disease risk may have increased during this time due to growing urban centers, increasing commercial trade, and the establishment of the religious route to Santiago de Compostela. Together these phenomena contributed to regional social and political changes that are incompletely described in the historical record. In this study, we sought to investigate both population-level genetic changes and disease burden during this time transect through analyses of a community from the Roman villa of La Olmeda (Palencia, Spain, 6th – 11th centuries CE). Genomic human DNA data from 51 individuals, representing all time transects, were investigated to evaluate broad changes in population composition from a genetic perspective over time. These data were paired with genetic and skeletal morphological analyses focused on the identification of infectious diseases. Together, these data provide a new perspective on the population of La Olmeda and the infectious diseases that impacted daily life in this prominent commercial and agricultural center during a period of considerable change.

7 BEHIND THE PLAGUE: PALEOPATHOLOGY IN THE LAST PHASE OF THE MEDIEVAL CEMETERY OF SAN MICHELE (ALGHERO, SASSARI -SARDINIA)

Abstract author(s): Serra, Rita (Department of History, Human Sciences and Education University of Sassari; Department of biomedical sciences, University of Sassari) - Bini, Anna (Department of History, Human Sciences and Education University of Sassari) - Bandiera, Pasquale (Department of biomedical sciences, University of Sassari) - Milanese, Marco (Department of History, Human Sciences and Education University of Sassari)

Abstract format: Oral

Located in northwest Sardinia, Alghero is a modern city, with Catalan culture and languages, whose Aragonese foundation is dated to the middle of the 13th century. To this period is related the area of San Michele, a medieval cemetery with five different phases of usage between the 13th and the 17th century AD. The last two phases, called “phase 4” (dated to 1582/1583) and “phase 5” (dated between the ends of the 16th and the 17th century) are related to an epidemic of *Yersinia pestis*. The former is characterized by trench burials, and the latter, maybe related to the last part of the epidemic, by multiple burials with different numbers of individuals in them; in most cases, these burials are aligned in a trench-like order. These tombs, for which family relation hypothesis studies are in progress, were subjected to anthropological and paleo-pathological analysis. The results show numerous pathological conditions that are not related to *Yersinia pestis*. In T.168, for instance, two people (one adult and one subadult) had evidence of *Spina bifida*. Another interesting burial is T.151, a tomb that contained two adult females. Both of these individuals had diffuse macro-porosity, fractures, and lesions that requires further macroscopic and microscopic analyses. Though this study is ongoing, these findings show that the plague was only one aspect of a more complex reality.

Acknowledgment: FAR-Uniss.

8 EXPLORING BIOMECHANICS AND CARE OF PHYSICALLY IMPAIRED INDIVIDUAL IN MEDIEVAL IRELAND

Abstract author(s): White, Jessica (Queen’s University Belfast)

Abstract format: Oral

This research focuses on the locomotion and daily life of a physically impaired middle-adult male (Sk67), from early medieval Ireland who suffered a femoral head fracture. The levels and patterns of habitual biomechanical stress are reflected in the quantity and distribution of cortical bone in the diaphysis and it is based on this assumption that allowed comparison of upper and lower limbs for signs of weight-bearing using cortical bone thickness (CBT) of antero-posterior and medio-lateral measurements from radiographs, revealing the level of function after injury. In addition, the upper limbs were examined for enthesal changes (Knüsel et al. 1993; Villotte et al. 2016; O’Reilly 2016) to indicate any use of walking aids. Using information from the CBT analyses, macroscopic analyses, and knowledge of human limb biomechanics, a 3D musculoskeletal model of Sk67 was developed using OpenSim, and gait was simulated with SCONE software revealing a visual locomotive model of Sk67’s limb function after impairment along with gait analysis data corresponding to the CBT and macroscopic analysis previously carried out. However, disability is not defined by a set of disease conditions; individuals will have different experiences of their condition depending on their socioeconomics. Therefore, macroscopic analysis of bone alone cannot infer the day-to-day quality of life of an individual and their associated limitations in activity. Based on the interdisciplinary analyses of this study and historical evidence a bioarchaeology of care profile was established revealing that they would have needed assistance for a couple of months post-injury, and likely used two axillary crutches to regain mobility and independence after their impairment. However, it would have been unlikely for him to contribute to his community as a typical male for that time following his impairment.

9 OSTEOBIOGRAPHICAL INVESTIGATION OF DISABILITY AND CARE IN THE EARLY MIDDLE AGES FROM ITALY

Abstract author(s): Micarelli, Ileana (McDonald Institute for Archaeological Research, University of Cambridge) - Zeppilli, Carlotta (Department of Environmental Biology, Sapienza University of Rome)

Abstract format: Oral

The bioarchaeological characterisation of disabled individuals from the past is particularly challenging because it pushes the boundaries of the interpretation of pathologies recognisable on human remains. The osteobiographical approach offers a possible framework in which human remains are studied to understand not only the embodied experience during life but also to frame people as playing diverse social roles (e.g. patient, healer, doctor, carer) in different times during life. Considering the meaning of disease, treatment methods, and caregiving customs, the Italian Peninsula in Post-Classical times offers the ideal scenario. This abstract aims: (1) to use the osteobiographical approach to explore a life narrative of a male (T90/5) in need of care from the site of Selvicciola (4th-7th c. CE, Italy) and (2) to contextualise the impact of his health status on his community. Visual inspection, CT-scan and X-rays

were used for palaeopathological assessment and biomolecular analyses to investigate the diet. The results show that a mature male survived at least two traumatic events and an injury of the left femur neck shortly before death. Surviving multiple traumas should be interpreted as a severe chronic condition. This caused several problems during the first phases (blood loss, infections) and long-term recovery. To survive, T90/5 was cared for by the community not only to avoid severe conditions in a pre-antibiotic era but also to sort out biomechanical activities. Stable carbon and nitrogen analyses on bone collagen show a dietary intake consistent with the rest of the group. His burial was a lithic stone coffin, close to other burials, indicating he was buried like the other community members. Osteological investigations (paleopathological assessment, biomolecular analyses) and burial evidence of social inclusion indicate a probable adoption of alternative tasks for subject participation in community life.

10 YOUTH IN DISABILITY- A CASE STUDY OF A YOUNG ADULT FROM AN EARLY MEDIEVAL CEMETERY IN NORTHWESTERN BOHEMIA

Abstract author(s): Witan, Joanna (University of West Bohemia in Pilsen; Institute for Preservation of Archaeological Heritage of Northwest Bohemia) - Mackiewicz, Klementyna (University of West Bohemia in Pilsen) - Szczurowski, Jacek (Wrocław University of Environmental and Life Sciences) - Crkal, Jiří (Institute for Preservation of Archaeological Heritage of Northwest Bohemia) - Čavka, Mislav (University Hospital Centre Zagreb)

Abstract format: Oral

Deformities and degenerative changes of the vertebral column are one of the more frequent abnormalities observed not only in historic and prehistoric populations but also in modern times. The aetiology of these lesions can be highly variable and with significant pathological changes can be difficult to establish. Nevertheless, individuals with severe deformities or degeneration may suffer from numerous life-limiting problems such as severe pain or neurological complications.

Excavations at the early medieval cemetery of Poláky-Dolany in 2022 (north-western Bohemia Chomutov district) revealed an H10 burial, in which the body was positioned in an unconventional manner - the entire torso and lower limbs of the individual were strongly rotated to the right. During anthropological analyses, the sex and age of the individual was determined to be male, with a maximum age of 20-21 years at the time of death. The greatest pathological changes were observed in the thoracolumbar region, as there was almost complete destruction of the vertebral bodies from Th7 to L3 and the formation of angular kyphosis due to the fusion of the vertebral remnants. In addition, there are advanced osteolytic lesions on the Th1-Th6 vertebrae. Such severe lesions may develop as a result of compression fractures, osteomyelitis or tuberculosis and it is primarily these conditions that should be considered in the differential diagnosis. However the vertebral lesions developed while the individual was still in progressive ontogeny entailed a number of morphological changes that were fixed in the skeleton by the young age of the individual.

The aim of this study is to establish the disease that affected the individual from grave H10 and to reconstruct, on the basis of the morphological changes in the bones, the mobility restrictions and neurological problems that he had to face on a daily basis.

11 DISABILITY AND SOCIAL CARE IN MEDIEVAL TRANSYLVANIA (ROMANIA): A BIOARCHAEOLOGICAL CASE STUDY FROM THE BRAȘOV CEMETERY

Abstract author(s): Diana, Annamaria (Terra Ultra Silvam Archaeology) - Marcu Istrate, Daniela (Institutul de Arheologie Vasile Parvan) - Toso, Alice (Bonn Center for ArchaeoSciences - BoCAS, Institut für Archäologie und Kulturanthropologie, Rheinische Friedrich-Wilhelms-Universität) - Bianco, Elizabeth (CUNY Hunter College)

Abstract format: Oral

This paper presents the results of the interdisciplinary osteo-biography performed on a case study from the medieval cemetery of Brașov, a city located in the historical region of Transylvania (Romania).

Skeletal remains from burial context M 667 were cleaned and catalogued for osteological analysis. Upon visual inspection, it was evident that the right lower limb of the skeleton, a male adult, was comparatively smaller in general size and length, than the left side. This abnormality was also observed at the level of the right side of the pelvis. Site photos of the fully exposed skeleton at excavation confirmed the size difference and illustrated an unusual burial position with the individual's right leg awkwardly bent and the left leg completely extended.

The case of individual M 667 sparked many questions. What was their social status? How did they walk? How were they treated by the community? Because of the breadth of our inquiries, we integrated information from the archaeological context and the interpretation of the burial ritual with the individual's biological/pathological profile and isotopic values from their teeth and bones to achieve a comprehensive view of the pathological condition causing their disability as well as how this impairment might have affected quality of life and longevity.

We know that they survived into adulthood despite a crippling condition which caused ambulatory difficulty and, possibly, other related complications. The question that remains is if this person was taken care of throughout their life,

and supported by family members and/or the wider community, or if they were outcast because of their impairment. We will discuss whether bioarchaeological, clinical, and historical evidence support either possibility.

12 HOW TO COPE WITH ADVANCED OSTEOARTHRITIS IN EARLY MEDIEVAL ITALY: A LIFE NARRATIVE OF AN ELDERLY WOMAN

Abstract author(s): Zeppilli, Carlotta (Department of Environmental Biology - Sapienza University of Rome) - Miccarelli, Ileana (McDonald Institute for Archaeological Research, University of Cambridge)

Abstract format: Oral

Osteoarthritis is a widespread pathological condition nowadays, as in the past. We present a case of severe degeneration of the coxofemoral joint in an old adult female buried in the Early Medieval cemetery of Selvicciola (Italy, 6th-8th c CE). In particular, the skeleton shows advanced deformation and bone remodelling of the right acetabulum. As a result, bone production extends up to the neck of the femur, locking its head within the acetabulum. Furthermore, the femoral head shows extensive porosity and eburnation, such as in the lateral condyle in the distal epiphysis of the right femur.

The objective is to detect the consequences of this unilateral pathology, whether and how much the pathology had restricted movements and, consequently, this woman's life.

After the macroscopic and palaeopathological examination of the skeleton, digital acquisition of the femurs and tibiae of both sides was obtained through a CT scan to deepen the effect on the cortical thickness of the lower limbs by a virtual approach. Then, the R package morphomap was applied to extract the differences in cortical thickness and biomechanical parameters along the entire diaphyses of the lower limbs.

Comparing the diaphyses of the lower limbs, the pathological femur shows a reduction in cortical thickness compared to the non-pathological one. Furthermore, cross-sectional geometry parameters (polar moment of inertia) confirm the left lateralisation in the femurs. On the other hand, a similar distinct difference was not observed in the diaphyses of the tibiae.

Our results suggest that this elderly woman experienced a reduction in movements in the lower limb, difficulties in walking and a significant amount of pain. She suffered from a degenerative condition that could not be healed, but she survived for years. She needed long-time care, and likely someone in her community cared for her during the last years of her life.

13 AGE-RELATED CHANGES OF FACIAL SKELETON IN ADULTS FROM MEDIEVAL CEMETERY SAMPLE IN CENTRAL EUROPE

Abstract author(s): Walczak, Anna - Krenz-Niedbała, Marta - Łukasik, Sylwia (Adam Mickiewicz University in Poznan, Faculty of Biology, Institute of Human Biology and Evolution)

Abstract format: Oral

Aging of the bone tissue results from disturbed equilibrium between bone resorption and formation, which promotes increased resorption. Those changes also apply to the facial skeleton, however they are uneven and site specific, with orbits, maxilla and mandible mostly affected.

The aim of this study was to perform an analysis of metric characteristics of the facial skeleton elements directly related to aging in a medieval population from Cedyňa (Poland) and to compare the results with the published data for modern populations. Combining the knowledge about diet-related stronger biomechanical forces in medieval than in modern times with the Wolff's law we hypothesized, that skeletal aging processes are more prominent today than they were in the Middle Ages.

In total, 230 facial skeletons of young, middle and old adults were 3D scanned. A subgroup of edentulous middle adults was distinguished. Measurements were performed using Geomagic Studio 12 and statistically analyzed within and between age categories (Kruskal-Wallis ANOVA) and between the dentate and edentulous subgroups (Mann-Whitney U-Test).

The parameters of the orbits and pyriform aperture tend to increase with age, however, this finding was significant only in males (right orbit: height $p=0.04$, left orbit width $p=0.01$, pyriform aperture surface area $p=0.03$). Maxillary height significantly decreased at right first premolar ($p=0.03$) and first molar ($p=0.02$) in females, together with mandibular ramus height (right side in females $p=0.02$). In edentulous individuals the orbits were wider ($p=0.03$ in females and $p=0.04$ in males), and maxillary and mandibular heights were reduced than in toothed individuals.

The results revealed, that the nature and direction of changes associated with aging are homogeneous in medieval and modern populations, while the intensity of those processes was lower in the past than at present.

MURDER IN THE GATEHOUSE? PLACING SKELETAL TRAUMA WITHIN THE HISTORICAL CONTEXT

Abstract author(s): Hopko, Rosalie - Dittmar, Jenna (University of Aberdeen) - Oxenham, Marc (University of Aberdeen; Australian National University) - Macdonald, Alastair - Crozier, Rebecca (University of Aberdeen)

Abstract format: Oral

Late medieval Scotland (13th-16th centuries CE) was characterized by turbulent social and political changes. This interdisciplinary study combines the fields of osteoarchaeology and history to explore interpersonal violence at Kildrummy Castle (particularly in context of its numerous sieges) and the insights this case offers into the health, lifestyles, and experiences of the individuals involved. The crania of two adult male individuals excavated from the east gatehouse at Kildrummy Castle were analyzed. The fracture types were classified using macroscopic and microscopic examination. Based on fracture morphology, the causal mechanisms and forces applied to bone were deduced. Primary source historical texts including the Scotichronicon and The Bruce were used to contextualise the archaeological findings. The skeletal trauma observed represents intentional injuries, likely sustained through violence. Sharp (SK #2), blunt, and projectile trauma (SK #1) were present. The pattern and types of fractures observed suggests that the two men involved were participants in a violent incident. The historical and archaeological evidence suggests that these individuals were killed during the Scottish Wars of Independence, likely during the siege of Kildrummy Castle in 1306. The interdisciplinary nature of this work creates a more precise narrative of events surrounding violence in late medieval Scotland and the history of Kildrummy Castle. Additional comparative studies are needed to determine how representative these findings are of the nature of violence in late medieval Scotland.

A. DIFFERENTIAL DIAGNOSIS VIA MORPHOLOGICAL AND MICROCT ANALYSIS OF A CALCIFIED OBJECT FROM AN EARLY MEDIEVAL BURIAL IN VIENNA, AUSTRIA

Abstract author(s): Strang, Sheridan (Novetus GmbH) - Luftensteiner, Katharina - Berner, Margit (Department of Anthropology, Natural History Museum Vienna) - Binder, Michaela (Novetus GmbH) - Mosser, Martin - Krause, Heike (Stadtarchäologie Wien) - Winter, Eduard (Department of Anthropology, Natural History Museum Vienna)

Abstract format: Poster

Calcification of soft tissue occurs due to a build-up of calcium secondary to inflammation and can appear all over the body, affecting areas such as organs, arteries, and joints. Although some degree of calcification is a normal side effect of ageing, oftentimes it is a sign of a more serious health condition such as atherosclerosis, neoplasm, or metabolic disease. Archaeologically, ossified objects are frequently found with skeletal remains. However, they are rarely reported in palaeopathological studies due to difficulties in diagnosing their underlying aetiology.

In 2021/2022, 40 individuals were excavated around St. Peters Church in Vienna, Austria. Radiocarbon dating determined this cemetery to be between 800 A.D to 1200 A.D. During the excavation an oval-shaped mass (31x27x27mm) was found lying on the lower cervical vertebrae (C5-C7) underneath the mandible of a middle-aged female (Grave 30, cal AD 690 – 880).

This study compared the calcified mass found in Grave 30 from Petersplatz to one probable calcified thyroid tumour excavated at the post-medieval cemetery of Bartholomäus-Platz, Vienna and three anatomical specimens identified to be thyroid masses/goitres (PASW MN272, MN331, & MN334) from the pathological-anatomical collection at the Natural History Museum in Vienna (PASW). The analysis consists of 1) an anatomical macroscopic comparison and 2) a MicroCT cross-sectional comparison.

There were similarities in size, shape, and texture between the objects, with the Petersplatz mass being most similar to the object from Bartholomäus-Platz, MN272 (thyroid adenoma) and MN331 (goitre). MicroCT scans showed that the calcifications from Bartholomäus-Platz, Petersplatz, and MN331 had very similar exterior and internal structures. All three had one large chamber and a few smaller cavities with small fissures in the cross-section. From the analysis of the structure and location along with comparisons to other known thyroid masses, the Petersplatz mass is most likely to be a goitre or thyroid tumour.

B. EXPLORING A POSSIBLE METASTATIC CARCINOMA IDENTIFIED IN A HUMAN SKELETON OF 17TH-19TH CENTURIES, FROM IASI (ROMANIA)

Abstract author(s): Groza, Vasilica-Monica - Bejenaru, Luminița (Romanian Academy – Iasi Branch, “Olga Necrasov” Center of Anthropological Research; “Alexandru Ioan Cuza” University of Iasi, Faculty of Biology) - Bilavschi, George - Bacumenco-Pîrnău, Ludmila (Romanian Academy – Iasi Branch, Institute of Archaeology; “Alexandru Ioan Cuza” University of Iasi, Faculty of Biology) - Popovici, Mariana - Ciorpac-Petraru, Ozana-Maria (Romanian Academy – Iasi Branch, “Olga Necrasov” Center of Anthropological Research; “Alexandru Ioan Cuza” University of Iasi, Faculty of Biology)

Abstract format: Poster

In this study, a case with possible metastatic carcinoma is presented; it was identified in a sample of skeletons discovered in the area of the Turkish cemetery from Iasi (Romania) during 2019-2020 archaeological campaign. According to the discovered coins, the limits over time of necropolis use are set between the 17th and 19th centuries.

The skeleton is one of the preferential sites for metastatic expansion of different cancers. Bone response to metastatic tumours can be either osteolytic, or osteoblastic, or a combination of both. Due to the mechanism of metastasis formation, the number and size of lesions visible upon radiographic examination usually exceed the number of lesions visible at exterior; so, the radiographic exploration is an important key in the differential diagnostic of metastatic carcinoma. Single metastases are rare; in most cases, multiple lesions are present.

The case of a possible metastatic carcinoma, described in this study, was identified in the skeleton codified M190, belonging to a male aged 30-35 years. Several perforations/lesions were identified in the cranial bones (i.e., frontal, parietal, and maxillary bones), and postcranial bones (i.e., femur, tibia, clavicle, sternum, and sacrum). The macroscopic, stereomicroscopic, and imaging analyses (i.e., radiology and computed tomography) were followed by histological evaluation. For histological analysis, bone samples were cut using a Dremel 3000 variable speed multi-tool. Samples were cleaned in multiple sonic baths and embedded in Buehler Epothin 2 epoxy resin. The sections were ground and polished using carbide paper, and then visualized through a transmitted light microscope. The microscopic analysis revealed histologically new periosteal bone formations. The obtained results could indicate the metastatic carcinoma.

This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-III-P4-PCE-2021-1180, within PNCDI III.

C. RECONSTRUCTING THE SEASONALITY OF CATASTROPHIC EVENTS IN THE MEDIEVAL MASS GRAVES IN KUTNÁ HORA-SEDEC (CZECHIA, 14TH CENTURY) USING CEMENTOCHRONOLOGY

Abstract author(s): Zazvonilová, Eliška (Institute of Archaeology of the Czech Academy of Sciences; Department of Anthropology and Human Genetics, Faculty of Science, Charles University) - Brzobohatá, Hana - Frolík, Jan (Institute of Archaeology of the Czech Academy of Sciences) - Velemínský, Petr (Department of Anthropology, National Museum) - Brůžek, Jaroslav (Department of Anthropology and Human Genetics, Faculty of Science, Charles University)

Abstract format: Poster

Famine or epidemic periods were not exceptional in the Middle Ages in Europe. These catastrophic events are evidenced by the extreme changes in the funerary ritual (mass graves). This is also the case of medieval Kutná Hora-Sedlec (Czechia, 14th century), where 32 mass graves were excavated during rescue excavations. Their chronology is based on the stratigraphic configuration with two levels of pits. Based on historical documents mentioning a period of famine in 1318 and plague epidemics in 1348-1350, radiocarbon dating, and coins, the presence of mass graves can probably be linked to these catastrophic events. In this study, we aimed to understand better the differences between these two groups of mass graves, focusing on estimating the season-at-death of 42 individuals buried in them based on cementochronology. Given that famine and plague epidemics are strongly linked to the environment, socio-economic conditions, or climate changes and exhibit seasonal dynamics, the differences in seasonality may contribute to clarifying the causes of mass graves or the connection with documented historical events. Our results showed that each group of mass graves corresponds to one season (graves: A, B = spring/summer, graves: C, D, E = autumn/winter), hypothetically related to different seasonal peaks of mortality of famine and plague periods, supported by historical documents. This study was supported by Czech Science Foundation (21-09637S) and Ministry of Culture (DRKVO 019-2023/7.l.e. 0002327).

D. AN INTERDISCIPLINARY APPROACH TO ITALIAN MOBILITY DURING MIDDLE AGES (11-14TH CENTURIES). THE CASE OF THE CEMETERY OF SAN SISTO, PISA

Abstract author(s): Sagliuoccolo, Agnese - Cantini, Federico (Department of Civilizations and Forms of Knowledge University of Pisa) - Fornaciari, Antonio - Giuffra, Valentina (Department of Translational Research and New Technologies, University of Pisa)

Abstract format: Poster

Human mobility is both a fascinating and a challenging issue for the archaeologist.

In the Middle Ages, human mobility was such a relevant phenomenon that Jacques Le Goff defined the medieval man as “a perpetual pilgrim in a travelling Middle Ages”.

During the Late Middle Ages pilgrims, soldiers and merchants were typical and common travelers, but some individuals were also attracted by the emerging occupational stimuli from cities in full rebirth.

Among these cities Pisa certainly played a leading role, both for its bustling and early economic growth since the 11th century and for the Mediterranean expansion of its trade.

Can human mobility find a bioarchaeological feedback and explain the Pisan material culture between the 11th and 14th centuries?

In an attempt to answer this question, the church of San Sisto, with its cemetery, is an excellent case study. The church was founded in 1087 by the citizens of Pisa with the incomes of the victory over the Saracens of Al Mahdiya, a town near Tunis.

The excavation of the cemetery of San Sisto has currently involved about 150 tombs. One of these contains a particular grave good: the burial of the so-called “pilgrim”, a 35/45-year-old woman, who revealed a specimen of pecten jacobaeus on the chest.

In the last few years in Italy there have been several studies combining archaeological and archaeometric data, in particular through the analysis of isotopes useful for the reconstruction of human mobility (^{87}Sr and ^{18}O). However, these studies focus on the prehistoric and classical ages, and on the Lombard necropoles, but there is currently no research with this approach for the Late Middle Ages. The case study of San Sisto aims to be a first test for an integrated approach to the study of the Italian medieval mobility.

614 FOOD CULTURE(S) OF NEOLITHIC SOUTHEASTERN EUROPE: CULINARY TRADITIONS, CUISINE AND POTTERY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Lyemperaki, Marianna (Democritus University of Thrace) - Dzhafvezova, Tanya (St Cyril and St Methodius, University of Veliko Tarnovo)

Session format: Regular session

The interpretation of the past culinary traditions and cuisine – as a means for better understanding of the prehistoric societies, entails thorough examination of the utensils used for the preparation of food. The cooking pots, as a use category, offer a great deal of information not only on prehistoric diet and dietary preferences, but also on complex issues referring to the construction of social and cultural identity, the symbolic systems, the political relations and economies.

The morphological and technological characteristics of these vessels - indicative of the various cooking techniques applied for preparation of food, reveal specific aspects of the culinary practices, associated with the cultural and the social dimensions of food. The application of variable scientific analyses (organic residues, microbotanical studies, etc.) thus provides essential information on the actual components that comprised a meal, explored in the context of the social practices and the ways of consumption.

In this session we are interested in the cooking pots, as they played a crucial role in the preparation of food. How the analysis of cooking pots contributes to the study of the Neolithic social transformations, human mobility, the cultural dynamics and the expressions of identity? What contribution have the scientific approaches to the better understanding of the local culinary traditions? Can we trace similarities or differences among the cuisines of the Neolithic societies of southeastern Europe? And how other materials (botanical and zoological remains, tools such as millstones, etc.) found in association with the cooking pots, provide insights into the food choices of the Neolithic people?

The aim of this session is to bring together the variable data obtained from the examination of the cooking pots, and along with the study of other related materials, to explore their role for the better understanding of the Neolithic societies.

1 FOOD PREPARATION IN THE NEOLITHIC OF THE BALKANS: INSIGHTS FROM POTTERY

Abstract author(s): Vukovic, Jasna (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

Abstract format: Oral

Food habits of prehistoric, especially Neolithic communities, are one of the most important fields of research. Functional analysis, namely use-alterations of Neolithic pottery in the Balkans are still rare. However, various food-related vessel classes were identified both in Early and Late Neolithic assemblages. These investigations were carried out based on analysis of use-alterations (accretions and attritions), vessel contours and morphology, and sizes, but also on performance properties (fabric and surface treatments). On the other hand, archaeobotanical and archaeozoological records recently became enriched with new data, little effort has been made to connect them with pottery. Analyses of organic residues were carried out on several assemblages, but with the main goal of identifying origin of lipids, not to reconstruct culinary practices or to establish correlation with specific vessel class. Additionally, spatial analyses in some cases revealed activity zones related to food processing and cooking. In this paper, all of these issues will be discussed, with emphasis on the role of pottery in food-related activities.

2 CULINARY TRADITIONS OF LATE NEOLITHIC NORTHERN GREECE: WHAT COOKING POTS CAN TELL US ABOUT THE FOOD CULTURE(S) OF THE AREA

Abstract author(s): Lymperaki, Marianna - Urem-Kotsou, Dushka (Department of History and Ethnology, Democritus University of Thrace) - Kotsos, Stavros (Ephorate of Antiquities of Thessaloniki, Hellenic Ministry of Culture & Sports) - Chondroyianni-Metoki, Areti (Ephorate of Antiquities of Kozani, Hellenic Ministry of Culture & Sports)

Abstract format: Oral

Pottery as a form of material culture directly related to the preparation and the consumption of food may be a powerful tool for understanding the extent to which food preparation and commensality contribute to social organisation. The examination of cooking pots, namely their shape and size, as well as the context in which they were used can provide information about the number of people who shared food, the type of cooked food and the social aspects of food preparation and consumption (e.g. private or communal level).

In this presentation we are going to present the final results of a study that focused on the cooking pots from two Late Neolithic sites in central and western regions of North Greece (Stavroupoli and Toumba Kremastis Koiladas respectively). The morphological and technological characteristics of these vessels along with the detailed analysis of their distribution on the sites have given us an insight on culinary traditions of the people in the area but also on their social and cultural identity. The organic residues and the microbotanical (starch and phytolith) analysis have also enriched our understanding of the local cuisines and provide further insight into the role of preparation and consumption of food in shaping local identities.

3 LONG-TERM STORAGE OF FOOD IN THE LATE NEOLITHIC DRENOVAC (CENTRAL SERBIA)

Abstract author(s): Bajcev, Olga - Obradovic, Djurdja (Institute of Archaeology, Belgrade)

Abstract format: Oral

Archaeological evidence from sites of the Late Neolithic Vinča culture (5400-4500 BC) in southeast Europe suggests that the autonomous household was the basic socio-economic unit. This is supported by the evidence of food storage, which is organized and controlled by households.

The aim of this paper is to examine the long-term storage of food in the Late Neolithic settlement at the site of Drenovac in Central Serbia. The topic will be investigated by combining archaeological and archaeobotanical evidence from recent excavations of three roughly contemporary burnt houses.

Burnt houses at Drenovac exhibit certain similarities in the organization of domestic space, but each one is unique in terms of quantity and variety of objects and tools, and their spatial distribution. The houses have usually two or three food preparation facilities located in different rooms and more than 50 ceramic vessels were found in each house. Some houses had an upper floor, which additionally complicates the matter of spatial analysis and reconstruction of allocated space for domestic activities. We will tackle the question of intra-household variability from the perspective of long-term storage.

Long-term storage of food in this Late Neolithic community is documented by the presence of large ceramic vessels – pithoi, which are mainly found inside houses. To provide an insight into storage practices we will examine: 1) the form, size, and capacity of pithoi, found inside three Late Neolithic houses; 2) their number and location in each house; 3) archaeobotanical evidence of food storage.

Using comparative analysis we will investigate the correlation between the size of the house and its storage capacity, and variations of the spatial distribution of pithoi between analysed houses. We will further discuss social and economic issues of household size and organization, as well as the social organization of food storage in this Late Neolithic community.

4 A PROTOCOL TO COMBINE THE EXTRACTION OF LIPIDS AND STARCH GRAINS FROM POTTERY VESSELS

Abstract author(s): Tarifa, Nadia - García-Granero, Juan José (IMF-CSIC)

Abstract format: Oral

Pottery played a fundamental role in the development of culinary practices and the transformation of food (e.g., soaking, boiling, etc.); it enabled the processing of a wide range of food products, as well as the mixing and preservation of ingredients. The microbotanical and biomolecular analyses of food-related artifacts provides remarkable insights into culinary practices. The analysis of organic residues associated with ancient pottery has been at the forefront of this field and it has been fundamental for identifying ingredients and understand combinations and processing. When combined with the typological analysis of cooking, storage and consumption pottery vessels, this information allows us to investigate past culinary pathways (i.e., the ways in which ingredients were transformed into meals). At present, starch grains and biomolecules are seldom analysed as part of the same study, and when analysed they come from different vessels, thus impeding an effective integration of the results. This is due to a) the very different expertise needed to recover and analyse these residues and b) the lack of specific laboratory protocols aimed at recovering both residues from a single sample and in a single procedure. Work combining interdisciplinary studies, such as microbotanical and chemical analysis, is uncommon, let alone work further integrating archaeological artefactual analysis. During this presentation we will discuss the flaws and strengths of a newly-developed laboratory protocol designed to extract starch grains and lipids from pottery vessels from a single sample and in a single procedure to disentangle the contents of these artefacts and document prehistoric culinary practices.

5 NEOLITHIC COOKING CERAMIC FABRICS: TECHNOLOGICAL CHARACTERISTICS, FUNCTIONAL PROPERTIES AND EVIDENCE OF USE

Abstract author(s): Dimoula, Anastasia (Eidikos Logariasmos Kondilion Erevnas A.P.TH, Aristotle Univ. of Thessaloniki) - Tsirtsoni, Zoi (UMR 7041-Archéologies et Sciences de l'Antiquité CNRS-Université de Paris I) - Valamoti, Soutana Maria (Eidikos Logariasmos Kondilion Erevnas A.P.TH, Aristotle Univ. of Thessaloniki)

Abstract format: Oral

Ceramic cooking fabrics, i.e. the clay recipes used in the production of cooking pots, are generally characterised by common functional attributes related to the intended use of cooking vessels over fire. On the other hand, their technological characteristics, from raw materials selection and processing to firing, vary significantly among sites and regions as well as over time. As for the evidence of use, research on this field has been very limited. In the scope of exploring this technological variability, along with establishing functional properties and detecting evidence of use on cooking pots, this presentation integrates macroscopic, analytical and experimental data, generated in the context of the ERC project PlantCult.

Methodology includes the integrated contextual, macroscopic and petrographic analysis of a spectrum of cooking pots sampled from four sites, dated from the Early-Middle to the Late-Final Neolithic/Chalcolithic (first half of 6th mill - end of 5th mill BC), located in northern Greece and Bulgaria. The study is complemented by the analysis of experimentally manufactured cooking pots, used in a series of cooking experiments. The results of our research demonstrate that cooking fabrics in our study area exhibit strikingly consistent functional properties, but are characterised by respective technological variability related to diverse factors, environmental and/or socioeconomic. Moreover, the comparison between analytical archaeological and experimental data paves the path towards identifying and interpreting evidence of use on ceramic cooking fabrics.

6 POTTERY FOR COOKING IN THE NEOLITHIC SETTLEMENT OF AVGI KASTORIA, NW GREECE. WARES AND FABRIC RECIPES

Abstract author(s): Saridaki, Niki - Papadias, Yannis - Katsikaridis, Nikos (Aristotle University of Thessaloniki) - Stratouli, Georgia (Ephorate of Antiquities of Kilkis)

Abstract format: Oral

The interest concerning cooking vessels and their morphological-technological characteristics remains at the center of archaeological research regarding prehistoric and historic societies along the Aegean region. Current state of research in cooking wares illustrates specific clay selection and potter's technology in their production tradition. Our research provides new information through the examination of the pottery assemblage from Neolithic Avgi in Kastoria.

The Neolithic settlement of Avgi Kastoria is located in NW Greece. The settlement is dated to the Late Neolithic (c. 5700 – 5400 cal BC), during which three distinct occupational phases were discerned based on the excavations results. There is an ongoing interdisciplinary research on the archaeological record of Avgi since 2008, part of which was the systematic study of pottery from the three main occupational phases of the site.

Our main objectives were to investigate the types of the pots, the raw materials choices and their technological features. Therefore, this paper implements morphological and technological characteristics of cooking vessels to discuss issues related to their production. The study revealed specific aspects of their manufacture regarding certain stages of the operational chain. For the above aims ceramic petrography accompanied with refring tests were chosen as the appropriate methods to supplement the macroscopic examination. The selected cooking sherds covers the pottery assemblages of all the phases of the settlement, as well as the different types of pots related to food preparation in order to investigate their production diachronically.

The preliminary results show specific choices in raw materials selection and particular processing of the clay paste that reflects a knowhow of making specific wares such as cooking pots. The result of the research helps us to understand better the cultural dynamics in the site and the choices of its inhabitants during the production of pottery and specifically the ubiquitous cooking vessels.

7 TINY BITES OF THE COOKING ARCHIVES: TOWARDS THE FOOD CULTURE(S) OF EARLY NEOLITHIC BULGARIA (FROM CERAMIC TECHNOLOGY PERSPECTIVE)

Abstract author(s): Dzhanezova, Tanya (St Cyril and St Methodius University of Veliko Tarnovo)

Abstract format: Oral

The paper explores those technological aspects of pottery manufacture, associated closely with certain ways of food preparation (cooking) and specific serving requirements. Particular attention is addressed to the technological group of the coarser cooking pots, as well as to the category of the finer and oftentimes decorated 'table ware'.

The identified variable clay pastes and the peculiar technical approaches are considered as a reflection of the specific ways of doing within the Neolithic communities in the focal area. Both the ceramic and the culinary traditions are seen as shaped by transferred knowledge – regarding the clay paste preparation recipes, as well as the ways of use of certain categories of vessels involved in the processes of preparation and consumption of food.

Considering the close links between the consumption practices and the expressions of social and cultural identity in certain communities, the technological and the cooking approaches are used as a proxy for the local culinary traditions amalgamated with the ceramic vessels production – as revealed by the pottery technology and use.

615 SOME LIKE IT HOT: COPPER AND BRONZE AGE SETTLEMENT PATTERNS AS RESPONSE TO CLIMATE CHANGE?

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Schaefer-Di Maida, Stefanie (Institute for Pre- and Protohistoric Archaeology, CAU Kiel; CRC 1266) - Dziegielewska, Karol (Institute of Archaeology, Jagiellonian University) - Raese, Hendrik (Institute for Pre- and Protohistoric Archaeology, CAU Kiel) - Schirmacher, Julien (Institute for Pre- and Protohistoric Archaeology, CAU Kiel; CRC 1266)

Session format: Regular session

In the Copper Age and until the end of the Bronze Age (ca. 4000-500 BCE), very different settlement patterns and dynamics can be observed in Europe. We can identify various settlement types ranging from farmsteads, hamlets or village-like structures up to fortified settlements and the so-called mega-sites in different regions at the same time. The developments of house layouts differ on a temporal scale and even within individual settlements, likely in response to economic activities, but possibly also by socio-political organizational structures. Additionally, for some regions we can recognise a connection between changes in house and settlement structures to climatic events. Yet, a more extensive evaluation of the interplay between different factors – particularly climatic events – on supra-regional and internal settlement patterns is missing. To deepen this discussion, we ask the following questions: How did people live together and organise themselves in the European Copper and Bronze Ages? Where, when, and how can we possibly identify particular settlement patterns, considering possible problems in determining contemporaneity? Is there a correlation between house or settlement structures and changing climatic conditions or are recognized patterns related to other factors like settlement size, site location, network integration, economy (e.g. subsistence strategies, metal production, etc.)? Are certain spatio-temporal differences detectable? Our focus is not limited to one area, but to the whole of Europe, in order to gather and discuss an overview of the research regarding these issues. With this session, we would like to bring together different studies on settlement structures and climate of the Copper and

Bronze Ages. Contributions are invited from archaeology (including its sub-disciplines) and climate science, as well as environmental science, ecology, and demographic studies.

ABSTRACTS

1 HYPOTHESES ON CLIMATE AND DEMOGRAPHIC DYNAMICS IN NEOLITHIC AND EARLY BRONZE AGE CENTRAL EUROPE

Abstract author(s): Großmann, Ralph (Kiel University)

Abstract format: Oral

It is clear that environmental hazards recurred throughout the Holocene. Episodes of increased socio-environmental stress combined with resource scarcity are likely to have promoted demographic collapses and possibly triggered migrations.

Here, we test hypotheses on socio-environmental dynamics from a European perspective and present results on the impact of climate and environmental hazards on past societies. Furthermore, we investigate to what extent socio-environmental transformations had an impact on the settlement systems of the prehistoric societies in question.

Specifically, this project aims to calculate and compare demographic trends based on ¹⁴C summed probability distributions (SPDs) for three Central European regions with a high concentration of archaeological sites and radiocarbon dates, which serve as a proxy for demographic trends. The study regions include: The Circumharz region, the Northern Alpine foothills, and the Czech Republic/Lower Austria. We focus our research on the Neolithic and Early Bronze Age (5500-3500 calBP).

The comparison of these regions allows us to identify different demographic dynamics, which were probably accompanied by migrations and transformations in social inequality and settlement systems. In addition, the demographic results are correlated with regional climate data in order to assess the impact of environmental hazards, in particular climatic bond events.

The results show that demographic “booms” in one region were accompanied by “busts” in neighboring regions, raising the possibility that regions prospered at the expense of their neighbors or that population shifted from one region to another. In addition, the results show statistical correlations between population fluctuations and hydroclimatic patterns. Thus, climate was at least partially responsible for demographic trends and changes in settlement systems.

2 ENVIRONMENTAL AND SOCIETAL DEVELOPMENTS IN WESTERN EUROPE IN THE 4TH AND 2ND MILLENNIUM BC

Abstract author(s): Weinelt, Mara (Graduate School Human Development in Landscapes CAU Kiel; Institute of Pre and Protohistoric Archaeology, Kiel University) - Schirrmacher, Julien (Institute of Pre and Protohistoric Archaeology, Kiel University)

Abstract format: Oral

Exploring patterns of socio-environmental change on deep historical time scales increasingly contributes to the current climate & socio-environmental impact debate. In particular, this perspective can help to narrow down the large uncertainties inherent to predicted global change scenarios, and to identify and to assess adequate and more sustainable mitigation strategies. Such efforts require an intense debate among paleo-environmental experts & archaeologists and a robust database to empirically test hypotheses of socio-environmental interaction.

Here we present an empirical approach based on a supra-regional comparison of past human and climate dynamics, covering the mid-Holocene period and spanning major late Neolithic and Bronze Age transformations. Our analyses build on an extensive dataset of radiocarbon data from archaeological contexts serving as a proxy for past human activities. The palaeo-climatological dataset comprises centennially-resolved temperature and precipitation changes.

This synoptic approach enables us to reconstruct the magnitude and rate of climate changes and of the intensity of human activities and/or changes in population density, and to assess external environmental vs endogenous societal triggers determining regional boom and bust patterns. On a regional scale socio-environmental developments are discussed for the Iberian Peninsula and Germany with a focus on people’s responses to rapid climate change and enhanced socio-environmental stress; to tentatively identify strategies which made people resilient to successfully deal with climate and environmental hazards.

Temperature time series reveal that after the Mid Holocene Thermal Maximum the 41st century BP was the coldest century in Western Europe. A sequence of spatial reconstructions reveals under typical NAO climate variability a complex mosaic where boom and bust regions coexisted next to each other. Along with the escalating 4.2 climate crisis the demographic patterns converge, suggesting a widespread population decline. 200 years later a recovery to the mosaic pattern is observed.

3 THE 4TH MILLENNIUM BC ON THE WESTERN BLACK SEA COAST AND THE SUBMERGED SETTLEMENTS AT ROPOTAMO AND SOZOPOL

Abstract author(s): Georgiev, Pavel (Centre for Underwater Archaeology, Ministry of Culture, Bulgaria; Centre for Maritime Archaeology, University of Southampton)

Abstract format: Oral

The 4th millennium B.C. on the Balkan peninsula is a period of great change, a transition from the Late Chalcolithic to the Early Bronze Age cultures with a gap in the C14 dates of several hundreds of years. The archaeological records of those two cultures differ drastically from one another. By the end of the LCA, there is evidence of a very complex social structure the population of which relied mostly on agriculture with a vast network of connections and trade that spread from the Aegean to Central Europe as well as advanced metalworking and craftsmanship. In comparison, the EBA can not be more different, flat isolated settlements with predominant stock-breeding traditions and a more mobile way of living.

Ever since the gap was identified there have been debates among scholars on the reasons for this drastic change in the way of prehistoric life. The most predominant being attributed to climate change and fluctuations of the sea level.

With this archaeological background comes the rationale behind this research. That is to enrich our understanding of this Transitional Period on the Balkan peninsula by looking into the submerged Early Bronze Age settlements at Ropotamo and Sozopol. To better understand their nature, are they coastal settlements or pile dwellings and how did their inhabitants react to the changes in the surrounding environment by the end of the 4th mill. BC? The aim is to gather qualitative and quantitative data from submerged prehistoric sites that will give an irrefutable answer to that question. It will be done through underwater excavations with very high-resolution documentation and interdisciplinary research. The results of this will be combined into a complete image of the past.

4 CLIMATE CHANGE RESILIENCE AND VULNERABILITIES OF WATERFRONT COMMUNITIES IN THE CIRCUM-ALPINE REGION (4000-800 BCE)

Abstract author(s): Heitz, Caroline (University of Bern, Institute for Archaeological Sciences; University of Bern, Oeschger Center for Climate Change Research)

Abstract format: Oral

Exploring how communities coped with climate change is crucial for a deeper understanding of vulnerability and resilience in the past and present. In this paper responses to climate change effects on waterfront settlements during the Neolithic and Bronze Age in the Circum-Alpine space will be examined using high temporal resolution data from the UNESCO World Heritage pile dwellings. Rising lake levels repeatedly rendered former lakeshore settlement areas uninhabitable and led to temporary interruptions of local settlement activities. To critically assess the narrative of the causal influence of climatic variability, archaeological information on settlement features as well as various global and regional paleoclimatic proxy data will be correlated utilizing qualitative methods and inferential statistics. First results show that Late Neolithic settlements were resistant to seasonal flooding but vulnerable to longer-term lake level rises of higher magnitudes. Settlement communities as such, however, were resilient to both, as spatial mobility and translocal socio-spatial configurations were an inherent part of their way of life. For the Bronze Age, however, these interrelationships are still poorly understood and hold great potential for future research.

5 SEARCHING FOR THE IMPACT OF 2.6-2.8 KA BP COOL EVENT ON EARLY IRON AGE SETTLEMENT PATTERNS IN THE POLISH PLAIN

Abstract author(s): Dziegielewska, Karol (Uniwersytet Jagiellonski)

Abstract format: Oral

The abrupt climate change at 2.6-2.8 ka BP (Bond event 2) had a variable and complex impact on the climate and environments of the Northern Hemisphere. In many regions of Eurasia, it is identified as the main trigger for fundamental settlement changes, such as the disruption of lake dwellings-settlements, and the intensification of nomadic activity on the steppes. Such a relationship is not fully apparent in many areas of the Central European Plain, characterised by ecosystems with a high degree of flexibility, allowing a delayed response to changes. With the help of an analysis of several case studies from different regions of the Polish Plain and its surroundings, it can be suggested that the impact of this natural climatic event was not decisive in the short term. More difficult to assess is its contribution to the gradual reduction in settlement potential observed towards the end of the Early Iron Age.

6 CHANGE OR CONTINUITY IN SETTLEMENT STRATEGIES FROM THE NEOLITHIC TO THE EARLY BRONZE AGE IN THE SOUTHWESTERN BALTIC SEA REGION

Abstract author(s): Raese, Hendrik (Institute for Pre- and Protohistoric Archaeology, CAU Kiel) - Feeser, Ingo (Institute for Pre- and Protohistoric Archaeology, CAU Kiel; CRC 1266)

Abstract format: Oral

In recent decades, significant linear infrastructure developments, surveys and research projects have taken place in the southwestern region of the Baltic Sea and north-eastern Germany. These have expanded the archaeological record for the period between the 4th and mid-2nd millennium BCE. This allows the analysis of settlement locations and potentially changing site selection processes from the end of the Middle Neolithic to the Early Bronze Age by means of pre- or postdictive modelling based not only on environmental (soil type, slope, aspect, etc.) but also on socio-cultural variables (visibility, previous occupations, distance to interregional routes, etc.). By comparing the predicted settlement patterns with the observed differences in previously published and new data on palynological proxies, soil erosion and the distribution of macro-remains, a connection or even a response to signals of the palaeoclimate can be discussed. The inclusion of archaeological material culture in the form of aoristic analyses and the calculation of calibrated summed probability distributions of ¹⁴C-dates as proxies for demographic development opens the possibility of qualifying probable changes in settlement and subsistence strategy due to population pressure or climatic events. Overall, this should allow the identification of a potential change or continuation of human-environment interaction at the turning point from the Neolithic to the Early Bronze Age.

A. WASTE DISPOSAL PROCESSES AND LANDFILL MANAGEMENT IN LATE BRONZE AGE INNER PERIPHERY OF THE CENTRAL EUROPE: BŘEZNICE SETTLEMENT (SOUTH BOHEMIA)

Abstract author(s): Štastný, Ondřej - Šálková, Tereza (Institute of Archaeology, Faculty of Arts, University of South Bohemia in České Budějovice) - Budilová, Kristýna - Kovárník, Jaromír (Laboratory of Archaeobotany and Paleoecology, Faculty of Science, University of South Bohemia in České Budějovice) - Novák, Jan (Department of Botany, Faculty of Science, Charles University) - Pavelka, Jaroslav (Centre of Biology, Geosciences and Environmental Education, University of West Bohemia) - Strouhalová, Barbora (Department of Physical Geography and Geoecology, Faculty of Science, Charles University) - Vobejda, Libor (Institute of Archaeology, Faculty of Arts, University of South Bohemia in České Budějovice) - Kuna, Martin (Institute of Archaeology of the Czech Academy of Sciences) - Chvojka, Ondřej (Institute of Archaeology, Faculty of Arts, University of South Bohemia in České Budějovice)

Abstract format: Poster

Our study is focused on the reconstruction of the community economy in the context of the Late Bronze Age; understanding the processes that led to the filling of features and the waste management.

The settlement of Březnice is located on less fertile soils in higher altitude (ca 455 m a.s.l.). The microregion of Bechyň is one of the warmest areas in South Bohemia. In terms of humidity, this area is characterised as below average, not exceeding annual total precipitation of 600 mm. During the Late Bronze Age (1300–1000 BC) the climate in South Bohemia was rather stable and dry.

These research questions were addressed based on plant macroremains, charcoals, phytoliths, starch, micromorphology, phosphates and magnetic volume susceptibility. The results showed the waste character of features infills which reflect specific economy and habitats of single households. The composition of the archaeobotanical assemblages was not determined by the type of feature, similarities in the plant spectra could often be observed in the infill of features that were located close to each other.

The dependence of crop spectrum on the quality of soils, and on the altitude, has been demonstrated for the Březnice site. The summer crops were dominant (barely and millet), while winter crops were cultivated in many species, but smaller amount. The economy was probably adapted to shorter vegetation seasons with possible precipitation fluctuation.

Charred remains of firewood inside the assemblages contained a proportion of burnt oak structures. The remains of various parts of uncharred plants were detected by phytolith and starch analyses. Animal proteins detected the presence of livestock meat and dung. Anomalies in soil phosphate contained different amounts of organic matter. Magnetic susceptibility measurements showed that the features were backfilled in a one-time event. Sedimentological analysis showed that the infills of the different types of features were similar.

B. BOATPEOPLE OR RURAL SETTLERS? NEW ASPECTS OF BRONZE AGE LIVING IN NORTH-EASTERN GERMANY

Abstract author(s): Nessel, Bianka (Mainz University) - Rieth, Dominic (GDKE Rhineland-Palatinate)

Abstract format: Poster

For some years the settlement chamber around the Late Bronze Age settlement in Lanke, dist. Barnim, Germany has been investigated intensively. It is located on a plateau, which in prehistoric periods was surrounded at least by wetland, maybe even water. Several nearby lakes have islands with Late Bronze Age settlement traces. This choice of sites has both advantages and disadvantages in terms of settlement structure, organization, and permanence. The limited area of the island sites raises for example the question of whether grazing areas were located within the settlements or were located in other regions, which are at least several kilometres away. It also raises questions about the mobility of humans and animals, since some islands could only be reached by boat. We present an approach of exploratory water level modelling to reconstruct the settlement landscape. This allows completely new insights into the settlement organization of Bronze Age communities in this area. It seems to be a subsistence based on animal husbandry and farming, organized around a network of water-bound settlements. This organisation type is currently completely unknown for Bronze Age communities in this region.

616 EAA COMMUNITY FOR CLIMATE CHANGE AND HERITAGE (CCH) ROUNDTABLE

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Martens, Vibeke (NIKU - Norwegian Institute for Cultural Heritage Research) - Biehl, Peter (University of California) - Davies, Mairi (Historic Environment Scotland - HES)

Session format: Round table

How do we meet the changes in heritage preservation caused by climate change? On the path towards a net zero emission society, we need interdisciplinary research on responses of previous societies to environmental change to help us develop resilience, mitigation, and adaptation strategies for sustainable cultural heritage management. We have as background the statements on climate change and heritage released by the EAA 2021 (<https://www.e-a-a.org/2021Statement>), SACC 2021 (<https://www.jma.uni-kiel.de/en/research-projects/sacc/sacc-statement-2021.pdf>), and the SAA 2022 (Microsoft Word - SAA Statement on Climate Change and Cultural Heritage (windows.net)), which all point to different important aspects on how archaeology and archaeologists can contribute. We also look at recent research on green transition impacts on heritage preservation.

This seventh roundtable organized by the EAA Community for Climate Change and Heritage (CCH) builds on the success of the previous ones and hopes to focus further on: (1) globalisation, (2) adaptation, (3) sustainability, and (4) resilience.

We are inviting representatives of key archaeology associations as well as specialists in climate change and heritage research as a sounding board for the CCH activities. The roundtable session will provide an update on the work done in and by the community since the previous meeting and discuss next steps for the Community to grow and extend its network and activities to help adapt to a global climate crisis, find good solutions for adaptation and mitigation, and thus increase heritage and societal resilience.

618 ARCHAEOLOGIES OF RELIGION AND SYMBOLIC BEHAVIOUR: BUILDING USABLE DIGITAL DATABASES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Canlas, Gino Ruggiero (University of British Columbia) - Radchenko, Simon (University of Turin) - Walsh, Matthew (National Museum of Denmark) - Nol, Hagit (Goethe University Frankfurt)

Session format: Round table

The archaeology of religion is a broad discipline that investigates the materiality of embodied practices in a sphere of life that is deeply integrated with other dimensions of the human experience. The development of digital platforms provides entirely new theoretical and methodological affordances, and scholars have accordingly been developing novel, innovative approaches to sharing, analyzing and visualizing archeological data. Digital databases for religions as well as for other symbolic behaviours, however, are not yet as widespread as in other fields. The goals of such databases are to record the archeological traces of such beliefs and behaviours and to enable both individual analyses and broad syntheses of large amounts of data, which other approaches are not as well equipped to handle. This session explores the challenges inherent in designing such databases as well as coding their features, and invites scholars who have either designed archaeological digital databases or who are interested in discussing the challenges that come with them to a discussion concerning the problems involved in converting qualitative into quantitative data (particularly in

a field where data are never completely preserved), as well as the potential that databases have in bridging traditionally divided disciplinary boundaries.

620 ISOTOPES AND ARCHAEOLOGICAL THEORIES OF COMPLEXITY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Vika, Efrossini (BioArCh, Department of Archaeology, University of York) - Toso, Alice (Bonn Center for ArchaeoSciences - BoCAS, Institut für Archäologie und Kulturanthropologie, Rheinische Friedrich-Wilhelms-Universität) - Varalli, Alessandra (Cases research group, Universitat Pompeu Fabra)

Session format: Regular session

Prehistoric archaeology has vigorously embraced biomolecular techniques to investigate poorly understood social phenomena. Archaeological theories of complexity brought forward the idea of societies as non-equilibrium systems and enhanced opposing discussions on the causality of societal change. Exploring several approaches to understand the organisation of interdependence, archaeology encompassed systems theory, network analysis, small-world theories, providing attractive tools to visualise plausible scenarios of multi-scalar social interactions.

Similarly, isotopic studies have enriched archaeological understanding of significant processes in prehistory. The reconstruction of dietary diversity within and across social strata and the symbolism associated with eating shed light on the identity of prehistoric communities and their evolution across time. This is because consumption patterns - and the consequential supply strategies - are an expression of economic interaction, social competition, community-level decision making, collective food traditions, gendered eating behaviours, and regional agricultural practices. The application of isotope analyses strongly contributes to the direct investigation of dietary patterns, subsistence strategies, and food system complexity.

We invite contributions that use isotope analyses of traditional and less explored elements (i.e., C, N, S, Ca, Zn) measured from collagen, collagen amino acids, calculus, to break long-held stereotypes of past social constructs, highlight complex networks, demonstrate economic diversity, pinpoint lifeway disturbances, identify system failures, and provoke new conceptualisations of past social organisation and interaction.

ABSTRACTS

1 FOOD INEQUALITY IN BRONZE AGE AEGEAN: A VIEW FROM STABLE ISOTOPE STUDIES

Abstract author(s): Vika, Efrossini (University of York)

Abstract format: Oral

The concept of food inequality has taken on critical dimensions in recent years. The recent health crisis clearly demonstrated that wealth determines access to food. Therefore, providing equitable access to not only enough, but also nutritious food, has become one of the greatest challenges of modern societies. At the same time, it is recognized that pressures of the food system determine land use change, pollution, and climate change, when tons of food go to waste.

But how is the idea of food inequality relevant to the Bronze Age, and what does a new research framework like this offer to our current world? In prehistory, we are used to identifying risk, vulnerability, collapse. But there is no methodological suite to identify and quantify the parameters that create the above situations, although we frequently talk about grain shortage and failure of production.

The present talk reviews stable isotope paleodietary reconstructions for populations in the Bronze Age Aegean, to debate whether we have enough methodological tools to identify the indicators of food access, understand gender parameters in food insecurity, and use the privilege of observing within the long durée to understand the social stresses caused by this inequality by comparing and contrasting societal trajectories, in order to contextualise food inequality as a driver of past social complexity.

2 QUANTIFYING VARIATION IN ISOSPACE FOR ARCHAEOLOGICAL APPLICATIONS

Abstract author(s): Cheung, Christina (Department of Anthropology, Chinese University of Hong Kong) - Szpak, Paul (Department of Anthropology Trent University)

Abstract format: Oral

In recent years, the use of isotope analyses in archaeological research has grown exponentially. Additionally, the increasingly interdisciplinary nature of research has allowed us to borrow analytical tools from many other fields, greatly expanding our analytical capacity. Utilising more isotope systems has also facilitated answering a larger range of archaeological questions. One particularly important improvement is the significant decrease in analytical costs for isotopic analyses, enabling larger and larger sample sizes to be generated within a single study. With bigger data sets,

and a growing emphasis on “big data analysis”, new mathematical approaches are needed to help unleash the full potentials of such datasets. Archaeologists now realise there is a need to move away from using only summary statistics, and take advantage of newer analytical toolkits to help better interpret their data. Using simulated as well as actual archaeological datasets as examples, this study presents a number of metrics borrowed from ecology, and discusses the applicability of different quantitative methods in answering archaeological questions.

3 DIFFERENT CULTURES, SAME ECONOMIES? DIET RECONSTRUCTION OF THE ENEOLITHIC AND THE EARLY BRONZE AGE COMMUNITIES FROM SOUTH-EASTERN POLAND

Abstract author(s): Szczepanek, Anita (Institute of Archaeology and Ethnology Polish Academy of Sciences; Department of Anatomy Collegium Medicum Jagiellonian University) - Jarosz, Pawel (Institute of Archaeology and Ethnology Polish Academy of Sciences)

Abstract format: Oral

Conducted analyses of stable carbon and nitrogen isotopes comprise comparative study of Eneolithic and Early Bronze Age communities from south-eastern Poland. We concentrated on representatives of the Globular Amphora, Corded Ware and Mierzanowice cultures. Collagen extracted from bone samples was analysed, including human and animal remains. Results were presented against the background of the local environmental data obtained from plant macroremains dated to the Neolithic. The obtained values allowed the diet of the analysed people to be generally described as inland, based on C3 plants, and supplemented with varied quantities of animal products. A comparison of the mobile Corded Ware culture population with the data obtained for the Globular Amphora and Mierzanowice culture communities revealed a significant share of animal products in the Corded Ware culture diet, indicating subsistence strategies based on pastoralism. Moreover our study demonstrates the typical variation resulting from the age at death of buried individuals with a distinctive group of the youngest children. The differences between adult females and males are not clearly discernible, although for most of the males the obtained $\delta^{15}\text{N}$ values are slightly higher.

The presented investigations were financed by National Science Centre Poland, NCN 2015/19/B/HS3/02149 and NCN 2020/39/B/HS3/00454.

4 BUILDING COMPLEXITY: USING MULTI-PROXY BAYESIAN CHRONOLOGICAL MODELLING AND STABLE ISOTOPIC ANALYSIS TO EXAMINE EASTERN EURASIAN PASTORAL NOMADIC COMPLEXITY

Abstract author(s): Green, Emilie (University of Aberdeen)

Abstract format: Oral

In this paper, we present a novel approach to examining cultural complexity across the Eastern Eurasian Steppe, with a focus on Mongolia, through the construction of Bayesian chronologies alongside stable isotopes as proxies for diet, foddering, and environment. Presented here will be an extensive suite of new and published radiocarbon dates alongside stable isotope data for C/N and S isotopes from human and animal remains excavated from burial contexts across the Egiin Gol. Traditional chronological and economic models for Eastern Eurasian Pastoralist groups have often depicted a narrative of generalisation and homogeneity. In recent years an image is emerging of a mosaic of different cultural groups along differing chronological trajectories, utilising, and at times influencing, a diverse range of resources and environments available to them. We present a robust Bayesian chronology for north Mongolia that supplements current chronological frameworks, corroborates emerging narratives of increasing cultural complexity across Eurasian Prehistory (focusing here on the Bronze and Iron Ages), and demonstrably questions traditional narratives of homogeneity. This research adds to the growing body of data endeavouring to disentangle these narratives to reconstruct models for Eurasian Pastoralist groups that account for the vast and diverse environmental, climatic, political, and socio-cultural mechanisms responsible for chronological trajectories and cultural complexity.

5 COMPLEXITY OF THE LATE BRONZE AGE IN THE BERETTYÓ-KÖRÖS REGION (HUNGARY) IN THE LIGHT OF CARBON, NITROGEN AND STRONTIUM ISOTOPES

Abstract author(s): Szigeti, Anna (International Radiocarbon AMS Competence and Training Center - INTERACT, Institute for Nuclear Research, Debrecen; Déri Museum) - Hajdu, Tamás (Department of Biological Anthropology, Eötvös Loránd University) - Dani, János (Déri Museum; Department of Archaeology, University of Szeged) - Molnár, Erika (Department of Biological Anthropology, University of Szeged) - Horváth, Anikó (International Radiocarbon AMS Competence and Training Center- INTERACT), Institute for Nuclear Research, Debrecen) - Marcsik, Antónia (Department of Biological Anthropology, University of Szeged) - Márkus, Gábor (Archeodata 1998. Bt., Kiskunlacháza, Hungary) - Molnár, Mihály - Major, István (International Radiocarbon AMS Competence and Training Center - INTERACT, Institute for Nuclear Research, Debrecen)

Abstract format: Oral

From archaeological point of view, the analysed bone samples are related to the so called Hajdúbagos/Cehăluț ceramic style. As far as we know, it was formed around the end of the complex transition period of the Middle and Late Bronze Age (MBA/LBA transition; ~1500/1450 BC), with a strong influence of the MBA and Tumulus culture traditions. The group used to flourish in current North-Eastern Hungary and North-Western Romania until at least the LBA IIa (~1300-1200 BC). According to the contemporary archaeological concept the group migrated to the Northern part of the Hungarian territory in the LBA IIa, abandoning the southern part its distribution area in the Berettyó-Körös region.

This paper presents those few inhumation graves within the Hajdúbagos/Cehăluț context, where the incorporation of the biritual funeral traditions from the Tumulus culture might have been occurred. While the literature has generally associated cremation burials with the group, Hajdúbagos/Cehăluț cemeteries have barely been known in both the Hungarian and Romanian territory, so far. We also provide new AMS C-14 data from the complicated transition period of the Middle and LBA (~1600-1500/1450 BC) until the LBA IIa, focusing on the Berettyó-Körös region. The samples were measured for stable carbon ($\delta^{13}\text{C}$), nitrogen ($\delta^{15}\text{N}$) and strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) isotopes too, to obtain more information about the diet habits and mobility of people, since these data has been absent from the archaeological records so far.

The research was supported by the European Union and the State of Hungary, co-financed by the European Regional Development Fund (project of GINOP-2.3.4-15-2020-00007 "INTERACT"); by the grant of the Hungarian Research, Development and Innovation Office (proj no. FK128013), the Bolyai Scholarship of the Hungarian Academy of Sciences; and by the New National Excellence Program of the Ministry for Innovation and Technology from the source of the National Research, Development and Innovation Fund.

6 DIET AT THE HUNGARIAN CONQUEST PERIOD SITE OF KAROS-EPERJESSZÖG (10TH CENTURY CE) RECONSTRUCTED FROM STABLE CARBON AND NITROGEN ISOTOPE ANALYSES

Abstract author(s): Gugora, Ariana - Demény, Attila (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences) - Fóthi, Erzsébet (Institute of Archaeogenomics, Research Centre for the Humanities)

Abstract format: Oral

The Hungarian Conquest period (9th and 10th centuries CE) is the time when the first Hungarians settled in the Carpathian Basin. Several cemeteries from this period are found across Hungary, such as the 10th century CE Karos-Eperjesszög. Although previous stable isotopic studies have examined the diet of medieval Europeans (including Hungarians), here we present the first such research conducted on a Hungarian Conquest period population. Stable carbon and nitrogen isotope analyses were performed on dental enamel, dentin, and bone from 63 individuals to reconstruct their childhood (teeth) and adulthood or later childhood (bone) diet. The enamel apatite carbonate $\delta^{13}\text{C}$ values range from -17.1‰ to -6.7‰, with a mean of -9.9‰, and the dentin collagen $\delta^{13}\text{C}$ values range from -19.1‰ to -14.2‰, with a mean of -16.4‰. The dentin collagen $\delta^{15}\text{N}$ values range from 9.5‰ to 14.2‰ and have a mean of 11.9‰. The bone apatite carbonate $\delta^{13}\text{C}$ values range from -13.9‰ to -8.2‰, with an average of -10.6‰. The bone collagen $\delta^{13}\text{C}$ values range from -23.8‰ to -12.3‰, with an average of -16.8‰, while bone $\delta^{15}\text{N}$ values range from 9.6‰ to 14.9‰, with an average of 11.4‰. These data indicate that C3 plants were the primary plant type consumed by the population but that varying quantities of C4 plants were also part of the diet. These results support the archaeological evidence that C3 plants dominated C4 plants in (early) medieval Central Europe. The $\delta^{15}\text{N}$ values show that animal protein constituted a moderate proportion of the diets of the study population, however, this is lower than expected for a former nomadic people. The results of this research reveal new information about diet during a dynamic and formative time in Hungarian history.

'SPECIALISATION, STANDARDISATION AND DIVERSITY': RE-EXAMINING THE ROLE OF MASS PRODUCTION IN ARCHAEOLOGY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: de Groot, Beatrijs (School of History, Classics and Archaeology, University of Edinburgh) - Mentasana, Roberta (GRACPE-ARQUB, Dept. d'Història i Arqueologia, Facultat de Geografia i Història, Universitat de Barcelona)

Session format: Session with keynote presentation and discussion

Mass production allows for a set of behaviours viewed as distinctly modern, relating to the mass consumption and mass discard of material goods. Mass production has been considered as a force disrupting traditional modes of production and an agent of globalization marking the age of supermodernity (González-Ruibal 2014, 1). Despite its modern connotations, archaeologists have also utilised the term 'mass produced' in specific pre-modern cases to describe classes of abundant material goods.

In this session, we create a platform for debating characterisations of mass production across archaeological contexts and discussing its impact on past social practices and behaviours. A common assumption relating to mass production is that it corresponds to processes of standardisation and labour specialisation. However, studies into early forms of mass produced ceramics show that production frequency does not always lead to higher levels of standardisation (e.g. Fragnoli 2021). Furthermore, although current capitalist economics assumes a causal relationship between consumer demand and production intensity, the link between the abundance and availability of objects and their frequency of use remains underexplored in archaeology.

We welcome diverse approaches to the study of material culture interpreted as mass produced from across archaeological contexts as well as more general discussion papers on the topic of mass production in archaeology. Topics of interest include the relation between standardisation, labour specialisation and production intensification and the relation between changing consumption patterns and mass-production. With this, we aim to develop a critical understanding of the concept of mass production and its utility for describing past material phenomena.

ABSTRACTS

1 A COKE IS A COKE

Abstract author(s): Graves-Brown, Paul (University of York)

Abstract format: Oral

Andy Warhol famously observed that „A Coke is a Coke and no amount of money can get you a better Coke than the one the bum on the corner is drinking.“ This tells us something rather striking about the democratising potential of mass production. In this paper I will explore this notion, particularly in relation to the work of Walter Benjamin, who, contrary to popular opinion, was not an opponent of „mechanical reproduction“. Whilst, as Marx observed, capitalist production does indeed alienate labour, there is a curious sense in which a consumer society, unintentionally, „levels the playing field“ for everyone, be s/he „the president“ or a „bum“. This is perhaps most striking where technological products need to be freely available to everyone in order to succeed, the internet being the most obvious example (others include the shipping container and UNIX based operating systems). Mass production requires mass participation which, potentially, creates a balance of power which is a continual state of flux.

2 IS "PERFORMANCE" EVERYTHING? EXPLORING THE CONCEPTS OF STANDARDS, TECHNOLOGICAL CHOICES, AND PERFORMANCE ON CERAMICS FOR SUGAR PRODUCTION FROM SICILY

Abstract author(s): Mentasana, Roberta - Buxeda i Garrigòs, Jaume - Madrid i Fernández, Marisol (Cultura Material i Arqueometria UB, ARQUB-GRACPE, Dept. d'Història i Arqueologia, Facultat de Geografia i Història, Universitat de Barcelona) - Hein, Anno - Kilikoglou, Vassilis (Institute of Nanoscience and Nanotechnology, N.C.S.R. „Demokritos“)

Abstract format: Oral

What influences craft production in the past, especially when it is aimed at industrial production? Is efficiency, in the modern most productive-less effort view, something considered by craftspeople during the design and manufacture

of the object? How can we assess it? In this paper, we explore these concepts by taking the case study of ceramics for sugar production, sugar pots, from Sicily, one of the main regions for sugar production in Western Europe in the 11th-16th centuries AD.

After the Islamic expansion, sugar production in Sicily had its peak in the 14-16th centuries having an important impact on the island, and on the western Mediterranean, social, cultural, and economic development. Often, the only archaeological evidence of this industry is the presence of sugar pots, used in the last phase of sugar production when the liquid syrup is left to crystallize. These specialized vessels require to be produced in high quantity and following specific technical requirements in terms of shape, volume, and thermal and mechanical features to absolve. Results on the sugar pots' morphological and technological profile aided by instrumental analysis (Petrography, SEM, XRF, XRD, mechanical and thermal stress test) have revealed different centers of sugar pots production on the island and specific choices in the design of the vessels and their properties while following a common manufacturing idea.

To take the study further, in this paper the technological profile reconstructed is considered together with the possible stresses that the vessels were subjected to aided by computer modelling (Finite Element Modeling). This allows the simulation of the performance of the vessels under different conditions and the discussion about whether the different choices adopted by the craftspeople had an impact on the performance of the vessels during use.

3 **"ALL THAT GLITTERS IS NOT GOLD" (OR SILVER) - MASS PRODUCTION OF IMPRESSIVE FITTINGS FOR HORSE HARNESSSES IN VIKING AGE DENMARK**

Abstract author(s): Jouttijarvi, Arne (Heimdal-archaeometry)

Abstract format: Oral

The presentation is based on a Equestrian burial dated to the 10th century, found in Fregerslev in Jutland, Denmark. But is connected with a number of other finds where the same type of mass-produced fittings occurs.

The approximately 800 fittings from the horse's harness seem to span a large variation in quality. Some are of a relatively well-known type of silver-decorated iron fittings, which are known from, among a number of other places, the equestrian grave from Grimstrup, and also from a supposed fitting for a casket found in Viborg. These fittings were found to be made by a kind of mass production, where the decorations that are most often made up of braid patterns have been prepared in advance, for later to be soldered to the iron plates. The fittings bear the impression of having been hastily produced, and often the decorations did not fit the fittings, and the excess was simply cut off with a knife. Nor was time sacrificed for a correct placement of the decorative elements in relation to each other.

Somewhat surprisingly, other fittings on the same harness appear to represent a significantly higher quality of craftsmanship, including a number of gold-plated copper alloy fittings. In these cases, it is both the manufacture of the fittings themselves and the decoration on them that has been examined.

From a number of finds, only the mass-produced fittings are known, while in a few other finds they are also supplemented with fittings of high quality. It has been debated whether the mass-produced mounts constituted a form of basic equipment, made in a central workshop, which was distributed by the local king or ruler to the warriors in his service, while the better fittings constituted a form of marking of a higher rank for some of the warriors.

4 **SPINNING WORLD OF THE SPINDLE WHORL: MASS-PRODUCTION OF AVAR PERIOD WHORLS AND THREADS?**

Abstract author(s): Seidl, Benedict (University of Vienna)

Abstract format: Oral

Spindle whorls represent an essential tool in the production of textiles, with enormous lengths of threads necessary in the lives of Early Medieval societies. Apart from the threads produced, what else can these tools themselves tell us and what did they represent? This contribution aims to explore the aspects of material, shape, decoration, and production of spindle whorls with the case study of the Avar period, which exhibits two rather simple types of whorls that are very specific to this period. One seems to have been mass-produced in a standardised, efficient manner, which interestingly has parallels in the woven textiles of this period as well. These standardised whorls show a stark contrast to isolated finds of whorls made of rarer materials, such as glass, Roman pottery sherds, or mountain crystal, begging the question of whether these tools represented status symbols. Subsequently, as threads were a product of high demand, whorls are found across many burials of this period, also in an unusually high proportion of male burials compared to other cultures and periods, which could show how thread production not so gender specific as one might think.

5 THE SCREMBY CUP: ROMAN METALLURGY CAST IN A NEW LIGHT?

Abstract author(s): Thompson, Lenore (University of Derby) - Crichton-Turley, Courtenay-Elle - Willmott, Hugh (The University of Sheffield)

Abstract format: Oral

Examination of an artefact can reveal details of its making that indicate processes of mass production, a practice that demonstrates specific societal goals and associated organisational decisions. Close material analysis, however, can reveal incongruities between production practices and the ultimate goals of the producers and consumers of these items, presenting a more complex story of social and technological choices. This paper explores the production and consumption of a cast bronze cup excavated from an Anglo-Saxon burial located in Scremby, Lincolnshire, UK, dated to the 6th century. The cup itself is thought to have been produced in the 2nd century, based on its likeness to a small corpus of Roman enamelled vessels found in the UK and continental Europe. The design of the cup reveals aspects of mass production, particularly in the open casting process used to create the separate bottom piece. This is seemingly at odds with the bespoke labour- and time-intensive practices requiring artisanal specialisation to craft the body of the vessel. Close analysis suggests that the cup was not used for food or drink, and instead arguments have been made that vessels such as this were akin to Roman souvenirs. The Scremby cup represents an artefact composed of a blend of mass and artisanal production techniques in one numerically limited object type, providing evidence of the complex human relationship with production strategies and concepts of value in the Roman period. The reuse of the cup in a Saxon funerary context also allows us to investigate how these relationships developed, and how conceptualisation of its use transformed through the centuries following its production.

6 CHANGING METHODS OF PRODUCTION, CHANGING TRADITIONS: LATE LA TÈNE POTTERY ON THE SHORE OF LAKE BALATON

Abstract author(s): Sörös, Franciska (Hungarian National Museum; Eötvös Loránd University)

Abstract format: Oral

During the 2nd and 1st centuries BCE, with the development of large open agglomerations and oppida, fundamental changes occurred not only in the settlement structure but also in the methods of production. With the emergence of production centers, craftsmen, who had partly preserved and partly developed on the material culture of the previous period, created more standardised forms of personal ornaments and pottery. This phenomenon can be explained by a greater specialisation of the division of labour, changing consumption patterns, and trade links. The constantly growing and more uniform material culture also changed the former relationship between users and objects, for example by alienating members of the community from certain forms of production.

Compared to earlier periods, Late La Tène pottery is characterised not only by changed production methods but also forms and decorations with regional differences. To illustrate this, this study will use archaeological material from the open site settlement of Zamárdi-Kútvölgyi-dűlő II and the nearby fortified settlement of Balatonföldvár. Close to a strategically important haven, the two sites are located on the southern shore of Lake Balaton, facing the Tihany oppidum on the northern shore.

The changes observed in Late La Tène pottery suggest a more structured production system that fundamentally transformed the previous social practices. As the methods grew more complex, the material culture became more uniform in nature. Although these transformations did not lead to a level on par with Roman mass production, they were a significant step towards it.

7 TECHNOLOGICAL INNOVATIONS AND MASS PRODUCTION: CONSIDERING THE SPREAD OF THE POTTER'S WHEEL

Abstract author(s): de Groot, Beatrijs (The University of Edinburgh)

Abstract format: Oral

Technological innovation – defined as any change in technology which has tangible and lasting effects on human practices (Spataro and Furholt 2020) – plays a significant role in influencing the drive towards mass production and mass consumption. However, contrary to modern suggestions that innovations determine consumption behaviour, insights from archaeology suggests that the link between innovations and socio-economic change is more nuanced. Examples from the study of the potter's wheel, for instance, demonstrate that in many cases, despite the potential of this technology for increasing efficiency in pottery production, its adoption does not correlate to the mass production of wheel-made ceramics.

Utilising the potter's wheel as a case study, this presentation critically examines the dynamics of technological change and innovation and economic shifts towards mass production. In particular, the research addresses the utility of Jevons Paradox for archaeological research into technology: the notion that an increase in the 'efficiency' of production leads to a rise in the demand for those products. Utilising examples from my work on the adoption of the potter's

wheel in Iron Age south-western Europe, as well as case-studies from other areas, this paper examines the diversity of contexts in which the technology was adopted and used. Addressing its use across different temporal scales seeks to offer insights into long-term trajectories towards mass production and the socio-economic contexts in which such forms of production and consumption emerged.

8 DECONSTRUCTING POTTERY SPECIALIZATION AND STANDARDIZATION PROCESSES DURING THE RECENT PREHISTORY AND PROTOHISTORY IN IBERIA: A SOCIAL APPROACH FROM TECHNOLOGY

Abstract author(s): Padilla Fernández, Juan Jesús (Universidad de Salamanca)

Abstract format: Oral

Specialization and standardization have been traditionally interpreted in archaeology from a linear perspective and as a key tool to progress. However, history and past societies cannot be understood from presentist conceptions connected with current economic ideas based on capital. A more aseptic study on the technology of pottery assemblages during recent prehistory and protohistory (Bronze and Iron Ages) of Iberia allows reconsidering the alleged secondary nature of maintenance activities and their domestic and social contexts, as well as the specialized nature of both these activities and the people in charge of carrying them out. Thus, this presentation intends to demonstrate two things: that more than two thousand years ago pottery specialization and standardization processes were not necessarily linked to mass production and that technological innovations would not be synonymous with technological advances but rather the effect of the imposition of new ways of conceiving the world and specific social changes.

9 CERAMIC MASS PRODUCTION AND THE EMERGENCE OF THE PHOENICIANS

Abstract author(s): Badreshany, Kamal (Durham) - Schmitt, Aaron (University Heidelberg) - Rummel, Michael (Freie Universität Berlin) - Walters, Benton (University of Bristol)

Abstract format: Oral

This paper discusses the results of the first integrated large-scale multi-disciplinary analysis of Iron Age II and III pottery (ca. 850-300 BC) from settlements in southern Lebanon, an area that forms the core of the Phoenician Homeland. The research presented is centred upon a large corpus of mass produced Phoenician ceramics of various types, including amphorae and table wares. Traditional typological investigations are combined with a focused archaeometric approach including a new quantitative method for the morphometric analysis of amphorae, thin-section petrography, geochemistry and organic residue analyses, that are aimed at gaining a more detailed understanding of the organization and the development of Phoenician economy and their interactions across the Mediterranean. Despite gradual, but marked typological changes, very little change in the fabrics of these vessels was noted over 400-years. The research, thus, demonstrates that the production of ceramics was highly organised, and was undertaken by long-lived, sustained and centralised modes. The foundation of new sites beginning around 850 BC and the development of a new large-scale mass-produced pottery industry coincides with great changes across the region, including the emergence of the world's first great imperial powers and the intensification of Phoenician expansion in the Mediterranean. The outcomes of this research provide new insights into socio-economic strategies adopted in the Phoenician homeland during this pivotal time.

10 SO MANY BOWLS...BUT IN WHICH SENSE? MESOPOTAMIAN COBA AND BEVELLED-RIM BOWLS AS EXPRESSIONS OF SERIAL AND MASS PRODUCTIONS

Abstract author(s): Baldi, Johnny (CNRS)

Abstract format: Oral

In the archaeological literature of pre- and protohistoric West Asia, the concept of mass production has played a key role as the pivot of a long-standing broadly consensual argument. This sort of clichéd postulate on the appearance of so-called social complexity put together repetitiveness of production, standardization of finished products, increasing craft specialization, and, at the same time as the outcome and the driving force of all these phenomena, the advent of urbanization and early states. This perspective associates mass production with serial production on a terminological level, without making any distinction on a conceptual, operational, or material-cultural basis. This paper aims to identify criteria to differentiate serial from mass productions by analysing various types of late prehistoric Mesopotamian ceramic containers, but especially Coba bowls from the 5th millennium and Bevelled-Rim Bowls (BRB) from the 4th millennium BCE. Based on data from recent and ongoing excavations in Syria, Iraqi Kurdistan, and Southern Iraq, the

purpose of characterizing serial and mass operational sequences is to show how these separate modes of production implied entirely different relationships – both in terms of rates and patterns – with the phenomena of standardization and specialization. Ultimately, the analysis of Coba and BRBOWls reveals different organizations of the production chains and stresses the multifaceted and articulated nature of complex manufacturing.

11 MAKING FOR THE MASSES? PRODUCTION AND CONSUMPTION OF PLAIN HANDLELESS CUPS IN EARLY BRONZE AGE PHAISTOS (CRETE)

Abstract author(s): Todaro, Simona (Catania University)

Abstract format: Oral

In Minoan archaeology the term plain handleless cup is used to indicate a distinctive type of small vessel, of hemispherical or conical shape, which appeared in south-central Crete in the late Early Bronze Age period (i.e., around 2300 BC) and spread in the rest of the island and in various extra-insular locations that were under Minoan control in the Late Bronze Age. Most research into this category of vessel has focused on the more ubiquitous later version, labelled conical cups, often excluding entirely the earlier types known from south-central Crete from consideration. From a southern Crete perspective, however, the conical cups of the second millennium BC cannot be regarded as a separate phenomenon from the plain handleless cups attested already there in the mid-third millennium BC. Recognition of this raises a series of questions. Why did plain handleless cups first appear in southern Crete, so much earlier than the rest of the island? How (and why) were they produced during the late third millennium? How were they used and in which aspects did this differ from their painted counterparts or from other types of handleless or handled cup? What lines of development can be traced between these earlier examples of plain handleless cup and the ‘conical cups’ of the second millennium BC?

This paper aims to address these questions by focusing on the find-contexts and mode of production of EBA plain handleless cups found in the ceremonial/palatial centre of Phaistos, and will argue that these cups were produced en masse with moulds by specialists and non-specialised potters to be used as ration-bowls in the context of work-feasts, i.e. as a means to manage collective labour in a manner that very closely recalls the use of ration-bowls of the redistributive political systems of the late Uruk culture.

657 THROUGH INFANCY AND BEYOND: BIOARCHAEOLOGICAL PERSPECTIVES OF CHILDHOOD IN THE PAST

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Hodson, Claire (University of Reading) - Dittmar, Jenna (University of Aberdeen) - Colombo, Antony (École Pratique des Hautes Études)

Session format: Regular session

Infancy, childhood, and adolescence are fundamental aspects within all our lives, representing unique periods of biological, social, and cultural growth and development. With critical understanding of the importance and impact that these integral periods have on our overall life-course, increasing numbers of bioarchaeological investigations into the experiences of these young individuals are being undertaken. Both social-cultural explorations of the interactions between non-adults, their mothers, and the social worlds and communities in which they develop have emerged, in addition to several innovative methodological advancements in skeletal analysis, such as new macroscopic methods for estimating pubertal stage, juvenile peptide sex estimation, and increasing numbers of isotopic analyses looking at dietary, weaning and health stress, as well as 3D and medical imaging to understand growth and pathological processes. Non-adult bioarchaeology is thus of sustained, contemporary importance. This session aims to highlight new interdisciplinary research focusing on these young lives, unbound by temporal or geographical constraints, drawing together researchers and projects to consider new advances in non-adult bioarchaeology.

1 INFANCY AND DEATH IN MEDIEVAL WALLONIA (BELGIUM): SOME BURIAL AND BIOLOGICAL ASPECTS

Abstract author(s): Laforest, Caroline (Royal Belgian Institute of National Sciences; PACEA, University of Bordeaux) - Théry, Marie - Henrard, Denis - Mora-Dieu, Guillaume (Wallonia Heritage Agency) - De Beusscher, Valentine (Recherches et Prospections Archéologiques asbl) - Ansieau, Cécile (Wallonia Heritage Agency) - Bétian, Eva (University of Clermont-Ferrand)

Abstract format: Oral

Recent discoveries in the cities of Liège and Mons have enabled the initiation of a new and interdisciplinary research project, still ongoing, regarding the funeral practices and bioarchaeology of babies during the Middle Ages (7th-mid 13th c.) in Wallonia; a place where investigations into the lives and roles of young children have been minimal. In Liège, the Notre-Dame-aux-Fonts church revealed the presence of about fifteen inhumations of young infants (from perinatal to 2-3 years) dated from the second half of the 7th century to the mid-10th century AD. These burials were grouped in a pit arranged against a gutter wall. On the contrary, ten infants tombs (from 7-months in utero to 2-3 years old) were scattered among the burials of adults and older children in Mons, in a cemetery at the feet of the Sainte-Waudru church. Two of these infants tombs are associated with adult burials, in the same grave. These tombs are equally dated from the second half of the 7th century to the end of the 9th century but also from the 11th to the 13th century. On both sites, the taphonomical analyses showed evidence of burial in individual coffins, with sometimes evidence of a shroud present. The age distribution shows the presence of individuals from 7 months in utero up to 2-3 years of age, but the demographic profile seems to reflect the early childhood risks more than the reality of neonatal mortality in pre-jennerian societies. Nevertheless, several individuals are characterized by shape abnormalities and bone alterations, attesting that they experienced different kinds of conditions during their short lives.

2 NEW KIDS IN TOWN - INVESTIGATING NON-ADULT SKELETAL REMAINS FROM THE 18TH CENTURY GARRISON HOSPITAL CEMETERY IN TALLINN, ESTONIA

Abstract author(s): Vilumets, Linda (University of Tartu, Faculty of Arts and Humanities, Institute of History and Archaeology)

Abstract format: Oral

The Great Northern War (1700–1721) was a military conflict between major political powers in the Baltic Sea region, which resulted in the emergence of the Russian Empire. During the war Tallinn fell under the Russian rule and the suburbs of the town became home to numerous garrison soldiers and their families. Very little is known about the lived experiences of these children who as a result also migrated to or were born in a foreign place. Archaeological rescue excavations have revealed that many of them died an untimely death and were buried at the Russian garrison hospital cemetery. The burial place was used from approximately 1715 to 1770s and provides a good opportunity to study the non-adult (0–17 years) skeletal remains (approximately 70) from a relatively short time period.

Previous research conducted on the non-adults of Tallinn who were buried at a regular suburban cemetery (16th to 18th century) has demonstrated the negative effects that the surrounding environment and dietary practices can have on children, including severely faltered growth (35%), respiratory infections (16%) and various metabolic diseases. Paleopathological and osteological analysis of soldier's children provides a chance to investigate the lives of this marginalized group previously invisible in historical records. Comparisons with other coeval populations reveal whether they suffered similar health insults as native juveniles and how did divergent cultural practices affect their wellbeing.

3 THE CHILDREN OF THE LAST HUNTER-GATHERERS' COMMUNITIES, NEW SKELETONS FROM CABEÇO DA AMOREIRA (PORTUGAL)

Abstract author(s): Coutinho Nogueira, Dany (CIAS - Research Centre for Anthropology and Health, University of Coimbra) - Godinho, Ricardo (ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behavior, University of Algarve) - Ramos Gaspar, Rosa (CIAS - Research Centre for Anthropology and Health, University of Coimbra; Centro Hospitalar Universitário de Coimbra - CHUC) - Bicho, Nuno - Cascalheira, João - Gonçalves, Célia (ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behavior, University of Algarve) - Umbelino, Cláudia (CIAS - Research Centre for Anthropology and Health, University of Coimbra; ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behavior, University of Algarve)

Abstract format: Oral

Discovered 160 years ago, the 13 archaeological sites of Muge located in the Tagus Valley (Portugal) have delivered one of the most important collections of human remains dated to the Final Mesolithic in Western Europe, with estimates of up to 300 individuals having been recovered from these contexts. The individuals are buried under or within shellmiddens (a.k.a k kkenm dding or concheiros) whose weight and calcareous nature have led to numerous taphonomic alterations: fragmentation, deformations, and calcareous encrustations. Despite about 30% of the sample being composed by non-adults, studies focusing on immature individuals are scarce and limited to pathological cases.

One of the shellmounds, Cabeço da Amoreira has been subjected to numerous excavation campaigns which yielded nearly 40 individuals, with ages at death ranging from infancy to elderly adults. Since 2011, new excavations with modern techniques have been conducted and led to the discovery of 6 new skeletons, half of which are non-adults, including a nearly complete skeleton of an individual who died during the perinatal period. The thoroughness of the excavations made it possible to collect data on the burial practices of these children, highlighting some differences between them. Paleoimaging techniques were employed to determine the age at death of the individuals (based on dental development of erupted and unerupted teeth) and to analyse porosities of the skeletons in order to determine if they correspond to normal bone growth or pathologies. One of the burials was removed en bloc and CT-scanned allowing to virtually reconstruction the position of the skeleton. Thus, the analysis of their skeletal and dental remains, combining macroscopic and paleoimaging methodologies, brings new information on their biological identity, health status, the growth and development of the last hunter-gatherers of Western Europe.

4 MULTIPROXY STUDY OF AN "UNUSUAL" INFANT FROM ALORDA PARK (CALAFELL, CATALONIA, 6TH-2ND C. BC)

Abstract author(s): Lucas, Marta (Universitat de Barcelona) - Le Cabec, Adeline (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199, F-33600) - Colombo, Antony (UMR 5199 PACEA, EPHE-PSL University) - Pruvost, Mélanie - de Belvalet, Harmony (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199, F-33600) - Garot, Elsa (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199, F-33600; Université de Bordeaux, UFR des Sciences Odontologiques) - Rack, Alexander (European Synchrotron Radiation Facility, Structure of Materials Group - ID19, CS 40220) - Asensio, David (Departament d'Hist ria i Arqueologia, Universitat de Barcelona - UB, Barcelona, Spain; Departament de Ci ncies de l'Antiguitat i de l'Edat Mitjana, Facultat de Filosofia i Lletres, Universitat Aut noma de Barcelona - UAB) - L pez-Onaindia, Diego (Univ. Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR 5199, F-33600)

Abstract format: Oral

During the Iron Age, funerary culture in Western Europe is characterised by a combination of unique practices. Cremation necropolis is the most common funerary treatment, which cohabitated with exhibition of decapitated skulls, and perinate burials in urban contexts. Regarding the latter, many questions remain to be answered; were the perinate individuals buried within urban contexts deliberately selected as it is likely there are not enough to represent all of the individuals who would have likely died at this age.

The archaeological site of Alorda Park (Calafell, Catalonia) was occupied from the 6th to 2nd century BC. Three phases deeply remodelled the settlement that transformed it from a typical rounded plan settlement to a fortified and squared plan one. All these changes caused stratigraphic alterations thus, most of the excavated individuals (MNI=17) are only partially preserved. From them, only 7 have been exhumated in situ, six of them in the chieftain's house and belonging the last phase.

Here, we present a perinate, individual ALP'01 S.08, who presents several anatomical anomalies: cervical ribs and a supernumerary tooth germ fused to the germ of the left mandibular lateral deciduous incisor. This individual is analysed through a multidisciplinary approach to better understand the reasons of the specific funeral practice it underwent. Indeed, ALP'01 S.08 is very well preserved and was found under a paved street. An analysis of the double fused incisor germ using synchrotron microtomography (scan resolution: 3 m) and virtual histology techniques has shown an accentuated line compatible with the neonatal line, confirming that ALP'01 S.08 survived beyond birth. The

paleo-genetic analysis have allowed to determine the sex and a micro-CT (μ CT) scan analysis of the bones presenting paleopathological signs allows us to propose a complex differential diagnosis including syndromes with congenital, micro-nutrient deficiency or as the result of environmental factors affecting development.

5 EVIDENCE FOR SMALLPOX IN THE ARCHAEOLOGICAL RECORD: A CASE FROM 7TH CENTURY HAYTON, YORKSHIRE

Abstract author(s): Crawford, Rosie (University of Cambridge; Cranfield University) - Hodson, Claire (University of Reading) - Errickson, Dave (Cranfield University)

Abstract format: Oral

Smallpox, caused by the variola virus (VARV), is estimated to have infected humans for around 2000 years. The disease is generally recognisable from its characteristic pustular rash and accompanying fever, but significant involvement of the skeleton has also been documented. Known clinically as osteomyelitis variolosa, this skeletal involvement comprises a typical set and distribution of sequelae and is a complication estimated to occur in 2-20% of non-adults with VARV. Most notably is the bilateral involvement of the elbows and, in the short-term, inflammation of the long bone metaphyses and destructive remodelling of the joint surfaces and surrounding bones. Whilst osteomyelitis variolosa appears only to begin developing in non-adult individuals, the condition can further progress to its classic 'late manifestations', which continue to be present for life; these include degenerative arthritis, flail joints, ankylosis, and stunted growth.

Currently, only six cases of archaeological osteomyelitis variolosa have been published, dating from the 10th - 19th centuries CE. These cases exhibit a mixture of the expected shorter- and longer-term osteological sequelae of smallpox, and comprise of five non-adult individuals, and one young adult. Here we put forward a potential seventh case.

Following a thorough review of the published clinical, palaeopathological, and archaeological literature on smallpox bone involvement since the 19th century, this study undertook the skeletal reassessment of a 7th century non-adult individual from a multi-phase archaeological site in Yorkshire. Both macroscopic, visual assessment and micro-CT imaging were used, and a multitude of pathological skeletal changes across the skeleton were recorded, consistent in type and distribution with the longer-term manifestations of osteomyelitis variolosa. Consequently, this research presents the oldest known case of osteomyelitis variolosa worldwide, and the earliest known physical evidence for the presence of smallpox in Britain.

6 RADIOGRAPHIC EVALUATION OF A 19TH CENTURY CASE OF RICKETS

Abstract author(s): Vicente, Lucia (Complutense University) - Ríos Frutos, Luis (Complutense University, Biodiversity, Ecology and Evolution Department)

Abstract format: Oral

The aim of this study is to analyze by means of radiography a sample of 84 long bones of children skeletons aged 0 to 6 years diagnosed with rickets. These cases came from the crypt of the Convento of Trinitarias Descalzas in Madrid, dated by documentary findings in the mid-nineteenth century. The radiographs were taken at the La Paz University Hospital (Madrid), and the iQ-LITE digital radiography viewer was used for visualization. In digital radiographs, several variables were taken from the paleopathological and clinical literature. The Line of Provisional Calcification (LPC) is the hypertrophic cartilage calcification. Radiographically it is observed in the growth plate as a radiopaque line. Thacher's radiographic scoring method is a 10-point score that assesses the degree of metaphyseal fraying and cupping and the mineralization of the growth plate. Both methods were used to evaluate the severity of rickets. Cases that show either radiolucent bands in the metaphyseal area or curvature in the diaphysis in individuals with no signs of active rickets could indicate previous episodes of rickets. In this study, a high frequency of severe radiological signs was observed (60% from LPC and 50% from Thacher), as well as the presence of past episodes of rickets (14%). We determined that there were significant differences in the signs of rickets between each long bone. For the interpretation of rickets, it is important to take into account the different growth rates of each segment of the arm and leg, which explains the diversity shown by the signs of this pathology on each bone. Digital radiographs assessed the severity of rickets, as well as signs of active healing, and signs of previous episodes of rickets. The contribution of radiographic evaluation for the study of rickets in paleopathology is discussed, as well as its contribution to the case of Trinitarias.

7 A CRADLE IN DEATH: COULD THE CONVENT OF SAINT DOMINGOS (LISBON, PORTUGAL) BE THE LARGEST NECROPOLIS OF NON-ADULTS EVER EXCAVATED?

Abstract author(s): Lourenço, Marina (University of Coimbra, Centre for Functional Ecology, Laboratory of Forensic Anthropology; Department of Life Sciences; University of Coimbra, Research Centre for Anthropology and Health; Department of Life Sciences; Era Arqueologia, S. A.) - Oliveira, Filipe - Calvo, Ever 3Era Arqueologia, S. A.) - Evangelista, Lucy (Era Arqueologia, S. A.; Interdisciplinary Center for Archaeology and Evolution of Human Behaviour)

Abstract format: Oral

In 2018, during rehabilitation works in the former convent of Saint Domingos, in the center of Lisbon, a large necropolis of non-adults was identified. It was located in the convent's cloister in an area of about 400m² and resulted from a short period of inhumations between 1755 (post-earthquake) and 1836.

We intend to present the results of the fieldwork that unearthed an osteological sample composed of approximately 2800 non-adults found in situ. A large number (~95%) died between the third trimester of gestational age to three years, with a very high percentage of perinatal deaths. Funerary practices show that the majority of individuals were buried in single graves, although a noteworthy number of collective graves were also identified. The space was abundantly reused, displaying an ample diversity of body depositions and orientations.

This necropolis is an exciting new finding, which stands out not only because of the large number of non-adults but also because of their overall good preservation and representativeness, and the restricted chronology associated, representing a meaningful opportunity to greatly enhance the knowledge about the growth, development, and health of non-adults in the recent past.

8 CHILD ABUSE AND NEGLECT IN ARCHAEOLOGY, WITH CASE STUDIES FROM MEDIEVAL AND POST MEDIEVAL SCOTLAND

Abstract author(s): Ashcroft, Elizabeth - Crozier, Rebecca (Department of Archaeology, University of Aberdeen) - Oxenham, Marc (School of Archaeology & Anthropology, Australian National University)

Abstract format: Oral

Child abuse and neglect remain under-explored (and perhaps avoided) in Archaeology, despite the recognition that a key determinant of any society is how we treat our children. Archaeologists find child abuse and neglect to be problematic topics because of the emotional sensitivity they provoke, and because of the complexity of the material evidence. To resolve these difficulties, a novel "jigsaw" model has been constructed which is an integrated, multidisciplinary, and child-centric investigation. The model is reproducible, applicable to individuals or groups of children from any Archaeological setting or time-period, and thus it permits comparative studies. The "jigsaw pieces" are the findings from investigations which extend beyond forensic or bioarchaeology to include burial archaeology, the archaeology of emotion, children's play, and the social and cultural context of the child's life in the past. The model leads to weighted, evidence-based conclusions about abuse and neglect, which are then open to broader archaeological interpretations. In this study thirty-five children's burial sites were identified across Scotland from the Medieval and Post-Medieval periods. The skeletal records of 2207 children were reviewed, with 443 being directly examined. Twenty-seven children (1.2%) were found to have skeletal trauma from a range of causes, and three further children had growth failure or stable isotope results leading to considerations of neglect. From the very substantial archives from St Nicholas Kirk, Aberdeen, two infants with skeletal trauma from abuse have been chosen as exemplars of the use of this novel "jigsaw model".

9 AN INTERDISCIPLINARY APPROACH TO THE STUDY OF CHILD ABUSE IN THE PAST: INTEGRATING METHODS FROM WITHIN AND BEYOND BIOARCHAEOLOGY

Abstract author(s): Marino, Roberta - Craig-Atkins, Elizabeth (Department of Archaeology, The University of Sheffield) - Millard, Chris (Department of History, The University of Sheffield)

Abstract format: Oral

Identifying evidence of child abuse in the bioarchaeological record has been the subject of debate. Past studies exhibited a lack of consistency in their approaches, leading to questions regarding the feasibility and potential of this area of research. To move forwards, it is crucial to critically explore the extent to which the evidence of the abuse of children in the past might be rendered more visible and its interpretation more reliable.

This paper will introduce a PhD project that investigates the methodological potential of a novel interdisciplinary approach that combines osteological and clinical evidence with radiological and bioengineering data and interprets these data within their historical, archaeological, psychological and socio-cultural context.

It takes a multi-scale sample approach, re-evaluating extant cases of suspected child abuse and examining a large medieval and post-medieval dataset (c.901-1900 AD; n=1074) using a novel protocol designed to identify instances of childhood skeletal trauma to discover new cases of abuse in the archaeological record.

Ongoing data collection revealed numerous instances of traumatic lesions. Preliminary data highlights how the application of knowledge from clinical/forensic sources is vital to accurately interpret non-adult skeletal trauma and how techniques developed within those fields can be highly complementary to osteological methods.

Thus far, 8 individuals have been selected for CT-based finite element (FE) analysis to investigate the mechanisms of long-bone fractures under a variety of loading conditions and thus evaluate the likelihood of inflicted injuries; 12 individuals have been chosen to test the potential of a high-resolution and non-destructive imaging technique (micro-CT) to achieve a more precise and accurate analysis of the degree of fracture healing.

These data will illuminate what can be learned from incorporating the various strands of evidence that can be brought to bear on the osteological data and allow for a critical evaluation of where the limitations lie.

10 **AN ANALYSIS OF THE LOCATIONS, ORIGINS, AND INFLUENCES BEHIND CILLÍNÍ (UNCONSECRATED CHILDREN'S BURIAL GROUNDS) IN COUNTIES FERMANAGH, MEATH, AND ANTRIM**

Abstract author(s): Mundt, Courtney (Queen's Univeristy Belfast)

Abstract format: Oral

Cillíní (unconsecrated children's burial grounds) were an unfortunate outcome of the Roman Catholic Church's Counter-Reformation (1545-1648 AD/CE). During the Counter-Reformation, the Church went back to and promoted their older theological teachings, including those of Saint Augustine of Hippo (354-430 AD/CE), who had proposed that unbaptised and stillborn children be refused burial in consecrated ground as they were still 'tainted' with Original Sin. Given no alternatives, the Irish began to bury their unbaptised and stillborn children close to or inside archaeological sites, and near anthropomorphic boundaries and prominent landscape features. Due to the complex emotions associated with the loss of a child carried by not just the families of the children but the community as well, the locations of many of these cillíní have faded out of memory, resulting in them being susceptible to agricultural and developmental destruction. With this in mind, it is the purpose of my doctoral dissertation to research and better understand the origins and locations of cillíní in the case study counties of Fermanagh, Meath, and Antrim. This was done by examining the current available map data and site documentation provided by Northern Ireland's Sites and Monuments Record (NI SMR) and the Republic of Ireland's National Monument Services (ROI NMS); researching the religious influences behind cillíní origins and locations; and performing oral history research fieldwork. This research has resulted in an increased number of recorded cillíní in the above counties; a better understanding of the Church's influences on the origins and locations of cillíní; and evidence of how cillíní oral traditions have survived in County Fermanagh. It is hoped that these results will continue the discussion of cillíní within Ireland and promote future research into these under-studied burial grounds.

11 **THE IMPACT OF THE ROMAN CONQUEST ON FOETAL, PERINATAL, INFANT, AND MATERNAL HEALTH IN BRITAIN**

Abstract author(s): Pitt, Rebecca - Lewis, Mary - Eckardt, Hella (University of Reading)

Abstract format: Oral

Recent bioarchaeological research highlights the importance of examining marginalised individuals to understand life within past societies, with a particular focus on foetal, perinatal, and infant skeletal remains. However, studies rarely examine these non-adults in comparison with the maternal population, often choosing to keep the world of non-adult and adult health separate. This presentation will compare the health of Iron Age and Roman non-adults aged up to 2.5 years (the first 1000 days after conception) (n=368) with women of childbearing age (20-45 years) (n=250) to observe how generations were impacted by the Roman conquest of Britain. Previous studies have suggested that the Roman conquest may have negatively impacted the lives of native Britons, yet comparisons with Iron Age populations have previously consisted of small datasets, raising the question of whether we are missing health stressors. Application of the Developmental Origins of Health and Disease (DOHaD) hypothesis alongside pioneering bioarchaeological methods to explore growth disruption and the obstetric hazards faced by women may develop an understanding of how the relationship between mother-infant was affected by the impact of changing socio-economic factors on the health of these individuals. Preliminary results suggest that health for both non-adults and adults worsened after the Roman conquest. In the non-adults, Iron Age individuals (n=46/174, 26.4%) showed less palaeopathological changes overall than both rural Roman (n=42/113, 37.2%) and urban Roman (n=41/81, 50.6%) populations. This pattern was also reflected in the adults, with Iron Age individuals (n=55/117, 47.0%) showing fewer pathological changes than the

rural Roman (n=40/65, 61.5%) and urban Roman (n=56/68, 82.6%) populations. Importantly, this suggests that the Roman conquest of Britain did have lasting, generational health effects on the population.

12 DISEASE, DIET, AND FALTERING GROWTH: INTERPRETING PRENATAL HEALTH IN THE LATE ANTIQUE TIBER VALLEY

Abstract author(s): Malis, Sierra (Smithsonian Institution, National Museum of Natural History; Department of Anthropology and Middle Eastern Cultures, Mississippi State University) - Wilson, Jordan (Department of Anthropology, The Pennsylvania State University) - Russo, Giuseppe - Lauteri, Marco - Chiocchini, Francesca - Ciolfi, Marco (Nation Research Council, Research Institute on Terrestrial Ecosystems) - Soranna, Gabriele (Independent Researcher) - Pickel, David (Department of Classics, Georgetown University) - Soren, David (School of Anthropology, University of Arizona)

Abstract format: Oral

Studies of juvenile growth and development in past populations have described the complex relationship between nutrition and infectious disease, especially among infants and children. In rural Roman Italy, diseases such as malaria, diarrheal infection, sepsis, and pneumonia interacted synergistically with undernutrition to increase morbidity and mortality, much as they do in present-day subsistence agricultural populations. The following research examines 60 fetuses, perinates, and infants from a Late Antique (5th cent. CE) agricultural community uncovered from the cemetery at Poggio Gramignano who were likely affected by an epidemic of *Plasmodium falciparum* malaria. Our study takes a syndemic approach to decoding the complex relationship between growth disruption, diet, and infectious disease. While previous research indicates the infants had increased indicators of physiological stress indicative of malnutrition or infectious disease, our study further reveals that mean skeletal age estimates were significantly lower than dental age estimates ($p < 0.001$), with 8 individuals (13%) showing evidence for growth disruption, along with a high incidence of pathological lesions. Although there is evidence of disrupted growth and increased indicators of physiological stress present among the infants, preliminary results of stable carbon and nitrogen isotope analysis of bone collagen suggest a variable and nutritionally rich diet. Specifically, mean $\delta^{13}\text{C}$ ($-21.1 \pm 0.7\text{‰}$) and $\delta^{15}\text{N}$ ($8.8 \pm 0.9\text{‰}$) values suggest that weaning and adult food consisted mainly of terrestrial resources such as C3 plants and terrestrial animals, following eating habits reconstructed from historical and archaeological sources from coeval sites. In light of this information, nutritional deficiencies alone cannot sufficiently explain the presence of physiological stressors and growth disruption among these infants. Thus, we consider how fetal and perinatal health was shaped by cultural factors alongside the complex interaction between diet and disease in this particular community and among its most environmentally sensitive members.

13 BREAST MILK AND SOLID FOOD - CHILDHOOD DIET IN THE NEOLITHIC. CASE STUDIES FROM THE POLGÁR REGION, HUNGARY

Abstract author(s): Somogyvári-Lajtár, Eniko (Institute of Archaeological Sciences, Eötvös Loránd University; Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences) - Pető, Ákos (Department of Nature Conservation & Landscape Ecology, Institute of Nature Conservation & Landscape Management, Szent István University Faculty of Agricultural & Environmental Sciences) - Gugora, Ariana (Institute for Geological and Geochemical Research, Research Centre for Astronomy and Earth Sciences) - Hajdu, Tamás (Department of Anthropology, Eötvös Loránd University) - Anders, Alexandra (Institute of Archaeological Sciences, Eötvös Loránd University)

Abstract format: Oral

Childcare is an important part of a community's everyday life. Breastfeeding, the process of weaning, and the dietary habits of non-adults are both a biological necessity and a socio-cultural phenomenon. In this paper, we shall use isotope chemistry to examine issues related to the nutrition and lifestyle of the non-adult members of the populations of two Middle and Late Neolithic (5500-4500 BCE) sites on the Great Hungarian Plain in eastern Hungary (Polgár-Ferenci-hát, Polgár-Csőszhalom). Last year (EAA 2022), we presented the preliminary results of this multi-year research project. This year, we can report on the final results. In the case of 71 child burials, we were able to examine the available archaeological, isotope chemistry, and anthropological data. We used five age group categories to analyse the results in as much detail as possible. We measured stable carbon and nitrogen isotope ratios on bone and tooth dentine collagen samples, and we measured stable carbon and oxygen isotope ratios on tooth enamel apatite samples to determine breastfeeding signals and weaning ages. We measured stable carbon and nitrogen isotope ratios on bone and tooth dentine collagen samples, and we measured stable carbon and oxygen isotope ratios on tooth enamel apatite samples to examine the general dietary habits. For the first time in Hungarian Neolithic research, we had the opportunity to examine children's dental calculus samples with micro-archaeobotanical methods, whereby we also obtained more information about the plant-based foods they had consumed. The present work is the first to systematically address the lifestyle of children in the Neolithic of the Carpathian Basin. The occupation of the two

sites spans roughly 1000 years, and thus we were able to observe both temporal and spatial changes. The project is funded by a grant from the National Research, Development and Innovation Fund (Grant K124326).

14 CHILDREN OF THE CITY: DIETARY DIFFERENCES BETWEEN BOYS, GIRLS, AND ADULTS IN A POST-MEDIEVAL URBAN ENVIRONMENT

Abstract author(s): Palmer, Jessica (ArcheOs, Laboratory for Biological Anthropology, Faculty of Arts and Philosophy, Ghent University) - Cherretté, Bart - Massagé, Liesbeth (Solva Archaeology) - Burnett, Alexandra (ProGenTomics, Laboratory for Pharmaceutical Biotechnology, Faculty of Pharmaceutical Sciences, Ghent University; ArcheOs, Laboratory for Biological Anthropology, Faculty of Arts and Philosophy, Ghent University) - Daled, Simon - Dhaenens, Maarten (ProGenTomics, Laboratory for Pharmaceutical Biotechnology, Faculty of Pharmaceutical Sciences, Ghent University) - Deforce, Dieter (Laboratory of Pharmaceutical Biotechnology, Faculty of Pharmaceutical Sciences, Ghent University) - De Groote, Isabelle (ArcheOs, Laboratory for Biological Anthropology, Faculty of Arts and Philosophy, Ghent University)

Abstract format: Oral

Diet and access to dietary resources form a fundamental aspect of culture and society. Differentiation in diet between individuals and demographic groups within an archaeological skeletal population can give unique insights into how that community was structured. This study analysed the diet of adults and non-adults from the post-medieval town of Aalst (Belgium) and its hinterland (n=444). For the current presentation, the focus is on the diet of lower-class non-adult individuals within the town. It combines the well-established bioarchaeological method of dietary stable isotope analysis (carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) from bone collagen with the novel peptide-based sex estimation from dental enamel (amelogenin X and Y). This multimethod dataset is used to study diet in the boys and girls aged 0 to ca. 18 years buried in a cemetery within the city (n=61). Results are analysed for sex and age differences in diet, and compared to dietary stable isotopes for adults and non-adults from five contemporary sites within and surrounding the city. The data show a clear difference in dietary protein intake between age groups, with a breastfeeding signal in infants and the 'poorest' diet in children in the age category 4-7 years at death. Adults from the same cemetery had a dietary isotopic signature indicative of more protein intake, and potentially more fish consumption, than the children. Interestingly, when compared to the overarching dataset, adult diet shows more inter-site variation whereas non-adult diet is relatively more stable between urban, rural, richer, and poorer burial locations. These results indicate a social differentiation in diet between adults and non-adults, with a societal age threshold which was on average close to the biological age of maturity. Thus, the current study highlights a fundamental difference in the lived experience of growing individuals as compared to adults within this post-medieval society.

15 BEYOND DIET: USING STABLE ISOTOPE ANALYSIS OF INCREMENTAL TISSUES TO STUDY GROWTH AND DEVELOPMENT

Abstract author(s): Feuillatre, Corinne - Beaumont, Julia - Batt, Catherine - Bryant, Eleanor (University of Bradford)

Abstract format: Oral

The stable isotope analysis of human remains has become an essential tool in palaeodietary reconstruction. Recent methodological developments based on the analysis of incrementally growing tissues like teeth allow the mapping of isotopic biographies of individuals. Based on the premise that the isotopic values of breastfed babies are one trophic level above that of their nursing mothers, studies of nitrogen and carbon stable isotope ratios ($\delta^{15}\text{N}$ and $\delta^{13}\text{C}$) of incremental dentine allow the identification of the start and completion of weaning. The ability of stable isotope techniques to reconstruct infant feeding practices in ancient populations makes them an ideal tool to uncover variations in infant feeding patterns both within and between populations rooted not only in subsistence and cultural practices, the sex or status of the baby, but also disasters like famines or pandemics. However, there are uncertainties surrounding the effect of physiological factors like stress and growth on isotope values in early life. Studies of contemporary babies for whom the diet, health and development are known are needed to examine changes in isotopic fractionation that may be specifically related to the physiology of the individual. In this presentation we share some preliminary results from case studies of mother/infant dyads combining anthropometric measurements, dietary and medical histories with longitudinal $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$ data from hair and/or fingernails reflecting the period from the third gestational trimester through the first year of life. We investigate how both maternal and infant physiology and diet interact to shape the isotopic composition of the infant and explore how such new understandings of the physiological effect can inform the interpretation of archaeological isotopic data beyond the reconstruction of dietary inputs.

DIET, HEALTH, AND SOCIAL INEQUALITY IN INDUSTRIAL ENGLAND: A MOTHER-INFANT PERSPECTIVE

Abstract author(s): Eggington, Jack (University of Reading; Cardiff University) - Lewis, Mary - Müldner, Gundula (University of Reading)

Abstract format: Oral

The detrimental long-term health effects of physiological stress, in the first 1000 days of life have long been recognised, with the nutrition of mother and child being particularly crucial during this early developmental period. Historical literature has identified socioeconomic status as a significant causative factor in health, morbidity, and mortality during the industrial period in England. However, the effect of social status on maternal-infant diet and health is less clear, and bioarchaeological analysis offers the only means to directly observe this sensitive relationship.

This study proposes a nuanced approach to exploring the mother-infant nexus, utilising both palaeopathological and chemical methods to provide a comprehensive understanding of the status and nutritional health of both mother and child. Young non-adults (20 weeks gestation to 3 years postpartum) and adult females (22-46 years) from two industrial cemeteries were analysed: suburban St John's Redhill, Surrey (n=139) and urban St. James, London (n=460). Both populations provide a temporal resolution that spans the late 18th to 19th centuries, allowing the distinction of low and high-status individuals by their burial location. Non-specific stress (enamel defects, cribra orbitalia, growth disruption and VNC), metabolic disease (scurvy and rickets), and caries were recorded utilising macroscopic and radiographic standards, providing evidence for the impact of nutritional deficiencies in young non-adults and adult females. Future research will encompass, carbon and nitrogen stable isotope ratios of bulk bone and sequential dentine collagen, being used to reconstruct diet, weaning age, and nutritional status during gestation and early life.

Preliminary results indicate that scurvy prevalence was greatest in the St. James population, with 10.0% (15/151) of all young non-adults being affected, compared to 3.7% (3/83) in Redhill. A high rickets prevalence was observed in both the St. James (12.6%) and Redhill (13.2%) populations.

A BIOARCHAEOLOGICAL UNDERSTANDING OF THE LIVED EXPERIENCES OF CHILDREN DURING THE EARLY MEDIEVAL PERIOD IN SOUTHEAST ENGLAND

Abstract author(s): Bowers, Alexandra - Jones, Jennifer (University of Central Lancashire)

Abstract format: Oral

There is a distinct lack of bioarchaeological studies of children from early Anglo-Saxon Britain, despite it being a dynamic period of cultural transition, migration and change. Something unique was occurring in southeast England, reflecting a blend of burial practices incorporating both Romano-British and Scandinavian influences (as shown in recent DNA, isotope and grave good research on Anglo-Saxon sites, e.g. Gretzinger et al 2022; Leggett 2022). Key archaeological questions are not focused on how cultural change happened during the transition period, but rather how this phase of change affected the living, breathing people experiencing it. Periods of transition and change can greatly affect childhood health, as children are valuable conduits through which stresses in the population based on changing environmental conditions and resource availability, may be observed.

Anglo-Saxon sites typically contain c.19% of non-adult remains, meaning sites like Oakington (Cambridgeshire), which contains c.50% non-adult burials are vital insights into understanding child burial, identity and health. Through studying child remains it is possible to explore the extent to which mixing of Romano-British and Scandinavian peoples in the early Anglo-Saxon period had an effect on population health, and the impact of the migrant experience on childhood. This research uses 65 non-adults (aged 0-18yrs) from the 5-6th century Oakington burial site to investigate childhood health during this significant transformation. Initial findings show that children buried at the site displayed enamel hypoplasia (c.10%) and cribra orbitalia (c.25%) mainly occurring in the age range of 1-10yrs, providing evidence for childhood stress at time of death. These pathologies are expressed past newborn ages, meaning it is not an effect of risks associated with childbirth and newborn vulnerability. Therefore, they may be reflective of environmental stresses the children experienced during growth, providing an argument for migration and cultural transition being a stressful period in their lives.

EXPLORING THE EFFECT OF PHYSIOLOGICAL STRESS ON GROWTH DISRUPTION IN FOETAL AND INFANT INDIVIDUALS OF KNOWN AGE-AT-DEATH FROM SANTIAGO, CHILE

Abstract author(s): Meza-Escobar, Ofelia - Craig-Atkins, Lizzy (University of Sheffield)

Abstract format: Oral

Foetal and early post-natal life stages are highly critical periods of rapid growth, when physiological assaults to the growing body might translate into skeletally visible stress markers. Archaeologically recovered skeletal remains of foetal and infant individuals of known chronological age (CA) offer the unique opportunity to evaluate the accuracy

of the methods used in bioarchaeology to estimate age, while also allowing us to better understand the impact physiological stress can have on growth disruption throughout the earliest stages of the life course.

This study assessed 47 individuals between 32 gestational weeks and 1 year of age-at-death excavated from the Santiago General Cemetery, Santiago, Chile. We compared CA and physiological age (dental development and skeletal growth) to evaluate the accuracy of current methods on a South American population, and then analysed the relationship between CA, growth disruption and physiological stress to explore exposure to environmental stressors in-utero and early life.

Results for age estimation methods showed that dental age was the most accurate for this sample. Estimations given by femoral length underestimate CA, while estimates using pars basilaris dimensions randomly over and underestimate CA regardless of age group or sex. Correspondence analysis with symmetrical normalisation showed growth disruption in this sample is particularly associated with presence of cribra orbitalia and periosteal new bone formation.

Our results support the idea that growth disruption due to physiological stress affects growth and maturation and can bias age estimations made using dental and skeletal elements. The effects of physiological stress causing growth disruption are present both pre- and postnatally, indicating elevated maternal physiological stress in this population.

19 **A LOST WORLD: USING FRAILTY ASSESSMENTS TO ADVANCE OUR UNDERSTANDING OF PAST CHILDHOOD HEALTH**

Abstract author(s): Grimley, Isobel (University of Bradford) - Craig-Atkins, Elizabeth (University of Sheffield) - Koon, Hannah - Curtis-Summers, Shirley (University of Bradford)

Abstract format: Oral

In living individuals, frailty assessments are used to predict adverse health outcomes and aid in clinical decision-making. When applied to past populations, they can increase the temporal depth of our understanding of health determinants and advance discussions on the osteological paradox (Wood et al. 1992). Index-based methods, such as the 'Skeletal Frailty Index' (Marklein et al. 2016), provide a comparable yet comprehensive evaluation of an individual's morbidity risk. Children, however, are almost completely absent from this work despite their health being an important, sensitive indicator of environmental change and key for understanding population health. This research presents a developmental skeletal frailty index which accounts for non-adult biology and incorporates new avenues of research to assess frailty from children's remains, such as the use of delayed puberty as an indicator of physiological stress. The stage of puberty an individual was in at the time of their death can be identified osteologically and their age compared to a benchmark for each stage to identify delay. The potential to use delayed puberty in this index is supported by existing osteological data linking pubertal delay to increased frailty scores (Grimley and Craig-Atkins, in prep.). Further combining frailty results with primary and established carbon and nitrogen stable isotope data will enhance the contextualisation of the osteological findings and facilitate a richer interpretation of individual variation in diet, physiological stress and skeletal manifestations of frailty associated with dietary deficiencies. Developing these methodologies will enable bioarchaeologists to gain a better insight into the lived experiences of past children by using a multidisciplinary approach to assess their physical health and ensure the full breath of the life course is encapsulated by archaeological frailty research.

20 **CRAWLING TOWARDS A NEW METHOD FOR SKELETAL STRESS ASSESSMENT: DECIDUOUS DENTAL CORTISOL**

Abstract author(s): Quade, Leslie (Department of Anthropology, Faculty of Science, Masaryk University)

Abstract format: Oral

Maternal and prenatal stress levels influence health and wellbeing, and can also act as determinates of future health outcomes. Cortisol is a glucocorticoid hormone that plays important roles in foetal development and within the biological stress response. However, excess maternal cortisol stemming from psychosocial or physiological stressors can negatively impact the foetus. A previous pilot study identified the presence of cortisol in deciduous (primary) tooth dentine and enamel from both archaeological and living populations. Based on studies of permanent teeth and hair, it is hypothesized that cortisol is incorporated into dental structures during tissue development. As a result, deciduous dental cortisol (DDC) is likely to reflect cortisol exposure from the earliest periods of life, including prenatal stages. In this way, DDC could potentially act as a metric for maternal and prenatal health and stress states.

To explore DDC, 35 deciduous teeth from living individuals and archaeological contexts were analysed for cortisol concentrations via ELISA (enzyme-linked immunosorbent assay). The primary aim was to build upon the pilot study, increasing sample sizes and generating new data. Five individuals provided multiple teeth, permitting analysis of consistency in DDC in dentine and enamel from within the same person.

As with previous studies of deciduous and permanent tooth tissues, not all samples produced results that could be quantified within the assay. Dentine and enamel samples with detectable cortisol concentrations mostly came from

the same teeth and individuals, suggesting that cortisol exposure differs primarily at the individual level. Various factors may be affecting these results including the preservation of tooth tissues and the quantity of tissue available for analysis. With further research, DDC may represent an additional tool to explore the effects of maternal and early life stress exposure on health outcomes in past and living populations.

21 DENTAL PEPTIDES REVEAL THE SEX DISTRIBUTION OF EARLY CHILDHOOD PHYSIOLOGICAL STRESS EVENTS IN THE NEOLITHIC CAVE-NECROPOLIS OF ESCOURAL (PORTUGAL)

Abstract author(s): Granja, Raquel (Centre for Archaeology, University of Lisbon - UNIARQ, Faculty of Humanities, University of Lisbon; Laboratory of Archaeosciences - LARC/CIBIO/InBIO, Direção-Geral do Património Cultural; Research Centre for Anthropology and Health - CIAS, Department of Life Sciences, University of Coimbra) - Araújo, Ana Cristina (Centre for Archaeology, University of Lisbon - UNIARQ, Faculty of Humanities, University of Lisbon; Laboratory of Archaeosciences - LARC/CIBIO/InBIO, Direção-Geral do Património Cultural; EnvArch, Environmental Archaeology Group /BIOPOLIS - CIBIO, Research Center In Biodiversity and Genetic Resources, University of Porto) - Lugli, Federico - Silvestrini, Sara (BONES Lab, Department of Cultural Heritage, University of Bologna) - Peyroteo-Stjerna, Rita (Centre for Archaeology, University of Lisbon - UNIARQ, Faculty of Humanities, University of Lisbon) - Silva, Ana Maria (Centre for Archaeology, University of Lisbon - UNIARQ, Faculty of Humanities, University of Lisbon; Research Centre for Anthropology and Health - CIAS, Department of Life Sciences, University of Coimbra; Laboratory of Forensic Anthropology, Centre for Functional Ecology - Science for People & the Planet - CFE, Department of Life Sciences, University of Coimbra) - Gonçalves, David Gonçalves (Laboratory of Archaeosciences - LARC/CIBIO/InBIO, Direção-Geral do Património Cultural; Research Centre for Anthropology and Health - CIAS, Department of Life Sciences, University of Coimbra; EnvArch, Environmental Archaeology Group /BIOPOLIS - CIBIO, Research Center In Biodiversity and Genetic Resources, University of Porto; Laboratory of Forensic Anthropology, Centre for Functional Ecology - Science for People & the Planet - CFE, Department of Life Sciences, University of Coimbra)

Abstract format: Oral

To date, the Escoural cave-necropolis, mostly dated to the Late Neolithic, is the only one identified in the inner Alentejo (Montemor-o-Novo, Southern Portugal) which houses a large concentration of megaliths, but mainly with no preserved human remains. Inside the cave, human remains are commingled, so no systemic examination of the skeleton is possible to estimate sex, but this can now be achieved through proteomic analyses of the tooth enamel, owing to the sex-linked isoforms of amelogenin (AMELY and AMELX). Besides being less expensive and less affected by taphonomic factors than ancient DNA, enamel-bounded peptides preserve well and show a high reliability in sex-estimation. On the other hand, linear enamel hypoplasias (LEH) record infancy's non-specific physiological stress events, often caused by severe illness and/or nutritional deficiencies. These linear defects are detectable mostly in the anterior dentition. We combined these two datasets to analyse 36 lower left canines (with enamel mineralization occurring at 1.5-6.5 years) from the necropolis of the Escoural Cave, to assess sex distribution of physiological stresses during the first childhood. The Escoural collection presents an unbalanced sex ratio of 1:2 (males/females) which may have been culturally determined and a large number of LEH was observed in both sexes (67%). LEHs were more present in males (n=13; 69%) than females (n = 23; 65%) although the difference is not statistically significant (p=.85). Mean LEH frequencies were similar (p=.82) in males (n=1.44) and females (n=1.53) in individuals who presented LEH. The age onset of the first hypoplastic defect was similar (p=.23) in males (n=4; 4.20 yrs) and females (n=11; 3.74 yrs). We concluded that between sexes the occurrence of physiological stress events seems identical in terms of frequency and age onset. Based on peptide sex determinations, odontometrics allowed better sex allocation (81%) of the Escoural individuals than the mandible (53-67%).

22 ACUTE INFECTIONS AS A CAUSE OF DEATH: WHAT DO BONE SIGNS OF DEFICIENCY TELL US?

Abstract author(s): Colombo, Antony (Ecole Pratique des Hautes Etudes) - Belcastro, Maria Giovanna (University of Bologna)

Abstract format: Oral

During infancy, non-adults are highly susceptible to infectious diseases and deficiencies especially because of their immature immune system and their high demand for calories and nutrients due to their high growth rate. This partly explains the high mortality rate before the development of modern medical knowledge. It is well known in bioarchaeology through the osteological paradox that the absence of pathological bone lesions does not necessarily mean that a child died under healthy conditions and that the cause of the death is the disease diagnosed from the identified bone lesions.

For this paper, we focused on the 109 infants (52 females, 57 males) aged 0-3 years from the collection of identified skeletons curated at the University of Bologna (Italy). Most of them died between 1900 and 1909 with a registered cause of death. These infants were meticulously observed for bone signs of deficiency diseases.

49.5% of the infants observed had at least one bone sign that could be associated with a deficiency, but less than 4% of them were recorded as having died of a metabolic disease. On the contrary most of the individuals with signs of deficiency died of infection, especially intestinal infection, mainly in an acute form.

Deficiency diseases, even if not lethal – until a certain point –, result in the dysfunction of one or several metabolic cycles that can impact the immune system and maximize the risk of infection. A high prevalence of deficiency diseases in archeological populations could be considered an indicator of a high mortality from acute infection. Preservation of valuable osteological collections such as those from identified skeletons is essential to better understand the biases associated with the osteological paradox.

23 MORPHOLOGICAL PATTERNS OF LOWER LIMB FIBROUS ENTHESES IN JUVENILE SKELETONS

Abstract author(s): Mameli, Davide - Pietrobelli, Annalisa - Mariotti, Valentina - Belcastro, Maria Giovanna (Alma Mater Studiorum Università di Bologna)

Abstract format: Oral

Entheses (locations where tendons and ligaments attach to the bone) are acknowledged as skeletal markers, capable of revealing several biological and behavioral aspects of past individuals and populations. However, recording standards for Enteseal Changes (EC) have been developed so far only for adult individuals. As far as we know, EC of juveniles have not yet been studied with a systematic approach. Thus, this contribution aims at investigating the morphological changes occurring at the femoral insertion of the gluteus maximus muscle and at the tibial origin of the soleus muscle. In order to investigate a possible relationship between the morphological features of those entheses and skeletal maturity, a sample of 118 skeletons ranging from 0 to 30 years with known sex and age, belonging to the Identified Human Skeletal Collection of the Certosa Cemetery (Bologna, Italy), has been utilized. For this purpose, morphological variability has been subdivided into four discrete categories and a recording protocol for each entheses in the immature individuals has been developed. Young adults were included to observe the variation of the entheses with respect to the last stages of skeletal maturation and have been assessed using previous standardized methods. Bone and enteseal measurements and degree of epiphyseal fusion have been recorded. These features were analyzed in relation to sex, age and locomotor developmental patterns.

Negligible sexual differences have emerged for both the entheses. A close relationship between the morphological changes of both entheses and age have been statistically observed. For the gluteus maximus, a relationship between the morphological enteseal changes and locomotor milestones seems to be observed.

Our protocol should be usefully tested on other identified juvenile skeletal collections in order to better understand the relationship with growth and development. This could have a relevant applicative value both in forensic and archaeological fields.

24 AGE AT DEATH ESTIMATION FROM DIAPHYSEAL LENGTHS IN INDIVIDUALS FROM SECOND TRIMESTER OF GESTATION TO ONE MONTH POSTNATAL

Abstract author(s): Fernández-Viejo, Marta (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos) - Rodríguez, Laura (Área de Antropología, Universidad de León) - Carretero, José Miguel (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos; Unidad Asociada de I+D+i al CSIC Vidrio y Materiales del Patrimonio Cultural - VIMPAC; Centro UCM-ISCIH de Investigación sobre la Evolución y Comportamiento Humanos) - García-González, Rebeca (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos)

Abstract format: Oral

There are some specific studies for estimating the age at death in foetal individuals from diaphyseal lengths based on regression equations (Scheuer,1980,Sherwood,2000, Adalian,2002,Carneiro2013). However,these regression equations were developed following an inverse calibration model, which is preferred when the age distribution for the reference sample forms a reasonable prior for the target sample (Konigsberg,1980). The samples used consist of foetuses between 13 to 40 weeks of gestation, with a peak between 38 and 40 gestational ages. The most common effect of these methods is that they replicate the peak observed in the reference samples. There are several methodological approaches to avoid this, such as using a Bayesian procedure, using classical calibration models, or using reference samples with a wider age-at-death distribution.

This work aims is generate regression equations to predict age at death in perinatal individuals based on inverse and classical calibration using a reference sample with a wide age range.

Our sample comprises 71 individuals (39 males;29 females) from the second trimester of gestation to one year post-natal from the New Mexico CT database. Individuas with limb malformation, pathological, intrauterine restriction or prematurely born were excluded. Diaphyseal bone length of the humerus, radius, ulna, femur, tibia, and fibula was taken from sagittal images from CT using 3D Slicer. Both right and left bones were measured. Since we did not detect

statistically significant differences between the two sides, the left side was used. Intra and inter-observer errors in the measuring process were calculated in 10% of the sample, no statistical differences were found.

Age estimation models were made for each bone, for sexes combined, and for each sex separately. Our results show that the length of the femur provides the most accurate age estimation, being the standard error of estimate of 2,14 (GAw).

25 ANALYSIS OF THE RELATIONSHIP BETWEEN IMMATURE BONE SHAPE AND DIVERSE BIOLOGICAL AND POPULATION FACTORS USING 3D COMPUTATIONAL METHODOLOGIES

Abstract author(s): Salazar Fernández, Azahara - García-González, Rebeca (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos) - Quintino, Yulieth (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos; Centre for Ecology, Evolution and Environmental Changes, Faculdade de Ciências, Universidade de Lisboa) - Rodríguez, Laura (Área de Antropología, Universidad de León; Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos) - Carretero, José Miguel (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos; Unidad Asociada de I+D+i al CSIC Vidrio y Materiales del Patrimonio Cultural - VIMPAC)

Abstract format: Oral

Skeletal development is divisible into two different yet closely integrated processes: growth and maturity. Growth implies incremental growth in size, whereas maturity implies a highly specialized and organized adult status. Growth is an important factor in archaeological population studies since have been used as a good predictor of nutrition and health, however, maturity can also provide information about these issues.

Therefore, our study proposes to analyze maturity in the pectoral girdle and upper limb long bones to detect any age-related, population, and sex differences.

Our study was based on three-dimensional approaches such as three-dimensional geometric morphometrics (3D GM) and finite element analysis (FEA). The 3DGM is a potent and intuitive tool for analyzing statistical shape differences between individuals or groups. On the other hand, FEA is a method that reduces a complex geometry into a finite number of elements that allows getting information for biomechanical studies. Statistical processes as well as machine learning algorithms were trained using data from digital 3D models to find group differences.

These analyses were performed on two samples; the known sex and age collection from the National Museum of Natural History (Lisbon, Portugal) and the age-dental estimated archaeological collection of San Pablo from the Laboratory of Human Evolution at the University of Burgos, Spain. The total sample included; 87 scapulae, 153 clavicles, 102 humeri 101 ulnae, and 130 radii.

Our results show that shape changes are quantifiable and suitable for the establishment of age groups based on skeletal maturity. Therefore, a new method for estimating skeletal age can be established. The onset and fusion of the ossification centers, the biomechanics and variables such as sex or ancestry influence the skeletal maturity of these bones. The results obtained in this study could be useful to forensic anthropology, archeology, or paleoanthropology.

26 POPULATION VARIABILITY IN THE ASSOCIATION OF PUBERTY SKELETAL INDICATORS

Abstract author(s): Muñoz-Guarinos, Julia - García-González, Rebeca (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos) - Rodríguez, Laura (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos; Área de Antropología, Universidad de León) - Carretero, José Miguel (Laboratorio de Evolución Humana, Departamento de Historia, Geografía y Comunicación, Universidad de Burgos; Unidad Asociada de I+D+i al CSIC Vidrio y Materiales del Patrimonio Cultural - VIMPAC)

Abstract format: Oral

Sexual and social maturation is attained during puberty and adolescence, playing a main role through ontogeny. New skeletal methods evaluating cervical vertebrae maturation stages (CVM) and other puberty skeletal indicators (PSI) such as the ossification and fusion of the epiphyses of the long bones, the iliac crest, and the maturation of the hook of hamate, allow assessment of pubertal timing and menarche in archaeological populations[1,2]. However, the CVM has been found to show some disagreement with other puberty indicators[3]. Individual variation in the timing of puberty has been described in modern populations[4], but the association between CVM and other PSI among archaeological populations has not been tested. Thus, the aim of this study is to evaluate variation in the association between CVM and other PSI in some archaeological samples.

To do that, we have analyzed the stages of each pubertal indicator in two non-adult archaeological samples from Spain(n=83) and UK(n=24) ranging in age from 8 to 24 years. A Bayesian statistical approach was carried out to

evaluate if the association between CVM stages and other puberty indicators were more or less likely to occur among populations.

Our results show that in both samples the most diverse association is between CVM3 and 4 -transition and deceleration phases respectively- and the rest of puberty indicators, but especially with long bones fusion stages. Moreover, significant differences in the probabilities of the association between CVM and other PSI among populations indicate that the British sample is more likely to start fusion of the elbow at earlier CVM stages than the Spanish sample. Nevertheless, the Spanish sample shows greater probabilities in the association of earlier CVM stages and fusion of the distal radius and the iliac crest, displaying also a wider range of CVM stages regarding the ossification process of the hamate hook.

27 A MULTI-PROXY APPROACH TO THE STUDY OF THE PATTERN OF DEVELOPMENT IN PAST POPULATIONS

Abstract author(s): García-González, Rebeca (Laboratorio de Evolución Humana, Universidad de Burgos) - Rodríguez, Laura (Universidad de León; Laboratorio de Evolución Humana, Universidad de Burgos) - Quintino, Yuliet (Centre for Ecology, Evolution and Environmental Changes, Faculdade de Ciências, Universidade de Lisboa; Laboratorio de Evolución Humana, Universidad de Burgos) - Salazar-Fernández, Azahara - Muñoz-Guarinos, Julia - Delgado-Esteban, Beatriz - Fernández-Viejo, Marta - Cirotto, Nico - Navarro-Pérez, Alba (Laboratorio de Evolución Humana, Universidad de Burgos) - Carretero, José Miguel (Laboratorio de Evolución Humana, Universidad de Burgos; Unidad Asociada de I+D+i al CSIC Vidrio y Materiales del Patrimonio Cultural - VIMPAC)

Abstract format: Oral

Many bioarcheological studies are focused on the study of skeletal growth for understanding and interpreting past populations. Much of them concerns growth on length of the long bones. Generally, in these studies differences in size among individuals of different populations are attributed to the effect of illness or malnutrition on the growth pattern. In contrast, studies of appositional bone growth and those about differential growth of body segments (allometric growth) have been less frequent. However, allometric studies can reveal localized functional influences on the dynamics of bone growth and the study of appositional growth is crucial to understand adult bone structure and mechanical adaptation. Moreover, the development process consists of more than accumulative changes in size, but also in maturity. Maturity implies an increase in complexity and its assessment allows us to correctly interpret differences in size among individuals of the same age.

The main objective of this work is to perform a complete study of development in the archaeological collection from San Pablo (ss. XIV- XIX) housed in the Laboratory of Human Evolution at the University of Burgos integrating results from linear and appositional growth and maturity of different skeletal regions. To accomplish that, we study growth and maturity in three bones: clavicle, humerus and femur. In this way, we evaluate the growth and maturity of the shoulder and upper body, stature, body mass and the relationship among these different variables during growth. This study was performed in at least 50 non-adult individuals and 30 adult individuals aged from zero to 30 years old.

Our findings show differences in the tempo of growth and maturation both among bones and among the different part of the same bone. Some of the variables studied are more susceptible to the effect of environmental factors than others.

A. INFECTIOUS INFANT DEATH OF A NEWBORN FROM AN IRON AGE SPANISH ARCHAEOLOGICAL SITE

Abstract author(s): Cuesta-Aguirre, Daniel - Martirosyan, Ani - Sandoval-Ávila, Carolina - Jordana, Xavier - Malgosa, Assumpció - Santos, Cristina (Grup de Recerca en Antropologia Biològica; Departament de Biologia Animal, Biologia Vegetal i Ecologia; Universitat Autònoma de Barcelona)

Abstract format: Poster

Infant mortality in ancient communities is expected to be mainly a result of complications during birth, congenital anomalies, or infections. In this work we present a possible case of infant death by infection of a 2-month-old child buried in the Iron Age Iberian site of Vilars d'Arbeca (northeast Spain). Morphological evidences were combined with dental histology and paleogenetic analysis.

Morphological age determination, based on different methods, indicates that the individual died 36 to 63 days after birth. It presents major porosity in several skull bones, especially in the basilar portion, which is incompatible with skeletal development for that age. The dental histological analysis shows the presence of the neonatal line and a survival of 65 days after birth. Moreover, two stress lines appeared 18 and 8 days before death. The paleogenetic study indicates that the individual is a male. The microbiome analysis of the shotgun sequenced sample allows to detect signs of *Acinetobacter lwoffii* bacteria. *A. lwoffii* has been increasingly reported as a pathogen associated with infections like septicemia, pneumonia, meningitis, urinary tract infections, and gastroenteritis.

All the combined information suggested that an infection caused by *A. lwoffii* was probably the cause of the death of the individual.

B. FIRST RESULTS OF PUBERTAL TIMING FROM EARLY MEDIEVAL CENTRAL EUROPE

Abstract author(s): Klostermann, Paul (Department of Anthropology, Natural History Museum Vienna; Doctoral School of Ecology and Evolution, University of Vienna) - Berner, Margit - Pany-Kucera, Doris - Wilschke-Schrotta, Karin - Eggers, Sabine (Department of Anthropology, Natural History Museum Vienna) - Hofmanová, Zuzana (Max Planck Institute for Evolutionary Anthropology; Department of Archaeology and Museology, Masaryk University) - Wang, Ke (Max Planck Institute for Evolutionary Anthropology)

Abstract format: Poster

The bioarchaeology of adolescence emerged as an innovative field that investigates life history questions and related health and stress experience in the past. Herein, the new methodology of pubertal timing on dry bone is applied to skeletal remains from Central Europe and the Early Medieval Period for the first time. Human remains from the Avar Period site Mödling in Eastern Austria dating to the 7th to the 9th century AD were analysed for Puberty indicators in the dentition, the upper limbs, and the pelvis. In order to capture the whole range of adolescent development, approximately 200 individuals from the ages of 8-30 were included in the analysis. Chromosomal sex estimation via ancient DNA on all studied individuals allows for the observation of pubertal timing in the sexes separately (84 females, 117 males) while ensuring the high reliability of the results. The results of this study will bridge the published pubertal timing data from the Roman to the High Medieval period leading to a better understanding of pubertal development trends in the past. This research will also contribute to sex-specific development patterns in ancient groups and their impact on past social structures. This project has received funding from the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation programme (grant agreement n° 856453 ERC-2019-SyG).

C. NON-ADULT HEALTH, DIET, AND BURIAL PRACTICES DURING THE ZHOU DYNASTY (1046-221 BCE) IN ZHOUYUAN (SHAANXI, NORTH-WEST CHINA)

Abstract author(s): Li, Ziyi (Department of Archaeology, Durham University) - Li, Nan (National Centre for Archaeology, China) - Gowland, Rebecca - Jakob, Tina (Department of Archaeology, Durham University)

Abstract format: Poster

The site of Zhouyuan, located in Shaanxi Province, north-west China, was the birthplace of the Zhou Dynasty. This poster aims to provide insights into the health, diet and burial practices of non-adult individuals by combining palaeopathological, stable isotope and archaeological evidence. A total of 39 individuals (aged from birth to 16 years) from two chronologically different periods of the Zhou Dynasty: the Western Zhou (Group 1, 1046-771 BCE, n=20), and Eastern Zhou periods (Group 2, 770-221 BCE, n=19) were included in this study. The palaeopathological analysis revealed that both groups had a low caries prevalence attesting to a diet low in complex carbohydrates. The frequency of non-specific stress indicators was also low, although this could mean that the children died before bone changes could occur. Carbon and nitrogen stable isotopic ratios from five of the Zhouyuan children and nine adults were compared. $\delta^{13}\text{C}$ values showed significant incorporation of C4 food for both non-adults and adults. In contrast, lower $\delta^{15}\text{N}$ values in non-adults indicated that these individuals had a different diet compared to adults. A decrease in $\delta^{15}\text{N}$ values between a 0-3-month-old and 1-2-year-old infant suggests dietary changes due to the weaning process. Funerary practices were also specific to life course stage: in both groups, younger children (0-5-years) were buried separately from older children and adults. In Group 1, the 0-5-year-olds were buried directly in earth-cut pits, covered with sherds, while in Group 2, their bodies were placed into urns. Furthermore, Group 1 showed an absence of 0-6-month-old infants. This shift in burial practices suggested changes in cultural and funerary perceptions towards children between the Western and Eastern Zhou periods. In conclusion, this study provides valuable insights into the health, diet, time of weaning, and funeral treatment accorded to the Zhouyuan non-adults.

FLOOR DEBATES. ANALYSIS AND INTERPRETATION OF ARCHAEOLOGICAL FLOORS AND OCCUPATION SURFACES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Alonso-Eguiluz, Mónica (MARI- Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel) - Lo Russo, Sarah (MARI- Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel; IPAS- Integrative Prehistory and Archaeological Science University of Basel) - Milek, Karen (Department of Archaeology, Durham University, United Kingdom)

Session format: Regular session

The identification and analysis of occupation surfaces in excavated buildings play a crucial role in the reconstruction and interpretation of social spaces of past societies, including living conditions, daily activities, and human-animal relations. The design, use, and choice of flooring materials and maintenance practices affect how a room is perceived, moved through, and experienced, not only visually, but also through touch, smell, and sound. From a wider perspective, the composition of occupation surfaces embeds critical information about past economic and social activities and the socially constructed concepts of 'dirty', 'clean', 'pure', and 'comfortable' – concepts that influence what is left behind on occupation surfaces and bias archaeological interpretations of activity areas. In recent years several advances have been made in scientific and theoretical approaches to the analysis and interpretation of archaeological floors and occupation surfaces, but more work needs to be done to integrate the method and the theory. The aim of this session is to build on recent developments, and to encourage dialogue and debate among archaeologists who analyze and interpret floors and occupation surfaces. We especially invite contributions on:

- Scientific methods applied to the identification and spatial analysis of different flooring materials, human and animal activity areas, and/or maintenance practices;
- How ethnoarchaeological, ethnohistoric, and/or experimental research can improve our understanding of how occupation surfaces can be analyzed and interpreted;
- How cultural and individual choices influence the use of flooring materials and maintenance practices;
- How different flooring materials and accumulations influence the perception of, movement through, and/or sensory experience of a room or area;
- The economic, social, and/or religious aspects of resourcing, preparing, applying, and maintaining flooring materials;
- The relationship(s) between flooring materials, maintenance practices, post-depositional processes, and artefact/ecofacts distributions on floors and occupation surfaces;
- The integration of interdisciplinary research on occupation surfaces and site activity areas.

ABSTRACTS

1 STONE TO SURFACE: EXPERIMENTAL LIME PRODUCTION AND THE ANALYSIS OF LATE BRONZE AGE PLASTER FLOORS AT KALAVASOS-AYIOS DHIMITRIOS, CYPRUS

Abstract author(s): Herrick, Hannah - Berna, Francesco (Simon Fraser University)

Abstract format: Oral

Multi-method geoarchaeological research conducted in association with the Kalavastos and Maroni Built Environments (KAMBE) project is focused on identifying the components and production process of lime plasters and mortars at the Late Bronze Age (LBA) regional site of Kalavastos-Ayios Dhimitrios (K-AD), Cyprus. Specifically, we aim to identify the natural lithic resources utilized in LBA lime production at K-AD, in order to understand the scale of lime production on-site and to better understand its environmental impact in LBA Cyprus as a whole. This paper discusses the results of laboratory-based experimental lime production conducted in 2023, using limestone, sandstone, and marl samples from the Kalavastos region. Using petrographic analysis and Fourier transform infrared microscopy (micro-FTIR), we compare samples of untreated stone, stone experimentally heated to a range of technology-specific temperatures (300°C - 1000°C), experimental lime, and archaeological lime plasters and mortars excavated at K-AD from 2015-2020. These results allow us to hypothesize the estimated temperature of lime production used in the making of these LBA floors, and therefore lay the groundwork for determining the energetic input and environmental impact of lime production technology in LBA Cyprus.

2 PAVING PROCESS OF THE BLACK AND WHITE MOSAICS IN HERCULANEUM

Abstract author(s): Lim, Yong Bing - Ogawa, Takuro - Hori, Yoshiki (Faculty of Human-Environment Studies, Kyushu University)

Abstract format: Oral

The black and white mosaics belong to a popular tradition within ancient Italy. Overall surfaces of mosaic, in white and black tesserae, became popular in the 1st century BC and remained in widespread use for domestic and commercial spaces down to the end of the 3rd century AD. In the rooms of the houses at Pompeii and Herculaneum which have simple patterns of large and small white squares separated by black rectangles, the black-and-white mosaics all use curvilinear motifs. It is generally agreed that small and simple figure compositions were set in separate fields of more or less equal importance within a basically geometric framework of black tesserae, which would have covered the incised lines showing on the setting bed, to act as a guide for the other tesserae. On the other hand, a pattern of laying mosaic exists, in which an entire floor is covered only with white tesserae without geometric motifs or figures of black tesserae. Through orthographic images created by laser scanning and photogrammetry, it has been observed that a floor without motifs is divided into rectangles and trapezoids, paved with white tesserae, like puzzle pieces. How did the craftsman end up covering over wide plain white mosaic floors? This division of the floor, not seen in mosaics with black tesserae motifs, could be key to revealing the craftsman's practical work, including the paving technique and the work rate involved. This study analyzes the plain mosaics of the House of Mosaic Atrium and compares them with those of some houses in Herculaneum to understand how to divide a floor into some areas like puzzle pieces.

3 A CENTRAL ANATOLIAN NEOLITHIC TRADITION? UNRAVELLING FLOOR TECHNOLOGIES AND HOUSEHOLD PRACTICES THROUGH MICRO-GEOARCHAEOLOGY

Abstract author(s): Garcia-Suarez, Aroa (Spanish National Research Council; University of Reading)

Abstract format: Oral

A notable feature of Central Anatolian Neolithic architecture is the prevalence of mudbrick houses, often displaying elaborate ritual and symbolic expressions, a highly structured use of domestic space, and a significant duration of buildings and fixtures in the same location. While these shared phenomena allow us to define what appears to be a long-lasting architectural tradition that flourished and was passed on for millennia in this part of the world, too strong a focus on building features shared by and between communities has created a rather monolithic view of these early sedentary societies.

This research examines Neolithic house floors from the sites of Pınarbaşı (9,000-7,900 cal BC and 6,500-6,000 cal BC), Boncuklu (8,300-7,800 cal BC), and Çatalhöyük (7,100-5,950 cal BC) as the material expression of distinct social practices, influenced by a wide range of variables that include resource availability, technological developments, symbolically-charged activities, and the representation of social identities. The multifaceted nature of living surfaces is here explored through the high-resolution examination of intact microstratigraphic sequences of floors, collapsed roofing and accumulated residues through integrated micromorphological and geochemical analyses. These methods bring us closer to the micro-historical scales at which consciousness of place and social relations are shaped in the everyday, in specific events and in life cycles, allowing us to investigate key issues in the creation and sustainability of settled life.

Results highlight the occurrence of distinctive building practices and maintenance strategies at each settlement as dictated by complex combinations of ecological adaptations and social boundaries, shedding light on the lesser-known aspects of Central Anatolian Neolithic architecture, such as the use of roofs and upper stories.

4 FLOORS ARE ON FIRE!! NEOLITHIC FIRED CLAY SOILS IN EL PORTALÓN DE CUEVA MAYOR SITE/SIERRA DE ATAPUERCA, SPAIN)

Abstract author(s): Iriarte, Eneko (Universidad de Burgos) - Francés-Negro, Marta (Universidad de Alcalá) - Carrancho, Ángel - Pérez-Romero, Amalia (Universidad de Burgos) - Alday, Alfonso (Universidad del País Vasco) - De Gaspar, Ignacio (Universidad Complutense de Madrid) - Smith, Colin - Valdiosera, Cristina (Universidad de Burgos) - Arsuaga, Juan Luis (UCM-ISCI) - Carretero, José Miguel (Universidad de Burgos)

Abstract format: Oral

El Portalón de Cueva Mayor located in the UNESCO World Heritage Archaeological Sites of Atapuerca, is one of the main Holocene archaeological sites in the Iberian hinterland and is located in a cave, at the entrance of the Cueva Mayor-Cueva del Silo karstic system (Sierra de Atapuerca). The archaeostratigraphic sequence of the site covers, at least, the last 30 kyr, from the Upper Pleistocene to the Middle Ages.

The ongoing excavation of the Neolithic unit has yielded unique architectural remains depicting a domestic area of Late Neolithic age (6-5 kyr cal BP). Among them an outstanding sequence of prepared clay floors which have been studied in detail and their composition and manufacture process analyzed and experimentally reproduced. Archae-

ological, petrological, mineralogical, geochemical and archaeomagnetic data indicate that the clay soils were made using an unprecedented technique. Miocene white marls from nearby outcrops were soaked into a malleable mass that was later spread on a bed of fine dry branches. Finally, fire was set at the level of branches and its combustion fired and hardened the marl paste, resulting in a uniform and cohesive orange to white colored soil floor on a fine bed of charred plant remains. This process was used at least 2 times in a room of at least 20 square meters and a large central excavated fire from a naturally illuminated habitation area, revealing the use of a constructive technique with no known analogues.

5 SOME LIKE IT RED: A MICROSTRATIGRAPHIC STUDY OF FLOORING PRACTICES IN THE AENEOLITHIC SETTLEMENT OF MONJUKLI DEPE (TURKMENISTAN)

Abstract author(s): Cereda, Susanna (Institute of Archaeologies, University of Innsbruck) - Pollock, Susan - Bernbeck, Reinhard (Institute for Near Eastern Archaeology, Freie Universität Berlin)

Abstract format: Oral

Monjukli Depe is a small village located at the northern fringes of the Kopet Dag mountains, in Southern Turkmenistan. According to the available ¹⁴C dates, inhabitation at the site started in the Late Neolithic (ca. 6200-5600 BCE) and continued—after a hiatus of approximately 800 years—into the Aeneolithic (ca. 4650-4340 BCE).

The architecture of this later phase is very well-preserved, with some walls still standing to a height of up to 1.5 m, and with houses showing notable similarities in shape, orientation and layout. In order to understand whether such macroscopic resemblance is also mirrored (at a finer scale) in the way people occupied these structures, samples for micromorphological analyses were collected from their earthen surfaces.

We here present the microstratigraphic study conducted on the floor of two buildings, House 4 and House 8, which focused on reconstructing how people took care of the built space (i.e., construction, use, waste management, maintenance and general treatment of earthen surfaces).

Results show that, beyond the existence of a shared “building standard”, houses were not inhabited in the same way and that variations in the nature, frequency and spatial arrangement of deposits indicate an origin from different activities and events, shedding also light on the relationship between humans and animals.

Ultimately, this microstratigraphic approach not only allowed to identify distinct formation processes, but also stimulated considerations about the social practices and cultural conventions materialised in those surfaces (e.g., life rhythms, concepts of cleanliness or propriety).

6 GETTING IN ON THE GROUND FLOOR? THE FLOOR SEQUENCES OF DRUMCLAY CRANNOG

Abstract author(s): Boyd, Rebecca - Barrett, Marie-Therese (IAC Archaeology)

Abstract format: Oral

At Drumclay Crannog, construction and occupation sequences were very clearly indicated during excavation, as one would expect on a crannog. The houses themselves were elementary architectural forms, essentially one-room buildings, which were often poorly preserved structurally. However, they contained as many as five different floor surfaces including timber and brushwood layers, peats, clays, wattle surfaces, hearth settings, stone pavements and wooden pathways. The chronological depth of deposits at Drumclay allows us to consider the composition and use of these floors on a continuum across the 9th to 14th centuries.

Our central question is can the depth and composition of floor deposits shed light on the duration and use of a surface? In interpreting the construction sequences, we used the presence and absence of introduced floors and surfaces to distinguish between short-term construction events and longer term occupation events. This became particularly relevant when floors were not associated with other structural elements (i.e. walls or hearths).

Our multidisciplinary analysis of the floor layers includes palaeoenvironmental work around pollen, plant, insect and animal bone assemblages, analysis of artefact assemblages, crafting practices, a dendrochronological dating programme and stratigraphical data. We will consider how the floors were constructed, maintained, and replaced at Drumclay. Our palaeoenvironmental work sheds light on the relationships between the floors, their builders and the local environment. The stratigraphic narrative allows us to consider the impact of post-depositional processes and site sinking, while the time-depths at Drumclay invites questions about building and settlement life-cycles and continuity.

In this talk, we will discuss how we combined these varied analyses (stratigraphy, environmental, artefact distributions, and chronologies) to illuminate how the people of Drumclay constructed, managed and used their floors and surfaces to structure their worlds.

7 IS IT THE FLOOR OR ISN'T IT THE FLOOR? HOW TO INTERPRET THE FILLING OF THE LA TÈNE SUNKEN HOUSES?

Abstract author(s): Lisá, Lenka (Institute of Geology The Czech Academy of Science) - Grison, Hana (Institute of Geophysics, The Czech Academy of Sciences) - Čížmář, Ivan (Institute of Archaeological Heritage Brno) - Stejskalová, Šárka (Institute of Geophysics, The Czech Academy of Sciences)

Abstract format: Oral

The floor is the horizon inside the building where different activities took place. Usually several phases of its formation producing the laminated sandwich can be identified from the section through the floor. The main aim of the paper is 1) to interpret the formation of the prehistoric sunken house floor typical by the absence of layering indicating the individual phases of the floor's formation; 2) to detect the geochemical and magnetic properties of the floor layers and describe the possible movement of phosphorus.

Five micromorphological blocks of the dimension of 20 cm was taken from different areas of the floor of La Tène sunken house in Němčice (Czech Republic). The blocks were continually resampled into small micromorphological samples transformed into thin sections of the dimension of 4 x 5 cm and the rest of the blocks was additionally sampled with the step of 1 cm into bulk samples, so each position of the bulk can be controlled in thin section. The bulk samples were measured using pXRF and magnetic properties.

Phosphorus moves about 2-3 cm below the dark infill originally interpreted as an active floor. It is linked to increased bioturbation and consumption of microfauna. Magnetic susceptibility significantly correlates with Cu and S representing metallurgic pollution. The frequency depended MS show the pedogenic processes only in the upper part of the active floor. The entrance corridor has higher values of Cu and Sn. The active floor has the parameters of a typical cultural layer without any layering or horizontally oriented material, but can be interpreted as having been formed in situ by repeated trampling of waste-contaminated material. It is therefore a certain form of active layer, i.e. from the point of view of formation processes represents the floor.

8 ANALYSES OF IRON AGE FLOORS IN NORTH-EASTERN IBERIAN PENINSULA: CONTRIBUTIONS FROM MICROMORPHOLOGY

Abstract author(s): Mateu, Marta - Belarte, Maria Carme (ICREA; ICAC)

Abstract format: Oral

We present the first results of an ongoing project focused on the study of protohistoric domestic floors through micromorphology. This technique provides information on the formation processes of domestic spaces as well as on their use and subsequent destruction. The methodology of study of occupation surfaces or floors consists on the collection of undisturbed samples from which we produce thin sections. These should allow us to observe the micro layers and micro remains that compose the sedimentation of floors, unnoticed during excavation. This technique thus enhances the information that can be obtained from the macroscopic study of archaeological remains. As study cases, we are presenting the preliminary results of the Early Iron Age site of Sant Jaume (Montsià, Tarragona) and of the Late Iron Age sites of l'Antic (Montsià, Tarragona) and Masies de Sant Miquel (Baix Penedès, Tarragona). These three sites have provided samples of occupation surfaces or floors, as well as fragments of construction materials or combustion structures that will be used for comparative purposes. Experimental works on combustion structures conducted in parallel to these analyses complement the information about the sedimentation processes of floors and the needs of maintenance related to daily activities.

FROM A HOUSE TO A STABLE: A GEOARCHAEOLOGICAL STUDY OF BUILDING 21 AT THE HILLFORT OF PUNGRT, SLOVENIA

Abstract author(s): Prijatelj, Agni (Centre for Soil and Environmental Research, Biotechnical faculty, University of Ljubljana; Centre for the Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Gruškovnjak, Luka (Centre for the Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Vojakovič, Petra (Centre for the Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana; Arhej Ltd.) - Milek, Karen (Department of Archaeology, Durham University) - Grčman, Helena (Centre for Soil and Environmental Research, Biotechnical faculty, University of Ljubljana) - Dolenc, Matej (Department of Geology, Faculty of Natural Sciences and Engineering, University of Ljubljana) - Črešnar, Matija (Centre for the Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana; Institute for the Protection of Cultural Heritage of Slovenia)

Abstract format: Oral

Pungrt above Ig is the first Slovenian Iron Age hillfort with a documented proto-urban design. As part of the ongoing research project at the site, we examined selected buildings at the micro-contextual level using integrated high-resolution approaches. These included micromorphology, micro-refuse and geochemical analyses, and Bayesian modelling of an extensive set of radiocarbon dates. Here, we present a dynamic socio-economic history of the Late Hallstatt Building 21. Constructed on the lowermost terrace next to a wide path along the inner face of the stone rampart, the wooden structure had stone foundations, internal partition walls, and several hearths and ceramic bowls built into floor surfaces. The floor sequence in the building consisted of a series of alternating earthen floors and dark, homogenous layers. Our microstratigraphic and geochemical analyses revealed the nature of these floor materials and accumulated occupation residues, their precise depositional pathways and their micro-contextual associations.

Throughout the building's life-cycle, three types of earthen floors were used, including constructed, clay-rich floors, calcareous mortars, and beaten floors. In addition to longer-term cycles associated with these deposit types, the microstratigraphic sequence in Building 21 contained records of various seasonal and daily activities. These included cyclical replastering of floor surfaces with finishing coatings and "red wash", re-deposited rake-outs in the vicinity of the hearths, and micro-laminations of occupational debris. In its final phase, the nature of the building changed and the structure, originally employed for dwelling, became a stable. These architectural choices and distinct household organisation provide insights into technological knowledge, social practices, human-animal relations, and multiple temporalities associated with the building's life cycle. As such, they allow us to address previously under-explored topics within the hillfort research, most notably the issues of the social space, ecological relations, various discard and sanitation practices, and overall community sustainability.

FLOOR OF A SMITHY VIEWED THROUGH THE MICRO-REFUSE ANALYSIS IN BUILDING 24 AT THE HILLFORT OF PUNGRT ABOVE IG, SLOVENIA

Abstract author(s): Gruškovnjak, Luka (Centre for Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Prijatelj, Agni (Centre for Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana; Centre for Soil and Environmental Research, Biotechnical Faculty, University of Ljubljana) - Vojakovič, Petra (Centre for Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana; Arhej d. o. o.) - Burja, Jaka (Institute of Metals and Technology - IMT) - Vinazza, Manca (Centre for Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Toškan, Borut - Tolar, Tjaša (Institute of Archaeology, Research Centre of the Slovenian Academy of Sciences and Arts) - Grčman, Helena (Centre for Soil and Environmental Research, Biotechnical Faculty, University of Ljubljana) - Črešnar, Matija (Centre for Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana; Institute for the Protection of Cultural Heritage of Slovenia)

Abstract format: Oral

Since the development-led excavation in 2020 and 2021, the proto-urban hillfort of Pungrt above Ig, located in the vicinity of the Slovenian capital of Ljubljana, has rapidly gained a reputation as one of the most important Early Iron Age sites in Slovenia. This excavation, the largest of any hillfort settlement in Slovenia, was accompanied by extensive geoarchaeological sampling of various floor sequences and open area surfaces across the best-preserved areas of the site. The two sampling strategies employed at the selected buildings were vertical micromorphological sampling in exposed sections and horizontal sampling in a grid for micro-refuse and geochemical analyses. In this paper we examine the insights into daily activities and the structured use of space provided by the micro-artefact analyses, and demonstrate that such a thorough understanding of space could never be garnered through the excavation data alone.

The ongoing laboratory analysis of micro-artefact assemblages – undertaken within a research project funded by the Slovenian Research Agency – is an integral component of this first high-resolution geoarchaeological study of any

hillfort site in Slovenia. Micro-artefact identification and characterisation involve several different analytical techniques, including petrography, metallography, chemical analysis and electron microscopy with microchemical analysis, which are coupled with zooarchaeological and paleobotanical analyses of bone and plant micro-refuse. The distributions of identified types of material are analysed in a GIS environment and complemented with magnetic susceptibility and micromorphology data. Here, we present the results of the micro-refuse analysis of the floor at the Late Hallstatt multi-room Building 24, including insights into the locations of the entrance into the building and various items of furniture, as well as different activities related to distinct indoor areas. Most notably, the seemingly inconspicuous southern room that provided no hints of its use during the excavation was identified as a smithy.

11 **UNDISTURBED SOIL SAMPLE METALLOGRAPHY AS A TOOL TO UNDERSTAND ACTIVITIES, ORGANISATION, DYNAMICS AND FLOOR MANAGEMENT PRACTICES IN A BLACKSMITH WORKSHOP**

Abstract author(s): Jeannot, Rémy (Laboratoire Chrono-environnement, UMR 6249, CNRS, Université de Franche-Comté; Laboratoire Metallurgies et Cultures - IRAMAT, UMR 7065, CNRS, Université de Technologie de Belfort-Montbéliard) - Gebhardt, Anne (Laboratoire Interdisciplinaire des Environnements Continentaux - LIEC, UMR 7360, CNRS; Laboratoire Image Ville Environnement, Université de Strasbourg - LIVE, UMR 7362, CNRS; Institut National de Recherche en Archéologie Préventive - INRAP) - Gauthier, Joseph (Laboratoire Chrono-environnement, UMR 6249, CNRS, Université de Franche-Comté; Centre de Recherche sur les Sociétés, les Arts et les Techniques, UR 3436, Université de Haute-Alsace)

Abstract format: Oral

Archaeology, through the study of structures and artefacts, allows a certain level of understanding of the purposes of artisanal spaces; but as structures can have multiple functions and artefacts may be evacuated throughout the time of activity, the image perceived by archaeologists is often quite incomplete. In this regard, the floor deposits, especially when composed of a thick accumulation of wastes, may conceal a new layer of information regarding the activities undertaken in the workshop, their spatial organisation and temporal dynamics.

In this communication, we aim to discuss the contributions of the study of undisturbed soil samples from a XVIth century mining forge – in regard of a few similar approaches – by reflected light microscopy. The excavation of this site, the Carreau Ste Barbe in Sainte-Marie-aux-Mines (France), from 2018 to this year, allowed to document a complex workshop, whose floor underwent multiple transformations, from drainage to levelling, while accumulating a large amount of smithing wastes. In this context, micromorphology helped to understand the dynamics of the accumulation; a metallographic investigation of the hammerscales and other microscopic debris then allowed to associate different areas with the activities they sheltered.

Similar approaches have been used occasionally for more than a decade, either by paleo-metallurgists or micro-morphologists, but rarely published; as they have become more widely employed in recent years, we hope to contribute to their development with examples in which these methods helped to understand the everyday works of blacksmiths and their perception of the floor they worked on.

12 **EVIDENCE FOR DAILY ACTIVITIES AND CULTURAL ASSOCIATIONS LOCKED INTO FLOORS**

Abstract author(s): Scott Cummings, Linda (PaleoResearch Institute)

Abstract format: Oral

Floors contain evidence of living conditions, daily activities, and more. The microfossil record including pollen, phytoliths, and parasite eggs may become embedded in compacted dirt floors, while macrofloral remains are more typically found in the “floor fill” or uncompacted fill immediately above compacted floors. Seeds are more fragile than either pollen or phytoliths, and, as such, they often are subject to breakage rather than being driven into the compacted occupational surfaces. Stratigraphic sequences of remodeling provide information concerning changes in activity or access to resources. Activity areas often revolve around architectural details in the living space. Use of the ceiling rafters to hang plants to dry may be reflected in distribution of pollen across floors or portions of floors. Concentrations of pollen associated with broken vessels may represent long-term or short-term storage. Recovery of those remains in the vicinity of a hearth, for instance, may signal preparing medicinal tea. Elevated quantities of microfossil remains may be mapped across floors to observe patterns reflecting activities. Exterior floors between dwellings may be compared with floors inside those dwellings to make inferences concerning use of the common spaces. Multiple examples of floors, ranging from prehistoric pithouses to historic bars are illustrated.

DAMP AND STICKY UNDERFOOT: INVESTIGATING FLOOR MAINTENANCE PRACTICES AT THE IRON AGE WETLAND SETTLEMENT OF BLACK LOCH OF MYRTON, SCOTLAND

Abstract author(s): Roy, Lynne - Crone, Anne - Cavers, Graeme - Robertson, Jackaline (AOC Archaeology Group) - Allison, Enid (Canterbury Archaeological Trust) - McKay, Helen (University of Durham) - Whitehouse, Nicki (University of Glasgow) - Davies, Kimberley (University of Bournemouth)

Abstract format: Oral

An extraordinary degree of organic survival at the Iron Age wetland settlement of Black Loch of Myrton has provided a rare opportunity for a detailed multi-proxy study of in situ flooring deposits. Focusing on the results of micromorphological analysis, this paper will discuss how analysis of flooring deposits from the two best preserved roundhouse structures in the settlement (Structures 2 and 3), has provided insight into floor maintenance practices and identification of activity areas.

The occupation of both structures took place in the damp of a Scottish lochside. Analysis of the composition of floors from both structures has revealed bracken to be the principal component, with reeds, sedge, peat, peaty turfs and roundwood also utilised. The flooring initially appears to have been laid in dry conditions, but as time progressed the flooring materials decayed and additional matter was laid down in rising damp. This necessitated regular flooring maintenance in the form of importation of yet more plant materials and the removal of decayed flooring.

The results of micromorphological analysis have been compared with analyses of plant macrofossils, insects, artefacts and faecal steroids in order to identify differential use of space. This has shown trampling of food and fuel around the hearths while beyond the hearth-space, the interior remained remarkably free of evidence for human activity.

This paper will conclude with a discussion of the implications of the analysis of the floors from Structures 2 and 3 for the interpretation of flooring deposits on equivalent dryland sites. Did the prevailing damp conditions require an approach to floor maintenance that necessitated importation of unusual quantities of organic material? Alternatively, are the maintenance practices inferred from the evidence in the flooring deposits from the structures representative of a practice that leaves little trace in the archaeological record in non-waterlogged sites?

FLOOR BIOGRAPHIES: THE MICROMORPHOLOGICAL STUDY OF LATE MEDIEVAL FLOORS FROM THE SITE OF IEPER DE MEERSEN (YPRES, BELGIUM)

Abstract author(s): Devos, Yannick (Vrije Universiteit Brussel) - De Groote, Koen (Flanders Heritage Agency)

Abstract format: Oral

In 2018 a series of well-preserved floor microstratified layers were discovered within three houses on the site of Ieper De Meersen, situated in the historical centre of Ypres. The site is situated on the westbank of the river Ieperlee and was developed as a new parish (St Nicholas) in the early 13th century. Around the middle of that century, several half-timbered houses were erected on a small dead-end street north of the churchyard. All the well-preserved floor levels can be dated between 1250 and 1325 AD. Although these plots remained inhabited until the establishment in 1598 of an abbey on this site, no younger floor levels have survived.

The individual layers are typically only a few millimeters thick, rendering their study a difficult task. Micromorphology, the study of soils and sediments in their undisturbed state at a microscopic level, allows to characterize the individual layers.

Beyond enabling to come to a typology of the different layers, it also permits to reconstruct the biography of the floor. Indeed, such a micromorphological study can provide details on the construction, maintenance and abandonment of the floors, their preservation status, but also on the spatial organization within the house.

THE MEETING OF OPPOSITES: A MICROMORPHOLOGICAL COMPARITIVE STUDY OF FLOORS FORMED THROUGH SEASONAL AND LONG TERM OCCUPATION IN PRE-INDUSTRIAL ICELAND

Abstract author(s): Beck, Sólveig (Institute of Archaeology in Iceland)

Abstract format: Oral

This paper presents the results of a micromorphological comparative study of floor layers from two tent booths at a medieval, seasonal trading station in Gásir in Eyjafjörður, Northeast Iceland, and two pre-industrial turf and stone buildings, historically known to have housed a school dormitory and a meat store at the episcopal see in Skálholt, Southwest Iceland.

The study reveals that floor structure within the tent booths consists of sequences of multiple, thin lenses of peat ash, and/or soil and sand mixed with such ash that can all be clearly delineated. There is indication of trampling or floor removal, and very little indication of anthropogenic debris beyond basic subsistence. The living space in the dormitory reveals fine soil floors with similar thickness as the tent booths, but clear multiple darker and sharper sequential floor crusts and indications of localised activities of the school boys such as peat ash, bone fragments and feather quill shav-

ings. The meat store floor structures are fundamentally different and represent deposits formed through long term, heavy duty cooking activities and trampling. The floors consist of multiple, thick sequences of turf layers inundated with large fragments of anthropogenic debris such as wood chips and burned bones, topped with sharp, dark floor crusts. Fuel debris present is a mixture of charred fragments and ashes from wood charcoal, peat and dung. Clear indications are identified of truncations likely due to cleaning, and floor maintenance, e.g. pockets of sandy soil, turves or wood chip layers for levelling.

It is clear from this study that the sampled living spaces demonstrate major structural and material differences between occupational surfaces formed in open tent booths during seasonal short term subsistence in close contact with its natural surroundings, and strongly organised and compartmentalized activities within roofed turf- and stone dwellings on farms occupied long term.

16 THE MULTI-FUNCTIONAL AND MULTI-SENSORY 'BYRE': THE ANALYSIS AND INTERPRETATION OF VIKING-AGE ANIMAL SPACES

Abstract author(s): Milek, Karen - Evans Tang, Harriet (Department of Archaeology, Durham University) - Harraut, Loïc (Department of Archaeology, Durham University; Laboratoire des Science de l'Environnement Marin, Université de Bretagne Occidentale) - Groenewald, Patricia (Department of Archaeology, University of Cape Town)

Abstract format: Oral

Microscopic and geochemical analyses of occupation surfaces in excavated buildings play crucial roles in the identification and interpretation of spaces occupied by animals. Geoarchaeological research on well-preserved floor deposits in Viking-Age houses in Iceland with putative byre ends has uncovered a surprising range of activities, including metalworking. This sheds new light on the features and objects previously found in presumed animal spaces that were interpreted as anomalies. Moreover, the traditional view that byre-dwellings were used only for cattle needs to be re-assessed in light of recent faecal lipid biomarker work demonstrating the presence of other small animals within houses, including goats. When faecal lipid biomarkers have been applied more widely across occupation surfaces, they have also shown that the presumed 'byre-end' is not the only place where animal faeces become integrated into house floor deposits. Moreover, combining faecal lipid concentrations and lipid markers for urine points to other parts of the house where small animals were likely to have been stalled, raising wider questions about where and how it was acceptable to keep animals in close proximity to humans. This paper draws on two detailed geoarchaeological case studies, the 10th-century houses at Aðalstræti 16, in Reykjavík, and Hrísbú, in Mosfellsdalur (Iceland), as well as other Viking-Age dwelling houses in the North Atlantic region, to explore the how the designs, varied uses, and maintenance of Viking-Age dwelling houses would have impacted how they would have been perceived – visually, by sound, and by smell – as people moved through them.

A. DIGITALISATION OF MAGDALENIAN FLOORS AS A METHOD OF ANALYSIS: THE CASE OF A MAGDALENIAN DWELLING STRUCTURE FROM LA GARMA (SPAIN)

Abstract author(s): García-Noriega, Carlos (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria-Gobierno de Cantabria-Grupo Santander; Grupo de Investigación Reconocido SCOPE) - Portero, Rodrigo (University of Salamanca; Grupo de Investigación Reconocido PREHUSAL; Grupo de Investigación Reconocido SCOPE) - Ontañón, Roberto (Museo de Prehistoria y Arqueología de Cantabria-Cuevas Prehistóricas de Cantabria; Grupo de Investigación Reconocido SCOPE) - Arias, Pablo (Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria-Gobierno de Cantabria-Grupo Santander; Grupo de Investigación Reconocido SCOPE)

Abstract format: Poster

Technological advances has allowed the development of new tools for scientific analysis to create new working methods with digital techniques. In this context, La Garma research project aims to develop a new method for the study of living floors, oriented towards the Intrasite Spatial Analysis of the occupation surface of a Paleolithic structures in The Lower Gallery of La Garma.

The method combines fieldwork with digital tools such as photogrammetry, Geographic Information Systems and Spatial Databases. Firstly, photogrammetry is used to obtain a high-resolution georeferenced orthophoto, which will be included in a Geographic Information System based project. The vector data is collected and stored in an object-oriented relational database management system, linked to our GIS project, so that we build a robust model for classifying, editing, recording and analysing the data.

Our objectives focus on the development of an efficient and simple method that, given the peculiarity of our case study, with an undisturbed occupation surface, is respectful of the conservation and preservation of the archaeological remains. Therefore, the main work is based on the use of non-invasive techniques that allow less manipulation of the archeological record, giving priority to the preservation of the archaeological site.

The results obtained make it possible, on one hand, to identify, catalogue and record all the archaeological data in real time and with great precision, facilitating the study both in the field and in the laboratory. On the other hand, this method makes it possible to observe and analyse spatial relationships between the archeological remains from a large amount of attributes or numeric data, so that the organisation of each layer can be reconstructed.

661 PATHOGENIC DISEASE IN THE PAST

Session theme: 6. Contested Pasts & Presents

Session organisers: Wilkin, Shevan (Institute of Evolutionary Medicine, University of Zurich) - Majander, Kerttu (University of Vienna)

Session format: Regular session

Diseases and epidemics have ravaged human populations for millennia. How we identify those who suffered from communicable diseases ranges across several methods, and often these can be combined to produce a more nuanced differential diagnosis. Commonly used methods include consulting historic documents that detail symptoms and their descriptions, paleopathological assessments of skeletal remains, and metagenomic screening for the presence of pathogenic bacteria or viruses. More recently, studies of bone and dentine proteomes are attempting to discover immunological biomarkers of specific illnesses, however this method is still in its infancy. This session aims to bring together those who utilize these methods, and others not mentioned above, to investigate disease and to improve our understanding of health states in past populations. Through presentations of published and ongoing studies, combined with fruitful discussions of the future of ancient diseases research, we aim to develop a strong, supportive working group of researchers within the discipline.

ABSTRACTS

1 GOATS, GERMS, AND GENES: EXPLORING THE NEOLITHIC IMPACT ON LIVESTOCK HEALTH AND ZONOSIS IN THE ZAGROS MOUNTAINS AND SOUTHWEST ASIA

Abstract author(s): L'Hote, Louis (Trinity College Dublin) - Bangsgaard, Pernille - Yeomans, Lisa (University of Copenhagen) - Mashkour, Marjan (National Museum Natural History Paris) - Zeder, Melinda (National Museum of Natural History, Smithsonian Institution) - Daly, Kevin - Bradley, Dan (Trinity College Dublin)

Abstract format: Oral

The Neolithic period in Southwest Asia was characterised by the domestication of livestock animals, which had a profound effect on human health, as it provided a stable source of animal protein and secondary products. However, this increased interaction between animals and humans also resulted in a heightened risk of zoonotic disease transmission, both within herds and between animals and humans. Despite the recovery of numerous ancient human pathogen genomes through high-throughput sequencing techniques, a limited number of livestock pathogen genomes have been recovered to date. My work focuses on obtaining pathogen and animal metagenomic aDNA from 10,000-year-old sheep and goat material from the Zagros Mountains in Iran, a region with some of the earliest evidence of goat herding and the zoonotic brucellosis in humans. The objective of this study is to understand the impact of the inception of animal farming on the evolution and spread of zoonoses within livestock populations and across species barriers. Additionally, I aim to explore the impact of this transition on the genetic health of ovicaprids by examining patterns of inbreeding and genetic diversity at the immune gene and genome levels, revealing the robustness of the early livestock herd and neolithic food security.

2 CONTRASTING EVOLUTIONARY AND ADAPTIVE HISTORIES REVEALED FOR THREE ORAL PATHOBIANTS RECOVERED FROM BRONZE AGE IRISH REMAINS

Abstract author(s): Jackson, Iseult (Smurfit Institute of Genetics, Trinity College Dublin; Science Foundation Ireland Centre for Research Training in Genomics Data Science) - Fibiger, Linda (University of Edinburgh) - Dowd, Marion (Atlantic Technological University) - Cassidy, Lara (Smurfit Institute of Genetics, Trinity College Dublin)

Abstract format: Oral

The development of ancient genomic techniques has allowed the exploration of both host genomes and the genomes of commensal and pathogenic microbes. Teeth provide a particularly rich substrate: as well as endogenous host DNA, they are a source of DNA from both bloodborne pathogens and the oral microbiota. We carried out metagenomic screening of a dataset of 344 published tooth and calculus samples from diverse prehistoric, Medieval and early modern contexts. This identified two teeth from a limestone cave (Killuragh, Co. Limerick, Ireland) with exceptional preservation of oral pathobiont species. Both were found to belong to a single Early Bronze Age individual (2343-2036 cal BC). Given the large quantities of pathobiont DNA recovered, novel ancient genomes could be assembled

de novo for two species, *Streptococcus mutans* and *Treponema denticola*, while a third, *Tannerella forsythia*, was reconstructed through reference alignment. An additional 38 *T. denticola* and 18 *T. forsythia* ancient genomes were reconstructed from published samples in the literature. This dataset provided unprecedented resolution on the evolutionary histories of these three pathobionts. Contrasting phylogenetic patterns were observed, with a very recent adaptive radiation observed for *T. forsythia* in the early modern period and deep divergences within modern *S. mutans* diversity, some pre-dating the branch leading to Killuragh. Comparative analysis also revealed differences in the functional repertoires of oral pathobionts. Changes in the presence of key virulence factors in the species' pangenomes correlates with changes in human behaviour, such as dairying, industrialisation and the widespread use of antibiotics. The timing of these changes appears to differ between species, suggesting differences in the factors affecting these pathobionts' co-evolution with their human hosts.

3 INFECTIOUS DISEASES IN THE LATE VIKING AGE TOWN OF SIGTUNA

Abstract author(s): Pochon, Zoé (Department of Archaeology and Classical Studies, Stockholm University; Centre for Palaeogenetics) - Kirdök, Emrah (Department of Biotechnology, Faculty of Science, Mersin University) - Oskolkov, Nikolay (Department of Biology, National Bioinformatics Infrastructure Sweden, Science for Life Laboratory, Lund University) - Krzewińska, Maja - Götherström, Anders (Department of Archaeology and Classical Studies, Stockholm University; Centre for Palaeogenetics)

Abstract format: Oral

Infectious diseases are not easy to detect in paleopathology. Long-lasting diseases such as tuberculosis, leprosy, syphilis and brucellosis can leave visible traces on the bones, but this is not the case for most infectious diseases. With the development of next-generation sequencing techniques, it is now possible to recover the genomes of ancient humans but also of the pathogens they were hosting at the time of death such as *Yersinia pestis*, the agent of plague. Here we focus on the impact of urbanization on infectious disease with the Late Viking Age town of Sigtuna as a case study. Over 40 individuals were subjected to shotgun sequencing and screening for potential pathogens using a new ancient metagenomics workflow developed in collaboration with the National Bioinformatics Infrastructure Sweden (NBIS), called aMeta and available on GitHub. Preliminary results are promising, with the detection of the foodborne pathogen *Yersinia enterocolitica* and the sexually transmitted infections *Neisseria gonorrhoeae* and Hepatitis B virus. A further increase in the number of individuals considered in this study suggests the presence of another infectious disease not common in these latitudes today. We are generating phylogenetic trees comparing the pathogenic strains found with other ancient and modern strains to better understand the way of transmission of these diseases through time and space. We hope that our study will provide greater insight into the infectious diseases that were common in a Late Viking Age early urban site.

4 PROTEOMICS OF ANCIENT IMMUNOLOGY: REFINED METHODS TO DETECT ACTIVE LEPROSY IN MEDIEVAL INDIVIDUALS

Abstract author(s): Wilkin, Shevan (University of Zurich) - Lannigan, Liam (The Globe Institute, University of Copenhagen) - Montes, Nuria - Fontanals-Coll, Maria (Unitat d'Antropologia Biològica, Universitat Autònoma de Barcelona) - Avanzi, Charlotte (Colorado State University) - Singh, Pushpendra (ICMR-National Institute of Research, India) - Schuenemann, Verena (Department of Evolutionary Anthropology, University of Vienna) - Taurozzi, Alberto (The Globe Institute, University of Copenhagen) - Collins, Matthew (McDonald Institute for Archaeological Research)

Abstract format: Oral

Palaeopathology and ancient DNA, often used in tandem, have been successfully used to identify diseases in past individuals. While this provides an effective method to detect pathogen presence, much remains unknown about identifying active infections and the host response to past pathogens. Protein analysis offers new insights into how the immune system of those suffering from infections and diseases responded. However, proteomic analysis of bone and dentine samples are often complicated by an overwhelming presence of collagen, the most abundant protein in both tissues. Tandem mass spectrometry focuses on the most common peptide masses which often leads to collagen "swamping" out lower abundance peptides, leaving these lower-abundance proteins undetected. Here we present a protocol combining a recently developed digestion enzyme to reduce collagen with optimized extraction steps to specifically target immune proteins that would be otherwise hidden. We conducted comparisons of tissue types, denaturation agents, extraction fractions, and digestion enzymes in order to identify the most effective protocol for identifying the non-collagenous portion of the proteome, specifically focused on immune-related protein recovery. We illustrate our optimized methodology through a combined DNA and protein immunological case study of individuals from a Medieval Spanish leprosarium, as well as four individuals interred in a non-leprosy associated context. Through this combined approach, we have identified specific immune-related proteins that may indicate active leprosy infections at the time of death of these individuals. The results of this study have widespread implica-

tions for future work, and present numerous possibilities for palaeopathological/biomolecular studies focused on past health and disease.

5 HIGH-COVERAGE GENOMES OF *TREPONEMA PALLIDUM* BACTERIA FROM ANCIENT HUMAN-REMAINS ILLUMINATE THE EVOLUTION OF TREPONEMAL DISEASES

Abstract author(s): Majander, Kerttu (Department of Evolutionary Anthropology, University of Viennaustria) - Pla-Díaz, Marta (Unidad Mixta Infección y Salud Pública FISABIO/Universidad de Valencia-I2SysBio; CIBER in Epidemiology and Public Health, Spain) - du Plessis, Louis (Department of Biosystems Science and Engineering, ETH Zürich; Swiss Institute of Bioinformatics) - Panagiotopoulou, Hanna - Doan, Karolina - Bogdanowicz, Wiesław (Museum and Institute of Zoology, Polish Academy of Sciences) - Dąbrowski, Paweł (Department of Anatomy, Wrocław Medical University) - Oziębłowski, Maciej (Faculty of Biotechnology and Food Sciences, Wrocław University of Environmental and Life Sciences) - González-Candelas, Fernando (Unidad Mixta Infección y Salud Pública FISABIO/Universidad de Valencia-I2SysBio; CIBER in Epidemiology and Public Health, Spain) - Schuenemann, Verena (Department of Evolutionary Anthropology, University of Viennaustria; Institute of Evolutionary Medicine, University of Zurich; Human Evolution and Archaeological Sciences - HEAS, University of Viennaustria)

Abstract format: Oral

Treponema pallidum bacteria, the causative agents of sexually transmitted syphilis, and the endemic nonvenereal yaws and bejel, are well adapted to their human host, and currently re-emerging despite the eradication efforts by WHO and medical communities around the world. *Treponema pallidum* spirochetes are extremely difficult to cultivate in vitro, stalling the research on the main functional mechanisms of treponemal infections and on the exact requirements of their transmission and host immunity evasion.

Ancient DNA has the potential to revolutionize the research on pathogens that have accompanied humans throughout history. Classical archaeology and paleopathology now come together with genetic approaches, such as high-throughput sequencing and target enrichment methods, in exceedingly successful studies where reconstructed genomes of past pathogens are used to complement the information provided by modern pathogen genomics.

Here we present some of the most recent advancements in resolving the history and origins of *Treponema pallidum*, and demonstrate the power of in-depth analyses gained through high-coverage ancient genomes of this bacterium. A novel, 17th century genome of the syphilis-causing *T. pallidum pallidum* bacterium, retrieved from human remains from an archaeological context in Wrocław, Poland, is used to reveal previously unknown recombination events and positive selection, affecting the patterns of divergence between the subspecies of *T. pallidum*. Furthermore, molecular dating of the treponemal subspecies' divergences is generated through a combined dataset of ancient and modern treponeme genomes. Overall, our results shed light on hitherto poorly known evolutionary adaptations of treponemes, and help tracing back the emergence and early relations of the treponemal subspecies.

6 THE BONE PROTEOME: CREATING A DATABASE OF 'NORMAL' VARIATION IN PEPTIDE COMPOSITION OF ARCHAEOLOGICAL HUMAN BONE

Abstract author(s): Burnett, Alexandra (ProGenTomics, Laboratory of Pharmaceutical Biotechnology, Faculty of Pharmaceutical Sciences, Ghent University; ArcheOs Laboratory for Biological Anthropology, Faculty of Arts and Philosophy, Ghent University) - Daled, Simon - Maarten, Dhaenens (ProGenTomics, Laboratory of Pharmaceutical Biotechnology, Faculty of Pharmaceutical Sciences, Ghent University) - Deforce, Dieter (Laboratory of Pharmaceutical Biotechnology, Faculty of Pharmaceutical Sciences, Ghent University) - De Groote, Isabelle - Palmer, Jessica (ArcheOs Laboratory for Biological Anthropology, Faculty of Arts and Philosophy, Ghent University)

Abstract format: Oral

Recent research has shown tantalising potential for the identification of bone protein biomarkers related to age, sex, and even ethnicity, which could be invaluable to the reconstruction of individual biographies and population demographics in archaeology (e.g. Sawafuji et al. 2017; Procopio, Chamberlain & Buckley 2017; Johnston & Buckley 2021). However, this research has predominantly been pursued through animal proxies or modern human bone, with limited comparability to archaeological human bone proteomes. Palaeopathological human studies, meanwhile, have usually been undertaken on singular individuals without comparators, making it difficult to assess the significance of proteins as indicative for immune responses (e.g. Bona et al. 2014). In the interests of improving knowledge of human bone proteome taphonomy, interrogating evidence for the survival of proposed biographical biomarkers over archaeological time, and providing a baseline for the analysis of pathological bone, we will analyse rib samples from a subset of the postmedieval population of Aalst, Belgium. We will explore intra-element variation, intra-individual variation, and inter-individual variation among children and adult men & women, by sampling multiple physiologically distinct areas across upper and lower ribs without apparent osteological lesions. These will be analysed using both data-dependent (DDA) and data-independent (DIA) acquisitions on state-of-the-art instrumentation – the ZenoTOF 7600 mass spectrometer – to explore the full range of semi- and non-tryptic peptides present, and to create a future-proof

data archive of the resultant ions for future re-analysis and widespread applications. Crucially, this comprehensive 'healthy' baseline is hoped to provide a basis for comparison in the analysis of pathological bone from Aalst and for other archaeological populations.

662 RUN TO THE VALLEYS [PAM]

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Pereira, Telmo (Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar; Centro de Geociências da Universidade de Coimbra; UNIARQ, Centro de Arqueologia da Universidade de Lisboa) - Abrunhosa, Ana (CENIEH - Centro Nacional de Investigación sobre la Evolución Humana; ICArEHB - Interdisciplinary Center for Archaeology and Evolution of Human Behaviour)

Session format: Regular session

Pleistocene and Early Holocene hunter-gatherer ecodynamics were characterized by the exploitation of resources from their natural sources. As environmental conditions changed, the presence, amount, quality, and visibility of many such biotic and abiotic resources also changed. Moreover, the overall comfort may have also been decisive in occupying or not a particular space during specific periods in relation to environmental conditions and accessibility to such resources.

One of the best setups where a diversity of resources and humans clustered were valleys and canyons. But, these geomorphological features were also where considerable erosion and deposition occurred. Ultimately, the environmental conditions that caused sedimentation and/or erosion were responsible for allowing the preservation or causing obliteration of the evidence of human presence and testimonies of human activity.

In this session, we bring together case studies of single and multiple occupation sites in valleys from around the world during the Pleistocene and Early Holocene. Our goal is to discuss human behaviour, adaptation, ecodynamics, resource exploitation, and archaeological visibility.

ABSTRACTS

1 THE MIDDLE STONE AGE IN THE TANZANIAN RIFT VALLEY: DGS, A NEW SITE IN THE OLDUVAI GORGE

Abstract author(s): Solano-Megías, Irene (Centro Nacional de Investigación sobre la Evolución Humana - CENIEH; Universidad de Burgos- UBU) - Maíllo-Fernández, José Manuel (Universidad Nacional de Educación a Distancia - UNED; The Institute of Evolution in Africa - IDEA) - Marín, Juan (Universidad Nacional de Educación a Distancia - UNED; Institut Català de Paleoecologia Humana i Evolució Social - IPHES) - Martín-Perea, David (Universidad Complutense de Madrid - UCM; The Institute of Evolution in Africa - IDEA) - Abellán, Natalia (Universidad Nacional de Educación a Distancia - UNED; The Institute of Evolution in Africa - IDEA) - Gidna, Agness (Department of Cultural Heritage, Ngorongoro Conservation Area - NCAA) - Mabulla, Audax (University of Dar Es Salaam)

Abstract format: Oral

Adaptation and exploitation of the environment by human groups in terms of its surroundings is one of the circumstances that make human beings particularly unique. Middle Stone Age (MSA) research in East Africa has received special attention over the past years. Dorothy Garrod Site (DGS), discovered during a fieldwork survey in 2017, demonstrate the enormous potential of Olduvai Gorge (northern Tanzania) for the study of the MSA period. DGS shed new lights on an almost unknown area at least for the MSA with a known stratigraphic context.

This communication reports on a new MSA site, located on the north bank of the Olduvai river and embedded within the Ndutu Formation, specifically in a cemented tuffaceous silt level. DGS is characterized by only one archaeological level that has yielded a functional association between faunal remains and lithic industry.

DGS shows a human occupation where lithic and fauna display evidence of human manipulation (knapping, percussion and burning remains), contributing enormously to understanding the settlement patterns and the interaction of modern humans with the environment.

From a technological point of view, the site is characterized by discoid methods and the near absence of other technological methods and lithic points. All raw materials used have a local origin, either of primary or secondary access. This pattern seems to correspond to the open-air deposits studied in the area. In contrast, the exogenous raw material

- obsidian from southern Kenya- is well known from sheltered deposits to the north and south of the Olduvai Gorge which was a passing point for the obsidian circulation.

2 LOCATING CAVE ENTRANCES AND OTHER KARSTIC PHENOMENA USING DRONE-DERIVED LIDAR DATA AT RIVER LIS' CANYONS (LEIRIA, PORTUGAL)

Abstract author(s): Dias, Rita (Era - Arqueologia, Conservação e Restauro; ICArEHB) - Fonte, João (Universidade da Maia/ISMAI; ERA Arqueologia S.A.) - Pereiro, Tiago - Hipólito, João (ERA Arqueologia S.A.) - Monteiro, Patrícia (LARC-DGPC; ICArEHB) - Pereira, Telmo (Universidade Autónoma de Lisboa; Instituto Politécnico de Tomar; Centro de Geociências da Universidade de Coimbra; UNIARQ)

Abstract format: Oral

Prehistoric spatial networks were subject to a plethora of variables both natural and human-dependent in an ever-changing landscape. In that sense, the central coast of western Iberia is an interesting case study to hunter-gatherer dynamics between coastal and inland territories, due to specific ecological and geomorphological features, abundant flint resources, and karstic canyons that connect the coast to the mountains inland.

To this day, there have not been many LiDAR surveys focusing on the discovery of karstic features entrances, and the few attempts were mainly focused on locating sinkholes. Here we attempt to investigate the existence of various types of entrances (small vertical cave shafts, horizontal and sub-horizontal caves, and rockshelters) in a densely vegetated terrain, with difficult foot access, through high-resolution drone-derived LiDAR data. An efficient pipeline to collect, process and visualise LiDAR-derived point clouds and elevation models of karstic landscapes was developed to further contribute to the understanding of prehistoric spatial networks in this type of landscape and specifically, in this case, the resources exploited in each settlement and the pathways used to move across and between landscapes. In addition, and depending on the increase in the cave entrances dataset, there is good potential for automating its mapping through artificial intelligence.

3 LATE PLEISTOCENE ARCHAEOLOGY OF THE TANANA VALLEY, ALASKA

Abstract author(s): Wygal, Brian (Adelphi University)

Abstract format: Oral

The Tanana Valley in interior Alaska has been home to the Dene people since time immemorial. Their longevity is a testament to the rich and changing ecosystems of interior Alaska. Consequently, the region has established a benchmark for late Pleistocene archaeology throughout eastern Beringia and has been critical for understanding the timing and routes of First Nation peoples in the Americas. In this paper, we review the unique periglacial environments of the middle Tanana Valley through the study of its rich geoarchaeological and palaeoecological records contained in deep deposits of calcareous aeolian loess. A history of research at key sites in the region combined with advances in archaeological methods and theory improves our understanding of people, plants, and animals during the Late Glacial period. While the Mead, Broken Mammoth, and Swan Point archaeological sites provide detailed views into late Pleistocene behaviors and especially their food quest, recent research from the Holzman site reveals specific aspects of Paleolithic life in the subarctic.

4 CANYONS AS REFUGE AREAS DURING THE LAST GLACIAL MAXIMUM IN WESTERN-MOST EURASIA

Abstract author(s): Pereira, Telmo (C.E.U.-Cooperativa de Ensino Universitário; Instituto Politécnico de Tomar; CGeo – Centro de Geociências da Universidade de Coimbra; UNIARQ – Centro de Arqueologia da Universidade de Lisboa) - Monteiro, Patrícia (LARC – Laboratório de Arqueociências, Direção Geral do Património Cultural; ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve) - Haws, Jonathan (Department of Anthropology, University of Louisville; ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve) - Benedetti, Michael (Department of Earth and Ocean Sciences, University of North Carolina Wilmington; ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve) - Carvalho, Milena (ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve) - Friedl, Lukas (Department of Anthropology, University of West Bohemia; ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve) - Paixão, Eduardo (TraCEr – Laboratory for Traceology and Controlled Experiments, MONREPOS – Archaeological Research Centre and Museum for Human Behavioural Evolution, RGZM; The Institute of Archaeology, The Hebrew University of Jerusalem; ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve) - Nora, David (The Institute of Archaeology, The Hebrew University of Jerusalem; ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve) - Paya, Alexandre (CGeo – Centro de Geociências da Universidade de Coimbra; Instituto Politécnico de Tomar)

Abstract format: Oral

The Last Glacial Maximum was a period of harsh global conditions with great pressure on flora, fauna, and human societies. In the northern hemisphere, including Europe, the coverage of most of the septentrional and high regions with ice sheets led people to change their land-use patterns and to move into lower and meridional territories. However, these were not homogeneous due to variations in geography and the availability of suitable habitat space at regional and local scales. In exposed regions such as the Atlantic margin, people may have preferred to live in the protected places instead of the open plains, uplands, and plateaus.

The western-most façade of Iberia, specifically Portuguese Estremadura, is characterized by coastal lowlands which abruptly end in the cliffs of the Estremadura Limestone Massif. Besides the overall severe environmental conditions, and regardless of the shore being further west at that time, both the lowlands and highlands were constantly exposed to strong and freezing winds from the Atlantic. However, this limestone massif is fractured by tectonics, and has several narrow canyons with caves and rock shelters that provide sheltered and comfortable conditions.

Here we present and discuss the set of published data and new data that seem to show the clustering of human occupations in karstic settings in detriment of the open areas, including inside of these valleys, during the LGM.

5 THEM VALLEY BONES: TAPHONOMIC HISTORY OF PLEISTOCENE ARCHAEOFAUNA AT ABRIGO DA BURACA DA MOIRA (CENTRAL PORTUGAL)

Abstract author(s): Paya, Alexandre (Instituto Politécnico de Tomar; CGeo – Centro de Geociências da Universidade de Coimbra) - Pereira, Telmo (C.E.U.-Cooperativa de Ensino Universitário; Instituto Politécnico de Tomar; CGeo – Centro de Geociências da Universidade de Coimbra; UNIARQ – Centro de Arqueologia da Universidade de Lisboa) - Detry, Cleia (UNIARQ – Centro de Arqueologia da Universidade de Lisboa) - Rossell, Jordi (IPHES – Institut Català de Paleocologia Humana i Evolució Social) - Monteiro, Patrícia (LARC – Laboratório de Arqueociências, Direção Geral do Património Cultural; ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve) - Paixão, Eduardo (ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve; TraCEr – Laboratory for Traceology and Controlled Experiments, MONREPOS – Archaeological Research Centre and Museum for Human Behavioural Evolution, RGZM; The Institute of Archaeology, The Hebrew University of Jerusalem) - Nora, David (ICArHEB – Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour, Universidade do Algarve; The Institute of Archaeology, The Hebrew University of Jerusalem) - Carvalho, Vânia (Museu de Leiria, Câmara Municipal de Leiria) - Holliday, Trenton (Tulane University; Centre for the Exploration of the Deep Human Journey, University of the Witwatersrand)

Abstract format: Oral

The Last Glacial Maximum brought long-term harsh climatic and environmental conditions. Hence, human groups had to adapt to such changes, which was done through the development of new technologies, shifting ecodynamics and settlement patterns. Buraca da Moira is a cave in Central Portugal with LGM human occupations in which faunal remains with different preservation conditions were recovered. The geomorphological setting of the site, in a valley sheltered from strong winds, with access to both lithic raw materials and fresh water, proves advantageous for Pleistocene human groups to settle in such places. This presentation focuses on the archaeofaunal assemblage recovered

from the layers associated to the LGM, and specifically its taphonomic history. Our results showed the diversity of fauna consumed between the Solutrean and the Gravettian, mainly red deer, and the anthropic activity on some specimens, such as cut marks, impact notches and burning, while carnivore activity was sparse. The conditions of deposition allowed for an overall good preservation of the remains, though carbonated concretions hinder analyses of the surfaces.

6 NEW DATA ON THE ACHEULEAN TECHNO-COMPLEX FROM THE LEFT BANK OF MINHO VALLEY (PORTUGAL)

Abstract author(s): Cunha-Ribeiro, João Pedro (University of Lisbon; Uniarq) - Monteiro-Rodrigues, Sérgio (Universidade do Porto; CITCEM) - Méndez-Quintas, Eduardo (Universidade de Vigo; GEAAT) - Santonja, Manuel (IDEA) - Gomes, Alberto (CEGOT) - Xavier, Pedro (Universidade do Minho; Lab2PT) - Ferreira, Carlos (Faculdade de Letras da Universidade de Lisboa) - Pérez-González, Alfredo (Universidad de Alcalá de Henares; IDEA)

Abstract format: Oral

Archaeological work carried out on the left bank of the Minho River (Portugal), since 2016, has allowed the identification of new Palaeolithic sites – Pedreiras 2 and Bela, in Monção, and Carvalhas, in Melgaço – generally associated with ancient river deposits, dating from the Middle Pleistocene (MIS 9/ MIS 8).

Their characteristic large cutting tools include different types of handaxes, most of them made from quartzite pebbles or wide flakes removed from large cores, cleavers and other artefacts such as cores and flakes, sometimes retouched.

In contrast to what occurs in southernmost river basins of the Iberian Atlantic Façade, where similar occupations are generally associated with high-energy depositional contexts, in the Minho valley such occupations are found often among fine deposits, related to flood phases.

In these cases, raw material sourcing for the production of lithic tools may have occurred away from the site, however not far. In small tributary basins of the Minho River the quartzite appears as an exogenous raw material, and always as knapped tools carried by humans.

In Carvalhas, one of the main sites, preliminary results suggest that the Acheulean implements are connected to an ancient river channel or meander, some of them carried from colluvia/slope deposit. Another assemblage, with a significant amount of flakes associated with a flood deposit, may date from a later period and may be related eventually to the Middle Palaeolithic (no dates available for this context).

These results, similar to those obtained in the right bank of the Minho River (Galicia, Spain), show abundance and diversity of the lithic assemblages, and attest to the human presence at the NW of Iberian Peninsula during the Middle Pleistocene.

7 ACHEULEAN OCCUPATION IN LIS VALLEY (PORTUGAL): THE CASAL DO AZEMEL SITE

Abstract author(s): Ferreira, Carlos (Faculdade de Letras da Universidade de Lisboa) - Cunha-Ribeiro, João (Faculdade de Letras da Universidade de Lisboa; UNIARQ – Centro de Arqueologia da Universidade de Lisboa) - Méndez-Quintas, Eduardo (Grupo de Estudos de Arqueología, Antigüidade e Território - GEAAT, University of Vigo)

Abstract format: Oral

Fluvial archives are key to understanding human behaviour in the Iberian Peninsula during the Middle Pleistocene and, specifically, to discuss the technological and chronological trends of the Iberian Acheulean techno-complex. Indeed, assemblages are mostly located in valley environments related to the main Atlantic regional rivers' basins, not only because they contain sedimentary archives that enhance the conservation of past human occupations' remains, but also due to the richness of these ecosystems.

In central Portugal, numerous Acheulean sites have been found in association to fluvial deposits in the hydrographic basin of the Lis River, and in some colluvial deposits that affect the top of formations that develop on adjacent plateaus. Among these, we highlight Casal do Azemel, a paradigmatic Large Flake Acheulean (LFA) site, with an assemblage composed of 3957 artefacts, in which the high presence of Large Cutting Tools (around 750) stands out. Despite the association of the remains with a colluvial deposit that locally affected the top of the Pliocene marine formation, their concentration in an area that does not stand out topographically from the surrounding flat surface, and the texture of the deposits that comprise them, are indicative of their anthropic origin. Given the pronounced eolisation of the artifacts, human occupation would take place during an important deflation phase and would have been seasonal since the location in a sandy plateau would only be possible in moments in which the scarcity of vegetation would allow human groups to benefit from the advantage of the control of a vast area. In this context, the production sequences identified at the site are the material evidence of a highly structured behaviour that would echo on other dimensions of these groups' dynamics, such as the ecodynamics of territorial exploitation, in which the lithic component would have played a key role.

THE ANTI-HABI TOOLKIT: PRACTICAL WORKSHOP ON SOLUTIONS AND MEASURES FOR PREVENTING AND ADDRESSING HARASSMENT, ASSAULT, BULLYING AND INTIMIDATION IN ARCHAEOLOGY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Coltofean-Arizancu, Laura (EAA Education, Training and Professional Development Advisory Committee; EAA Appeal and Anti-Harassment Committee; Archaeology and Gender in Europe Community of the EAA - AGE) - Hawkins, Kayt (Institute of Archaeology, University College London) - Hlad, Marta (Vrije Universiteit Brussel; Archaeology and Gender in Europe Community of the EAA -AGE)

Session format: Workshop

This workshop is the first in a series of training events that its organizers wish to host at future Annual Meetings of the European Association of Archaeologists (EAA). As a follow-up to the 2022 EAA session “The anti-HABI toolkit: Practical solutions and measures for preventing and addressing harassment, assault, bullying and intimidation in archaeology”, this collaborative, interactive workshop aims to provide practical steps to help prevent HABI occurring. As such it also builds on the many HABI-focused discussions, papers, sessions, publications, and measures that have taken place in recent years, initiated by both EAA members and other colleagues from across the archaeology sector.

The workshop will include:

- A short presentation on what constitutes HABI, its different forms, and its occurrence in European archaeology based on the latest surveys;
- An interactive training session in which workshop participants will learn to identify HABI and practice skills to safely use when witnessing HABI situations;
- A discussion in which workshop participants can ask questions about HABI, share their experiences of the training, and their feedback on it.

The workshop is organized under the aegis of the EAA’s Education, Training, and Professional Development Advisory Committee, its Appeal and Anti-Harassment Committee and its Archaeology and Gender in Europe Community, in collaboration with the British Archaeological Job Resource’s RESPECT Campaign.

The session is limited to 40 participants on a first come first serve basis. We understand individuals, particularly those who have experienced HABI, may wish to step out of the workshop at any point for a short period and a safe space will be made available.

UNDERSTANDING ISOSCAPES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Chala-Aldana, Dobereiner (University of Tübingen) - Valenzuela Suau, Lua (Universitat de les Illes Balears) - Maurer, Anne-France (Universidade de Évora) - Morell-Rovira, Berta (Institució Milà i Fontanals-CSIC) - Diaz-Zorita Bonilla, Marta (University of Tübingen)

Session format: Regular session

Isoscapes are one of the latest developments for the spatial analysis of geochemical and environmental variability in past mobility scenarios. They have become powerful tools for analysing the interaction between human groups, animals and their surrounding landscapes. The combination of Geographic Information Systems, Geochemistry, Archaeometry and Bioarchaeology poses methodological challenges expressed in publications that often show different strategies to elaborate these models. The main aim of this session is to share experiences, results and ideas that could help to find a common frame that integrates such strategies. It will also be an open forum to discuss methodological and theoretical aspects surrounding research designs, sampling strategies, environmental variables, new developments and publication standards on isoscapes models. We would like to welcome scientists using different isotope systems and dealing with similar archaeological questions when building isoscape maps to join the conversation, and to contribute in the generation of common frames for understanding isoscapes with regards to mobility studies.

1 CROWD-SOURCING ISOSCAPE DEVELOPMENT FOR MESOAMERICA THROUGH PUBLIC ENGAGEMENT

Abstract author(s): Buckley, Gina (University of Missouri Research Reactor; Universidade do Algrave) - Thakar, Heather (Texas A&M University) - De Leon, Jason (University of California) - García Hurtado, Maria Fernanda - Solís-Pichardo, Gabriela - Schaaf, Peter (Universidad Nacional Autónoma de México)

Abstract format: Oral

Isoscape development has reached a fever pitch among archaeologists. Part of this phenomenon can be attributed to the fact that sampling for these projects tends to be relatively easy to conduct without the need for significant manual labor or extensive permits. $^{87}\text{Sr}/^{86}\text{Sr}$ isoscapes for human mobility and migration studies have exploded in the last decade, particularly in Europe. Individual studies here generally concentrate within the political boundaries separating modern-day countries. However, prehistoric individuals, who are often the focus of these investigations, did not adhere to these borders. Additionally, isoscapes have potential forensic applications to identify modern-day, displaced individuals. This talk presents new efforts since 2022 to develop isoscapes for the combined region of Mexico and Central America (Guatemala and Belize south to Panama). This region was home to numerous and dynamic prehistoric cultural groups whose lives were interwoven through human mobility and economic relationships for thousands of years before Spanish Contact. However, the combined region constitutes nearly 2.5 million km², making the sampling of this area a huge undertaking. To tackle this large feat, international researchers, including the director of the Undocumented Migration Project, a group committed to identifying human remains of those who have perished attempting to cross the U.S.-Mexico border, have joined forces to create a publicly engaged study. The goal is to foster collaboration with “community scientists” consisting of local people who will be trained in environmental sample collection based on a grid-map system. Community-based sample collecting efforts are a robust avenue for public engagement and provide hands-on learning experiences for anyone interested in archaeological and environmental science. Sampling strategies and preliminary results from the 2022 and 2023 Mesoamerica Isoscape Project (MIP) field seasons will be presented along with future plans to expand this project.

2 THE INFLUENCE OF ALTITUDE AND RIVERS ON STRONTIUM ISOTOPE DATA - INSIGHTS FROM SLOVENIAN PLANTS

Abstract author(s): Gerritzen, Carina (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel) - Goderis, Steven (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel) - James, Hannah (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel) - Črešnar, Matija - Gruškovnjak, Luka - Leskovar, Tamara (Centre for interdisciplinary Research in Archaeology, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Potočnik, Doris - Ogrinc, Nives (Department of Environmental Sciences, Jožef Stefan Institute) - Snoeck, Christophe (Analytical, Environmental & Geo-Chemistry Research Unit, Vrije Universiteit Brussel; Multidisciplinary Archaeological Research Institute, Vrije Universiteit Brussel)

Abstract format: Oral

The diverse landscape of Slovenia provides us with an excellent opportunity to understand and unravel more secrets from our bioavailable Sr dataset. While only a small country, the alpine mountains in the north, the karst plateaus in the southwest, and the vast glacier-fed river systems can make it challenging to create maps of bioavailable strontium in Slovenia. In our large-scale study, we use plant samples to examine how factors such as altitude and proximity to rivers influence Sr isotope data. Triple sampling of tree, shrub, and grass from 101 locations across Slovenia serve as the initial dataset. All samples were analyzed for stable ($\delta^{88}\text{Sr}$) and radiogenic ($^{87}\text{Sr}/^{86}\text{Sr}$) strontium isotopes. Strontium isotope data vary with weathering, which in most cases can be correlated to altitude and the proximity to water sources. In water-rich regions the correlation between Sr isotopic values and the bedrock becomes unclear, because of a large amount of Sr transport across geological boundaries. While mapping of bioavailable Sr in geographically diverse regions is challenging, our results in Slovenia provide a promising start framework towards creating complex isoscapes.

3 TOWARDS A BETTER APPLICATION OF ISOTOPE SAMPLING STRATEGIES: A PROPOSAL FOR DATA RECORDING THROUGHOUT GIS IN NE IBERIA

Abstract author(s): de la Fuente Seoane, Rubén (Universitat Autònoma de Barcelona) - Diaz-Zorita Bonilla, Marta (University of Tübingen) - Subirà, M. Eulàlia (Universitat Autònoma de Barcelona)

Abstract format: Oral

The current incorporation of isotopes analysis to estimate the mobility of human groups in archaeology is complemented by improvements in the sampling and their spatial representation. These two features are rapidly being incorporated into archaeological studies.

In this communication we would like to present the record and sampling methodology in strontium isotopes analyses ($^{87}\text{Sr}/^{86}\text{Sr}$) we have used in many archaeological sites in the NE of the Iberian Peninsula. On the one side, to explain the GIS tools we have applied for the sampling and the mapping, such as the QField. On the other side, the implementation of isoscapes to encourage the sharing of results and thus favour the spreading of data to the scientific community.

We present two cases study in which we want to determine the local isotopic print with aiming to interpret the main problems of these sites. First, we have two Iberic sites, Puig Castellar (Barcelona) and Ullastret (Girona), both of them are crucial to understand the practice of the nailed heads in the Iberic societies in this area. Secondly, we have the local strontium study we have develop in the medieval necropolis of Roquetas (Tàrraga, Lleida) where the historical records showed the arrival of Jews from other neighbouring settlements fleeing from an episode of pogrom anthropologically documented by us in Tàrraga.

Both cases, in addition to the differences in chronology, also differ in the way we have performed the sampling. The comparison of the data recording in two very distinct cases makes it possible to evaluate the reliability of the method.

4 WHICH FOODS ARE WHAT? PREDICTING PALEODIETARY PATTERNS AMONG ABORIGINALS OF THE CANARY ISLANDS AND THE PROBLEM OF BASELINES

Abstract author(s): Cuello del Pozo, Paloma (Texas A&M University)

Abstract format: Oral

Stable isotope analyses (SIA) of nitrogen ($\delta^{15}\text{N}$) and carbon ($\delta^{13}\text{C}$) are well-established predictors of ancient human mobility patterns in archaeology. Physical processes in the environment and within the chemistry of organisms cause changes between atomically heavy and light isotopes of elements in food sources. These shifts allow archaeologists to interpret diet preferences. For example, $\delta^{15}\text{N}$ relate to trophic level position and protein ingestion, and when contrasted against $\delta^{13}\text{C}$ values from the mineral and organic portions of bone and teeth, we can better predict diet origin. As long as archaeology has applied SIA, researchers have emphasized the need to supply dietary proxy measurements by creating localized baselines to help elucidate ancient human food menus. Regional isotope ecology directly influences interpretations of results because of this direct connection between humans and their environment via food and water intake. This communication emphasizes such requirements in the context of the archaeology of the Canary Islands where a great deal of information has been obtained from ethnohistoric sources. However, descriptions are constrained to the last epoch of pre-Hispanic aboriginal life and appear tainted by eurocentrism. Thus, we lack a diachronic understanding of subsistence patterns. In an effort to learn about economic practices and procurement strategies, this communication accounts for intraregional differences in insular paleodiets. By measuring $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$ from ancient Canary human skeletons and incorporating her results to already-published isotopic data, the author proposes a mixed approach to economy where a generalized approach occurred at a regional context. Results from metadata analyses encourage future studies to further test the hypothesis that diet variability was observed based on ecozones in Gran Canaria and Tenerife islands. Finally, the author motivates archaeologists working in the region to start collecting $\delta^{13}\text{C}$ ratios from human and faunal bioapatite to attain a holistic approach to Canary insular paleodiets.

5 FROM IRELAND TO EUROPE – A DECADE OF MAPPING BIOLOGICALLY AVAILABLE STRONTIUM

Abstract author(s): Snoeck, Christophe - Gerritzen, Carina (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB; Multidisciplinary Archaeological Research Institute, Department of Art Sciences & Archaeology, Vrije Universiteit Brussel) - Sengeløv, Amanda (Research Unit: Anthropology and Human Genetics, Department of Biology of Organisms and Ecology, Université Libre de Bruxelles, CP192; Department of Archaeology, Ghent University) - Dalle, Sarah (Multidisciplinary Archaeological Research Institute, Department of Art Sciences & Archaeology, Vrije Universiteit Brussel; Department of Archaeology, Ghent University) - Capuzzo, Giacomo (Department of Humanities, University of Trento; Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB) - Salesse, Kevin (Department of Anthropology, Faculty of Science, Masaryk University) - James, Hannah (Research Unit: Analytical, Environmental & Geo-Chemistry, Department of Chemistry, Vrije Universiteit Brussel, AMGC-WE-VUB; Multidisciplinary Archaeological Research Institute, Department of Art Sciences & Archaeology, Vrije Universiteit Brussel)

Abstract format: Oral

Creating isoscapes of bioavailable strontium (BASr) are a time-consuming, labour-intensive, and expensive process. From my first solo sampling campaign in Ireland in 2012 to numerous team-sampling campaigns across Europe in 2022, our methodologies have significantly changed. Sampling strategies have improved and evolved thanks to the inclusion of experts from different fields, while sampling itself has been made much easier with the help of smartphones, digital maps and roaming. Plant processing has also changed from dry ashing to microwave digestion, allowing a much higher throughput needed for large scale BASr mapping. Different mapping methodologies have also been applied (from interpolation models and machine learning to domain mapping approaches) with pro's and con's.

This presentation highlights how these new methodologies and possibilities have shaped the current sampling strategies, plants processing, and mapping possibilities. It discusses how these are adapted depending on the research question(s) and area under study. It also provides some ideas for future work and collaboration with on-line open-access databases such as IsoArch.

666 PROSPECTING PREHISTORIC LAND USE AND ITS ENVIRONMENT: CHALLENGES AND PERSPECTIVES FOR INVESTIGATING LIFEWAYS OF HUNTER GATHERERS AND EARLY FARMERS [PAM; ARCHAEOLOGICAL PROSPECTION COMMUNITY]

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: De Smedt, Philippe (Department of Environment, Ghent University; Department of Archaeology, Ghent University) - Davis, Stephen (School of Archaeology, University College Dublin) - Koivisto, Satu (Archaeology, University of Turku) - Moucheron, Martin (School of Archaeology, University College Dublin; Irish Research Council)

Session format: Regular session

While advances in survey methods for studying past landscapes have been a boon, comprehensive approaches for mapping Stone Age land use remain challenging to design and implement. This is particularly true for more elusive aspects of such activity, such as settlement and occupation traces of Palaeolithic and Mesolithic hunter-gatherers. Often, this elusiveness is exacerbated by pedological and geographic configuration of study areas: peatlands and mountainous areas are notoriously challenging environments for identifying well-preserved remains. While offering more potential for more recent periods, limited preservation potential and shallow soils of dryland areas often result in a striking absence of these subtle traces of prehistoric land use.

The expanding archaeological prospection toolkit does, however, create new opportunities. By accounting for strengths and limitations of complementary survey methods, some recent, well-structured integrated approaches enable detailed palaeolandscape reconstructions, and can provide fine-grained site-specific insight into cultural activities. Still, such advances remain marginal and little integrated into general prehistoric archaeology, and development-led archaeological frameworks – with particular consequences for the Palaeolithic and Mesolithic. While available survey toolkits are promising, their implementation into daily field practice remains variable, restricting the potential of this archaeological resource. Although in some regions, fine-tuning prospection strategies has increased the quantity of informative Stone Age sites, in other areas this number has stagnated or – e.g., following intensified farming, forestry or drainage practices – deteriorated.

This session aims to bridge the gap between fundamental questions related to Palaeolithic to elusive types of Neolithic archaeology, and established and novel survey approaches. We consider archaeological prospection in its broadest sense: from non-invasive (e.g., remote sensing, geophysics, predictive modelling), to minimally (borehole, direct-push) and highly invasive (test pitting, trial trenching) methods, complemented with spatial sampling strategies

tailored to elusive prehistoric targets. Here, we particularly welcome contributions that present integrated survey approaches in challenging environments.

ABSTRACTS

1 CITIES UNDER CIRCLES: HIGHWAY FROM HUNTER-GATHERERS TO EARLY AGGLOMERATIONS

Abstract author(s): Kalafatic, Hrvoje (Institute of Archaeology) - Šošić Klindžić, Rajna (University of Zagreb) - Šiljeg, Bartul (Institute of Archaeology) - Meyer, Cornelius (CMprospection)

Abstract format: Oral

The Neolithic period saw a significant shift in human society as people transitioned from a hunter-gatherer lifestyle to a settled agrarian one. During this time, large complex settlements emerged in eastern Croatia, many of which had the characteristics of early cities. The proposed conference paper will present the results of a geomagnetic survey of large complex Neolithic enclosed settlements in Eastern Croatia. Some of these settlements have been the subject of ongoing archaeological investigation for several years. The geomagnetic survey, conducted using state-of-the-art equipment, has allowed for the creation of high-resolution subsurface maps of these sites. These maps, in turn, have provided valuable new information about the layout, size, and construction of the settlements, as well as offering insight into the social, economic, and political organization of the communities that lived there. The results of the survey indicate the presence of numerous structures and features, including large buildings, streets, and squares that support the interpretation of the settlements as early proto-urban agglomerations. Some of the structures obtained with remote sensing analysis predate large agglomerations and belong to earlier populations. The results of this research will be discussed in the context of current understanding of early urbanism and early Neolithic society in the region.

2 ILLUMINATING THRACE'S NEOLITHIC HABITATION WITH GEOPHYSICAL MAPPING

Abstract author(s): Sarris, Apostolos (Sylvia Ioannou Chair on Digital Humanities, University of Cyprus) - Papadopoulos, Nikos (Foundation for Research and Technology, Hellas) - Urem-Kotsou, Duska - Sgouropoulos, Kyriakos - Chysafakoglou, Periklis (Democritus University of Thrace)

Abstract format: Oral

Geophysical prospection was carried out in tandem with surface survey in a number of Neolithic settlements in the Aegean Thrace under the auspices of the Mapping the Early Farmers in Thrace (MAPFARM) project. The goal of the venture was to investigate a number of settlements in two geographical regions in Thrace (Xanthe and Rhodope) emphasizing the way of habitation of the region in terms of their intra-site organization and the relation of them with respect to their surrounding environs. Eight settlements in total (Yfantas, Krovili, Fanari, Diomideia, Lafrouda, Nea Santa, Myllon Manna and Paradimi), each one established at different environmental settings, were explored through the combination of multisensory magnetic survey, ground penetrating radar and EMI techniques, which covered more than 250,000 square meters of the terrain. Drone images were also used to create DEMs that were employed as background layers contributing towards the interpretation of the geophysical and conventional survey results.

The distribution of surface finds, normalized in terms of the surface visibility, complemented the results of the geophysical survey, which provided a more detailed image of the extension of the sites (a lot of which have been confined within ditches), their architectural relics (most of which consisting of residues of burnt daub-based structures and pits) and other features that expect further verification through excavation approaches. The particular results have confirmed previous test excavations in some of the sites and coring analysis.

3 DEVELOPER FUNDED ARCHAEOLOGICAL EVALUATION AND THE QUESTION OF PROSPECTING FOR LANDSCAPES: LESSONS FROM THE NM20 CORK TO LIMERICK PROJECT

Abstract author(s): Armstrong, Kayt (AOC Archaeology Group) - O'Keeffe, Paul (Transport Infrastructure Ireland) - Lawton, James - Cavers, Graeme - Sykes, Chris - Ovenden, Susan (AOC Archaeology Group)

Abstract format: Oral

This paper will demonstrate the potential of larger scale geophysical surveys carried out for archaeological evaluation in a developer-funded context; in particular large infrastructure projects, as a major contributor to the study of earlier prehistoric and palaeolithic landscapes. It will utilise the authors experience of large-scale surveys undertaken for developer led evaluation, particularly on linear infrastructure schemes. We will specifically reference a recent project undertaken in partnership with local government bodies and Transport and Infrastructure Ireland (TII) on the N/M20 Cork to Limerick project in the Republic of Ireland.

We will discuss the methodological approach developed in partnership with TII, which follows the recommendations arising from previous research into the efficacy of geophysical prospection on Irish Road schemes (Bonsall et al 2014). This has involved over 100ha of shallow (i.e., using 1m coil separation instruments) electromagnetic surveys

alongside more traditional magnetic gradiometry and twin probe earth resistance, in targeted locations along the already extensively prospected 80km road corridor. The benefits, challenges and results of this undertaking will be covered, followed by a discussion about the role developers and legislators can have in advancing archaeological scientific practice, and lessons learned for future partnerships. We will also explore the utility of legacy datasets collected for other purposes (near surface geophysics and airborne laser scanning) in the reconstruction of past landscapes and their exploitation by humans.

4 LOOKING UP FOR MESOLITHIC SITES IN MOUNTAIN LANDSCAPES IN EUROPE

Abstract author(s): Warren, Graeme - Butler, Micheal (University College Dublin) - Doughty, Alice (University of Maine) - Mann, Bruce (Aberdeenshire Council) - Moucheron, Martin - O'Brien, Cormac - Kelley, Sam (University College Dublin)

Abstract format: Oral

Mountains are a prominent feature of the European landscape and were settled in during the Mesolithic period across Europe. However, our knowledge of these post-glacial landscapes is fragmentary, with the majority of sites the result of chance finds. Mountain landscapes present challenges to archaeological survey and our baseline knowledge of site distribution is sometimes limited. As such, managing the archaeological resource in these landscapes is challenging. This is especially concerning because mountains are dynamic landscapes - with socio-economic and climate drivers causing significant landscape modification.

'Looking Up' (2021-2023, IRC Coalesce/2021/78) combines novel archaeological and geological data on a case study landscape in the Cairngorm mountains, Scotland - Britain's highest mountain landscape. This aims to contribute to our understanding of site distribution and, by working with stakeholders, directly contribute to the management of these archaeological landscapes. Looking Up uses geological and archaeological perspectives to develop models of areas of high potential for sites, integrating geochronological techniques, numerical modelling of ice cover, and archaeological simulation modelling. Small scale testing of these predictions is ongoing and includes a citizen science component. Working with stakeholders, the models will be used to inform the development of recommendation for the management and conservation of these mountain landscapes. We hope that this approach can be applied to similar mountain landscapes across Europe

5 AGRICULTURE IN THE CENTRAL PYRENEES DURING THE NEOLITHIC? A GIS-BASED MULTICRITERIA ANALYSIS FOR CROPPING ZONES

Abstract author(s): Salvador-Baiges, Guillem (High Mountain Archaeology Group, Departament of Prehistory, Universitat Autònoma de Barcelona) - Antolín, Ferran (Natural Sciences Division, German Archaeological Institute; IPNA/IPAS, Department of Environmental Sciences, University of Basel) - Gassiot-Balbè, Ermengol (High Mountain Archaeology Group, Departament of Prehistory, Universitat Autònoma de Barcelona)

Abstract format: Oral

Mountain areas, and in particular the Pyrenees, have historically been considered seasonal livestock areas. The arguments used have been that these locations were marginal areas to live in and to develop agriculture, much less for the first farming groups using the mountain range in the Neolithic period. Recent archaeological research in sites dating to the Neolithic period (5600-2300 B.C) has begun to change this vision. Systematic prospection has increased the number of archaeological sites known in the area, and researchers have begun to outline a shifting settlement pattern in the innermost area of the Central Pyrenees. Firstly, Early Neolithic sites, located at altitudes between 1000 m and 1700 m, show evidence related to year-round farming practices. Secondly, from 3500/3300 B.C. onwards, settlements begin to appear in the subalpine levels above 2000 m, associated with evidence related to livestock farming that might go along with occasional finds of cereal pollen and cereal polish in some lithic tools. Was agriculture indeed possible at different altitudes in mountain environments between the 6th and the 3rd millennia BC?

This paper presents a GIS-based multi-criteria analysis proposal to assess the suitability and possibility of land cultivation for cereals and leguminous crops (wheat, barley and peas) at the different altitudinal stages in the study area. The performed models are based on palaeoclimatic, topographic and soil variables, as well as the environmental requirements for the crops and their seasonality to obtain suitability maps for each period and to be related with the settlements.

6 CHILD'S PLAY AND RABBIT HOLE: SURVEYING TWO MESOLITHIC SHELL SITES ON THE EAST COAST OF IRELAND

Abstract author(s): Moucheron, Martin (UCD School of Archaeology)

Abstract format: Oral

If increasing the number of known early prehistoric sites is undisputedly a worthy survey objective, the limited resources allocated to research programmes and the tremendous impact of developer-led archaeology in Ireland suggest an alternative approach: applying integrated survey approaches to increase, refine, and question knowledge on existing sites. Indeed, in the past thirty years commercial archaeology has added a dramatic number of such elusive sites on the map, including some paradigm-shifting discoveries like that of an early Mesolithic burial site at Hermitage, Co. Limerick. However, their scope is quantitatively and qualitatively limited by their very nature – recording that which is being destroyed by development, with strict time and spatial constraints.

This paper will discuss the challenges and benefits of applying combined survey methods to known early prehistoric sites, by focusing on two late Mesolithic “middens” excavated in the 1940s and 50s on the east coast of Ireland. Their story illustrates the potential of archaeological prospection to (re)discover and (re)interpret sites that were excavated in the past – an archaeological retrospection.

A. PREDICTING AND PROTECTING LITHIC LANDSCAPES, DARTMOOR, UK

Abstract author(s): Stockley, Emma - Basell, Laura (University of Leicester) - Bray, Lee (Dartmoor National Park Authority) - Chapman, Henry (University of Birmingham)

Abstract format: Poster

The presence of lithic finds and scatters, sometimes situated within or below peat deposits, indicate significant activity on Dartmoor from the Mesolithic period onwards. This poster will summarise how Geographic Information Systems and non-invasive (predictive modelling) and invasive (test pitting) prospection methods are being employed to characterise the extent and significance of Dartmoor's prehistoric subsurface archaeology and predict areas of the moor where lithic scatters are most likely to be found.

Dartmoor covers 365 square miles and has the largest area of upland peatland in southern England. These ombrotrophic and minerotrophic peatland environments have potential for storing large quantities of carbon. In part, this is why Dartmoor is the focus of increasing numbers of landscape-scale conservation initiatives e.g., peatland restoration. Climate change is undoubtedly a key issue, but there is also a statutory responsibility to preserve and protect the National Park's heritage and archaeology.

A GIS predictive model was developed using parameters from Dartmoor's known lithic scatters. Randomly, and at locations identified by the predictive model, a programme of test pit excavations was undertaken. Data on the presence and nature of lithic finds was used to identify potential new sites and further enhance the model. This approach will support efforts to protect the rare traces of Britain's hunter-gatherers while still allowing Dartmoor National Park Authority to deliver programmes aimed at addressing the climate crisis.

B. MAGNETOMETER MAPPING OF BURIED LEVEE SYSTEMS AS A TOOL FOR PROSPECTING UNDERWATER PALEO LANDSCAPES

Abstract author(s): Huisman, Hans (University of Groningen) - Os, Bertil (Rijksdienst voor het cultureel erfgoed) - Dekkers, Mark (Utrecht University) - Brenk, Seger (Periplus research) - willemsse, Nico (RAAP) - Aalst, Warner (Utrecht University)

Abstract format: Poster

Submerged former inhabited coastal areas can contain a highly valuable archaeological record.

Such records are difficult to study and are threatened by recent increase in economic activities as wind parks and extraction of sand. Mapping of submerged geomorphological units and geology can help to establish the reconstruction of the past landscape and to infer human activities.

Here we present a novel way of using magnetometer surveys to characterize a buried Mesolithic/Neolithic landscape. Magnetometer maps, traditionally made for identifying unexploded ammunition and obstacles on the seafloor, were taken from the IJsselmeer area (Netherlands). These show patterns of paired linear features that resemble banks or levees that straddle channel-like features. Subbottom profile transects and sediment core analyses confirm that the observed linear features are formed during the Mesolithic and Neolithic period. They represent submerged and buried channel and bank/levee systems. These connect to known onshore buried channel systems from that period. Moreover, they can be identified and mapped in high detail. Palaeomagnetic research on the core samples reveal that the signal is caused by the formation of the mineral greigite during the first salt water intrusion in the investigated area. It

is clear that this makes it possible to indicate areas of particular high archaeological potential which, if threatened can be investigated in more detail by targeted drillings or other underwater excavation methods.

669 HOW TO MAKE GENDERS AND SEXUALITIES VISIBLE IN THE ANCIENT MEDITERRANEAN?

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Lo Monaco, Viviana (São Paulo State University - UNESP) - Figueira da Hora, Juliana (Universidade de Santo Amaro - UNISA) - Magalhães dos Santos, Juliana (University of São Paulo - USP) - Dolcetti, Francesca (Ca' Foscari University of Venice)

Session format: Regular session

In recent years we have witnessed an increasing interest of some scholars of antiquity in issues related to the representation of “minority” social groups, that is, portions of the population largely neglected by literary sources and classical archaeological production. The first studies on Antiquity were carried out focusing on the search, among the vestiges of material culture, of what were considered the principles of universal beauty and morality, and normally associated with the “normative” genders and their predetermined characteristics.

The reflections on gender issues, based on the analysis of decoloniality, allow us to observe the production of dominant discourses that hides multiple experiences of gender relations and representations of bodies from the point of view of critical thinking about historically marginalized people. In an attempt to build a critical and transdisciplinary thought that is materialized from representations and discourses of power we propose a broader and more decentralized analysis of materiality. It is possible to rethink the idea of a Mediterranean of human relations immersed in discussions that problematize the gender relations in everyday life in the synchronic and diachronic social sphere.

The session aims to present proposals and perspectives on how archeology can contribute to think about biological sexual differences between individuals, feminine, masculine, “non-normative” representations in different societies, the diversity of representations of the body, sexuality and desires on various material supports in the Ancient Mediterranean.

In this way, we wonder how Archeology can contribute to rethinking genders in ancient times from the decolonization of theoretical and methodological analysis that, especially from the 19th century, turned their interests to the Mediterranean.

We invite you to participate with contributions oriented towards the above issues and other similar ones, such as:

- Science and theory in the study of human remains
- Intersectionality
- Invisible people in the past
- Feminism in Archaeology

ABSTRACTS

1 WOMEN IN ANCIENT SICILY THROUGH THE EVIDENCE OF THE NECROPOLIS, FROM THE BRONZE AGE TO THE III CENTURY BC

Abstract author(s): Lo Monaco, Viviana (São Paulo State University)

Abstract format: Oral

We perfectly know that European written history was, mainly, a male history. Also, was the history of “winners”. In the context of the Ancient Mediterranean History, about non-Greek people and the relationship between them and Greek apoikoi we have few information coming from Greek textual sources. The Greek society was extremely masculine in its values, and the female component on rare occasions took part in the historical narrative. In the context of the “colonization”, this lack includes both Greek and non-Greek women, but it is important to address certain questions, even if the answers are not always easy to find or unanimous: How did the social role of the indigenous woman change with the arrival of the Hellenic groups? What role did Greek and indigenous women play in the transmission and preservation of the cultural traits of their groups of origin? Has the arrival of the Hellenic component radically changed the vision of being female within pre-existing societies?

Fortunately, Archaeology has compensated for the lacuna of written history, and archaeologists have been able to recover data especially from funerary contexts. This paper aims to show some examples of female burials, their contexts, and funerary goods from archaeological sites in Sicily. I choose to cover a large range of time (from Bronze Age to the III century BC) in order to observe the changes in representing the woman and her social role in a portion of Ancient Mediterranean through one of the most sacred moments of human life: death.

2 THE IDENTIFICATION OF TWO-SPIRIT PEOPLES USING OSTEOLOGICAL ANALYSIS, AND THE CONSEQUENCES OF EUROPEAN COLONIZATION FOR NATIVE AMERICAN PERCEPTIONS OF GENDER

Abstract author(s): Howard, Laura (University of Manchester)

Abstract format: Oral

When examining a non-Western culture's relationship with gender the possibility that that culture departed from the traditional binary western framework should be more than a footnote of interest. Rather, that culture's conception of gender should be central in all discussions of sexual difference within that culture. It is also important to recognise the impact of Eurocentric gender orders not simply on academic research, but on a culture's own understanding of personal identity. This study aims to determine the utility of archaeological methods in identifying historical evidence of Two-Spirit people amongst Native American communities. This will be achieved through the analysis of osteological remains, funerary practices and grave goods. This study also examines the effects of European colonization on current perceptions of the Two-Spirit's within Native American communities by collecting oral histories. These will then be compared to historical texts and the results of the funerary analysis, in order to gain an understanding of how gender systems have evolved since the pre-colonial era, and to evaluate the impact of colonization. This project aims to provide visibility and understanding of Two-Spirits in Native American communities, whilst questioning academic commitments to the western binary norms when researching these communities.

3 A GENDER STUDY IN TWO CONTRASTING TESTIMONIES: HERODOTUS AND MATERIAL CULTURE

Abstract author(s): Junqueira, Nathalia (Federal University of Mato Grosso Do Sul)

Abstract format: Oral

Aiming at the presentation of new possibilities in studying the women in the Classical Antiquity involving the discussions of the Cultural History, gender studies, identity and subjectivity of the historical subjects, we have chosen as a source of such presentation the work of Herodotus from Halicarnassus, the Greek historian, born in 484 BC, who who visited the lands of the pharaoh and wrote Histories in the fifth century B.C. Our intention is to analyze the selected passages in Book II in which the Egyptian women are presented in several situations, searching for evidences that this historian would support an ideal of a woman which could be part of the imaginary of a great deal of the Greek male population. Thus, we intend to demonstrate the way female behavior is represented in our sources and how varied feminist social practices could be present in the same imagined world for women in the ancient world.

4 EROTISM AND SEXUALITY IN APULIAN ICONOGRAPHY OF THE IV CENTURY A.C.

Abstract author(s): Santos, Juliana (University of São Paulo - USP; INCT Proprietas)

Abstract format: Oral

This presentation aims to analyze sexuality and its relation to eroticism from the iconographic perspective produced in Apulia from the fourth century BC. Far from Athens, the consumption of prestige artifacts was accompanied by a particular reading of the world, sociocultural interests in Attica and ended up in a way of consuming, interpreting and using the pieces in southern Italy. These conceptions also reflected in the artisanal production. As a result, a typical „way of doing“ of the region reflected the tension of sociocultural forces through political relations: on the one hand the sexual interests and performances expected by women and men, on the other, their personal interests. In this sense, we understand the role of Eros as a symbolic sexual element and as fundamental to translate the conception of gender expressed in the region. Through the images we will observe how this dialogue was constructed by examining and identifying the importance of eroticism and sexuality for this colonial region, and the relation of these conceptions to the Athenian one.

5 CERES, DIANA AND PROSPERITY IN COINS OF LIVIA AND AGRIPPINA THE YOUNGER

Abstract author(s): Pagoto Bélo, Tais (University of São Paulo; Université Libre de Bruxelles)

Abstract format: Oral

This presentation will aim to explain the monetary iconography of two of the most important empresses of the Roman Empire: Livia and Agrippina the Younger.

Livia, who was Augustus' wife, has an extensive monetary iconography, interspersed with personifications linked to goddesses associated with prosperity, fertility, procreation and abundance, such as Ceres/Demeter among others, such as Vesta/Hestia and Juno/Hera. Her coins are listed by legends that denominate her as Mater Patriae, Diva Augusta and even Genetrix Orbis, confirming her connection with fertility and sanctioning her characteristics of the ideal Roman matron.

Agrippina the Younger, daughter of Agrippina the Elder and Germanicus, was married to Claudius and was the mother of Nero. During her life she seems to have aimed to follow in Livia's footsteps, as "Augusta" and priestess of her divinized husband. She appears in monetary iconography with elements of Ceres, such as the crown of corn cobs; and mainly linked to Diana, with the representation of the goddess herself on her coins, and/or with her elements, such as the crescent moon, quiver, arrow, bow and torch, as well as elements linked to prosperity like those of Livia.

The comparison of the iconography of these two Roman women will aim to conclude their identity links with the goddesses and the gender strategies constructed for their coinage. Consequently, it will be highlighted how these women were represented in such objects, once their reproductions should have been elaborated to send appropriate messages to the public, in view of the governmental interests of power dispute and gender.

6 INTERSECTIONALITY AND MASCULINE IDENTITIES IN ARCHAIC ETRURIA

Abstract author(s): O'Donoghue, Eoin (Brandeis University)

Abstract format: Oral

This paper will consider the construction and representation of masculine identities in Etruria and northern Latium during the Archaic period (c. 560 – 480 BCE). It is argued that Archaic central Italic society operated via a complex system of social and gender inequalities that

revolved around the authority of groups of élite men. This system was maintained through the public and private performance of specific élite male activities and rituals and the consequent subjugation of non-élites. It is shown that a core component of central Italic society was the corresponding high status of élite women within this social framework, which complemented the status of élite men and provided élite women with considerable power and an elevated social status. This social framework draws on Raewyn Connell's model of hegemonic masculinities and Kimberlé Williams Crenshaw's ideas relating to intersectionality. The evidence for this derives from a study of burial assemblages and iconographic representations. It includes the examination of gendered burials viz. Archaic period burial

data associated with four settlements: Chiusi, Crustumerium, Satricum, and Veii. These are compared with the representation of gendered figural representations from tomb-paintings in Tarquinia and funerary reliefs from Chiusi, which in turn are contrasted with the public presentation of figural scenes on architectural terracottas from buildings from throughout central Italy.

670 NEOLITHIZATION OF THE MEDITERRANEAN: INTEGRATED APPROACHES TO OLD QUESTIONS

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Nafplioti, Argyro (Ancient DNA Lab, Institute of Molecular Biology & Biotechnology - IMBB, Foundation for Research and Technology - Hellas - FORTH) - Atakuman, Çiğdem (Department of Archaeometry, Middle East Technical University - METU) - Somel, Mehmet (Department of Biological Sciences: Biology/Molecular Biology and Genetics, Middle East Technical University - METU) - Carter, Tristan (Department of Anthropology, McMaster University)

Session format: Session with keynote presentation and discussion

The spread of Neolithic lifeways, farming and herding, from the Middle East and Anatolia to the rest of the Mediterranean and Europe approximately 9 thousand years ago is a complex landmark event in the history of humankind that so far has been understood only in broad strokes.

Despite the extensive scholarship on the subject that includes studies of material culture, settlement, linguistic, archaeozoological, archaeobotanical, biogeochemistry and archeogenetic data offering explanations about the processes involved, major questions remain concerning the specifics of demographic and cultural change, and chronology. Where population movement has been invoked to interpret change and cultural discontinuity, movements tend to have been simply identified as events, rather than further investigated as to the size, composition or organisation of the migrant groups, the motivation and consequences for all social groups involved, i.e. the people moving, the receiving communities as well as those staying behind.

This session therefore aims to shed new light on the Neolithic expansion through the Mediterranean in this context by studying population changes in detail and linking it to changes in material culture, language, lifeways and the socio-economic organisation of the populations involved, within a clear chronological framework. To this end we invite proposals for papers on this topic from a broad array of disciplines including archaeology, bioarchaeology, archaeogenetics, biogeochemistry, archaeodating, and linguistics.

1 TIME AND ITS PERCEPTION(S) IN ARCHAEOLOGICAL DISCOURSES: THE CASE OF THE NEOLITHISATION PROCESS OF THE CIRCUM-AEGEAN SPHERE

Abstract author(s): Reingruber, Agathe (Freie Universität Berlin)

Abstract format: Oral

The perception of past time and the determination of time spans are among the great challenges of prehistoric analyses. They contribute significantly to the understanding and interpretation of transformations: How fast or how slow did they occur, and how can we determine their duration and explain their rhythmicity? These questions are far from banal, as different perceptions of time lead to sometimes contradicting ways of explaining change.

In my presentation, I will address two different perspectives relying on examples from the circum-Aegean region at the transition from the Mesolithic to the Neolithic:

- the perception of time based on relative chronological appraisals obtained from ceramic analysis and the presumed speed of stylistic changes, and/or from stratigraphic deposits and the presumed duration of single levels;
- the perception of time resulting from the interpretation of radiocarbon data, either without or with the help of statistical (Bayesian) models.

In doing so, I will turn to the vexing question of how much weight can be attributed to single radiocarbon dates and which dates must be excluded from the discussion as outliers: A strict evaluation of the results leads to a rather short chronology, while a more tolerant interpretation adds to an extended chronological appraisal.

2 BUILDING CASTLES ON SAND: CURRENT MODELS ON THE IMPACT OF INSULAR AEGEAN HUNTER-GATHERER POPULATIONS ON NEOLITHISATION PROCESSES

Abstract author(s): Carter, Tristan (McMaster University)

Abstract format: Oral

Excavation and survey over the past 15 years in the insular Aegean and western Anatolian littoral has provided a wealth of Mesolithic sites, requiring us to rework long-held models concerning the cultural history of Mediterranean islands (Cherry, PPS 1981). With demic diffusion now widely accepted as the “inescapable hypothesis” (C. Perlès) to explain the introduction of Neolithic lifeways into continental Greece, and Crete in the earlier 7th millennium cal. BC, these Mesolithic populations are now being rightly forefronted in discussions of Neolithisation processes. Given that these hunter-gatherers were occupying those intermediary islands via which migrating farming populations would have tramped as they voyaged westward out of Anatolia (and/or Cyprus), can we talk of an indigenous input to these processes? Might common use of Melian obsidian by insular Aegean hunter-gatherers and western Anatolian farmers provide us with a context where knowledge of safe sea routes and islandscapes were apprehended by the latter group prior to their migration? Do we conceive of interaction, inter-marriage, and creolised communities, or do we envisage a complete demographic replacement, and a depopulation in most Aegean islands during the Early Neolithic due to their lacking the environments favoured by cattle raising villagers (with the possible exceptions of Naxos, and Rhodes)?

While much ink has been spilled pondering these possible relations, we fear that these models are based on flimsy evidence, with huge gaps in our knowledge concerning the absolute chronology, demographics, and seasonality of these Mesolithic sites. This paper critically reflects the archaeological data, taking a minimalistic perspective, arguing that – as with recent demands for ‘gold standard’ evidence for alleged Palaeolithic activity in the Aegean basin – our energies need to be spent in excavating and dating these sites, with survey data of insufficient quality to provide the evidential bases for many of the current debates.

3 WHAT DO ARCHAEOLOGICAL AND GENETIC DATA TELL US ABOUT THE DISPERSAL AND INTERBREEDING BEHAVIOUR OF EARLY MEDITERRANEAN FARMERS?

Abstract author(s): Fort, Joaquim (Universitat de Girona)

Abstract format: Oral

Recently, a database with 215 early Neolithic dates the western Mediterranean has been gathered, and it has been used to infer that the Neolithic spread rate was much faster than inland and that this implies displacements per generation of hundreds of kilometers and an importance of 0–21% for cultural diffusion, compared to 79–100% for demic diffusion [1]. A comparable study for the eastern Mediterranean could be very important in the context of possible general laws of Neolithic spread [2], but it would require an archaeological database similar to that recently gathered for the western Mediterranean [1]. On the other hand, the genetic cline of mitochondrial haplogroup K in early Ne-

olithic individuals [3] leads to more precise estimations of the importance of cultural and demic diffusion, and it also makes it possible to estimate the percentage of early Neolithic individuals who interbred with hunter-gatherers [4].

4 THE NEOLITHIZATION OF THE NORTHEASTERN BLACK SEA REGION

Abstract author(s): Valery, Manko (Institute of Archaeology of NAS of Ukraine)

Abstract format: Oral

The process of Neolithization of the North-Eastern Black Sea region is associated with the development of the Kobuletian Culture.

The Kobuletian Culture emerged at the turn of the 10th-9th millennia B.C. in West Georgia and developed to the VII millennia B.C. Kobuletian sites were found in the mountain gorges of Javakheti, Adjara, Guria, and the Central Caucasus. The main sites are Kobuleti, Khutsubani, Kvirike, Bavra, Bavra-Ablari (Layer IV), Darkveti (Layer V), and Sosruko (Layers M-2 and M-1).

The features of the Culture are the usage of hand-pressing technique and the presence of bullet-like cores, backed blades and bladelets, oblique truncated faceted blades, bilateral burins, scrapers on flakes in complexes.

There are two complexes with faunal remains (Bavra-Ablari, Layer IV and Darkveti, Layer V), which contain bones of wild deer and bull. First experiments with pottery making began at the turn of the 8th-7th millennia B.C. Kobuletian Culture transformed to Neolithic Odishi Culture just in the beginning of VI millennium BP, when traces of farming were fixed.

The origin of Kobuleti Culture connected with the M'lefaatian of Middle East. The migration of carriers of M'lefaatian relates with the beginning of Holocene with the warming and a better climate situation in Black Sea Coast. Carriers of M'lefaatian inhabited the empty territory in conditions of absence of competition.

The migration of M'lefaatian population took place in a time when farming had not been practiced yet at Middle East. The relations between two groups of cognate population led to the appearance of pottery, weaving and farming husbandry. So, we can trace the model of Neolithization, when process was ensured by the early migration of the population, which was only on the threshold of Neolithization. The subsequent Neolithization of the North-Eastern Black Sea region was associated with the preservation of ties with the parent territory.

5 VIOLENCE IN THE NEOLITHIC NEAR EAST: FACT OR FICTION?

Abstract author(s): Erdal, Yilmaz Selim (Department of Anthropology, Hacettepe University; Hacettepe University Skeletal Biology Laboratory - Husbio_L)

Abstract format: Oral

There are different views about whether Neolithization, which is characterized by the transition to permanent settlements, and domestication of animals, cereals, and legumes, increased interpersonal violence. Some scholars propose that the Neolithization process contributed to increased interpersonal violence including warfare and feuding. Yet, the limited number of studies on human remains in the Near East did not provide sufficient evidence in early Neolithic sites. In recent years, human remains from Anatolia, which have been examined with different approaches, allowed us to explore this issue by taking into account different stages of Neolithization. Early Neolithic sites had a high frequency of skeletal traumas only a few of which seemed fatal. More than one-third of the early Neolithic people had healed depressed cranial traumas. However, Late Neolithic and Early Bronze Age sites have more frequent signs of fatal combat. We propose that the spread of fully domesticated lifeways in marginal zones, new homelands, and the meeting of Mesolithic/Epipalaeolithic locals and farmers, led to more fatal encounters and violent death becoming more visible. It seems that the centralized political and economic system that emerged during the Bronze Age also controlled and organized violence.

6 EARLY SETTLERS ON THE MALTESE ISLANDS: AN ISOTOPIC INVESTIGATION OF DIET, PROVENANCE AND RESIDENTIAL MOBILITY

Abstract author(s): Nafplioti, Argyro (Institute of Molecular Biology & Biotechnology, Foundation for Research and Technology - Hellas - IMBB-FORTH) - McLaughlin, Rowan - Malone, Caroline (School of Natural and Built Environment, Queen's University Belfast) - O'Connell, Tamsin - Stoddart, Simon (McDonald Institute for Archaeological Research, University of Cambridge)

Abstract format: Oral

This paper investigates diet, provenance, migration and residential mobility in relation to early settlers on the Maltese islands. Multi-isotope (carbon, nitrogen, oxygen and strontium) ratio analysis of the remains of the people themselves from the mortuary contexts at Xagħra and Xemxija, carried out for the first time in the Maltese islands by the FRAGSUS project, explore the above issues.

Current evidence points to a purposive Neolithic colonization of the islands. Covering a total surface area of 316Km², it appears that the earliest period when the islands would have offered a viable landmass for human permanent occupation would have been the Neolithic with the onset of agriculture. These newcomers are generally considered to be the first settlers. In this context, carbon and nitrogen isotope ratio data presentation and discussion focuses on understanding what nourished the ancient residents of the Maltese islands, on interpreting evidence for dietary variation and on elucidating the relationship between the remarkable prehistoric cultures of these islands and the landscape upon which human life depended. Oxygen and strontium isotope ratio signatures of human teeth from the above two sites are assessed with a view to reconstructing geographical origins and tracking residential change for the people analysed, while specific hypotheses for contact and mobility within the Maltese islands, as well as between the latter and the rest of the Mediterranean are being addressed.

7 POPULATION DYNAMICS DURING THE NEOLITHIZATION OF WEST ANATOLIA

Abstract author(s): Somel, Mehmet - Koptekin, Dilek (Middle East Technical University) - Aydoğan, Ayça (Hacettepe University) - Kazancı, Duygu Deniz (Middle East Technical University) - Özer, Füsün - Altınışık, Ezgi - Erdal, Yılmaz Selim (Hacettepe University) - Atakuman, Çiğdem - Karamurat, Cansu (Middle East Technical University)

Abstract format: Oral

The population dynamics behind the emergence of Neolithic villages in West Anatolia between 7000-6000 BCE have remained contentious. Based on material culture analyses, the Levant and Central Anatolia had been suggested as potential sources of population movement into West Anatolia. Meanwhile, results of previous genetic analyses have raised the possibility of local Mesolithic groups contributing to Neolithic populations, or potential admixture from Balkan Mesolithic-related groups to West Anatolians. Here we analyse and present published and unpublished genomic data in relation to the spread of Neolithic settlements. The evidence suggests the presence of a local population in West Anatolia before 7000 BCE that was genetically related to Pre-Pottery Neolithic Central Anatolia, but less affected by eastern gene flow than Central Anatolians. In the period following 7000 BCE, i.e. the Pottery Neolithic, the genetic profiles of West Anatolian Neolithic populations were again similar to contemporaneous Central Anatolians, suggesting migration from Central Anatolia and/or North Mesopotamia. However, we also infer that the West Anatolian Pottery Neolithic groups may have carried ancestry from local West Anatolian populations, and were thus likely admixed. We further observe inter-site and intra-site heterogeneity in genetic ancestry in the Marmara region, where we have the most comprehensive genomic sample from West Anatolia.

8 LIFEWAYS AND HUMAN ADAPTATION AT THE TRANSITION TO AGRICULTURE IN THE CENTRAL MEDITERRANEAN: AN INTEGRATED BIOARCHAEOLOGICAL APPROACH

Abstract author(s): Parkinson, Eóin (Queen's University Belfast)

Abstract format: Oral

The advent of farming is among the most important chapters in the human story. The impact of this process on the human body has a long history of study, but systematic large-scale studies are lacking for Mediterranean Europe. However, recent advancements in archaeological science and multi-disciplinary 'big data' approaches now make it possible to draw together and cross-analyse multiple strands of bioarchaeological evidence, enabling new and detailed understandings of Neolithic 'lifeways'. This contribution explores the long-term biological trajectories of human societies across the transition to agriculture in the central Mediterranean c. 8000 years ago through an integrated approach that examines archaeological and bioarchaeological data related to skeletal growth, population dynamics, habitual behaviour and diet. Utilising datasets of skeletal measurements from 389 individuals, dietary stable isotope data from 1787 individuals and 5714 radiocarbon dates, the results demonstrate the close interplay between demographic change, human health and nutrition and lifestyle. Moreover, the data is presented and analysed on a continuous timescale, enabling high a chronological resolution and unique insights into the first farming communities in

the central Mediterranean. The results are interpreted here within a broader evolutionary context, and promote the importance of multi-method and integrated approaches in bioarchaeology.

9 TRANSFORMATIONS OF GENOMES AND CULTURES DURING THE NEOLITHIC IN WESTERN EUROPE

Abstract author(s): Geigl, Eva-Maria (Université Paris-Clté, CNRS, Institut Jacques Monod)

Abstract format: Oral

The analysis of ancient genomes revealed that the Neolithic lifestyle known and defined through archaeological evidence expanded into in western Europe through migrating populations. They originated in the Eastern Mediterranean and spread to the west using two different dispersal routes, one across the continent and one across the Mediterranean. These paleogenomic studies linked in broad strokes material culture and genomes. At the end of the Neolithic, the emergence of the archaeological culture of the corded ware complex has been shown, again in broad strokes, to coincide with the arrival in central Europe of migrants from the eastern European steppes. These results represent a large frame that needs to be filled with results from fine-scale, regional studies in a jigsaw-like fashion. It is the aim of this presentation to provide both the frame and some of the puzzle pieces that begin to refine our view of the biological mechanisms behind the social processes associated with the interactions, emergence and replacement of cultures in western Europe

10 PHYLOGENY OF THE INDO-EUROPEAN LANGUAGES: STATE OF THE ART

Abstract author(s): Kassian, Alexei (-)

Abstract format: Oral

This is a keynote lecture on linguistics in the session entitled 'Neolithization of the Mediterranean: Integrated Approaches to Old Questions':

After a very brief overview of the history of research on IE phylogeny, the recently proposed IE tree (Kassian et al. 2021 <https://doi.org/10.1515/ling-2020-0060>) will be discussed. In this paper, we apply reasonably formal techniques of linguistic data collection and post-processing that have been recently proposed by our team. We use sequential phylogenetic workflow and obtain a consensus tree based on several computational algorithms. Probably for the first time in IE studies, the resulting tree topology and datings are entirely compatible with established expert views. Further discussion will be devoted to some common problems of computational approach to language phylogeny (e.g., why computational tree usually contradicts our previous knowledge and established expert views) and how to combine the traditional linguistic and philological methods with modern computational algorithms to obtain consistent and reliable genealogical classifications of the world's languages.

671 ROCK ART, LANDSCAPE, AND SETTLEMENTS - STUDY OF CONTEXT AND PLACEMENT

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Palonka, Radoslaw (Institute of Archaeology, Jagiellonian University in Krakow; Crow Canyon Archaeological Center) - Medici, Paolo (Centro Camuno di Studi Preistorici) - Polkowski, Paweł (Archaeological Museum in Poznan)

Session format: Regular session

To enhance our comprehension of human past cultures it becomes essential to take into consideration all the possible archaeological data, among which rock art (and an in-depth analysis of it) is acquiring a new importance. In particular, in those areas where archaeological remains are scarce and rock art is one of the few (or only) evidence of human presence. It is especially important where the environment makes it hard to preserve the traces of a given culture (high mountain or rocky areas), or where the natural processes have destroyed them (i.e., floods, earthquakes). Then the panels with paintings (pictographs) and petroglyphs can be the main carriers of information about the presence of people in a particular place, its chronology, demographics, migrations, and cultural transformations.

This session emphasizes the study of rock art in the context of its relationship to human settlements and the surrounding terrain, including water bodies, mountain peaks, and other landscape features and elements of the natural environment. All these elements often formed a certain coherent whole in ancient and historic human cultures, also constituting elements of the so-called sacred landscape. Aspects of the analysis of rock art in the context of showing its dynamic character and role as an important element of the landscape will also be raised.

Today, a more comprehensive understanding of rock art and its relation to settlement and landscape is possible with the extensive use of digital methods of documentation and spatial analysis including Geographic Information System/GIS as well as subsequent analysis and visualisation (including virtual) of rock art. The application of digital methods

as well as theoretical approaches of rock art in the context of landscape-settlement features are also welcomed in this session. We invite papers that deal with the landscape context of rock art from prehistoric and historic cultures in Europe and other parts of the world.

ABSTRACTS

1 INTRODUCTION - ROCK ART, LANDSCAPE, AND SETTLEMENTS - STUDY OF CONTEXT AND PLACEMENT

Abstract author(s): Medici, Paolo (Centro Camuno di Studi Preistorici) - Palonka, Radoslaw (Institute of Archaeology, Jagiellonian University in Krakow; Crow Canyon Archaeological Center) - Polkowski, Paweł (Archaeological Museum in Poznan)

Abstract format: Oral

In many places around the world the rate of survival of archaeological remains can be low due to the presence of specific environmental conditions as well as various natural processes and events. It happens that the only available evidence of human presence is rock art. In such cases, paintings and petroglyphs may become essential for our comprehension of past human activities in the given areas. Rock art images become then the indexes of people's presence in these places, providing potential knowledge of chronology, demographics, migrations, religious activities, and cultural transformations.

Often, the study of rock art can be, however, carried out in the context of its relationships to settlements and other preserved archaeological remains; the entire landscape with its features may have been a crucial element of ancient and historic landscapes. Recent researches analyse rock art in its context as a dynamic and important component of the landscape. A more comprehensive understanding of the relation with settlement and landscape is now possible, for instance, with the use of digital methods of documentation and spatial analyses including Geographic Information Systems, as well as subsequent various modes of rock art visualization.

In this session, we wish to put a particular stress on the relationships between rock art assemblages and settlements. This appears as one of the ways to go beyond the question of pure representation, i.e., of what rock art depicts, and to orient research towards the question of what rock art does. Such a view can help appreciate not only functional aspects of rock art, but also – or perhaps especially – its potential agency or power in maintaining or altering past social realms. In this introduction to the session, the authors will present their thoughts on approaching rock art-settlements relationships by referring to examples from prehistoric and historic contexts.

2 SCALES OF SACRED LANDSCAPE - REVISITING THE ROCK ART AT THE SLEEPING GIANT OF ASTUVANSALMI, SOUTHEASTERN FINLAND

Abstract author(s): Lahelma, Antti (University of Helsinki) - Gjerde, Jan Magne (NIKU - Norwegian Institute for Cultural Heritage Research)

Abstract format: Oral

Astuvansalmi is one of the most intriguing rock art sites in northern Europe, but remains comparatively little known outside Finland's borders. It features one of the largest concentrations of open-air rock paintings in the region, including elk, anthropomorphs, boats, handprints, paw-prints, a bird and line figures. Several of the figures are clearly interacting, appearing as scenes. A new documentation of the site reveals details and figures not previously documented and suggest that there are more than 80 figures.

Excavations carried out in front of the cliff have uncovered arrowpoints and amber pendants, the latter found under water. The finds in front of the cliff and in the lake beneath have been interpreted either as depositions and/or offerings. Based on the excavations (diagnostic artefacts) and shoreline dating, the site can be dated from the Neolithic and to the Early Metal Period (ca. 4000–2200 BCE).

The main body of the rock art is placed on a section of the cliff shaped by a large pothole. The massive cliff sculpted by nature has the appearance of a giant human head that observes passers-by moving through the lakescape by boat or walking on frozen lakes during winter. This effect has been accentuated by the exceptional acoustic qualities of the curved cliff. Rock art at anthropomorphic cliffs is found at several places in Fennoscandia, yet Astuvansalmi is perhaps the most prominent example of this phenomenon. The geomorphology of the site makes us suggest that nature and culture were intertwined in the landscape of the past at Astuvansalmi. Revisiting Astuvansalmi, we examine the paintings, the geomorphology of the site, the labyrinthine landscape of lakes and islands, and the contemporary archaeological sites and finds found in said landscape, in order to shed new light into a classic site and its landscape context.

3 **MARINE ENVIRONMENTS OF THE RED OCHRE CLIFF PAINTINGS IN FINLAND: CHRONOLOGY, CONTINUITY AND CHANGE**

Abstract author(s): Niskanen, Karen (University of Oulu)

Abstract format: Oral

Post-glacial rebound in Finland resulted in isostatic land uplift, a process that continues today. In the inland lake area, resplendent with red ochre pictographs, the resulting tilt of the earth's crust affected the ancient marine landscape and water routes. Around 6,000 years ago, the water above the Salpausselkä ridge burst and the River Vuoksi was formed and there was an estimated four-metre decrease in the water level of Ancient Lake Saimaa. Many painting sites, once situated on islands, are now found on peninsulas or on the mainland. Besides the cliff paintings above the lakes, there are also paintings on boulders near the shores. These momentous, observable environmental changes necessitated adaptation and innovation for the residents.

According to Seitsonen (2005), painting of the pictographs in this area occurred over 5 periods between 4000 Cal BC-1800 Cal BC, from the Early Comb Ware, (CW1) period to the Early Metal Period. Though most sites have only a single image, superimpositions and multi-horizon paintings suggest some sites were in use or re-use for up to 5 periods. Seitsonen presents a typology attributing differing motifs to the different horizons.

This research relies on site catchment analysis and nearest neighbour analysis using ArcMap 10.7.1. Databases include archaeological sites and finds recorded by the Finnish Heritage Agency, estimated dates provided by recent shoreline chronology research and data from the National Land Survey of Finland. The aim is to establish site distribution and chronology of pictograph sites and settlement patterns along the ancient waterways.

4 **FOPPE DI NADRO: FROM THE SCENE TO THE CONTEXT**

Abstract author(s): Galvaldo, Silvana - Medici, Paolo - Gastaldi, Cristina (Centro Camuno di Studi Preistorici)

Abstract format: Oral

The paper submits some achievements about last research on rock art in Foppe di Nadro (Valcamonica – Italy), from Late Neolithic to Iron age. The Authors try to enhance the possible interrelation between rock art and landscape context, not only regarding the different chronological phases, but also the relations among rock art, landscape, and environment.

The chronological distribution pattern of the engravings allows us to recognize a different view on landmarks, such as water streams, clearings, panoramic viewpoints, cliffs. This analysis could lead us also to a hypothetical reconstruction of ancient trails and settlements.

For example, during the Copper Age phase, the monumental area around rock 30 seems to have been the focal centre of a complex, with a clearing right before the engraved boulder and a little stream flowing that passed by some engraved surfaces.

Significant and decisive has been also the modern technical approach, integrating and updating traditional research with new methodologies: 3D rendering, digitization, GIS, integrated databases, and others. In particular, the integral documentation of the scenes and the attention towards the context allow a better understanding of dispositions and chronologies of the engraved subjects. The access to complete data, integrated with new methodologies, also permits significant thematic insights, even regarding topography.

Thus, the rock art site in Foppe di Nadro offers the possibility to demonstrate how an integrated approach on the engravings, the context and the digital data is fundamental to fully understand a site.

5 **BETWEEN THE SETTLEMENTS: ROCK ART ALONG THE ROUTES OF THE DAKHLEH OASIS, EGYPT**

Abstract author(s): Polkowski, Pawel (Poznan Archaeological Museum)

Abstract format: Oral

Dakhleh is one of several grand oases in the Western Desert of Egypt. Colonised by the ancient Egyptians in the middle of the third millennium BC, it became a remote province of the kingdom – separated from the Nile valley by a three-hundred kilometres stretch of barren land. Egyptians brought with them knowledge and technology, created farmlands and founded settlements. They also 'imported' their own specific rock art and rock inscriptions, which became one of the ways of taming the landscape still inhabited by indigenous pastoralist communities at that time.

Petroglyphs became a common feature of the Dynastic-period Dakhleh landscape; however, not attested in or near settlements, but rather in the oasis' margins. Significant concentrations of dynastic petroglyphs are known from the areas cut by major routes: Darb el-Tawil in the north, Abu Ballas Trail in the south, and Darb el-Ghubari in the east. Moreover, certain smaller local routes are also known for their large quantities of rock images.

In this paper, I firstly intend to briefly characterise types of rock art attested in these marginal sectors of the oasis in order to distinguish major groups of motifs associated with routes and movement. Further, I discuss the potential relationships between the oasis margins and the major dynastic settlements. By focusing on the selected motifs, such as depictions of divinities, I hypothesise that pharaonic rock art was more a feature of movement to and from Dakhleh, than a feature related to the oasis' interior – a far more settled and organised area. In other words, rock art would be mainly produced in liminal zones, more unpredictable and dangerous, exposing the travellers to sundry experiences which rock art may have helped to deal with. To address these issues a short reference to Egyptian ontology, and religion seems to be necessary.

6 THE STRUCTURE OF DWELLINGS FROM THE UPPER PALAEOLITHIC SETTLEMENTS (MEZHRYCH, DOBRANICHIVKA, HINTSI)

Abstract author(s): Chymyrys, Marharyta - Shydlovskyi, Pavlo (Taras Shevchenko National University of Kyiv; Centre for Paleoethnological Research) - Tsvirkun, Ostap (National Museum of the History of Ukraine; Centre for Paleoethnological Research)

Abstract format: Oral

A striking feature of the Upper Palaeolithic sites is the structure of the settlements. Different occupation characteristics can be identified by the functional specifications of individual archaeological structures in relation to the paleoecological framework and the dynamics of settlement development over time.

Mezhyrich, Dobranichivka, Hintsy is a Late Upper Palaeolithic settlements in the Middle Dnieper basin (Ukraine) that belongs to the Epigravettian cultural complex. Palaeolithic cultural layers of the site lie 2.5-3 m below the modern surface. The sites were dated between 15-14.3 thousand years BP (uncalibrated) using the bones of several species of animals, including the mammoth.

A typical settlement area consists of several mammoth-bone dwellings, usually 4, but there may be more. Each unit consists of functionally different structures located around a mammoth bone dwelling and in different archaeological horizons, and should be considered as a complex dynamic structure characterising the interaction of a small social group with the local landscape.

The analysis of individual buildings with functional features of Upper Palaeolithic sites allows to reconstruct the interaction of inhabitants with the surrounding landscape, to understand the connections between various types of activities within the territory of the settlement, to establish functional and seasonal characteristics of occupations and to reveal the behavioural characteristics of Palaeolithic settlers.

The analysis of dwellings shows symmetry in large bones disposition that forms the so-called “architectural ornament”, which makes it possible to consider dwellings as landmarks of monumental art. And this analysis include location, frequency and regularity of objects of mobile art inside buildings as well. The art was applied to mammoth bones or objects made from them. The drawings were made in red ochre. Peculiar line drawings are presented on anthropomorphic figurines.

7 A SPATIAL LIFE: ROCK ART DISTRIBUTION AND VISIBILITY AMONG MOBILE-PASTORAL SOCIETIES IN THE MONGOLIAN ALTAI

Abstract author(s): Jurkenas, Dovydas - Fisher, Michael - Jamsranjav, Bayarsaikhan - Jambajantsan, Amina (Max Planck Institute of Geoanthropology)

Abstract format: Oral

The prevalence of seasonal, impermanent settlements among both ancient and modern pastoral communities in Mongolia has led archaeologists to look in two directions for understanding past mobile societies: the ethnographic record and extramural monumental and artistic remains. Past inhabitants of the Mongolian Altai left behind few sedentary habitation sites but thousands of ritual and funerary monuments and tens of thousands of petroglyphic images. These images depict a wide range of subjects, including wild and domesticated species, figural scenes such as horse masters and birthing women, and technologies of their time such as chariots and stirrups. They provide insights regarding both the spatiality and temporality of access to the mountain faces and rocky outcrops where the petroglyphs appear.

In this paper, we combine field data collected under the Mongolian Archaeology Project: Surveying the Steppes (MAPSS) with satellite imagery interpretation and archival survey data in order to help address the question of how mobile pastoralists organised themselves within a mutable social landscape. We document the locations and types of petroglyphs in relation to ancient monuments, ancient campsites, and modern campsites, at both local and micro-re-

gional scales. We collect the data in GIS and apply geospatial methods such as watershed and least-cost path analyses to determine and compare variable degrees of visibility, accessibility, and connectivity between rock art clusters and between potential settlement areas. While research is ongoing, our preliminary results suggest that during the Mongolian Bronze Age (ca. 2500-700 BCE), rock art may have marked communal space more than private space, producing implications for the nature of Bronze Age polities within a context of mobile pastoralism and emergent social complexity.

8 THE START, THE WAY UP AND THE FINISH. HIGH MOUNTAIN PETROGLYPHS IN UZBEKISTAN AND THEIR RELATIONSHIP TO THE WORLD BELOW

Abstract author(s): Leloch, Michal - Kot, Małgorzata - Szymczak, Karol (Faculty of Archaeology, University of Warsaw)

Abstract format: Oral

The main concentration of petroglyphs in the Kyzyl Dara Gorge is between 2,600 and 3,100 metres above sea level. The site is inaccessible for most of the year and remains challenging and difficult to access during the rest of the year. Despite this, the depictions present there indicate that this space has been intensively visited since the Bronze Age, and its use continues today. Today's users of the grassy slopes of the gorge do not create new petroglyphs and have no relationship with them. However, their motivations and action strategies may provide some indication of what inspired the prehistoric petroglyphs creators.

As in prehistoric times, people today come to Kyzyl Dara seasonally, travelling from settlements in the lowlands or lower valleys. As the survey carried out in recent years shows, the valleys leading up are covered with clusters of different burials in the form of kurgans or cairns, which are gradually being discovered. The features passed by those travelling up to the petroglyphs, located in a very specific space, must have been an essential part of their perception of space.

Analysing a single cluster of sites with petroglyph art will not allow one to draw the correct conclusions about their importance to ancient communities. Only by treating the lowland settlements, the burials on the hills and the high mountain rock art as a single complex will it be possible to fully understand the significance of the unique site of Kyzyl Dara.

8 ROCK ART, LANDSCAPE, AND DIGITIZATION OF NATIVE AMERICAN CULTURAL HERITAGE: THE CANYONS OF THE ANCIENTS NATIONAL MONUMENT, SOUTHWESTERN COLORADO (USA)

Abstract author(s): Ciomek, Katarzyna (Institute of Archaeology, Jagiellonian University in Kraków) - Palonka, Radosław (Institute of Archaeology, Jagiellonian University in Kraków; Crow Canyon Research Institute/Crow Canyon Archaeological Center) - Zych, Bolesław (Institute of Archaeology, Jagiellonian University in Kraków) - MacMillan, Vincent M. (Canyons of the Ancients National Monument, US Bureau of Land Management) - Szczepanik, Piotr - Śliwa, Jakub (Institute of Archaeology, Jagiellonian University in Kraków)

Abstract format: Oral

Rock art in the Mesa Verde region of southwestern Colorado and southeastern Utah in the US Southwest represents one of the most visible traces of Ancestral Pueblo culture and later historic indigenous tribes and cultures of this area (as well as Euro-American presence). Paintings and petroglyphs may be found in rock alcoves and shelters, but mostly in open-air spaces: on exposed canyon walls and on isolated boulders.

This paper will examine the placement of rock art documented and analyzed by the Sand Canyon-Castle Rock Community Archaeological Project, a Polish archaeological project in southwestern Colorado, USA. It will present several aspects of the specific locations of rock art panels in relation to the human settlements, natural landscape features, and surrounding environment, including mesas (plateaus), mountain peaks, and canyons. Another important issue will be presenting the relation of some petroglyph panels to the astronomical phenomena (and Ancestral Puebloan knowledge) as sunrises and sunsets during the summer and/or winter solstices.

In our paper, we will also summarize the non-invasive methods we applied during the research for documentation, inventory, and spatial analyses of particular rock art sites and separate panels. It includes mostly various methods of advanced digital photography, Terrestrial Laser Scanning/TLS, close-range and UAV (drone) photogrammetric methods, and experimental use of panoramic photography (using GigaPan Pro equipment and software). For understanding the spatial dependency data is included in the Geographic Information System/GIS (line of sight, watershed, and other visibility analyses); the information was integrated also with the LiDAR data.

9 SACRED LANDSCAPES IN ROCK ART

Abstract author(s): Taylor, Bernie (Community Member)

Abstract format: Oral

Global anthropologic surveys of hunter-gatherers as well as classical literature from ancient peoples widely record the teachings of their cultural stories through structurally common narratives of journeys in their sacred landscapes. These narratives, typically of a hero on his or her journey, often include elements designating time of day and seasons with those sacred landscapes. This time-factoring is sometimes described by the sun, moon and stars, as well as illustrative changes in flora and fauna. Interacting characters frequently involve anthropomorphic deities, humans, animals, and mixtures of the three. The relatively uniform structures of journey narratives worldwide appear integral to the human experience and presumably emerged before rock art.

This study examined indigenous Basque and ancient Phoenician, Greek and Roman myths in the context of historically recorded mountain faces, rocky areas, bodies of water, and other features of the natural environment that are often still revered in the region. Digital images of Iberian cave images were then visually compared with those landscapes for possible matches.

The findings of this study suggest that Upper Paleolithic artists on the Iberian Peninsula found pareidolia in their natural environment and projected those visualizations into their rock art. Real and supernatural characters, geographical features and motifs, some that may still be recognized in Iberian mythology and Mediterranean region classical literature were surfaced. This study also suggests that structural characteristics of the journey narrative with their descriptive sacred landscapes may be studied with rock art in other regions to better understand geographical uniqueness and perspectives of the original artists.

A. HIMMELSTALUND- A CULTURAL HERITAGE IN A CONSTANTLY CHANGING LANDSCAPE

Abstract author(s): Furuskog, Theres (Norrköping city museum)

Abstract format: Poster

Himmelstalund in Sweden is one of northern Europe's largest concentrations of rock carvings from the Bronze Age and in constant change. From the environment that once made the landscape sacred and a place for rituals, until today's fight for its existence in the middle of a growing city. The city of Norrköping expands around the rock art area, making its surroundings change drastically. The poster will show how the landscape has changed during the past 10 000 years and how humans have used its natural resources during that time. This has affected both the landscape and the Bronze Age carvings which are constantly exposed to the elements as well as to human wear and tear. The poster will also show the rock art and its relationship to known settlements as well as its place in a once sacred landscape characterized by the Motala river. The landscape is about to change drastically as the city of Norrköping is planning for a new district that will surround the rock carving area. Close to the rock carving area is one of Sweden's largest settlements from the Bronze Age called Pryssgården. Was this the home of the rock carvers? New excavations will soon teach us more about life in this area during the Bronze Age.

672 HUNTER-GATHERER ANIMAL EXPLOITATION IN THE PLEISTOCENE AND THE ARCHAEOLOGICAL RECORD [PAM]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Lengyel, György (Hungarian National Museum) - Wilczyński, Jarosław (Polish Academy of Sciences)

Session format: Regular session

In the Pleistocene epoch, animals were common food resources for humans. The archaeological findings of animal exploitation largely are related to herbivores and carnivores but remains of any other living creature of the Earth's biome can be part of the faunal assemblages. Archaeozoological studies indicated that animal species of different kinds were hunted or scavenged for dietary purposes, to obtain raw materials for clothing, ornamentation, musical instruments, housing, tools of domestic activity, and to construct hunting weaponry. Therefore, animals were the most important resources for a thriving human existence in the Pleistocene. Prey animals were of different species, each of which had a specific behavior that may have demanded particular knowledge and technique of hunting and exploiting methods. As animal bones are often part of the Pleistocene archaeological site, there must be various evidence of animal exploitation embedded together with artifacts and fossil remnants of human behavior. The exploitation of animals by Pleistocene humans thus shapes and fundamentally contributes to the formation of the Pleistocene archaeological record.

This session aims at

- inspiring to review archaeological assemblages to illustrate human purposes, techniques, technologies, constraints, and adaptations in animal exploitation;
- seeing the variability or principles of human behavior involved in animal exploitation;
- discussing how prey ecology affected the organization of human living, subsistence strategy, and technology;
- reconstructing the variability of hunting strategies;
- studying adaptiveness in human behavior that adjusts subsistence strategy to the changing environment and prey spectrum;
- understanding human mobility and settlement network of hunter-gatherers in relation to animal exploitation;
- finding correlations between prey species and artifacts;
- studying the roots of animal domestication in hunter-gatherer societies;
- exploring the role of Pleistocene wildlife in the formation of the archaeological record.

ABSTRACTS

1 REEVALUATING THE “ELEPHANT BUTCHERING AREA” AT THE MIDDLE PLEISTOCENE SITE OF NOTARCHIRICO (MIS 16) (VENOSA, BASILICATA, ITALY)

Abstract author(s): Pineda, Antonio (Museum National d’Histoire Naturelle; Institut Català de Paleocologia Humana i Evolució Social) - Mecozzi, Beniamino - Iannucci, Alessio (Sapienza University of Rome) - Carpentieri, Marco (Università degli Studi di Ferrara) - Sardella, Raffaele (Sapienza University of Rome) - Rabinovich, Rivka (The Hebrew University of Jerusalem) - Moncel, Marie-Hélène (Museum National d’Histoire Naturelle)

Abstract format: Oral

The archaeological site of Notarchirico represents a key site to study the onset of the Acheulean technology in Western Europe and to better comprehend the its human occupation during the Middle Pleistocene. The site was excavated from 1979 to 1995 under the direction of Marcello Piperno. In 1990 and 1991, during the excavation of the level named A1, almost 40 elephant (*Palaeoloxodon antiquus*) remains were recovered, mostly belonging to the cranial skeleton (cranium, mandible and tusks) of a young adult male, where 42 stone tools were found around, including a chopper, two handaxes and several flake-tools. This “elephant area” was originally interpreted as a butchering site.

Since 2016 a project focused on archeological and paleontological record of Notarchirico started with new excavations. One of the aims of the fieldwork activities is to restudy the findings in situ preserved in the Paleolithic Park of Notarchirico. In order to examine the anthropic role in of mega-herbivores exploitation, such as elephants, we have conducted a taphonomic and technological reevaluation of the original archaeological materials, as well as a reanalysis of their spatial distribution. Such analyses require both detailed examination of each element surface as well as their relative deposition. Actually, the way the remains were left in situ, is indeed very impressive, but a closer look have shown that the elements are not completely exposed thus preventing a thorough examination of their surfaces and relative allocation. The preliminary observation of the spatial relationship of the different materials seemed to suggest the existence of more than one depositional event. Here, we present the first results of the revision of these materials, and we discuss the importance of applying detailed taphonomic examination in order to reconstruct the anthropic role in processing of mega-herbivores.

2 NEANDERTHAL HUNTING STRATEGIES AND TERRITORY EXPLOITATION IN SOUTHERN FRANCE: SITES FROM THE LIMESTONE PLATEAU OF THE GRANDS CAUSSES

Abstract author(s): Roussel, Audrey - Gourichon, Lionel (Université Côte d’Azur; CNRS, UMR 7264 CEPAM) - Brugal, Jean-Philip (Université Aix-Marseille; CNRS, UMR 7269 LAMPEA)

Abstract format: Oral

Our research investigates human-environment relations during the Middle Paleolithic (MP) in Europe in order to determine the settlement patterns and subsistence strategies of Neanderthal communities. For this purpose, we propose an analysis of Human-Animal relations through the study of faunal record from two archaeological sites: the Canalettes rock-shelter and the Rescoundudou, both dated to the OIS 5/4 and located on the Grands Causses, limestone plateaus on the edge of the Massif Central (South of France). The results will be compared with data from other major archaeological sequences in the region for the same period.

Our study combines two complementary approaches using macroscopic (zooarchaeology) and microscopic (cementochronology) analysis, especially applied to the teeth of cervids and bovids, which are the main preys. To this end, we relied on two main parameters: the composition of the animal groups hunted and their season of acquisition. These data allow us to address the issue of the organization of human groups to cope with seasonal and spatial variations in the resources available in the environment. Moreover, several other MP sites in this region bring complementary elements to our analyses, offering a general overview of Neanderthal organizational strategies.

Such innovative approach provides new information, such as the schedule of activities and functions of the site linked with short-term hunting objectives of the human groups. Our results evidence clear seasonal patterns with a preferential exploitation of the faunal resources during the warmest period/season, as well as differential game acquisition between steep forested valleys and grassy highlands. This research demonstrates the great knowledge of prey eco-ethology by Neanderthals, and all their abilities to anticipate in seasonally and geographically highly contrasting environments.

3 USEWEAR ANALYSIS ON RETOUCED AND NON-RETOUCED CALLISTA CHIONE VALVES: A MULTI-ANALYTICAL APPROACH. A PRELIMINARY STEP TO INTERPRET NEANDERTHAL SHELL TECHNOLOGY

Abstract author(s): Chaniotaki, Evangelia (Sezione di Scienze Preistoriche e Antropologiche, Dipartimento di Studi Umanistici, Università degli Studi di Ferrara; Departament d’-Història i Història de l’Art, Universitat Rovira i Virgili) - Tumung, Laxmi (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Instituto Internacional de Investigaciones Prehistóricas de Cantabria, Universidad de Cantabria, Gobierno de Cantabria, Grupo Santander) - Romagnoli, Francesca (Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid) - Ollé, Andreu (Institut Català de Paleoeologia Humana i Evolució Social - IPHES-CERCA; Departament d’-Història i Història de l’Art, Universitat Rovira i Virgili)

Abstract format: Oral

Seashells have been consistently present alongside the Homo species, especially to their adaptation in the coastal zones. Shell as tools has been identified in several Pleistocene and Holocene sites along Mediterranean and Atlantic coasts of Europe, mainly thanks to use-wear analysis. However, use-wear studies on shell implements are not systematic yet.

Currently, the most ancient use of shell as tools in European regions has been identified in Middle Paleolithic sites. Neanderthals retouched valves of *Callista chione*, a big marine mollusk, to shape tools. The goal of this paper is to build an experimental protocol for create a reference collection to further assess the function of retouched *Callista chione* through a multi-analytical approach.

The experimental program will integrate the experimental protocol previously developed to assess the functional potential of these tools and the methodological SEM protocol for use wear analysis on shells.

For our experiments, we have used 16 fresh valves of *Callista chione*. Different cleaning protocols has been tested and moulds and casts were done for the cutting edges to document the edge before the use. We used retouched and non-retouched *Callista chione* to perform different experimental activities and check the edge efficiency. Comparing retouched and non-retouched shell edges, we tried to understand how the different use-wear develops. All the experimental samples were used in a sequential order during 5, 10 and 15 minutes sessions. The experimental shell tools have been used in butchery and wood working activities.

For the multi-analytical approach, we used the combination of three different microscopes (Optical Microscope, 3D Digital Microscope SEM). These microscopes give an insight about distinguishing characteristic traces of use-wear on the working edge of the shell tools. Combining different microscopic analysis we tried to understand, identify and interpret the traces developed on the marginal edge of the modified and non-modified *Callista chione*.

4 INVESTIGATING SEASONAL MOBILITY OF PREY SPECIES AT LAZARET CAVE, FRANCE (MIS 6) USING STRONTIUM ISOTOPES AND SPATIAL ASSIGNMENT MODELS

Abstract author(s): Barakat, Sarah - Le Corre, Mael (Department of Archaeology, School of Geosciences, University of Aberdeen) - Willmes, Malte (Norwegian Institute for Nature Research) - Cohen, Jessica (LDPL - Laboratoire Départemental de Préhistoire du Lazaret) - Vuillien, Manon (CEPAM UMR 7264 CNRS, Université Côte d’Azur; Archéozoologie, Archéobotanique : Sociétés, Pratiques et Environnements, AASPE UMR 7209, CNRS / Muséum national d’Histoire naturelle) - Desclaux, Emmanuel (LDPL - Laboratoire Départemental de Préhistoire du Lazaret; CEPAM UMR 7264 CNRS, Université Côte d’Azur) - Britton, Kate (Department of Archaeology, School of Geosciences, University of Aberdeen)

Abstract format: Oral

The Middle Pleistocene site of Lazaret Cave, located in modern-day Nice (France) has a rich archaeological record, with a vast assemblage of faunal remains pertinent to understanding early Neanderthal (*Homo neanderthalensis*) subsistence behaviours as well as red deer (*Cervus elaphus*) ecology in MIS 6. Zooarchaeological studies at Lazaret Cave have shown a high abundance of red deer and ibex (*Capra ibex*) remains throughout the majority of archaeological layers suggesting preferential hunting of these two species which is not seasonally dependent. This study examines molars from red deer and a single ibex from archaeological layer UA25 (dating to ~150 kya) for strontium ($^{87}\text{Sr}/^{86}\text{Sr}$) and oxygen ($\delta^{18}\text{O}$) isotopic analysis to reconstruct seasonal mobility patterns during tooth formation.

The isotope data was then combined with a local $87\text{Sr}/86\text{Sr}$ isoscape and computational spatial assignment was undertaken to reconstruct potential migration ranges of red deer and ibex in order to better understand Neanderthal hunting ranges.

Results from this study show that red deer had a minimum seasonal migration range of approximately 20km with their winter ranges located near Lazaret Cave. In comparison, the single ibex showed no seasonal mobility and could have occupied the landscape surrounding Lazaret throughout the year. This means that while Neanderthals could have hunted red deer in the local area during winter periods, they would have had to travel up to 20km during summer occupation events. Through the combination of zooarchaeology, isotopic analysis, and spatial assignment we identify possible Neanderthal hunting patterns and provide the first evidence for red deer spatial ecology in southern France dating to MIS 6. Further work is currently underway on faunal remains from other layers to investigate whether red deer and ibex spatial ecology and Neanderthal hunting patterns change due to climatic variations throughout MIS 6.

5 LATE PLEISTOCENE CAVE EXPLOITATION IN THE SOUTHERN CARPATHIANS

Abstract author(s): Chu, Wei (Leiden University) - Demay, Laëticia (Muséum National d'Histoire Naturelle) - McLin, Scott (University of Tuebingen) - Peudon, Floriane (UMR 7269 - LAMPEA) - Ciornei, Alexandru - Dobos, Adrian (Institute of Archaeology „Vasile Parvan“)

Abstract format: Oral

Caves and other karstic features are main archives of Pleistocene animal fossils in East-Central Europe. At the same time, these caves are generally poor in Paleolithic artifacts, particularly when compared to other regions of Europe and the Levant. This phenomenon also contrasts with the sometimes-dense accumulations of lithics at open-air sites, where fauna is seldom well-preserved. In the past, scholars have suggested that reasons for this may have to do with (a) lesser research intensity (b) differences in regional sedimentary regimes; or (c) diverse hominin subsistence strategies across time and space, including a greater use of caves as animal exploitation resources. However, understanding how these caves were used by hominins and animals has partly been hampered by a reliance on legacy excavations for which data is often unreliable. Here we present preliminary lithic, faunal, and taphonomic data from test trenches and excavations of a newly excavated cave of Copta Mare in the southern Carpathians with the aim to illuminate how a Late Pleistocene cave was used in the Paleolithic. The implications of this work contribute to our regional understanding human mobility and settlement network of hunter-gatherers in relation to their animal exploitation patterns.

6 UPPER PALAEOLITHIC SUBSISTENCE STRATEGIES IN THE WESTERN CARPATHIANS

Abstract author(s): Lengyel, György (Hungarian National Museum - Magyar Nemzeti Múzeum) - Wilczyński, Jarosław (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences)

Abstract format: Oral

The Upper Palaeolithic period in the Western Carpathians (Southern Poland, Moravia, Slovakia, Hungary, Lower Austria) is dated to between 43,000 and 12,000 cal BP. Culturally, it is composed of Early Aurignacian, Late Aurignacian, Early Gravettian, Pavlovian, Late Gravettian, Early Epigravettian, Late Epigravettian, Magdalenian, and Epimagdalenian. These cultures can be best differentiated by their hunting osseous and lithic equipment. The various hunting tool types most likely are representations of different hunting strategies and thus human subsistence. We aimed at finding a correlation between the faunal composition of the cultures and the hunting weaponry to be able to reveal what makes the archaeological record of the anatomically modern human population variable throughout the Upper Palaeolithic. We studied both cultural and faunal data against the climatic changes during the late MIS3 and the whole MIS2, to see how climate affected human subsistence strategy. Also, art, burials, site features, lithic dumps, all that can indicate the duration and the function of the site, and human paleogenetic data are taken into account to accomplish this research. We used data from our investigations and from papers published by other scholars. This multivariate analysis is expected to reveal the formation of the Upper Palaeolithic archaeological record.

7 ON THE PERIPHERY OF A MAMMOTH „KJÖKKENMÖDDING“. THE NEW EXCAVATION OF THE EXTENSIVE BONE DEPOSIT AT DOLNÍ VĚSTONICE I.

Abstract author(s): Novák, Martin (Institute of Archaeology of the Czech Academy of Sciences) - Wilczyński, Jarek (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences) - Händel, Marc (Austrian Archaeological Institute, Austrian Academy of Sciences) - Boriová, Soňa - Herčík, Ondřej - Chlachula, Dominik (Institute of Archaeology of the Czech Academy of Sciences)

Abstract format: Oral

Our contribution presents first results of the recent excavation at the classic Gravettian site Dolní Věstonice I undertaken in summer 2022. The new fieldwork focused on the eastern periphery of the large mammoth bone deposit located in the site's upper part, initially excavated by B. Klíma in 1966-1968.

The find layers were re-assessed to obtain new zooarchaeological material for aDNA and stable isotopes analyses, as well as samples for age determination and reconstruction of the paleoenvironment within the ERC project “MAMBA - Exploring Mammoth Bone Accumulations In Central Europe“. The project focuses on the formation of mammoth bone deposits at Upper Palaeolithic sites in Central Europe. It aims to clarify how and why these large accumulations of faunal remains were formed, and to explore their function in the settlement and subsistence strategies of hunter-gatherer groups in the corridor between south Poland, Moravia, and northeast Austria in the period between 35-25 ka.

The main find layer contained abundant faunal remains together with lithic artefacts, charcoal fragments, and malacofauna. Site and find layer formation are very complex and document a post-occupational interplay between different natural factors, including a baseline aeolian sedimentation, pedogenesis, slope processes, and permafrost features. The new excavation yielded thousands of bone, tooth, and tusk specimens belonging to animal species commonly found here during previous fieldwork, as well as at other sites in this region, such as woolly mammoth and rhinoceros, horse, reindeer, wolf and fox. The scarce lithic material includes a few microdentulates, which allow us to unambiguously attribute this assemblage to the Pavlovian. New data were also obtained for the geomorphological setting and spatial structure of the deposit.

Acknowledgement: The excavation at Dolní Věstonice I was supported by the ERC Consolidator Grant “MAMBA“, reg. nr. 101045245.

8 THE SIGNIFICANCE OF REINDEER FUR FOR THE SUBSISTENCE OF THE EPIGRAVETTIAN HUNTER-GATHERERS IN KAMMERN-GRUBGRABEN, LOWER AUSTRIA

Abstract author(s): Pasda, Kerstin (Institute of Pre- and Protohistory, Friedrich-Alexander-Universität) - Mayr, Christoph (Institute of Geography, Friedrich-Alexander-Universität; Department Earth and Environmental Sciences & GeoBio-Center, Ludwig-Maximilians-Universität) - Maier, Andreas (Institute for Prehistoric Archaeology, University of Cologne) - Reiss, Lilian (Institute of Geography, Friedrich-Alexander-Universität) - Einwögerer, Thomas - Händel, Marc - Buchinger, Norbert (Austrian Archaeological Institute, Austrian Academy of Sciences) - Lücke, Andreas - Wissel, Holger (Research Center Jülich GmbH, Institute of Bio- and Geosciences)

Abstract format: Oral

We present reflections on the importance of reindeer fur for the Epigravettian hunters of the eastern part of Central Europe. For this purpose, the Epigravettian site of Kammern-Grubgraben (Last Glacial Maximum (LGM), approx. 24 – 19 ka cal BP) was compared to Early Gravettian assemblages (approx. 33 – 29 ka cal BP) from the sites of Krems-Hundssteig, Krems-Wachtberg, and Langenlois A in Lower Austria. In particular, differences in the animal bone composition were investigated that point to changes in living conditions and consequently to changes in subsistence strategies.

The faunal composition of the sites under investigation changes substantially over time, from mammoth-dominated assemblages in the Early Gravettian to a dominance of ungulates, such as horse and ibex, but predominantly reindeer in the Epigravettian. Additionally, a shift in the nitrogen isotope baseline of bone collagen between the specimens of the Early Gravettian sites and the Kammern-Grubgraben is best explained by decreased soil and plant $\Delta^{15}N$ values during the LGM due to decreasing mean annual temperature.

The increasingly cold and arid climate may also have led to a growing need of warm clothing and other goods made of reindeer fur and skins by the Epigravettian hunters.

The dominance of reindeer of all ages and sexes, but especially the high proportion of young animals in the Kammern-Grubgraben site, is striking. Also, the fact that reindeers were hunted exclusively in winter could indicate that a major purpose of repeated visits at this site was to obtain skins. The presence of all skeletal parts in reindeer and the high number of carnivores may be considered further indications supporting this hypothesis.

9 FOCUS ON REINDEER: THE ZOOARCHAEOLOGY OF LAST GLACIAL MAXIMUM UPPER PALEOLITHIC SITES IN NORTHEAST ROMANIA

Abstract author(s): Demay, Laëticia (Muséum national d'Histoire naturelle de Paris) - Mărgărit, Monica (Doctoral School of Economics and Humanities, Valahia University Târgoviște) - Anghelinu, Mircea (Faculty of Humanities, Valahia University Târgoviște,) - Händel, Marc (Austrian Archaeological Institute, Austrian Academy of Sciences) - Niță, Loredana (Faculty of Humanities, Valahia University Târgoviște,) - Cordoș, Cristina (Institute of Archaeology, Romania)

Abstract format: Oral

New field research brought to light fresh data about the chronology, cultural affiliation and subsistence activities of Gravettian and Epigravettian hunter-gatherer groups occupying northeast Romania during the LGM. Our focus here is on the recently reassessed sites Bistricioara Lutărie III (Bistrița Valley), Dolhasca Dealul Viei II (Siret Valley) and

Cotu Miculinți (Prut Valley). Zooarchaeological studies applied to the faunal remains from these find spots unraveled new data regarding the preservation of the assemblages, the types of acquisition and use of animal resources for dietary and raw material purposes, and identified the modalities of site occupations by determining the types and seasonality of human activity. Although uneven in terms of preservation and resolution, the data from the new sites add to the existing corpus of zooarchaeological data highlighting the crucial importance of reindeer for the regional Upper Paleolithic hunter-gatherers, both in terms of subsistence and raw material for domestic and hunting equipment.

10 THE ROLE OF FOSSIL MOLLUSC SHELLS IN THE UPPER PALAEOOLITHIC OF HUNGARY

Abstract author(s): Bálint, Csaba (Dobó István Vármúzeum)

Abstract format: Oral

The archaeological find material of the Upper Palaeolithic sites of Hungary occasionally yield fossilized marine mollusc shells, intentionally transported there by the occupants. The sites that contain most of these items are located relatively close to one another, within the Danube bend area, in Northern Central Hungary. The mollusc shells probably originate from mostly tertiary geological sources that are also found in the Danube bend area. By their nature, the shells represent one of the inedible animal resources of the Pleistocene, so the purpose of their procurement raises questions. In the literature these items are often referred to as jewelry. Despite that notion, only a small portion of the shells bear signs of modification that would hint at them being worn as parts of human attire. The aim of this paper is to shed light on the purpose of the exploitation of these items, their possible or intended function and the reason why the settlements containing fossil shells are concentrated in a relatively small area within the Central Carpathian Basin. As the assemblages show heterogeneity to one another due to the most preferred species of molluscs being different for each site, further questions can be raised on the relationship between settlements of the area.

674 METHODS, MEANINGS AND MAINTENANCE - APPROACHES TO MEDIEVAL ECCLESIASTICAL BUILDINGS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Seppanen, Liisa (Aalto University; Helsinki University) - Savolainen, Panu (Aalto University) - Schöffbeck, Tilo (Independent researcher) - Hallgren, Matthias (Independent researcher)

Session format: Regular session

Since the 19th century, medieval churches have been valued as important cultural heritage and have been investigated frequently and intensively in many countries. In recent times, studies have been also addressed to roofs and attics constituting the unique testimony of still standing and functioning original wooden constructions from the Middle Ages.

The fire of Notre-Dame of Paris in 2019 as well as destructions of many other ecclesiastical buildings have reminded us how important it is to make surveys and studies and document the constructions in detail when they are still standing. Church attics and roof constructions (as well as attics of other buildings) contain and demonstrate both tangible and intangible heritage manifesting the expertise and craftsmanship of the time, engineering and woodworking skills, emergence and existence of professional networks, transition of know-how and adoption of innovations.

In this session, we invite participants to present past and on-going studies about churches and other monumental buildings focusing on the following issues:

- documentation, surveys and research methods (with special attention to roof constructions)
- resource management (including production, acquisition, and use of the materials) related to construction and maintenance of monumental architecture
- building workshops, constructors, and the identity of builders
- emergence and transition of innovations and local traditions
- restorations and transformations in different times.

Furthermore, we welcome papers discussing how the churches and other monumental buildings, notably their attics, were used and viewed at different times and how the aspects of heritage have been and are considered and discussed by different parties when justifying the preservation or transformation of monumental buildings and environments in changing societies. We wish to highlight the invisible roofs and attics as an important part of architectural history and heritage and increase communication between experts representing different research fields and related praxis.

1 EPISTEMOLOGICAL EXPLORATIONS WITH ROOF CONSTRUCTIONS AND CHURCH ATTICS

Abstract author(s): Savolainen, Panu (978-952-68929)

Abstract format: Oral

The presentation examines the research and epistemology of wooden constructions, especially timber frames, and attics. It is based on an iterative process of documentation of medieval Finnish structures with a cross-disciplinary research group formed both of practitioners and scholars.

The intention of my presentation is twofold. First, I approach the development of understanding and surveying the structures within the duration of the research project “Medieval roof structures in Finland” (2022-2024). During the fieldworks, new and unexpected phenomena have been discovered in the structures. I shed light on the ways this has shaped the goals of the project as well the priorities and epistemology of surveying the structures.

Second, I contemplate the possible but hitherto unexplored information and data that would be possible to gather from the structures. Here I also reflect the opportunities of analysing and understanding society, communities and individuals through the interpretation of complex architectural structures made of timber.

2 DISCARDED AND HIDDEN HERITAGE - THE ARCHAEOLOGICAL AND ARCHITECTURAL EVIDENCE FROM THE CHURCH ATTICS IN FINLAND

Abstract author(s): Seppanen, Liisa (Aalto University; Helsinki University)

Abstract format: Oral

Medieval churches manifest manifold both tangible and intangible heritage which is discussed from different perspectives and by various stakeholders. The changes and repairs of clerical spaces reflect the needs of the physical building, ideological changes, and demands of the parish and the surrounding society.

Medieval church attics are impressive spaces that mostly have been visible mainly to those engaged in building, repairing, and maintaining them. Sometimes the builders have left behind materials, tools, and equipment used or meant for the construction of the church. For centuries, the attics could have been used for storing and hiding, and thus may contain and reveal information about the use of the space as well as the beliefs, ideas, and history of the people accessing the attics.

Although many churches have suffered from destructive fires and consequent transformations, the archaeological heritage is still available in many medieval churches. Constructions on the attics reveal the phases of construction as well as maintenance, but quite often the stratified and otherwise materialized archaeological heritage is lost due to clearing activities related to repairs and maintenance work.

In this paper, I am discussing the aspects of heritage regarding Finnish medieval churches. The churches highlighted in this presentation are in Sipoo and Ulvila in the southern and western parts of Finland. Both churches were built in the latter part of the 15th century and have been included in an ongoing research project focusing on medieval churches in Finland. The field works conducted in these churches have demonstrated the need to emphasize and document the remaining heritage in the attics, too, and widen the scope of heritage both in discussions and in practice.

3 MEDIEVAL ROOF STRUCTURES IN CLIMATE CHANGE AND GREEN TRANSITION

Abstract author(s): Sandin, Ylva (RISE Research Institutes of Sweden) - Haugen, Annika - Agasöster, Björg (NIKU)

Abstract format: Oral

This study concerns Swedish and Norwegian medieval roof trusses in churches. These impressive structures have carried their loads for up to nine hundred years and are important sources to knowledge of medieval timber building. They also form unique historic spaces. We now see that climate change risk threatening them directly or indirectly in three ways: 1) By the changed climate itself. 2) By actions taken with the good intention of reducing greenhouse gas emissions from property management – energy efficiency measures or transition to renewable energy sources. 3) By climate adaptation measures, such as installation of gutters or vapour barriers.

Climate change is coming faster than expected and measures are also being carried out at a high pace. It is extremely important that the measures implemented do not technically damage these unique constructions or reduce their heritage values.

This study aims at compiling good examples of how medieval church roofs can be managed to achieve reasonable energy efficiency while preserving cultural and historical values. Through literature studies, interviews and workshops, a guide for safeguarding heritage values when choosing measures is developed. Good examples are collected and presented. Informants are chosen to represent initiated people ranging from caretakers, property managers, carpenters, engineers, architects and antiquarians to researchers.

This both resilient and fragile medieval cultural heritage is of public interest and a unique part of a good built environment. The project is important for today's and future managers of the churches as well as for researchers and the public.

4 A ROOF DRAWING IN A MEDIEVAL PARISH CHURCH: EVIDENCE OF ARCHITECTURAL CHANGE

Abstract author(s): Hollis, Crystal (University of Exeter)

Abstract format: Oral

Graffiti is often recorded and used to add new layers of understanding to the social history of a parish church. These inscriptions have a variety of designs. Less popularly discussed, are architectural drawings and pieces of evidence pertaining to building design and development. Some architectural schema do exist, though they are rare and often depict pieces of moulding or windows.

The medieval church of Ampney St. Mary is famous for its thirteenth and fourteenth century wall paintings and its Romanesque tympanum. However, on the walls of the chancel is a rare architectural inscription depicting a roofing structure. Such remnants of the medieval building and design process rarely survive, and graffiti of roof structures is rarely found in English parish churches. More interestingly, the design on the chancel wall does not match the current medieval roof. This paper will explore the connection between the current roof and the roof design drawn on the wall, as well as explain how graffiti such as this can be used to better interpret building chronologies and histories. By investigating drawings such as these, researchers can better understand the process of church building, restoration, and alteration over the centuries.

5 TREE-RINGS AND TIMBERS IN SCOTLAND'S MEDIEVAL CHURCHES: DENDROCHRONOLOGICAL RESULTS FROM SE SCOTLAND REVEAL POTENTIAL OF AN UNDOCUMENTED NATIONAL HERITAGE RESOURCE

Abstract author(s): Mills, Coralie (Dendrochronicle; University of St Andrews)

Abstract format: Oral

As the South East Scotland Oak Dendrochronology research project heads towards a close, a key outcome has been discovering, dating and provenancing previously unknown medieval timber structures in several Scottish medieval churches. Dendrochronology and buildings archaeology have been relatively poorly supported in Scotland compared to England and much of Europe and Scandinavia. Thus, the roof structures and timberwork of Scottish medieval ecclesiastical buildings are largely unknown, un-surveyed and untapped in terms of research potential. Surprising dendrochronological results from St Giles in Edinburgh, St Mary's in Haddington and Kirkliston Parish Church reveal precise medieval dates and unexpected timber provenances, evoking specific relationships in time and space between woodlands, patrons, wrights and suppliers, and indeed, between nations. St Giles exemplifies the rich information which may be obtained through dendrochronological study, in this case from a medieval timber structure hiding in plain sight in the centre of a capital city. Due to timber shortages in Scotland since at least the 15th century, in other churches the results show that early timbers can survive recycled into later fabric, allowing us to see the ghosts of earlier iterations of the church buildings and providing precision dating for construction in times when historical documentation is sparse.

This regional study demonstrates the untapped potential in Scottish medieval churches and has significant implications for the future conservation, documentation and scientific study of surviving medieval church fabric across Scotland as whole. This largely untapped resource is also key to understanding the evolution of roof forms and wood-working technologies in medieval Scotland and as a repository of material for developing regional reference chronologies to assist the future application of dendrochronology in Scotland more widely.

6 MANAGEMENT OF WOODEN RESOURCES DURING THE CONSTRUCTION OF MEDIEVAL CHURCH ROOF STRUCTURES IN FINLAND

Abstract author(s): Dalheimer, Franziska (Aalto University)

Abstract format: Oral

During the last two decades investigations intensified on the wooden roof structures of medieval stone churches in Finland. Only around 20 of these large-scale wooden roof trusses outlasted the past 550 years and they represent the last still standing medieval structural timber in Finland's built environment. The gained insights started shifting the attention from church interior and facades to the marvels of medieval wood construction in the attics. This research goes beyond the physical evidence of the timber structure and reveals perceptions of the local resource management of major medieval construction projects in Finland.

This research follows the case studies of Pyhtää and Ulvila church with the research question of What do the quantities of wooden material of Pyhtää and Ulvila churches' roof structures reveal about the resource management? The main methods include field work studies, microscopic wood identification, analysis of pollen percentage and experimental archaeology research. The Life Cycle Assessment methodology gives additionally structure to reconstruct the resource consumption of wooden material during the life cycle phases of production and construction. This includes a reconstruction of extracted material quantities and an inventory of the used wood species, material extraction places and the extraction impact on the surrounding of Pyhtää and Ulvila church. The data can additionally be used to speculate on material shortages, certain material choices, medieval manufacturing process and waste management.

The study is tied to the previous and ongoing research at Aalto University (Medieval Wooden Building Heritage in Finland) which includes a close collaboration with specialists in architectural conservation, veterinary medicine, wood science and archaeology. The output is preserving Finland's medieval wooden building heritage and gaining deeper sociological and architectural insight of medieval resource use in Finland through use of current technological advancement.

7 EKESKOG - ASSESSING A 13TH CENTURY TIMBER BELFRY IN WESTSWEDEN

Abstract author(s): Hallgren, Mattias (TRADITIONSBÄRARNA) - Gullbrandsson, Robin (Västergötlands museum)

Abstract format: Oral

Sweden has 12 preserved timber belfries from the Middle Ages, most of them recognized as medieval constructions in surveys that started around 2010. One of these was found nearby the 13th century church of Ekeskog in the province of Västergötland, West Sweden. In total seven timber belfries are dated or attributed to the Middle Ages in this region. They date from the 14th and 15th century and are distinguished by their way of construction, a timber framing with no sill. Originally, the posts stood only on flat stones. This kind of belfry construction is related to preserved High and Late Medieval ones in Denmark and Northern Germany.

The belfry of Ekeskog has for long been in need of a proper restoration due to severe damages caused by fungi. In 2022, we documented and evaluated the construction, history and damages of the belfry. The assessment included dendrochronological analysis (made by University of Lund), archival studies, and minor archaeological trench excavations. The analyses demonstrated that the fir trees were felled at the same time as the trees for the church roof, in the 1240s and 1260s, dating the construction of the belfry to the 1260s. According to the analysis, Ekeskog is hitherto the oldest dated still standing construction of this kind in Sweden. Archival sources testify that the belfry was dilapidated in the 18th century and therefore large reparations were made in 1804 when sills were supplemented /added. The timber was felled already in 1790.

The recently finished assessment has shown the exceptional values inherent in the belfry of Ekeskog. Now a restoration is under preparation to maintain and enhance these values.

8 WHO WERE THE BRICKMAKERS? TRACING CHURCH CONSTRUCTION TEAMS IN LATE MEDIEVAL FINLAND

Abstract author(s): Aalto, Ilari (University of Turku)

Abstract format: Oral

During the 15th century, an unprecedented wave of stone construction took place in Finland (then part of the kingdom of Sweden): most of the medieval stone churches in mainland Finland were built between 1420 and 1550. However, only sporadic written evidence of the organization of church construction sites remains, and the only way to gain new insights to the building processes is to study the churches themselves. Brickmakers' personal marks found in the churches form an important, yet hitherto overlooked set of data. Such marks were used in Finland from 1440s to 1480s, and the material allows one to identify individual master brickmakers who can be followed from one church to another. This paper makes a spatial analysis of where the marks can be found geographically and seeks to answer the question of whether the identified masters worked as fixed professional groups or as itinerant, freelancer craftsmen. The set of data consists of ten churches with brickmakers' marks, situated in Southwest Finland.

9 AT THE INTERSECTION OF FAITHS AND CULTURES - RESEARCH ON HISTORY OF ST.DOMINIC'S CHURCH IN PŁOCK

Abstract author(s): Dobek, Mikolaj (First year student of master's studies, Nicolaus Copernicus University in Toruń) - Dabralet, Igor (Second year student of master's studies, Nicolaus Copernicus University in Toruń)

Abstract format: Oral

One of the main tasks faced by archaeologists is to fill in the "blank spots" in the history of given communities. In practice, this often means recognizing the history of changes in places about which written sources are silent. Until

recently, this type of place was the church of St. Dominic in Płock along with the post-Dominican monastery. The order functioned in this place for 500 years. Later, in the 19th and 20th centuries, the Evangelicals and Orthodox Christians used the complex. In recent years, the complex was inventoried and a number of architectural and conservatory analyzes were carried out (roof constructions, altar, internal monastery walls). However, no archaeological work has been carried out until 2022.

The lack of sources about the changes in the construction of the church and monastery was the reason why the students of the NCU in Toruń created the project "At the intersection of faiths and cultures - research on history of St. Dominic's Church in Płock". During the interdisciplinary research, archaeological exploration of the undergrounds under the complex was made. A second entrance to the crypt was discovered, the existence of which was confirmed in the descriptions found by the archivist. The bone material from two ossuaries was analyzed by an anthropologist. Analysis of post-medieval movable object and the stratigraphy of the crypt allowed to broaden the knowledge about the construction phases. The presentation of the research results of the post-Dominican church in Płock, shows how much even a low-budget research project can influence the recognition of the centuries-old history of a medieval sacral building. Conducting interdisciplinary excavations in a place that doesn't have a sufficient source base in the form of written sources made it possible to outline the history of a given place and its users through the prism of archaeological objects.

10 EARLY MEDIEVAL BAPTISTERY AT THE CHURCH OF SAINTS MARIA ET DONATO ON THE ISLAND OF MURANO IN VENICE

Abstract author(s): Zukowski, Robert - Baranowski, Tadeusz (Institute of Archaeology and Ethnology Polish Academy of Sciences)

Abstract format: Oral

Basilica of Saints Maria and Donato on Murano Island is a jewel of Venetian Romanesque architecture of the Ravenna type. It was probably built in the 7th century, but written sources date it to the 10th century. In the 12th century it was restructured at the time of the arrival of the remains of San Donato.

The research into the origins of the church is especially important for reconstruction of the history of one of the main settlement centers of the Venice Lagoon foundation and its transformation up to our times, which allows us to observe the regularity of the birth of cities in Europe.

Many data on the issues of spiritual and material culture of the inhabitants of Murano were obtained during the archaeological work thanks to the remains of sacral architecture found and the burials near the church. These are particularly important sources of knowledge of the past, which provide direct and indirect information on the local population, also indicating their level of economic and social development.

The aim of this paper is presentation of unique research conducted in the area of Murano which allow to reconstruct the process of formation of the early city structure of Venice and its society, as well as its impact on the mediaeval and modern city's layout.

11 METAL AS CONSTRUCTION MATERIAL IN GOTHIC ARCHITECTURE: CHRONOLOGY, PROVENANCE AND USES OF IRON ARMATURES IN NOTRE-DAME DE PARIS

Abstract author(s): Bernard, Mathilde (Laboratoire Archéomatériaux et Préviation de l'Altération - LAPA, IRAMAT UMR7065, NIMBE UMR3685, Université Paris-Saclay, CEA/CNRS) - L'Héritier, Maxime (Université Paris 8, ArScAn UMR7041, CNRS) - Beck, Lucile - Delqué-Kolic, Emmanuelle (Laboratoire de Mesure du Carbone 14 - LMC 14, LSCE-IPSL, CNRS/CEA/UVSQ) - Azéma, Aurélie (Laboratoire de Recherche des Monuments Historiques - LRMH, CRC UAR3224, Muséum National d'Histoire Naturelle - MNHN) - Lorquet, Philippe (Institut National de Recherche Archéologiques Préventives - INRAP) - Bauvais, Sylvais (Centre de Recherche Français à Jérusalem - CRFJ, UMIFRE n°7 CNRS/MEAE, UAR3132) - Dillmann, Philippe (Laboratoire Archéomatériaux et Préviation de l'Altération - LAPA, IRAMAT UMR7065, NIMBE UMR3685, Université Paris-Saclay, CEA/CNRS)

Abstract format: Oral

Following the set up of the scientific program coordinated by the French National Centre for Scientific Research after the fire of the 15th April 2019, the clearing, sorting and inventory of the remains of Notre-Dame de Paris revealed a great diversity of iron alloys within the cathedral. The study of these metals allows enriching our knowledge of the monument but can also reveal social practices and their evolution according to the different periods of the building site. On seeing the cathedral architecture as a materialization of the social life around the construction yard, the archaeometallurgical analyses of the iron armatures can provide information on the production and circulation of the metal, the manufacturing processes or their role in the structure of the building, along with the dating of the material.

Among iron artefacts in the cathedral are found staples in the masonry of the tribunes, nave, aisles and upper walls. The restoration works also reveal various tie-rods, dowels, ridge caps and framing irons such as nails, bolted rods or

keyed dowels. The shaping of 28 of these ferrous armatures and the quality of the metal production has been highlighted by metallographic analyses. Artefacts with sufficiently high carbon content were also radiocarbon dated, revealing the different construction and repair campaigns of the cathedral. Slag inclusions were analyzed by SEM-EDS (major elements) to study the iron manufacturing processes and by LA-ICP-MS (trace elements) to look for iron provenance. Trace element composition of slags from 9 archaeological iron production sites in Île-de-France was also determined by ICP-MS. The comparison with the composition slag inclusions of the metal reinforcements enables to propose provenance hypotheses for the supply of Notre-Dame's building yard. These archaeometallurgical studies show a great diversity of provenances and renew our understanding of iron circulation and trade in medieval Paris.

12 A CHRONOLOGICAL APPROPRIATION OF LEAD THROUGH ANALYTICAL, HISTORICAL AND ARCHAEOLOGICAL STUDIES FROM THE CASE OF NOTRE-DAME DE PARIS

Abstract author(s): L'Héritier, Maxime (CNRS - SCTD - 0150; University of Paris 8; ArScAn CNRS UMR 7041) - Baron, Sandrine (CNRS TRACES UMR 5608) - Daussy, Diane (ArScAn CNRS UMR 7041) - Sarah, Guillaume (CNRS IRAMAT UMR 7065) - Azéma, Aurélia (LRMH CRC UAR 3224) - Syvilay, Delphine (Sorbonne Abu Dhabi) - Lestel, Laurence (CNRS METIS UMR 7619)

Abstract format: Oral

The Paris fire at Notre-Dame reminded us of the massive use of lead in the construction of monumental buildings: roofing, sealing of stones and iron fittings, waterproofing elements, decorations and stained glass windows. At Notre-Dame, the archives bear witness to this use over the centuries: more than 200 tons of lead, partly recycled, were used in the 19th century to make the last roof, its cresting and the spire. However, its very low melting point (327°C), its malleability and careful need for maintenance increase the possibilities of remelting and reuse. Thus, several leads from different supply sources and from different implementation phases can coexist in the same structure.

The Notre-Dame CNRS/MC scientific project provides an opportunity to address the issue of the chronological appropriation of lead material throughout the history of the building. The coordination of archaeometric, archival and archaeological studies sheds light on the different lead uses and makes it possible to examine the lead supply markets, the practices of plumbers and their evolution, thus renewing our understanding of the building. About 300 lead artefacts, mainly from the 12th-13th and 19th century campaigns, were sampled in place and from materials recovered from the remains of the burnt-out parts. Trace element chemical analyses by LA-ICP-MS allowed constituting a corpus relevant for the performance of lead isotope analyses by MC-ICP-MS.

The results reveal very different lead supply modalities between the medieval period and the 19th century. For the latter, the archives make it possible to orientate the search for the relevant mining references to be mobilised with regard to the historical context. The isotopic results highlight the combined use of ores mobilised from the large Andalusian deposits (Sierra de Cartagena and La Carolina), thanks to the dynamic Franco-Spanish trade. The elemental analyses also confirm the practice of recycling lead by remelting.

13 GATES TO PARADISE: ANALYSING METAL DOORS AND THEIR WOODEN SUPPORT FROM 11TH-12TH CENTURY CHURCHES

Abstract author(s): Fera, Martin (NOVETUS) - Mödlinger, Marianne - Schlie, Heike - Utz, Judith - Ghiara, Giorgia (IMAREAL, Universität Salzburg) - Negri, Martino - Bontadi, Jarno - Fellin, Marco (CNR-IBE, Trento)

Abstract format: Oral

About 30 bronze doors from the 11th-12th century represent the only surviving complex of large bronzes from the European Middle Ages. Apart three doors in Germany, one in Russia, one in Poland they are all located in Italy, from Sicily to Venice and Verona.

All doors are made of different copper alloys by the lost wax process: they could be cast as a whole, or individual metal fittings were attached to a wooden support. Some doors have inlays of various materials that allowed the coloured depiction of different biblical scenes or saints.

Through comprehensive material analyses of all doors and their wooden support on-site during the course of our project at the University of Salzburg, Austria, we pay particular attention to the characterisation of materials and techniques used in the construction of the doors and how they are implemented in the churches. Moreover, the focus is on the identification of the workshops and artists involved in the construction of the doors, and the wider context from their design to the final mounting of the doors at the church's entrances.

Methods used include 1) image based three-dimensional recording of the doors, documenting the relief structure and surface texture for further studies; 2) non-invasive chemical surface analyses to identify the alloys used; 3) dendrochronological analyses to identify and date the types of wood used, providing important information about restorations, additions and the use of local woods.

The data obtained expand our knowledge of the comprehensive complex of medieval large bronzes, which relate to each other and whose material communicates closely with the meaning of the pictorial representations. We reconstruct the production as well as the cooperation and networks of the individual craftsmen and patrons and thus shed light on an important chapter of medieval craft and art history.

676 INTEGRATING NEANDERTAL LEGACY: RECENT RESULTS OF MULTI- AND INTERDISCIPLINARY RESEARCH [PAM]

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Mihelic, Sanjin (Archaeological Museum in Zagreb) - Janković, Ivor (Institute for Anthropological Research, Zagreb) - Leskovar, Tamara (University of Ljubljana) - Romagnoli, Francesca (Universidad Autónoma de Madrid) - Rivals, Florent (Institut Català de Paleoecologia Humana i Evolució Social)

Session format: Regular session

Neandertals are a pan-European phenomenon and their skeletal remains or cultural evidence of their presence can be found in almost all European countries and further to the Western and possibly Central Asia and stem over a period of more than 200 000 years. This has resulted in vast amount of data on various aspects of their biological evolution and variability, as well as their behavioral aspects. Further, this data has been a subject of numerous studies from different scientific disciplines (i.e. archaeology, anthropology, genetics and so on). Thus, and especially in the light of new technical advancements (new studies using digital and virtual methods, ancient DNA from fossils and/or sediments and so on) allow a new insight into the past events. However, a truly integrated approach to the subject is still missing from Neandertal research.

The main aims of the session are to create a dialogue between scientists from different disciplines and using different approaches to the study of Neandertal legacy (biological and cultural) through presentation of new research and methods, thus promoting better understanding of the overall legacy of this Pleistocene population. Further, this dialogue will help to better evaluate the state of research and its potential for both new research, as well as for presentation and dissemination for general public.

The session is organized in partnership with the network of scholars gathered around COST Action 19141: Integrating Neandertal Heritage: From Past to Present (<https://www.cost.eu/actions/CA19141/#tabs|Name:overview>).

ABSTRACTS

1 UNREVEALING NEANDERTAL LIFESTYLES AT TEIXONERES CAVE: AN EXAMPLE OF A MULTI- AND INTERDISCIPLINARY APPROACH APPLIED TO A MIDDLE PALAEOLITHIC SITE

Abstract author(s): Rivals, Florent - Blasco, Ruth (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; Universitat Rovira i Virgili - URV, Departament d'Història i Història de l'Art) - Rufà, Anna (ICArE-HB – Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour, FCHS – Universidade do Algarve; Univ. Bordeaux, CNRS, MCC, PACEA, UMR 5199) - Rosell, Jordi (Universitat Rovira i Virgili - URV, Departament d'Història i Història de l'Art; Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA)

Abstract format: Oral

Recent advances in archaeological sciences, with the improvement of existing techniques or the conception of new ones, are fostering multi- and interdisciplinary studies for the study of past human behaviour. Multidisciplinary works on Middle Palaeolithic sites indicate a high capacity of Neandertals to adapt to different climatic and environmental conditions, which suggests a significant behavioural plasticity of this human species. In this work, we present the results from the Mousterian site of Teixoneres Cave (Moià, Barcelona, Spain). The geochronological, paleoecological and archaeological studies suggest a highly diverse and changing environment throughout MIS 3, with a combination (or alternation) between animals of temperate and cold environments. Throughout the sequence, Neandertal occupations changed progressively with a loss of territorial (and temporal) stability. In the lower unit IIIb, dated to ~ 50-90 ka, the groups settled intensely in the territory, while in the upper units (IIIa, IIb, IIa; ≤40 ka) the presence is characterised by short-term settlements that alternated with carnivore occupations, mainly by hyenas and cave bears. The recent discovery of human remains allowed for the inclusion of other disciplines, such as palaeoanthropology, proteomics and genetics. Experimental studies are currently developed to better understand the impact of carnivores at the site and the effect of taphonomic processes on the assemblages. Thus, Teixoneres Cave represents a key site to understand the evolution of the Neandertal lineage in the Northeast of the Iberian Peninsula, as well as the evolution of their subsistence strategies starting from the Middle Pleistocene until their disappearance in the MIS 3-2.

2 NEANDERTHALS' MOBILITY AND SITE OCCUPATION IN THE NORTH-EAST OF ITALY: COMBINING ZOOARCHAEOLOGY, DENTAL WEAR AND CEMENTOCHRONOLOGY TO INFER SEASONALITY

Abstract author(s): Livraghi, Alessandra (Universitat Rovira i Virgili - URV, Departament d'Història i Història de l'Art; Università degli Studi di Ferrara, Dipartimento degli Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche) - Rivals, Florent (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA; ICREA) - Rendu, William (CNRS - ArchaeoZOOlogy in Siberia and Central Asia - ZooSCAn, CNRS - IAET SB RAS International Research Laboratory, IRL2013) - Peresani, Marco (Università degli Studi di Ferrara, Dipartimento degli Studi Umanistici, Sezione di Scienze Preistoriche e Antropologiche)

Abstract format: Oral

The study of the settlement dynamics and the spatial temporal organization of the human groups during the Middle Palaeolithic has always been a challenging task. A valuable help is offered by the observation of the seasonal organization of the activities and the timing of site occupation, which both document the choice made by Neanderthals in managing the environmental resources. In this scenario, some valuable methods can be applied to teeth, such as the analysis of stable isotopes, the study of tooth eruption and replacement patterns, the dental micro- and mesowear analyses and the cementochronology technique.

With this aim, we integrated traditional zooarchaeological studies with dental wear analyses and cementochronology to molars from large game exploited by the human groups at De Nadale, San Bernardino and Fumane Caves (North-east of Italy). Focusing on the traces observable on the occlusal surface of the teeth and comparing them with samples of extant ungulates, dental wear analyses gave positive results in defining the extent of site occupation. Cementum analysis instead provides information about the seasonality thanks to the observation of the season at death of the game. With the support of recent multi-disciplinary studies on lithic industry, raw material procurement and intra-site spatial distribution the present contribution also gives significant information about the nature of the anthropogenic deposits themselves, characterizing the three sites as short-term occupation, probably linked to a specific season.

Moreover, the present study has been an important testing ground to check the reliability of a new multi-proxies technique that integrates tooth wear analyses and cementochronology. This combined approach allowed us to double-check the results and obtain higher resolution data, overcoming possible lack of information caused by the application of a single technique.

3 NATURAL VS ANTHROPOGENIC LAYERS AT THE LOS ALJEZARES MIDDLE PALAEOOLITHIC OPEN-AIR SITE FINGERPRINTED BY RARE EARTH ELEMENTS SIGNATURES

Abstract author(s): Cuevas-Gonzalez, Jaime (University of Alicante) - Gallelo, Gianni - Eixea, Aleix (University of Valencia) - Díez-Canseco, Davinia (University of Alicante)

Abstract format: Oral

Los Aljezares represents one of the few Middle Palaeolithic open-air sites in the Iberian Peninsula. The data provided from the excavated levels I and II, showed that this site probably was a passage point for Neanderthal population between Mediterranean coast and the interior of the Iberian Peninsula. The low archaeological record is pointing out to sporadic human activities related to lithic procurement, hunting and woodworking. However, the anthropogenic contribution in the development of these levels remains unclear. In order to understand the development history of the levels I and II and the anthropogenic signals in sediments, several samples were taken across six columns and from each section the sampling was carried out at different depths through 1m deep sections. Major, minor and trace elements including rare earth elements were determined employing XRF and ICP-MS. Results were processed employing multivariate statistics and cross-referenced with sedimentological and archaeological data to aid interpretation. The analysis highlights the anthropogenic or natural origin of the majority elements. A correlation between sedimentary layers, facies and REE distribution is shown through the levels. Moreover, an anomaly of phosphorus would be related to biogenic hydroxyapatite most likely linked to the human activity of managing biotic resources. The results show that REE provide interesting details regarding the levels history, and therefore help archaeologists to better understand the occupation, use and abandonment phases of the site.

4 NEANDERTALS, MODERN HUMANS, SAINTS: RECENT RESEARCH AT ROMUALD'S CAVE, ISTRIA, CROATIA

Abstract author(s): Jankovic, Ivor (Centre for Applied Bioanthropology, Institute for Anthropological Research; Department of Anthropology, University of Wyoming) - Komso, Darko (Archaeological Museum of Istria) - Radovic, Sinisa (Institute for Quaternary Palaeontology and Geology, Croatian Academy of Sciences and Arts) - Ahern, James (Department of Anthropology, University of Wyoming) - Becker, Rory (Department of Anthropology and Sociology, Eastern Oregon University) - Oberreiter, Victoria (Department of Evolutionary Anthropology, University of Vienna; Human Evolution and Archaeological Sciences, University of Vienna) - Vidas, Lia (Centre for Applied Bioanthropology, Institute for Anthropological Research) - Pinhasi, Ron (Department of Evolutionary Anthropology, University of Vienna; Human Evolution and Archaeological Sciences, University of Vienna)

Abstract format: Oral

Romuuld's cave in Istria is a well known archaeological site that was visited by many for different reasons. According to the legend, it was a place where St. Romuuld lived for several years around the year 1000, which caused numerous visits by pious inhabitants of the regions in the past. However, archaeological excavations provided evidence that the cave was visited since the Pleistocene. A Mousterian sequence testifies that the site was visited by Neandertals, while the upper layers yielded material from (most likely) two different phases of the Upper Palaeolithic. This is also supported by the recent discovery of the Palaeolithic cave paintings in the main channel of the cave. Here we present an overview of preliminary analysis of archaeological, zooarchaeological, anthropological, genomic, and other of data from the site that will provide a more detailed insight into the site use and behavior of the Pleistocene hunter-gatherers in the region. The research was supported by the Croatian Science Foundation (grants no. UIP-11-2013-7789 and IP-2019-04-7821, PI: Ivor Janković) and the University of Vienna "Mineralogical Preservation of the Human Biome from the Depth of Time (MINERVA)" Research Platform, (PI: Ron Pinhasi).

5 A CRITICAL VIEW OVER THE SEQUENCE OF TABUN CAVE, ISRAEL, AND ITS REFLECTION ON THE LEVANTINE MIDDLE PALEOLITHIC HOMININ POPULATIONS

Abstract author(s): Shimelmitz, Ron (University of Haifa) - Hershkovitz, Israel (Tel Aviv University) - Weinstein-Evron, Mina (University of Haifa)

Abstract format: Oral

Tabun Cave, Mount Carmel, Israel, constitutes a major landmark in the research of human evolution due to its exceptional long sequence and the presence of several hominin remains within the Middle Paleolithic layers, which are attributed to different hominin populations. Thus, it constitutes one of the key localities to address inter hominin group encounters long before occurring in Europe. The Middle Paleolithic sequence that is commonly addressed through a triple division of three superimposed phases, or type industries – 'Tabun D', 'Tabun C' and 'Tabun B' – is the result of the pioneering work of D.A.E. Garrod between 1929-1934. Even a century after, this "classical" sequence is still considered a reference yardstick for the onset and subsequent proliferation of the Levantine Middle Paleolithic. A. Jelinek's excavations at the site during 1967-1971, already demonstrated the high variations along the sequence and provided a wider perspective that combined behavioral and environmental proxies from layers paralleling Garrod's layers C and D. Nonetheless, high-resolution investigation to better grasp and reconstruct the complexity of hominin populations that roamed Mount Carmel during the Middle Paleolithic, addressing their behavioral patterns, episodes of migration and potential interactions, alongside reconstructing the environmental changes, is still much needed. In this presentation we use the results of our new multi-disciplinary excavation project at the upper part of the sequence, Tabun B, that was not excavated since the 1930s, alongside our on-going work on the materials of former excavations at Tabun, to re-evaluate the complexity of the regional Middle Paleolithic sequence and provide a critical review of what we know and do not know of the various hominin populations at this key site.

6 EVIDENCE OF FRESH WATER TURTLE REMAINS IN THE NEANDERTHAL SITE OF BAWA YAWAN ROCKSHELTER, WEST-CENTRAL ZAGROS MOUNTAINS, IRAN

Abstract author(s): Heydari-Guran, Saman (Neanderthal Museum)

Abstract format: Oral

Four seasons of systematic excavations in the Bawa Yawan rock shelter in the West-Central Zagros Mountains, led to the discovery of five geological layers (GH 1 to 5) with hominin occupations from the Middle to Late Paleolithic periods. The lower part of layer two to five in Bawa Yawan have been associated with Middle Paleolithic cultural materials including lithic artefacts, fauna and a Neanderthal tooth. In this section along with significant remains of a wide range of fauna have been found including various herbivores species such as Large and small mammals like Bovidae antilopinae, Ovis/Capra or Gazella and Equidae. Among these faunal remains a significance number of fresh-water turtle bones were found as well. These finds in the Bawa Yawan Rockshelter indicate that the Neanderthals beside their

substance strategies on terrestrial preys, have also focused on diverse food spectrum such as aquatic food sources in this part of the world.

7 THE PROBLEM WITH RECONSTRUCTIONS OF SYMBOLIC BEHAVIOUR IN THE PALAEOLITHIC; HOW DUALISTIC THINKING STILL CREATES PROBLEMS IN THE THEORETICAL FRAMEWORK

Abstract author(s): Kuipers, Karel (Faculty of Archaeology, Leiden; Erasmus School of Philosophy, Rotterdam) - Zwart, Hub (Erasmus School of Philosophy, Rotterdam) - Soressi, Marie (Faculty of Archaeology, Leiden)

Abstract format: Oral

In recent years, the concept of 'symbolic behaviour' has emerged as the defining property of 'humanness', effectively taking the place of 'modern behaviour' in the discussion about hominins' cognitive capacities. While some archaeologists do not give a clear definition of what exactly a 'symbol' is, typically archaeologists tend to favour a definition of the Symbol based on Charles Alexander Peirce's semiotic theory. Yet, if we consistently use his view on how the symbolic sign operates, it is practically impossible to prove whether an archaeological artefact from the Palaeolithic was a symbol or not. In a Peircean definition, identifying something as a symbol relies heavily on the role of the interpretant, a means to interpret a semiotic sign, which is something that is lacking while excavating the Palaeolithic. In an attempt to reconstruct signs from the Palaeolithic, the archaeologists that favour this framework in fact create a parallel sign which may, or may not be a correct reconstruction. In addition, recent studies have shown that animals may be able to exhibit behaviour that could be interpreted as symbolic when the same general standards are applied. These two issues make the concept a questionable marker for humanness, as well as a dubious tool for determining extinct hominins' cognitive capacities. This tension in the theoretical framework could be seen as symptomatic of the underlying dualistic notion that the Symbol would be something Cultural, in direct opposition to Nature.

8 THE NEANDERTAL TRAIL IN ISRAEL; FROM THE MEDITERRANEAN SEA TO THE SEA OF GALILEE

Abstract author(s): Been, Ella (Sports Therapy Department, Faculty of Health Professions, Ono Academic College) - Oz, Avishay (Israel Antiquities Authority) - Barzilai, Omry (Head of South district, Israel Antiquities Authority)

Abstract format: Oral

Israel is blessed with numerous Middle Palaeolithic sites. These were occupied by two types of hominins, Neandertals and Homo sapiens. Diagnostic fossil remains of the two species have been discovered in the Carmel Mountain, Jezreel valley and the Galilee in caves (Neandertals and H. sapiens) and open-air sites (Neandertals). The absolute chronology of the Israeli Middle Paleolithic fossils indicates that H. sapiens existed there between 170 and 90 ka and again from 55 ka on; Neandertals existed in that region between ca. 120 ka and ca. 55 ka. Moreover, the same area also contains human remains from much earlier periods in human evolution. Those include the remains of early Pleistocene hominin fossils (H. erectus sensu lato) from Ubeidiya.

The purpose of the Neandertal trail is to let the passenger/Hiker experience the lives of Neandertals in the Mediterranean woodland by walking between their main occupation sites (caves and open-air sites), water fountains, raw material outcrops, mountain trails, and natural vegetation. The trail will start at the famous Neandertal cave - Kebara, not far from the Mediterranean Sea shore, and will end at Amud cave near the Sea of Galilee. To enhance the understanding of the complexity of Neandertal's lives during the Middle Paleolithic in Israel the trail will pass through the major H. sapiens sites as well (Skhul, Qafzeh) and would include an important visit to the World Heritage Site - 'Nahal Meaorot'. As both Neandertals and H. sapiens have probably evolved from H. erectus sensu lato, the trail will include the major early Pleistocene sites including the open-air site of Ubeidiya.

In our talk, we will present the 70 kilometers trail which will be divided into five segments (one walking day per segment).

A. MICROSCOPIC INSIGHTS WHEN USE-WEAR IS NO MORE. RESULTS OF A MICRO-WEAR ANALYSIS ON CHÂTELPERRONIAN LITHICS FROM QUINÇAY CAVE, FRANCE

Abstract author(s): Leventi, Areti (Leiden University)

Abstract format: Poster

Micro-wear analysis aims to reconstruct what type of activities were performed on archaeological sites and how objects were used (1). By applying this method, our research focuses on exploring the function of Châtelperronian end scrapers from the cave site of Quinçay, in a context associated with the demise of late Neandertals approx. 40.000 years ago (2). Our main questions concern the function of these tools in relation to the impact of taphonomy on use-wear preservation within the stratigraphic sequence.

The micro-wear analysis on 40 Châtelperronian end scrapers from two stratigraphic layers showed use-wear traces on 17 artefacts interpreted as used for scraping hide and bone, whereas the rest of the lithics indicated wear traces related to taphonomic alterations affecting the natural surfaces of the end scrapers (3). We focus on these wear patterns from taphonomic alterations, while assessing the preservation of those artefacts within their stratigraphic context. With both low and high approaches, our final interpretation was conducted in comparison with experimental use-wear traces from a flint reference collection in Leiden University.

In conclusion and related to our research, we emphasize on the need to investigate the Châtelperronian assemblage with such a method, by means of exploring not only the function of these objects or the intra-site activities, but also the potential interconnectivity, and the taphonomic impact in such archaeological context.

B. A JOINT DIGITAL ARCHIVE FOR NEANDERTHAL RESEARCH

Abstract author(s): Riethus, Anna - Auffermann, Bärbel (Stiftung Neanderthal Museum)

Abstract format: Poster

The preservation of archaeological finds and fossils via 3D scanning plays an ever growing important role in today's archaeological research and heritage management. Having an easily accessible platform to upload, share and access international data on tools, fossils, art and comparative material both provides a valuable database for researchers worldwide as well as strengthens our international research community.

Neanderthal Museum in Mettmann, Germany, recognized this development very early on: already in the museum's first mission statement from 1996, the development of a digital database on the cultural heritage of Neanderthals is named as a central task. Its former database project NESPOS established an internationally accessible online database and collected anthropological and archaeological data related to Neanderthal research and human evolution, including 3D scans, CT scans, scanned literature, site information, images and tables.

Since February 2022, the new digital archive of Neanderthal museum continues this task: the archive aims to support researchers worldwide. Our archive specializes on Human fossils, Stone Age Artefacts and Ice Age Art. This poster presents the functions and opportunities of using the archive, highlights advantages for research, and invites the research community to share and expand the collections together.

677 EARLY CHRISTIANITY AND ITS IMPACT ON LIFE DURING THE RISE OF THE FIRST EAST CENTRAL AND NORTHERN EUROPEAN MONARCHIES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Wadył, Sławomir (University of Warsaw) - Szczepanik, Paweł (Nicolaus Copernicus University in Toruń) - Profantová, Nad'á (Institute of Archaeology of the Czech Academy of Sciences)

Session format: Regular session

Christianity had a huge impact on human life during the rise of the first European monarchies. It is indisputable. However the conversion to the new religion was not the same everywhere, and there are numerous premises that early medieval societies were partially pagan long after the conversion had been officially completed. Finally, Christianity dominated the lives of both peasants and the nobility.

Our goal is not to re-discuss the issue of the Christianization of individual regions, but to show the complexity of the phenomenon. We would like to discuss different aspects of the "human side" of early Christian times. Human stories, ranging from the stories of ordinary people to the nobility, give a different perspective.

We are looking for contributions that focus on different topics related to the 'difficult' time of transition. We are expecting a multidisciplinary approach, therefore we invite archaeologists, historians, anthropologists and those examining human remains. Questions could be related to the pace of Christianisation, cremation and inhumation graves in the time of transition; the oldest Christian graves; chamber graves; peasants and the nobility burials at the time of changes; regionalisation of funeral rites; mobility and diet.

Furthermore, we would like to establish a scientific community beyond EAA 2023 with a view to the exchange of knowledge and experiences.

1 CHRISTIAN PAGANS AND PAGAN CHRISTIANS FROM GREAT MORAVIA (CASE STUDY BASED ON FINDS FROM POHANSKO NEAR BŘECLAV)

Abstract author(s): Prichystalová, Renáta - Dresler, Petr - Zlámalová, Denisa (MUNI - Ústav archeologie a muzeologie) - Sládek, Vladimír (Department of Anthropology and Human Genetics, Charles University) - Kalová, Kateřina (MUNI - Ústav archeologie a muzeologie)

Abstract format: Oral

The period of the second half of the 9th and the beginning of the 10th century in the territory of historical Great Moravia was a time of religious eclecticism. This mixture of pre-Christian (Slavic, Indo-European) religious traditions and new principles brought by Christianity can be observed very well in the burial rites of the early Middle Ages in the area of Central Europe. Excellent study material are the church cemeteries and the so-called settlement dispersion burial grounds, which were investigated in the central fortified settlement of Pohansko near Břeclav. The question is what was the relationship between the population buried in the churches and the population buried in the burial grounds in the frame the settlement structures. The number of more than 480 graves discovered outside church cemeteries (559 graves have been discovered in church cemeteries to date) suggests that the relationship between the two populations was mutually tolerant. The conference paper will discuss how burial practices were organised in both populations and how these practices may have been influenced by religious, social, health or chronological aspects. Both classical archaeological, historical and religious approaches will be used, as well as findings from the natural sciences (anthropology, palaeopathology, genetics, stable isotope studies, etc.).

2 EVANGELIZATION ON SELECTED EXAMPLES OF FEMALE GRAVE EQUIPMENT FROM THE 9TH AND 10TH CENTURIES IN MORAVIA (CZECH REPUBLIC)

Abstract author(s): Kouril, Pavel (Archeologický ústav AV ČR, Brno, v. v. i.)

Abstract format: Oral

Findings of the most characteristic tangible evidence of the acceptance of the new faith and religiousness – crosses, are typical almost exclusively of female burials in the grave equipment; exclusively in the infans or juvenis category and not in the group of mature women. In the rural environment of the central regions of Great Moravia, simple cast lead cross pendants equipped with crosshatching decoration evoking the schematized body of the Savior are associated only with these age groups. They are incorporated into necklaces, the dominant element of which are crescent pendants. The crosses are synchronized with the closing decades of the 9th and early 10th centuries. We believe that their prototypes are the simple popular rhombic pendants – amulets passing through many cultures. It cannot be ruled out that in the period of emerging Christianity, their purpose could have been re-evaluated in a new religious context, so that they were tolerated by the church and could supplant classic cross pendants in personal use. It was most likely the crosshatched ornament that gave the pendants a hallmark of a Christian nature, even though they also continued to bear, at least in the initial phase, their original ethos – their original function and significance. As such, one of these primary functions could have been the support and preservation of human reproduction, thus explaining their exclusive occurrence in female graves, in the graves of sexually untouched girls. Exceptionally, a pigeon skeleton appears among other equipment with the buried; we don't know for sure if it is a coincidence or an intention, but the dove is associated with the act of baptism. It can be stated that the reasoning that members of the female sex were subjected to Christianization on a larger scale than the male part of the population may have a real basis.

3 LUDMILA. THE UNSURE PATH OF A PRINCESS TO SAINTHOOD. A CONSEQUENCE OF GENDER OR BAPTISM BY METHODIUS?

Abstract author(s): Profantová, Nadezda (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic)

Abstract format: Oral

Princess and later a widow Ludmila, the first Czech saint from the Přemyslid dynasty, was murdered in 921 A.D. in Tetin stronghold. I interpret her – as a legend stylised – biography in the context of the dual Christianization of Bohemia (845 A.D. in Regensburg and 882/3 A.D. in Moravia) and the intermezzo of the rich graves in the rivalry between Latin and Old Slavonic tradition. I discuss why she displaced her husband Bořivoj from the traditional role of the prince Christianizationator despite his baptism in Moravia by archbishop Methodius and how to read the wavering beginnings of her cult and its originally local character (Prague, the veil trial in Cosmas' Chronica Boemorum, the absence of churches dedicated to her in the 11th - 13th century). How conveniently did the gender stereotype cover the inappropriate origin of Czech Christianity, and how did gender quicken the overshadowing of her worship by the cult of St. Wenceslas (+935)?

4 THE BEGINNINGS OF INHUMATION IN THE PIAST DYNASTY STATE IN THE LIGHT OF RADIOCARBON DATING

Abstract author(s): Blaszczyk, Dariusz (Faculty of Archaeology, University of Warsaw)

Abstract format: Oral

One of the key issues concerning the Middle Ages in Poland are the beginnings of inhumation, i.e. the use of the so-called skeletal funeral ritual. From the very beginning of their presence on Polish lands, i.e. at least from the 5th - 6th centuries CE, the Slavs practiced the custom of burning their dead at the stake and then placing their remains in urns or pits in the ground. The introduction among the Slavs, but in different areas at different times, of the inhumation is most often associated with the adoption of Christianity. In the case of Poland, it took place, as evidenced by written sources, in the second half of the 10th century, around the year 966.

However, there is a discussion among archaeologists whether inhumation was introduced immediately after the baptism of Duke Mieszko I, or whether it became popular only in the times of his son Boleslav I the Brave. One of the ways to answer this question is to conduct radiocarbon dating of skeletons from the oldest (initial) phases of use of early Christian skeletal cemeteries. In the presentation, the results of ¹⁴C research obtained for individuals buried in elite chamber graves from the area of the early Piast dynasty state will be presented and discussed. Carrying out this type of research resulted from the assumption that in the first phase of Christianization, the new religion was accepted by social elites and only later it spread among the rest of society. Therefore, the oldest Christian burials should be sought among elite graves.

5 TO BE OR NOT TO BE A CHRISTIAN? BURIAL AND STATUS IN 11-12TH C. POMERANIA

Abstract author(s): Szczepanik, Pawel (Nicolaus Copernicus University in Torun) - Wadył, Sławomir (University of Warsaw)

Abstract format: Oral

Early medieval Pomerania is one of the most interesting, but still poorly recognised by archaeologists, areas of the Polish lands. The area was Christianised very early, as evidenced by the establishment of the bishopric of Kolobrzeg in 1000. However, this institution lasted only a few years. The formal Christianisation of Pomerania occurred in the first decades of 12th century after the missions of St. Otto of Bamberg.

The formal diversity of early medieval graves in Pomerania is very high. Despite apparent Christianization, cremation burials are still known, which was a direct manifestation of pagan beliefs. In addition to urn graves, there were also cremation graves of the Alt Käbelich type, referring to the idea of the house of the dead.

In addition, we also know of cremation and skeletal barrow graves, along with their unique type, which are quadrilateral objects of the Orzeszkowo type. From the area of Pomerania, we also know inhumation flat cemeteries. The diversity of graves in these cemeteries is enormous. One of the essential elements is diversity between modest, simple graves without equipment and rich chamber graves. The lasts are connected by scholars directly with Christianisation, but the reality was probably more complex.

The multitude of interpretative problems related to funerary rites mainly concerns the question of belonging the dead to the Christian religion or cultivating pagan traditions. The long persistence of pre-Christian beliefs in Pomerania and contacts with the Christian world through contacts with the peoples of the Baltic Sea and Eastern Europe are evident in the distinctiveness of Pomerania from the Piast's first state. Our proposed analysis of selected elements of Pomeranian funerary rites in the early Middle Ages will allow us to understand the process of the Christianisation of Pomerania and answer the question posed in the title.

6 THE CHRONOLOGY AND SOCIAL STRATA IN THE LIGHT OF RECENT STUDY OF BURROW K8 IN NOWY CHORÓW, POMERANIA

Abstract author(s): Nowosadzka, Ilona (University of Warsaw)

Abstract format: Oral

Early medieval burial sites of "Orzeszkowo" type are characteristic exclusively to Pomeranian area in Poland and its hallmarks are burrows with square shaped base including various stone constructions. They usually contain inhumation as well as cremation graves. The last research of the "Orzeszkowo" type site was conducted in Żydowo between 1967 and 1968 and chronology of the site was based solely on relative dating methods.

Our project is based on 2022 excavations of a site in Nowy Chorów, Słupsk county, and is focused on graves from a burrow K8.

In this paper I will present results of radiocarbon calibrations dating and stable isotopes of carbon and nitrogen method. Using collagen from five inhumation graves we were able to determine an absolute chronology of the burials and correlation between inhumation and cremation burials. Results of stable isotopes of carbon and nitrogen levels gave

us access to information about diet of people buried on the site, possibly giving an insight into the status and hierarchy of the early medieval population in the area.

A. CONVERSION AS RELIGIOUS EXPERIENCE OR REPRESENTATION: THE MEANING AND TRANSFORMATIONS OF CHRISTIAN MATERIAL CULTURE

Abstract author(s): Cechura, Martin (The Museum of West Bohemia)

Abstract format: Poster

The questions of the conversion of early medieval societies and the adoption of Christianity as the main religious system are among the major topics of historical sciences. In the current paper, I will focus on examples of material movable and immovable artefacts that are generally associated with the spread of the Christian faith, and attempt to outline alternative explanations for their occurrence and use. These include, for example, the occurrence of golden metal crosses, small lead crosses, and other objects found primarily in graves. Although these objects are primarily of religious significance, the circumstances of their use and deposition may have other significance. The next category of sources on which I will address identical questions are the earliest sacred buildings. Although churches are primarily intended for the celebration of worship, the circumstances of their foundation and construction may also - or primarily - have other reasons, such as representational ones. This dichotomy continues deep into the medieval and modern periods. However, contrary to the common interpretation that this is a survival of pre-Christian (or pagan) customs, it is much more likely to be a survival of primitive or simplistic Christianity.

678 METALS AND METALWORKING II - ARCHAOMETALLURGICAL NARRATIVES OF THE IRON AND MIDDLE AGES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Saage, Ragnar (University of Tartu) - Wärmländer, Sebastian (Stockholm University) - Neiss, Michael (Uppsala University) - Kmošek, Matěj (Institute of Archaeology of the Czech Academy of Sciences) - Kurisoo, Tuuli (Tallinn University)

Session format: Regular session

Archaeometallurgy is a multidisciplinary field where researchers from different fields, and different traditions, come together to answer questions related to ancient metals and metalworking. Most research in this field is based on metallurgical analysis, but studies involving e.g. experimental archaeology or isotope characterization for material provenancing are also common. In line with the overall theme of the 2023 EAA meeting, i.e. "Weaving Narratives", for this session we welcome full-length papers on all aspects of archaeometallurgy from the advent of the Iron Age to the end of the Middle Ages. Our aim is to focus on how metals and metalworking have contributed to the narratives of past societies. "Narratives" should here be interpreted in a broad sense, both as the stories that we create about the past, and as the stories that past societies have created themselves. As there are many ancient stories and myths involving metals and the transformation and creation of metals, we invite researchers that involve literary and ethnological sources in their research. As many analytical tools have become an inseparable part of modern research, we welcome papers focusing on new methods and interesting materials. Contributions from all geographic regions are welcome and we encourage students and young researchers to present their research projects.

ABSTRACTS

1 FOLD, TWIST, AND MAYBE DRAW - A TALE OF FORGING FINE, BASE-METAL WIRES

Abstract author(s): Mazis, Matasha (Technical University Darmstadt) - Klein, Matthias (Technical University Kaiserslautern)

Abstract format: Oral

Wire-making is an important development in metal technology. In antiquity, wires were used to mechanically fasten materials, form the basic shapes of fine tools, produce chain links, and create filiform ornaments and jewellery. There are accounts of wire production from the medieval period, particularly the important technological step of drawing solid metal into a thin wire, and we have examples of actual draw plates from Roman, European Iron Age, and medieval assemblages. To date much research has gone into the production of ancient wires that are made from precious metals. Few studies have examined the less-ductile base metals that were formed into wires in antiquity: copper alloys and iron are challenging materials for solid wire-drawing, to say the least. In particular, we lack information on the morphologies of ancient wires made from copper alloy or iron. In this paper, we look at the story of ancient wire production so far, previous experimental work on iron wire, and the metallography of several copper alloy wires from the Hellenistic period.

2 OBJECT BIOGRAPHIES OF EARLY MEDIEVAL GOLD BRacteATE PENDANTS: HOW THINGS FALL APART

Abstract author(s): Wicker, Nancy (University of Mississippi)

Abstract format: Oral

Many of the over one thousand extant early medieval Scandinavian gold bracteate pendants are marred in one way or another, showing evidence of pre- and post-depositional damage. Suspension loops may be torn or missing entirely; the gold disks bent, punctured, or fragmentary; and decoration including wire edge rims and repoussé-soldered-additions pulled loose, mutilated, or lost. Additionally, some broken pieces were repaired, which complicates our understanding of methods and materials to construct these objects as well as their use.

In this paper, I focus on studies of bracteate wear and tear to create narratives of how bracteates were used. First, I consider pendants that may have been worn throughout women's lives and then deposited in their graves. These examples often reveal a great deal of wear, which may or may not have been repaired. Carefully placed on the chest of a deceased elite woman, such examples apparently lay undisturbed until excavated archaeologically. I also examine bracteates discovered through settlement excavations and as single finds from agricultural and related activities or through avocational metal-detecting. These finds may reflect both pre- and post-depositional damage. For example, a bracteate that dropped to the ground due to a worn-out suspension loop may be further damaged underfoot soon after loss or any time up to its modern discovery. Methods for distinguishing gradual breakage of gold from long-term wear versus abrupt damage from violent action offer clues to understanding how things fall apart. The myriad conditions in which bracteates are found support diverse object biographies created by archaeologists.

3 ONE BONE AND ONE ANTLER PLATE USED TO DRAW SILVER WIRE IN MEDIEVAL SIGTUNA, SWEDEN

Abstract author(s): Wärmländer, Sebastian (Department of Archaeology and Classical Studies, Stockholm University; UCLA/Getty Conservation Programme, Cotsen Institute of Archaeology, UCLA)

Abstract format: Oral

Metal wire is in modern society produced by drawing metal rods through dies with tapered holes of increasingly smaller diameters. The origin of this wire-drawing technique is unclear. Current evidence suggest that it was invented somewhere in Europe during the 1st millennium AD, replacing earlier techniques for the manufacture of gold and silver wire such as hammering, block twisting, strip-twisting, strip-drawing, and roll-drawing. Clarifying the history of wire production technology is important not only to archaeometallurgists, but also to forensic scientists, as such understanding can help with authentication of antique jewelry with elements of gold or silver wire.

Here, we investigated two possible draw-plates from Old Sigtuna, Sweden's administrative centre during the 11th and 12th centuries. One plate is made from bone, and the other from antler. Both plates display multiple conical holes, and technical examination with SEM-EDS revealed that many of the holes contain silver residue. This shows that both plates were used for drawing silver wire. It is well known that the indigenous Saami population of Northern Scandinavia used (and still use) draw-plates of bone/antler to draw tin wire, which is used in traditional Saami textiles and which has become a signature element in Saami handicraft. Otherwise, draw-plates are typically made from iron, and used to draw wire of harder metals such as copper and silver. To our knowledge, this is the first finding of draw-plates of bone/antler being used to produce silver wire. As the studied bone and antler plate pre-date the Saami tradition of drawing tin wire with tools of bone/antler, the wire-making in Sigtuna may have inspired the later Saami technique.

4 IRON SÁMI - ON THE CONNECTION BETWEEN IRON PRODUCTION, ASBESTOS POTTERY, AND SAAMI LANGUAGE C. 2600 - 1400 CALBP FINLAND

Abstract author(s): Pesonen, Petro (Department of Geosciences and Geography, University of Helsinki; Archaeological Field Services, Finnish Heritage Agency) - Piha, Minerva (Faculty of Education and Arts, Nord University) - Ahola, Marja (Department of History, Culture and Communication, University of Oulu) - Holmqvist, Elisabeth (Department of Cultures, University of Helsinki)

Abstract format: Oral

In this paper we ask if it is possible to connect a special (pre)historical language group and a set of archaeological assemblages. Our focus is on the eastern Fennoscandia during the Late Bronze Age and Early Iron Age (c 2600-1400 calBP). During this period, the area saw the forming of ancestral forms of current Saami and Finnic languages as well as other related languages that have disappeared from the language map of Northern Europe long ago. Our study material consists of archaeological indications of new arrival in the form of asbestos-tempered Luukonsaari and Sirnihta potteries. These vessels sometimes show remains of iron production and are occasionally accompanied with iron production ovens, iron slag and small pieces of iron tools or tool preforms. Chemical compositions of slag, iron artefacts

and ceramics potentially used as crucibles were examined via XRF to characterise and compare iron production at the studied sites. Linguistic evidence is searched via the presence and timing of iron-related vocabulary in relevant Saami languages. We discuss our observations in the context of spreading and distribution of Saami languages and their relation to other Uralic languages of Northern Europe. A further line of discussion concerns the ethnographic accounts of ironworking in the north as well as the distribution of iron-related place names in the vicinity of archaeological sites.

5 OLD FINDS, NEW INTERPRETATIONS: MEDIEVAL BLACKSMITHING IN TARTU (ESTONIA) BASED ON THE ARCHAEOLOGICAL EXCAVATIONS OF THE OLD SMITH STREET

Abstract author(s): Blehner, Marie Anna - Saage, Ragnar (University of Tartu)

Abstract format: Oral

The first quarter of the 13th century was a time of change in Estonia:

the land was ravaged by The Northern Crusades, which – ending in 1227 – started the medieval period. Tartu was conquered in 1224 and a town was built there which became an important center for trading and crafts during the next centuries. Tartu has been archaeologically heavily excavated in the 20th and 21st century. During the old Smith street excavations between 1985 and 1990 ample evidence of metalworking was found and tentatively 28 furnace structures were discovered. Various authors have interpreted these furnaces both as iron smelting sites and as furnaces for non-ferrous metal processing, but sometimes the opinions presented contradict each other or are based on incomplete information. As a result, a new study has been undertaken the aim of which is to find out whether the mentioned furnaces were used mainly for iron smelting, forging, non-ferrous metal processing or some combination thereof. To study this, metallographic analysis, measurements with pXRF, and analysis of the distribution of hammer-scales have been applied. Out of the three, hammer-scale distribution analysis proved to be the most impactful, as it very clearly outlined the areas where forging was done. New and more precise AMS dates have also helped to get a better understanding of the metalworking site, as many of the dates fall into the very beginning of the medieval town. The results of this study give us a better understanding of the types of activities performed in medieval Tartu and highlight the importance of applying new study methods to old finds in order to fully understand the excavated material.

6 TRACES OF COPPERSMITH ACTIVITIES FROM LATE VIKING PERIOD DISCOVERED BENEATH THE NAVE OF STAVANGER CATHEDRAL: AN ARCHAEOLOGICAL INVESTIGATION

Abstract author(s): Gebremariam, Kidane (Museum of Archaeology, University of Stavanger - UiS)

Abstract format: Oral

Diverse non-burnt and vitrified clays, slag-like and corroded metal fragments, acquired from a recent archaeological excavation in the nave of the Stavanger Cathedral, were investigated. The specific type of the metallurgical activity and operational conditions required elucidations based on analyses of composition, morphology and microstructure. The results obtained from the limited selections of samples point to bronze casting at the site. There are strong indicators of operations linked to a coppersmith workshop. Different clay materials with very fine tempers were utilized. Some of them were subjected to low temperatures and the others to very high ones. Microscopic mineralogical and thermal analysis of the different sections of the vitrified clays show attainment of very high temperatures, up to 1100 °C and even beyond. The corroded bronze nodules and fragments investigated are found to be leaded bronze as cast. The microstructural analyses indicated the absence of granular patterns to imply heat treatment following cooling of the molten bronze. The globular and dendritic microstructural features revealed that the bronze materials did not go through hammering or annealing processes. Some signs of the use of cassiterite are identified. Melting from a copper ingot and processing along with cassiterite is a possibility. The combination of the metallurgical evidence of corroded bronze fragments, a possible use of tin source (cassiterite) and the identification of several fragments of diverse clay structures, interpretable as furnaces hearth walls, casting moulds and crucibles subjected to different temperatures, strengthen the claim that bronze production was going on the site. Typological and physicochemical characterizations revealed a one stage technology, not a two-stage technology (furnace based primary smelting followed by melting/refining in crucibles). The metallic and slag-like materials have also offered additional opportunities in terms of gaining insight into the alterations of metals during burials since they are found in corroded states.

7 ROUND AND OVAL BROOCHES IN THE LATE IRON AGE NORTHERN FENNOSCANDIA - THEIR MATERIALS AND USE

Abstract author(s): Puolakka, Hanna-Leena (University of Oulu)

Abstract format: Oral

Only around fifty round and oval brooches are known from the areas of northern Sweden, northern Finland and North-Western Russia from the Late Iron Age (ca. 800–1400 AD). These round and oval brooches are not as common in northern Fennoscandia as they are in the southern regions, and most of them are loose finds.

Of these, the eastern type oval brooches found from the area are sometimes made of an unusually coloured grey metal, and they have historically been described as being made of silver. In recent study and metallurgical analysis, it was found that this was not the case. What does the metal composition of these brooches tell us, and what did it mean to its users? Were these brooches forgeries, made to fool the people of the north and sold as silver? Or was the choice of metal deliberate, with perhaps the colour being the only thing that mattered? Did the color hold a special meaning or a purpose?

When describing metal objects and their value, we often turn to the contemporary knowledge and values, especially with precious metals. In this presentation I will take a novel angle in studying these rare brooch finds, their materials and use in the Late Iron Age northern Fennoscandia.

8 TRASH OR TREASURE? ARCHAOMETALLURGICAL INVESTIGATION OF PRODUCTION WASTE FROM CENTRAL AGGLOMERATION SITE NĚMČICE NAD HANOU (CZ)

Abstract author(s): Kmosek, Matej (Institute of Archaeology of the Czech Academy of Sciences)

Abstract format: Oral

Němčice nad Hanou is a singular settlement site operating as production and exchange supraregional centre. The site is situated in central Moravia (CZ) and had its peak during 3rd and 2nd century BC (LtC1-C2). Except of iron smelting, amber processing and glass production, plentiful evidence of copper-based metallurgy was found especially in a form of semi-finished products and rejects. It is mostly connected to (chain-)belt components, rings and bushings, but also sprues and copper ingots and casting spills are abundant. Through archaeometallurgical research by combination of methods (morphology, microscopy, surface pXRF, bulk ED-XRF analysis, metallography), production waste is investigated. That is uncovering precious information from finds unattractive at first glance, but substantial from perspective of manufacturing techniques of La Tène period, especially concerning casting moulds construction and mass vs. custom production. The metallurgical results are compared with archaeological evidence in the form of distribution maps of finds, which production is documented in Němčice. That is revealing production and distribution networks of La Tène period copper-based metallurgy in central Europe.

9 HANDICRAFT ARCHAEOLOGY BASED ON INTELLIGENT TECHNOLOGY (HABIT)

Abstract author(s): Neiß, Michael (HABIT)

Abstract format: Oral

Thanks to new possibilities in natural and digital sciences, Viking Age scholarship is experiencing an unparalleled renaissance in material research. But when it comes to the question of cultural transformation, some important aspects of ancient metal crafting remain to be explored. The Viking Age saw many “tribal” societies transform into heterogeneous Christian realms with urban centres which sometimes would grow further on into medieval towns. This transformation can be likened to interlocking chains of events that involved a plenitude of agents with different incentives. But the key contributions of the craftspeople to this ideological transformation have long been bound to eschew our grasp – due to some outdated dichotomies that need to be overcome! Although, the scholarly debate on the Viking Era urbanisation process is gravitating towards the significance of different groups of craftspeople, it still remains to be connected with the similarly important debate on urban centres as meeting points for ideologies and religions. What sets Viking Age towns apart from antedating central places is the ever increasing output in standardized utility goods that conveyed pictorial messages. Nowadays, artisans are envisioned as active creators of the cultural universe they inhabit. Many choices within the manufacturing process are culturally conditioned and express a mentality. Thus, an analysis of operational sequences might offer a key to the inner workings of Viking Period society. Certain changes in the artisan habitus that facilitated standardization were not likely caused by new selling opportunities alone, but also by the very gradual mental shifts that contributed to the emergence of a novel ideological superstructure that transformed Scandinavia into Christian realms. It is therefore imperative to analyze the interplay between this cultural change and the habitus of Viking Period artisans, their pictorial messages and how their output was received at different stages of the process.

10 A NEW PROJECT ON CASTING MOULDS FOR JEWELLERY AND DRESS ACCESSORIES FROM HEDEBY

Abstract author(s): Sirkin, Annika (Centre for Baltic and Scandinavian Archaeology)

Abstract format: Oral

This paper presents a post-doc project that just started on casting moulds for jewellery and dress accessories from the Viking Age trading port of Hedeby (Germany). Questions about chronology and relations to the hinterland of Hedeby are attempted to be answered not only on the basis of the moulds, but also on the basis of end products such as Borre style brooches. The aim of this project is to analyse the phenomenon of mass production and the manufacturing

techniques, organisation, trade and politics behind the craft. The hypothesis to be proven is that mass production in Hedeby only starts after the end of the production peak in the nearest trading port, Ribe.

A relatively new method used in this project is 3D scanning to create 3D models of the moulds. With the help of these models, it is possible to fit mould fragments and assign final products to moulds. In conjunction with the ongoing examination of moulds from Ribe (Denmark), the 3D models give the opportunity to form a database for future AI analyses, such as fully automated fittings.

11 LEARNING THE HARD WAY: 45 YEARS OF BLOOMERY IRON SMELTING EXPERIMENTS IN ESTONIA

Abstract author(s): Oks, Kristo - Saage, Ragnar (University of Tartu)

Abstract format: Oral

Bloomery iron smelting was practiced in Estonia from the 1st to early 15th century AD. However, only archaeological sources have remained from this time period. January 2023 marked the 45th anniversary of the first bloomery iron smelting experiment in Estonia, that was conducted indoors. Since then, many different experiments have been carried out, testing different iron ores and furnace types. There have been successful attempts to produce high-quality iron, but most have had disappointing results. But in science, failed experiments are often the most useful because we learn from our mistakes. Our goal is to give a comprehensive overview of the iron smelting experiments in Estonia, to discuss why some experiments have failed and what was learned from them, and to highlight the most successful attempts of iron smelting.

The experimentation can be divided into three periods. The earliest experiments, starting in 1978, were carried out by people with a strong background in engineering, but no practical knowledge of how bloomery iron smelting should be done. The second phase was led by Jüri Peets in the late 80's and 90's, who combined his background in chemistry and archaeology to produce some quantities of iron, but never had an experiment that could be called successful. The third iron smelting wave began a decade ago and used all the knowledge from previous experiments, but also incorporated a lot of experience from practical bloomery smelters from abroad. This combined result has been successful and has elevated the experiments to a completely new level, where the finer points of bloomery smelting can be tested and discussed.

12 HIDDEN RICHES IN THE EARLY MEDIEVAL RHINE DELTA: IRON WORKING AT MEROVINGIAN OEGSTGEEST

Abstract author(s): Heal, Tobias (Université de Liège, Centre Européen d'Archéométrie - CEA; Laboratoire Archéomatériaux et Prévision de l'Altération- LAPA-IRAMT UMR 7065 CNRS UO/UBFC/UPSac and LAPA-NIMBE UMR 3685 CEA CNRS, CEA Saclay) - Dissler, Alexandre - Mercier, Florence (Laboratoire Archéomatériaux et Prévision de l'Altération (LAPA-IRAMT UMR 7065 CNRS UO/UBFC/UPSac and LAPA-NIMBE UMR 3685 CEA CNRS, CEA Saclay) - Sarah, Guillaume (IRAMAT-Centre Ernest Babelon, UMR 7065, CNRS/Université d'Orléans) - Theuvs, Frans (Faculty of Archaeology, Leiden University)

Abstract format: Oral

Increased study of the Early Medieval Rhine Delta has forced a reappraisal of the socio-economic role of the region's rural settlements. Far from isolated backwaters, excavations at these sites have found extensive production and importation of quality goods, some from as far afield as the Mediterranean. However, many aspects of these sites remain poorly understood. This paper focuses on such a site: the 6th-8th century settlement at Oegstgeest (Netherlands) and is particularly interested in the remains of iron working. This study was undertaken with two goals in mind: understanding the techniques and materials available at Oegstgeest and elucidating networks of iron supply available to the settlement. This information was then used to consider the role of the settlement within its wider society. Thirteen iron finds and twenty-three slags were studied using optical microscopy, SEM-EDX and Raman spectrometry. This established the use of quality iron, advanced forging techniques like welding and quenching as well as tandem iron and copper working. The slag inclusions in the iron samples underwent additional analysis to establish the origin of the iron used at the site. This found Swabia in Southern Germany as a likely source for three finds, with a fourth showing a potential match with South-Eastern Belgium. However most samples did not match any of the considered sources of iron. In summary, not only were quality materials and skilled smiths present at Oegstgeest but the settlement fully benefited from its integration in local and regional trade networks.

13

OUTSIDE THE CENTERS, EVIDENCE OF HOUSEHOLD LEVEL AVAR IRON SMELTING IN RESOURCE RICH AREAS

Abstract author(s): Mlyniec, Michael (International Archaeological Research Institute Inc)

Abstract format: Oral

Questions surrounding scale of production have always been of great interest to archaeologists, particularly in relation to metallurgy. Large scale production centers are far more likely to be identified, while evidence of small-scale production is much more elusive. Understanding household level production is particularly important in studying nomadic communities and understanding how people interact with the landscapes they travel through. Much is known about large scale Early Medieval Avar metallurgical production centers at Zamárdi, Kaposvár, and Margyartád-Kéri határta dűlő (Górnóri, 2011) however evidence of household production by nomadic groups is also emerging. Small-scale Avar smelting was identified during Rescue Archaeological Research on the Route of the Main Gas Pipeline from the Bulgarian Border up to the Hungarian Border Section 4 on the Municipalities of Kanjiža, Szenta, and Ada.

Excavations at Site 122 located in the Pannonian Basin near the modern town of Kanjiža uncovered evidence of household iron production. A single bloom iron furnace was discovered with a late 7th to mid-8th century Avar house structure. Slag, iron bloom fragments and vitrified furnace lining were recovered in the area. This furnace was constructed in the same style as the furnaces excavated at Zamárdi, however, it appears to have only been used once with evidence pointing to a single discrete smelting event and the subsequent destruction of the furnace. The area surrounding the site contains rich bog iron ore deposits, the identification of which would provide a source of high-quality iron ore for smelting. The knowledge and identification of these resources would provide an opportunity to produce metal for the basic needs of the transitory peoples as they continued to travel across the landscape away from the more established centers.

MANUFACTURING TECHNOLOGIES OF DOUBLE-EDGED SWORDS FROM THE 10TH CENTURY CARPATHIAN BASIN - DIFFERENCES, SIMILARITIES AND UNIQUE CASES

Abstract author(s): Tóth, Boglárka (Pázmány Péter Catholic University) - Langó, Péter (Eötvös Loránd Research Network, Research Centre for the Humanities, Institute of Archaeology) - Barkóczy, Péter (University of Miskolc, Institute of Physical Metallurgy, Metalforming and Nanotechnology) - Török, Béla (University of Miskolc, Institute of Metallurgy)

Abstract format: Oral

In 2020 an extensive research has started in collaboration with associates of the Pázmány Péter Catholic University and the Archaeometallurgical Research Group of the University of Miskolc (ARGUM). During the research, twenty double-edged swords were examined by using archaeometrical-archaeometallurgical methods. The primary aims of the research from archaeometrical point of view were the investigation of the microstructure of the sword's blades, the determination and comparison of the manufacturing technologies.

After the preparation, the microstructures of the samples were examined with Zeiss Axiolmager optical microscope (OM; max. 1000X magnification) and Zeiss EVO MA10 scanning electron microscope equipped with EDAX energy dispersive spectroscopy (SEM-EDS). The investigations were completed with Vickers-microhardness test (Instron Wolpert microhardness tester) and, in some cases, energy dispersive X-ray fluorescence spectrometry (ED-XRF – Oxford Instrument X-MET8000).

Among the examined samples interesting manufacturing technologies and microstructures can be distinguished. The most common microstructures, which were found in every blade, are ferrite and pearlite. However, martensite and bainite were also detected but only in few cases. Based on the results of the examinations, it was possible to determine the frequently used forging technologies (e.g. hot forging, folding; forge welding etc.) and reconstruct the different manufacturing steps, moreover, some special cases were observed as well.

This present talk seeks to highlight the differences and similarities among the examined blades, especially the unique cases.

15

ON THE CUSP OF CONVERSION: IRON AGE AND EARLY MEDIEVAL METALWORKING FROM NORTH ROSCOMMON, IRELAND

Abstract author(s): O Maolduin, Ros (Archaeological Management Solutions) - Rondelez, Paul (Independent) - Campbell, Eve (Archaeological Management Solutions)

Abstract format: Oral

In 434 AD St Patrick is reputed to have come to the west of Ireland and to have been instrumental in the conversion of its peoples from pagan beliefs to Christianity. The exact timing and processes of conversion are often hotly debated but it is apparent that the societal and technological impacts that accompanied it were profound. On a recent infra-

structure project, the N5 Ballaghaderreen to Scramoge Road Project, Co Roscommon, archaeological sites dating to either side of and occupying the time of this conversion were uncovered, including one that St Patrick is reputed to have personally established. Metalworking, including iron smelting and smithing, and fine metal casting, was identified on habitation and Ecclesiastical sites, in seemingly more remote locations and in funerary contexts. This paper will consider the technological aspects revealed and the changing societal context in which it was carried out and weave this together with literary allusions to the period.

16 **CUTTING INTO NARRATIVES. ROMAN EMPIRE (II AND III CENTURY AD AND BEYOND) ATTITUDE TOWARDS WEAPONRY**

Abstract author(s): Boragno, Lorenzo (Ecole Française de Rome)

Abstract format: Oral

“Quis fuit, horrendos primus qui protulit enses?” (Tibullus Elegiae 1.10).

As ancient historians started looking at warfare as a natural phenomenon and a specifically human phenomenon, weapons became something that defined and distinguished humans from feral beasts. As Tibullus said, we turned into weapons what was originally intended to defend ourselves from beasts.

While the iconic weapons of the Republican times were rightfully considered by Roman authors as important factor of Rome success during the earlier years of its stunning expansion, later historians, both Greek and Latin, went largely silent on the topic, offering very few information on this subject.

While from a modern point of view, technological superiority is a vital winning factor, this idea appears to be flimsy and not fully established in Roman strategic culture.

With a specific focus on the teleological dimension of these narratives, the study proposes to explore how weapons were conceptualized and entered in the public and cultural debate. From the II century AD, inheriting from a military tradition well rooted in the Republican history, Roman military leaders increasingly invested their communication in highlighting military reforms, competent technical decisions, and sporadically addressed technological superiority.

From Hadrian's reforms, mirrored by Arrian's detailed treaty, through Herodian's anxiety about the loss of Roman military superiority, to Dexippus' focus on valour over equipment in his recently recovered pages of his work, the study aims to open a debate on this sometimes neglected subject to appreciate how the Empire conceptualised warfare and technology.

Focusing on historiographical narratives, and using the analytic tool offered by the modern concept of “strategic culture” (here intended as), the present contribution aims to cut into narratives to highlight the “dramatic role” of weapons and armours in historiographical accounts.

A. DATING ARCHAEOLOGICAL BRONZES: MULTIPLE-SCAN VOLTAMMETRY (VIMP)

Abstract author(s): Mödlinger, Marianne - Osete Cortina, Laura (Universität Innsbruck) - Doménech-Carbó, Antonio (University of Valencia) - Doménech-Carbó, Maria Teresa (Universitat Politècnica de València)

Abstract format: Poster

The application of a multiple-scan strategy to nanosamples taken from cross-sections of Bronze Age arms and armour, the surface from Bronze Age tools, as well as recent and Roman coins using the voltammetry of immobilized microparticles (VIMP) methodology is described. The voltammetric responses in contact with aqueous acetate buffer can be attributed to the reduction of cuprite with variable degree of compaction and crystallinity revealing significant differences in the gradient of such properties with depth. The voltammetry study of both metallographic and surface samples of the bronze objects shows correlation with the age of the objects, respectively the period of their deposition. We discuss also (potential) influence of different factors on the VIMP measurements, such as deposition context (soil, water), chemical composition of the copper alloys, and microstructural features (as-cast, annealed, work-hardened), and how to overcome these issues. Specific attention will be paid to the results of currently ongoing research on over 250 bronze objects from the Copper Age to the Modern Era.

B. HOW WERE THEY BENT? THE ART OF DISTORTING A HALLSTATT C PERIOD IRON SWORD

Abstract author(s): Joosten, Ineke (Cultural Heritage Agency of the Netherlands) - van Eijk, Lambert (TU Delft) - van der Vaart-Verschoof, Sasja (National Museum of Antiquities)

Abstract format: Poster

The Chieftain's burial of Oss is one of the richest prehistoric graves in the Netherlands. Dating the Early Iron Age Hallstatt C period, it was uncovered in 1933 during reclamation work on the heath near Oss. Among the grave goods were a bronze situla and an iron Mindelheimsword with gold-inlaid handle. Later excavation revealed that the bronze urn and all it contained had been buried in an already ancient Bronze Age barrow, and then covered with one of the

largest barrows in Northwest Europe, 53 m in diameter. The artifacts were deposited in the bronze vessel and the curled-up sword was placed hilt-down in the middle of the bucket. Given the massive size of the barrow the mourners could have elected to leave the exceptional sword straight and deposit it alongside the bronze urn, but instead the invested time and effort into bending it round. Why? In addition to the sword from Oss, several other bent swords dating to the Hallstatt C period have been found in the Netherlands, for example the sword-grave of Heythuizen and the wagon-grave of Wijchen. The question remains, how were these swords bent, by brute force or by heating and hammering? Could this have been done at the place of burial or was it necessary to bring the sword to a smithy? The aim of this research is to study the technology of bending and folding an iron sword, preferentially by non-invasive methods. Therefore, the structure and composition of the metal (and the corrosion) will be studied through neutron imaging. Fortunately, we could sample one of the swords which enables us to perform metallography to study the structure and composition of the metal and corrosion. The results of neutron imaging will be compared to the metal structure seen in the cross-sections.

682 A GLIMPSE INTO THE INEQUALITIES ALONG THE MARGINS: SURPLUS ECONOMY, TECHNOLOGICAL CHANGE AND TRADE IN THE WESTERN MEDITERRANEAN HINTERLANDS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Nieto-Espinet, Ariadna - Prats, Georgina - Tarongi, Miguel (University of Lleida) - Rovira, Núria (Université Paul Valéry-Montpellier 3; ASM-UMR5140) - Hanot, Pauline (Muséum national d'histoire naturelle - MNHN; CNRS-UMR 7179 MECADEV)

Session format: Regular session

Europe experienced numerous crucial cultural and economic changes between the Late Neolithic and the Iron Age (c. 3200 BC – 150 BC). The specific case of agriculture and animal husbandry in the Western Mediterranean saw a shift from a more diversified and local production to a more specialised and intensive production supplying food products to an emerging demand from Mediterranean markets. This flourishing intra-Mediterranean and cross-European connectivity accelerated the consolidation of social inequalities that were already emerging in earlier periods and progressively oriented local economies towards the potential of new markets. How did the hinterland economies adapt to demographic growth and cope with the increasing pressure on resources? To what extent did the Mediterranean network include the “marginal” hinterland?

The term “marginal” in archaeology mainly serves to refer to lands with low productive capacity far from the central Mediterranean axes of communication. There is a consensus that these areas were remote and passive, the last to be incorporated into more integrated and interconnected economic systems. But was this really the case?

We want to investigate how the economies of the marginal inland areas adapted and integrated into the Mediterranean markets. How is it possible to observe the outset of these more intense and interconnected economies through archaeological indicators? This session will prioritise contributions that identify the processes of intensification of production and the emergence of social inequality from a diachronic and multi-scale approach so as to address the following topics:

- Incorporation of new technological innovations into agricultural production.
- Management of new cultivation areas and the emergence of specialised production.
- Changes in storage capacity and surplus accumulation.
- Changes in the mobility of people, animals and goods between territories.
- Incorporation of animals into agricultural work and transport of goods.
- Interdisciplinary contributions integrating archaeological, bioarchaeological, ethnographic and biochemical data.

ABSTRACTS

1 MARGINS AND CENTER AREAS IN IBERIAN AGRICULTURAL PRODUCTION DURING THE FIRST MILLENNIUM BC

Abstract author(s): Alonso, Natàlia (University of Lleida) - Pérez-Jordà, Guillem (University of València)

Abstract format: Oral

The Iberian Peninsula is located at the western end of the Mediterranean. At the beginning of the first millennium some areas in the south and east were integrated into the commercial system that operated in this sea. Products of agricultural origin occupied a prominent place in this commercial traffic, and in Iberia certain areas focused on cereals and others on the cultivation of fruit trees and the production of wine and oil.

The coastal regions are the first to be integrated into this market, although there are significant differences among the areas. At the same time, there are inland territories that remained on the margins of this commercial activity and certain areas that were integrated to varying degrees. Some of them were limited to receiving products, while others were also producers. Factors such as the existence of communication routes to facilitate the transport of these products, which are generally heavy and bulky, conditioned the socioeconomic characteristics of each territory.

In this paper we will present different realities in coastal and inland areas, mainly in Catalonia, in the Valencian Country, as well as in Andalusia and Extremadura, defining how the new crops were introduced in each of these areas and at the same time defining the degree of integration of each territory in this new commercial reality.

2 BETWEEN LAND AND SEA. PLANT USES BETWEEN „CENTRES“ AND „MARGINS“ IN CATALONIA AND SOUTH-EASTERN FRANCE DURING THE LATE IRON AGE

Abstract author(s): Rovira, Núria (University Paul Valéry-Montpellier 3) - Alonso, Natàlia (Universitat de Lleida)

Abstract format: Oral

The late Iron Age (c. 500-150 BCE) is a crucial period for Mediterranean societies with regard to agricultural production. Archaeobotany is witnessing a wave of new plant species arriving on the Mediterranean coasts with Phoenician, Greek and Etruscan settlers and/or merchants. However, the arrival of new plants does not mean that they will be grown locally, or even adopted for any use by local communities.

In some cases, their cultivation and adoption, from both an economic and socio-cultural point of view, may take time or even not occur at all. If the evolutionary vision considers any new idea, practice and/or product as a witness of human progress and, therefore, fundamentally good to take, we must not ignore the ability to choose that individuals or societies possess. Who decides on these adoptions or refusals? Are they the cause of inequalities within the same society or neighboring communities?

We intend to reflect on these different issues through an approach, both theoretical and practical, using carpological data and different production instruments (millstones, agricultural tools, etc.) found on archaeological sites in Catalonia and south-eastern France. Our main objective is to determine whether these new plant products are also accompanied by new agricultural and consumption practices, as well as to trace their expansion inland. We will also try to identify whether any changes are observed on the different social levels (household, community, extra-community) and between genders.

3 MARGINAL OR CONNECTED HINTERLANDS? A NEW VISION THROUGH ARCHAEOLOGICAL LEGUMES IN THE WESTERN MEDITERRANEAN DURING THE 1ST MILLENNIUM BC

Abstract author(s): Tarongi, Miguel (Universitat de Lleida)

Abstract format: Oral

During the first millennium BC, the Phoenician and Greek colonization processes in the western Mediterranean stimulated important cultural and economic transformations in the local societies. Previous studies show that these changes are observable through the archaeological record.

Archaeobotanical studies have been especially revealing in this sense since they have allowed us to identify important changes in agricultural production. The introduction of new types of crops, such as arboriculture; as well as new technologies such as iron agricultural tools are some of the main indicators of these economic changes. Although the study of agricultural changes linked to colonial influences has already been widely studied, the processes of incorporation of leguminous plants into the diet of local communities are still largely unknown. Although the possible introduction of chickpea cultivation has been noted, it seems that other species appear or increase exponentially in the archaeobotanical record in relation to these contacts.

Interestingly, archaeological seed concentrations of these legume species appear in almost all cases on indigenous sites, while in the colonies these legumes are scarce or even non-existent. This fact has motivated a detailed analysis of the different sites where these seeds are found, in order to establish whether there is a direct or indirect relationship between these indigenous and colonial societies. On the other hand, information from indigenous areas located in the more marginal inland areas, where these legumes seem to be scarcer, has also been compared and integrated. In this paper we will discuss whether these changes in agricultural production were due to the internal needs of indigenous societies or if they were a consequence of colonial influences.

4 SCALES OF SOCIAL INEQUALITY FROM WESTERN CATALONIAN PLAIN (1ST MILLENNIUM BCE): DEMOGRAPHIC GROWTH, AGRICULTURAL EXTENSIFICATION AND LAND STRUGGLES

Abstract author(s): Prats, Georgina - Nieto-Espinet, Ariadna (Prehistoric Research Group - GIP-UdL, Department of History, University of Lleida)

Abstract format: Oral

Between the First and the Second Iron Ages (VIII - I c. BCE), crucial urban planning and architectural changes are documented in the inland valleys of Western Catalonia, characterised by the appearance of the first fortifications with a complex urban structure (VIII c. BCE). These changes occurred prematurely concerning the rest of the neighbouring territories closer to the coastal areas. These first manifestations of power became generalised and consolidated throughout the territory of NE Iberia during the Middle Iron Age (VI-V c. BCE), characterised by a hierarchical system of occupation implemented and the emergence of what Iberian Culture. But was this visible process of territorialisation and the emergence of social differences in these inland areas accompanied by economic intensification before the arrival of the Romans?

Establishing a strategic balance between increasing demographic pressure on resources, the struggle for access to land, and the intensification of economies in response to increasingly integrated markets, may have represented a significant challenge for Iron Age human communities. Likely, increased pressure on arable land is linked to the extensification of agricultural fields, requiring more labour and using draught animals. At the same time, this would reduce grazing areas, encouraging the intensification of livestock management.

Which archaeological proxies probably stem from changes in the productive structure (more extensive) and social organisation (more hierarchical)? How can surplus storage capacity be integrated into the context of social inequalities? What about the workforce? How did livestock farming adapt to these changes locally? Can changes be observed in the management and format of species intended for agricultural work (cattle) and the light transport (equids) of goods at this time? To answer these questions, we will focus on the integrated analysis of the data provided by studying the capacities of storage systems and archaeozoology for the hinterland areas of Western Catalonia.

5 EXPLORING THE INTENSIFICATION PROCESSES OF PROTOHISTORIC HINTERLAND ECONOMIES (EBRO VALLEY): A VIEW FROM THE ANALYSIS OF THE EQUID BONE STRUCTURE

Abstract author(s): HANOT, Pauline (UMR 7179 MECADEV, CNRS/MNHN) - Pallardó Latorre, África - Torra Burgués, Ada - Sánchez Salguero, Xavier - Villalba Mata, Daniel (Departament de Ciència Animal, Universitat de Lleida) - Nieto-Espinet, Ariadna (Grup d'Investigació Prehistòrica, Departament d'Història, Universitat de Lleida)

Abstract format: Oral

Of all the animals to have been domesticated, few influenced human societies as much as equids. By facilitating long-distance transport, they revolutionized mobility, facilitated trades and the spread of cultures. Moreover, they have taken on significant symbolic dimensions in many societies and contributed to transform warfare and agricultural practices. However, whereas particular attention has been drawn to their significance for religion and expression of high-status identity, their economical role is often poorly known.

The Ebro valley, in Northeast Iberia, has yielded high amounts of equid bone remains, providing evidence of continuous and intensive interactions between equids and human populations since the Late Neolithic. Although they are supposed to have contributed to the development of protohistoric economies in the hinterlands regions, their role and management is badly understood. Various archaeological indicators suggest incipient processes of economic intensification in the inland valleys of Northeast Iberia prior to the arrival of Romans. If so, this could have translated into important changes in the uses, management and improvement of species destined for agricultural production and the light transport of goods, such as equids. In that respect, the skeleton is perfectly suited for studying the uses and lifestyle conditions of past animals, as bone structure is an excellent marker of function. Through the CENTAURO project, we investigate equid bone remains from 18 sites in the Ebro Valley dating from the Late Neolithic to the Roman period. Bone structure is characterized both internally and externally to assess the impact of selective pressures and mechanical loadings experienced during individuals' lifespan. Together with zooarchaeological data, our results allow to depict the morphological and functional diversity of the equids from the Ebro Valley to better understand how they have been shaped by human management and have in turn impacted agricultural and economic systems of these inland areas.

6 FROM THE IRON AGE TO HIGH MIDDLE AGES: FOOD CONSUMPTION AND ANIMAL HUSBANDRY FROM INLAND CATALONIA (ST. ESTEVE D'OLIU, LLEIDA)

Abstract author(s): Cajtak, Karl - Asensio Vilaro, David (Universitat de Barcelona) - Cardona, Ramon (Centre d'Estudis Lacetans) - Morer de Llorens, Jordi (Mon IberRocs) - Nadal, Jordi (Universitat de Barcelona) - Valenzuela-Lamas, Silvia (CSIC-IMF)

Abstract format: Oral

Recently, there's been an impressive and concerted effort to analyse the zooarchaeological material of North-Eastern Iberia. This research has shown a strong correlation between changes in the political structure and the livestock production systems (Nieto-Espinet et al. 2021), but much remains to be done for inland areas of Catalunya such as the Solsonès. This paper seeks to characterize changes in animal production and food consumption in the longue durée as well as the evolution of the relationship between people, livestock, and their environment for Sant Esteve d'Olius in the Solsonès. This archaeological site had two main phases of occupation, one during the Iron Age (5-3th c. BCE), and one in the High Middle Ages (10-12th c. CE), both with an important number of excavated structures for cereal storage (silos). This limits the risks of mixed deposits between chronologies. In addition, new radiocarbon dating has been generated and is presented here. When contextualized with other archaeological and zooarchaeological data from North-Eastern Iberia, the zooarchaeological results suggest that the socio-political context had a major influence on animal production and consumption in this area. Moreover, it helps us better understand the potential changes and/or ruptures between the Iron Age and the Middle Ages, as well as potential differences between inland and coastal areas. These changes seem to be confirmed by archaeological excavations and paleoenvironmental data of the site, which do show important changes in the land use and territorial occupation between the Iron Age and the Middle Ages, from a secondary urban nucleus and cereal storage centre to a mostly rural and ecclesiastical settlement after the depopulation of the Late Antiquity.

684 FORENSIC ARCHAEOLOGY IN EUROPE: CONTESTING THE PRESENT

Session theme: 6. Contested Pasts & Presents

Session organisers: Harte, Aidan (Munster Archaeology) - Groen, Mike (Netherlands Forensic Institute - NFI, Ministry of Justice and Security)

Session format: Regular session

Forensic Archaeology can no longer be considered a new sub-discipline and has been successfully applied to criminal and humanitarian cases across the globe.

This session seeks to explore the application of forensic archaeology as a key method in identifying evidence and addressing contested narratives. Of course, all criminal investigations involve contested versions of events, but can archaeology offer definitive proof, recognisable and acceptable by Europe's legal systems? The standard of proof in criminal prosecutions can vary across jurisdictions and the admissibility of archaeological evidence is a critical factor in the application of Forensic archaeology. However, as with other sectors within archaeology, the standards applied, and even recognised accreditation for the specialism, are far from universal.

It is hoped that this will appeal to those practicing forensic archaeology, either in a consultant role or as part of an institution and highlight the commonalities in practice across Europe. It will also be of interest for those archaeologists who have worked in the forensic sector in the past, who may want to know more about the different difficulties encountered and the potential of forensic archaeology as a specialism in the future.

ABSTRACTS

1 UKRAINE: MULTIDISCIPLINARY FORENSIC TEAM APPROACH DURING THE WAR

Abstract author(s): Benthous, Sven (European Training Center DVI & Forensic Sciences ETAF) - Guerra, Rosario (ETAF)

Abstract format: Oral

Shortly after the outbreak of war in Ukraine, the European Training Center of Disaster Victim Identification and Active Forensic Sciences (ETAF) signed a request for support from the Ukrainian Minister of Justice. ETAF's mission is to actively support forensic and medical colleagues in Ukraine with material and training on international standards for victim documentation and identification. Unlike after the conflicts in the former Yugoslavia, this time the international community has already started investigations during the war. The International Criminal Court in The Hague has, for the first time in history, sent a Joint Investigation Team to the scene of the conflict.

In this context, ETAF has initiated a Joint Forensic Support Group to deliver best forensic practise. Within the framework of the Joint Forensic Support Group, the Ministry of Justice, the Ministry of Health and the Secret Service of

Ukraine are involved. After a factfinding mission to Kyiv, Borodianka, Irpin and Bucha at the beginning of 2022, we were able to train the first forensic colleagues from Kyiv in a multidisciplinary way in Miskolc Hungary. This humanitarian course on victim identification was made possible by the Federal Police Hungary. Specialists from Forensic Archaeology, Forensic Anthropology, Forensic Odontology, Law Enforcement, DNA, Forensic Pathology and CSI worked together as a team. International standards (Interpol, Berkely, Minnesota Protocol) were put in context with the criminal procedure code of Ukraine. In the area of recovery and documentation, forensic archaeology is of particular importance.

There must be a paradigm shift in international forensic workflow. Less competition and more scientific teamwork in multidisciplinary teams. Forensic archaeology is an essential team player which needs to fit in international binding standards. (www.etaf-dvi.org)

2 IMPLEMENTING FORENSIC ARCHEOLOGY WITHIN THE SWEDISH POLICE AUTHORITY

Abstract author(s): Hagberg, Christoffer - Olsson, Jesper - Alfsdotter, Clara (Swedish Police Authority)

Abstract format: Oral

The first effort to develop Forensic Archaeology (FA) within the Swedish Police Authority (SPA) took place in the 1990's when a "workgroup for Forensic Archaeology" (AFFA) was created. Since then, FA initiatives have been intermittent at the SPA until the National Forensic Center (NFC) created a first full-time position in FA in 2018. Within the SPA, NFC is responsible for defining and assuring the quality of all forensic processes, now including that of Forensic Archaeology. As of 2023, three forensic archaeologists are employed with development and implementation of FA.

This paper will discuss the implementation of archaeological methods in the Swedish forensic work. That includes the benefits and challenges of working within a governmental authority, such as balancing academic in- and output, development of the forensic process, navigating the Swedish judicial system and seeing to the investigative needs of FA. A major current effort of the Swedish FA work lies in defining the role of FA within the Police authority and to communicate the potential for FA to other police employees in order to maximize the potential of FA and collaborations.

3 THE SIGNIFICANCE OF ARCHAEOLOGICAL EVIDENCE IN UNRAVELING THE MYSTERY OF THE TREBLINKA CAMPS' INDIVIDUAL BURIALS

Abstract author(s): Drath, Joanna (Pomeranian Medical University) - Jarzęcka-Stąporek, Joanna (Museum of the Second World War) - Lisman, Dagmara - Parafiniuk, Mirosław - Ossowski, Andrzej (Pomeranian Medical University)

Abstract format: Oral

Among the Treblinka extermination and labor camp's crew were employed German SS- soldiers and indigenous collaborators, the Wachmanschaften, who outnumbered the Germans, but were extremely loyal and obedient to the Nazis. Because of their mercilessness, they were essential in the execution of the "Operation Reinhard" plan. Since they served as mediators between the captives and the camp's commanding crew, they were subjected to any form of prisoner resistance. It is unknown what happened to their bodies if they died during their service.

During an archaeological survey in 2019 in the area of Treblinka museum, a row of individual burials was uncovered. By the command of the National Institute of Remembrance's prosecutor, a team of experts including archaeologists, anthropologists, medical pathologists and geneticists, were appointed to identify the bodies of the people buried in those graves.

The anthropological analysis revealed that all the deceased were biologically males, the majority of them were under 30 at the time of death, they had European ancestry, and their stature ranged from 157 to 176 cm. On two skeletons were visible perimortem trauma lesions. However, the most crucial in the investigation was the analysis performed by an archaeologist. The results show that the people buried in the graves were interred with honors, which included placing funeral wreaths on top of the coffins. The graves were plundered at certain times after the funerals. From the artefacts found in the skeletons' proximity we may infer, that in the graves were buried guards working in Treblinka extermination and labor camps. Combining the results obtained from all the engaged experts, it is possible to deduce the provenance of the buried victims and their possible cause and manner of death.

4 THE MASS GRAVE PROJECT. USING ACTUALISTIC TAPHONOMIC EXPERIMENTS TO ADVANCE THE INVESTIGATION OF MASS GRAVES

Abstract author(s): Mickleburgh, Hayley (ACASA, University of Amsterdam; Forensic Anthropology Center, Texas State University) - Wescott, Daniel - Gocha, Timothy (Forensic Anthropology Center, Texas State University) - Doro, Kennedy (Department of Environmental Sciences, University of Toledo) - Procopio, Noemi (School of Natural Sciences, University of Central Lancashire) - Gino, Sarah (Department of Health Sciences, Università del Piemonte Orientale) - Ogbanga, Nengi (Forensic Science Research Group, Faculty of Health and Life Sciences, Northumbria University) - Kootker, Lisette (Geology & Geochemistry Cluster, Vrije Universiteit; Co van Ledden Hulsebosch Centre) - Robinson, Eugene (Forensic Anthropology Center, Texas State University)

Abstract format: Oral

Mass graves are complex and extremely challenging archaeological deposits to investigate. They often have high rates of disarticulation and commingling of bodies and personal items. Devising appropriate excavation, documentation and sampling strategies requires deep understanding of how taphonomic processes can modify the archaeological record. Yet, mass grave taphonomy is poorly understood and we have little grip on the variables determining the preservation and spatial patterns of the remains. Actualistic taphonomic experiments can help to refine and test methods used during the investigation of mass graves.

The 'Mass Grave Project' is an interdisciplinary experiment simulating primary and secondary clandestine mass and single graves with whole body donors at the Forensic Anthropology Center, Texas State University. It aims to contribute to the development, testing, and validation of scientific methods for mass grave investigation, by increasing current knowledge and understanding of mass grave taphonomy. The project includes four core research areas: [1] detection and location, [2] (3D) documentation and sampling, [3] biomolecular and biochemical methods supporting human identification, and [4] training – including excavation training and the development of a Virtual Reality training tool. Specific objectives include, among others: refining remote and ground-based detection methods and validating 3D documentation techniques, studying differential decomposition and its impact on evidence, investigating biomolecular and microbial biomarkers for more precise and accurate PMI and age-at-death estimation, studying DNA degradation and transfer in mass graves, and evaluating diagenesis and alteration of isotopic signatures of different human tissues. The project further aims to generate recommendations for documentation, sampling and analysis protocols.

We report on the results of the first phase of the project – the burial and subsequent excavation of the primary graves (May 2021–November 2022)– and discuss their significance in relation to standardization of practice in forensic archaeology and the role of archaeological evidence in different legal systems.

5 FORENSIC ARCHAEOLOGY AND THE HIERARCHY OF PROPOSITIONS: CONFRONTING EQUIFINALITY AND UNDERDETERMINATION IN THE EVALUATION OF ARCHAEOLOGICALLY-DERIVED FORENSIC EVIDENCE

Abstract author(s): Randolph-Quinney, Patrick (Forensic Science Research Group, Northumbria University; Centre for the Exploration of the Deep Human Journey, University of the Witwatersrand) - Basu, Nabanita (Forensic Science Research Group, Northumbria University)

Abstract format: Oral

Forensic Archaeology is the specialist application of archaeological techniques to the search and recovery of evidential material from major crime scenes, and is often but not always related to buried human remains. The discipline has borrowed much in terms of methods of practice from mainstream archaeology, but has yet to develop a significant theoretical basis to deal with evidence evaluation, and in particular competing behavioural forensic hypotheses. This lack of theoretical rigour is perplexing given that forensic archaeology routinely deals with activity level, and sometimes offence level, interpretations of human action in the recent (forensic) past. Perreault in 'The Quality of the Archaeological Record' (2019) has argued that the interpretive processes borrowed by archaeologists operate over very short time scales – so much so that most of them are in fact irremediably affected by both underdetermination and equifinality in the archaeological record. Forensic archaeology on the other hand may circumvent some of these issues in the evaluation and interpretation of past events. This paper will address some of the operational and evidential issues that forensic archaeologists encounter, with particular reference to the hierarchy of forensic propositions, and the explicit use of likelihood ratio and Bayes theorem in evaluating competing behavioural hypotheses. Wider applications to mainstream (non-forensic) archaeology, particularly ways of confronting underdetermination and equifinality in the archaeological record will be discussed.

6 FALLING BETWEEN THREE STOOLS: THE PLACE OF FORENSIC ARCHAEOLOGY WITHIN AN IRISH LEGISLATIVE FRAMEWORK

Abstract author(s): McCullagh, Niamh (-) - Harte, Aidan (Munster Archaeology)

Abstract format: Oral

Ireland has clear procedures in dealing with criminal cases, although Forensic Archaeologists are not part of the Civil Service. Procedures surrounding burials of archaeological interest are also well defined within the National Monuments Acts. Issues occur where unrecorded burials may have criminal or humanitarian implications. A new Institutional Burials Bill has been enacted to deal with such cases. However, it seems unlikely that this will be applicable in every case, thus allowing many searches or forensic excavations to fall between these three legislative pillars.

Following the formation of the Irish state in 1922, responsibility for maternity care of 'unmarried mothers' was given to the catholic church. Thousands of women and children were placed in institutional care from the 1920s to the 1990s. In recent years the Irish state has been confronted with the significant trauma experienced by many who were confined to these institutions known as 'Mother and Baby Homes'. Many infant children died in these institutions and their burials are largely unrecorded and unaccounted for. There are also concerns about cause of death of these infants, in addition to issues around illegal adoption and medical trials.

The question of unrecorded, unregistered, and inappropriate infant burials in such institutions has become a pressing issue in the 21st century. In several cases, it has brought into focus the conflicting interests of three distinct groups - developers wishing to build at these sites, the state which was responsible for the regulation of these institutions, and the survivors whose children may have been buried in these places.

This paper will look specifically at one of these sites and the role that forensic archaeology has played and can play in the investigation of burials at this location. What role, if any, can forensic archaeologists play in mediating this contested past?

7 WHO MAKES THE LAW? THE IMPACT OF LEGAL SYSTEMS ON THE FIELD OF FORENSIC ARCHAEOLOGY

Abstract author(s): Hayes, Hayley (University of Exeter)

Abstract format: Oral

Forensic archaeologists play a key role in criminal investigations, particularly when searching for unknown graves. Criminal procedures place an important part of forensic investigations, forensic archaeologists locating and excavating gravesites and human remains need to have an awareness and understanding of the current regulations used within the country they are working. However, for those who have never studied or know little about them regulations can be confusing. What is accepted as standard practice in one country may not be in another, which can cause evidence to become inadmissible in court. In most cases archaeologists will be expected to abide by the legal system of the country they are in, but in certain cases, such as mass grave investigations are carried out under the laws of the International Criminal Court. The majority of mass graves are the result of conflict and/or human rights atrocities. Despite the implementation of international laws, conflict and the creation of mass graves are still recurring issues today. Whilst crimes under the International Criminal Court are not affected by the statute of limitations, criminal cases worked under domestic law are. Should archaeologists abide by the laws set out within individual nations, or should countries adopt a standard set of procedures to create a more comparable dataset? Therefore, this paper sets out to discuss the differences between domestic and international legal systems, the effect they have on practicing forensic archaeologists.

8 EXPLORING THE GROWING IMPORTANCE OF FORENSIC GEOARCHAEOLOGY IN ITALY

Abstract author(s): Barone, Pier Matteo (American University of Rome; Forensic Geoscience Italy; ANCRIM) - Di Maggio, Rosa Maria (Forensic Geoscience Italy) - Mesturini, Silvia (GORS)

Abstract format: Oral

Forensic geoarchaeology provides a comprehensive and interdisciplinary approach to the investigation of crime scenes. This field combines the techniques and methods of archaeology, geology, geophysics and remote sensing to provide a more complete picture of the events that took place at a site. Forensic geoarchaeologists can provide not only valuable information about the context and environment of a crime scene, but it also can help reconstructing the events that took place as well as collecting relevant information about mispers.

Moreover, the use of geospatial technologies and the analysis of evidence together with a vast range of scientific methods and techniques helps forensic geoarchaeologists to provide compelling and reliable evidence useful in court and by law enforcement agencies.

Despite the fact that there are still some Italian reticence in recognizing forensic geoarchaeology as a fundamental discipline at the crime scene, it is crucial and it is now growing in Italy thanks to the decision of the Italian Standards Organization (UNI) to regulate it together with other criminalistic expertises. Here will be presented not only the path that allowed to get there but also a comparison with the UK experience.

685 RE-INTEGRATING THE ENVIRONMENTAL ARCHAEOLOGY OF EUROPE'S 'WET' AND 'DRY' NEOLITHIC LANDSCAPES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Ballantyne, Rachel (School of Archaeology, University of Oxford) - Bishop, Rosie (Arkeologisk Museum, Universitetet i Stavanger) - Isaakidou, Valasia (School of Archaeology, University of Oxford) - Marinova, Elena (Laboratory for Archaeobotany, Baden-Württemberg Cultural Heritage State Office, Geienhofen-Hemmenhofen)

Session format: Regular session

The environmental archaeology of the European Neolithic is dominated by findings from 'dryland' sites, where biological remains consist of charred plant remains, and faunal and human skeletal remains, enhanced by a growing wealth of biomolecular techniques. 'Wetland' Neolithic settlements (e.g., on lakeshores) are increasingly documented from across Europe and preserve a rich diversity of fragile, uncharred organic remains of plants, from foodstuffs to faeces, alongside rapidly deposited and exceptionally well-preserved charred plant remains and (macro to micro) fauna. To what extent do the contrasts in preservation between these 'dry' and 'wet' Neolithics offer different perspectives on biodiversity, land use and food-related activity?

Papers are invited on 'wet' and/or 'dry' case studies from across Europe, with the goal of this session being to re-integrate and re-contextualise these elements of the European Neolithic. A regional perspective is encouraged in addition to site-specific papers. In this effort, we seek to explore and build on emerging results from the ERC synergy 'EXPLO' project, focused on lakeshore sites in south-east Europe, where significant ecofactual assemblages shed new light on Europe's early farming communities.

ABSTRACTS

1 REHYDRATING SUBSISTENCE PRACTICES AND LIFEWAYS IN THE EUROPEAN NEOLITHIC

Abstract author(s): Ballantyne, Rachel (School of Archaeology, University of Oxford) - de Vareilles, Anne (Historic England) - Rajkovača, Vida (Cambridge Archaeological Unit, University of Cambridge) - Bogaard, Amy (School of Archaeology, University of Oxford)

Abstract format: Oral

The adoption of farming practices in Neolithic Europe, spanning over 2500 years and over 3500 km, transcended diverse topographies, soils, climates, and cultures. In this paper, we seek to 'rehydrate' Neolithic subsistence practices and lifeways with two case studies from the very different archaeological records of eastern Albania and eastern England. In southeast Europe, clear occupation deposits occur at open sites (tells and flat-extended settlements); in northwest Europe food-related refuse is ambiguous and often mixed with 'ritual' remains at pit clusters, monuments and other open sites. Whilst exceptionally preserved waterlogged assemblages occur episodically throughout Europe, we should build from these to illuminate the once widespread freshwater habitats of pools, streams, rivers, lakes, marshes and mires.

At the pile-dwelling settlement of Lin, Lake Ohrid, Albania, (mid/late 6th millennium BC), the EXPLO project has recovered a rich diversity of uncharred and charred plant remains preserved by waterlogging. By building from baseline regional data for topography and soils, a broad distribution of different utilised habitats can be shown moving away from the lakeshore. The results support the growing picture of southeast European Neolithic farming communities that made significant use of wild resources. Inspired by the first case study, we then reconsider Neolithic subsistence patterns and habitats in the Fens of eastern England. This was an extensively 'wet' riverine Neolithic landscape, but the charred plant and animal bone assemblages come from dryland gravel and sand terraces. The emerging results emphasise that watery places and wild resources were integral to early farming communities.

2 CHARRED VERSUS UNCHARRED PLANT REMAINS: HOW WATERLOGGED PRESERVATION CONDITIONS DETERMINE OUR UNDERSTANDING OF SETTLEMENT ECONOMY AND ENVIRONMENT

Abstract author(s): Steiner, Bigna - Akeret, Örne - Kühn, Marlu (Integrative Prehistory and Archeological Science - IPAS) - Vandorpe, Patricia (Institut Català d'Arqueologia Clàssica - ICAC; Integrative Prehistory and Archeological Science - IPAS)

Abstract format: Oral

Circum-alpine Neolithic lakeshore settlements (ca. 4200-2400 BCE) are well-known for their excellent conditions of preservation. Their resulting waterlogged, uncharred organic macrofossils (i.e. seeds and fruits) can provide a detailed insight into past economic strategies and the local environment. Settlements located in the hinterland of the lakeshores generally stem from dry mineral soils where only charred plant macrofossils are preserved. Accordingly, the density of plant macrofossils is much lower and the number of plant taxa is reduced. A comparison between the plant spectra of dry and wetland sites is therefore hardly possible. In this paper, we will focus on an often less explored aspect of the lakeshore settlements: the charred plant assemblage. How does our interpretation of crop plants and environment of a settlement change if we only take the charred plant assemblage into account? How does this compare to contemporary less well-preserved sites? To examine this in more detail, we present a few case studies from Swiss lakeshore settlements with excellent preservation.

3 RECONSTRUCTING MIDDLE NEOLITHIC AGRICULTURE IN THE NORTH-WESTERN MEDITERRANEAN BASED ON WATERLOGGED AND CHARRED PLANT REMAINS

Abstract author(s): Follmann, Franziska (Freie Universität Berlin) - Antolín, Ferran (Deutsches Archäologisches Institut; Universität Basel) - Jacomet, Stefanie - Jesus, Ana (Universität Basel) - Soteras, Raül (Deutsches Archäologisches Institut) - Steiner, Bigna (Universität Basel)

Abstract format: Oral

Neolithic agricultural dynamics in the north-western Mediterranean had a strong focus on free-threshing cereals, which was different from other areas in Europe where glume wheats were prioritized from the Early Neolithic onwards. The current state of research suggests that in southern France free-threshing wheat was the most important crop before an economic threshold around 4000 BC, when glume wheat gained in importance. To what extent the shift in the crop spectrum represents a local or a supra-regional phenomenon has not yet been clarified due to a lack of well-dated and well-preserved sites.

The two Middle Neolithic sites of Les Bagnoles (end of 5th to beginning of 4th millennium BC, France) and Isolino Virginia (end of 6th to beginning of 4th millennium BC, Italy) have yielded waterlogged deposits with excellently preserved plant remains. Our data provides information about the development of the local agriculture at these two sites. The results are being compared to those from dryland sites to generate a broader picture of the regional development in the northwestern Mediterranean as well as to understand the impact of wet and dry preservation on the data.

4 COMPARING THE 'WET' AND 'DRY' NEOLITHIC IN WESTERN MACEDONIA, GREECE: THE ARCHAEOBOTANY OF DISPILIO AND AVGI

Abstract author(s): Ergun, Muge (School of Archaeology, Oxford University) - Gkatzogia, Eugenia - Kotsachristou, Dimitra (Department of Archaeology, Aristotle University) - Margaritis, Evi (Science and Technology in Archaeology and Culture Research Center, The Cyprus Institute) - Bogaard, Amy (School of Archaeology, Oxford University)

Abstract format: Oral

Dispilio is a long-lived lakeshore settlement occupied from the mid-6th millennium BCE on the southern shore of Lake Orestias in Kastoria, western Macedonia. It is so far one of the earliest lakeside settlements known in southern Europe, and it is unique in the Aegean due to its exceptional waterlogged preservation conditions. Recent archaeobotanical research at Dispilio, within the interdisciplinary ERC-Synergy project EXPLOR (Exploring the dynamics and causes of prehistoric land use in the cradle of European farming), investigates newly excavated waterlogged plant assemblages comprising both uncharred and charred material. The goal is to gain a more holistic understanding of the agricultural practices and diverse foodways of the 'mature Neolithic' in this upland setting. The nearby Neolithic dryland site of Avgi, overlapping chronologically with Dispilio, provides the opportunity to compare the 'wet' and 'dry' Neolithic more widely in western Greek Macedonia. This paper presents new archaeobotanical results from both sites and considers their wider implications for our understanding of social and ecological processes in Neolithic lifeways.

5 FARMING AT THE EDGE – NEOLITHIC AGRICULTURAL EVIDENCE FROM THE NESS OF BRODGAR, ORKNEY

Abstract author(s): Timpany, Scott - Haston, Sarah Jane (University of the Highlands and Islands) - Bishop, Rosie (University of Stavanger) - Card, Nick (University of the Highlands and Islands)

Abstract format: Oral

This paper presents the first results of the investigation of archaeobotanical remains recovered during the excavation of the monumental Neolithic ‘house’ site at the Ness of Brodgar, located within the Orkney World Heritage Site. This study focuses on deposits sampled and processed from two of the excavated buildings, Structure 8 and Structure 14. Radiocarbon dates indicate the buildings were in use and contemporary during the Late Neolithic around 3005-2915 cal BCE to 2990-2910 cal BCE for Structure 8 and 3025-2905 cal BCE and 3015-2910 cal BCE for Structure 14. Archaeobotanical information from these structures provides insights into the agricultural practices, foraging activity and fuel resources used by Orcadian Neolithic communities. A charred cereal grain assemblage demonstrates a reliance on naked barley with hints that emmer wheat may also have been cultivated. The wild taxa recovered suggest the use of peat or turf as the primary fuel source with an abundance of heathland species and charcoal comprised predominantly of Ericaceae fragments. The collection of wild foodstuffs is evidenced from recovered pips of crab apple and hazel nutshells, providing important insights for exploring foraging activity as a part of Neolithic life in the north. The archaeobotanical data from the Ness of Brodgar will be explored in the context of other Neolithic archaeobotanical evidence from the Northern Isles and mainland Scotland. The impact of this community on the landscape will also be discussed against the backdrop of larger environmental change occurring during the Orcadian Neolithic using recent palynological studies from nearby wetland sites.

6 WILD WETLANDS AND DOMESTIC DRYLANDS? A METHOD FOR INTEGRATING WET AND DRYLAND DATASETS ASSOCIATED WITH THE EAST ANGLIAN FENS, UK

Abstract author(s): Huisman, Floor (University College Dublin)

Abstract format: Oral

Well-preserved environmental remains from wetland areas are of great palaeoecological significance, providing information on biodiversity, land-use, past economies and subsistence, and allowing detailed reconstructions of human-environment interaction. These rich and relatively rare wetland datasets contrast with often less-well preserved remains from dryland sites, which are more common in European Neolithic archaeology. The higher levels of preservation of wetland datasets frequently result in different sampling strategies and recovery methods, making it even more difficult to compare environmental remains from wet and dry contexts. These differences have not only led to a disciplinary divide between wetland and dryland archaeology, but also to a dichotomy between wetland and dryland sites and communities. For a more detailed and complete understanding of the European Neolithic, we need to consider both wet and dryland sites. Yet how can we integrate the often disparate datasets from these sites?

This paper will present a regional case study focussing on the former East Anglian Fens, once the UK’s largest low-lying wetland area, and its dryland surroundings to demonstrate one way in which divergent ecofactual datasets may be compared. This study recorded and compared the presence and absence of various food remains (wild and domestic plants and animals) from sites in wet and dry environments to reconstruct human-environment interaction through time. Focussing on the Neolithic and Bronze Age (c. 4000-800 BC), some results of this comparative analysis will be presented, alongside a pilot study assessing how differential preservation and various sampling and recovery methods on wet and dryland sites affected the observed patterns. I will reflect on the method’s strengths and weaknesses and briefly discuss its potential applicability in other European Neolithic settings, aiming to demonstrate that the integration of diverse datasets can provide a more holistic understanding of Neolithic life.

7 THE WET AND THE DRY IN THE NEOLITHIC OF GREECE: DISENTANGLING TAPHONOMY, SITE LOCATION AND STRATEGIES OF ANIMAL EXPLOITATION

Abstract author(s): Isaakidou, Valasia (University of Oxford) - Halstead, Paul (University of Sheffield) - Bogaard, Amy (University of Oxford)

Abstract format: Oral

According to current understanding of the Neolithic of Greece, the animal component of land use and diet was based overwhelmingly on the classic farmyard animals – domestic sheep, cattle, goats and pigs – and on mixed exploitation of the three domestic ruminant species for a mixture of meat, milk and (in the case of cattle) traction. This understanding is based on information from a range of site types (open-air settlements of both tell and flat-extended form; caves/rock-shelters) variously situated in riverside or coastal locations or at a distance from such water bodies, while the evidence of animal exploitation exhibits some differences apparently related to both site type and site location. Hitherto, however, faunal data have been derived only from dry depositional environments in which discarded animal

remains were more or less subject to attrition by trampling and scavenging, causing uncertainty as to the severity of losses to fragile categories (e.g., young animals). Drawing on faunal data from late Neolithic (late 6th-mid 5th millennium BCE) waterlogged deposits from the lake-side settlement of Dispilio, NW Greece (collected in the context of the EXPLo project), and on comparative (mainly unpublished) data from 'dry' sites of similar date, this presentation will seek to disentangle differences in zooarchaeological preservation from variation in strategies of hunting and herding.

Preliminary results confirm that, as expected, the Dispilio faunal assemblage is better preserved than its counterparts at contemporary 'dry' sites, but also suggest that its distinctive characteristics in terms of both domestic and wild animal exploitation (e.g., rarity of cattle and pigs; relative abundance of roe deer) are attributable less to its taphonomic history and its upland lakeside location per se than to the nature of human activity at the site.

8 A WATERLOGGED SITE THAT BECAME DRY - IS THIS COMPARABLE WITH DRYLAND SITES? A CASE STUDY FROM SOUTHWESTERN GERMANY

Abstract author(s): Marinova, Elena (Laboratory for Archaeobotany, Baden-Württemberg State Office for Cultural Heritage) - Rosenfelder, Marc (Institute of Prehistory and Archaeology of the Middle Ages, Eberhard Karls University Tübingen) - Nelle, Oliver (Tree ring laboratory Baden-Württemberg State Office for Cultural Heritage) - Ebersbach, Renate (Wetland Archaeology Unit, Baden-Württemberg State Office for Cultural Heritage)

Abstract format: Oral

The settlement of Iznang Unter den Eichen, an early Horgen lakeshore settlement situated on Lake Constance, is characterised by a 1,4 m thick cultural layer with several burning horizons containing numerous well-preserved finds deposited within a few decades (dendro dates 3274 and 3250 BCE). Remarkably, it is located at 396 meters above sea level and thus above the wet shore zone in which wetland sites are preserved today, hence this site represents a former wetland site that became dry. Taking as a starting point this unique constellation, we consider here the overall available archaeobotanical information from 52 samples from different layers and areas and evaluate its taphonomy by considering in detail the depositional context, presence/absence of burning horizons, concentration and diversity of the archaeobotanical assemblages, and specific find categories such as chaff remains, small fragile seeds/fruits etc. The characterisation of this dataset allows to assess the composition of the archaeobotanical assemblages in a quantitative way and will be useful in the future in achieving comparisons with the archaeobotanical assemblages from dryland deposits in the wider region.

9 DROWNING AS THEIR CHANCE TO LAST: EXPLORING THE AGRICULTURAL POTENTIAL OF SUBMERGED NEOLITHIC WETLAND CREEK SYSTEMS

Abstract author(s): Smuk, Ana (Groningen Institute of Archaeology - GIA, Faculty of Arts, University of Groningen) - Schepers, Mans (Centre for Landscape Studies, University of Groningen) - Madella, Marco (Department of Humanities and ICREA, Universitat Pompeu Fabra) - Maurer, Arnoud - Komrij, Tirsia (Groningen Institute of Archaeology - GIA, Faculty of Arts, University of Groningen) - Bakker, Michael (Centre for Landscape Studies, University of Groningen) - Kubiak-Martens, Lucy (Biological Archaeology & Environmental Reconstruction, BIAx Consult) - Familetto, Elena - Cohen, Kim (Department of Physical Geography, Faculty of Geosciences, Utrecht University of Utrecht) - Huisman, Hans (Groningen Institute of Archaeology - GIA, Faculty of Arts, University of Groningen)

Abstract format: Oral

Preservation conditions are a major factor to consider when trying to explain data produced in archaeobotanical analyses. The Finding Suitable Grounds project seeks to identify areas within wetland landscapes that may have been used for arable farming in the Early Neolithic of the Netherlands (5th millennium BCE). The upper part of these farming grounds must have been drained for large parts of the year, which created unfavorable conditions for the preservations of organic remains, compared to more generally waterlogged surroundings. We apply a multi-proxy approach (macro remains, phytoliths, pollen, micro charcoal, micromorphology, sedimentology, geochemistry, and 14C dating) to cored material from a submerged wetland creek system found buried under younger sediments after geophysical mapping. The coring campaign sampled three major landscape elements: creek channels, creek banks (natural levees), and floodbasins. The wetland character of the landscape is sedimentologically evident, but how wet the banks zones in the landscape were throughout a typical year, and what this implies for exploitation suitability, is unestablished.

This contribution will present the investigation results, taking into account differential preservation conditions, as well as the complex formation processes associated with fluvial environments with an open connection to the coast. Following this discussion, we will address the question of whether we should indeed strive for a re-integration of wet and dry landscapes. Simultaneously, we acknowledge that substantial ecosystem variability is to be expected within both of these broad categories and this variability is potentially meaningful from an exploitation potential perspective. The plant remains identified from the wetland areas enable an exquisite opportunity to reconstruct the broader landscape

and its attributes prior to anthropogenic activities, also the human imprints caused by land-use, as parts of the landscape could have offered drier conditions for cultivation within the wetlands.

10 IN THE LAKE AND ON THE SHORE: UNCOVERING NEOLITHIC FOOD PRODUCTION AND LAND USE AT PLOČA, MIČOV GRAD, LAKE OHRID

Abstract author(s): Holguin, Amy (School of Archaeology, University of Oxford) - van Vugt, Lieveke (Institute of Plant Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Brechbühl, Sarah (Institute of Plant Sciences, University of Bern) - Charles, Mike (School of Archaeology, University of Oxford) - Gobet, Erika (Institute of Plant Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Hafner, Albert (Oeschger Centre for Climate Change Research, University of Bern; Institute of Archaeological Sciences, University of Bern) - Tinner, Willy (Institute of Plant Sciences, University of Bern; Oeschger Centre for Climate Change Research, University of Bern) - Bogaard, Amy (School of Archaeology, University of Oxford)

Abstract format: Oral

The Late Neolithic pile-dwelling site of Ploča (Mičov Grad, Lake Ohrid) in North Macedonia, rests within the wetland interface between southern Europe's third largest lake and mountainous deciduous mixed oak, pine and beech forests. Occupying this mosaic environment, the inhabitants of this lakeside settlement had access to a broad range of crops and wild plant resources. Here, we combine on-site plant macrofossil and off-site palynological results, from the EX-PLO project, to explore whether the eco-system diversity of this wetland landscape was reflected in the settlement's food production systems and land-use. The excellent preservation of the plant macrofossils (relating to the main occupation phase lasting c. 120 years and dating to the mid-5th millennium BCE) and detailed off-site palynological dataset (encompassing 8 millennia) offer a rich record of human subsistence and landscape change. We find that the population of Ploča, Mičov Grad used a broad spectrum of edible plants including cultivated cereals and pulses, oil-seed crops and gathered fruits and nuts. We suggest that despite environmental differences, the food-systems of Late Neolithic Ploča, Mičov Grad were broadly consistent with contemporary dryland settlements in the southern Balkans. Using functional weed ecology, we infer that the agrosystem at Ploča, Mičov Grad resembles high-input practices suggesting that cultivation was small-scale and labour-intensive. Our regional vegetation reconstruction shows the resilience of the forests to human disturbances and their fast recovery after land use phases. However, the forest composition did gradually change as a response to land use and logging activities. Such inferences are often not possible due to the preservation conditions of dryland assemblages in the region.

11 TOWARDS AN UNDERSTANDING OF THE NEOLITHIC LANDSCAPE OF THE KORÇA PLAIN, ALBANIA

Abstract author(s): Anvari, Jana (Department of Prehistoric Archaeology, University of Cologne) - Andoni, Edlira (Institute of Archaeology at the Academy of Albanological Studies) - Willett, Patrick (Department of Anthropology, University at Buffalo, SUNY)

Abstract format: Oral

This contribution will present preliminary field data and interpretations from the ongoing project "Contextualising the Neolithic of the Korça plain, Albania". The project researches several Neolithic sites in the Korça plain (6450-3000 BC), some of them 'dry' and some 'wet' insofar as they were situated on the shore of the now disappeared Lake Maliq. The project focuses both on an understanding of the settlement structure and environmental setting of individual sites through surface collection, geomagnetic survey and sondage excavations, as well as an understanding of the Neolithic cultural and natural landscape of the Korça plain on the basis of on-site and off-site data from an intensive survey in the mountains surrounding the plain. Through a better understanding of this important and yet under-researched microregion, we hope to contribute towards discussions of greater issues in southeast European Neolithic research as well as better heritage protection of the sites, which are threatened by modern constructions.

12 FOSSIL INSECTS AND THE NEOLITHIC - FIRST RESULTS FROM DISPILIO, GREECE

Abstract author(s): Panagiotakopulu, Eva (School of GeoSciences, University of Edinburgh) - Kyrillidou, Stella (Dept of Archaeology, University of Thessaloniki) - Bogaard, Amy (School of Archaeology, University of Oxford) - Kotsakis, Konstantinos (Dept of Archaeology, University of Thessaloniki)

Abstract format: Oral

There are limited studies of insect assemblages from waterlogged sites in Greece and the Balkans. Preliminary research from Dispilio provided information on the preservation of fossil insects and new data about the presence of *Sitophilus granarius*, the introduced flightless granary weevil, during the middle Neolithic in northern Greece, providing further data on the spread of storage-based farming from the Near East to Europe. New excavations at Dispilio

have provided the opportunity for sampling of insect remains from various well dated contexts on the excavation. The samples have excellent preservation and provide additional information on cereal pests and living conditions around the lake. This paper will present the first data from the new contexts at Dispilio, will discuss taphonomy and preservation at the site and will reconstruct past environments based on the insect faunas. The assemblages from Dispilio will be compared with other Neolithic assemblages and the spread of farming will be discussed on the basis of the spread of invasive species from their original niches in terms of time and space.

13 **SEDADNA AND WETLAND ARCHAEOLOGY- CHALLENGES AND POTENTIAL: DATA FROM THE STONEHENGE AREA AND SUFFOLK, UK**

Abstract author(s): Hudson, Sam (University of Southampton) - Brown, Tony (University of Southampton; University of Tromsø) - Alsos, Inger (University of Tromsø) - Pears, Ben (University of Southampton)

Abstract format: Oral

The extraction and analysis of sedimentary ancient DNA (sedaDNA) is making an increasing contribution to environmental archaeology from both off-site and on-site contexts, particularly at wetland locations. SedaDNA analysis of two prehistoric archaeological sites in the UK - Blick Mead, in the Avon Valley at edge of the Stonehenge World Heritage Site, Wiltshire (8th- 5th millennium BCE) and Seven Springs, Martlesham, Suffolk (4th – 3rd millennium BCE), highlight the potential of the method for reconstructing plant and animal communities associated with wetland archaeological activity. The importance of small wetlands and springs to Mesolithic cultures is reinforced by the data from Blick Mead, which indicates a damp-meadow environment attractive for the hunting of large mammals and easy access to water. However, at Martlesham, sedaDNA from plants and mammals, alongside pollen and geochemical analysis, reveals evidence for Neolithic pastoral activity in enclosed woodland (forest farming) surrounding a palaeochannel fed by spring activity. This suggests that springs also held significance for Neolithic agro-pastoralists and demonstrates how early farmers may have utilised woodlands for watering holes, additional grazing and fodder. From the environmental and archaeological evidence, both sites are proposed to have begun as a known locations for the hunting of aurochs, with Martlesham later becoming a site for the watering and pasturing of domestic animals. This research indicates that alluvial sediments and peats can preserve DNA from past plant and mammal communities effectively, but will also highlight how potential disturbance of sediment can limit environmental reconstructions using sedaDNA.

14 **LIFTING THE LID ON THE HEBRIDEAN NEOLITHIC: USING ORGANIC RESIDUE ANALYSIS TO RECONSTRUCT FOODWAYS IN WET AND DRY-LAND HEBRIDEAN LANDSCAPES**

Abstract author(s): Brown, Daniel - Cramp, Lucy (University of Bristol) - Garrow, Duncan (University of Reading)

Abstract format: Oral

This contribution will present preliminary results from the analysis of dietary practices of the early farming communities of the Early-Middle Neolithic of the Outer Hebrides, c. 3700-3200 BCE. This project utilises cutting-edge organic residue analysis of pottery lipids from both 'wet' crannog-related contexts and 'dry' domestic settlements and burials/tombs. It also compares the usage of distinctive ceramic assemblages associated with these 'wet' and 'dry' sites. This will allow a greater understanding of the activities taking place at these different sites and their roles in this region at the north western edge of the European Neolithic.

Hebridean crannogs are artificial islets set within lochs. Underwater surveys have recovered archaeological material from the loch-beds surrounding some of these islets and the waterlogged conditions have enabled the recovery of elusive lipid biomarkers for cereals. It has been proposed that these sites were important centres for the formation of community identity via feasting activities. Therefore, by re-constructing the dietary patterns and social role of these sites, the functions and activities taking place at these centres can be explored.

My work extends previous analyses of pottery residues from four Hebridean islets, bringing in additional 'wet' crannog sites for comparison and increasing the representation of key forms of pottery to test hypothesised differences in use. I am comparing these results with pottery from 'dry' domestic settlement sites such as the site of An Doirlinn, and from tombs. By reconstructing and comparing the dietary patterns at these sites, a more detailed interpretation can be constructed for their social role. Comparing the uses of different vessel forms further allows for a greater understanding of specific culinary practices and the relationships between peoples and early pottery in these islands.

FOLLOWING THE STEPS OF PAST SHEPHERDS. SEARCHING FOR PASTORALISM IN MOUNTAIN AREAS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Domingo Ribas, Guillem (Newcastle University) - Garcia Casas, David (Institute of Heritage Sciences - Spanish National Research Council)

Session format: Regular session

Managed grazing systems are regarded as one of the most extensive forms of land use on Earth. Pastoralism has been considered as one of the main causes of landscape transformation in many upland areas, where centuries of livestock mobility have actively modelled the character of the landscape and, in some cases, helped preserve threatened ecosystems.

This session is aimed at sharing how researchers identify past pastoral practices in mountain environments, as well as the problems and challenges emerging from it (e.g., difficulty of locating mobile pastoral sites, scarce material culture, rugged nature of upland areas). In this line, we encourage participants to address the methodological approaches that have enabled them to deal with these issues. Approaches include (but not only):

- Survey strategies (e.g., surface survey, remote sensing)
- Scales of register: from the archaeological site to the object (e.g., how to record dispersed but continuous evidence over mountain spaces, how to delimit a mobile pastoral site)
- Multitemporal approaches (e.g., dating methods, working with different scales of time)
- Ethnoarchaeology and pastoral groups
- Computational archaeology (e.g., computer modelling and simulation, predictive modelling)

In addition, in the face of global warming, depopulation and mass tourism, this session also seeks to generate debate on how archaeological research can inform future landscape planning to maintain and promote sustainable practices in upland areas, such as non-industrialised pastoral systems.

The objective of the session is to share and discuss different methodological approaches that have been successfully applied to the study of pastoralism in mountain areas. Speakers are encouraged to share how common problems in this field are handled in different areas, highlighting the potential of their methodologies. Overall, this session aspires to be a platform to move forward in the research of past pastoralism, while generating proposals for the future of mountain spaces.

ABSTRACTS

1 HUTS, ENCLOSURES AND OTHER DRY-STONE REMAINS. TIME, SPACE AND PEOPLE IN PYRENEAN UPLAND LANDSCAPES

Abstract author(s): Garcia Casas, David (Incipit - Institute of Heritage Sciences) - Gassiot Ballbè, Ermengol (Autonomous University of Barcelona) - Rodríguez Antón, David (Autonomous University of Barcelona; Catalan Institute for Human Palaeoecology and Social Evolution) - Salvador Baiges, Guillem - Díaz Bonilla, Sara - Obea Gómez, Laura (Autonomous University of Barcelona) - Mazzucco, Niccolò (University of Pisa)

Abstract format: Oral

Archaeology in high mountain areas has undergone a strong development in the last 20 years. In different zones of the Pyrenees, as well as in other southern European ranges, numerous research programs have collected a large amount of new archaeological data about ancient pastoral groups. The results show a pastoral use of mountain landscapes since the Neolithic. However, research in these environments and the classification of material remains face some difficulties. The first is dispersion of archaeological evidence which affect the scales of register and the interpretation and, secondly, the scarcity of material culture in the archaeological sites which obstruct the assessment of the function of archaeological sites. Among other questions, these problems make it difficult to build social interpretations about the historical evolution of seasonal pastoralism in high mountain zones.

This paper presents a theoretical and methodological approach based in ethnoarchaeological procedures and computational analysis of the architectural morphology of open-air sites with the aim of classifying the dry-stone shepherd's structures in chronological and cultural terms. The main goal is to elaborate typologies of architectural remains which can help us to identify the historical discontinuities in pastoral landscapes and explaining the social changes over diachronically sequences of time. These proposals have been applied with success in The National Park of Aigüestortes i Estany de Sant Maurici (Catalonia) and nowadays in field research in Ordino (Andorra).

2 PASTORAL LANDSCAPES DYNAMICS, RESOURCE MANAGEMENT STRATEGIES AND SOCIAL ORGANIZATION IN NORTHERN SPAIN BETWEEN THE 18TH AND 20TH CENTURIES

Abstract author(s): Menendez Blanco, Andres (Universidad de Oviedo - Departamento de Historia; Università di Genova - DAFIST, Dipartimento di Antichità, Filosofia, Storia) - Santeramo, Riccardo (Università di Genova - DISTAV, Dipartimento di Scienze della Terra, dell'Ambiente e della Vita) - Stagno, Anna Maria - Panetta, Alessandro - Gago Chorén, Laura (Università di Genova - DAFIST, Dipartimento di Antichità, Filosofia, Storia)

Abstract format: Oral

European mountains have been characterised by productive multifunctionality throughout history. In the modern period, the presence of extensive wooded pastures —usually in common lands— is well documented in many European areas. In this type of landscape, grazing coexisted with the management of other resources such as timber, firewood or charcoal. From the 18th century onwards, the spread of new rationalising ideas brought to a specialisation of these areas, separating forest from pastoral areas. Antigone and TemPa projects aim at deepening our understanding of these transformations by analysing two areas in northern Spain: Asturias and the Basque Country. Both territories show some divergent vegetation and landscape dynamics, which are visible in archaeological surveys, archaeobotanical analysis and written sources. On the one hand, Álava preserves abundant old forests with pollarded trees and evidence of charcoal production. On the other hand, charcoal kilns in Asturias are placed in open areas or in young forests. The aim of this communication is to present the first results of our archaeological and archaeobotanical research of these areas and to reflect on processes behind landscape changes: is deforestation linked to charcoal production or to the abandonment of past multi-practices? Are different management strategies responsible of regional differences? And if so, is there a relationship between these strategies and the social organisation of communities?

3 THE ARCHITECTURE OF PASTORAL STRUCTURES. DATA ARCHIVING AND ANALYSIS THROUGH DIGITAL SURVEY

Abstract author(s): Pizzonia, Lorella (Mediterranean University of Reggio Calabria)

Abstract format: Oral

The research project, directed towards the territorial enhancement and development of the tourism sector, aims to investigate the fields of rural architecture and anthropic modifications produced by pastoral activity in Aspromonte (Calabria, Italy). Through the production of integrated photogrammetric architectural surveys, it is intended to realize a digital archive equipped with a typological and topographic organization of the heritage investigated.

The main objective of the research is to investigate the theme of the architecture of pastoral structures, transhumance routes, enclosures, shelters and the countless anthropogenic changes, produced as a function of pastoral activity in Aspromonte, starting from selected case studies, which allow to capture elements of connection and independence. Connecting material and immaterial heritage to the landscape dimension of the sites hosting these emergencies, it will be possible to have a new system of description and dissemination of memory, expression of the multiple aspects of Mediterranean identity.

Basically the workflow is divided into two phases: the acquisition of data and the production of a digital database.

The first phase starts from the act of 'Observare': observing in order to know better and preserve. It's proceed with architectural surveys to draw new aspects and establish hierarchies. This phase it is accompanied by the consultation of witnesses of the places, to indicate the existing structures and those that are now part of the memory, in order to retrieve valid explanations of their use.

The second phase involves integrating the collected data into a database, with the aim of analysing and comparing the investigated area in a broader context.

The methodology used for the database synthesizes the results of studies and research projects already known in selected areas, and provides for the study area the insertion of the data obtained first-hand.

4 TRANSHUMANCE AND TERRITORIES IN THE FINAL PREHISTORY IN THE SOUTH CENTER OF THE IBERIAN PENINSULA: AN ETHNOARCHAEOLOGICAL AND EXPERIMENTAL APPROACH

Abstract author(s): Moya-Maleno, Pedro R. (Universidad Complutense de Madrid)

Abstract format: Oral

After joining for several seasons one of the last families of transhumant shepherds who move their cows and sheep between the center and the south of the Iberian Peninsula, it is clear that an ethnoarchaeological study strategy from the very experimental nature of the fact allows formulating new approximations to different phenomena and territorial patterns of past eras.

Specifically, of this route of about 400 km between the Iberian System and Upper Andalusia, the passage of cattle through the Sierra Morena mountain range -which separates the Submeseta Sur from the Guadalquivir valley- shows,

first of all, the constant control of the settlements from the Bronze Age to the Iron Age of said mountain passes and surrounding areas. It is about a validity of routes that manifests itself even in the direct control of resting places, drinking troughs and places where cattle spend the night. Thus, it is possible to positively consider whether such current movements allow us to address, on the one hand, other similar movements in such stages of Recent Prehistory that respond to the coincidences and/or cultural expansions between territories apparently separated by mountains. Even more, to project for remote times and from said experienced reality other material, socioeconomic and ideological aspects present in these movements, such as routes, duration of the stages, organization system, socialization mechanisms with local communities, topographic memory, etc.

5 MAKING THE INVISIBLE VISIBLE. SHIELINGS, PASTORALISM AND TRANSHUMANCE IN THE SCANDINAVIAN IRON AND MIDDLE AGES

Abstract author(s): Dahle, Kristoffer (NTNU University Museum; Møre & Romsdal county council)

Abstract format: Oral

The Scandinavian shieling system is well documented through ethnography and represents an important characteristic of traditional upland and outfield landscapes. Based on palaeobotanical analysis it appears as if mountain areas have been exploited – to various extents – since the introduction of domesticated livestock in the Late Neolithic. Yet, the archaeological record of shielings and other transhumant sites is still sparse, both due to their distant location, ephemeral structures and scarce material culture, as well as limited focus within archaeological research and management.

In this paper I will present a step-by-step approach to identifying and delimiting Iron Age and Medieval shieling sites, and how to separate these from other agrarian and pastoral sites in mountain environments. The methodology includes both visual surveys, remote sensing and environmental sampling, offering various possibilities and limitations. Based on my current PhD-study in Møre & Romsdal on the Northwestern coast of Norway, I will also point at some future challenges for pastoral archaeology.

6 THE DEVELOPMENT OF LIVESTOCK STRATEGIES AMONG THE CERRETANI: THE TOSSAL DE BALTARGA SITE (4TH-3RD C. BC)

Abstract author(s): Vila, Oriol (Universitat Autònoma de Barcelona) - Colominas, Lidia (Institut Català d'Arqueologia Clàssica) - Portillo, Marta (Institut Milà i Fontanals. CSIC, Barcelona)

Abstract format: Oral

The archaeological research developed in the Cerdanya region (Oriental Pyrenees) in the last 20 years has allowed to identify the main settlement, social and productive patterns of the Cerretani, the Iberian community living in the Pyrenees. Their settlement patterns show the occupation of the alluvial plain, but also some high lands areas. Recent archaeological research in the “Tossal de Baltarga” site has identified several animals (sheeps, goat, horse, dog) preserved thanks to the main destruction of the site, but also the bioarchaeological remains of their feeding and treatment, in an outstanding example of Iberian Stalls. We will focus on the “Building G”, a two floor house where the souterrain was used as stall, and where we have preserved not only the nearly complete bodies of the animals (4 sheeps, 1 goat, 1 horse) but also the remains of their treatment, thanks to micromorphology studies (identification of the formation processes of dung deposits, from animal nutrition through defecation, trampling and degradation). In the upper floor, we have identified a domestic space where several activities (food processing, cooking, textile) were developed.

From this example we could reconstruct part of the cerretanian livestock strategies.

7 SEARCHING FOR PASTORALISM IN THE SOUTH-EASTERN ALPS

Abstract author(s): milavec, tina (University of Ljubljana) - Horvat, Jana (Institute of Archaeology ZRC SAZU)

Abstract format: Oral

In this contribution we would like to share the results and methodological issues of the last 25 years of research into high mountain archaeology in the Slovenian (south-eastern) Alps. Contrary to previous belief, research, first of the interested public, and later also academic archaeology, has shown that south-eastern Alps have been seasonally used since at least the Mesolithic and more extensively since late Bronze Age.

Through time the settlement remains vary in intensity, certain periods are better represented, while others are lacking. As elsewhere, modest archaeological remains (mainly pottery, more rarely hearths, structures and metal artefacts) make it difficult to conclude what the exact nature of the use was. We expect hunting, medicinal herb gathering, uses of mountain passes, pastoralism and iron ore collecting. Written sources do not mention visiting the high altitudes before the High Middle Ages or a little earlier for the Italian Friuli.

Years of research have shown that particular altitudes and positions in the landscape, vicinity of water sources and other factors were observed and are starting to form a pattern which in the future might be used to predict and interpret the sites.

8 IN THE FOOTSTEPS OF THE FIRST SHEPHERDS IN THE EASTERN PYRENEES: ARCHAEOLOGICAL AND PALEOENVIRONMENTAL CHARACTERIZATION OF NEOLITHIC PASTORAL PRACTICES

Abstract author(s): Pescini, Valentina - Carbonell, Arnau - Colominas, Lidia (Catalan Institute of Classical Archaeology - ICAC) - Égüez, Natalia (Archaeological Micromorphology and Biomarkers - AMBI Lab, Instituto Universitario de Bio-Organica Antonio González, Universidad de La Laguna; Department of Anthropology, University of California) - Mayoral, Alfredo (Catalan Institute of Classical Archaeology - ICAC; Université Clermont Auvergne, CNRS, GEOLAB) - Palet, Josep Maria (Catalan Institute of Classical Archaeology - ICAC)

Abstract format: Oral

Pastoralism has had a central role in the formation and management of Mediterranean mountain landscapes. Yet, only fragmented traces of this millenary practice remain, and they are often difficult to identify and interpret. This contribution presents the results of the archaeological and palaeoenvironmental investigations carried out in the Molleres II site (2.525 m a.s.l.) and its surrounding area of Puigpedrós-Malniu (Meranges, La Cerdanya, Eastern Pyrenees).

A high-resolution multi-proxy research applied both “on-site” and “off-site” is proposed, combining archaeology, soil micromorphology, anthracology and biomolecular analysis together with radiocarbon dating. Such methodological approach allowed to identify the functionality of the pastoral structures and the characteristics of the local palaeoenvironment providing new insights on the occupation dynamics and livestock practices in high mountain spaces starting from the Neolithic onward.

Based on our results Molleres II has been interpreted as a complex and wide open-air site build up by the end of the Late Neolithic (3636-2701BC), consisting of large enclosures entirely dedicated to seasonal animal husbandry, and located at an exceptionally high altitude. These unique settings make this site a primer for this period in the eastern Pyrenees, revealing the considerable intensity of the animal presence since the Prehistory in these highlands. Much later, a second phase of more intense occupation likely occurred during Middle Ages (1179-1434AD), although the animal presence in this mountain area probably never decayed across pre- and historical periods. Our palaeoenvironmental data also suggest that such intense and long-term animal presence possibly accompanied by use of fire could be at the origins of stable grassland-dominated environments and open landscapes that persisted until nowadays.

9 BEYOND MATERIALITY: ETHNOGRAPHICAL AND ECOLOGICAL KEYS TO INTERPRET THE ARCHAEOLOGICAL RECORD OF PASTORALISM AT THE PYRENEAN SUMMER PASTURES

Abstract author(s): Fernández-Piñar, Carlos (Universidad Politécnica Madrid; Institute of Heritage Sciences, Spanish National Research Council)

Abstract format: Oral

Pastoralism has been the main economic activity that has shaped the high mountain traditional cultural landscape. However, the material remains of it are usually reduced to the footings of hundreds of small temporary huts and dry-stone enclosures. These structures usually offer little evidences about the livestock exploitation system to which they were associated and are difficult to interpret.

A multidisciplinary approach can shed new light. Geographical and ecological studies show us that aspects like type of relief, climate and altitude of the grasslands are important to understand the development of diverse forms of livestock management. The type and breed of cattle raised and the productive orientations of animal husbandry have also to be considered. Other sources like the ethnographic and documentary records or place-names can provide valuable information.

This paper points out how the use of different terms to designate pastoral settlements in the summer pastures at the Aragonese Pyrenees suggest diverse herding strategies in the past. Also, the importance of studying documents that regulated the communal use of the uplands is exposed in order to interpret the archaeological record of the pastoral activities in the highlands.

10 COMPUTATIONAL METHODS IN MOUNTAIN ARCHAEOLOGY: OPPORTUNITIES AND CHALLENGES

Abstract author(s): Carrer, Francesco (Newcastle University)

Abstract format: Oral

The use of quantitative approaches and digital tools is well established in the archaeology of mountain landscapes today. In particular, the analysis of the interaction between human communities and upland ecosystems increasingly relies on methods that enable the identification of meaningful patterns and the formal evaluation of alternative scenarios. Cost surface and least cost path, for example, are used to test specific hypotheses on past mobility, which in mountain areas is often associated with the seasonal migration of pastoral groups. Predictive models, which pinpoint locations where sites are more likely to be found, are growing in popularity because they enable effective field surveys in inaccessible areas. Numerical and agent-based modelling, although still rarely applied in mountain regions, are becoming crucial tools for studying the evolution of upland landscapes and their driving forces. Despite the enormous potential of these methods, their use in the mountain archaeology can be problematic. The complex morphology of mountain landscapes affects the estimation of cost parameters and the accurate assessment of the archaeological risk. The seasonal occupation of the uplands must be considered when investigating human-environment interactions in mountain regions. The influence of non-environmental factors on settlement and mobility in the past should not be underestimated. In this paper I will provide examples of these challenges drawn from some of case studies in the Alps, and I will provide some technical and theoretical suggestions to address them.

11 WHAT DOES A ROMAN DO ON TOP OF THAT MOUNTAIN? MICROREGIONAL LANDSCAPE ANALYSIS OF LAND-USE DYNAMICS IN THE EASTERN PYRENEES

Abstract author(s): Carbonell, Arnau - Pescini, Valentina - Colominas, Lidia - Gallego, Abel (Catalan Institute of Classical Archaeology, Landscape Archaeology Research Group) - Mayoral, Alfredo (Catalan Institute of Classical Archaeology, Landscape Archaeology Research Group; Université Clermont Auvergne, CNRS, GEOLAB) - Garcia-Molsosa, Arnau (Catalan Institute of Classical Archaeology, Landscape Archaeology Research Group) - Orengo, Hèctor (Catalan Institute of Classical Archaeology, Landscape Archaeology Research Group; Catalan Institution for Research and Advanced Studies - ICREA) - Palet, Josep Maria (Catalan Institute of Classical Archaeology, Landscape Archaeology Research Group)

Abstract format: Oral

This work presents from a long-term perspective the occupation and land-use of different mountain valleys across the headwaters of Ter and Segre in the eastern Pyrenees, with a special focus on the Roman period. Within a broader Landscape Archaeology approach, we cross-checked palaeoenvironmental (soil micromorphology, anthracology, and biomolecular analysis) and archaeological data (photointerpretation, historical cartography, photogrammetry, extensive survey, test pit digging, and excavation together with radiocarbon dating), in order to characterize socio-environmental interactions. This multidisciplinary approach revealed an intensive land use and anthropization of high mountain environments from the Neolithic but also in Roman times. From this period onwards, the archaeozoological and field survey studies documented an increase in the activity and complexity of livestock practices mainly focused on sheep. This research also characterized forest management, primarily devoted to wood cutting and collecting as well as pitch and charcoal production. In some areas, we found evidence of metallurgical activities, including iron mining and smelting. Structures with a possible connection with administrative activities, such as border controls, were also detected in the area. Our results show a high variability and heterogeneity in land-use dynamics between the different valleys studied, highlighting the relevance of studies at a microregional scale.

12 THE TRACKS OF THE SHEPHERDS IN THE CENTRAL SLOVAKIAN MOUNTAINS

Abstract author(s): Mino, Martin (Monument Board of Slovak Republic)

Abstract format: Oral

Raising livestock is in its very essence an activity that needs a lot of space and grass. Thus the operational area of the pastoralists is far more extensive and restricts overlapping with the neighbours. The nature of pastoral activities results in a low-density settlement structure which is hard to detect. Pastoralists across the centuries have adopted different strategies, even while exploiting the same environment. The further in the past the harder it is to identify the strategies employed and the harder it is to identify pastoralist-related relics on the ground. A combination of various approaches can be a viable solution. Even old pastures long absorbed by woods or built-up areas can offer an insight into past pastoralists' life. Fine pastures were often used continuously for a long time or repeatedly in different time phases. Following recent shepherds, searching for open landscape-grown trees, or evaluating old maps and pictures helps to identify the pastoralist habitat. Old routes across the mountains often might take advantage of shepherd's camps for food supplies and shelter. Thus, route modelling helps scale down the search area for pastoralist settlements. Repeti-

tive walk-through surveys in different conditions of the terrain bring related artefacts. Lidar imagery shows animal enclosures, cabin terraces, livestock drive trails and characteristic land adjustments. Even environmental samples from sedentary settlements can bear information concerning pastoralism. The combination of all these methods brought the first fruit in the identification and closer definition of past pastoralism from Prehistory until the Modern Age in the mountainous zone of central Slovakia.

13 SHEPHERDS, FLOCKS AND PASTURES: ARCHAEO-HISTORY OF PASTORALISM IN A BASQUE VILLAGE (FRENCH PYRENEES)

Abstract author(s): Le couedic, Melanie - Champagne, Alain (Universite de Pau et des pays de l'Adour, Equipe ITEM)

Abstract format: Oral

The shepherd's huts excavated west of the Pyrenees have yielded too little fauna for further analysis of livestock mobility; only petrography has shown, for the Bronze Age, varied patterns of mobility (P. Dumontier and F. Convertini). Beyond the great Pyrenean transhumance circuits traced by geographers at the beginning of the 20th century, we have direct written and planimetric evidence for recent periods, mainly from the contemporary period, for summering at shorter distances. From the Napoleonic cadastre, or from rental leases, we have traced the links between huts and villages, between huts and houses, for the mountainous part of the Basque Country, in Soule and in Cize. Put in series, in space and in graphs, these sources inform us of the sharing, access, paths and possessions in the mountains. Also, from the Middle Ages onwards, neighborhood agreements inform of spaces in compascuity, common to several communities of neighbors in different ways. This raises the question of their spatialization according to toponyms that disappear, move or are deformed through time.

687 HISTORICAL ARCHAEOLOGY OR THE MATERIAL HISTORY OF THE MODERNITY: EXPERIENCING LANDSCAPES AROUND THE FOURS CORNERS OF THE WORLD

Session theme: 6. Contested Pasts & Presents

Session organisers: Muniz, Tiago (Centre Alexandre-Koyré, Centre national de la recherche scientifique - CAK/CNRS) - Oliveros, Johana Caterina (Akademische Rätin, Institut für Archäologie und Kulturanthropologie, Abteilung für Altamerikanistik)

Session format: Regular session

European colonialism created an unprecedented chapter in the history of humanity. Flows of people, plants, animals, objects, goods, knowledge, and ideas took place, however, in a differentiated and unequal way. While positioning the Americas as its production centre, Africa, and Asia as its supply space, within these new geographical articulations, Europe became the centre for profit concentration. Whether during the colonial period in the Americas or the European expansion in Africa along the 19th century, processes of negotiation, adaptation and resistance to colonization generated contexts of interaction and struggle between the social groups involved (e.g., Indigenous, Africans and Europeans), as well as between these and the inhabited environment. In that sense, the making of the modern world, understood as a system of relations, is marked by the simultaneity of material assemblages and experiences related to violence and pain, pleasure or joy, and invention.

Throughout the 19th and 20th centuries colonialism developed additional specificities. It gave birth to new relations of dependency and subjection, now marked by economic dynamics and particular forms of exploitation (e.g., the end of slavery and intensification of smuggling, peonage in rural areas for the exploitation of tobacco, sugar, or rubber). Thus, the advent of what has been called the "Second Slavery" was possible insofar as new conditions were required for the very expansion of capitalism. Within this broad context in mind, we invite colleagues to present their case studies. Some of the questions to address are: Where, when, and how did individuals and groups confront the new conditions of inequality and living? How did the making of the modern world shape new "experiences of being" around the globe? How these analyses help to dimension the limits of modernity and to imaging new possibilities of relation?

1 THE STRUGGLE FOR NATURAL RUBBER SPECIES OR HOW ITS LOCAL PROCESSES AND GLOBAL STORIES MOVED (AROUND) THE WORLD

Abstract author(s): Muniz, Tiago (CNRS)

Abstract format: Oral

The rubber case is probably the best example of botanical colonialism in world history. During the 19th century, it became increasingly common to acquire species from other territories due to the intense circulation of items between metropolises and colonies. In 1876, the Englishman Sir Henry Wickham sent 70,000 seeds of *Hevea brasiliensis* from the Lower Amazon (Pará, Brazil) to the Royal Botanic Gardens of Kew (London, United Kingdom). From this seed transfer, the monopoly of rubber production in the Amazon was threatened by subsequent technological innovations, including the creation of new plants, the organization of plantations, the standardization of cutting techniques, and the organization of labor. As a result, rubber plantations became lucrative investments around the world, with different species and actors involved. The high demand for rubber items for the industry (seals for engines, personal protective equipment, and tires) and medicine (surgical gloves) led to an increasing race for rubber. The decline of the rubber economy in Brazil (1850-1920) impacted rubber tappers and entire villages that were left behind - and we can still read these stories of domination of nature in the landscape. The present research aims to identify, in a broad sense, the types of rubber, companies and historical characters that played an important role in the colonial circulation of plants and knowledge around the world, with a special focus on comparing the efforts of the British and French empires in the struggle for rubber. In this way, the debates here raised concern the history of science and technology, the role of the global south, commodities, globalization, and the environmental humanities. Through archaeology of rubber, it is still possible to stimulate a critical vision of the impacts of commodities worldwide, taking into account the perceptions of the environment in communities impacted by its industry and heritage.

2 TRANSMODERNITY AS A MODEL FOR IMAGINING PLURIVERSAL RELATIONS - INSIGHTS FROM THE AFRICAN 'PERIPHERY'

Abstract author(s): Bialostocka, Olga (Human Sciences Research Council)

Abstract format: Oral

Nzima village in Grand-Bassam and Abbashawl in Asmara were intrinsically connected to the 'modern' colonial capitals of present-day Côte d'Ivoire and Eritrea, respectively, on the verges of which they functioned. However, structurally, organisationally and ontologically, they profoundly differed from their French- and Italian-planned 'neighbours', together with which they are today inscribed on the UNESCO World Heritage List. Interpreted as antithetical counterparts, products of African encounter with modernity, the two urban entities – European and African – tend to be described as interdependent, representing two sides of the same coin, neither of which could have existed without the other. This paper interrogates the said interpretation using decolonial concept of transmodernity that offers a possible conceptual framework to understand experiences of being of the colonised outside of the colonial hierarchisation and the core-periphery dynamic created by the politics of modernity.

What can be said about approaches to colonisation applied by the French and the Italians based on the analysis of architecture and urban planning in the two cases? How was separation and exclusion in Grand-Bassam and Asmara instituted by the coloniser? And what did it mean for the relations between the Europeans and the African populations? The paper proposes to look at Nzima village and Abbashawl urban development using affirmation of difference lens to visualize reality that contests the 'universalistic' binaries created by Western modernity in seeking pluralistic politics.

3 ARCHAEOLOGY OF THE DOMESTIC SPACE: ASYMMETRIC DEPENDENCIES AND TACTICS OF RESISTANCE IN SAN BASILIO DE PALENQUE. COLOMBIA. 19TH-20TH CENTURIES

Abstract author(s): Mantilla Oliveros, Johana (Department of Anthropology of the Americas)

Abstract format: Oral

In this presentation, I analyse three architectural models of houses in the Afro-Colombian community of San Basilio de Palenque. Initial field research points to developments in domestic spaces, each related to specific contexts of social, economic, and cultural transformations. Original domestic formations, for example, date from the early stages of the emergence of this maroon community. Another form of house spread in the 19th century when slavery was still legal but was increasingly embedded in industrialization processes due to new labour regimes such as peonage. Eventually, a third form of domestic space appeared from the 1960s onwards with the arrival of electricity and increased migration to cities. The persistence of specific spaces and their use suggests an internal process of resistance to change. The archaeological analysis of domestic spaces in San Basilio de Palenque provides insight into how af-

ro-descendant populations in rural areas of the Americas deal with contexts of asymmetric dependencies during the transition from colonialism to industrialization.

4 NETWORK HIERARCHIES AND SOCIO-ECONOMIC STRATIFICATION IN RUSSIAN AMERICAN SETTLEMENTS

Abstract author(s): Rendt, Victoria (University of Aberdeen)

Abstract format: Oral

Archaeological assemblages of ceramics from 18th and 19th century Russian American sites have predominantly been studied independent of other sites within the Russian American network. In this paper I explore potential connections and patterns across sites, using examples from Fort Ross, California; Kodiak Island, Alaska; and Sitka, Alaska. These locations were all of great significance in the development and expansion of the Russian American Company. Through cross-referencing ceramic assemblages, and studying the composition and the location of certain goods within selected sites, the aim is to improve our understanding of the hierarchy of settlements within the network. Network hierarchies are important as they have the ability to influence the socio-economic stratification of the occupants located in and around the settlements. How does network status affect access to goods being transported between settlements? How is access reflected in the resulting variation in the ceramic assemblages? And, importantly, what does this variation say about the social affordances of the ceramics and the status of the occupants? By using ceramics as a material lens and moving beyond individual sites, I argue that a wider understanding of the Russian American network becomes possible – one that can help us answer questions about whether access to goods led to the polarization of socio-economic status or a quasi-socialist distribution of goods among occupants.

5 THE SEEDS OF CHANGE: APPLE TREES AND HUMAN MIGRATIONS

Abstract author(s): Hull, Emily (University of Idaho)

Abstract format: Oral

Apples have a long history in the human imagination, from golden apples and apples of youth in European legend to figures of mythological stature such as Johnny Appleseed in North America. Originating in Eurasia, ancestral apple forests still dot the lines of the Silk Road in Kazakhstan, and volunteer apples from cores cast out of train windows delineate now-deserted railway lines across the North American West. Abandoned homesteads may now be identified only by venerable apple trees, remnants of Euroamerican human settlements.

This study aims to identify and use apples, apple trees, and apples varieties, in conjunction with landscape archaeology and historical archaeology, to trace human movement, culture, and culinary trends. These apple trees symbolize not only the hopes of disenfranchised homesteaders, but also trace the lines of colonial incursions into western North America. Not only do the trees show migration, they also remain standing and are accessible to visitors and locals, as well as wild animals who use these symbols as food and symbol. This study aims to look at the living apple trees in all their complexity, as both a symbol of hopeful futures, and the sign of colonialism and land theft, as well as exploring how these plants can remain as accessible, living histories to communities in the present.

688 BIOARCHAEOLOGY OF GIRLHOOD, MAIDENHOOD, AND MOTHERHOOD IN PAST SOCIETIES. RECONSTRUCTING WOMEN'S LIFE-HISTORY THROUGH MORPHOLOGY, HISTOLOGY, AND BIOGEOCHEMISTRY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Gigante, Melania (University of Padua) - Nava, Alessia (Polish Academy of Sciences)

Session format: Regular session

From an evolutionary and biocultural perspective, reconstructing biological life histories in humans – e.g., growth trajectories, health, mobility, diet, reproductive behaviours, fertility and mortality rates – has been crucial for understanding how ancient populations adapted to ecological, cultural and social changes over time. While the use of analytical tools from life history theory and the application of cutting-edge techniques in the study of ancient human remains have allowed us to explore many aspects of past human biology, women's reproductive life histories in ancient human populations have received scant attention. Consequently, relatively little is known about the evolution of female reproduction in past societies or how transitions from maidenhood to womanhood to motherhood changed through time.

This session invites state-of-the-art bioarchaeological research on women's life histories, mother-infant dyad, adolescence, and female rites of passage. The aim is to explore the nature and timing of female puberty, childbirth and womanhood in past societies. We welcome papers which use morphological and/or histological and/or biochemical

analyses of human mineralised tissues (bones and teeth) from ancient women and their offspring in order to explore variability in the timing of female puberty, women's reproductive histories and womanhood across human history.

ABSTRACTS

1 RECONSTRUCTING REPRODUCTIVE LIFE-HISTORIES IN YOUNG GIRLS. ASSESSMENT OF THE AGE-AT-MENARCHE IN HUMAN MINERALISED TISSUES: A HISTOLOGICAL AND BIO-GEOCHEMICAL APPROACH

Abstract author(s): Gigante, Melania (University of Padua) - Nava, Alessia (Geochronology and Isotope Geochemistry Laboratory, Institute of Geological Sciences, Polish Academy of Sciences) - Bondioli, Luca (Department of Cultural Heritage, University of Padua) - Müller, Wolfgang (Institute of Geosciences, Goethe University Frankfurt; Frankfurt Isotope and Element Research Center - FIERCE, Goethe University Frankfurt)

Abstract format: Oral

Menarche, or the first menstruation, is a crucial milestone in women's reproductive life history. As an adaptive response serving to maximise reproduction opportunities, age-at-menarche in young girls is determined by a complex interplay of genetic and environmental factors. Clinical studies on living populations have documented a persistent relationship between intra-uterine milieu, childhood, and psycho-social stressors, with variations in timing of reproductive maturity and physiological growth. Variation in the age-at-menarche is thus a sensitive measure to estimate female health in general and the impact of changes in environments and human behavioural choices on women's life history across space and time.

However, whilst secular trends of the age-at-menarche in women from contemporary societies are well-known to physiologists, there are large gaps in our knowledge of how female puberty and reproductive life history in women changed in recent human evolution.

Traditional bioarchaeological approaches to puberty's reconstruction rely upon skeletal and dental maturation, although with a few limitations. Recent studies on modern primates' samples – with known life-history information – have shown the potential of permanent teeth to histologically detect the menarche as accentuated increments in dental microstructures. However, little research has been conducted on past human dental specimens.

This paper illustrates the state-of-art of bioarchaeological research on puberty and menarche in human mineralised tissues. We present the preliminary results of the chemical investigation of menarche in human tooth enamel as part of a pilot study. Using dental histology and LA-ICPMS (laser-ablation inductively coupled plasma mass spectrometry), we identified variations in Sr/Ca and Ba/Ca elemental profiles at the known age-at-menarche in human extracted third molars. This result opens up an unexplored way to unravel the timing of the first menstruation in past human populations, which may help contributing to the question of how current life history trajectories evolved.

2 LIFE AS GIRL IN THE NORTHEASTERN EUROPEAN MESOLITHIC: SOCIAL IMPLICATIONS FROM BIOANTHROPOLOGICAL DATA

Abstract author(s): Batanina, Olga - Eckelmann, Rebekka (University of Helsinki) - Stewart, Nicolas (University of Brighton)

Abstract format: Oral

This paper studies the social roles of girls and girlhood in Mesolithic Hunter-Gatherer-Fisher community in the European North combining bioanthropological data and archaeological evidence.

While the issues of prehistoric childhood have gained their place in the bioarchaeological and ethnographic research, the world of girls in past societies is still marginalized. One of the reasons for their "invisibility" has often been the scarcity of reliable sex estimations of immature skeletal remains. The emergence of DNA- and, more recently, enamel peptide-based methods do, however, have the potential to change this status quo fundamentally.

The anthropological material analyzed here is originating from the burial site of Yuzhniy Oleniy Ostrov (YOO), Karelia, Russia. Radiocarbon analysis dates the site to 6000-6200 ca BC, and it is considered the largest Mesolithic burial site in Northeastern Europe containing at least 177 burials. The number of individuals of both sexes and various age groups is sufficiently high to investigate social relationship within the YOO group.

Using multiple proxies, including pathological manifestations, dietary reconstructions and burial practice, we question whether immature females at YOO constitute a distinct social group within the burial community.

This subject is of additional import since previous research at YOO suggests that only specific individuals may have been selected to be buried at the site. This claim leads to the question of possible reasons for why these immature females were chosen for burial at this specific location.

3 THE MOTHER-INFANT NEXUS IN ANCIENT HUMAN POPULATIONS: DIETARY SHIFTS IN EARLY LIFE THROUGH HIGH-RESOLUTION HISTOLOGICALLY-CONTROLLED COMPOSITIONAL BIOGEOCHEMISTRY OF DENTAL ENAMEL

Abstract author(s): Nava, Alessia (Geochronology and Isotope Geochemistry Laboratory, Institute of Geological Sciences, Polish Academy of Sciences; Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome) - Bondioli, Luca (Department of Cultural Heritage, University of Padua; Department of Cultural Heritage, University of Bologna) - Mahoney, Patrick (School of Anthropology and Conservation, University of Kent) - Anczkiewicz, Robert (Geochronology and Isotope Geochemistry Laboratory, Institute of Geological Sciences, Polish Academy of Sciences) - Müller, Wolfgang (Institute of Geosciences, Goethe University Frankfurt; Frankfurt Isotope and Element Research Center - FIERCE, Goethe University Frankfurt)

Abstract format: Oral

Mammalian teeth preserve a record of the individual biological life history from a few weeks after conception to adolescence. Dental tissues formed before birth are capable to record the health status, diet and mobility of the mother, carrying information about the mother-infant dyad during pregnancy. These crucial moments in individual life are still underexplored in past human populations.

Maternal diet, nursing practices, and the onset of weaning can be reconstructed at the highest temporal resolution using laser-based elemental and isotopic biogeochemical analyses of dental enamel. Indeed, human growth and development strongly correlate with dietary behaviours – including that of the mother during pregnancy. A close-to-longitudinal analysis of the incorporation of trace elements in dental enamel allows for disentangling even subtle variations in the individual diet at a sub-weekly resolution, while the high-resolution topographic analysis of diagenesis indicators (U, Mn, REE), allows distinguishing the biogenic signal from the diagenetic one in fossil and archaeological specimens.

In this contribution, we present both the models of trace element incorporation in enamel derived from contemporary infants with well-known biological life histories and their application to archaeological and fossil human specimens.

4 INFANT FEEDING PRACTICES IN ROMAN ITALY: WEANING VARIATION AND ITS RELATIONSHIP TO THE LIVED EXPERIENCES OF WOMEN IN THE PAST

Abstract author(s): Oldershaw, Leigh (Department of Anthropology, The Ohio State University) - Lugli, Federico (Laboratory of Osteoarchaeology and Paleoanthropology - BONEs Lab, Department of Cultural Heritage, University of Bologna; Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia) - Boczkowska, Marcelina (Geochronology and Isotope Geochemistry Laboratory Institute of Geological Sciences Polish Academy of Sciences) - Kożuch, Michał (Geochronology and Isotope Geochemistry Laboratory Institute of Geological Sciences Polish Academy of Sciences) - Sperduti, Alessandra (Museum of Civilizations, Bioarcheology Service) - Coppa, Alfredo (Department of History, Anthropology, Religion, Arts and Performing Arts, Sapienza University of Rome) - Guatelli-Steinberg, Debbie (Department of Anthropology, The Ohio State University) - Bondioli, Luca (Department of Cultural Heritage, University of Padua; Department of Cultural Heritage, University of Bologna) - Anczkiewicz, Robert (Geochronology and Isotope Geochemistry Laboratory Institute of Geological Sciences Polish Academy of Sciences) - Nava, Alessia (Geochronology and Isotope Geochemistry Laboratory Institute of Geological Sciences Polish Academy of Sciences; Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome)

Abstract format: Oral

Bioarchaeological studies play a critical role in elucidating infant health, breastfeeding, and weaning in past human populations. Currently, sources of information on weaning timing in the Roman world are limited to some written sources and to bioarchaeological determinations of weaning timing acquired via stable isotopic analyses. This research takes traditional isotopic weaning studies one step further by combining Laser Ablation-Inductively Coupled Plasma-Mass Spectrometry (LA-ICP-MS) time-resolved analyses of elemental ratios (Ba/Ca, Sr/Ca and Pb/Ca) and traditional histological methods to reconstruct individual weaning timelines at the highest temporal resolution for 52 molars from 48 individuals from across Roman Italy dating from the 1st-5th centuries AD. These individual timelines help to elucidate the degree to which the weaning process varied in mode and time, thereby serving to establish a baseline for understanding the role maternal (or caregiver) choice and differential access to resources may have played in determining early to late feeding practices, and infant health, in Roman Italy. Results are contextualized using existing documentary and archaeological data.

5 RECONSTRUCTING WOMEN'S BIOGRAPHIES: AN EXCEPTIONAL CASE STUDY FROM VALENCINA (SEVILLE, SPAIN)

Abstract author(s): Cintas Peña, Marta - Luciañez Triviño, Miriam - Montero Artús, Raquel (Department of Prehistory and Archaeology, University of Seville) - Bileck, Andrea (Department of Analytical Chemistry, University of Vienna; Joint Metabolome Facility, University of Vienna) - Bortel, Patricia (Department of Analytical Chemistry, University of Vienna) - Kanz, Fabian (Center for Forensic Medicine, Medical University of Vienna) - Rebay-Salisbury, Katharina (Department of Prehistory & Western Asian/Northeast African Archaeology, Austrian Archaeological Institute, Austrian Academy of Sciences) - García Sanjuán, Leonardo (Department of Prehistory and Archaeology, University of Seville)

Abstract format: Oral

In recent years, human bone biogeochemistry has opened up entirely new pathways of understanding the biographies of past people. This paper examines the exceptional case of the most socially prominent individual of the Iberian Pre-Beaker Copper Age (c. 3200-2500 cal BC), who died between the ages of 17-25 and was buried alone in a megalithic tholos-type structure alongside a set of luxurious prestige goods in the site of Valencina (Seville, Spain). Evidence suggests that single burials were relatively common, yet individualized grave goods were reserved for only a few adults—no infants or juveniles were found with individualized grave goods. This person's life-history has been reconstructed through anthropological analysis, strontium isotopes and mercury data, and contextual evidence. Initially assumed to be a male, recent analysis of sexually dimorphic amelogenin peptides in tooth enamel has allowed us to determine her female chromosome sex. This sex determination, combined with the fact that at present only women, not males, seem to have enjoyed a similarly high social position in Valencina, leads us to reevaluate previously established interpretations of the political role of women at the beginning of early social complexity. By reconstructing this woman's life-history, we seek to contribute to a better understanding of female biographies during prehistory.

6 WOMEN'S LIFE HISTORIES AMONG ANCIENT VENETI: THE MIDDLE IRON AGE NECROPOLIS OF CUS-PIOVEGO (PADUA, ITALY)

Abstract author(s): Beck De Lotto, Michael Allen (Department of Cardiac, Thoracic, Vascular Sciences, and Public Health, University of Padua) - Capasso, Giusy (Department of Cultural Heritage, University of Padua) - Lugli, Federico (Department of Cultural Heritage, University of Bologna) - Bondioli, Luca - Vidale, Massimo (Department of Cultural Heritage, University of Padua)

Abstract format: Oral

The Middle Iron Age necropolis of CUS-Piovego (second half of the VI - first half of the IV century BCE) is one of the most important – and most intensively studied – pre-Roman necropolises in Padua, representing a key context for understanding the socio-political transformations in the crucial transition phase towards full urbanization. The necropolis yielded 135 cremations, 25 inhumations, 6 horse burials, and the grave of an adult male inhumed with a horse. The bioarchaeological study of the human skeletal remains was supported by proteomic analysis of dental enamel to confirm/deny the morphological sex estimates and by strontium isotope analysis for the study of mobility.

Among the inhumed individuals, the 40-years-old female from Grave V, inhumed supine, shows extra/para-masticatory wear in teeth diagnostic for fiber processing, several enthesal changes in the upper limbs, and subacromial impingement syndrome in the right shoulder girdle, all suggesting repeated and intense work activity of spinning/weaving. $^{87}\text{Sr}/^{86}\text{Sr}$ analysis suggests this individual was local.

The 17-20 years old female from Grave IX was inhumed in a prone position, without grave goods. The anomalous position of all limbs, constrained behind the back, recalls the 'hogtie' binding, in which the legs and wrists are held in tension by the same rope. However, no evidence of stress or inflicted trauma was recorded. $^{87}\text{Sr}/^{86}\text{Sr}$ analysis suggests this individual was non-local.

Looking at the relationship between women, work, and violence, this analysis shows that inequalities existed within the women of the inhumed segment of the CUS-Piovego population. While the elder individual seems to have had a work-dominated life, anyhow allowing her to reach adulthood, in the second case, the young non-local female experienced an episode of violence with a probable fatal outcome during her adolescence.

7 LIFE HISTORY OF A CROATIAN NOBLEWOMAN RECONSTRUCTED THROUGH (BIO) ARCHAEOLOGY, PALAEO RADIOLOGY AND BIOCHEMISTRY

Abstract author(s): Novak, Mario - Jankovic, Ivor (Institute for Anthropological Research) - Plese, Tajana (Croatian Conservation Institute) - Cavalli, Fabio (General Hospital Trieste)

Abstract format: Oral

The study aims to reconstruct the life history of an individual whose skeleton was recovered during the excavation of the Pauline monastery of the Blessed Virgin Mary in Moslavacka Gora, Croatia. The monastery was one of the most important ecclesiastical centers in continental Croatia during the 14th/15th century and was abandoned between 1520 and 1544 due to Ottoman attacks. The inscription and coat of arms on the tombstone of a monumental tomb located in the church apse as well as archival records indicate that the skeleton belongs to Sofia Kastelanovic née di Prata (di Pordenone), a member of Croatian high ranking nobility.

We conducted conventional bioarchaeological study, carbon and nitrogen stable isotopes analysis, CT scanning and 3D facial reconstruction. The bioarchaeological analysis showed that the skeleton belongs to a middle-aged woman with an estimated stature of about 159 cm. Numerous changes such as ATML, caries, abscess, linear enamel hypoplasia, and osteophytosis were observed during the analysis with the most notable pathology being the fracture of right distal tibia and fibula also confirmed by CT scanning. Carbon and nitrogen isotopic values are consistent with terrestrial diet based on C3 plants with no marine input, and the consumption of large quantities of animal-based proteins. 3D facial reconstruction revealed her physical appearance which allows us to compare it with facial characteristics of other members of her family.

The presented results confirm the assumption that the skeleton belongs to Sofia Kastelanovic, thus making her the first historic individual with reconstructed life history and known name from that period in Croatia identified by using a multi-analytical approach.

A. PUBERTY AND ADOLESCENCE IN MEDIEVAL IRELAND

Abstract author(s): Ham, Allison (University of South Carolina)

Abstract format: Poster

Adolescence is a critical period in the human life cycle for physical and psychological development, but long-term trends in the effects of ecological, cultural, and biological diversity on variation in patterns of adolescent growth and maturation are not well understood. Using skeletal remains excavated from ten archaeological sites dating to the medieval period in Ireland (CE 500-1550), this study analyzed sex-specific patterns of pubertal timing to better understand the relationship between environmental conditions during this critical developmental and culturally relevant age period and patterns of growth and maturation in the past. Pubertal timing was assessed on individuals between 8-25 years of age (n=83) using skeletal markers associated with stages in the adolescent growth spurt: mandibular canine mineralization, cervical vertebrae maturation, and fusion of the hand, elbow, wrist, and iliac crest. The threshold for delayed pubertal timing was based on the 95% confidence interval (pooled sex) for the within-sample expected age of attainment for pubertal stage, and the fusion of the distal phalanges, iliac crest, and pubertal stage-at-death was used to assess whether female individuals had achieved menarche. The results of the study revealed similar mean ages-at-death for males and females within the peak height velocity stage (~14 years), but females had older mean ages-at-death compared to males for both the deceleration and maturation stages. Within the sample, three males and two females were identified as having delayed pubertal growth, and menarche was achieved by 17 years of age for female individuals. Overall, these findings suggest that females in medieval Ireland were experiencing an elongated adolescent growth period, which expands our understanding of the effects of cultural and environmental pressures on sex-specific patterns of adolescent growth and maturation and provides insight into human reproductive life histories in the past.

B. SEX DIFFERENCES IN PERIODONTAL DISEASE IN LATE MEDIEVAL AND EARLY MODERN BERLIN

Abstract author(s): Brennan, Emily (University of South Carolina)

Abstract format: Poster

Periodontal disease (PD) is the result of chronic bacterial infection and represents one of the most common chronic contemporary conditions. The majority of studies from both living and archaeological populations have seen higher frequencies of PD in males compared to females. This study examines sex differences in periodontal disease in the late medieval (c. 1200-1500) and early modern (c. 1500-1717) periods from adults (individuals with complete epiphyseal fusion) excavated at Petriplatz, the churchyard of St. Peter's Church dating to c. 1200, in the medieval city of Cölln/Berlin, now present-day Berlin. PD was scored on the left mandible according to guidelines developed by Kerr. Hazards modeling and Fishers Exact tests were used to examine trends in periodontal disease across estimate

sex and time period. During the late medieval period, estimated males have higher frequencies of PD than estimated females, while in the early modern period, estimated females display a slightly elevated frequency compared to estimated males, though these results are not significant for either period. For adults with PD in both time periods, estimated females have an increased risk of mortality compared to estimated males, and this increase is significant in the early modern period. Therefore, while frequencies by sex differed little, females with PD face an increase in mortality compared to males with PD. This sex differential may be due to greater underlying frailty in females as PD can be associated with other comorbidities. Cultural attitudes surrounding health/dental care and access to treatments for women at the time may also have exacerbated mortality risk. The Protestant Reformation (c.1517) enforced a new gender hierarchy and placed a greater emphasis on marriage for women. Even as knowledge of oral hygiene increased in the early modern period, this gender hierarchy may have constrained women's ability to access care in the event of infection.

C. PALAEOHISTOLOGICAL ANALYSIS OF BONE LESIONS SUGGESTIVE FOR TREPONEMATOSIS, IDENTIFIED IN HUMAN SKELETON OF 15TH-19TH CENTURIES FROM IASI (ROMANIA)

Abstract author(s): Ciorpac-Petraru, Ozana-Maria - Popovici, Mariana ("Alexandru Ioan Cuza" University of Iasi, Faculty of Biology; Romanian Academy – Iasi Branch, "Olga Necrasov" Center of Anthropological Research) - Neagu, Anca-Narcisa ("Alexandru Ioan Cuza" University of Iasi, Faculty of Biology) - Groza, Vasilica-Monica - Bejenaru, Luminita ("Alexandru Ioan Cuza" University of Iasi, Faculty of Biology; Romanian Academy – Iasi Branch, "Olga Necrasov" Center of Anthropological Research)

Abstract format: Poster

In 1995, during the archaeological excavations at the Romano Catholic Cathedral from Iasi city (Romania), several human skeletons of 15th-19th centuries were discovered. Three of the 89 inhumation skeletons showed several pathological modifications on bone surface, suggestive for treponematosi. Although treponematosi lesions in human skeletons has been studied, particularly by macroscopical and imagistic approaches (i.e., X-rays, CT scans), the microscopical analysis of the affected archaeological bone tissue is an issue that has not been addressed at the same scale. This study focuses on only one skeleton with such lesions (M40, adult female), to provide information on cellular activity related to this disease from the past. Bone tissue samples were collected from the left femur and right humerus, being then subjected to the methodology for histological examination of dry bone and histotaphonomical evaluation. The taphonomic evaluation showed that the bones were very well preserved in archaeological context. Both proliferative and osteolytic processes were identified as a result of an inflammatory process. A more compact proliferative bone structure (polster) was identified in the femur sample, in which woven and lamellar bone were observed. The proliferative tissue from the humerus had a villous like architecture with numerous crypts, with the woven bone being more predominant than the lamellar one. The presence of woven bone may indicate that the inflammation was active at the time of death, and the different amounts of it between the samples may suggest that the periostitis had a different timing, first in the femur bone and then in the humerus. Sinuous lacunae were also observed in the compact bone tissue, indicating an osteolytic activity. This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-III-P4-PCE-2021-1180, within PNCDI III.

690 IN SEARCH OF SUSTAINABLE PASTORALISM: STORIES OF HERITAGE, RESILIENCE, AND COLLABORATION

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Lash, Ryan (University College Dublin) - Nieto-Espinet, Ariadna (University of Lleida) - Del Fattore, Francesca Romana (Soprintendenza Archeologia, Belle Arti e Paesaggio per le Province di L'Aquila e Teramo)

Session format: Regular session

Responding to the climate crisis will require alternatives to intensive, high emission, and environmentally destructive modes of food production. Traditional, small-scale, and extensive forms of pastoralism are increasingly recognized as possible sources of biodiversity, carbon capture, and environmental stewardship. This session considers how archaeology and ethnography can advance the search for sustainable alternatives among the vast and variable heritage of pastoralism globally.

Models of sustainability often reduce the concept to a challenge of environmental adaptation. Yet, sustainability is always also a challenge of social reproduction. Practices that are ecologically responsible must also be maintained as socially desirable and economically viable. Thus, we encourage contributions that explore the ecological, economic, and experiential dynamics of pastoralism in the past and present. In short, how can the experiences, values, and traditional knowledge of pastoralists foster the future sustainability of pastoral livelihoods?

Contributors might address one or more key themes:

- Heritage:

How do traditions of pastoralism rely upon the transmission of specific embodied skills, sensory dispositions, and perceptions of value? How do music, storytelling, and festivities play a role in valorising pastoral heritage? Can pastoralists offer alternative models for conceiving human relationships and responsibilities to animals and ecosystems?

- Resilience:

How have humans adapted pastoral livelihoods to environmental, climatic, economic, and political dynamics in the past? Does resilience depend upon the long-term reproduction of existing social and environmental conditions or short-term flexibility in the midst of inevitable change? How have different strategies of husbandry (selective breeding, transhumance, biodiversity management, etc.) enabled resilience across time?

- Collaboration:

How can collaboration with contemporary practitioners inform understandings of the past and inspirations for the future of pastoralism? Can archaeological research contribute to the improvement of current land management and planning policies?

We especially invite contributions from researchers involved in ethnography, ethnoarchaeology, and public engagement.

ABSTRACTS

1 COLLABORATION, HERITAGE AND RESILIENCE: A METHODOLOGICAL APPROACH TO SUSTAINABLE LANDSCAPE ENHANCEMENT THROUGH THE STUDY OF TRANSHUMANCE

Abstract author(s): Migliorati, Luisa (Sapienza Rome University) - Muntoni, Italo Maria (Soprintendenza ABAP per le provincie di Barletta-Andria-Trani e Foggia) - Del Fattore, Francesca Romana (Soprintendenza ABAP per le provincie di L'Aquila e Teramo) - Camerata, Flavio (U-SPACE srl) - Canino, Dario (Parco Archeologico dell'Appia antica) - Vecchione, Alessandro - SITAR-Roma)

Abstract format: Oral

The network of European transhumance routes has been a vector for the dissemination of ideas, cults, traditions, trades, knowledge of natural phenomena, diseases, remedies, etc., and has also been a factor in the integration of different human groups. The sectorial approach of transhumance studies has shown however its limits. A change is needed to deal with such a complex phenomenon that developed in different geographical regions and with different types of herds.

A multidisciplinary approach is therefore necessary to obtain fruitful results from a cultural and environmental point of view, that can be applied to different territories crossed by pastoral routes. Very often the development of mountainous/marginal geographic areas requires enhanced support through forms of close cooperation between public bodies and local communities. The aim is to foster valid forms of spatial planning compatible with protection.

Our proposal is the result of a scientific team work/confrontation that led to the definition of an ERC proposal submitted in 2020. This multidisciplinary 'cultural hub' aimed to highlight the cultural and environmental potential of the "transhumance system" in Central and Southern Italy through a strong contamination between hard sciences and humanities. We propose an innovative, sharable and replicable methodology potentially useful for defining international protocols for the study and valorisation of pastoral landscapes.

2 STORIES OF COLLABORATION, HERITAGE AND RESILIENCE. PASTORAL TESTIMONIES AND MEMORY CARRIERS ALONG THE VIA SALARA (ABRUZZO, ITALY)

Abstract author(s): Del Fattore, Francesca Romana (Soprintendenza Archeologia, Belle Arti e Paesaggio per le Province di L'Aquila e Teramo)

Abstract format: Oral

This presentation is part of PECUS (Pescasseroli Candela Upland Survey - www.pecus-project.eu), an ongoing interdisciplinary research focusing on the sheep-tracks network in Central-Southern Italy. We use data acquired between 2010 and 2016, during Fluturnum, a field-project conducted in collaboration between the University of Bologna, Matrix 96 cooperative (www.matrix96.it) and the Municipality of Scanno (L'Aquila province, Abruzzi).

The route - probably a protohistoric path - connected the municipium of Sulmo with the Samnium area, through the Sagittarius Valley and the Godi pass (L'Aquila province, Abruzzi). This seasonal "via" later became part of the network of pastoral routes (tratturi) of historical times. Humans, ideas, animals, seeds and consumer goods moved along it, including salt (as the toponym suggests) used to preserve food and as a vital supplement in ovicaprine diet. The area has been permanently inhabited at least since the late and final phases of the Bronze Age, as surveys and stratigraphic excavations demonstrate.

The long-distance transhumance towards the Apulian Tavoliere stopped in the sixties of the last century. Nevertheless, along the Via Salara, some breeders are still conducting residual pastoral activities, often reusing caves and shelters already known in ancient times. Some of them have actively collaborated with our research team, providing knowledge of places, memories and know-how. They shared with us working areas, sheepfolds and stories.

Through their testimony, they share their perception of the surrounding landscape and suggest possible strategies to respond to climate changes and to counter depopulation and abandonment in the inland Apennines areas.

3 USING TOPONOMY AND PARTICIPATORY MAPPING TO INTERPRET HERITAGE AGROSILVOPASTORAL LANDSCAPES FOR FUTURE SUSTAINABILITY

Abstract author(s): Hearn, Kyle (Public University of Navarre) - Atik, Meryem (University of Akdeniz)

Abstract format: Oral

In the county of Miranda do Douro, Portugal and the district of Serik, Turkey for centuries pastoralism, agriculture, and forest management have been closely interlinked. This agrosilvopastoral land use has created human modified cultural landscapes that are reflected in their territorial organization, local landscapes, biodiversity, and, until the mid-20th century, their sustainability as well. In both of these Mediterranean region countries, emigration and governmental natural park preservation strategies are altering a once diverse landscape that is slowly becoming abandoned and consequently more biologically homogenous as agropastoralism declines. Toponymy is a valuable lens in landscape analysis to elucidate and characterize past land uses and management as the local memory of the historic landscape fades with depopulation and abandonment. Collective memory of toponyms represents part of the Local Spatial Knowledge of the village populations. Utilizing Public Participation GIS (PPGIS) in this study, we demonstrate the value of PPGIS as a tool to access Local Spatial Knowledge to chart never before mapped toponyms of these endangered rural heritage landscapes. Using three case studies in Turkey and three in Portugal, results were placed in a GIS. Participating residents in both countries revealed field names at precise locations at a municipal and local scale that demonstrated a changing landscape once wholly dedicated to agrosilvopastoralism. In our paper, public collaboration and toponymic analysis through PPGIS demonstrated not only the declining memory of local toponymy and its connection to historic landscape use, but most importantly, they provide a visual map and database for land managers today to understand past agrosilvopastoral landscapes to apply to sustainable strategies for the future.

4 PLAYING WITH YOUR FOOD: ENRICHING ARCHAEOLOGICAL PERSPECTIVE WITH MODERN ANIMAL HUSBANDRY

Abstract author(s): Rose, Samantha (University of Aberdeen)

Abstract format: Oral

As some may say: there is no substitute for experience. This is certainly the case with husbandry skills which require hands-on knowledge transfer, in which „tricks of the trade“ help calm unruly livestock so farmers can work smarter and not harder. These tricks can also keep farmers and their animals safer and maximize yields. But how does this apply to archaeology? When examining the material culture of certain animal practices, it is this generational knowledge of animals, their behavior, their physiology, and the establishment of a working human-animal relationship that can develop new approaches to archaeological study. For this talk, sheep shearing is used as an example of how modern sheep farming retains an unbroken line of human-animal interactions passed down through prehistory. The tools, modern fleece management and processing, and even the very patterns in which sheep are sheared may have changed with time and geography, but at its core the physicality and subsequent bond between sheep and shearer remain.

5 ISLAND PASTURES: THE HERITAGE OF MARITIME PASTORALISM IN CONNEMARA, IRELAND

Abstract author(s): Lash, Ryan (University College Dublin) - Burke, Tommy (Inishbofin Island Archaeology and Heritage Walks)

Abstract format: Oral

Small-scale farming represents an important source of identity and income for inhabitants of coastal and island communities along Ireland's Atlantic seaboard. Although livestock animals feature as icons of Irish heritage in promotional tourist material, farmers working within areas of special conservation and heavy tourist traffic face significant challenges to their livelihoods.

This paper uses archaeological, ethnohistoric, and ethnographic evidence to provide a deep historical perspective on patterns of change, continuity, and the potential sustainability of small-scale pastoralism in western coastal Ireland. It will focus particularly on a distinctive form of maritime pastoralism involving the movement of livestock by boat or by swimming between coastal and island settings. Pedestrian and drone-aided survey on the border of counties Galway and Mayo has documented the remains of stone huts, boundary walls, and enclosures on numerous small, uninhabited

islands that are still used for grazing sheep or cattle. Originating in the early medieval period – if not earlier – practices of maritime pastoralism have shifted dramatically in the last century with the emergence of motor-powered boats and the transition from dairying to an exclusive focus on meat production for export.

Oral history and participant observation with contemporary farmers indicate how maritime pastoralism generates distinctive embodied skills, maintains traditional knowledge, and could play a role in the preservation of local archaeological and environmental heritage. Stories from island pastures offer both cautionary tales and inspirations for future work on the intersection of archaeology, conservation, and sustainable agriculture.

6 PASTORALIST HERITAGE, WATER SECURITY, COMMUNITY ENGAGEMENT AND SUSTAINABLE DEVELOPMENT IN NORTHERN KENYA AND SOUTHERN ETHIOPIA

Abstract author(s): Lane, Paul (University of Cambridge) - M'Mbogori, Freda (National Museums of Kenya)

Abstract format: Oral

In this paper we present the initial results of an ongoing collaborative research project supported by the British Academy and other funding bodies between archaeologists and pastoralist community organisations on the long-term history of indigenous water management and well digging in northern Kenya and southern Ethiopia, and their related settlement history. Conceived as a community archaeology project from the outset on the biocultural heritage of extant and abandoned wells, the project has brought together various local stakeholders with diverse knowledge, skills, and experience to exchange understandings of pastoralist self-organisation and sustainable development in these arid but resilient landscapes. Currently, demand for water drives government and investor development in these arid regions and is focused on building infrastructure to extract new energy sources (oil, wind, hydroelectric) to the exclusion of pastoralist rangelands and water points. While creating new economic and employment opportunities and intended to enhance water security in the region, these projects have also posed both physical and ontological threats to pastoralist heritage in both southern Ethiopia and northern Kenya, raising key questions as to how best to integrate the protection and celebration of cultural practices and traditions and heritage sites alongside providing socio-ecological development initiatives that meet community-determined values, procedures, and priorities.

7 THE POLLINO ARCHAEOLOGICAL LANDSCAPE PROJECT, ARCHAEOLOGY AND ETHNOGRAPHY OF PAST AND PRESENT PASTORAL PRACTICES IN THE POLLINO MOUNTAINS (SOUTHERN ITALY)

Abstract author(s): Attema, Peter (Groningen Institute of Archaeology) - de Neef, Wieke (University of Ghent / University of Bamberg)

Abstract format: Oral

One of the main objectives of the Pollino Archaeological Landscape Project (PALP) is the study of pastoral use of the Pollino mountain range (southern Italy) from its origins to the present day. Archaeological and environmental survey as well as the recording of abandoned pastoral structures were key activities in the first two field seasons (2020 and 2021). To this we added an interview in 2022 with a pastoralist who still had remembrances of daily life in the upland summer camp of Mandra Vecchia located at ca. 1910 m altitude near the major mountain pass known as the Grande Porta del Pollino. The interview was highly informative on the spatial, logistic, productive and social organisation of the camp of which we had documented the material remains. We also held an interview with a pastoralist still actively involved in cattle herding and discussed today's practices in comparison with past practices. In our paper we will discuss two topics. Firstly, our academic interest in the reconstruction of mountain economies over the *longue durée*. Secondly, the contribution we can make to share a valuable cultural heritage known with a wider audience in the context of the Pollino Mountain range as one of Italy's UNESCO Global Geoparks. To this end PALP collaborates closely with the governing body of the Parco Nazionale Del Pollino that generously supports the team logistically and financially.

8 SUSTAINABLE LIVESTOCK FARMING AND ARCHAEOLOGY: RESEARCH, INTERDISCIPLINARITY, COLLABORATION, AND TRANSFER AT THE SERVICE OF THE TERRITORY (CATALONIA, SPAIN)

Abstract author(s): Nieto-Espinet, Ariadna (Grup d'Investigació Prehistòrica - GIP, Departament d'Història, Universitat de Lleida, CENTAURO - PID2020-113369RJ-100 & MOBICEX - PID2019-110022GB-I00) - Trepal Deltell, Eduard (Associació d'Iniciatives Rurals de Catalunya - ARCA) - Borell Amorós, Marc (Institut per al Desenvolupament i la Promoció de l'Alt Pirineu i Aran - IDAPA) - Batalla-Carrera, Laia - Díaz De Quijano Barbero, María (Escola de Pastors i Pastores de Catalunya, Associació Rurbans) - Torras, Bernat - Aldabó, Cesc (Associació Catalana de Tracció Animal Moderna - ACTA) - Alonso, Natàlia (Grup d'Investigació Prehistòrica - GIP, Departament d'Història, Universitat de Lleida, CENTAURO - PID2020-113369RJ-100 & MOBICEX - PID2019-110022GB-I00) - Torra Burgués, Ada - Villalba Mata, Daniel (Departament de Ciència Animal, Universitat de Lleida)

Abstract format: Oral

In the European Union, Community zootechnical regulations and the current Common Agricultural Policy (CAP) have biodiversity preservation as one of their major goals, to advance a growing commitment to sustainability and care for the environment. In line with this European agricultural model of sustainability, local breeds are a clear example of a multifunctional element, providing benefits in three dimensions: economic, social, and environmental. However, the genetic diversity and continuity of many of these breeds are currently threatened by the abandonment of their exploitation and loss of their traditional uses. This is a challenge for public administrations and livestock farmers.

Archaeozoological research can provide knowledge on the evolution of livestock farming, the resilience of pastoral practices in different economic systems, and the adaptations of livestock species to local landscapes over time. Some previous results from Catalonia (Spain) warn about the disconnection between the extensive livestock models that have been traditionally implemented in the area since the Neolithic and the current industrial ones. Archaeology can help to raise social awareness of the ecological and cultural value of local breeds and traditional livestock systems. To this end, the transfer of knowledge is essential, to establish a dialogue between science and society, connecting the past with the present. But are we adapting the transfer and dissemination to the reality of the different social groups linked to the rural and livestock world? In this paper, we will reflect on these issues from the experience of more leisurely and decentralised archaeological research. We will present various experiences and initiatives of scientific transfer and dissemination that we have carried out thanks to the collaboration between livestock farmers, herders, researchers in bioarchaeology, veterinary and agronomy at the University of Lleida, and the entities working for the conservation of local breeds and extensive livestock farming in Catalonia.

691 FEELING AND LEARNING ABOUT THE PAST: NEW METHODOLOGIES FOR STUDYING ARCHAEOLOGICAL SITES

Session theme: 3. Heritage Narratives and Representations

Session organisers: Angliker, Erica (British School at Athens) - Tardin Cardoso, Isabella (Unicamp - University of Campinas)

Session format: Regular session

Excavations are the ideal place to learn about the various tasks used in archaeological fieldwork, such as registering artefacts, charting the various levels of the dug area, conserving the site, studying the ceramic finds, etc. Yet aside from familiarising students with the technical skills required in the field, excavations also put them in contact with the past, encouraging them to reflect not only on this past, but also on the environment. This panel aims to explore the many forms of learning at archaeological sites while considering new approaches and methodologies. Amongst the topics to be considered are the connections between sensorial studies and archaeological fieldwork, more specifically, how touch, light, and smell may enhance learning at archaeological sites. Of equal interest are new methodological approaches that integrate experimental activities focused on the sensorial aspects of the site, which too can teach us something about the past. We welcome papers from various regions and different periods of history.

1 LIMINAL LANDSCAPES: MATERIAL CHRONOLOGY AND THE TIMELESSNESS OF SENSORY PHENOMENOLOGY

Abstract author(s): Gipe-Lazarou, Andrew (Virginia Tech, School of Architecture) - Lafasciano, Luigi (The Diakron Institute)

Abstract format: Oral

According to renowned architect and phenomenologist, Juhani Pallasmaa, the physical landscape and built environment are understood as a total sensory experience, in which ‘qualities of space, matter and scale are measured equally by the eye, ear, nose, skin, tongue, skeleton and muscle’. These spatial qualities, which are subject to and evidence of the passage of time, provide a chronological reference for the timelessness of sensory learning, so that a partial wall, whether recently constructed in the Archaic Period or recently exhumed in the present day (mostly) conveys the same sensory experience of roughness, durability, and order. And though the architecture or artefacts of a particular time period may not be wholly extant or accessible (or else may co-exist with alternative chronologies), we maintain that their careful organization can provide the basis for a substantive (even if partial) experience of antiquity.

What is the relevance of experiential learning to contemporary education? What are the pedagogical possibilities of multisensory experience? How can modern sensory experiences inform our understanding of Antiquity?

This paper presents the pedagogy of The Diakron Institute’s ongoing Cultural Exploration of the Cyclades, an immersive educational program which explores the history and culture of the Greek islands. Students and faculty from around the world participate in the excavation of an Archaic sanctuary on the island of Despotiko, and are guided through the landscape of ritual activities carried out by Ancient Greek adolescents in preparation for ephebeia. These activities included learning how to fish along the coast and on the Sea, to sing and dance in public space, to recite poetry and practice divination in meditative space. The program’s organization references a wide range of literary and archaeological sources, emphasizing elements of cognitive and experimental archaeology, used as both a didactic tool and a platform for original academic research.

2 FROM ARCHAEOLOGICAL SITE TO CLASSROOM: EYE-TRACKING AS A TOOL TO LEARN HOW TO ANALYSE ARCHAEOLOGICAL REMAINS AND UNDERSTAND EXPERT THINKING

Abstract author(s): Michalik, Tomasz (Polish Centre of Mediterranean Archaeology, University of Warsaw)

Abstract format: Oral

Visual analysis of cultural layers and artefacts is a basic procedure in archaeological research. However, teaching the visual analysis of archaeological remains can be a challenge, mostly because seeing is not an entirely conscious process. Eye-tracking technology can be a solution to this challenge, allowing for insight to the strategies used by experts to visually analyse archaeological data.

The presentation will discuss the use of the eye-tracking technology in archaeological teaching. As a part of the project archaeological experts were invited to create educational materials presenting their methods of visual analysis of artifacts and cultural layers. Remote eye-tracking Tobii Pro Glasses 3 have been used for the recordings. The videos were shot during the excavation campaign in Archaeological Site in Old Dongola (Sudan), in the offices of the University of Warsaw and at the National Museum in Warsaw. Subsequently the educational materials were used during archaeology classes conducted at the University of Warsaw and evaluated by students.

The results show that the recordings of experts’ eye movements during the analysis of artefacts (flint tools, stone tools, pottery fragments and paintings) provide numerous educational benefits for archaeology students (i.e. acquiring the first-person perspective of the experts). The students see the potential of this method in learning how to analyse various archaeological data. Moreover in students opinion the videos can make a significant contribution to remote education (i.e. in situation when personal contact with expert and artefacts is limited). Thus eye-tracking materials can be an important element in the democratization of learning – making experts’ way of thinking more accessible for students participated in fieldwork, in classroom as well as in remote education.

3 THE USE OF SENSORIAL STUDIES TO REPOPULATE ANCIENT EGYPTIAN HOUSES: THE CASE OF AMARNA

Abstract author(s): Rocha da Silva, Thais (University of Oxford; University of São Paulo)

Abstract format: Oral

The study of ancient Egypt settlements and houses traditionally focused on architectural features and artefact assemblage to determine how people lived in the past. Isometric models and photogrammetry have been used to, sometimes, fill the gaps of missing data, allowing scholars to extrapolate the available information and readjust their

questions. In parallel, these models have allowed non-academic audiences to glimpse the lifeways of ancient populations. As much as the investigation of settlements have developed in the last decade, ancient Egypt cities and houses are still depopulated. The nature of Egyptological publications for settlements and houses, either focused on architecture, or on artefact groups, offers but a fragmentary perspective about how ancient Egyptian may have lived. In this regard, sensorial studies have demonstrated to be useful to repopulate these locations. In this presentation I discuss the benefits and limitations of sensorial studies to the investigation of ancient Egyptian domestic space, taking the ancient city of Amarna as a case study. By highlighting the sensorial experience of dwelling, we need to include modern ethnographic information and bring local communities upfront.

4 **DESPOTIKO: A SITE FOR LEARNING ARCHAEOLOGY THROUGH SENSORIAL EXPERIENCES**

Abstract author(s): Angliker, Erica (British School at Athens)

Abstract format: Oral

Excavations are the ideal place to learn about the various tasks involved in archaeological fieldwork, such as registering artefacts, charting the various levels of the dug area, conserving the site, and cataloguing the ceramic finds. Since 2022, students in classics, history, literature, and law have been coming to the site of the sanctuary of Apollo on the island of Despotiko in the Cyclades to familiarise themselves with the technical skills that archaeologists use. This contact with the past encourages them to reflect not only on this piece of the past but also on the environment in which the people who worshipped at the sanctuary lived.

This paper describes the new forms of learning taking place at archaeological sites such as Despotiko, where new approaches and methodologies are helping to re-evaluate the past. Thus, the students register their sensorial experiences during the process of excavating through such activities as drawing, photographing, or taking video of the site or recording their impressions in writing. These data are then registered and compared to reveal ways in which touch, light, and smell can enhance learning at archaeological sites. Likewise, the new methodological approaches, by integrating experimental activities such as carving marble with ancient tools and producing pottery, help to reveal the sights, sounds, smells, tastes, and textures of the site so as to bring the past alive.

5 **SENSORIAL APPROACHES IN THE ARCHAEOLOGICAL FIELDWORK**

Abstract author(s): Pyrgaki, Marie (Universite Paris I, Pantheon-Sorbonne; Hellenic Open University)

Abstract format: Oral

In this paper we discuss the influence of the “sensory turn” in the social sciences that was first manifested in archaeology in the late 1990s. We examine how the field of sensoriality of an archaeological excavation, is structured by. This paper aims to correlate current trends on archaeological theory about non-rational decision-making factors in pre-historic communities, such as senses, with current mapping and geo-analytical techniques. We explore why sensorial approaches in archaeology have been criticized.

We explain how the significant advances in archaeological computing, digital methods, and sensory approaches have help archaeologists to rethink strategies and methods for creating narratives of the past.

Progress in data visualization and implementation, as well as other digital sensory methods, means that it is now easier to explore and experience ancient space from a perspective, from the individual body or single building to the wider landscape.

We think that sensory archaeology is one more element in the toolkit that enriches our understanding of the past.

692 **CRMARCHAEO WORKSHOP: A STEPPING STONE TO FAIR PRACTICE**

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Stead, Stephen (Open University; Paveprime Ltd) - Jansen, Jane (Arkeologerna; Intrasis)

Session format: Workshop

In this workshop we will explore how to use CRMarchaeo, part of the CIDOC Conceptual Reference Model, to link a wide range of existing archaeological documentation.

When working with data deposited in archives in different eras and by different organisations using ever-evolving recording methodologies, a recurrent problem is being able to systematically access elements of the record without immersing oneself in the recording milieu of the original deposits. This high intellectual cost must be paid by each scholar wishing to work on the records of a particular archaeological investigation and so effectively creates a barrier to extensive reuse of archived data. The FAIR data principles require “that all research objects should be Findable, Accessible, Interoperable and Reusable (FAIR) both for machines and for people” (Wilkinson et al. 2016). One approach to making data FAIRly accessible while reducing the effort to a single “intellectual act” is to map to a “lingua franca”, such as CRMarchaeo.

The CRMarchaeo extension has been created to promote a shared understanding of how to formalise the knowledge extracted from the observations made by archaeologists. It provides a set of concepts and properties that allow clear explanation (and separation) of the observations and interpretations made, both in the field and in post-excavation.

Attendees will work through a series of case studies that reflect different excavation documentation practices: from 1950s style day books through to context recording sheets. Followed by database/CAD combos and on to modern integrated object oriented database/GIS systems, like Intrasis.

The aim is to explore archetypical solutions and provide attendees with hands-on experience of mapping actual documentation practice to CRMarchaeo. This can then be applied to their own or archive documentation, both current and historical, in their own institutions or archives and lead to integrated reusable composites being available for both internal and external use.

693 ZOOARCHAEOLOGY AND MOBILITY IN THE PAST: HUMAN-ANIMAL INTERACTION IN ARCHAEOLOGY FROM PALAEOLOGIC TO MEDIEVAL TIMES [PAM]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Pazos García, Rocío (Universidad de Salamanca) - Cerezo Fernández, Rosana (Universidad de Salamanca; Université Toulouse) - Portero Hernández, Rodrigo (Universidad de Salamanca; Instituto de Investigaciones Prehistóricas de Cantabria) - Detry, Cleia (Centro de Arqueologia da Universidade de Lisboa - UNIARQ) - Álvarez Fernández, Esteban (Universidad de Salamanca)

Session format: Regular session

Mobility is a quality of individuals and social groups that have the ability to move around the territory for economic, social and/or cultural reasons. In this sense, mobility is a dynamic reality that must be considered in archaeological research on all historical periods. In recent decades, zooarchaeology has advanced in the knowledge of the forms of mobility of human groups from Prehistory to the present day in combination with various analytical techniques (DNA, dental microwear, osteometry, isotopic analysis, ZooMs). Aspects such as the seasonality of human occupations in the Palaeolithic in relation to hunting, migratory movements as a subsistence strategy, the functionality of settlements, the introduction of domestic animals, the improvement of certain aspects of livestock or the presence of “exotic” species in various archaeological contexts are some of the markers that allow us to trace the networks of mobility in past societies. These markers are part of the daily activity of past societies and are linked to their survival and social behaviour. Therefore, zooarchaeology has become a very useful tool to establish mobility in the various (pre) historical societies, be it short, medium, or long distance.

This session aims to create an open forum to analyse human decisions to move through different territories based on the relationship between humans and animals documented in the archaeological record in any spatial framework from Palaeolithic to Middle Ages. Proposals related to, among others, the following are welcome:

- Mobility as a subsistence strategy
- The seasonality of occupations based on dental meso- and micro-wear
- Social and commercial relationships in ancient societies
- The introduction of domestication
- DNA analysis and animal migrations
- Mobility through isotopic analysis
- Osteometry and species variability
- Ancient communication networks
- The introduction of livestock improvements
- Trade in animals and secondary products
- The presence of exotic animals in archaeological contexts
- Animal resources management

ABSTRACTS

1 THE OSSEOUS INDUSTRY IN THE SOLUTREAN-BADEGOULIAN TRANSITION OF ABRI FRITSCH (INDRE, FRANCE)

Abstract author(s): Borao, María - Pétilion, Jean-Marc (CNRS, Laboratoire TRACES – UMR 5608)

Abstract format: Oral

Abri Fritsch is located in the Indre area, in the centre of France. The site was discovered in 1957 by A. Fritsch, who directed the excavation first, followed by J. Allain and F. Trotignon over 18 years. The stratigraphy reached three metres and it is composed of rich Solutrean, Early and Late Badegoulian layers. Nowadays, the site is being restudied by

different archaeological disciplines to obtain more accurate data from the archaeological remains and reconstruct the way of life at Abri Fritsch over time.

In this work, we focus on the Solutrean and Early Badegoulian osseous industry. The aim is to develop a systematic study from a technological point of view to identify and characterise operational schemes on bone and antler. Through the “Refitting by default” method we analysed waste products, blanks, roughouts and objects. It allowed us to observe how raw material was obtained and transformed into a toolkit. Then, we extracted enough economic information to compare both cultural periods from a technical and typological perspective, inferring not only from the employed techniques but from the variability of the manufactured tools and their use in daily life at the Abri Fritsch.

2 FOOD IN THE PITS: CONTENT ANALYSIS OF MAGDALENIAN NEGATIVE STRUCTURES IN THE TITO BUSTILLO CAVE-DWELLING AREA (RIBADESELLA, ASTURIAS, SPAIN)

Abstract author(s): Alvarez-Fernández, Esteban (University of Salamanca) - Cueto, Marián (Universitat Autònoma de Barcelona) - Fernandes, Ricardo (Max Planck Institute for Geoanthropology) - García-Escarzaga, Asier (Universitat Autònoma de Barcelona) - Tapia, Jesús (Sociedad de Ciencias Aranzadi) - Aronés-Abad, Marco - Cerezo-Fernández, Rosana - Marchán, Alberto - Martín-Jarque, Sergio (Universidad de Salamanca) - Uzquiano, Paloma (UNED, Talavera de la Reina)

Abstract format: Oral

The valley of the river Sella concentrates many caves and rock shelters with prehistoric occupations, among them Tito Bustillo Cave. It has one of the most important Magdalenian occupations in Western Europe. In the 2022 fieldwork carried out in the Dwelling Area, three structures were excavated to a semi-sterile level in a space of less than one square metre. Abundant biotic and abiotic remains were documented in them. Among the former, the great abundance of marine molluscs stands out (particularly the marine gastropod *Littorina littorea*, but also *Patella vulgata*), as well as a considerable number of remains of ungulates, particularly *Cervus elaphus*. The content of the pits is completed by anthracological remains and bone and lithic industry. In this communication we analyze these remains in detail, discuss their chronology, and assess the functionality of these unusual structures in Upper Palaeolithic cave sites. Finally, we value the management of the territory of the human groups that inhabited Tito Bustillo Cave during the Magdalenian.

3 REINDEER ANTLERS AS HUMAN MOBILITY MARKERS IN NORTHERN IBERIA DURING THE MAGDALENIAN (CA. 21-13 CAL KA BP)

Abstract author(s): Lefebvre, Alexandre (Grupo I+D+i EVOADAPTA, Universidad de Cantabria) - Pétilion, Jean-Marc (CNRS, UMR 5608 TRACES) - Marín-Arroyo, Ana (Grupo I+D+i EVOADAPTA, Universidad de Cantabria) - Cueto, Marián (Universitat Autònoma de Barcelona) - Álvarez-Fernández, Esteban (Departamento de Prehistoria, Historia Antigua y Arqueología, Universidad de Salamanca) - Arias Cabal, Pablo (Instituto Internacional de Investigaciones Prehistoricas de Cantabria, Universidad de Cantabria) - Ontañón, Roberto (Museo de Prehistoria y Arqueología de Cantabria; Instituto Internacional de Investigaciones Prehistoricas de Cantabria, Universidad de Cantabria) - Berganza, Eduardo (Sociedad de Ciencias Aranzadi)

Abstract format: Oral

Interactions between prehistoric foragers and reindeer at the end of the Pleistocene are still poorly documented in northern Iberia, particularly the reasons and means by which their antlers were collected, processed and circulated. This is particularly due to difficulties in determining the extent of the ecological niche of the species in the region, and more especially to the lack of extensive studies focused on their antler. Here we have systematically reviewed the main osseous industries, dated to between 21 and 13 cal ka BP, focusing on the use and circulation of reindeer antlers as a raw material for the production of weapons and tools by Magdalenian foragers. Thirty-six reindeer antler artefacts were identified from 11 Iberian sites that are located at either end of the Pyrenees: the Cantabrian region to the west, and to a lesser extent, Catalonia to the east. Despite biases in the identification of production objectives (end-products), a detailed techno-typological, chronological and geographical analysis of these assemblages reveals both the existence of a consistent reindeer antler industry in northern Iberia and long-distance connections between the Cantabrian region and the Pyrenees. Finally, the integration of contemporary archaeozoological data makes it possible to explore the extension of the reindeer’s ecological niche, as well as strategies for the acquisition and circulation of reindeer antlers in northern Iberia.

This study was financed by an international collaboration between the Spanish Ministry of Science and Innovation (MCIN/ AEI/10.13039/501100011033) and the European Union (NextGenerationEU/PRTR) as part of the HumAntler project (PCI2021-122053-2 B).

4 **ANTLER MANAGEMENT IN THE SELLA VALLEY: THE OSSEOUS INDUSTRY FROM THE SITE OF COVA ROSA (RIBADESELLA, NORTHERN SPAIN)**

Abstract author(s): Fernández, Rosana (University of Salamanca; Université Toulouse) - Pétilion, Jean-Marc (Université Toulouse) - Cueto, Marian (Universitat Autònoma de Barcelona) - Panero, Lucia (University of Salamanca) - Portero, Rodrigo (University of Salamanca; Instituto de Investigaciones Prehistóricas de Cantabria) - Tapia, Jesus (Sociedad de Ciencias Aranzadi, San Sebastián) - Jordá Pardo, Jesus (Universidad Nacional de Educación a Distancia, UNED) - Álvarez Fernández, Esteban (University of Salamanca)

Abstract format: Oral

This communication introduces aspects of the management and transformation of deer antler by hunter-gatherer groups during the Cantabrian Magdalenian (17-14 Ka cal BP), and specifically in the Sella valley. Numerous Magdalenian sites are concentrated in this region, making the study of their material remains interesting to determine the potential particularities of a specific territory inhabited by human groups. To this end, more than a hundred remains of this raw material from the archaeological site of Cova Rosa (Asturias, Northern Spain) have been analyzed. The examination of these antler remains, from an anatomical, taxonomic, typological and technological point of view, has allowed us to distinguish several strategies for the collection and selection of the antler, as well as to reconstruct part of the „chaîne opératoire“ of the manufacture of tools at this site. This study has also enabled us to introduce aspects of the use and recycling of the tools. Finally, through a bibliographical review of studies of the osseous industry in the Sella valley, we can confirm a relative homogeneity, at least topologically, of osseous tools in the archaeological record. Ultimately, this communication highlights the need for the inclusion of these methodological approaches in research on deer antler working during the Magdalenian period in the studied territory.

5 **CONSUMPTION OF FAT IN THE MAGDALENIAN: STUDY OF THE FRACTURING PATTERNS OF PHALANGES FROM TITO BUSTILLO CAVE (RIBADESELLA, ASTURIAS, SPAIN)**

Abstract author(s): Arones Abad, Marco (Universidad de Salamanca) - Portero, Rodrigo (Universidad de Salamanca; Instituto de Investigaciones Prehistóricas de Cantabria) - Cueto, Marián (Universitat Autònoma de Barcelona) - Tapia, Jesús (Sociedad de Ciencias Aranzadi) - Álvarez-Fernández, Esteban (Universidad de Salamanca)

Abstract format: Oral

Fat is a basic element in the human diet both for its high energy balance and for the multiple physiological functions performed by lipid components. The consumption of fat from the bone marrow obtained through the intentional fracturing of bones is widely attested in the Cantabrian Upper Paleolithic. In this study, the fracturing patterns of the phalanges of mammals (one of the last reserves of fat in an animal) are evaluated with the aim of identifying the patterns of their processing and verifying whether cultural inferences can be made in this regard. To this end, bone remains recovered from the Dwelling Area in Tito Bustillo Cave (Ribadesella, Asturias, Spain), one of the most representative Magdalenian sites on the Cantabrian coast, are analyzed. In turn, the archaeozoological analysis of this study aims to be an approximation to the capture of resources and the mobility of Paleolithic groups in the Sella valley.

6 **SUBSISTENCE STRATEGIES AND TERRITORIAL MANAGEMENT ON THE LOWER MAGDALENIAN AT EL CIERRO CAVE (RIBADESELLA, ASTURIAS, SPAIN)**

Abstract author(s): Portero Hernández, Rodrigo (University of Salamanca) - Cueto Rapado, Marián (Autonomous University of Barcelona) - Elorza, Mikel (Aranzadi Science Society) - García-Villanova, Rafael - Álvarez-Fernández, Esteban (University of Salamanca)

Abstract format: Oral

El Cierro cave (Ribadesella, Asturias, Spain) has one of the most complete stratigraphies in Cantabrian Spain, with different levels spanning the Middle Palaeolithic to the Mesolithic. In this conference we discuss the zooarchaeological analysis of the Lower Magdalenian levels, Cierro G1, Cierro G and Cierro F, resulting from the archaeological fieldwork carried out in the site between 1976 and 1979 by F. Jordá Cerdá and A. Gómez Fuentes, and those carried out in 2014 by E. Álvarez-Fernández. These levels have been dated between 20 and 17 ky cal BP.

The analysis of the faunal remains from these levels has documented the presence of macromammals, fish, molluscs, and birds. Through taphonomic analysis we determined the role played by the different animal resources in the diet of the Magdalenian hunter-gatherers, establishing the processing and consumption of prey and the seasonality of their captures. In addition, we calculate the caloric energy and nutritional intake of these resources in relation to the cost of searching, handling, and transporting them. This allows us to approach the ways in which human groups managed the resources in their environment and to compare the results at different times of Magdalenian occupation of the cave.

7 IDENTIFYING FRESHWATER TURTLES AND TERRESTRIAL TORTOISES IN THE ARCHAEOLOGICAL RECORD TO STUDY MOBILITY, TRADE, AND RESOURCE USE IN THE MEDITERRANEAN

Abstract author(s): Chorro-Giner, Marina (University of Sheffield; Archaeology.biz)

Abstract format: Oral

Terrestrial tortoises and freshwater turtles have been exploited by humans across the Mediterranean since the early Pleistocene; they were exploited for food, raw materials for crafts, and had symbolic values. By studying the remains of different species we can explore how different Mediterranean communities interacted with their resources and the mechanisms of trade and exchange that may have existed. Most of these species occupy distinct regional areas, thus they make excellent proxies to study mobility, trade, and cultural interactions. However, the difficulty in identifying and differentiating terrestrial tortoises and freshwater turtles in the archaeological record makes this task especially challenging. Current methodologies rely on the use of morphological traits for the differentiation and identification of species, which requires specialist knowledge and can be highly subjective, leading to mis- and under identification. To improve the study of these species, a new methodology based on morphometry is here proposed. With this new approach, we can improve our ability to reliably identify these species in the archaeological record, a critical step in unlocking the potential for these assemblages to inform on the people who exploited them and their environment. This paper explores the potential for the establishment of a new morphometric approach to the study of terrestrial tortoises and freshwater turtles in the Mediterranean through the study of zoological and zooarchaeological collections. Once established, morphometric approaches can be applied easily and affordably to a wide range of archaeological collections allowing for new research opportunities and a better understanding of mobility, trade, and cultural interactions across the Mediterranean from prehistory to post-medieval times, which will be illustrated through case studies.

8 NEW DATA ABOUT SHELLFISH GATHERING DURING THE LATE PLEISTOCENE IN THE SELLA VALLEY

Abstract author(s): Marchán, Alberto (Universidad de Salamanca, Departamento de Prehistoria, Historia Antigua y Arqueología) - Uribesalgo, Amaia (Universitat Autònoma de Barcelona, Departament de Prehistòria) - Cueto, Marián (Instituto Internacional de Investigaciones Prehistóricas de Cantabria - IIIPC, Universidad de Cantabria) - Jordá Pardo, Jesús (UNED, Laboratorio de Estudios Paleolíticos, Departamento de Prehistoria y Arqueología) - Martínez Villa, Alberto (Centro Ecomuseo de la Fauna Glacial de Onís) - Tapia, Jesús (Sociedad de Ciencias Aranzadi) - Álvarez-Fernández, Esteban (Universidad de Salamanca, Departamento de Prehistoria, Historia Antigua y Arqueología)

Abstract format: Oral

This communication presents the results of the analysis of archaeomalacological remains from archaeological excavations in the Sella valley (Asturias, Spain). Shells from Tito Bustillo (Dwelling Area, SUs 101 to 104), Cova Rosa (Layers AO to B11), La Lloseta (Clark Sector, Level VI) and El Cierro (Sala de la Natividad, Levels 3 and 4) have been studied. This analysis has been performed from a taxonomic, quantitative, taphonomic and biometric point of view. In the selected sample, species collected for their bromatological interest prevail (mainly *Patella vulgata* and *Littorina littorea*), although taxa of no food value have also been documented. Anthropogenic alterations have been detected in the shells, ranging from thermoalteration to fractures caused by limpet collection. The latter alteration has been identified by experimentation with current specimens. The results obtained in this study are compared with existing information on nearby sites, reflecting on the mobility of shellfishing groups in the Sella valley during the Magdalenian period.

9 HERDING IN THE DESERT: ANIMAL MANAGEMENT, SETTLEMENT STRATEGIES, AND CULTURAL DYNAMICS THROUGH BIOMOLECULAR ARCHAEOZOOLOGY IN THE HOLOCENE CENTRAL SAHARA

Abstract author(s): Di Matteo, Martina (Department of Ancient World Studies, Sapienza University of Rome) - McGrath, Krista (Department of Prehistory & Institute of Environmental Science and Technology - ICTA, Universitat Autònoma de Barcelona) - Soncin, Silvia (Department of Environmental Biology, Sapienza University of Rome) - di Lernia, Savino (Department of Ancient World Studies, Sapienza University of Rome; GAES, University of the Witwatersrand)

Abstract format: Oral

Pastoralism is seen as a lifestyle in which animal husbandry and mobility are fundamental elements. Animals and movements define how humans perceive and live in the world. Animal resources provide a vehicle for lasting social relationships in pastoral societies, relationships that are maintained across generations.

Due to its flexibility and mobility, pastoralism is considered a resilient adaptation strategy and key to ecological uncertainties and social pressures.

The study of pastoral phases in Saharan contexts, and those from hyper-arid environments, is affected by a highly fragmented zooarchaeological record, which leads to limited taxonomic determinations. This causes a lacunose picture of the animal species exploited in the past.

“Zooarchaeology by Mass Spectrometry” (ZooMS), offers new research perspectives on animal management strategies in this context by identifying morphologically ambiguous or unidentifiable bone fragments.

ZooMS applied to faunal remains referable to pastoral sites (8300-4600 years ago calibrated) from the Central Sahara (SW Libya) has the potential to better define the relationship between animals, humans, and the territory, in one of the areas with the oldest evidence of domesticated animals in the African continent.

Using this biomolecular approach, this paper deepens the characteristics of Saharan pastoralism through a detailed analysis of how animal resources were exploited and managed. It also permits the identification of those species that are still ‘invisible’ in the archaeozoological record (like sheep and goats) but represent important pastoral cultural markers. This furthermore helps to better evaluate the seasonal mobility systems enacted to cope with an unstable and unpredictable environment.

10 HISTORICAL SOURCES FOR THE STUDY OF PREHISTORIC COASTAL SOCIETIES IN NORTH IBERIA: BEYOND ANALOGIES

Abstract author(s): León Cristóbal, Alejandro - Fano, Miguel Ángel (Universidad de La Rioja)

Abstract format: Oral

In recent years, knowledge of the use of coastal areas in north Iberia by hunter-gatherer societies has been favoured by the application of sophisticated analytical techniques that generate data of special interest for the study of the archaeological phenomenon of shell-middens. However, the limits of our work are still marked by the ‘archaeological record’, and therefore it is assumed that strictly social aspects, or social organisation, lie outside the scope of our possibilities of interpretation, since they do not crystallise in archaeological materiality. It is now some time since the North American view of ‘Archaeology as Anthropology’ built bridges towards the ‘dynamics’ of past societies. Our own academic tradition has also applied ethno-archaeological approaches, from a different perspective, such as the one carried out on Yamana society. The interest of actualist approaches is still valid, possibly today more than ever, owing to the need to furnish the new data with an interpretative theoretical framework in which they can acquire their full value. We accept that information about historical hunter-gatherer societies, such as the descriptions of those who took part in the colonisation of America, can be used in the formulation of hypotheses, in order to widen the choice of questions to ask of the archaeological record corresponding to the Mesolithic and early Neolithic on the Cantabrian coast; in sum, to add new tools to our study methodology. This communication will present the theoretical proposal and assess the possibilities offered in relation to all this by historical sources (15th century and thereafter) that describe the coastal hunter-gatherer societies and incipient farming communities known to Spanish chroniclers in America. Priests, sailors and soldiers provided information about their economy and social organisation, among other aspects.

11 WALKING IN CATTLE SHOES: THE EFFECT OF ENVIRONMENT ON THE MORPHOLOGY OF BOS PHALANGES

Abstract author(s): Yousef Pouran, Kaveh - Saña, Maria - Alcàntara Fors, Roger (Archaeozoology Laboratory, Departament de Prehistòria, Universitat Autònoma de Barcelona)

Abstract format: Oral

The analysis of spatially small-scale movements can elucidate the sociocultural structure of the Neolithic communities at a higher resolution and in finer detail than the study of large-scale expansions. Like long-distance movements, some short-distance communications between settlements were facilitated by animals, such as cattle, as transportation mediums or subjects of trade. Any change in animal locomotion pattern resulting from travelling with humans can be potentially reflected by long bones such as metapodials and phalanges. However, in the case of spatially small movements, and due to the shorter travelled distance, the said effect is harder to detect even for cart-pulling cows, especially the younger ones. This can happen if the mechanosensor cells do not receive enough stimulation to trigger bone remodelling, and consequently, the resultant macroscopic morphological changes are harder and even impossible to detect. All things considered, if the short distance included a significant variation in the mechano-environment of the animal in question, then the morphological changes will be detectable. Such a scenario is common in mountainous areas where, over a short trip, walking on a more or less flat land turns into a physically demanding climb. In this regard, Pixarelles cave provides an exceptionally unique opportunity to study small-scale movements between the (Iberian) middle neolithic communities. It is in a mountainous region, slanting enough to affect the animal's loco-

motory system permanently. The main objective was to determine if Bos were being herded locally in Pixarelles or if they had been transferred from neighbouring societies. Finite element analysis confirmed that the observed variation reflects the effect of the environment, such as the slope of the ground, on the cattle locomotory system. It was concluded that the cave consisted of various assortments of cattle, some local to the mountainous nearby area, others from more flatland, and some experienced hard labour exploitation.

12 SHIFTING LANDSCAPES, CHA(LLE)NGING IDENTITIES? WANDERING COMMUNITIES BETWEEN CARPATHIANS AND LOWER DANUBE IN THE TWILIGHT OF EARLY IRON AGE

Abstract author(s): Mandescu, Dragos (Arges County Museum)

Abstract format: Oral

On the territory between Carpathians and Lower Danube (southern Romania), the transition from the middle stage of the Early Iron Age to the late one (during the end of the 8th c. and the first half of the 7th c. BC) involves structural transformations due to the dissolution of the Basarabi cultural unity and the emergence of various cultural groups that share different smaller territories. The paper will focus on the habitat changes and transformations that occurred in the funerary domain during this specific period in one of these smaller cultural groups, namely the Fergile group. The favorite habitat territories of the vanishing Basarabi culture, such as the Danube Plain, are abandoned and new areas are occupied instead, especially the high submontane hills rich in salt (a must-have resource for herds). Many cremation necropolises appear, but the settlements are missing. The absence of significant settlements, contrasting with the stable previous Basarabi habitats, outlines the idea of increased population mobility. This also means a change in the economy, from one predominantly based on agriculture, to one focused on animal husbandry, always on the road in search of new pastures for herds. The meat offerings from the graves belong to species suitable for transhumance. The alignment of the cemeteries along the rivers seems to indicate precisely the transhumance routes of these much more mobile populations than those of the Basarabi culture. The horse, as agent of mobility, takes on an increasingly significant place within communities, as can be seen from the widespread distribution of horse gear and even horse bones in some graves. The question that remains is whether this clear change in environmental and economic patterns is the result of an old population adapting to new realities, or are we dealing with a dramatic population replacement?

13 ZOOARCHAEOLOGY OF EARLY IRON AGE IN CENTRAL SPAIN: THE SITE OF CERRO DE SAN VICENTE (SALAMANCA, SPAIN)

Abstract author(s): Pazos García, Rocío (Universidad de Salamanca) - Saña Seguí, María (Universitat Autònoma de Barcelona)

Abstract format: Oral

This presentation will show the first results of the zooarchaeological and taphonomic analysis of the Early Iron Age settlement Cerro de San Vicente (Salamanca, Spain). A sample of the faunal remains from the 7th-6th centuries BC midden excavated during successive campaigns (2006, 2017, 2021 and 2022) has been studied, which corresponds to the discarded culinary waste from an aristocratic district of the settlement where sumptuary products from the Eastern Mediterranean were documented. It will give us an insight into the organisation of food resources of animal origin at the site during these centuries. We will examine questions such as the composition of the livestock, the permanence of hunting activities, the use of animals as pets, the socio-economic status of its inhabitants, etc. For this purpose, the remains were analysed from an anatomical and taxonomic point of view. The NR, NISP, MNE and MNI were calculated to estimate the volume of fauna that occupied the site. Subsequently, using bone fusion standards and dental eruption and wear, the age at which individuals died was determined. Finally, a taphonomic analysis of the marks found in the archaeological material (anthropogenic, produced by carnivores, and by natural agents) was carried out. This research will show which species were part of the settlement, and will be compared with other sites of similar chronology on the Iberian Peninsula.

14 CATTLE MOBILITY FROM THE MEDITERRANEAN TO PRESENT-DAY AUSTRIA DURING THE IRON AGE: COMBINING ANCIENT MITOCHONDRIAL DNA ANALYSIS AND MORPHOMETRY

Abstract author(s): Saliari, Konstantina (Naturhistorisches Museum Wien) - Amory, Christina (Institute of Legal Medicine, Medical University of Innsbruck) - Draganits, Erich (Department of Geology, University of Vienna) - Rams, Peter (Institute of Prehistory and Historical Archaeology, University of Vienna) - Tobias, Bendeguz (Institute for Medieval Research, Austrian Academy of Sciences) - Pucher, Erich (Natural History Museum Vienna) - Parson, Walther (Institute of Legal Medicine, Medical University of Innsbruck)

Abstract format: Oral

Morphometric examinations on cattle bones from Roman period sites in present-day Austria suggest the arrival of a new cattle population, which has been connected with the conquest of this area by the Romans and related imports

of cattle from the South. However, recent finds of cattle remains, similar to those found in the Roman period, in two late Iron Age sites suggest import of cattle from the Mediterranean already long before the arrival of the Romans. Ancient mitochondrial DNA analysis on fourteen Iron Age and Roman period cattle teeth and bones provide for first time clear evidence on cattle mobility from the Mediterranean to areas north of the Alps through the documentation of haplogroups T1 and T5. Our results offer new archaeogenetic data, help testing established morphometric criteria used for the study of the various Iron Age and Roman period cattle morphotypes, offer insights into the origins and evolution of local cattle populations in present-day Austria and suggest contacts and complex mechanisms of live-stock exchange during the late Iron Age, before the arrival of the Romans.

A. POPULATION GENOMICS AND DOMESTICATION HISTORY OF YAKS FROM THE INDIAN HIMALAYA: PRELIMINARY INSIGHTS FROM ANCIENT DNA

Abstract author(s): Natesh, Meghana - Witonsky, David (University of Chicago) - Ota, S B (Archaeological Survey of India) - Joglekar, Pramod (Deccan College) - Raghavan, Maanasa (University of Chicago) - Rai, Niraj (Birbal Sahni Institute of Paleosciences)

Abstract format: Poster

Domestication has played an important role in human history, particularly over the Holocene. DNA-based analysis on domesticates and their wild relatives has helped to elucidate the genomic changes underlying domestication. Where possible, the addition of ancient and historical samples has helped enrich our understanding of the time-scale and the evolutionary history of the domesticates.

Yaks (*Bos grunniens*) are a bovid species endemic to the high elevations (~ 3000 – 6000 MSL) of the Tibetan plateau and surrounding regions, including the Himalayas. They are adapted to the harsh environment at high elevations, including hypoxic conditions, grazing on short grasses, and high UV exposure. Yaks form an integral component of many high high-altitude Himalayan human communities in India. Genomic data from modern yaks from Tibet places the domestication event close to 7,300 YBP, coinciding with human population expansions in the region (Qiu et al., 2015). We aim to analyse ancient yak DNA from the Ladakh region in Northern India, in addition to modern domestic and wild yak, to study their genomic history and the timing of domestication.

DNA was extracted from bone samples (n=6; morphologically identified as yaks) from archaeological sites in Ladakh, and screened for endogenous content. The DNA was mapped against yak and cow reference sequences to confirm species identity. Our preliminary results from low coverage sequencing suggest that the DNA originates from yaks and contains damage signals consistent with ancient samples. A preliminary mitochondrial phylogeny confirms their identity as yaks. Based on further sequencing data from the samples, we will analyse nuclear variation to examine their demographic history and divergence from cattle and wild yaks.

B. ONLY HARNESSSES AND HORSES. COULD HUMAN SKELETAL TRAUMA BE THE EARLIEST EVIDENCE OF HORSE-RIDING IN NORTH-WEST EUROPE?

Abstract author(s): Grzybowska, Milena (Archaeological Research Services Ltd)

Abstract format: Poster

Identification of the earliest examples of horse utilisation relies heavily on preservation of harnessing equipment (i.e. cheek pieces, terrets etc.) and the analysis of animal bone assemblages. This paper highlights one under-explored avenue of research that may offer complementary data to this subject, namely the analysis of human skeletal trauma and its potential to furnish new information on horseback riding.

This case study focuses on multiple skeletal lesions of an adolescent female, radiocarbon dated to the Early Bronze Age, and placed centrally within a ring ditch in Ponteland, Northumberland (England). The investigation was prompted by the results of prior analysis of the individual's widespread perimortem trauma, best understood as concomitant injuries induced by a high velocity fall, that had occurred most likely while travelling at speed.

This phase of research focuses on a detailed characterisation of pelvic morphology, and characterisation and understanding of possible aetiologies of antemortem injuries suffered by the adolescent. This was achieved with help of three-dimensional modelling as well as microscopic and radiographic imaging. Results were then considered in the light of current medical research on equestrian/sport injuries.

The skeletal remains of the adolescent presented a host of evidence that was indicative of a specific set of conditions associated with the observed trauma. All identified skeletal changes, although not specific to horseback riders, frequently occur among this sport group. This evidence is reviewed against wider regional evidence for horsemanship to consider the potential for human skeletal evidence to contribute to this important area of study.

Session theme: 3. Heritage Narratives and Representations

Session organisers: Mele, Marko (Universalmuseum Joanneum) - Fabian, Szilvia (Hungarian National Museum) - Mihelić, Sanjin (Archaeological Museum Zagreb)

Session format: Regular session

Archaeology is continuously juggling the need toward ever refined specialization and the necessity of opening up to wider reaches of society. The first force drives our discipline to sharpen its focus on increasingly smaller segments, while the other stimulates us to develop empathy towards local communities, local authorities, NGOs or the tourism sector. The ongoing trend of demanding an ever more abundant body of evidence from our profession towards the society to justify public funding, has arguably shrank the size of the financial pie for undiluted research. On the other hand it has also inspired us to open our minds and hone our soft skills in dealing with others in the public/private arena in a synergistic search for common benefits.

Routed Archaeology EAA sessions have for the past few years aimed to bring together professionals who have subscribed to the idea that a participative approach to governance of archaeological heritage is either the solution, or at least a useful methodological framework for deciding and acting for the benefit of everyone across the stakeholder spectrum, not least our discipline or local communities.

In searching for tested and proven examples that participative approach is a valuable and useful strategy we once again wish to put forward in this session series the concept of cultural routes, as they offer a highly useful context for constructive alignment of otherwise often conflicting objectives advocated by diverse stakeholders.

Alongside practical and theoretical contributions on cultural routes we invite also discussions on the most important documents that have substantially shaped our approach to dealing with archaeological heritage, such as the Faro Convention and the brand new ICOMOS International Cultural Heritage Tourism Charter: Reinforcing Cultural Heritage Protection and Community Resilience through Responsible and Sustainable Tourism Management.

ABSTRACTS

1 ARCHAEOLOGICAL ROUTES - CHALLENGES OF THE SUSTAINABLE EXPANSION OF NETWORKS

Abstract author(s): Mele, Marko (Universalmuseum Joanneum GmbH)

Abstract format: Oral

International cultural routes are strongly depending on networks, which sustain, support and upgrade the existing offers on sites or in museums. Such networks are mostly established by heritage institutions, museums, monument protection authorities, NGOs or private associations in the cultural sector. At the beginning such networks are rather simply to establish and to sustain, since the mentioned members have very similar interests and joint benefits. The challenge that such initiatives have is, how to diversify their network to expand their activities and find new approaches and resources for the protection, promotion and sustainable touristic use of archaeological heritage. This second step is mostly quite difficult, since the network is faced with stakeholders, which are not only or even at all responsible for cultural heritage, but might be focused on completely different tasks, like local or regional development, policy making, tourism, spatial planning, production of goods and offering services, education.... Which benefits are interesting for different stakeholders to join the network? Which tools should be developed to successfully include stakeholders from different spheres of society? Besides the general analysis of the described challenges and potential solutions, the author will include practical experiences of the establishment of the Iron Age Danube Route in Austrian Styria.

2 CULTURAL ROUTE OF SELECTED TRADITIONAL PROFESSIONS OF IOANNINA, EPIRUS, GREECE

Abstract author(s): Kosta, Elissavet (University of Ioannina)

Abstract format: Oral

In the context of the present study, a cultural route is proposed which focuses on selected traditional professions of Ioannina from the liberation of the city and then, which used as a base the area around the castle and the lake of Ioannina, Epirus, Greece.

A cultural route is defined as a product of cultural tourism which is formed based on a specific cohesive element. The cultural route proposed through the present research includes the following traditional jobs of Ioannina: traditional shoes makers, tanners, silver smiths and traders. The stations where the professionals were active in the city of Ioannina will be selected as stations of the route.

The relatively recent institution of the cultural route is, due to its capacity, an important “tool” for the exploitation of cultural heritage. Cultural routes are quite widespread on the European continent as they offer opportunities for the exploitation and promotion of cultural heritage.

The cultural routes include possibilities for the creation of new tourist products, maintaining the dynamics created by the new trends of tourism, something that we consider necessary for the city of Ioannina. It is important to understand that the creation of new cultural tourism products from existing resources, in our case the traditional professions, is one of the most effective strategies to be able to make a destination special.

In addition, the points of interest included in the route will help residents and visitors to understand the traditional jobs better, as the route creates an atmosphere of “merging” materials and intangible cultural elements in a network with the aim of better interpreting the topic.

3 **A MATCH MADE IN HEAVEN: SYNERGY BETWEEN MUSEUMS AND CULTURAL ROUTES - A CASE STUDY**

Abstract author(s): Rakvin, Marta (University of Zagreb, Faculty of Humanities and Social Sciences; Iron Age Danube Route Association) - Balen, Jacqueline (Archaeological Museum in Zagreb)

Abstract format: Oral

Sustainable management is one of the biggest challenges in the management of archaeological heritage. Proposed solutions should strive to find ways to successfully integrate archaeological heritage into cultural tourism offer of a particular region in a scientifically accurate way and to create palpable benefits for the stakeholders involved, while simultaneously preserving the heritage in question. Furthermore, the emphasis must be placed on the local communities, which must be educated in order to be able to recognize the value of heritage situated in their vicinity. In this regard, the cultural routes programme of the Council of Europe has proven to be very successful. As one its certified routes, the Iron Age Danube Route is a network where visitors can discover Iron Age landscapes and heritage through archaeological and open-air museums, reconstructed houses and tumuli, as well as through archaeological trails. In addition, the Route acts as a platform where experts, institutions, organizations, small and medium enterprises and non-governmental organizations can meet, collaborate, practice and develop sustainable models of heritage management. In doing so, heritage institutions, especially museums (as members of the Route), play an extremely important role. During the recent years, the role of museums has shifted and turned them into places of increasing inclusion and involvement with the community and its sustainable development. Within the framework of the Council of Europe’s cultural route networks, museums act as custodians of heritage, interpreters, and focal points of cultural tourism content.

In this paper, we are going to present the ways in which the Archaeological museum in Zagreb embarked on this new venture as one of the members of the Iron Age Danube Route.

4 **PARTICIPATIVE APPROACH IN CREATION OF SUSTAINABLE CULTURAL DESTINATION**

Abstract author(s): Jozic, Antonija (Prefect of Pozega Slavonia County) - Lukacevic, Marijana (project associate)

Abstract format: Oral

The well-known archaeological sites from the early Iron Age Kaptol - Gradca and Kaptol - Cemernica are located in the Pozega Slavonia County, above the village of Kaptol, within the borders of the Papuk Nature Park and the UNESCO Geopark. The mentioned archaeological sites have been continuously researched for 23 years and numerous scientific facts about the life of this Hallstatt community have been discovered and provide a wide range of presentation scientifically supported topics. Through the implementation of the Interreg Iron Age Danube project, an educational trail „ Paths of the Warriors - Early Iron Age in the Pozega Basin“ was created with 11 educational boards. In 2021, this educational trail became part of the cultural route with the certificate of the Council of Europe „Iron Age Danube Route“, and connects Croatia and Kaptol with 7 other European countries and archaeological sites. Regional and local authorities recognized the importance of this brand and directed their financial investments and actions into the presentation of the sites. Regional and local authorities, Pozega Slavonia County, Kaptol Municipality, other public institutions in the service of society and scientific institutions have recognized that a model of joint cooperation and an interdisciplinary approach of the presentation and preservation of the mentioned archaeological sites is the only correct way to create a sustainable tourist destination of cultural tourism. This presentation will explain the model of joint cooperation of all stakeholders in the area of archaeological sites Kaptol - Gradca and Kaptol - Cemernica. The Pozega Slavonia County and the Municipality of Kaptol, as applicants and investors of projects financed by the EU, strongly support the development of the destination of archaeological cultural tourism, what the local community recognized and also participate in the sustainable creation and management of this tourist destination.

5 UNDERGROUND4VALUE: ACTIVATING COMMUNITY TRANSITIONS TOWARDS SUSTAINABLE AND INCLUSIVE HERITAGE INTERPRETATION AND VALORISATION

Abstract author(s): Pace, Giuseppe (Institute of Studies on the Mediterranean ISMed-CNR)

Abstract format: Oral

With a focus on the Underground Built Heritage (UBH), the COST Action underground4value explores different processes to guide local promoters, municipalities, practitioners, scholars, community leaders, and stakeholders in their valorisation activities. Moving from process-oriented and goal-oriented to practice-oriented approaches, the Action defines a multi-disciplinary step-by-step methodology, the Strategic Transition Practice (STP), structured in four phases and eight blocks, but designing a process dynamic, interactive, flexible, and adaptable to different contexts and level of maturity. This methodology is intrinsically dependent on the value attributed to the heritage by local cultures and practices, on the formal and informal planning regimes, on how the process is adapted to local contexts and how the communities empowered. This theoretical approach has been experimented, validated, and implemented in 12 case-studies with the establishment of living labs differently designed for specific cultures, goals, sites, and organisations, with the organisation of scientific missions and of a training school, for some cases.

With the scope of facilitating the dialogue between global heritage community and local communities, local experiments stimulated communities to focus on a people-centred approach, to the interdisciplinary interaction and cross-fertilisation, and towards a strategic thinking process. By providing access to information or resources not easily available at local level, and supporting stakeholders in developing partnerships, the living labs' activities demonstrated the value-added by working together, enhanced democratic governance, and ensured relevant and effective decision-making. Finally, it favoured sustainability transitions and integrated heritage conservation strategies within the larger goals of the overall sustainable development, by providing deeper knowledge for allowing local communities to develop, nurture, experiment, and learn in real-life circumstances. In many cases, this approach promoted experimentation, learning, and sharing ideas at community level, and innovative schemes for the heritage perception, interpretation, and management.

6 THE ROMAN WAY

Abstract author(s): Czifra, Szabolcs - Kovács, Loránd Olivér - Fábrián, Szilvia - Pálkás, Adrienn (Hungarian National Museum)

Abstract format: Oral

Heritage tourism is a journey to visit places and participate in activities that authentically represent the past and present, connecting people who lived then and now. It includes historical, cultural and natural attractions. This experience-based touristic offer can incorporate the extraordinary wealth of our museums and collections, the exceptional atmosphere of our towns and villages and the uniqueness of our landscapes.

This special interweaving is particularly striking in the Balaton uplands, where our landscapes show an impressive diversity, from the almost untouched natural environment, through the landscape shaped by centuries of human activity, to the cities. Even 1500 years later, the features that made this area attractive to the Romans are still recognisable and archaeology helps to uncover and visualize these traces. Farming, at a high level, cultivating vineyards and the remains of their villa estates around the Lake proves that the Romans once settled here were not only experts of farming but also consumers with refined tastes, in many cases associated with extravagant preparation of dishes, consumption of exotic foodstuff and luxury wines - mostly from silver vessels. The remains of these practices and the rural luxury of the elite on the territory of the former province of Pannonia are best preserved by the Villa Romana Baláca. Our presentation showcases the revitalization process of the villa, and how we interweaved the heritage promotion approaches of the Underground4Value and Danube's Archaeological eLandscapes projects into the cooperation between the Hungarian National Museum, the local municipality and SMEs for the improvement of the heritage tourism offer under the umbrella of the Veszprém-Balaton 2023 ECOC program.

Acknowledgement

This abstract is partially based upon work from the COST Action 18110 'Underground Built Heritage as catalyser for Community Valorisation', supported by COST Association. The author gratefully acknowledges the COST association for the financial support.

7 SYNERGY OF SOCIAL REGISTERS: THE HUNGARIAN NATIONAL MUSEUM ON THE ROAD OF DEVELOPING COMMUNITY INVOLVEMENT IN ARCHAEOLOGICAL PRACTICES

Abstract author(s): Petervary, Tamas (Hungarian National Museum - Magyar Nemzeti Múzeum) - Rózsa, Zoltán (Hungarian National Museum, Head of the Department of Community Archaeology)

Abstract format: Oral

In early 2022, the Hungarian National Museum set up its Department of Community Archaeology (DCA). The reason d'être for this brave and - in a civic sense - even controversial and provocative step towards community involvement in archaeological research deserves an explanation. This paper provides (1) a summary of the socio-historical context in which civic initiatives tend to operate in Hungary, (2) an introduction of the goals and the structural/functional layout of the department, (3) an overview of the work so far completed under the auspices of the department, (4) a self-critical evaluation of our achievements in terms of social involvement, life-long learning and public reach. The aim of this presentation is (a) to bring our initiative onto an international stage and so to share our experiences in the field of community involvement, (b) to broaden our worldwide network of exchanging ideas and practices, (c) and to spur further collaborations of parties dealing with community archaeology.

8 CULTURAL ROUTES AS VEHICLES OF SUSTAINABLE TOURISM MANAGEMENT: WE ARE ALL IN THIS TOGETHER

Abstract author(s): Mihelic, Sanjin (Archaeological Museum in Zagreb)

Abstract format: Oral

A lasting contribution by the cultural routes approach is the idea that heritage is a common resource whose governance and enjoyment is not a prerogative of a single group or entity, but a shared right and responsibility. Over the years, cultural routes have proven an excellent vehicle for bringing the various stakeholders together in the perennial battle for the protection and preservation of cultural heritage.

This paper looks at some of the key doctrinal documents that have shaped the approach of the archaeological profession with regard to the protection of archaeological heritage, with an emphasis on the roles and rights of non-professionals - local communities in particular. Alongside the Convention on the Value of Cultural Heritage for Society (Faro Convention), a special focus is awarded to the revised International Cultural Tourism Charter, which—twenty-two years after its last version—has explored ways in which stakeholder collaboration and participatory governance may lead to enhanced and more beneficial stewardship of cultural heritage. The Charter's principles and objectives are discussed and illustrated with real-life examples from archaeological contexts around the globe.

696 CLOTH CULTURES IN AND BEYOND VIKING AGE [EAA COMTEX]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Andersson Strand, Eva (Centre for Textile Research; University of Copenhagen) - Harris, Susanna (School of Humanities; University of Glasgow) - Mannering, Ulla (National Museum of Denmark) - Wallace Walser III, Joe (National Museum Of Iceland) - Vedeler, Marianne (Museum of Culture History; Univ. of Oslo)

Session format: Regular session

The period AD 650-1150 offers a rich set of data of textiles, leather, fur objects and textile tools from rural and urban settlements as well as burials in Denmark, Norway, Iceland, and Sweden alongside other regions, such as Ireland, the UK and Russia. Previous scholarship has indicated that a series of changes took place in clothing traditions, textile design, technology, and the organization of textile production on the threshold of the Middle Ages (Bender Jørgensen 1986).

New studies have shown that research on cloth culture holds great potential for general archaeological interpretations of the development of society. Cloth culture is based on the idea that all societies use cloth-type materials, such as textiles and leather, but how they do this is specific to each culture (Harris 2010). It is clear that textiles and textile production played a major role and had an economic, social and cultural impact on Viking Age society (Andersson Strand 2021). By integrating established methods of textile analysis with new innovative methods, such as proteomics and aDNA-analyses combined with a clear theoretical framework, a better and more diverse understanding of textile and skin crafts and their importance can be gained.

In this session, we will facilitate new and innovative perspectives and insights into Viking Age Cloth Cultures. We invite all scholars working with questions and materials related to new knowledge about Viking Age textiles and clothing, craft technologies and knowhow about the significance of textiles and textile production in general.

1 TEXTILE RESOURCES IN VIKING AGE LANDSCAPES -TRIVAL

Abstract author(s): Andersson Strand, Eva (Centre for Textile Research; University of Copenhagen)

Abstract format: Oral

Knowledge of textile history is a key to our understanding of society. In the last decade, there has been a growing interest in the use and exploration of Viking Age landscapes and its connection to the development of production and trade. Research has suggested the intensification of iron and tar production, implying new ways of organizing production, which influenced the whole structure of Viking Age society. Textile research clearly indicates a new and increasing need of sails and a change in the textiles and clothing produced in the Viking Age. However, textile resources as a marker of large-scale production and exploration of land has hitherto never been investigated. In a new project Textile Resources in Viking Age Landscapes – TriVaL funded by the Independent Research Fund Denmark we will combine landscape analysis of textile resources with analysis of textiles, textile tools, and contexts investigations to determine the variation, organization and impact of textile production on the Danish Viking Age landscape and settlement structures. The overarching aim of is to contribute to the understanding of the great needs for textiles resources and its impact on the use of the Danish landscapes and influences on settlement structure with case studies around Limfjorden and East Zealand. Furthermore, to integrate the results and make them visible and accessible to the study of socio-political structures. The project is truly interdisciplinary with participants covering different research fields, humanities, as well as natural and digital disciplines. In this presentation, I will give a brief overview of the project and the first results and further discuss the advantages’ and disadvantages working in a truly interdisciplinary environment.

2 VIKING AGE AESTHETICS: CLOTH CULTURES IN THE BALTIC REGION

Abstract author(s): Rammo, Riina (Department of Archaeology, University of Tartu (Estonia))

Abstract format: Oral

The Viking Age Period does not offer a rich set of textile-type materials in Estonia due to the dominating cremation burial custom in the area. This is why the area has remained blank on the map of the Viking Age cloth cultures around the Baltic Sea. The earliest archaeologically investigated inhumation cemetery in Raatvere (Eastern Estonia) is dated to the 11th century. This site is exceptional in Estonia as numerous textile fragments from the deceased’s clothing have been preserved thanks to favourable conditions. This unique textile corpus has recently been reexamined with modern methods such as microscopy for fibre identification and chemical dye analyses. The presentation aims to look at the Raatvere textile finds in the context of the wider Baltic region. The Raatvere textiles represent a specific cloth culture in terms of technology, aesthetic values, and functionality sharing similar values with contemporaneous Finnish finds in the north. For example, the preference for various 2/2 twill weaves woven with plied warp (Sz) and single weft (z) can be pointed out as one of the easiest to notice. Although the Baltic Sea had a connecting role, which enabled trade, migration and cultural exchange, the Raatvere finds seem remarkably different from the Scandinavian Viking Age textiles at first sight. However, it can be argued that certain features of textiles, especially the aesthetic ones, were shared in the different cloth cultures in the Baltic region. The presentation will explore these shared features and the nature of the contacts they reflect.

3 A MOMENT IN TIME: CLOTH CULTURE OF AN EARLY MEDIEVAL HOARD BURIED IN GALLOWAY, SCOTLAND, 900 CE

Abstract author(s): Makin, Alexandra - Harris, Susanna (University of Glasgow)

Abstract format: Oral

Cloth culture provides the framework to recognise the cultural significance of an assemblage of textiles and leather in a particular time and place. This paper examines the cloth culture of the textiles, skin products and braids that wrap and connect an assemblage of metal and precious objects that form the Galloway Hoard. The hoard was buried around 900 CE in the modern county of Dumfries and Galloway, Scotland. To trace the cloth culture of the textiles and braids, we consider their individual object biographies, and their significance when used as layered wrappings of objects in the hoard.

Each of these organic materials had contexts and meanings in early medieval society. The textiles represent the homespun, wool, the more exclusive, linen, and the exotic, silk. A radiocarbon date (670-780 cal AD/CE) is evidence that the wool textile is possibly a century older and was therefore an heirloom with a generational story. The silk compound weave (samite) is a weaving technology from the east, of a type made in Central Asia, Syria, or Egypt. Silk textiles and braid such as these, had long, transformative histories. During their life histories, they passed through many hands, contexts and locations before arriving Galloway, then part of the Anglo-Saxon Northumbria. The yarns and structures used to create the simple weaves of wool and plant fibre demonstrate that these too had specific stories

and heritage. Explored this way, the textiles of the Galloway Hoard provide new insights into the people(s) living in an area of cultural diversity at a time of change and upheaval, and their understandings of and interactions with textiles.

4 **"THEY WILL NEVER BE WANTING FOR SATIN OR SILK OR SENDAL": WOMEN, LABOUR, AND IDENTITY IN VA DUBLIN**

Abstract author(s): Valante, Mary (Appalachian State University)

Abstract format: Oral

Scholars have often referred to the population of Viking-Age Dublin as 'mixed', 'Hiberno-Norse', or 'Hiberno-Scandinavian'. DNA and strontium analyses can provide clues about an individual's ancestry or where they were born, but they cannot tell us how either individuals or communities thought about themselves. But examining more closely the work women did may provide clues. In *Gender and Archaeology*, Roberta Gilchrist argued that women's work and the products of their work have too often been diminished both in historic sources as well as by modern archaeologists. But archaeological and historical sources demonstrate that cloth culture was vital to the urban economy of the Viking-Age, including Dublin and other towns in Ireland. Women's labor, especially when it came to textile work, helped establish and maintain local networks of exchange within Ireland, creating demand for local production of raw materials such as wool and flax. At the same time, women's work was vital to the international trade economy, bringing in silk and other materials from far away and turning those into high-status items that were clearly in demand in Ireland. Looking at division of labor, modes of production, and the preservation of specialized skills, can reveal the ways that gender and socioeconomic status intersected with "Scandinavian-ness" vs "Irish-ness," helping create a community in Viking-Age Dublin that was more complex than the "mixed" identity we're used to thinking about.

5 **A 10TH CENTURY BURIAL IN EASTERN ICELAND PROVIDES NEW INSIGHT INTO VIKING AGE CLOTHING**

Abstract author(s): Vedeler, Marianne (Museum of Cultural History University of Oslo) - Traustadóttir, Ragnheiður (fornleifafræðingur Antikva ehf) - Mannering, Ulla (The National Museum of Denmark)

Abstract format: Oral

A magnificent grave was discovered in Iceland in the summer of 2021 which contained very well preserved textiles. Remnants of clothing combined with dress accessories will give new information on female dressing in the Viking age. The farmstead Fjörður, which dates to the settlement era in Iceland, stands near the coastline of Seyðisfjörður in East Iceland at the roots of the mountain Bjölfur. During the excavation of the farmstead a longhouse and outhouses were revealed that date back to the 10th century. Adjacent to the longhouse stood a weaving room. A landslide destroyed the walls of the longhouse around the year 1100 and forced people to relocate on the farmstead.

A burial site was found 50 metres north of the longhouse. One of the burials revealed a woman's grave with very well preserved textiles. She lay in a deep pit covered with large stones that were placed over her. Earth and turf were added to the grave to form a burial mound. Tephra layers suggest that the burial took place sometime after the year 940 but before the landslide since the landslide lay over the site.

The micro context in the grave is well documented, and it is possible to identify three layers of clothing: an outer garment, a dress and a serk. Two oval brooches with well-preserved straps show that she was dressed in a suspended dress, trimmed with colourful tablet woven bands. Additional grave goods add to the story.

We will give you a short presentation of the elegant woman from Seyðisfjörður.

6 **ICELANDIC MITTENS**

Abstract author(s): Rimstad, Charlotte - Mannering, Ulla (The National Museum of Denmark) - Wallace Walser III, Joe (The National Museum of Iceland) - Mueller, Susanne (Independent researcher)

Abstract format: Oral

Protecting the hands from coldness and wetness has been essential in all prehistoric and historic periods. Due to preservation, the archaeological remains of gloves and mittens are few, but the existing finds still hold important information on everyday life in the past. With a starting point in two Icelandic finds we will shed light upon how especially mittens were produced with different techniques and how they were used and repaired in the Viking Age and Medieval periods in the North. An exceptional pair of child mittens from Heynes, Hvalfjardarsveit in Western Iceland (Djms. 1960-77) are sewn of woven cloth and have recently been dated to the Viking Age. The mitten from the site of Arnheiðarstaðir in Eastern Iceland (Djms. 3405), dated to 1480-1640 is instead made with the needlebinding technique. Other finds from Iceland, Denmark, Norway and Sweden will be included, and they all show different solutions for keeping the hands warm in a time before knitting became the main technique used for handwear.

7 A PUZZLE WITH NO TEMPLATE: REINTERPRETING THE OSEBERG TAPESTRY FRAGMENTS THROUGH THE USE OF INTERACTIVE DIGITAL REASSEMBLY

Abstract author(s): Havgar, Margrethe (Museum of Cultural History University of Oslo) - Gigilashvili, Davit (Norwegian University of Science and Technology) - Vedeler, Marianne (Museum of Cultural History University of Oslo)

Abstract format: Oral

Despite belonging to a well preserved textile collection dated to the Viking Age, the Oseberg tapestry fragments have never been more fragile than they are today. Due to varying degrees of preservation in situ, as well as changes in conservation methods since their extraction in 1904, the motifs on the fragments have also become increasingly difficult to distinguish.

Both past and present research suggest that several of these fragments may originally have been parts of larger tapestry scenes. Though challenging to discern by the naked eye alone, many such scenes have been proposed. However, owing to the faded and fragile nature of some of the fragments, whether or not these have been part of larger scenes has been close to impossible to determine.

The recent advancements in imaging and machine learning techniques provide new solutions for complex problems in virtual reconstruction of cultural heritage. Could modern computer science methods - such as machine-learning based digital interactivity that uses ultra high resolution digital photography, RTI, and hyperspectral imaging - assist in new reconstruction attempts using both mostly faded as well as the more visible tapestry pieces? In this paper, we examine how said methods are currently being employed to explore and possibly reassemble the Oseberg tapestry fragments in a digital space.

8 ACTS OF ART(E)FACTS: THE PSKOV CASE. THE USE OF 3D SOFTWARE TO ANALYSE AND INTERPRET ARCHAEOLOGICAL DRESS FINDS

Abstract author(s): Pallin, Karolina (The Society for Textile Archaeology & Culture Studies - Texark) - Larsson, Anika (The Society for Textile Archaeology & Culture Studies - Texark; Uppsala University) - Lind, Kerstin (Linköping University Dep. of Culture and Society; The Society for Textile Archaeology & Culture Studies - Texark)

Abstract format: Oral

This presentation focuses on a new method for analysing and interpreting fragmentary dress finds. The method, using the fashion industry software CLO3D, was first tested within the dress research program at the Vasa museum in Sweden, with good results. Usually, when interpreting archaeological textile/dress finds, the final work is based on so many choices, assumptions and qualified guesses that it is hard to, in the end, know what is what. Often, the focus is also to conclude the work in one or a few dress models. Especially if the result is recreated physically. In doing so, it is inevitable to lose information along the way. The point of using a digital tool is that we can choose less and instead try (almost) all aspects one needs in both the analysis, interpretation and recreation phases. The tool also leaves open to go back and forth in the research process, an often wanted flexibility.

Viking dress is a field of research quite challenging to navigate. The archaeological finds are fragmentary, and the interest is high. This field would benefit from access to a new method and tool for analysis and interpretation, and several finds might need to be revisited.

In 2019 my colleagues and I had the opportunity to visit The Archaeological Center of Pskov region (Russia). We received a warm welcome and an excellent guided tour of their collection and archaeological sites. One of the more important finds for our research was the dress find in Chamber Grave 3 (excavation IV, 2006). The digital analysis, interpretation and reconstructions attempts made here are based primarily on our photos and data collected.

This lecture is part of a comprehensive international research project entitled ACTS OF ART(e)FACTS. Additional partial studies within the project are presented in sessions #498 and #601, respectively.

9 FROM TEETH TO TEXTILES - BIOMOLECULAR IDENTIFICATIONS OF OVICAPRINE REMAINS FROM LATE IRON AGE AND VIKING AGE SOUTHERN SCANDINAVIA

Abstract author(s): Jæger, Jonas (Centre for Textile Research, SAXO-Institute, Faculty of Humanities, University of Copenhagen; Section for GeoBiology, GLOBE-Institute, Faculty of Health and Medical Sciences, University of Copenhagen)

Abstract format: Oral

The Late Iron Age and Viking Age of Southern Scandinavia saw a large demand for wool textiles. In addition changes in wool quality indicates the introduction of new sheep breeds or novel sheep husbandry strategies. However, the difficulties of morphologically distinguishing sheep and goat remains complicates species-specific research into ovicaprine husbandry.

Here, ZooMS (Zooarchaeology by Mass Spectrometry), a biomolecular method for species identification, is applied to 35 mandibles and teeth previously identified to species on the basis of osteomorphology. The results from the analysis show discrepancies between morphological and biomolecular species identifications which may have implications for our interpretation of species-specific exploitation patterns and thus our understanding of the production of wool during the Late Iron Age and Viking Age in Southern Scandinavia.

The results from the ZooMS analysis can furthermore provide the basis for additional zooarchaeological and biomolecular investigations into sheep husbandry practices and help answer questions regarding topics such as selective breeding or flock sex composition.

697 SO DIFFERENT, YET SO SIMILAR: BIOCULTURAL IDENTITY AND PLURALITY IN THE MEDIEVAL AND POST-MEDIEVAL WORLD

Session theme: 6. Contested Pasts & Presents

Session organisers: Diana, Annamaria (Terra Ultra Silvam Archaeology) - Marcu Istrate, Daniela (Institutul de Arheologie Vasile Parvan) - Toso, Alice (Bonn Center for ArchaeoSciences - BoCAS, Institut für Archäologie und Kulturanthropologie, Rheinische Friedrich-Wilhelms-Universität)

Session format: Regular session

The concept of 'identity' in areas of highly concentrated cultural, religious, genetic and linguistic admixture, in addition to research pathways towards a better understanding of the processes leading to biocultural diversity, are the main focus of this interdisciplinary session.

We would like to discuss and present case studies that assess the fascinating phenomenon of identity formation in the medieval and post-medieval period through the observation of both conflicting and balancing forces and their interpretation in the archaeological context. We also wish to analyse and discuss how cultural affinity and the sense of 'belonging' are expressed by groups or individual members of past and present populations. We seek to bring together scholars and professionals who have explored and identified trends and new perspectives in this field of study through traditional and ground-breaking approaches.

The Carpathian Basin and the Balkans are a prime example of large geographical areas that have been deeply shaped by the coexistence of diverse religious, ethnic, and cultural groups throughout their history. The legacy of these populations reverberates in the architecture, material cultures, rituality, food practices as well as customs and traditions observable today.

We welcome contributions exploring (but not limited to):

- Processes of identity formation as a result of migration, colonisation and other forms of population mobility;
- The identification and reconstruction of biocultural diversity through a multi- and cross-disciplinary approach;
- Non-linear power dynamics and dependencies between cultural groups.

ABSTRACTS

1 EXPLORING FOOD, CULTURE AND IDENTITY IN EARLY MODERN IRELAND (C. AD 1550-1650): A MULTI-ISOTOPE APPROACH

Abstract author(s): Rose, Alice - Montgomery, Janet - Gröcke, Darren (Durham University) - Flavin, Susan (Trinity College Dublin)

Abstract format: Oral

The Early Modern period in Ireland (c. AD 1550-1650) was a time of economic development and intercultural contact but also of conflict and colonisation. Through the integration of archaeological and historical evidence, the interdisciplinary 'FoodCult' project aims to study the role of food in the demonstration and negotiation of authority and power in Ireland in the 16th and 17th centuries, how 'national' food cultures were developed and expressed and how various social factors influenced food and drink consumption.

This paper presents results from multi-tissue, multi-isotope analysis ($\delta^{13}\text{C}$, $\delta^{15}\text{N}$, $\delta^{34}\text{S}$, $\delta^{18}\text{O}$, $87\text{Sr}/86\text{Sr}$) of c.130 Early Modern individuals excavated from 13 archaeological sites across Ireland, generated as part of the 'FoodCult' project. These individuals were carefully chosen to reflect the social and cultural complexity of Ireland in this period. The sites include examples of urban and rural attritional burial assemblages, as well as burials associated with specific episodes of warfare. The individuals studied include the native Irish; the so-called 'Old English', who were Gaelicised settlers from a wave of 12th century colonisation, and 'New English' Protestant colonists who arrived from the sixteenth century. These groups, who include men, women and children represent complex, entangled and competing identities in Irish society.

Isotopic analysis of this archaeological skeletal material has allowed for information relating to diet to be generated on an individual and population scale. The isotopic evidence allows for exploration of the consumption of food in these diverse communities in relation to aspects such as social class, gender, religion, warfare and migration. When integrated within an interdisciplinary framework, the results can be used to discuss the social and cultural meaning of food in these different contexts and to test assumptions regarding the expression of identity through food in Early Modern Ireland.

2 **ARCHAEOGENETICS AND THE SOCIAL DYNAMICS OF ANCESTRY AND IDENTITY IN VANDAL AND BYZANTINE CARTHAGE, TUNISIA**

Abstract author(s): Morgan, Reed (Harvard University, History Department; Max Planck Institute for Evolutionary Anthropology, Department of Archaeogenetics) - Chalhouni, Najd - Ben Romdhane, Hamden (Institut National du Patrimoine Tunisie) - Bockmann, Ralf (University of Hamburg) - Ringbauer, Harald - Krause, Johannes (Max Planck Institute for Evolutionary Anthropology, Department of Archaeogenetics)

Abstract format: Oral

The early medieval history of Carthage saw the western Mediterranean's second largest city change hands numerous times, between Vandals, Byzantines, and ultimately Arabs. Up to the time of its destruction, it remained a vital port at the centre of Mediterranean trade routes, and historical sources portray it as a vivid hub of cosmopolitan activity. Carthage was a crucible of encounter for a wide array of cultural, linguistic, and religious groups: Romans, Vandals, Berbers, and Eastern Mediterranean populations; Latin speakers, Greek speakers, and speakers of indigenous North African languages; Orthodox, Donatist, and Arian Christians. Up until now, North Africa has remained a major lacuna on the map of ancient DNA research, and bioarchaeological research more generally. Here, a new collaboration between historians, archaeologists, and archaeogeneticists aims to examine biological ancestry and kinship patterns in light of our current understanding of social identities in the early medieval city. We present new archaeogenetic results from more than 150 fifth- to seventh-century burials, representing a wide range of social identities from around the city, including extramural cemeteries, intramural cemeteries, elaborate basilicas, and isolated burials. This paper will present a first attempt to integrate the new genetic insights into migration, ancestry, demography, and kinship in early medieval Carthage together with the longstanding historiography of identity formation in post-Roman North Africa.

3 **IDENTITY FORMATION IN EARLY MEDIEVAL NUBIA: PRELIMINARY REMARKS FROM MULTIDISCIPLINARY INVESTIGATION OF FUNERARY CONTEXTS**

Abstract author(s): Ciesielska, Joanna (Faculty of Oriental Studies & Institute for Advanced Studies, University of Warsaw)

Abstract format: Oral

The populations of early medieval Nubia (modern Sudan) were likely formed of groups of various ethnic origins, cultural practices, and economic strategies, together comprising a complex and heterogeneous society. Over the preceding Post-Meroitic period the valley has been gradually infiltrated by the Nobades and other sub-Saharan tribes dwelling in the western deserts, mixing in with the descendants of Meroites settling the alluvial plains. In the sixth century Nubia entered the phase of important socio-cultural transformation associated with the adoption of Christian faith, which coincided with the formation of centralised states. This resulted in gradual reformulation of social networks and possibly a redefinition of one's identity along the lines of new social determinates. While religion was not initially a part of individual's explicit identity claims, the changes in mortuary realm reflect a progressive turn towards the homogenization in the spiritual realm. Meanwhile, archaeological record shows dynamic demographic networks with high degree of residential mobility. Isotopic research reveals the significance of the fluid boundary between sedentism and mobility, agriculture and pastoralism, based on mixed subsistence strategies highly dependent on changing ecological and economic circumstances. Bioarchaeological investigation of Early Medieval funerary sites explores thus the association between ethno-cultural heterogeneity and specific lifeways by the assessment of the scale of paleomobility and ecological complementarity.

4 CONTINUITY AND DISCONTINUITY DURING THE MIGRATION PERIOD FROM THE KESZTHELY-FENÉKPUSZTA FORTRESS PERSPECTIVE

Abstract author(s): Traverso, Luca (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Bollók, Ádám (Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Gneccchi Ruscone, Guido (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Koncz, István (Institute of Archaeological Sciences, Eötvös Loránd University; Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Knipper, Corina (Curt-Engelhorn-Center Archaeometry gGmbH) - Pohl, Walter (Institute for Medieval Research, Austrian Academy of Sciences; Department of History, University of Vienna) - Geary, Patrick (Institute for Advanced Study, Princeton) - Krause, Johannes (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) - Vida, Tivadar (Institute of Archaeological Sciences, Eötvös Loránd University; Institute of Archaeology, Research Centre for the Humanities, Eötvös Loránd Research Network) - Hofmanová, Zuzana (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology; Department of Archaeology and Museology, Faculty of Arts, Masaryk University)

Abstract format: Oral

For the Carpathian Basin, the Early Middle Ages represented a period of intense human mobility across the region, reflected in the complexity of the archaeological findings dated to that time. The Keszthely-Fenékpuszta site with its seven cemeteries dated between the 4th and the 7th centuries provides unique insights into the historical developments of this turbulent epoch. The site's late Roman fortress, continuously inhabited by a mixture of local and newcomers throughout the Hun, Langobard, and early Avar periods, retained its importance until the mid-7th century.

Here, we analysed cemeteries from the 5th-7th century, employing newly generated genome-wide ancient DNA, archaeological finds and C, N and Sr isotopes data. Thanks to the entire-cemetery sampling approach with a combination of different methods employed in the frame of the HistoGenes ERC project, genomic diversity was co-analysed with isotopes, grave goods and other archaeological analyses on the specific and broader scale.

Since the 1960s, the identity of the people buried in Keszthely has been lively debated, especially the Early Avar period burials with lavish Merovingian and Early Byzantine grave goods (so-called Keszthely Culture). From the analysis of more than 130 individuals, we extrapolated the differences between the cemeteries and tackled some of these questions.

Through the study of the genomic structure of the population integrated with a detailed analysis of the isotope data, we investigated the apparently continuous inhabitation of the fortress, which was in contrast to the partial discontinuity in material culture, and tested the hypothesis of a re-population of the fortress during the 7th century.

This approach allowed a further insight into the social structure, tracing a process of continuous restructuring of elite groups of different origins that were buried here. The results also shed some light on the role of biological relatedness during the Migration Period.

5 COMBINING OSTEOARCHAEOLOGICAL AND ISOTOPIC DATA: PRELIMINARY RESULTS FROM THE MEDIEVAL CEMETERY OF BRAȘOV (TRANSYLVANIA, ROMANIA)

Abstract author(s): Toso, Alice (Bonn Center for ArchaeoSciences - BoCAS, Institut für Archäologie und Kultur-anthropologie, Rheinische Friedrich-Wilhelms-Universität) - Diana, Annamaria (Terra Ultra Silvam Archaeology) - Marcu Istrate, Daniela (Institutul de Arheologie Vasile Parvan)

Abstract format: Oral

The historical region of Transylvania (Romania), is an area of conflicted interests and overlapping communities, cultures and traditions, still poorly understood both historically and archaeologically.

This pilot study, developed from the broader Brașov Bioarchaeology Project, presents the results of isotopic and bioarchaeological analyses conducted on a group of skeletons from the Brașov medieval cemetery. In the 12th century, Brașov, like other Transylvanian centres, was colonised by Saxon communities, invited by the Hungarian rulers. While the Saxons have left abundant written documentation and vestigial structures, little is known about the local populations, who were obviously displaced and pushed away from the central urban areas.

A randomly selected sample of 50 adult skeletons was analysed osteologically. Isotopic analysis of $\delta^{13}\text{C}$, $\delta^{15}\text{N}$ and $\delta^{34}\text{S}$ were carried out on the same group as well as 10 contemporaneous faunal samples with the aim to explore 1) dietary practices in the population of Brașov during the Middle Ages; 2) the potential overlap of pathological cases with isotopic signals that deviate from the norm of the population 3) the impact of mobility on the local subsistence strategies and the presence of non-locals in the assemblage.

By integrating osteoarchaeological information from each skeleton with isotopic values from their bones and from the local fauna, we have been able to identify and better understand population affinity and diversity based on age- and

biological sex- related dietary, pathological, and developmental patterns. Archaeological interpretation of this large cemetery, amounting to over 1,400 burial contexts, is yet to be carried out, and analyses must be extended to a much larger number of skeletons to build a more scientifically grounded picture. Despite those limitations, our research shows that new advances in bioarchaeology and isotopic analysis can significantly contribute to the study of this multi-faceted, multicultural region in the heart of the Carpathians.

6 SZEKLER-HUNGARIAN PERSISTENCE AMONG CHANGE IN THE CARPATHIAN BASIN: A CASE STUDY FROM THE PAPDOMB SITE (AD 1100- 1800), VĂLENI ROMANIA

Abstract author(s): Zejdlik, Katie (Western Carolina University) - Nyárádi, Zsolt (Haáz Rezső Múzeum, Odorheiu Secuiesc, Romania) - Bethard, Jonathan (University of South Florida)

Abstract format: Oral

Szekler-Hungarians are a specific cultural expression embedded within the larger Hungarian identity. Current understanding is that the Szeklers arrived in the Carpathian Basin in the 12-13th century to defend the eastern border for the Kingdom of Hungary. Archaeological and genetic evidence supports a continued and stable Szekler presence in this socially tumultuous context of Transylvania with their descendants still present there today. Excavation of the Papdomb site, a rural church and mortuary landscape in Harghita, County, Romania and just outside Odorheiu Secuiesc (Székelyudvarhely), referred to as the “Seat of the Szeklers” demonstrates this continuity. Since 2014, 864 human interments ranging in date from approximately 1100calAD to the 18th century show consistency in type and frequency of grave offerings, body orientation and position, and communal use of mortuary space within this rural context. This presentation provides a macro-scale overview of the site within the larger timeline of the Hungarian presence in the Carpathian Basin, a broad discussion of the impact rural communities have on stasis amidst larger social change, architectural evidence of political and religious impacts, and finally, 800 years of consistent approaches to human interment all of which demonstrates that despite the upheaval around them, the Szeklers were steadfast in the cultural practices that they could control, reaffirming their identity and claims to the landscape over time.

7 CONTENDING IDENTITIES IN A COLONIAL CONTEXT: A COMPARATIVE ANALYSIS OF POPULATION MOVEMENT ON THE EUROPEAN AND NORTH AMERICAN CONTINENTS

Abstract author(s): Bianco, Elizabeth (CUNY Hunter College) - Diana, Annamaria (Terra Ultra Silvam Archaeology)

Abstract format: Oral

The colonisation of unexplored areas or the occupation of pre-inhabited territories functioned as the primary mode of population movement for millennia. As a consequence of this process, the geo-political boundaries of regions were redrawn, local resources were seized, and the socio-cultural identities of communities and populations at large were altered indelibly. In addition to these general trends in colonisation, the integration of outside populations into established communities bore unique ramifications for each settlement colonised. During the Middle Ages, a period characterized by the expansion and dissolution of chiefdoms, kingdoms, and empires as competing powers struggled to establish themselves as unified entities, the displacement, and relocation of groups of people was a common practice.

By collecting archaeological and historical evidence, our contribution aims to compare and contrast identity formation and retention of plurality in American sites of colonial origin and in the emblematic case of the Carpathian Basin in Europe. Our discussion will be guided by the following questions:

- Can the arrival of settlers in an area with a pre-existing population ever be peaceful?
- What, if any, are the consequences of past population movements and the foundation of colonies today in the compared areas?
- What is the best methodology for examining archaeological sites and remains from problematic, culturally disputed areas of the colonial past?

Whether a new settlement is formed peacefully through the means of a systematic, organised process, or, on the contrary, in the form of a violent imposition on local autochthonous populations, cultural tension is an inevitable effect of colonization. Recently anthropological and archaeological research has moved towards redefining forgotten pluralities and voicing the narratives of groups whose identity was stifled or nullified by dominating socio-political forces; with this contribution, we would like to discuss current views and future research paths on this subject in archaeology.

A. ARTIFICIAL CRANIAL DEFORMATIONS AS THE MANIFESTATION OF CULTURAL AND/OR SOCIAL IDENTITY AT THE SITE OF ČATAJ (SLOVAKIA)

Abstract author(s): Krošláková, Mária - Jakab, Július - Hukelova, Zuzana (Institute of Archaeology, Slovak Academy of Sciences)

Abstract format: Poster

Artificial cranial deformation, or modification, is the intentional alteration of human skulls from early childhood, using binding cloth or binding between two pieces of wood, for example. Artificial cranial deformation has occurred in many historical cultures through the ages, separated geographically, and is still in practice in some areas and communities in the world.

Artificial cranial deformation can therefore represent manifestation not only of ethnicity but also of social status and/or spiritual beliefs. Intentionally modified skulls could also indicate wisdom or just trends(?) in beauty.

There is a peak of this trend among the populations in Europe in the late Migration period (5th century AD), presumably thanks to the movement of the Huns across the continent. Two out of 17 individuals from the archaeological site of Čataj - Zemanské Gejzové (Slovakia), also manifested artificially deformed skulls, probably using the two-bandage cranial binding technique, possibly implying their cultural or social difference.

699 STONE, BRICK AND MORTAR: ARCHITECTURE OF THE EARLY MEDIEVAL PERIOD IN THE BALKANS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Hoxha, Zana (Institute of Albanology in Prishtina) - Fabijanić, Tomislav - Baraka Perica, Josipa (University of Zadar) - Rama, Zana (Archaeological Institute of Kosovo)

Session format: Regular session

The session “stone, brick and mortar” focuses on the architecture of the early medieval period (5th-10th centuries) in the Balkans. During this period, we notice a blooming of architecture in both sacral and secular buildings throughout the Balkans. Moreover, castles on high peaks were being reconstructed and reused. Additionally, the building program of Emperor Justinian, a program characterised by large-scale investments, left us with some unique examples of architecture. Through the remains of stone, brick, and mortar, and evidence of building techniques, we understand the ups and downs of the empire in the region. Therefore, this session welcomes researchers from the Balkans and abroad that are working towards understanding the architecture of this period by mapping, archaeological excavation, or any other scientific methods. Also, as a result of this session, we aim to comprehend typologies of sacral and secular buildings and how different universal designs adapted to local conditions. We are delighted to accept papers on a date range from the beginning of the 5th century up to the 10th century. Different approaches in this session will complete a missing general overview of the early medieval architecture of the Balkans.

ABSTRACTS

1 SOME CONSIDERATIONS ABOUT VILLAGE LIFE IN LATE ROMAN RURAL DALMATIA: THE CASE OF RIVINE – CRKVINA SITE

Abstract author(s): Baraka Perica, Josipa - Uglešić, Ante (University of Zadar)

Abstract format: Oral

Village life in late Roman rural Dalmatia flourished, but it is still an insufficiently studied topic that holds great potential. Archaeological research confirms that the most common rural archaeological sites in this period are churches. The dominance of churches as late antique rural sites is closely related to the long tradition and success of early Christian archaeology in our region, mostly due to the importance of the capital Salona. Even if in addition to churches there are also numerous other kinds of sites they are mostly mentioned in the literature as isolated individual sites, and only rarely presented in context.

With the intention of expanding the research from the churches to the wider area, as it has already been done for the site of Doci bazilika, on this occasion we would like to present the archaeological image of the site of Rivine – Crkvina, a late antique site situated in the vicinity of the town of Stolac in Bosnia and Herzegovina. The relationship of the Early Christian church and the production facility is a special characteristic of this site that has proven to be unique for the Roman province of Dalmatia.

The site is located on an elevated position on the north-eastern edge of a larger field. The church and the production facility next to it were probably a part of a much larger settlement that might have encompassed the unexplored architecture located in the immediate vicinity.

The aim of the lecture proposal is to present the architecture of this exceptional site but also to extend the scholarly interest to the entire nearby landscape, and the selected sites, in order to obtain a much larger picture about village organisation, and also to compare it with some other similar sites in Dalmatia, especially in its hinterland.

2 THESSALONIKI: ARCHITECTURAL TRACES OF SECULAR AND RELIGIOUS LIFE OF THE EARLY BYZANTINE CITY

Abstract author(s): Iosifidis, Theodoros (Aristotle University of Thessaloniki)

Abstract format: Oral

Thessaloniki was always a city and the second largest one of the Eastern Roman Empire, hidden behind the glory of the capital. Thessaloniki was also a capital; it was the tetrarchic capital of Galerius, after the division of the Roman Empire, imposed by Diocletian. Galerius built his large palatial complex, traces of which dominate even the modern urban tissue of the city. Another dominant feature in modern city is the so called "Roman Agora" which remained a big and important public space during the first byzantine centuries, maintaining some of its earlier functions. Thessaloniki was also equipped with a port, through which access to the Aegean Sea was achieved, rendering it an important military base and commercial arrêt obligatoire of the peninsula. Apart from the secular life, Thessaloniki presents numerous examples of religious architectural remains. Saint Demetrios, the patron saint, and his basilica famous for the healing miracles constituted one of the major pilgrimage sites of the Balkans. The cathedral of the city was the five aisled basilica of Saint Sophia and for a period of time Panagia Acheiropoiitos. These parish churches were the glorious expression of religious architecture, however traces of smaller and less important churches, sometimes charged with different functions, can be detected in multiple areas of the city map. Lastly, in this paper, the traces of private life will not be excluded. Houses and mansions will be studied and conclusions will be drawn about the factors that shaped the image of Early Byzantine Thessaloniki.

3 STONE, SOME BRICKS AND LESS MORTAR: CONSIDERATIONS ON CHANGES IN ARCHITECTURE IN LATE-ANTIQUITY AND POST-ROMAN DALMATIA

Abstract author(s): Fabijanic, Tomislav (University of Zadar)

Abstract format: Oral

Many elements of Antique and late Antique civilisation and culture in general are proved to be very resilient to changes. However, some of them, particularly those related to architecture and construction, have inevitably been transformed due to new realities in post-Roman period. This contribution aims to explore different examples of transformations of Antique buildings in late antiquity and especially in the early Middle Ages, reusing of construction material as well as introduction of new architectural and urbanistic elements needed to deal with emerging perils. Some of these are well known and documented (e. g. auxiliary fortification walls in Iader and Asseria), and some are only mentioned in scientific literature without in-depth analyses (for example, early medieval drywalls built within Antique buildings in Aenona). Although the contribution will primarily be focused on Dalmatian coastal area and its hinterland, some examples of early medieval dwellings in Peri-Pannonian area will also be examined.

4 LATE ROMAN FORTIFICATION IN TOWN OF HVAR CROATIA

Abstract author(s): Viskovic, Eduard (Kantharos d.o.o.)

Abstract format: Oral

True development of the settlement begins in late antiquity. All archaeological excavations in the town of Hvar have found the remains of a late antique city. This is happening because in late antiquity trading routes are transferring from dangerous land routes to the more secure sea routes. Trade was well developed in the late 4th and early 5th century, although the Western Roman Empire was nearing its end. However, though the Western Roman Empire was in decline, eastern Adriatic coast showed progress in economic and demographic sense, as illustrated by Hvar and some other Adriatic settlements that flourished in Late Antiquity. Late 5th and the first half of the 6th century were marked by dramatic military and political events in Dalmatia. The final fall of the Western Roman Empire was ensued by short-lasting rule of the Ostrogoths who were defeated by the Emperor Justinian. Crucial battles happened exactly in Salona where both opposing sides had their strongholds. Salona was a regional center whose catchment area also encompassed Hvar. Late antique fort around big port structures in Hvar was erected in this period. Every building enterprise of this scope suggests highly organized management structure in a settlement, and possibly also a state intervention during Justinian's Reconquista. Late antique fort was found by archeological research in the Arsenal area, and lately in front of the Radosevic palace where archaeologist found eastern part of the Late Roman fortification. Eastern wall of late antique fortification with a door was dated to the late 5th century by radiocarbon analysis of the charcoal from mortar. It is unknown whether the defensive walls played any role in the defense of the city, which for some reason was largely abandoned during the early Middle Ages.

5 THE LATE ANTIQUE FORTIFICATION SYSTEM ALONG THE ROAD LISSUS-NAISSUS

Abstract author(s): Rama, Zana (Archaeological Institute of Kosovo)

Abstract format: Oral

The Province of Dardania, the central territory of which lies in today's Kosovo, as many other parts of the Byzantine Empire, was endangered by the tribe invasions such as: the Avars, Huns, Goths, Slavs, etc. during the Late Antique Period. This led to the re-organization, construction and re-construction of the fortification system. It started with the building of castrums in the 4th century and reaches its peak of development during the rule of the Emperor Justinian I, with the building of a dense fortification network. These series of constructions were carried out after a powerful earthquake hit the region in 518, by destroying 24 fortifications only in Dardania. According to the scholar Procopius of Caesarea in his writings "De Aedificiis" (On buildings), during the rule of the emperor Justinian I, only in Dardania 69 fortifications were built from which 61 were reconstructed and 8 were constructed. Fortresses were built in strategic areas, with dominant position, along important roads, close to important towns and mining areas. During the Late Antiquity the road Lissus-Naissus, which was the main road crossing through Dardania, by linking the central Balkans with the Adriatic Coast, had around 40 fortified centers, including road stations and checkpoints, some of which are mentioned also in the Tabula Peutingeriana. This paper will present the role of the road Lissus - Naissus, the organization of the fortification system, their typology and their architectural characteristics.

6 EARLY CHRISTIAN CHURCHES AS PART OF THE COMPLEX OF LATE ANTIQUITY FORTRESSES IN KOSOVO

Abstract author(s): Hoxha, Zana (Institute of Albanology)

Abstract format: Oral

Today's territory of Kosovo was inhabited by one of the largest Illyrian tribes, the Dardanians. The Roman Province of Dardania was established as a self-administrated province in 297 AD within the frame of the Roman Empire by Emperor Diocletian. The geographic characteristic of Kosovo consists of the mountains of Karradak, Sharr, and Cursed Mountains and stretches on two plateaus: the Plateau of Kosovo and Dukagjini. This diverse geography allowed the local population to inhabit both fields and mountains. A very important characteristic of the period is that the population moved to high altitudes due to continuous attacks by Goths, Huns, Avars, and Slavs. Thus, a huge investment was made in the reuse of prehistoric fortresses, but now with innovation, on the highest peak of the fortress a church was built. Moreover, Emperor Justinian with his big project in Dardania, besides his investments in new cities, built eight new fortresses and rebuilt sixty-one. Although more than one hundred castles have been identified until today, only a few of them have been excavated. Out of the fortresses that have been excavated six of them on the highest peak of the citadel hold an early Christian church. The typology of these churches varies in typology. This paper will elaborate on the early Christian architecture of the Castle of Harilaq, Kasterc, Korisha, Vuqak, Keqekolla, and Syrigana. Through this analysis, we can understand more about the social aspect of these churches, as some examples lead us to believe that they were serving beyond their basic functions, as places of pilgrimage. Concluding, these churches play a key role in understanding the complete situation of the Early Christian Architecture of the territory of Kosovo.

701 TERRACOTTA FIGURINES AS RANDOM OR DELIBERATE OFFERINGS. A COMPLEX CONTEXT REVISITED

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Spathi, Maria (Harvard's Center for Hellenic Studies) - Wallensten, Jenny (Swedish Institute at Athens) - Chidiroglou, Maria (Curator, National Archaeological Museum, Athens)

Session format: Regular session

One of the most popular types of offerings in ancient Greek sanctuaries are terracotta figurines. And while other finds from sanctuaries, such as ceramics, often had, together with possible cultic and religious uses, a practical function, figurines are believed to have had mainly symbolic properties. Terracotta statuettes from sanctuaries can therefore offer, under certain conditions, valuable evidence about the worshipped deity, his/her attributes, ritual practices as well as information regarding the worshippers themselves and their motivations for offerings of specific coroplastic types. In addition to the questions of dating, typology and manufacture, the following questions regarding the coroplastic products are still pertinent to this day:

1. should the anthropomorphic figurines be seen as representing the deities worshipped in a certain location or do they symbolically depict the dedicant?
2. What does the act of deposition 'mean' and what symbolism(s) may have attended it or underscored its purpose?

These questions are certainly not new, but still merit discussion, as figurines continue to surface in excavations and enrich an already vast material. They will provide an overarching background to the discussion of this session, which

will investigate if the choice of specific figurine types is influenced by random factors or if it is deliberate and related to the worshipped deity. More specifically, the following questions will be approached:

- a. Does a set of figurines characterize the worship in a sanctuary or not?
- b. Does a coroplastic assemblage from a sanctuary portray the attributes, qualities and cultic practices of a worshipped deity or not?
- c. If the figurines can be seen as characteristic for worship and/or worshipped deity, to what extent and why?

This session will thus provide a multifaceted exploration of types and meanings of Greek terracotta figurines in connection to specific cult sites in Greece and the eastern Mediterranean.

ABSTRACTS

1 COLUMNAR FIGURINES FROM EARLY IRON AGE RITUAL SITES AND EARLY ARCHAIC SANCTUARIES IN LACONIA

Abstract author(s): Fragkopoulou, Florentia (Acropolis Museum, Athens, Scientific Collaborator)

Abstract format: Oral

Clay columnar figurines which seem to span the end of the 8th and mid-7th centuries from sites where ritual (not yet cultic) enactments are attested both in the area occupied later by the Spartan polis and the wider region of Laconia have not attracted the attention they deserve by modern scholars. This paper seeks to fill in this lacuna by examining the common characteristics of this figurine type and their LH IIIC predecessors across Laconia. The material discussed comes primarily from Artemis Orthia and Geraki (ancient Geronthrai), which are not transformed into cult sites before the Late Geometric and late Archaic times respectively. Columnar figurines from these two very popular (within the so-called Spartan studies) sites are then compared with similar figurines from the famous Amyklaion, a clearly cultic site since its establishment in the LH times. The aim is double. First, to show that the 'trend' of employing columnar clay figurines at sites where ritual activity is attested since the post-palatial era across Laconia follows contemporary developments known from elsewhere in Greece. Second, to emphasise that these figurines are equally encountered at sites where both male and female deities are identified from the second half of the 7th century in the whole of Laconia. In this way, the significance of gradual ritual transformations, which reflect populations' consolidation within Laconia over time, and how these changes affect celebrants' preferences over the use of specific figurine types for ritual purposes, are brought to the fore as decisive factors in shaping worshipping behaviour in the particular region roughly from LH IIIC to the early Archaic period.

2 THE ATHANA LINDIA SANCTUARY IN RHODES: A DISCUSSION ON THE VOTIVE TERRACOTTA FIGURINES

Abstract author(s): Hoffmann, Sanne (The Danish Institute at Athens)

Abstract format: Oral

The paper will present an overview of the different figurine types discovered in the Athana Lindia sanctuary in Rhodes, Greece. More than 2740 Greek votive terracottas were found and are dated between the Geometric period and 330 BC.

The terracotta types and their attributes will be discussed in order to establish if they could be used as identification markers for the specific cult and/or the use of the cult. The argument will be substantiated by a survey of the presence of selected types in a variety of goddess sanctuaries.

Finally, the terracotta figurines will be considered in relation to other find groups from the sanctuary, such as the Cypriote limestone figurines, the Egyptian amulets, and the large amounts of fibula.

The paper aims at contributing to further the understanding the cultic references in votive terracotta figurines, the cultic interactions in ancient Greek sanctuaries, and the concept of votive offerings in general.

3 MUSIC FOR THE GODDESS?

Abstract author(s): Kolotourou, Katerina (Independent researcher)

Abstract format: Oral

Music for the goddess

As one of the most prevalent components of ritual, musical performances are regularly represented on artefacts of various media (vases, seals, metalwork, miniature votive instruments) that are deposited at early Greek sanctuaries from the turn of the first millennium BC on. These representations can be understood as material expressions of the complex performative dynamics in the context of the respective cults. By contrast, terracotta figurines of musicians

are not only rare in early Greek sanctuary deposits, but they also make a remarkably late debut in the 8th century BC, with a unique example of a frame drum player from the Heraion at Samos, which is only followed up in the 7th/6th century BC by dedications of terracotta musicians of Cypriote style at the same sanctuary, and a few more isolated examples at the sanctuaries of Hera at Argos and of Athena Lindia at Rhodes. This paper will consider the reasons for the scarcity of this particular iconographic type from early Greek cultic contexts, in the light of its great popularity in Cyprus and the Eastern Mediterranean, and will also examine the reasons propelling its first appearance in connection with the cult of Hera at Samos.

6 TERRACOTTA FIGURINES FROM SANCTUARIES IN THE NATIONAL ARCHAEOLOGICAL MUSEUM, IN ATHENS. AN OVERVIEW OF DEDICATORY PRACTICES, PER TYPE(S) AND CONTEXT(S)

Abstract author(s): Chidioglou, Maria (National Archaeological Museum, Athens)

Abstract format: Oral

A number of Greek terracotta figurines of Archaic to Hellenistic times, found in various sanctuaries and cultic sites in Greece, are housed in the National Archaeological Museum in Athens. They come from systematic or salvage excavations undertaken in the late 19th and early 20th centuries, in Attica, Boeotia, such as the Kabeirion at Thebes, the Peloponnese, such as the Heraia at Argos and Perachora, Corfu, such as the small Artemis sanctuary there, and other regions. In this assemblage are contained figurines of deities, such as of Artemis, female and child figures, dancers, actors and terracotta complexes.

This paper aims at an overview of a number of representative Greek votive terracotta figurine types from the Collections of the National Archaeological Museum. More specifically, coroplastic types of deities and mortal female, male and child figures, as well as contexts of excavated sanctuary assemblages will be investigated, together with comparanda from modern research and more recent excavations. Archival data on the finds will be supplied, together with relevant literary and inscriptional sources or other information, where available.

A brief, albeit analytical, presentation of this type of find-assemblages will help us investigate as to what extent a set of similar terracotta figurines may or may not characterize the worship of a deity or deities in a given sanctuary, whether a coroplastic assemblage from a sanctuary may or may not portray the attributes, qualities and cultic practices of the worshipped deity or deities, and if it does, the reason or reasons why.

In this paper we will therefore examine if the deposition of standard or gradually standardized coroplastic types in various sanctuaries can be considered as a random, generic, votive choice, or seen as a part of deliberate, diachronic or periodically specific votive practices of the dedicants, closely related to the worshipped deity or deities.

7 TERRACOTTA FIGURINES FROM SANCTUARIES OF DEMETER: VOTIVE OFFERINGS WITH A PURPOSE

Abstract author(s): Spathi, Maria (Center for Hellenic Studies, Harvard University)

Abstract format: Oral

A set of terracotta figurines from a sacred context can constitute a group with specific meaning. And while individual figurines from sanctuaries may be considered as indicative of personal expressions by the dedicants, a coherent and repeated set reflects a collective and recurring practice, made by groups of individuals in a period of time. This type of sets of figurines may provide reliable indications of the character and attributes of the worshipped deity.

The majority of the finds, and especially the terracotta figurines, that have been unearthed in sanctuaries of Demeter are finds one expects to see in sanctuaries of the goddess. They have proven to be very helpful for the identification of the worshipped deity, even in cases where the literary and epigraphical evidence are missing. In most sanctuaries of Demeter, there have come to light figurines of *hydriaphoroi*, together with figurines of women holding a piglet, of *kourotrophoi*, usually found together with figurines of children, of young women with symbolic objects or attributes related to fertility and sexuality, of *Baubo*, *protomes* and figurines of young men. They are usually found together with other characteristic finds, such as miniature clay *hydrias* and *kernoi*.

All the above figurines form a relatively homogenous set and, from the 5th century BC onwards, they are characteristic finds of the worship of Demeter, as evidenced by assemblages from South Italy, Sicily, Ionia and the Greek mainland. They constitute conscious votive choices made by visitors to the sanctuary. The sanctuaries of Demeter are therefore, in many cases, similar to each other in terms of the types of votive offerings and cultic practices. These offerings repeat or echo traits of the basic persona of the goddess revealed in the *Thesmophoria* festivals, namely as one concerned with female and animal fertility and the productivity of the land.

Abstract author(s): Ammerman, Rebecca (Colgate University)

Abstract format: Oral

To what extent can the intentionality of a worshipper be inferred from a terracotta dedicated at a sanctuary? Intriguing answers are provided by 1800 terracottas recovered from the spring sanctuary at Pantanello in the chora of Metapontion. Plaques molded in low relief provide insights to the practice of cult in the fourth century BCE due to their rich, pictorial narratives. Two groups stand out. Most numerous are reliefs depicting a dancing female figure in the company of Pan or Silenos within a grotto. Reliefs portraying a reclining banqueter accompanied by a female figure and male infant are likewise plentiful.

My interpretation of the dancing female as a Nymph, whose waters formed the focus of rites enacted by the rural population, points to a specificity of intent by the craftsmen who fashioned the plaques (unique to Metapontine workshops) as well as by worshippers who dedicated the plaques at the spring's source. The plaques reflect literary portraits of Nymphs and offer a mythic analogue for the mortal nymph, who sought to ensure her own fertility by the requisite prenuptial bath in the waters of the divine Nymph. The banqueter plaques enjoyed a long history among Greek poleis on the Ionian coast of Italy. Interpretations of this imagery are as wide-ranging as the number of sanctuaries where the plaques were dedicated. Did such a terracotta thus serve as an "all-purpose" gift? While assigning identities to the figures of what appears to be a family portrait is difficult, the terracotta, within the context of Pantanello, may again provide a pictorial analogue for ceremonies associated with the local cult. Variant findspots for the two different terracotta images indicate moreover that worshippers elected where to display their gift, memorializing their piety, concerns, and possibly their own ritual actions within the grounds of the sanctuary itself.

INTERDISCIPLINARY INTEGRATION IN RECONSTRUCTING AGRICULTURAL CROP HISTORIES

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Fuks, Daniel (McDonald Institute for Archaeological Research, University of Cambridge) - Ryan, Philippa (Interdisciplinary Research, Royal Botanic Gardens Kew) - Alexander, Michelle (BioArCh, Department of Archaeology, University of York) - Peña-Chocarro, Leonor (Paleoconomía y Subsistencia de las Sociedades Preindustriales, Instituto de Historia, Consejo Superior de Investigaciones Científicas - CSIC)

Session format: Regular session

The knowledge of the origin of cultivated plants is interesting to agriculturists, to botanists, and even to historians and philosophers concerned with the dawnings of civilization."

The above opening line from Alphonse de Candolle's *Origin of Cultivated Plants*, originally published in 1882, rings truer today more than ever. Crop histories are now reconstructed through the work of geneticists and agricultural scientists, historians and linguists, archaeobotanists and ethnobotanists. Research on long-term crop histories has been recognized as important for global food security and sustainability since current agro-biodiversity is a product of long-term crop diffusion and evolution. Yet, interdisciplinary integration within this field of study has been underutilised. In association with the newly formed Crop History Consortium, this session aims to explore the added value of interdisciplinary, multidisciplinary and mixed methods research for uncovering the trajectories by which agricultural crop plants have diffused and evolved. We seek papers that exemplify novel or underutilised synergies, including but not limited to: integration between ethnobotany, textual and linguistic studies, the range of archaeobotanical subdisciplines (carpological, palynological, anthracological, phytolith, starch, parenchyma analyses, etc.) and the range of archaeological science techniques applied to ancient plant remains (GMM, stable isotopes, archaeogenomics, other chemical and biomolecular techniques, etc.). We aim to focus on the past 2000 years but will consider all papers involving integrated research on the spread, cultivation, and evolution of crop plants following their initial domestication.

1 CROP HISTORY RESEARCH: FORGOTTEN AND REMEMBERED CROPS

Abstract author(s): Peña-Chocarro, Leonor (Research Group Palaeo-economy and subsistence of pre-industrial societies, Institute of History, Spanish National Research Council - CSIC) - Ryan, Philippa (Interdisciplinary Research, Royal Botanic Gardens Kew) - Alexander, Michelle (BioArCh, Department of Archaeology, University of York) - Ros, Jérôme (Institut des Sciences de l'Évolution de Montpellier [UMR ISEM]) - Gros-Balthazar, Muriel (Institute of Research for Development) - Dabrowski, Vladimir (Muséum National d'Histoire Naturelle, UMR 7209) - Muthukumar, Sureshkumar (Department of History, National University of Singapore) - Hansen, Annette (Research Group Social and Cultural Food Studies - FOST, Department of History, Vrije Universiteit Brussel) - Heinrich, Frits (Research Group Social and Cultural Food Studies - FOST, Department of History, Vrije Universiteit Brussel; Research Group Industrial Microbiology & Food Biotechnology - IMDO, Department of Bioengineering Sciences, Vrije Universiteit Brussel) - Fuks, Daniel (McDonald Institute for Archaeological Research, University of Cambridge)

Abstract format: Oral

Domesticated plants represent massively diverse stories of evolutionary success and failure. Some domesticates overcame restricted natural distributions of their wild progenitors to become among the most widely grown plants on the planet. Some survive only in small pockets marked by rare microenvironments and/or unique symbioses with humans. Others have become extinct entirely. The evolution of numerous agricultural varieties, each adapted to unique environmental and cultural conditions is part of this process, recently catalyzed by post-industrial developments in selective breeding, genetic engineering, and gene editing. Modern crop improvement has, in turn, promulgated research by agronomists using crop histories as key to winning the race toward higher yields or resilience. In so doing, the history of research may have replicated inherent biases toward high-yielding grain crops, leaving others forgotten. Meanwhile, the drive toward high-potential new crops may have introduced a source of counter-bias and in research. We explore such trends in crop history research through a meta-analysis of multi-disciplinary research conducted on a number of domesticated plants. Our aim is to evaluate the extent to which research in different disciplines fields (ethnobotany, comparative linguistics, history, archaeobotany, biogeography, population genetics and palaeogenetics, geometric morphometrics, stable isotopes and other archaeological sciences) has been conducted for a variety of domesticated plants. More than a historiographic cross-section of crop history research, this study may have important implications for agenda-setting in the present and future.

2 FROM PAST TO PRESENT - INTEGRATING ETHNOBOTANICAL, ARCHIVAL, AND ARCHAEOBOTANICAL EVIDENCE FOR CROP HISTORIES IN NORTHEAST AFRICA

Abstract author(s): Ryan, Philippa (RBG Kew)

Abstract format: Oral

Integrating ethnographic, archival, and archaeological evidence can provide deep time perspectives on crop histories. Agricultural systems in NE Africa have changed profoundly over the last century at different temporal and spatial scales. Combining both recent and long crop histories can be important for considering the extent to which current agrobiodiversity reflects processes of long-term crop diffusion and evolution and insight into the past history of crops increasing described today as 'forgotten'. This paper focuses on northern Sudan and several case-study crops, including barley, date palms, lablab and lupins to compare the types of information recoverable from diverse sources. The value of expanding historical approaches with ethnobotany will be discussed, for example developing ethnobotanically orientated oral histories and methods for interrogating archives. Additionally, the potential of such methods will be briefly contrasted between Sudan and Ethiopia - through highlighting how variations between data sources, modern development histories and persisting crop diversity and traditional practices will influence both the scope and methodological approaches for examining long term crop histories.

3 ON THE EVOLUTIONARY HISTORY OF THE DATE PALM (PHOENIX DACTYLIFERA)

Abstract author(s): Gros-Balthazard, Muriel (IRD Montpellier)

Abstract format: Oral

The history of the date palm (*Phoenix dactylifera*) remains a mystery despite its significant importance in oasis agrosystems of North Africa and West Asia.

For more than 10 years, multiple lines of evidence have been used to study the origins and evolution of this species. The analysis of hundreds of genomes from the entire distribution range has helped us understand the structure and extent of its diversity. This combined with seed morphometrics showed that the ancestral wild date palms can be found in Oman, contrary to earlier beliefs that they were extinct. This evidence also revealed gene flow from a wild

relative species into the North African germplasm. Archaeogenomics of ancient remains has provided further insight into this introgression event, including a timestamp. Finally, seed morphometric analysis of ancient seeds has shown how diversity has evolved over the last 3,000 years.

Expanding our study of ancient samples by both morphometrics and archaeogenomics is expected to provide additional insights into the domestication and diffusion history of this iconic crop, and by extension, that of oases.

4 THE STORY OF OLIVE CULTIVATION IN THE SOUTHERN LEVANT: GENETIC AND MORPHOMETRIC ANALYSIS OF LIVING TREES AND ARCHAEOLOGICAL FINDINGS

Abstract author(s): Ben Dor, Elad (Institute of Plant Sciences, Department of Vegetables and Field Crops, Volcani Research Institute; The Robert H Smith Faculty of Agriculture, Food and Environment, the Hebrew University of Jerusalem) - Schmerler, Noam - Cvikel, Deborah (School of Archaeology & Maritime Cultures, University of Haifa) - Dag, Arnon - Barazani, Oz (Institute of Plant Sciences, Department of Vegetables and Field Crops, Volcani Research Institute)

Abstract format: Oral

The domestication process of olives (*Olea europaea*) is still a subject for debate among scholars. One of the main hypothesis is that its domestication started in the southern Levant. With that assumption in mind and with some of the earliest evidences of olive fruits usage (table olives and olive oil) that have been found in this region, the history of olive cultivation in the southern Levant is being studied. Here, molecular tools are used to understand the genetic background of local ancient landraces and the wild ancestor of cultivated olive (var. *sylvestris*). In addition, computerized analysis tools are applied in morphometric measurements of their pits in comparison to the available collection of archeological olive pits from. Doing this, our work is centered on elucidating the history of cultivar selection and use. It is also assumed that by assessing several agronomical traits of ancient landraces, information on past selection processes can be provided, which can also result in reintroduction of ancient cultivars that were selected by humans to withstand the local semi-arid conditions.

5 ETHNOGRAPHICAL AND ARCHAEOBOTANICAL RESEARCH IN THERASIA ISLAND IN CYCLADES WITHIN THE FRAMEWORK OF ARCH2PLANT PROJECT

Abstract author(s): Gkatzogia, Eugenia (LIRA Lab - Laboratory for Interdisciplinary Research in Archaeology Research, Dept of Archaeology, School of History and Archaeology, Aristotle University of Thessaloniki) - Stavridou, Evangelia (Institute of Applied Biosciences, Centre for Research and Technology - Hellas) - Sbonias, Kostas (Department of History, Ionian University) - Athanasiou, Konstantinos (Department of Architecture, Polytechnic School, Aristotle University of Thessaloniki)

Abstract format: Oral

The ethnographical research is part of Arch2Plant project an innovative interdisciplinary collaboration of scientists, from fields of architecture, agricultural sciences and archaeology/ archaeobotany that aims to reconstruct the unexplored rural, residential and natural environment of Therasia island, and its two-way relationship with the modern and ancient plant biodiversity. More specifically, the ethnographical work was based on fieldwork and oral interviews carried out in Therasia island. The ethnographical work provides information on the traditional cultivated crops, wild, fruit and nut harvests, old-fashioned farming practices (manuring, watering, etc.) and the role of plants in the everyday life of the inhabitants of Therasia until the recent times. Many aspects of the rural history of the island are highlighted, such as the relationships and patterns emerging from the dietary habits and uses of plants in Therasia island. The ethnographical work offers a valuable feed-back of the knowledge of traditional crops that gets lost, due to decline in population, internal migration, and abandonment of traditional agricultural modes of production. In combination, the archaeobotanical study of the Early and Middle Bronze Age settlement of Koimisis, situated in the south side of the island, will shed light into reconstructing the prehistoric plant diversity, paleoeconomy and the paleoenvironment of the settlement.

6 A LEAP FROM THE PREHISTORIC TO THE MODERN AGRO-DIVERSITY AND FLORA OF THERASIA. AN INTEGRATED APPROACH OF THE ARCH2PLANT PROJECT

Abstract author(s): Stavridou, Evangelia (Institute of Applied Biosciences, Centre for Research and Technology - Hellas) - Gkatzogia, Eugenia (Department of Archaeology, School of History and Archaeology, Aristotle University of Thessaloniki) - Madesis, Panagiotis (Institute of Applied Biosciences, Centre for Research and Technology - Hellas) - Sbonias, Kostas (Department of History, Ionian University) - Athanasiou, Konstantinos (Department of Architecture, Polytechnic School, Aristotle University of Thessaloniki)

Abstract format: Oral

This work is part of the Arch2Plant project seeking to study the rural architecture and diachronic settlement development in relation to the flora of the region and plant palaeoenvironment with the aid of additional archaeological, architectural, and ethnographic evidence, complemented with innovative molecular plant identification approaches. To understand the modern and past agricultural environment and flora of Therasia we have employed an interdisciplinary synergy by investigating the modern and prehistoric plant diversity of the island. We aim to explore the common agricultural crop plants of the past and the present and how agriculture has evolved in this unique volcanic environment. The multi-disciplinary approach will be focusing on i) reconstruction of the past plant diversity through on-target sequencing of the sedimentary ancient DNA (sedaDNA), along with archaeobotanical analysis of plant remains from the pre-historic soil stratum of the systematic excavation of the Early and Middle Bronze Age settlement of Koimisis, ii) the molecular analysis of modern plant species using DNA barcoding, iii) taxonomic identification of plant species along with seasonal coverage and composition of modern vegetation in the abandoned settlements and different rural habitats and measuring vegetation from satellite images with normalized difference vegetation index (NDVI) in different seasons, and iv) ethnographic research of the island's traditional crops and recent agricultural history. This work is expected to reconstruct a comprehensive picture of the island's cultural landscape and plant diversity in relation to rural activity and the changing pattern of the island's inhabited sites diachronically, ultimately shedding light on the emergence of Therasia's uniqueness. Such an interdisciplinary approach may offer a new perspective for similar environmental, spatial, biomolecular, archaeological, and ethnographic studies.

7 WHY WON'T YOU EAT YOUR PEAS?! AN INTERDISCIPLINARY APPROACH TOWARDS INVESTIGATING UNDERUTILISED CROPS

Abstract author(s): Collins, Adam - McClatchie, Meriel - Negrão, Sónia (University College Dublin)

Abstract format: Oral

The UN Food and Agriculture Organisation estimates that 75% of crop diversity has been lost between 1900 and 2000. Such loss of biodiversity has serious implications for food security in the context of climate change and environmental degradation. Urgent action is required to diversify crop production and broaden genetic diversity. Ireland has a deep and rich history of farming. Although ancient Irish farmers cultivated a wide range of crop species and varieties, nowadays farming is focused on a narrow variety of crops. This has resulted in some crops being underutilised, despite their great potential in terms of being nutrient dense, suited to European climates and environments, and viable for sustainable production in Ireland. *Pisum sativum* (pea) is a good example of this, having been cultivated for around two millennia in Ireland but not extensively cultivated nowadays. CROPREVIVE is a mixed-methods project that investigates the trajectories of selected crops to understand how their use has diffused and evolved in Irish agricultural practices. CROPREVIVE aims to align findings on ancient practices (from archaeology and history) with current data from plant sciences to seek resilient crops adapted to sustainable practices, and to tackle environmental, economic and cultural barriers to increased production in a modern context.

8 EVOLUTION OF PLANT CONSUMPTION IN THE MEDIEVAL CITY OF SAINT-OMER, FROM THE 13TH TO THE 16TH CENTURY

Abstract author(s): Connan, Marion (EVEHA)

Abstract format: Oral

Two excavations campaigns carried out between 2020 and 2021 by Eveha in the city of Saint Omer (62) in the north of France revealed a dense occupation linked to the rise of the Medieval town of Saint-Omer. This demographic growth was likely encouraged by the founding of the abbey of Saint-Bertin, the development of the textile trade thanks to a canal linking the city to Gravelines and the English Channel, as well as the establishment of cultivable marshes in the immediate vicinity.

A complex stratification and many exceptionally preserved structures were recovered due the high water table and other waterlogged contexts. Several wooden elements, leather and abundant plant macroremains were also found.

The study of the carpological remains from Saint-Omer provides a picture of the evolution of plant consumption and exploitation between the central Middle Ages and the Modern era. In particular, it allows the probable identification of market gardening practices related to vegetable gardens and orchards, noticeable through many cultivated species and associated weeds.

The aim of this submission is to present these two macrobotanical data sets and their implications for the evolution of plant foods production and supply.

9 PEARL MILLET IN THE IBERIAN PENINSULA: FROM AN UNKNOWN MEDIEVAL CROP TO A FORGOTTEN FOOD TODAY

Abstract author(s): Jorda, Guillem (University of Valencia) - Peña-Chocarro, Leonor (Instituto de Historia, Spanish National Research Council - CSIC) - Sabato, Diego (University of Valencia)

Abstract format: Oral

Pearl millet (*Pennisetum glaucum* L.) is a crop originating in West Sub-Saharan Africa, which has been cultivated until recently in small pockets in the Spanish province of Ciudad Real (south of Madrid). It was traditionally used to produce a type of cakes widely consumed in times of scarcity although nowadays it has almost disappeared. The first archaeobotanical evidence in Iberia suggests that it was introduced around the 12th century AD, perhaps by the Almohads whose empire extended from present-day Mali and Mauritania to Syria including the south of the Iberian Peninsula. Beautiful desiccated inflorescences, spikelets and grains have been found in cliff-granaries of the Valencia region (eastern Iberia) together with many other plant remains. More recently, seeds have been also recovered from an Islamic site in the city of Córdoba (southern Iberia) in later chronologies which suggests an association with the Arab world.

Surprisingly, the Castilian chronicles written after the conquest of the Islamic territories do not include references to this crop, so little information is available in the written sources. However, some Valencian sources, recall the cultivation of a species called “dacsá” which seems to have been a widespread crop at the time. Written sources have always translated “dacsá” as sorghum (*Sorghum bicolor*) and the term is currently given in Catalan to maize (*Zea mays*), suggesting that the word may have been transferred from an old crop when in the 16th century maize was introduced into Europe. By combining, archaeobotany, written sources, ethnobotany and linguistics, this presentation explores the history of this crop in Iberia, its traditional uses in those areas where it has been cultivated until recently, and it examines the possibilities that “dacsá” was the name given to pearl millet instead of shorgum. This work has been done within the framework of the ERC project MEDAPP (ERC-AdG-101054883).

10 USING VARIANCE IN GRAIN MEASUREMENTS TO EXAMINE THE EVOLUTION OF IMPROVED RICE CULTIGENS IN YAYOI TO HISTORICAL JAPAN

Abstract author(s): Stevens, Chris - Brainerd, Leah - Carrignon, Simon - Crema, Enrico (McDonald Institute, University of Cambridge)

Abstract format: Oral

Rice agriculture came to the Japanese archipelago in the Yayoi Period (c.950 BCE-250 CE). From northern Kyushu agriculture first spread eastwards to become established in western Honshu by 800 to 500 BCE, diffusing via coastal regions of the Sea of Japan into northern Japan (Tohoku) by the later 1st millennium BCE. However, this first agricultural foray was short-lived and disappeared before the end of the 1st millennium BCE only becoming firmly re-established during the Kofun Period (250-538 CE).

It has been hypothesised that the first rice cultigens were genetically variable, with a slow adaption resulting in varieties better suited to the changing environments across the Japanese Archipelago. Previous studies used rice measurements and aDNA to examine the appearance of new varieties, however, little change in grain size and shape was detected. In this paper a different approach was taken. It was hypothesised that early less adapted strains would have a higher variance in grain measurements compared to later adapted varieties, especially as rice agriculture moved into higher latitudes. An analysis of 34,000 published charred rice grains metrics from 234 sites was conducted to test this theory. Variation in the assemblage-wise means and variance of rice metrics were examined via a multi-level Bayesian model for Yayoi and Kofun periods. Preliminary results suggest a possible correlation in increased variance in grain shape and size with higher latitudes. Further, variance was higher in grain shape in the Yayoi period than the Kofun period.

This initial study supports the hypothesis that after the Yayoi period rice varieties emerged that were better adapted to environments found within the Japanese Archipelago particularly within more northerly latitudes. This theory can be compared to previous evidence that suggest a transition occurred during the Yayoi to Kofun period that resulted in more stable agricultural systems.

FIELDS, SICKLES, AND GRAINS: SPECIES DISTRIBUTION MODELLING OF THE ECOLOGICAL NICHE FOR RICE IN JAPAN DURING THE YAYOI PERIOD

Abstract author(s): Brainerd, Leah - Carrignon, Simon - Crema, Enrico (University of Cambridge) - Madella, Marco (University Pompeu Fabra) - Yoshida, Akihiro (Kagoshima University)

Abstract format: Oral

During the 1st millennium BCE, migrant communities from the Korean Peninsula entered Japan, introducing an extensive culture package and profoundly changing life within the archipelago. Core elements of this cultural package were rice and millet agriculture, which dispersed into the Japanese islands through a mixture of demic and cultural diffusion. This process led to different responses amongst the incumbent population of complex hunter-gatherers, the Jomon people. In some areas the uptake of this new subsistence saw significant delays, and in others the early adoption of farming was followed by reversion to a predominantly hunting and gathering economy. The geographically diverse response to the continental subsistence economy is generally assumed to be reflecting the underlying variation in the environmental and climatic settings of the Japanese islands. However, this assumption remains untested, and further exploration of the relationship between environmental and social factors is required to elucidate the diversity of local responses. This paper contributes to this research agenda by exploring how environmental suitability for rice agriculture impacted the spatial distribution of archaeological sites in the Yayoi period. To explore this topic, we employ Bayesian species distribution modelling (otherwise known as eco-cultural niche modelling) to estimate the realised ecological niches for Japonica rice using three distinct proxies for its presence: paddy field sites, charred remains of rice grains, and stone sickles. The comparison and exploration of these different lines of archaeological evidence will offer a robust inferential framework for reconstructing the ecological and cultural factors that promoted or hindered the diffusion of rice farming in prehistoric Japan.

705 RECONSTRUCTING HUMAN-ENVIRONMENT RELATIONSHIPS IN EXTREME ENVIRONMENTS: THE ROLES OF GEOARCHAEOLOGY, ZOOARCHAEOLOGY, AND ARCHAEOBOTANY IN WATER-DOMINATED AND IN WATER-DEPRIVED LANDSCAPES

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Rizzetto, Mauro - Bivolaru, Alexandra (Ca' Foscari University of Venice) - Aragón-Nuñez, Enrique (University of Almeria) - Garavello, Silvia - Forti, Alessandra (Ca' Foscari University of Venice)

Session format: Regular session

Interdisciplinary approaches to the reconstruction of past human-environment relationships have become standard practice in archaeological research. The integration of results from geoarchaeological, zooarchaeological, and archaeobotanical research plays an especially important role when human settlement developed in 'extreme' environments, such as water-dominated (e.g. river deltas, lagoons, archipelagos) and water-deprived landscapes (e.g. desertic and semi-desertic regions). Here, these disciplines face peculiar challenges and opportunities, with methods and research questions having to be constantly adapted based on site accessibility, preservation conditions, and the nature of past and present human occupation. Research projects in past human interactions with water-dominated and water-deprived landscapes also provide a historical background to current climate change-related draughts and floodings, whether as isolated events or longer-term changes in environmental conditions, which are increasingly impacting on modern communities throughout the world and imposing constant re-assessments of water management policies. This session invites presentations integrating evidence from geoarchaeological, zooarchaeological, and/or archaeobotanical research focusing on specific sites and regions where water or its absence impacted on the nature of human settlement. The session aims to provide a common platform for researchers tackling human-environment relationships in such peculiar environments, from northern Europe to the Mediterranean, and from prehistoric times to the Modern Era.

ABSTRACTS

1 ZOOARCHAEOLOGICAL AND ARCHAEOBOTANICAL RESEARCH IN THE VENETIAN LAGOON: EVIDENCE, OPPORTUNITIES, AND CHALLENGES

Abstract author(s): Forti, Alessandra - Garavello, Silvia - Rizzetto, Mauro (University Ca' Foscari of Venice)

Abstract format: Oral

Zooarchaeology and archaeobotany in the lagoon of Venice are now well-established disciplines, being developed by researchers from local (Ca' Foscari University of Venice, Natural History Museum Venice) and foreign institutions under the auspices of archaeological Soprintendenze. This paper will provide a state-of-the-art review of the evidence

so far available, and offer examples of how the results from these two disciplines can be integrated. The evidence presented belongs to the Roman and medieval periods. In fact, most of the material analysed was recovered from sites dated to these periods; at the same time, this chronological comparative approach will allow to highlight and interpret differences and similarities on both sides of the Roman-medieval transition, as well as within the Middle Ages. The results need to be contextualised within the environmental setting of these sites, all located around the lagoon or on islands within it; the settlement layout and economy would have been strongly influenced by water in different ways: from threats posed by erosion and silt-up, to the use and improvement of water courses, trade and supplies, the management of fresh water, and the exploitation of marine resources. This study also provides the opportunity to present and discuss the advantages and methodological challenges of excavations in these environmental settings, from water management, to preservation of the material and recovery strategies. Finally, zooarchaeological and archaeobotanical research in the lagoon can inform initiatives aimed at improving the sustainability of animal and plant use in such peculiar environments, as well as integrate educational offers within an intensely frequented microregion.

2 NATURAL CONSTRAINTS AND POTENTIALITIES IN THE VENICE LAGOON IN ANTIQUITY: A GEOARCHAEOLOGICAL PERSPECTIVE

Abstract author(s): Bivolaru, Alexandra (Ca'Foscari University)

Abstract format: Oral

This paper discusses the importance of a multi-proxy geoarchaeological approach to the interpretation of the archaeological dataset in a water-dominated environment – the Venetian Lagoon. Despite their high potential in terms of understanding the constructions of waterscapes in the lagoon and human-environment entanglement, the paleo-environmental reconstructions at site-scale remain surprisingly overlooked in archaeological research. We propose hence an integrated multi-proxy approach to discuss micro-ecologies and geoarchaeological narratives by choosing as study-case the Roman site of Lio Piccolo. More specifically, the focus will be on understanding (i) the evolution of wetlands in the floodplains and the lagoon through geochemical, bio-sedimentological, palynological and archaeobotanical analysis; (ii) the role of an environment plentiful of resources between eco-determinism and economic/social and political choices; (iii) river and coastal constraints (accessibility to the sea, flooding, erosion due to sedimentary budget crises, vulnerabilities, etc.), which have led to progressive clogging of the margins of the lagoon and caused environmental changes; (iv) measuring the impacts of human actions on the natural evolutive trend of the lagoon (direct through actions such as engineering works, channeling, dredging, metal pollution revealed by stable isotopes of lead and trace elements or indirect impacts such as forest clearing).

Through this case study, we aim to emphasize the importance of an integrated palaeoenvironmental approach when addressing long-term societal dynamics within peculiar and challenging environments.

3 THE PILE-DWELLING SITE AT THE LAKES OF SAN GIORGIO AND SANTA MARIA (REVINE-LAGO AND TARZO, ITALY): NEW CONTRIBUTIONS

Abstract author(s): Modolo, Marta (Università degli Studi di Ferrara, Dipartimento di Studi Umanistici, Sezione di Scienze preistoriche e antropologiche) - Rizzo, Enzo (Università degli Studi di Ferrara, Dipartimento di Fisica e Scienze della Terra) - Deiana, Rita (Università degli Studi di Padova, Dipartimento dei Beni Culturali: archeologia, storia dell'arte, del cinema e della musica) - Censini, Matteo (Università degli Studi di Padova, Dipartimento di Geoscienze) - Thun Hohenstein, Ursula (Università degli Studi di Ferrara, Dipartimento di Studi Umanistici, Sezione di Scienze preistoriche e antropologiche)

Abstract format: Oral

The lakes of San Giorgio and Santa Maria are two basins located in a glacial valley, at the foothills of the Veneto Pre-Alps, in the municipalities of Revine-Lago and Tarzo (Treviso, Italy). Archaeological pre-existences date back to 1923 when a Sauerbrunn bronze sword, followed by other bronze artefacts, was found while excavating an artificial canal. In 1987, the first pile-dwelling remains were discovered. During the 1990s, several excavation campaigns documented a peri-lacustrine settlement dating to the late Neolithic-Eneolithic, with sporadic frequentation during the Bronze Age. Since 2019, as part of the reLacus project, the University of Ferrara has undertaken a new phase of multidisciplinary research in collaboration with the University of Padua. During three field campaigns, underwater prospectings, geoarchaeological cores, geophysical acquisitions and archaeological excavations were carried out to identify new settlement areas and reconstruct formation processes and paleoenvironment. Non-invasive prospectings on over 7,000 m² identified magnetic anomalies concentrations and permittivity variations, which would be connected to anthropic evidence.

The test pits and the excavation of 2022 highlight a rather homogeneous peat layer of anthropic origin, representing the settlement phase. A lake flooding phase, with grey clay loam deposition, has sealed the anthropic layer allowing exceptional conservation of remains. Archaeobotanical analyses describe an environment characterized by predominantly mixed oak woods, also with arboreal hygrophytes and fruit plants. The faunal assemblage is characterized by

domestic animals, mainly bovinds, pigs and sheep/goats, flanked by some wild species like bears and small carnivores. The settlement continuity is further confirmed by pottery production, both for daily use and food storage, by the production of necklaces and pendants from bones and teeth, as well as by the procurement of lithic raw material from areas close to the settlement.

4 FROM WETLAND TO DRYLAND: LANDSCAPE CHANGE OF LAKE NEUSIEDL AREA (AUSTRIA/HUNGARY) DURING THE HOLOCENE

Abstract author(s): Draganits, Erich - Weißl, Michael (University of Vienna) - Tobias, Bendeguz (Austrian Academy of Sciences) - Saliari, Konstantina (Natural History Museum Vienna)

Abstract format: Oral

The Lake Neusiedl area is a unique lakescape, situated at the geodynamical and geomorphological border between the Alps, Carpathians and the Pannonian Basin, and represents an important transition zone concerning terrain, climate, vegetation, fauna and cultures. We use geological, geoarchaeological, archaeological, archaeozoological, high-resolution topographic, geomorphological approaches and data, as well as topographical and historical maps plus historical charters to reconstruct the palaeohydrology of Lake Neusiedl documenting dramatic landscape changes, especially in the last two centuries. Today, Lake Neusiedl (143 km² open water, 178 km² reed area) is the largest lake of Austria; it is regarded as endoreic lake with only 1120 km² catchment and thus mainly controlled by local precipitation and evaporation. The average depth is only about 1.4 m and the maximum depth not exceeding 1.8 m; the average lake level of the recent years was about 115.5 m above sea level (asl, Trieste, Adria). To the east, the lake is associated with about 30 shallow lakes – the largest less than 2 km long.

In contrast, virtually all historical maps and historical charters before 1780 show Lake Neusiedl connected with a low-moor, the so-called Hanság in the east. Additionally, in contrast with today, the Lake/Hanság was connected with several rivers from the south and the documented episodic variation of the water levels of Lake Neusiedl, between desiccation and highest flood levels (117.6 m asl), affected enormous areas in this extremely low-relief region. More than 370 shallow lakes and presently dry basins, documented in this study are newly interpreted as thermokarst lakes that formed during early Lateglacial permafrost degradation after the end of the Late Glacial Maximum (LGM). These reconstructions have a huge impact on the landscape, fauna and vegetation, human settlement patterns, land use and communication routes – which should be considered in regional archaeological and historical interpretations.

5 A HAVEN IN THE MARSHES: AN INTEGRATED GEOARCHAEOLOGICAL APPROACH OF THE ARCHAIC AND CLASSICAL HARBOUR OF ANCIENT ABDERA, THRACE, GR

Abstract author(s): Mayoral, Alfredo (ICAC-Catalan Institute of Classical Archaeology, Landscape Archaeology Research Group - GIAP, Generalitat de Catalunya & Universitat Rovira i Virgili; Université Clermont Auvergne, CNRS, GEOLAB) - García-Molsosa, Arnau - Georgiadis, Mercurios (ICAC-Catalan Institute of Classical Archaeology, Landscape Archaeology Research Group - GIAP, Generalitat de Catalunya & Universitat Rovira i Virgili) - Papadopoulos, Nikos (Laboratory of Geophysical–Satellite Remote Sensing & Archaeo-Environment GeoSat ReSeArch, Institute for Mediterranean Studies - IMS, Foundation for Research & Technology Hellas - FORTH) - Kallintzi, Constantina (Ephorate of Antiquities at Xanthi, Archaeological Museum of Abdera) - Kefalidou, Eurydice - Trasanis, Gerasimos (National and Kapodistrian University of Athens, School of Philosophy, Department of History and Archaeology) - Ejarque, Ana (ISEM, Univ Montpellier, CNRS, IRD) - Orengo, Hèctor (ICAC-Catalan Institute of Classical Archaeology, Landscape Archaeology Research Group - GIAP, Generalitat de Catalunya & Universitat Rovira i Virgili; Catalan Institution for Research and Advanced Studies - ICREA) - Palet, Josep Maria (ICAC-Catalan Institute of Classical Archaeology, Landscape Archaeology Research Group - GIAP, Generalitat de Catalunya & Universitat Rovira i Virgili)

Abstract format: Oral

Mediterranean coastal landscapes have been the scenario of complex socio-environmental interaction since Prehistory, although they were often difficult to settle for ancient societies due to the widespread wetlands. The Thracian coast between the Nestos delta and the lake Vistonis was not an exception when Greek colonists from Klazomenae founded Abdera c. 650 BC, taking advantage of the single good anchorage in an otherwise marshy landscape. After its resettling by the Teians in 545 BC, Abdera flourished thanks to maritime trade and its excellent harbour. In order to explore the largely unknown socio-environmental interactions around that infrastructure crucial for the life of the colony, and its palaeogeographic evolution since Archaic times, we implemented an integrated geoarchaeological approach including coring, trenching, remote sensing and geophysics. Dry Early-Holocene palaeosols at the bottom of the stratigraphies of our cores are overlaid by marine seafloor sandy facies deposited after mid-Holocene transgression. These are in many cases covered by a thick unit of dark, organic fine silts rich in malacofauna and archaeological artifacts, developed since the 6th c. BC. These sedimentary facies are geographically constrained and seem to correspond to the infilling of a potential harbour basin. Geophysical results show that beach profiles were steeper,

and draughts deeper in the southern part of the harbour area, whereas its northern part had a much longer and shallower profile. All the area was gradually silted by sandy sediments since the 3rd-2nd c. BC, and geomorphological data suggest that sedimentary fluxes coming from the Archaic-Classical enceinte after its abandonment could have contributed significantly. In the Late Antiquity, all these deposits were draped by an irregular layer of coarse sediments likely resulting of a tsunami. Forthcoming multiproxy analyses of selected sedimentary sequences will allow us to dive deeper into the history of the harbour of ancient Abdera.

6 DROUGHT AND SUBSISTENCE PRACTICES: DISENTANGLING POSSIBLE ADAPTATIONS DURING PREHISTORIC TIMES IN SOUTHERN IBERIA

Abstract author(s): Schirmmayer, Julien (Christian-Albrechts-Universität Kiel) - Almeida, Nelson (Universidade de Lisboa) - Stika, Hans-Peter (Universität Hohenheim) - Weinelt, Mara (Christian-Albrechts-Universität Kiel)

Abstract format: Oral

Today the southern Iberian Peninsula is characterized by a highly seasonal climate with a rainy season during winter and distinct aridity during summer. Particularly, the south-eastern part is prone to desertification as overall precipitation levels are exceptionally low. This Mediterranean climate with pronounced seasonal differences in temperature and precipitation gradually established after the Holocene Thermal Maximum approximately 6000 years ago. In addition, the overall climate became drier during the last 6000 years. These long-term developments are punctuated by several aridity events – among others the well-known 4.2 ka event.

Particularly, the aridity events exerted a strong pressure on prehistoric societies. Archaeological studies point to frequent booms and busts of different societies on the southern Iberian Peninsula. One such example would be the Bronze Age El Argar society in south-eastern Iberia. Still, varying spatio-temporal patterns of human activity during drought events imply a highly dynamic and complex interaction between prehistoric societies and climatic deteriorations.

In order to disentangle this complex picture, we analyze archaeobotanical and archaeozoological remains from the southern Iberian Peninsula during Neolithic to Bronze Age times. A regional evaluation enables us to identify certain societies, which developed successful adaptation strategies to aridity crisis and others who might have failed.

7 LANDSCAPE DEGRADATION AND THE 'FAILURE' OF ALCATRACES, THE FIRST EUROPEAN OUTPOST IN A DRY TROPICAL ARCHIPELAGO (SANTIAGO ISLAND, CABO VERDE)

Abstract author(s): Castilla Beltrán, Alvaro (University of La Laguna) - Nogué, Sandra (CREAF) - Evans, Christopher (McDonald Institute for Archaeological Research)

Abstract format: Oral

Cabo Verde was the first dry tropical archipelago settled by Europeans (the island of Santiago in 1460 CE). Being previously uninhabited, the attempts at establishing a profitable colony in these unfamiliar dry volcanic landscapes involved different levels of socio-ecological adaptations and experimentation. In this study, we investigate the socio-ecological interactions in the environs of Alcatraces, an early Portuguese site situated within an estuarine embayment on the southeastern shores of the island, which was allegedly abandoned c. 1516 CE. The study of a 275cm test pit (SIR) composed of 12 strata with abundant shells and charred material allows for a long-term diachronic view of land use change associated with the rise and dawn of this early settlement. Multi-proxy archaeobotanical and palaeoecological analyses including palynomorph (pollen, spores), phytoliths, and charcoal analyses show different stages including the occurrence of fires, erosion, vegetation change, and finally the establishment of monocultures in the XIX and XX centuries. We evaluate diverse hypotheses of culture-environmental interactions that could explain site abandonment based on this new palaeoenvironmental data.

706 ON LAND AND UNDERWATER. DETECTION AND EVALUATION OF ARCHAEOLOGICAL SITES: COMPARATIVE METHODOLOGY ON A EUROPEAN SCALE [ARCHAEOLOGICAL PROSPECTION COMMUNITY]

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Peake, Rebecca (INRAP) - Ritondale, Manuela (Groningen University) - Marcigny, Cyril - Fontaine, Souen - Hulin, Guillaume (INRAP)

Session format: Regular session

Since the Planarch project in the early 2000s, the question of detection and evaluation of archaeological sites on land have been discussed but the specificities of underwater, wetland or land-water interface areas are often less considered. These areas - offshore and nearshore waters, intertidal zones, sandy coastal areas, lagoonal or deltaic

context and rivers have a strong archaeological potential. The EAA provides the perfect opportunity to think about the relevance of methods of investigation used in different countries across Europe, that include little or non-intrusive interventions (geophysical prospection, remote sensing, etc.) or the very intrusive interventions of (from auger sampling to linear trial trenches).

This session will initially focus on sharing experiences to assess how implemented methods are relevant in the case of detection and evaluation of archaeological sites, both from a theoretical point of view (regulatory framework) and from the point of view of practical application in the field. The aim will be to examine how various investigation methods (preliminary documentary studies, remote sensing, geophysical and hydrographic solutions, extent of trial trenches and organisation, recording systems, etc.) contribute to and limit archaeological detection and evaluation in these areas with severe constraints.

For water contexts as for the more common land areas, it seems relevant to discuss how we can use the preliminary evaluation phase as a research tool in its own right. While the scientific validity of the data from an evaluation phase is generally accepted, the value of this type of “sampling” as a tool for a large-scale interpretation can still be ignored.

Our aim is to share different experiences to highlight how datasets from archaeological evaluation are used to build models on different scales that provide information on the evolution of the impact of human activity on the natural environment, on its transformation and development.

ABSTRACTS

1 THE USE OF HIGH DEFINITION ORTHOPHOTOGRAPHY, LIDAR AND NEAR INFRA-RED IMAGERY TO IDENTIFY NEW ARCHAEOLOGICAL SITES AROUND NORTHERN IRELAND'S COASTLINE

Abstract author(s): Dunlop, Colin (Department for Communities: Historic Environment Division; Department of Agriculture, Environment and Rural Affairs : Marine & Fisheries Division)

Abstract format: Oral

In 2021 the Department for Agriculture Environment and Rural Affairs (DAERA) commissioned a topographic LiDAR, orthophotography and near-infrared survey of Northern Ireland's c.650km of coastline. Data at 0.25m resolution was acquired across a total area of 285km², encompassing the zone between the mean low water mark and 200m inland of the mean high-water mark, as well as all sand dune complexes. Desk-based analysis and review of the coastal LiDAR and orthophoto survey data was then undertaken for the purposes of mapping new heritage assets (and known heritage assets at risk from coastal erosion) for the entire coast of N. Ireland. This included creation of a marine heritage dataset for integration into the Historic Environment Record of Northern Ireland and the publicly available marine spatial planning map viewer. Where these features were not found to be already present within the Historic Environment Record of Northern Ireland, they were verified through physical site inspection before addition to the national monuments record. The survey identified 256 new archaeological features, 154 below the mean high-water mark and a further 102 sites within the 200m boundary above the mean high-water mark. These features included hut sites, enclosures, promontory forts, raths, quays, slipways, shipwrecks, defence heritage infrastructure and a helicopter.

This presentation will outline the methodology undertaken during the survey, the limitations identified within each of the three survey data sets and provide a summary of the results of the project.

2 A NOVEL APPROACH FOR AUTONOMOUS 3D ACQUISITION OF BURIED OBJECTS IN INTERTIDAL ENVIRONMENTS - FIELD EXAMPLES FROM AVALDSNES, NORWAY

Abstract author(s): Olsen, Thomas - Weibull, Wiktor - Escalona, Alejandro (Department of Energy Resources, University of Stavanger) - Vivås, Arild (Stavanger Maritime Museum, Museum Stavanger - MUST)

Abstract format: Oral

Underwater archaeology relies on expensive and time-consuming invasive methods to excavate objects or identify layers in shallow and intertidal environments. Areas with high level of sedimentation has better conditions for preservation of organic material i.e., archaeological objects. Invasive methods have a significant impact in the layers and the conditions for preservation as well as a low recovery factor in relation to time invested. To visualise cm level details sufficient for underwater archaeology, a non-invasive 3D acoustic acquisition with dense survey coverage is proposed to both increase the area of investigation and limit the use of destructive methodologies. Acquiring a sub bottom profiling dataset is normally performed by manually steering a vessel. However, the challenging conditions seen in an intertidal environment such as shallow water, narrow sounds, tidal changes, outcropping basement, and man-made structures make manual acquisition difficult.

The paper presents a solution to solve these challenges in form of an autonomous reconnaissance vessel that can acquire 3D acoustic data by a high frequency 2D Chirp sonar. The vessel was tested in four different environments

with man-made objects, strong currents, seaweed, and shallow waters and showed good results in terms of manoeuvrability and repeatability, producing a 25 cm x 25 cm 3D dataset with good resolution and S/N ratio. The dataset was further interpolated and migrated to a 15 cm x 15 cm bin size. The final 3D migrated cube shows a seismic image of a known buried shipwreck from the medieval period. The vessel's design has global implications as it can act as a first stage for archaeological survey in areas where traditional methods are difficult. Improving the design by adding low-frequency acquisition instruments can enable penetration through shell sand layers and for applications in geo-technical investigation.

3 RECONSTRUCTING THE CULTURAL DYNAMICS OF COASTAL AND SHALLOW SUBMERGED ARCHAEOLOGICAL SITE WITH GEOINFORMATICS

Abstract author(s): Papadopoulos, Nikos (Foundation for Research and Technology Hellas- FORTH)

Abstract format: Oral

The projected sea level rise due to climatic and geological factors has rendered the accessibility to information regarding the current-state of coastal and shallow submerged archaeological sites a necessity. Thus the development of ways to explore and promote these under-studied submerged contexts, improving at the same time the community awareness and involvement in protection practices is quite important. Based on this framework the project "Clepsydra: Translating Submerged and Buried Cultural Heritage from Shallow Water to Digital environment with Geoinformatics" funded by the Hellenic Foundation for Research and Innovation, will integrate the archaeological research with state-of-the-art methodologies and innovative technological aspects in order to document and promote coastal and submerged cultural heritage material adapting the equipment and practices to the ultra-shallow underwater context. The contribution to the documentation of current state of cultural heritage in different sites in eastern Mediterranean focusing mainly in Greece will pass through: a) aerial/satellite remote sensing –specifically targeted to historical reconstruction of coastal zone and seabed–, b) digital photogrammetry –with customization of remotely controlled floating device and specific protocols to account for the camera/lens distortion in water medium–, c) geophysical mapping (electrical resistivity tomography and multisensor magnetic gradiometry) –with adaptation of sensors and protocols for the wet environment, d) risk assessment –integration of collected spatial information for the estimation of risks for cultural sites–, e) Virtual/Augmented Reality platform –fed with the above for the promotion of submerged cultural material in unprecedented ways. Ultimately, the results of this work can be integrated in the strategic framework of developing an effective interdisciplinary research model that could be applied to similar archaeological surveys in coastal or shallow-water environments thus contributing substantially towards the management and promotion of the concealed cultural resources.

4 OSTIA: NEW RESEARCH FOR THE RECONSTRUCTION OF THE COASTAL AREAS

Abstract author(s): Turci, Marcello (University of Graz) - Poletto, Alice (British School at Rome) - Ducati, Fabrizio (University of Palermo) - Montesinos, José (Universitat Politècnica de València) - Stoppioni, Maria Luisa (Soprintendenza Emilia-Romagna) - Salomon, Ferréol (CNRS - University of Strasbourg) - Saintenoy, Albane (University of Paris Saclay) - Mathé, Pierre-Ethienne - Uehara, Minoru (CEREGE - CNRS)

Abstract format: Oral

This paper presents the findings of an ongoing international and multidisciplinary project started in 2018, whose aim is to investigate the transformations of Roman Ostia's coastal area outside the so-called Porta Marina.

Building on the investigation of two large compounds—the Baths of Porta Marina (thermae maritimae) and the Sub-urban Complex IV, XVII, 4, to the north of the via Severiana—and through a multidisciplinary approach that includes the examination of archive documents and findings from previous excavations, UAV photogrammetry, remote sensing, ground coring, as well as archaeological excavations, this project aims to investigate the evolution of Ostia's coastal landscape between the first and the sixth centuries AD.

In this paper, we will concentrate on two different phases, that are distinguished by significant transformations. First, we will look at the second half of the first century AD, just before Trajan-Hadrian's urban renovation of Ostia. We will then address the latter half of the third century AD—the years of the so-called Illyrian emperors—which will be examined against the backdrop of the remarkable urban transformations that Ostia's coastal area underwent in the fourth century AD, when it will play a crucial role in the new, poly-centric layout of the late-antique city.

5 GEOPHYSICAL PROSPECTION OF NORTH-FRISIAN TERP LANDSCAPES. AN ERASMUS+ BLENDED INTENSIVE PROGRAM

Abstract author(s): De Smedt, Philippe (Ghent University) - Rabbel, Wolfgang - Majchczack, Bente - Wilken, Dennis - Wunderlich, Tina (Institute of Geosciences, Kiel University) - Trinks, Immo (Vienna Institute for Archaeological Science, University of Vienna) - Verhegge, Jeroen (Department of Archaeology, Ghent University; Department of Environment, Ghent University)

Abstract format: Oral

The North-Frisian terp landscape (DE) is characterised by multi-phase settlement systems in a complex wetland environment. This archaeological landscape stems from the colonisation and exploitation of the area from the Iron Age to the Middle Ages, during which it was transformed by the construction of terps on riverbanks, and the later reclamation of bog areas.

This complex context poses significant challenges for prospection and landscape reconstruction. In the summer of 2022, in a collaboration between the Universities of Kiel, Vienna, Ghent, Bratislava and Mainz, a multi-method prospection campaign was mounted to map the archaeology and environmental setting of the area. To this end, we combined geophysical surveys with downhole logging and core sampling. Two type-sites were chosen; a village terp originating from the 1st century BCE and a group of smaller, High Medieval, terps. This field research was conducted as a field school in a Blended Intensive Programme from the ERASMUS+ programme, providing 20 students with hands-on survey experience. Subsequent on-line teaching sessions provided theoretical background on the different survey methods, and integration sessions allowed exploring aspects of data interpretation and combination.

The complex archaeology of the terp landscapes does not provide the most straightforward target for archaeological prospection. Particularly unravelling different occupation phases, or clear settlement structures beyond traces presumed related to the later (High to post-medieval) occupation of the landscape, proved highly challenging in the survey areas. This complexity provided a highly useful backdrop for teaching geophysical methods, as both the potential and limitations of each method could be clearly illustrated, alongside the need for multi-method approaches and invasive validation.

In this presentation, we will outline the course structure and learning goals, along with the survey outcomes and impact on both teaching and researching archaeological prospection.

6 SCALING NEA PAPHOS' MARITIME CULTURAL LANDSCAPE

Abstract author(s): Babucic, Nikola (University of Hamburg) - Misk, Łukasz (Jagiellonian University Kraków) - Ostrowski, Wojciech (Warsaw University of Technology) - Papuci-Władyka, Ewdoksia (University of Warsaw; Jagiellonian University Kraków) - Seifert, Martina (University of Hamburg)

Abstract format: Oral

The UNESCO Heritage Site of Nea Paphos which covered an area of over 100 hectares in ancient times, is located on a prominent promontory on the island of western Cyprus. In the Hellenistic and Roman period, it was a distinctive urban center in the ancient eastern Mediterranean. Its maritime cultural landscape changed until today demonstrating a continuous settlement history. Over the last eight years, non-invasive and invasive methods have been carried out in the area of Nea Paphos Archaeological Park. The international collaboration project follows an interdisciplinary approach providing new insights into the spatial organization of the city. The focus is on the research of urban development, social and economic infrastructure in general. Essential are the investigation of the maritime infrastructure, especially the port facilities and landing places. Methods as remote sensing, photogrammetry, geophysical prospection, survey and excavation have been generated varying data sets for archaeological evaluation. From the data obtained so far, geophysical interpretation maps of the archaeological features, models of coastal transformation, as well as 3D models of the excavation sections were created, which will be fed into an interactive WebGIS in the course of the project.

In our paper, we will show how such a multifaceted approach allows us to understand the reciprocal interaction of sea and land in the formation of cultural, social and economic phenomena.

7 THE CULTURAL LANDSCAPE OF FAILAKA ISLAND IN THE ARABIAN GULF, KUWAIT

Abstract author(s): Nowakowska, Magdalena (University of Warsaw) - Świda, Jakub (Freelancer)

Abstract format: Oral

The Polish-Kuwaiti project: „Waterfront and Underwater Archaeology of Kuwait. Archaeorisk on the Coastal Zone around Failaka Island, Kuwait” started in spring 2013. It is the first archaeological project on Kuwait’s underwater cultural heritage. It aims to locate and document archaeological sites that bear witness to the activities of local communities in the coastal zone around Failaka Island in the Arabian Gulf. The task includes the presentation of an archaeological map of „underwater archaeological sites” with their catalogue, which could be used to prepare a programme for

the protection of Kuwait's underwater cultural heritage and serve the implementation of the 'UNESCO Convention for the Protection of the Underwater Cultural Heritage, Paris 2001'.

During the six survey seasons (2013 - 2019), 35 stone structures were recorded. Most of them were of two types of stone structures interpreted as fish traps: 1. circular stone structures and 2. linear structures of varying sizes. Both types are also referred to in the literature as stone tidal weirs which we understand as weirs or overflows, used to catch fish in the floodplain. In addition to the infrastructure related to fishing, which was probably one of the most important economic profiles of the islanders during the Islamic period, the remains of two harbours were also located (fig. 2). One large port with a full infrastructure in the bay of Al-Khidr, probably functioning as early as the second millennium BC, and the remains of a second small port or harbour in the bay of Karaib el-Desht.

The Polish-Kuwaiti Archaeological Mission operates on the basis of an agreement between the Centre for Mediterranean Archaeology at the University of Warsaw and the Kuwait National Council for Culture, Arts and Letters.

8 FORMAL MODELLING APPROACHES TO OPTIMIZE ARCHAEOLOGICAL INVESTIGATIONS: AN ENQUIRY INTO LIMITATIONS, POTENTIALS AND CHALLENGES OF PREDICTIVE ASSESSMENT IN UNDERWATER CONTEXTS

Abstract author(s): Ritondale, Manuela (Groningen Institute of Archaeology, University of Groningen)

Abstract format: Oral

Despite the significant contribution of remote sensing technologies to the detection and documentation of previously unreachable underwater archaeological sites, extensive surveys remain costly and challenging to sustain in extensive areas. This contribution, which is based on the results of a PhD research concluded in 2022, will discuss the utility of predictive modelling for optimizing archaeological investigations, particularly in underwater contexts. Indeed, within the maritime domain, the adoption of archaeological predictive maps is extremely rare and not yet standard practice for supporting desk-based preliminary studies carried out in advance of archaeological prospection. This underdevelopment highlights the necessity to overcome methodological shortcomings but also hints at possible distrust toward the technique, which reflects a mistaken notion of what formal modelling in general, and predictive modelling in particular are, and what they should achieve. After introducing a GIS model developed to predict the shipwreck probability in Mediterranean territorial waters based on multicriteria cost-surface analysis, this lecture will particularly focus on the solutions adopted to overcome some of the main limitations of current archaeological predictive modelling; these include the unheeded effects of input data biases and problematic testing. The aim is to promote, on the one hand, the increasing adoption of a tool that may significantly optimize archaeological surveys and the detection of underwater sites, thus without neglecting their current limitations; on the other hand, encourage international cooperation to share best practices - and data- for testing archaeological models, which is essential to their improvement.

707 OPEN ACCESS REMOTE SENSING DATA IN CULTURAL HERITAGE MANAGEMENT, ARCHAEOLOGICAL RESEARCH, AND CITIZEN SCIENCE

Session theme: 3. Heritage Narratives and Representations

Session organisers: Dias, Rita (Era Arqueologia S.A.; ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour) - Fonte, João (Universidade da Maia/ISMAI) - Neves, António (Universidade de Aveiro) - Marsh, Fernando (Universidade de Aveiro) - García Sánchez, Jesús (Instituto de Arqueología de Mérida, Consejo Superior de Investigaciones Científicas)

Session format: Regular session

The increasing availability of open access remote sensing data (airborne LiDAR, aerial and satellite imagery...) has been critical for archaeological research and cultural heritage management by both public and private institutions namely local, regional, and national governments and universities but also in preventive archaeology. In addition, the development of simplified and highly efficient computing algorithms, the increase in computational power and the increasingly systematic use of artificial intelligence (automation vs manual archaeological mapping) have greatly contributed to this panorama. However, what is the real impact of these data on efficiency and effectiveness at the level of mapping and cataloguing of archaeological sites? Has the true potential of this data really been exploited by the public and private sectors for the benefit of cultural heritage and society? What synergies can we create to encourage their increasingly systematic use? What examples and good practices can we learn from? What constraints and threats can there be to cultural heritage?

We would like to discuss the pressing social demand for a new generation of high-resolution open access remote sensing data, and how these data would benefit both scientific research and heritage management. We would also like to discuss the role of crowdsourcing and citizen science in contributing and benefiting from these data. Our goal is to showcase projects and case studies that contribute to the discussion on the potential and impact of open access

remote sensing data on archaeological research, cultural heritage management and citizen science and crowdsourcing practices. Finally, we also want to discuss the potential limitations and threats to cultural heritage due to the availability of these data in open access.

ABSTRACTS

1 COMPARATIVE PERSPECTIVES ON THE USE OF OPEN-ACCESS REMOTE SENSING DATA IN ARCHAEOLOGY AND CULTURAL HERITAGE IN SPAIN, PORTUGAL AND ITALY

Abstract author(s): Fonte, João (ISMAI) - García Sánchez, Jesús (Instituto de Arqueología de Mérida, CSIC) - Dias, Rita - Pereiro, Tiago (Era-Arqueologia)

Abstract format: Oral

In Spain, the National Geographic Institute (IGN) has long had a policy of open-access to remote sensing data, particularly in the scope of the National Aerial Orthophotography Plan (PNOA). This includes essentially multitemporal aerial imagery, as well as two LiDAR coverages, the third of which is already underway. All data can be downloaded online.

In Portugal, the Directorate General for Territory (DGT) only recently has started to make their data available in open-access. The data is only available through web servers, so it cannot be directly downloaded. No systematic LiDAR coverage is yet available in Portugal. DGT has recently announced the first systematic LiDAR coverage of Portugal and this data will be fully open-access.

In Italy, only areas prone to hydrogeological risk were covered by LiDAR data. The acquisition organized in different phases contributed to the creation of datasets with great potential for archaeological research. LiDAR data is available through WMS or direct communication with Environmental agencies.

Comparatively, what was the differential impact at the level of archaeological work and heritage management, both in the public and private sectors in these countries? This paper will discuss the main limitations and opportunities for archaeology and cultural heritage derived from this open-access to different types of remote sensing data.

The participation of data collectors has great potential, and the importance of engaging the public in the scientific process thus promoting a scientific culture is clear. In Mediterranean countries, this is still an uncommon practice. The risks of these practices in archaeology and cultural heritage are, in part, due to the need for more social awareness of heritage's good practices and an underground culture of treasure hunters. The generalization of recreational use of drones, geocaching, trekking, and other activities could have the potential to importantly contribute invaluable data for archaeology and cultural heritage.

2 OPEN-SOURCE REMOTE SENSING DATA FOR THE CHARACTERIZATION OF THE IRON AGE IN ESUKADI

Abstract author(s): Hidalgo-Masa, Jagoba (UPV/EHU) - García Sánchez, Jesús (IAM-CSIC) - Solana-Muñoz, Andrea (INCIPIT, CSIC) - Vicente García, Víctor (Veterum Archaeologists S. L.)

Abstract format: Oral

The intended paper aims to present the ongoing research about the Iron Age occupation of the Atlantic coast of the Basque Country (Iberian Peninsula). The project departs from common Landscape Archaeology premises stemming from other scholarship in the Iberian Peninsula. However environmental issues as thick pine forests, extremely rugged terrain and access to sites. These three environmental factors pose serious problem for both research and heritage preservation. A non-invasive approach based on LiDAR sensing would provide a basis for testing research hypothesis and to assess the preservation of archaeological zones.

We will present the methodological approach consisting of a spatial sampling of the Basque coast to assess different archaeological scenarios. This process is organized among the team members who inspect several LiDAR products from geo.Euskadi.eus and create a comprehensive map of features and traces that later on are related to legacy data, such as archaeological gazetteers, evidence in the Archaeology Museum at Bilbo. Secondly, the project uses a combination of the abovementioned publicly available LiDAR datasets with private drone-mounted Lidar flights over key sites (Malmasin or Sollube) on sites where the data quality is not good enough to provide answers posed by the project, as the existence of ramparts, fortifications, or other earthworks. The later process involved the participation of local communities in the organization of flight plans, cleaning, and other works in the sites before ground-truthing with on-site geophysics, and eventually the assessment of heritage conservation and elaboration of guidelines.

3 HERITAGE QUEST: TWO-TIER CITIZEN SCIENCE RESEARCH PROJECT ON LIDAR DATA FROM THE CENTRAL NETHERLANDS

Abstract author(s): Lambers, Karsten (Leiden University) - Kaptijn, Eva (Erfgoed Gelderland) - Verschoof-van der Vaart, Wouter (Landschap Erfgoed Utrecht; Leiden University) - Bourgeois, Quentin (Leiden University)

Abstract format: Oral

In this paper the results of the first large-scale citizen science project in Dutch Archaeology, named Heritage Quest (Erfgoed Gezocht in Dutch), are presented. The goal of this project was to record archaeological remains at large scale in forested areas in the central Netherlands.

The Citizen Science project consisted of two parts. First, in 2019-2020 more than 6500 citizen researchers participated in an online project, run on Zooniverse, in which they were asked to mark three classes of archaeological objects, namely barrows, Celtic fields, and charcoal kilns in small snippets (300x300 m²) of open LiDAR data from the Veluwe and Utrechtse Heuvelrug regions in the central Netherlands. The system provided these snippets in two different visualizations, hillshade and Simple Local Relief Model, to aid the volunteers, many of whom had little prior archaeological knowledge. To achieve comparable results across the datasets, every snippet was classified by 15 (Veluwe) or 60 (Utrechtse Heuvelrug) individuals before it was retired.

This online project resulted in over 22.000 potential barrows, 38 km² of previously unknown Celtic fields, and over 900 potential charcoal kilns. While some of these locations were marked by only a few people, others were marked by many, indicating a varying degree of consensus among the citizen researchers.

Subsequently, in 2021-2022 a coring campaign by citizen researchers and students from Leiden University was conducted to validate a representative selection of the detected barrows, covering the full range from few to many markings in the online project. The results of the fieldwork indicate a clear correlation between the number of markings and the probability that the marked location was indeed a barrow. Based on this, a plausible probability can now be assigned to the many other potential barrow locations, thus helping regional heritage managers to assess the value of the new archaeological dataset.

4 UNCOVERING THE PAST: THE ROLE OF REMOTE SENSING IN ARCHAEOLOGICAL RESEARCH OF THE CHOLISTAN DESERT

Abstract author(s): Rai, Tajammal (Heritage Matters)

Abstract format: Oral

This paper will focus on recent archaeological discoveries through remote sensing in the Cholistan Desert, located in southeastern Punjab, Pakistan. Previous archaeological surveys of the 1940s, to the 1990s, explored hundreds of archaeological sites of the Indus Valley Civilization and explained the changing course of the old bed of the Ghaggar-Hakra River; the lifeline of ancient dwellers. However these surveys were carried out in the lesser Cholistan but the greater Cholistan remained unexplored, except for the identification of four medieval forts. In contrast, during recent investigations of the greater Cholistan using remote sensing tools and techniques, more than fifty archaeological sites have been discovered in the greater Cholistan or deep desert. The discovery of these archaeological sites can provide researchers with further sources to understand the population shift based on the Ghaggar-Hakra River from greater Cholistan to lesser Cholistan. A physical survey is currently underway to verify and discover new archaeological sites in the deep desert; it recently confirmed four recently discovered sites through remote sensing with little difference in their diameter. There could be some drawbacks of open access remote sensing such as ambiguous interpretation of heritage sites and exploitation of the facts but still, remote sensing is one of the best ways to discover and analyse archaeological sites. The present research project comprises a comprehensive survey and mapping of archaeological sites and ancient routes using GPS-generated tracks, locations, and pictures of the current situation of sites tracing the dried bed of the Ghaggar-Hakra River. The current survey is showing the importance of remote sensing particularly in deserts and forests. At the end of this survey, a complete map of the region will be produced using ArcGIS from the first discovered site to the last one.

5 THE FOOTPRINT OF THE STONE: IDENTIFICATION AND GIS-BASED ANALYSIS OF IRON AGE HILLFORTS IN THE UPPER EBRO REGION

Abstract author(s): Solana-Muñoz, Andrea (INCIPIIT - Institute of Heritage Sciences; CSIC - Spanish National Research Council)

Abstract format: Oral

This proposal steams from my current Ph.D. project, which aims to study the historical sequence of the Iron Age (8th - 2nd c. BC) in the Upper Ebro from a Landscape Archaeology perspective.

Large areas within the study zone - province of La Rioja and part of the provinces of Soria, Burgos, Navarre, Araba and Zaragoza- are characterized by the fragmentation and scarcity of archaeological information, as well as the absence of studies that relate the sites to each other and to their surroundings. Being conscious the biased archaeological record, I argue that an approach from the perspective of Landscape Archaeology and the use of non-invasive methods, is promising to produce a broad-scale temporal and spatial interpretation of the social dynamics of this period.

The work I will display will include showing how the use of remote sensing products (LiDAR), has been instrumental in the identification of defensive structures of the sites catalogued as Iron Age hillforts. In addition, and based on the scholarship of Parcero-Oubiña and Nión-Álvarez (2021), this work aims to establish quantitative variables through GIS-based methods to identify spatial dynamics reflected in their construction: extension of settlement area, percentage of total area occupied by defensive structures, and the amount of effort invested.

Results from the present study will illustrate the potential that non-invasive methodologies and GIS have for the reconstruction and modelling of past landscapes, as well as the importance of Landscape Archaeology for the interpretation of social and cultural patterns. Besides, this study will show how the use of remote sensing data is essential for proposing new perspectives on the study and management of the archaeological record in the area.

A. FIRST RESULTS OF GEOPROSPECTION SURVEY ON THE NORTH-EASTERNMOST NEOLITHIC RONDEL IN EUROPE AT TYLICE, POLAND

Abstract author(s): Urban, Maciej (Nicolaus Copernicus University in Toruń) - Czerniec, Jerzy (Institute of Archaeology and Ethnology of the Polish Academy of Sciences) - Sosnowski, Mateusz (Nicolaus Copernicus University in Toruń)

Abstract format: Poster

It was believed until recently that rondels were a distinctive element of the early Neolithic landscape in the region of modern Austria, Slovakia and the Czech Republic. However, recent discoveries from the North European Plain have changed this view: at least ten enclosures have been reported from Poland that are identified as rondels, including two enclosures of such type coming from the Chełmno land. The same region has yielded evidence for an intensive and stable settlement by the early farming communities, which formed the northeastern border of the European Neolithic. The discovery of rondels in northern Poland proves to be essential in tracing the flow of the idea of erecting monumental enclosures and testifies to cross-cultural relations in Central Europe throughout the 1st half of 5 millennium BC.

This work reports on the newly discovered rondel in Tylice near Toruń. The discovery was made through analysis of satellite images and followed by a geoprospection survey of the site. The combined results of the geomagnetic prospection and UAV imaging provided a complementary dataset allowing to zoom into the spatial arrangement of the rondel, including its ditches and entrances. The DMT data obtained from the LIDAR analysis allowed the assessment of the nearby landscape and physiography, which helps to better understand the act of erecting a rondel at Tylice. Future research is planned at the site to excavate the structures and associated material identified so far.

B. INTEGRATION OF DEEP LEARNING MODELS INTO THE ODYSSEY GIS FOR ARCHAEOLOGICAL SITE DETECTION USING A MICROSERVICES ARCHITECTURE

Abstract author(s): Canedo, Daniel - Georgieva, Petia - Neves, António (University of Aveiro)

Abstract format: Poster

Recently, Deep Learning has been explored as a promising solution for detecting archaeological sites in LiDAR data. However, the integration of these algorithms with existing or under development archaeological Geographic Information Systems (GIS) remains a challenge. To address this issue, in this work we propose the use of web services that streamlines the integration process. These web services can be called by the GIS for training deep learning model or inference tasks. As a use case, we explored this architecture in the Odyssey project GIS, where a user interface page has the option for selecting a region on the map, where LiDAR data is available. When used for training, the information about the location and dimensions of the region, as well as the existing occurrences validated on sites on that region are sent for the web service. Moreover, the user can choose from available Deep Learning models and determine which classes of archaeological occurrences to use for the training process. The web service converts the selected region into a dataset of the LIDAR data, that meets the model requirements, performs data augmentation, and trains the selected model. If the inference task is selected, the user can choose which Deep Learning model to use and the eventual detected occurrences in that region are returned to the GIS. This microservices architecture offers a powerful and semi-automatic way of accommodating Deep Learning solutions into archaeological GIS.

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Vindrola-Padrós, Bruno (Institut für Ur- und Frühgeschichte, Christian-Albrechts-Universität zu Kiel) - Almansa Sánchez, Jaime (Instituto de Ciencias del Patrimonio, Consejo Superior de Investigaciones Científicas) - Scholtus, Lizzie - Szilágyi, Kata - Müller, Johannes (Institut für Ur- und Frühgeschichte, Christian-Albrechts-Universität zu Kiel)

Session format: Regular session

Since the emergence of phenomenological approaches in archaeology, there has been a wide appreciation of the epistemological importance of understanding how people perceived their environment, rather than creating disembodied representations of it (often claimed to be 'objective'). With the advent of material agency and post-phenomenological theories, the understanding of past human perception and how it was influenced by the material world has become even more vital, highlighting the need to develop appropriate methodologies to answer these questions. Methods for studying human perception have evolved in archaeology from the pioneering studies in landscape archaeology, such as viewshed analysis using GIS and the study of site acoustics, to more recent chertic approaches and eye-tracking methods. Yet, bearing weight on these approaches is the recognition that, because humans are socialised in different ways, there may not be a clear way to characterise a 'model' of feeling, thinking or doing that pertains to all humans. Consequently, the meaning of how we perceive the world today may not correspond to how people perceived it in the past, i.e. contra 'presentism'. One potential solution, which XSCAPE (ERC-funded project) is trying, is to substitute the "how" of perception as content, for the "how" of perception as a way: what cognitive processing tell us about past and present perceptions and how this is influenced by the material world.

The session aims to discuss methods/techniques used for the study of past human perception, attempting to integrate methodological innovations with more established ones in our discipline. Secondly, we wish to enquire on the limitations of assuming universal models of human perception and how we might be able to address them. We welcome papers that bring forth new perceptual methods for archaeological research and concrete applications in specific case studies, as well as submissions that critically engage with questions about presentism.

ABSTRACTS

1 HUMAN PERCEPTION IN ACTION: THE COLLECTION AND USE OF FOUND OBJECTS AS MEDIUMS FOR OBJECT-MAKING DURING THE PALAEOLITHIC PERIOD

Abstract author(s): Efrati, Bar (Department of Archaeology and Ancient Near Eastern Cultures, Tel Aviv University)

Abstract format: Oral

This study will propose that conscious perception has existed since Early Palaeolithic times and can be detected and discussed by inspecting the first facilitators of cognitive practice: the process of object-making using subtraction methods (e.g., knapping and carving).

The study will hold a theoretical discussion on perception through the presentation of three Paleolithic case studies of tools and portable objects made from defined material mediums using subtraction, proposed to be termed found objects: the collection and recycling of 'old' existing flint items into tools, the use of bones as materials for the creation of tools and portable objects, and handaxes made on thin and/or small flint slabs. Especially since the limited shape range of the original material may dictate a change in the engagement and creation process if subtraction is used, thus requiring a change in perception.

The discussion will focus on the perception of these materials from an "enactive" perspective and follow the decision-making process from the decision to collect and re-create from found objects until the finished product is achieved. By choosing to relate to perception as enactive, the discussion will deal with the active place and role of the senses; of knowledge and experience; as well as of ontological, cosmological, and cultural worldviews as facilitators of an attentive state which afford to perceive particular objects and work from them.

Finally, the study will claim that enactive perception was involved in every step of the item's chaîne opératoire, from the choice to act and collect, through the process of alteration, to the finished object.

2 PERCEPTION AND STONE TOOLS. AN APPROACH TO PAST VISUAL BEHAVIOUR THROUGH LITHIC TECHNOLOGY

Abstract author(s): Silva Gago, María (Instituto de Ciencias del Patrimonio - INCIPIT, CSIC) - Fedato, Annapaola (Centro Nacional de Investigación sobre la Evolución Humana - CENIEH) - Terradillos-Bernal, Marcos (Universidad Isabel I de Castilla) - Bruner, Emiliano (Centro Nacional de Investigación sobre la Evolución Humana - CENIEH)

Abstract format: Oral

Vision is the dominant source of sensory information in humans. It channels the relationships between the individual and the environment, including tools. Due to the fact that we receive a huge amount of information from our surroundings, it is essential to selectively focus the attention on some stimuli instead of others. The patterns of visual attention can be studied through eye-tracking technology, which consists of measuring eye position and movements. Taking into account the relevance of visual perception in the human genus, this technology can provide a useful approach to understand visual behaviour from an evolutionary perspective. In this sense, we developed a series of experimental studies involving different stone tool technologies and different scanning conditions. Our results showed that each lithic technology triggers a different visual strategy, which suggests that there are distinct attentional patterns involved in the interaction with these tools. Although tools have been interpreted as the output of the cognitive system, different disciplines have adopted an embodied cognition perspective, arguing that physical tools should be considered as a functional part of the cognitive network. Following this approach, archaeological remains would be an active element of cognition, and not mere products of the brain. Likewise, different sets of artefacts would represent different cognitive elements, which are susceptible to experimental studies

3 ARTSOUNDSCAPES: EXPLORING SOUND PERCEPTION AND EMOTION IN PREHISTORIC ROCK ART LANDSCAPES

Abstract author(s): Díaz-Andreu, Margarita (ICREA; Institut d'Arqueologia de la Universitat de Barcelona - IAUB; Universitat de Barcelona) - Santos da Rosa, Neemias - Alvarez Morales, Lidia (Institut d'Arqueologia de la Universitat de Barcelona - IAUB; Universitat de Barcelona) - López-Mochales, Samantha - Aparicio-Terrés, Raquel (Brainlab; Institute of Neurosciences; Universitat de Barcelona) - Escera, Carles (Brainlab; Institute of Neurosciences; Institut d'Arqueologia de la Universitat de Barcelona - IAUB; Universitat de Barcelona; Institut de Recerca Sant Joan de Déu - IRSJD)

Abstract format: Oral

Most rock art studies are carried out framed in an image-centred Western ontology, prioritising sight over sound perception. However, sound, and the emotions that it triggers, are fundamental components of every cultural, social and ritual practice. The inclusion of sound in archaeological studies in general, and in the field of rock art in particular, is not an easy task. It requires the interdisciplinary collaboration of several, disparate fields, including archaeology, physical acoustics, psychoacoustics, neuroacoustics and ethnomusicology. Since 2018 the ERC Artsoundscapes Project has put together specialists in all these disciplines to work together exploring the interconnections between sound and rock art. In particular, the Artsoundscapes project aims to study the role of sound and emotion in the way in which rock shelters and areas were selected to be painted or carved, and the sonic experiences that individuals may have lived through in them. The project has undertaken fieldwork in a series of rock art landscapes in Europe, Africa, Asia, and North America. The project team has developed a multidisciplinary approach through six research lines. In this paper, we present the methods and practices related to this innovative perspective and discuss two case studies to dissect the relevance of human sound perception to the study of prehistoric rock art landscapes

4 XSCAPE: A CONCEPT TO GO FROM FORMAL REGULARITIES IN THE MATERIAL WORLD TO SHARED INNER MODELS

Abstract author(s): Criado-Boado, Felipe (INCIPIT-CSIC)

Abstract format: Oral

XSCAPE is the acronym for a project on which this session is based (an ERC Synergy Grant). But what does it mean? We have landscapes, seascapes, skyscapes, soundscapes..., we have scapes of all kinds. Landscape is a concept based on an ancient root that also refers to relationship and is even related to form and shape. This etymology, despite the frequent use of landscape studies in archeology and other disciplines, has often not been recognized. Etymology suggests that shapes, related to different realms of experience and different material or cultural codes, present something in common that relates them to each other. This conjectural sense requires to go beyond anhistorical etymologies to social and cultural history and ask if there is in fact a certain regularity common to different phenomena in the same field, and if this regularity is compatible with the arrangements present in other fields. Is there something that approximates the common form of certain types of architecture, for example, the pattern of the landscapes of which they are part, the way of ordering their skyscape and their domestic scape? That common can be called, conjecturally,

XSCAPE. If such an XSCAPE exists, it implies the existence of an inner model that crosses the different fields of experience of a given society, which would have a cognitive dimension and be linked to the social mind of the moment and which, being so, could be explored empirically and experimentally, and not just be based on a robust theory. That is what the XSCAPE project on Material Minds intends to analyze. Part of the methodological model for this research is based on the X-EXPECT concept, which was the reference chosen by Andy Clark to analyze how expectations and predictions influence this internal model, instead of just being their effect.

5 STEPS TOWARDS MODERNISING POTTERY STYLISTIC ANALYSIS: THE FIRST RESULTS OF USING EYE-TRACKING METHOD IN GERMANY

Abstract author(s): Szilagy, Kata - Scholtus, Lizzie - Vindrola-Padros, Bruno (XSCAPE Project on “Material Minds” - ERC 2020 Synergy Grant 951631; Kiel University, Institute of Pre- and Protohistoric Archaeology)

Abstract format: Oral

A new ERC project (Material Minds: Exploring the Interactions between Predictive Brains, Cultural Artefacts, and Embodied Visual Search) has been established in Santiago de Compostela, Kiel and Brighton. The research focuses on how the human mind perceives the material world. We want to know more about the cognitive process of information and to address two questions: (1) what is the relation between human modification of the world and the transformation of cognition through perception of increasingly complex ways? (2) is there any universal unconscious way how we are looking at objects and creating our ‘material codes’ during the process of information? The classical archaeological research uses a typology for classifying objects based on their visual appearance and putting them into a previously determined order (material, cultural, chronological, etc.). This is the basis of all the pottery typo(-chrono)logical systems, which mostly count with the most preferred vessel forms and the typical decoration style. We would like to integrate the eye-tracking method into our archaeological tool-box to study the perception process of human-made objects like pottery and this way explore alternatives for the creation of more suitable classificatory systems. To this end, we create a database for further cross-cultural/regional analysis of how we are looking at different vessels.

In this paper, we would like to present the first results of our eye-tracking experiment at the Landesmuseum Halle (Saale). We preselected the pottery styles by 250 years of timespan based on the absolute chronological dataset and the previously existing detailed pottery typological system in Central Germany. We paid particular attention to marked socio-environmental transformational periods (5500-5400, 4900, 3800, 3300, 2800, 2200, 1800, 1600, 1300, 800, 400, and 150 cal BC) to prepare further studies about the cognitive archaeological modelling as well.

6 AN ARCHAEOLOGICAL PERSPECTIVE ON HUMAN COGNITION. CASE STUDY; TALL-E BAKUN (AN IRANIAN PREHISTORIC SITE)

Abstract author(s): Yadollahy, Sima (University of Leicester)

Abstract format: Oral

Cognition is engaged with the world, and human cognition is intertwined with material culture. Material culture, as a dynamic and integrated component of human life, has an important role in understanding and extending our knowledge of past ways of thinking and acting.

All material culture was created for specific purposes and reasons, and it reflects a part of its creators’ intentions, beliefs, actions, and minds. Tall-e Bakun A (ca 4000–3500 BC) is one of the most important late prehistoric sites in southern Iran, with discernible socioeconomic complexities. A new painted beautiful distinctive pottery at Tall-e Bakun displays a variety of geometric patterns, animals, humans, and composite decorative motifs. The decorative motifs and style of Bakun ceramics, as new material signs, create new ways of acting and understanding the world, as well as new modes of thinking.

This paper investigates the role of Tall-e Bakun ceramic decorative motifs and style in affecting people’s thoughts and cognition and explores how decorative styles have the capacity of guiding and influencing human cognition drawing upon Material Engagement Theory.

7 RETHINKING SENSES THROUGH TIME: SENSORIAL PUBLIC ARCHAEOLOGY AT THE FORT BIJ UITHOORN

Abstract author(s): Mura, Sara (Cluster of Excellence ROOTS; Christian-Albrechts-Universität zu Kiel) - Jordan, Pamela (Universiteit van Amsterdam)

Abstract format: Oral

Any built environment is a full sensory experience; architecture embodies a three-dimensional construct of certain intentions that is then manipulated by inhabitants, encoding their full sensory experiences through time. Built envi-

ronments are simultaneously perceived through our senses as a separate physical object and through the socially and culturally informed engagements we have with them. These engagements derive implicitly from our modern cultural framework (presentism); the role played by our contemporary interpretation of sensory experience is put into relief when the original users leave no direct accounts of their presence, as in many archaeological sites. How we experience a place today informs how we interpret its past.

Sensory archaeology can be applied to any silenced historical built environments, not solely archaeological settings. This presentation discusses the application of combined qualitative and quantitative sensory investigatory strategies at the Fort bij Uithoorn (NL), one of dozens of early 20th C. military forts encircling Amsterdam recognized as a UNESCO site. The detailed embodied history of the fort is effectively silent, often obscured behind military confidentiality. The structure remains in physical decline without alteration or significant conservation, in contrast to many related forts that have been functionally revitalized at the expense of sensorial authenticity.

A customized sensory walk and survey were developed to ascertain the sensory layer's contemporary composition and discover its relevance to visitors' historic encounter at the fort. The survey incorporated both quantitative and qualitative components, and participants were free to determine the most relevant areas for study throughout the site. The discussion focuses on the construction of the public sensory walk and the results and feedback it generated through this flexible approach. The multidisciplinary potential for this kind of approach to sensory archaeological investigations will be highlighted, particularly its reliance on public input and the benefits of less rigid research formats.

711 FAIR REUSE OF ARCHIVE DATA

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Jansen, Jane (Arkeologerna; Intrasis) - Stead, Stephen (Paveprime Ltd; Open University)

Session format: Regular session

The archaeological research community was an early adopter of digital tools for data acquisition, organisation, analysis, and presentation of research results of individual projects. (Richards 2022). As several projects have shown, digital data can be shared, but how can that data be used? To address those questions, principles and ontologies have been created and are ready to be applied.

One concept is FAIR data. FAIR data is data which meets the principles of Findability, Accessibility, Interoperability, and Reusability (FAIR). The acronym and principles were defined in the journal *Scientific Data* in 2016.

Digital archive access projects will revolutionise archaeological research and are vital if we want to attain the R in FAIR. However, it is necessary to apply an ontology to the data, otherwise the time needed to understand the semantics of each datasets is insurmountable. CRMarchaeo, an extension of the CIDOC CRM, is one way to link a wide range of existing documentation from archaeological investigations. It was created to promote a shared formalisation of the knowledge extracted from archaeological observations. It provides a set of concepts and properties that allow clear explanation (and separation) of the observations and interpretations made, both in the field and in post-excavation.

Using FAIR principles is critical to the creation of wider pictures of regions or periods and can also be a stepping stone to generating Big Data for further analysis.

In this session we invite presentations from organisations or projects who are addressing these issues. We are particularly interested in applications of the CIDOC CRM and its extension CRMarchaeo.

Richards, J. 2022, Presentation at CHNT Vienna

ABSTRACTS

1 TRUE INTEGRATION: MOVING FROM JUST FINDING ARCHIVES TO INTERPRETING ARCHAEOLOGICAL DOCUMENTATION UTILISING CRMARCHAEO

Abstract author(s): Stead, Stephen (Paveprime Ltd; Open University) - Jansen, Jane (Arkeologerna; Intrasis)

Abstract format: Oral

This integration study considers how the body of archaeological excavation databases of The Archaeologists (a department within the National Historical Museums of Sweden) were prepared for integration utilising the CRMarchaeo extension of the CIDOC Conceptual Reference Model (CRM). The Archaeologists create about 250 new Intrasis-databases each year (one for each new site) and currently have 1200 active and 1100 archived databases. Traditional GIS based gazetteers allow the discovery of which archives/databases are about the correct type of site or that are in the right geographic area. However, the researcher still needs to immerse themselves in the details of the individual archive to see if the research questions, excavation/recording methodology, and pragmatic responses to circumstances are compatible with the goals of the researchers' study. In comparison, with the CRMarchaeo ontology applied to the archives/databases, the work required to check if the data is fit for the study's purposes is possible at the

integration layer. This means more opportunities for innovative intra- and inter-site research as the effort required to discover appropriate material is reduced.

The presentation will showcase the work undertaken by Intrasis and Paveprime to prepare this approach and the benefits that have accrued from it: in particular the improved reusability when the databases are accessible through Swedigarch and also the greater clarity in the approach to future documentation practice.

CRMarchaeo, an extension of CIDOC CRM, is a way to link a wide range of existing documentation from archaeological excavations. The CRMarchaeo extension has been created to promote a shared understanding of how to formalise the knowledge extracted from the observations made by archaeologists. It provides a set of concepts and properties that allow clear explanation (and separation) of the observations and interpretations made, both in the field and in post-excavation.

2 REUSE OR NOTHING! THE MATERIALISATION OF R PRINCIPLE THROUGH THE IMPLEMENTATION OF A SPATIAL DATA INFRASTRUCTURE: PEPADB

Abstract author(s): Romero-Garcia, Galo (Universidad de Sevilla) - Odriozola-Lloret, Carlos P. (Universidad de Sevilla; UNIARQ) - Garrido-Cordero, José Ángel (Universidad de Sevilla) - Sánchez-Gómez, Daniel (Universidad de Lisboa)

Abstract format: Oral

The significant growth of digital spatial information has led archaeologists all over Europe to increasingly rely on digital data to prepare and carry out archaeological research (McKeague et al. 2019). The main interest in the publication of spatial and non-spatial indexed archaeological data is to offer users the possibility of querying, downloading, and/or accessing them in external applications. These apps are aimed to model, analyze, display, or generate new geospatial data, information, and value-added resources, both in academia and general public. Given the extremely high cost of generating spatially indexed archaeological data, the reuse of this data by users is highly expected. As the result of not complying with the FAIR EU policy, the already existing spatial indexed archaeological data are not easily accessible and therefore hard to reuse by the general public, or the academia (Sobotkova 2018). PEPADB (Prehistoric Europe's Personal Adornment database) is a long term multidisciplinary and open research project which has materialized in a SDI (Spatial Data Infrastructure) and a web-app for the online publication of georeferenced archaeological scientific data referring to late personal adornment in Europe's Late Prehistory. PEPADB is maintained since 2010 through the concatenation of several R&D projects funded by the Spanish government. This initiative aims to comply with the FAIR principles encouraging the reusability of archaeological data through the use of standards by means of web spatial technologies.

3 CONVERGING AND DIVERGING VOCABULARIES - A CONSTANT STRIVE FOR NATIONAL AGREEMENT

Abstract author(s): Uleberg, Espen - Matsumoto, Mieko - Dell'Unto, Nicolo (Museum of Cultural History, University of Oslo) - Callieri, Marco (Institute of Science and Technologies of Information - National Research Council) - Pantos, George - Bonelli, Letizia - Indgjerd, Hallvard (Museum of Cultural History, University of Oslo)

Abstract format: Oral

The Norwegian university museums are presently cooperating in UniMus:Kultur to create a new version of the CIDOC-CRM-compatible artefact database that has been in use since 2004 (<https://www.khm.uio.no/english/research/projects/unimus-kultur/>).

The data are published at the Unimusportal (unimus.no/portal). They can also be downloaded or accessed as an open API at unimus.no.

Recent additions are 3D models from the BltFROST project and multilingual thesauri.

The artefact database has controlled vocabularies for cadastral entities, period names, artefact names, materials, find circumstances and find categories. As results of the ARIADNE+ project and cooperation within EOSC, the list of period names is registered in Perio.do, while artefact names and find categories are mapped to Getty's AAT.

The Museum of Cultural History (MCH) works through the 3D archive and dissemination infrastructure project BltFROST (<https://www.khm.uio.no/english/research/projects/bitfrost/index.html>) to increase the use of 3D documentation in research and teaching. BltFROST has improved MCH's structures for storing 3D data, and supports open source technologies as an approach for FAIR data management. It is built around the 3DHOP viewer, and it shares resources and strategies with the Dynamic Collections project in Lund, Sweden.

The mapping to of vocabularies to Getty's AAT is good to reach out internationally, but local translations between neighbouring countries can be more precise due to shared traditions and similar ecological conditions. One example is the Nordic cooperation "Nomina Rerum Mediaevalium" that has drawings and terminology for mediaeval artefacts in the five Nordic languages (Norwegian, Danish, Swedish, Icelandic and Finnish) - a dataset that we have now also mapped to Getty's AAT.

Mapping to common vocabularies and more standardisation will increase the FAIRness of archaeological datasets. However, regulated vocabularies can impose limitations on the understanding we have of material culture. Technology can have a distancing effect, and digital data can create what Huggett refers to as different data-imaginaries.

4 PHYTOLITH ONTOLOGIES - A COMMUNITY WORK TO IMPROVE THE INTEROPERABILITY AND THE REUSABILITY OF DATA

Abstract author(s): Dunseth, Zachary (Brown University) - Kerfant, Celine (Universitat Pompeu Fabra) - Lancellotti, Carla (Universitat Pompeu Fabra; ICREA) - Karoune, Emma (The Alan Turing Institute) - Ruiz-Pérez, Javier (Texas A&M University) - García-Granero, Juan José (Spanish National Research Council) - Harmse, Henriette (European Bioinformatics Institute - EMBL-EBI)

Abstract format: Oral

Phytoliths are microscopic silica bodies that form within living plants and can be used for taxonomic identification. They thus provide information for modern and ancient botanical, paleoenvironmental, paleoclimatic, paleontological and archaeobotanical reconstruction. Today, phytolith data are numerous but few are interoperable (e.g., readable by humans or machines), easily translatable to other languages, or reusable, and this hampers the development of the discipline (Karoune 2022). These long-standing issues negatively impact collaboration in archaeology, palaeoecology, and related disciplines, prevent reuse and meta-analysis of data, and have ramifications on learning, equity, and inclusion in phytolith science worldwide.

In response to these issues, the International Committee on Open Phytolith Science (ICOPS) was created within the International Phytolith Society (IPS) to work on increasing the knowledge and implementation of open science practices in the phytolith community. We present here one of the first initiatives of the group: the establishment of a unified phytolith ontology to help structure phytolith data for use and reuse in the future. This project is structured around the latest ICPN 2.0 nomenclature to assign unique and persistent identifiers to each phytolith morphotype. The ontology is built using ROBOT and Protégé, using version control on GitHub to work collaboratively and transparently, so all our work-in-progress is accessible.

5 MAPPING DATASETS TO THE CRMSURV MODEL: PROGRESS REPORT ON THE SEMAFORA PROJECT

Abstract author(s): van Leusen, Martijn - de Haas, Tymon (Groningen Institute of Archaeology) - Bruseker, George - Nenova, Denitsa (takin.solutions) - Siebinga, Sjoerd (Delving.eu)

Abstract format: Oral

In the course of 2022, the authors constructed and documented a conceptual reference model for fieldwalking surveys, CRMSurv, according to the CIDOC CRM guidelines, and have begun the construction of a mapping interface to allow data owners, with some training and expert guidance, to map their datasets to this model. Figuring out how to do this has caused some delays in the work, but we now expect to complete the mapping and validation by summer 2023. In this paper we will focus on the steps needed to achieve FAIR data *after* the construction of the conceptual model: how to present mapping options to data owners in a logical manner and sequence, how and where to enforce standardization of terminology and meaning, how to maintain centralized documentation of the mapping system (hint: ARCHES!), and how to seduce data owners to relinquish their data monopolies. We will also look beyond the ending of the funded SEMAFORA project in December 2023, to such questions as how to develop a sustainable business model for data mapping.

WHAT TO DO WITH YOUR CODE? TOOLS AND BEST PRACTICES FOR THE LONG-TERM SUSTAINABILITY OF CODE OUTPUTS IN ARCHAEOLOGY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Daems, Dries (Middle East Technical University) - Angourakis, Andreas (Ruhr-Universität Bochum)

Session format: Workshop

The volume of digital outputs produced by archaeologists has been increasing exponentially. Together with other types of digital objects, computational scripts, being those for data processing, analysis, visualisation or simulation, are now ubiquitous in almost all archaeological projects. However, this increase has raised important concerns about their long-term sustainability, which also carries similar challenges to the ones encountered in research data management more generally (Kansa & Kansa 2022). Where should they be stored? What contextual information should they contain? Who should maintain them beyond the life of a particular project? And how do we adjust the academic reward framework for those who deal less with standard publications and more with GitHub releases? These are but a few of the many concerns associated with this fundamental shift towards digital scientific practice. While many archaeologists are increasingly aware of these issues, many still lack hands-on practical experience with tools to implement best practices for code sustainability.

This workshop combines practical training and roundtable-style ideas exchange. During the workshop, we will:

- Review the most common platforms, tools and tricks for ensuring a long life of computational scripts,
- Exchange the experiences of making code, pipelines and metadata replicable and reusable,
- Discuss the current state of archaeological open science and ways in which we can advance the agenda (Marwick 2017).

At the end, we will draft a checklist of best practices and associated tools that can be used by any archaeologist planning a project that involves computational scripts.

ARTEFACTS, ARCHAEOLOGICAL SCIENCE AND EUROPEAN IDENTITIES IN IRON AGE ALPS, PANNONIA AND THE BALKANS [EAA COMTEX]

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Gleba, Margarita (University of Padua) - Potrebica, Hrvoje (University of Zagreb)

Session format: Regular session

Europe before national borders, especially in the Iron Age, was a world of intensive interactions and movements, resulting in fluid and composite identities. The study of such composite identities requires disentangling of their eclectic material culture. This session examines the identities of the communities in Iron Age Alps, Pannonia and the Balkans through studies of archaeological artefacts they left behind. Such artefacts and materials include but are not limited to textiles, leather, foodstuffs, metalwork, glass, pottery. Thanks to the advances in archaeological science we now have a far stronger set of tools to characterise and date these artefacts and to infer their provenance. Among numerous and varied methods are genetic, proteomic, isotopic and organic residue analyses, metallography as well as archaeobotanical and zooarchaeological approaches. Applying these and other methods to archaeological evidence, our goal is to understand the mechanisms behind identity formation and expression in this area using a bottom-up approach, providing a novel perspective on interaction networks measured on the basis of people's mobility and exchange of material objects, technology/skills/ knowledge, concepts/ideas/cultural traits. We particularly welcome innovative approaches that use archaeological science to disentangle the often eclectic nature of the material culture associated with populations that inhabited the region which was at the crossroads between Central European and Mediterranean cultures.

1 IRON AGE VENETIC NECROPOLIS OF PADUA: NEW DATA BY STRONTIUM ISOTOPE ANALYSIS

Abstract author(s): Gambacurta, Giovanna - Bortolami, Fiorenza (Ca' Foscari University Venice) - Cavazzuti, Claudio (University of Bologna) - Cipriani, Anna (University of Modena - Reggio Emilia) - Gamba, Mariolina (Independent researcher) - Lugli, Federico (University of Bologna) - Moscardo, Cecilia (Independent researcher) - Onisto, Nicoletta (Independent researcher) - Rasia, Piera Allegra (Independent researcher) - Ruta, Angela (Independent researcher)

Abstract format: Oral

From many years the team focused its attention on studying the protohistoric necropolis of Padua, especially the two largest and oldest. Alongside the systematic edition of contexts and physical anthropological analyses by gender, age, and paleopathology, isotopic analyses begin with this project. Strontium isotope analysis has been carried out on a sample of 24 individuals, 18 from the necropolis of Padova-via Tiepolo and 6 from the necropolis of Padova-Palazzo Emo Capodilista-Tabacchi, which represent two of the most relevant contexts for interpreting the dynamics of formation of the urban centre of Padua during the Iron Age. The analysed burials are dated to various phases of use of the burial areas, ranging from the 9th to the 6th century BCE. We sampled mostly adult individuals of both sexes from 18 cremations and 6 inhumations. The isotopic results, compared with available environmental baselines, show an overall intense mobility, with at least 43% of non-indigenous subjects. Interestingly, only one allochthonous individual is compatible with a provenance from the southern part of the Po plain, while most of the newcomers seem more probably to have originated from the more radiogenic districts of the Eastern Alps and/or from the Brenta/Sile/Piave river valleys. Non-indigenous individuals are documented in all phases, as well as amongst males and females, or amongst inhumations and cremations. Tomb EMO-664, one of the most ancient (900-825 BCE) is of particular interest, as it belongs to a high-status mature female with remarkable grave goods, whose probable origin is from the Eastern Alpine regions.

2 ELEMENTS OF CENTRAL/EASTERN EUROPE TRADITION IN 8TH CENTURY BC ARISTOCRATIC GRAVES IN VENETO (ITALY). CIRCULATION AND SHARING OF SELF-REPRESENTATION CODES

Abstract author(s): Baratella, Vanessa (University of Padua)

Abstract format: Oral

Between the end of the 9th and the 8th century B.C., the development and consolidation of the “proto-urban” system is clearly distinguishable in Veneto Region (Northern Italy). One of its peculiar markers is the highly-complex community structure, in which the emergence of aristocratic elites’ groups is attested. Relevant in these proto-urban societies is the strong, even wide-ranging, network established with the surrounding contemporary cultural entities, both Italic and extra-Italic. Well known and discussed in literature are the significant contacts and connections between Veneto and Central and Eastern European areas: the circulation of specific artefacts of high symbolic and ideological value, in particular bronze weapons, horse harness and metal-sheet vessels, marked by punctual typological parallels in a wide area between Austria, Germany, Croatia, Slovenia and Hungary, testify this phenomenon.

With the aim to investigate a possible widely and common shared ideology, expressed with the deposition in the grave goods of specific objects linked to precise codes of self-representation of the members of the aristocratic élites, some high-ranking graves – specifically from Este (Padua) and Rivoli Veronese (Verona) cemeteries – characterised by the presence of artefacts that can be surely included in this framework of relationships, will be discussed. In this regard, a deep analysis focused on typological and chronological aspects of these particular elements, certainly connected to relevant and apical figures of these communities, will be proposed.

3 BETWEEN THE MEDITERRANEAN AND CENTRAL EUROPE. CULTURAL IDENTITY FORMATION IN THE SOUTH-EASTERN ALPS THROUGH THE SETTLEMENT PRISM

Abstract author(s): Vojakovic, Petra (Arhej d.o.o.; Centre for Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Prijatelj, Agni (Centre for Soil and Environmental Research, Biotechnical Faculty, University of Ljubljana; Centre for Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Gruškovnjak, Luka (Centre for Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana) - Toškan, Borut - Tolar, Tjaša (Institute of Archaeology, Research Centre of the Slovenian Academy of Sciences and Arts) - Črešnar, Matija (Centre for Interdisciplinary Research in Archaeology - CIRA, Department of Archaeology, Faculty of Arts, University of Ljubljana; Institute for the Protection of Cultural Heritage of Slovenia)

Abstract format: Oral

During the early first millennium BC, distinct regional cultural characteristics started to emerge on the fringes of the south-eastern Alps (i.e. present-day Slovenia and its surroundings). Traditionally six cultural groups, primarily discriminated on the basis of their burial practices, are recognized in this area. While the burial rites reflect significant differences in the identities of these communities, the correlation between settlements and identities is less well understood.

In this paper, we address the issue by discussing two settlements in central Slovenia: Tribuna (in Ljubljana) and Pungrt above Ig (near Ljubljana), located a mere 10 km apart. Given that the two sites were excavated very recently with modern methodological approaches, they have both yielded a wealth of information on the Late Prehistory settlement culture in the region. As such, they are relevant to the ongoing debate regarding prehistoric identities. Tribuna is a lowland settlement, well protected by a river. Together with the surrounding sites, it forms the most important archaeological complex of the Gorenjska cultural group. In contrast, Pungrt, a hillfort settlement that has a monumental stone rampart and rises above the Ljubljana marshes, lies at the crossroads of the Gorenjska, Dolenjska and Notranjsko-Kraška cultural groups. While the two sites represent distinct settlement types, seemingly belonging to different cultural groups and exhibiting differing settlement dynamics, they share a number of similarities. Both are designed with a clear internal layout, suggesting urbanistic planning. As long-lasting settlements existing (with shorter hiatuses) for almost a Millennium, they also share long term sustainability and resilience. By focusing on their overlapping Late Hallstatt settlement phases (6th-5th centuries BC), we aim to compare and contrast their construction technologies, building layouts and distributions of artefacts. In doing so, we seek to reconstruct distinct communal identities and identify social differentiation among the inhabitants at the two neighbouring settlements.

4 THE GROUP IDENTITY ISSUE OF PRIGORJE IN THE EARLY IRON AGE

Abstract author(s): Šejic, Laura (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology, PhD student) - Mavrovic Mokos, Janja (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

Abstract format: Oral

Prigorje is a geographical subdivision in the north-western part of Croatia, stretching from today's border with Slovenia, across the southern slopes of Medvednica mountain and in the east to the Moslavina region. This area is dominated by the Sutla River and the Sava River as the main artery of prehistoric trade from the south-eastern Alps to the Danube. In addition to the mentioned rivers, numerous natural wood and ore sources on Medvednica form an extremely suitable area for settlement. It is assumed that Prigorje intensively participated in the exchange of ideas and goods in prehistoric times, especially during the Iron Age.

Although little is known about the Iron Age in this area, systematic archaeological excavations and field surveys have confirmed the existence of four Early Iron Age sites – Sveti Križ, Podsused-Kamenolom, Gornji Grad and Kuzelin. According to the material remains, settlement patterns and burial customs, all four mentioned sites belong to the Hallstatt culture and are characterised by important strategic positions that controlled the surrounding area and the assumed communication routes. Considering that the sites are located in an area where no Hallstatt cultural group is defined, we cannot say with certainty which cultural group the sites belong to, although many influences are visible from neighbouring regions. The site Sveti Križ particularly testifies to the intense communication between the area of Prigorje and the Dolenjska Group.

However, Prigorje remains “the area between defined cultural groups”, which creates an issue of group identity in the Early Iron Age. We would like to present and discuss the mentioned sites and the archaeological material that links Prigorje to the south-eastern Alpine region and the Pannonian Plain. Wider research of this area within the TRANS RIVERS project should clarify a new understanding of the Early Iron Age group identity in north-western Croatia.

5 STONE PENDANTS OF SOUTHERN PANNONIA - SIGNS OF CHANGE AND TRANSFORMATION

Abstract author(s): Potrebica, Hrvoje (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology; Center for Prehistoric Research)

Abstract format: Oral

Syrmian group is the name given to communities which emerged in the area of eastern Transdanubia in Hungary and eastern Slavonia in Croatia between the late 6th century and early 4th century BC. The group developed over an area previously culturally defined by various Eastern Hallstatt groups as well as the Dalj group. The most important characteristics of this group is a break with previous Early Iron Age traditions, development of certain new common features (primarily in the female costume), and a switch to flat inhumation graves after the abrupt disappearance of cremation burials under tumuli in the mid-6th century BC. The paper will discuss universal signs of identity at the level of the so-called Syrmian group. The case of stone pendants is presented as an example, because they are part of the female costume which is the most distinctive feature of the Syrmian Group, and have no intrinsic or functional value other than their symbolic content. Furthermore, the paper will discuss the distribution and chronology of these objects, as well as their contextual position within each costume and demonstrate that the area encompassed by this universal form of identity is larger than previously thought. This new identity was formed in the liminal area of three different cultural circles, and incorporated communities which, in the Early Iron Age, belonged to rather distinctive cultural groups. This phenomenon could also reflect a change in the relationship between the individual and general identity, which deeply influenced this area, departing from the separate, individual Early Iron Age traditions and setting the stage for the La Tène culture which was to follow.

6 THE NORTH-EASTERN PROVINCE OF THE HALLSTATT CULTURE ON THE EXAMPLE OF TEXTILE FINDS

Abstract author(s): Slomska-Bolonek, Joanna (Institute of Archaeology and Ethnology of the Polish Academy of Sciences)

Abstract format: Oral

The field research carried out in Poland in recent years clearly have indicated the need to redefine the social relations prevailing in the lands located north of the Alps in the Early Iron Age. They made it possible to capture an anomaly within south-western Poland - area settled by the local population of the Lusatian culture which appeared to be of a different character than other regions. The transformation of the local population took place here as a result of direct contact with the dominant cultural centres of Europe at that time. There were clear changes within the social structure, manifested in funeral customs which were a copy of the burial rites of the Hallstatt culture. A hitherto unknown local aristocracy appeared here, importing luxury materials from distant Alpine and Mediterranean areas. The above premises allowed to make an argument and maintain thesis about development on this area regional province, the north-eastern group of the Hallstatt culture.

Is it possible to see the direct influences of the Hallstatt population when analyzing the remains of weaving products? Definitely yes. Textiles of a clearly higher quality of workmanship than in other parts of the country were found here. They are made of very good quality wool yarn, with a thickness of 0.20-0.30 mm. Thus, these were extremely delicate textiles, the density of which clearly exceeded 20 threads per 1 cm. What is particularly important, dyed yarns, selvages, sprangs, plaited bands and fabrics made in a 2/2 twill weave were also recognized here. All of them are among the oldest finds in their categories that have been discovered in Poland. Thus, they were a clear example of new ideas and skills that reached the area of south-western Poland through the arrival of people of the Hallstatt culture.

7 DEVELOPING A RESEARCH QUESTIONS FOR ORA ACROSS EUROPEAN ARCHAEOLOGICAL SITES: A CASE STUDY IN IRON AGE CROATIA

Abstract author(s): Drahotusky-Bruketa, Luka - Ovčarić, Franka (Department of archaeology, The Faculty of Humanities and Social Sciences, Zagreb)

Abstract format: Oral

The starting point of an ORA study is defining a clear research question. The question can relate to diet, resource use, settlement patterns, trade networks, technology, etc. The main goal is to complement the study of fatty substances in ceramic vessels and understand how they were transformed, stored and consumed by relating them to the shapes of vessels and their location inside the settlements. A well-constructed sampling strategy can help refine research questions into hypotheses and contribute to the aims and objectives of the project.

However, besides the search for the “usual suspects” of the extent of consumption and processing of foodstuffs, spatial and temporal questions about the site itself can be questioned as well. Intra-site variability can be observed when samples selected from several different buildings or contexts are selected across both temporal and spatial scales.

In an archaeological project involving ORA, the first step is to determine clear research questions that ORA can help answer. These can relate to issues like diet, settlement patterns, trade networks, and technology. Research questions can also be multifaceted, examining the function and form of vessels in addition to the commodities stored or processed in them. Intra-site variability can also be studied through selecting samples from different buildings. The relationship between commodity and vessel characteristics can also be examined. The aim is to understand how organic products were transformed, stored, and consumed by relating the study of fatty substances in ceramic vessels to the shapes of vessels and their location in settlements. The research questions can be refined into hypotheses and tested through appropriate sampling strategies and techniques.

The development of research questions for ORA at the site level can be evaluated by comparing research questions from various sites in Europe, including the IronFoodTexMet project in Croatia.

8 FIRST FIBRE INVESTIGATION OF MINERALISED TEXTILES FROM IRON AGE BALKANS USING SCANNING ELECTRON MICROSCOPY

Abstract author(s): Gleba, Margarita (University of Padua)

Abstract format: Oral

Within the scope of the project IronFoodTexMet (“Creation of European Identities – Food, Textiles and Metals in the Iron Age Between Alps, Pannonia and Balkans”), funded by the Croatian Science Foundation, more than 60 mineralised textile samples were analysed using conventional textile analytical methods and Scanning Electron Microscopy (SEM). They were predominantly preserved on bronze or iron objects that were excavated from the Iron Age funerary contexts in Slovenia, Croatia, Bosnia and Serbia. Despite the often poor preservation of textiles, SEM permitted identification of raw material in most cases. The materials identified include plant bast fibres (in some cases identified to species level as flax), and sheep wool. Wool quality analysis using the established procedure of measuring the diameter of over 100 fibres, furthermore showed inter and intra site variation in wool fineness, suggesting that different varieties of sheep were used in textile production in the Iron Age Balkans. These data provide, for the first time, information regarding the raw materials used to produce textiles in the area, adding an important new dimension to our understanding of cloth as an element of local and regional identity. The paper presents the new results of fibre investigation and sets them in the broader context of Iron Age Central and Eastern Mediterranean regions.

714 REPOSITORIES AND DATASETS AS OPERATIONAL TOOLS IN COUNTERING THE ILLICIT TRAFFICKING OF CULTURAL GOODS

Session theme: 3. Heritage Narratives and Representations

Session organisers: Traviglia, Arianna (Italian Institute of Technology) - Mödlinger, Marianne (University of Salzburg) - De Bernardin, Michela (Italian Institute of Technology)

Session format: Round table

In the last twenty years, the massive devastation of archaeological sites, particularly in areas of the Middle East impacted by conflict, has increased public awareness of the dangers of looting and illicit trafficking in cultural heritage. Both European and US legislations now include stronger restrictions for the commercialisation of artworks of dubious origin. Law enforcement agents still struggle, nonetheless, to identify looted objects and connect them to their place of origin.

Databases of stolen objects and provenance research activities have been developed by dedicated units, such as the Carabinieri Command for the Protection of Cultural Heritage in Italy, the French OCBC, and INTERPOL’s Works of Art Unit. The potential of informatics and social network analysis applied to web-scraped content is currently being investigated to track illicit online sales and identify active criminal networks by cross-referencing the objects offered on the art market to those included in such datasets. This technical evolution brings forth the practical need for increased availability of open, searchable repositories of antiquities, such as specific sales archives, museum acquisition archives, private collections catalogues, and other types of datasets.

This session invites short presentations (6 minutes max., Pecha Kucha fashion) dealing with the creation of digital repositories of acquired, sold, or stolen archaeological goods (public and private), as well as research catalogues of specific sets of objects with clear geographic provenience, and beyond. Presentations will be followed by a structured discussion: the roundtable aims to engage the participants in critical dialogue, in order to highlight how to effectively connect these datasets and make them exploitable by law enforcement experts.

The session is organised within the framework of the HE RITHMS project, which aims to create an interoperable digital Platform able to identify organised criminal networks involved in the trade of cultural property, thus providing investigators with valuable intelligence.

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Solheim, Steinar - Sand-Eriksen, Anette (Museum of Cultural History, University of Oslo) - Johannsen, Jens (Aarhus university)

Session format: Regular session

Today, food production faces serious challenges in terms of climate change, shifting weather regimes and soil degradation. Population affects food production directly through changes in agro-ecological conditions and indirectly by affecting growth and distribution of incomes. Archaeological and historical evidence suggests that human action has always played a role in either exacerbating or mitigating climate-driven effects and the available food resources.

The spread of farming was a major driver of social and ecological change in human history. Cultural choices and environmental factors conditioned the introduction and expansion of farming into new regions, and the differences in ecology, vegetation and landscapes led to different cultural trajectories in this process. A variety of strategies for food production has been used across the globe, depending on ecology and crops.

Subsistence based on farming also include the use of wild resources, both terrestrial and marine. The importance of wild resources compared to domesticated species is often under-communicated, however. Human exploitation of wild species could have been related to a variety of tasks and strategies, both seasonal and unique to different ecological settings and landscapes.

The interaction between human population and food production is multifaceted, and equal to modern societies; pre-historic ones were also vulnerable to increased pressure on resources caused by either population growth or environmental factors.

In this session, we want to look into different strategies and varieties for food production. We also want to explore if new (scientific) methods (e.g. isotope analysis of cereals) can challenge traditional views on prehistoric farming practice (manuring vs. slash and burn). We invite papers discussing methods of food production, including the use of wild resources. Papers addressing the social consequence of shifts in food production, the entanglement of population dynamics and food production and/or environmental change and food production are welcome.

ABSTRACTS

1 AGRICULTURE AND FOOD AT TEL KINROT: AN INTERDISCIPLINARY APPROACH

Abstract author(s): Demeulenaere, Eline - Findiklar, Şengül (Institute for Archaeological Sciences, University of Tübingen) - Starkovich, Britt - Riehl, Simone (Senckenberg Centre for Human Evolution and Palaeoenvironment - SHEP; Institute for Archaeological Sciences, University of Tübingen) - Kamlah, Jens (Institute for Biblical Archaeology, University of Tübingen)

Abstract format: Oral

Plant and animal remains are powerful tools for archaeologists to understand the classic nature/culture dichotomy. Relationships between humans and their surrounding environment, especially the cultural aspects of food, are visible in the archaeological record. In that sense, archaeobotany and zooarchaeology are important tools for tackling questions in paleoenvironmental research but also in cultural studies in the past.

Although archaeobotanical and zooarchaeological research in the southern Levant have a long history, there are still regional and chronological gaps in our understanding of ancient agriculture and food production. One of the main reasons for this gap, we suggest, is the lack of multiproxy approaches. The earlier phases of our research have dealt with this problem in other Bronze and Iron Age Levantine sites. Here, we apply such an approach in our case study of Bronze and Iron Age layers at Tel Kinrot, an archaeological site located at the Sea of Galilee in northeast Israel. At Tel Kinrot, we are employing strategic and systematic sampling in order to effectively integrate archaeobotanical and zooarchaeological data.

Our contribution will discuss archaeobotanical and zooarchaeological data from Tel Kinrot, crop and animal husbandry practiced by the Iron Age inhabitants and consider their role in understanding ancient human-environment interactions of this region. The methodological framework of our multiproxy approach will also be discussed.

2 CHANGES IN CROP CULTIVATION DURING THE BRONZE AGE AND THE IRON AGE IN SOUTHEASTERN BALTIC: A CASE STUDY OF KERNAVĖ

Abstract author(s): Minkevicius, Karolis - Vėlius, Gintautas - Vengalis, Rokas - Piličiauskienė, Giedrė - Pilkauskas, Mindaugas (Vilnius University, Department of Archaeology)

Abstract format: Oral

The past decade has witnessed major advancements in the study of prehistoric agriculture in the southeastern Baltic. The deconstruction of the concept of subneolithic farming, examination of the Late Bronze Age and Roman Iron Age agricultural transitions alongside other advances have expanded our understanding of the evolution of farming in northern Europe. However, some of the more complex issues, i.e. the nature and evolution of agricultural systems, are still underexplored.

The scarcity of rich archaeobotanical assemblages from long-term sites with coupled an overall the lack of excavated certain period settlements makes such tasks particularly challenging. Still, a few sites present opportunities to explore these issues in greater detail. One such example is Kernavė - a UNESCO world heritage site in eastern Lithuania. It was continuously inhabited from the final Paleolithic until the Late Medieval period and was left undisturbed by modern agricultural activity and urban development due to its exceptional status. An ongoing research project at this site is aimed at addressing these very questions. It seeks to reconstruct the functional development of the archaeological complex over the span of ca. 2 500 years.

Archaeobotanical assemblages collected over several decades alongside some of the more recent samples reveal the long and complex history of agricultural activity at the site. The material presents evidence for the first agricultural activity starting as early as the Late Bronze age, suggests the existence of permanent field cultivation instead of a slash-and-burn agriculture, reveals a sharp increase in both agricultural and social activity towards the end of the 1st millennium AD, and provides insights into a more complex agricultural strategies of the Iron Age and Medieval Europe.

3 SUBSISTING ON THE EDGE: FAUNAL AND ISOTOPIC EVIDENCE REFLECTING SUBSISTENCE STRATEGIES EMPLOYED AT THE KNOWE OF SWANDRO IN ROUSAY, ORKNEY

Abstract author(s): Koon, Hannah - Bond, Julie (School of Archaeological and Forensic Sciences, University of Bradford)

Abstract format: Oral

The Knowe of Swandro is situated on the edge of a windswept and boulder strewn beach on the small island of Rousay. The site has a long chronology with successive occupancy and is dominated by an Iron Age settlement. Due to ongoing severe coastal erosion the archaeological features at the site have become truncated. However, careful excavation and sampling of these deposits means it is possible to explore the sequential changing subsistence strategies at the site. Through analysis of the faunal material this paper will discuss animal husbandry practises and the exploitation of marine resources as well as wild mammal and bird species. We will argue that when living in such an isolated location an over-reliance on a narrow range of protein sources is risky and thus a greater and more varied range of animals had to be exploited to ensure long-term survival of the inhabitants of Swandro. We will also consider the best approach to creating an isotopic faunal baseline that truly reflects the diet at a site with such varied exploitation of animal protein.

4 BUILDING THE BIGGER PICTURE: BOG BUTTER AND FARMING IN PREHISTORIC IRELAND

Abstract author(s): O'Toole, Karen (University College Dublin)

Abstract format: Oral

Bog butter is among the most common finds recovered from Irish peatlands and represents the unique survival of an agricultural product. The practice of its deposition extends from the early Bronze Age to the early modern period and the application of organic residue analysis and aDNA studies have revolutionised our understanding of the phenomenon. Combined with the assemblage-wide archival and geospatial research carried out by the present author, these have provided enormous insights into past diets, food storage, subsistence practices and society during this time. In particular, the study of bog butter raises interesting questions around farming practices in Bronze Age and Iron Age Ireland in relation to scale, strategy, and security. This presentation will focus on the results of this research, demonstrating the complexity of dairying practices in Irish prehistory, challenging traditional views of early Irish agriculture and exploring what this tells about society at this point in Irish prehistory.

5 FOODWAYS IN BRONZE AGE IRELAND: SELF-SUFFICIENT HOUSEHOLDS OR COMMUNAL COOPERATION?

Abstract author(s): Cleary, Kerri (University College Dublin; Archaeological Consultancy Services Unit)

Abstract format: Oral

More than 300 Bronze Age (c. 2200–800 BC) settlement sites are currently known across the island of Ireland, but associated studies of agricultural practices and foodways remain sparse. This is currently being addressed by a new project, FOODSEC: Food Security in Bronze Age Ireland, which is examining food remains and food storage facilities to explore how society managed the challenges of achieving food security. This presentation will focus on one aspect of that project: what can a reassessment of the surviving archaeological remains (e.g. storage pits, above-ground structures, plants and animals) and artefact assemblages (e.g. pottery, grinding stones) tell us about a household's food? Key case studies will be used to explore how a settlement's relationship with food might have changed over time. This will include recent organic residue analysis on pottery vessels from Corrstown, Co. Londonderry/Derry, which as yet represents the largest collection of domestic Bronze Age pottery (449 vessels) from a single site in Ireland. From its production, consumption, storage and management, to its social and symbolic value, what can the archaeological evidence for food tell us about a household's responses to shortage and surplus, seasonal cycles and social change? Furthermore, can this data be used to indicate fluctuations between self-sufficient practices and a reliance on communal cooperation?

724 ARCHAEO-RIDDLE: THE ULTIMATE CHALLENGE

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Cortell-Nicolau, Alfredo - Carrignon, Simon - Crema, Enrico (McDonald Institute for Archaeological Research, University of Cambridge) - Rubio-Castillo, Xavi (Universitat de Barcelona)

Session format: Workshop

Archaeo-riddle is a collaborative project aiming to evaluate the robustness of archaeological inference through the quantitative analyses of a simulated, virtual archaeological dataset. The project started with the creation of a virtual world (called Rabbithole) where a population of farmers (the Poppychewers) expands and replaces an incumbent population of hunter-gatherers (the Rabbitskinners) while generating a virtual archaeological dataset.

This replacement process follows a set of rules and parameters which are known only by the organisers of the session. The project has been thought of as a game, but also an opportunity for international collaboration to understand the robustness and the inferential power of different current theoretical and methodological approaches under a controlled environment.

The goal of the game is for archaeologists to propose their own methodological solutions to answer specific questions about how the farming population replaced the hunter-gatherers in the simulated world. These questions are available on the website of the project.

The game has already been launched in this year's annual meeting of the Computational Archaeologists Association. Researchers can download the dataset through the website and explore it using their own methods until June 2023 when they will have to submit their answers to the question with the scripts and tools they developed and used to reach these answers. Before this final stage, the project will be presented in other scientific meetings and engaging audio-visual content will be advertised on social media, to enhance participation. This workshop will mark the end of the project, where the selected participants will be able to showcase their solutions, and discuss them. Finally, out of this workshop, a publication will be prepared with all the interested participants, which intends to be both an assessment of current archaeological methods and an open declaration of support to collaborative work.

725 ISLANDS, MONASTERIES AND WATER

Session theme: 5. (Extreme) Environments – Islands, Coasts, Margins, Centres

Session organisers: Hueglin, Sophie (University of Tuebingen) - Petts, David (Durham University)

Session format: Session with precirculated papers

This year Mont Saint-Michel in Normandy is celebrating the 1000-year anniversary of the foundation of its Romanesque Abbey and in 2024 the monastic island of Reichenau in Lake Constance anticipates the 1300-year anniversary of its legendary foundation. As UNESCO world heritage sites, they are paradigmatic examples of medieval monasticism on islands. Their situation represents both landscape types: an island in the sea surrounded by salt water and an island in a lake or river surrounded by fresh water.

There are many more landscapes of island monasteries across Europe and the World that we would like to explore in this session. While focusing on Christian monasteries on islands in Europe, contributions are welcome that examine

the phenomenon of spiritual communities on islands in other world regions and religions as well as in other periods. Of special interest will be the role of water as a material or spiritual resource for island monasteries. This might become evident in their choice, use and transformation of watery landscapes, in the way they manage water within their precincts but maybe also in the diet of their inhabitants.

Continuing from Budapest, this year in Belfast, we welcome pre-circulated papers by authors who would like to contribute to an edited volume on “Islands, Monasteries and Water” which is planned as open access publication for 2024.

ABSTRACTS

1 FROM AVALON AND ATHOS TO THE SKELLIGS AND SRI LANKA – ISLANDS AS MONASTIC LANDSCAPES

Abstract author(s): Hueglin, Sophie (University of Tuebingen)

Abstract format: Oral

Across periods, across religions, and across the world, islands are sites and symbols of monastic life. They create a third space where humans can be isolated and at the same time well-connected, alone and in a community. While the island monastery distances itself from the mainland world, its aspect will be duplicated on the water surface, and it can be seen, and its bells be heard from far away (Meier 2009). Islands have the potential to build a bridge between this and the otherworld; they offer a suspended space between life and death. Nüllen (2021) describes islands as uninhabitable, hostile, and uncultivated terrain before Christian conversion turns them into a paradisaical place even a heaven on earth. Saints and monks tame the tempest and reorder the insular space until they return and mission the mainland.

Contradictory characteristics and conflicting concepts seem to surround islands and monastic life where this hybrid geosphere serves a secluded lifestyle. Europe and Christianity offer a great variety of situations of single sites (e.g. Mont Saint Michel, Mount Athos) or whole monastic island land- and waterscapes (e.g. Lake Constance, Ireland or the Dalmatian Islands). Case studies of Buddhist and Hindu island monasteries in Sri Lanka and India will be included to make an attempt to widen the horizon and study the phenomenon on a global scale. Islands, monasteries, and water are entangled human actor-networks with elements of nature or to say it with Zygmunt Bauman (2005) “Liquid Life” on liminal land.

2 MEDIEVAL UNDERWATER REMAINS AND WATER LEVELS AROUND REICHENAU ISLAND IN LAKE CONSTANCE

Abstract author(s): Blazek, Tristan (University of Tübingen)

Abstract format: Oral

Reichenau Island is one of the most important early medieval monastic sites. In 2000, it has been declared an UNESCO World Heritage site. Located in Lake Constance in SW-Germany, close to the borders to Switzerland and Austria, the 8th century island monastery with its three churches has been the focus of historical research and archaeological investigations. Many of the underwater features, some of which have only recently been discovered, have not yet been systematically dated and investigated, especially in connection with historical water levels.

Once plotted, dated, and seen in context with the 1707 plan of the island, the underwater remains are likely to provide a better picture of the usage of the lake as for example a waterway, food source or waste deposit. The simulation of different water levels can contribute to a new understanding of the coastline changes and the accessibility of different parts of the island. This will also allow to anticipate changes connected with climate change. The extremely high temperatures of Summer 2022 led to a very low water level which exposed even more – normally underwater – features which were documented by aerial photography.

This project aims to widen the attention from the island with the monasteries to the surrounding lake with its underwater landscape. This will lead to recommendations how UNESCO and the regional heritage and landscape management authorities should not only protect underwater traces of historic lake use but also enable the continuation of lived traditions on Lake Constance.

3 THE BELOVED ISLAND –A STUDY OF A MONASTERY ON AN ARTIFICIAL ISLAND.

Abstract author(s): Mollerup, Lene (Museum Skanderborg)

Abstract format: Oral

For the Cistercian monks who settled at Øm Abbey, Denmark in 1172, it had been a long and troublesome journey from the time they left the motherhouse seven years earlier, and until they settled at Øm.

With three failed monastic foundations behind them, they settled on a narrow strip of land between two freshwater lakes. From the surviving chronicle, we know in detail about the monastic foundation. Here the monks wrote, “They came to a place called Øm, surrounded on all sides by water and swamp, and they found there near the forest between two lakes, Gudensø and Mossø, a place overgrown with shrubs, and which seemed to them suitable. If only it had not been lacking in water for the various needs of the monastery”. One of the first things they did, when they arrived, was to create canals across the isthmus and thus creating an artificial island. They named the monastery ‘Cara Insula’ – meaning ‘The Beloved Island’. But why was it necessary for the monastery to create an artificial island, and furthermore, why invest labour and economic resources in the construction of several canals? This presentation discusses different theories as to why the monks found it necessary to place the monastery on an artificial island.

4 BUILDING ISOLATION AND CONNECTION: TRACING MONASTIC USE OF CRANNOGS IN MEDIEVAL SCOTLAND

Abstract author(s): Stratigos, Michael (University of York) - Noble, Gordon (University of Aberdeen)

Abstract format: Oral

Artificial islands known as ‘crannogs’ were a common feature of the medieval settlement landscape in Scotland and Ireland. In Ireland, there is extensive evidence for the use of crannogs as dwellings for lay and ecclesiastic elite from at least AD 600 until the post-medieval period with specific documentary association between Christian clergy, including monks, and crannogs. In Scotland, there is much less direct evidence especially before AD 1200, with most crannog investigations focusing to date on their Iron Age (800 BC-AD 400) origins in Scotland. What medieval ecclesiastic evidence there is comes from just a few excavated sites, a scattered record of antiquarian excavations, limited radiocarbon dates, stray finds, high and late-medieval ecclesiastic use, place names and local legendary associations. This paper reviews the available data on the presence and use of medieval crannogs in Scotland as ecclesiastic, particularly monastic, settlement. Foundational questions on where, when and how crannogs were adopted across the country by monastic and ecclesiastic elite will be addressed through exploring key case study examples with a view to understanding how the artificiality of these islets was (un)important to the Christian communities who used them.

5 WELCOME, SEA-PILGRIM? INSTANCES OF LANDING-PLACES, CHAPELS, SPRINGS AND SHRINES AROUND THE ISLE OF MAN

Abstract author(s): Johnson, Andrew (Manx National Heritage)

Abstract format: Oral

Over 170 medieval chapels are known on the Isle of Man, a small island of 580km² lying in the northern half of the Irish Sea: of these, around 40% lie within 1km of the coastline, and include amongst their number two sites which purport to be monastic. Three more monastic sites of 12th- through to 14th-century date are located rather more discreetly 1 to 2km inland and appear to be on already-holy ground.

Accessibility is proving to be an important factor determining both the location of many of these chapels and their continued use through and after the medieval era, in spite of being superseded by a new parochial system of just seventeen parishes in the 12th century.

For the coastal sites, their maritime liminality suggests additional dimensions involving the to-and-fro of tides, the viability of landing places, and the specific curation of particular natural resources. Of direct interest are the identification of places which are capable of providing safe landing sites at particular states of the tide; space above the strandline to beach small open sea-craft; springs and wells for refreshment and cleansing; bedrock suitable for carving; and white quartz pebbles as devotional offerings.

The collation of these criteria provides a growing case for recognizing pilgrimage and the development of local cults. Additionally, this package of attributes also explains in great part the continued significance of this type of site into the 19th century and the particular veneration of a small minority long after the move to a parochial system of worship more than 700 years ago.

6 ISLAND MONASTICISM ON THE NORTH SEA COAST OF BRITAIN

Abstract author(s): Petts, David (Durham University)

Abstract format: Oral

Most discussions of British and Irish island monasticism tend to focus on the rocky coastal seascapes of the ‘frayed Atlantic edge’ of western Scotland and Ireland. This paper aims to shift the balance and instead explores the evidence for island monasteries on North Sea (eastern) coast of Britain. Along many parts of this coast – particularly around the Humber estuary, the Wash and East Anglia, a formerly complex intertidal landscape of tidal fen and marsh has been erased by medieval and post-medieval land drainage and coastal re-alignment. However, it is clear from the archaeological evidence that this region was once home to complex networks of early medieval monastic islands that are now

often entirely land-locked and situated well inland from the modern coastline. This paper explores the practical and symbolic dimensions of this North Sea islandscape, examining the economic affordances such locations presented, but also unpicking the complex social and symbolic dimensions of inhabiting islands in marsh, fen and sandflats.

7 **TRANSFORMING THE SOUL, TRANSFORMING THE LANDSCAPE. THE POTENTIAL OF GEOARCHAEOLOGY TO EXPLORE SYMBOLIC, PERFORMATIVE, AND ECONOMIC LANDSCAPES OF ISLAND MONASTERIES**

Abstract author(s): Kahlenberg, Raphael - Milek, Karen - Petts, David (Durham University, Department of Archaeology)

Abstract format: Oral

Europe's island monasteries are often seen as the closest approximation of the Desert Fathers' arid retreats in the temperate climate zone. Colonising the wilderness and subsequent domestication of the landscape by monks and nuns are common motives in late antique and early medieval religious writings. Examples of the relationship between spiritual growth and transforming the environment can be seen in the reclamation of a patch of land by St Antony on his Inner Mountain, or in St. Cuthbert's efforts to grow cereals on Inner Farne in North East England.

Despite critical re-examinations of the factors influencing the location choice for early monastic foundations in Europe, such as trading routes, relationships to secular power centres, and the perception of islands in pagan societies, there has been limited research on the subsequent transformation of these sites by monastic communities.

This paper argues that geoarchaeological research of monastic islands can deepen our understanding of how the concept of the desert and its reclamation materialised in Western and Central Europe, the construction of performative space around the monasteries, and the question of self-sufficiency of their communities. It draws on previous studies, as well as recent geoarchaeological research on Holy Island, the site of the influential early medieval monastery Lindisfarne.

727 **CENTURIATED LANDSCAPES BEYOND THE WESTERN MEDITERRANEAN: ROMAN IMPACTS ON LANDSCAPE EVOLUTION**

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: de Haas, Tymon (University of Groningen) - Bődöcs, András (Eötvös Loránd University)

Session format: Regular session

The impacts of Roman conquest on provincial landscapes were diverse: they range from the settling of colonist farmers and the re-organisation of pre-existing settlement systems to the introduction of new crops, animals and agricultural strategies and the laying out of road and hydrological infrastructure. One particularly transformative element of Roman interventions in rural landscapes are cadastral systems, generally referred to as centuriations. These centuriations are particularly well-known in the central and western Mediterranean area (Italy, France and the Iberian peninsula) where long traditions of topographic and, more recently, integrated interdisciplinary approaches have been developed to both reconstruct these systems and to assess their chronology, functions, impact on settlement and land use, and ultimately their role in the long-term evolution of the landscape.

While traces of centuriations have been found in many other parts of the Roman Empire (from Britannia to Achaia and from Pannonia to Africa) dedicated research in these areas is much more rare and in terms of theoretical frameworks and methodological toolboxes more fragmentary. This significantly hinders our understanding of centuriation as a global phenomenon that not only transformed landscapes in the Roman World and shapes our conception of the Roman provinces, but also contributed significantly to the subsequent evolution of landscapes throughout the Mediterranean and beyond.

This session proposes to bring together scholars working on centuriated landscapes, with the aim to discuss the status quo of centuriation research (including current theoretical frameworks and approaches) in different parts of the Roman Empire, thus building towards a more cohesive research community and a new synthetic perspectives on the phenomenon of centuriation. We particularly welcome papers that frame current work (case studies) within a broader regional and/or theoretical framework. We aim to publish a selection of such regional synthetic contributions as an edited volume.

1 ROMAN CENTURIATION IN CORINTH AND BEYOND

Abstract author(s): Romano, David (University of Arizona)

Abstract format: Oral

Evidence of Roman landscape planning, centuriation, in Achaea has been discussed by a number of scholars over the past thirty years or so. These examples are primarily located in the territoria of major Roman colonies, including Corinth, Patras and Dyme. My own work at Corinth has demonstrated that the extents of the Roman landscape planning goes beyond the immediate area of the urban area of the city to include large extents of the province of the Corinthia. This suggests to me that the work of the Roman agrimensores in Achaea may be far greater than is generally acknowledged and that it is likely that there are more examples of Roman land planning to be discovered. There are of course additional Roman cities in the provinces of Macedonia and Epirus. I discuss the extents of Roman centuriation in and around Corinth, including the isthmus and the greater area of the Corinthia and propose a number of areas of the Peloponnesos where it is likely that further examples of Roman land planning may be discovered. I include a summary of the methodologies that I have utilized in my own research and the techniques developed as well as some of the difficulties of centuriation research in general.

2 RESEARCH OBJECTIVITIES IN THE CENTURIATED LANSCAPE OF COLONIA CLAUDIA SAVARIA

Abstract author(s): Bődöcs, András (Eötvös Loránd Tudományegyetem)

Abstract format: Oral

The Roman colony of Savaria was the first founded town in Pannonia (colonia Claudia Savaria). Inscriptions attest the so-called deductio, the settlement of veterans. The first reconstruction of the centuriatio of Savaria was made by András Mócsy, who attempted to draw it using medium-scale topographic maps. Since his publication, no substantial archaeological attempt has been made in the last 40 years to verify his theory. In the last decade, research into the existence of the Savarian centuriatio has been pursued using GIS methods. Fortunately, we have found a correlation between the results of some archaeological excavations and the information of aerial archaeological phenomena, and we have managed to build a predictive model-network for the centuriatio. The new network is completely different from the previous reconstruction. We have collected hundreds of archival aerial photographs from the 1950s and 1980s, and we have also carried out test flights for aerial archaeological reconnaissance to verify the new theory.

The model has been continuously refined and validated by archaeological fieldwork and geophysical survey. The new reconstruction has led to new possibilities for interpreting the sites excavated in recent decades and the previously known Roman roads and aqueducts.

Another interesting correlation between the watercourses running through the former colonia and the Roman centuriatio was also detected: the impact of Roman agriculture on the landscape transformation that has survived to the present day. Our pilot project, launched this year, plans to verify these effects with multispectral drone surveys and geophysical measurements to show whether there were former streams along the presumed Roman channels that could provide evidence to support this hypothesis.

3 A ROMAN LAND DIVISION IN NORTHERN GAUL, PART OF A LARGER PROJECT?

Abstract author(s): Vermeiren, Luc (Catholic university Leuven)

Abstract format: Oral

In 1958, J. Mertens questioned whether the scarce and fragmentary traces of Roman land division in Gallia Belgica indicated a centuriated landscape with a similar orientation.

An archaeomorphological approach frames the landscape as a relict of a trajectory of human interventions. The nature and chronology of traces relative to each other and their resistance to dateable changes in the landscape allows to discern a comparably oriented structure, possibly pointing to a Roman land division operation, called centuriatio.

In methodological terms, an UTM projection was applied with Qgis to Google Maps. Georeferenced (old) maps were used to select and document sequences of changes. Using this framework, we propose to reconstruct a centuriatio in Lebbeke, formerly located in the Civitas Nerviorum.

Traces of Gallo-Roman land division with a terminus ante quem of 100 CE in the controlled context of a nearby archaeological excavation confirmed the location, orientation and Roman dimensions of this centuriatio.

In a next step, we used these elements to construct a working-grid with Roman characteristics considered to have measured 20 by 20 actus, the cardo oriented at -31.095°.

The grid was plotted over Gallia Belgica in order to find out how far it hypothetically extended. This resulted in a large number of observations of both archaeomorphological and archaeological nature which validated the grid in its ori-

entation, location and dimensions in Belgium, the western parts of Germany, the Netherlands, northern France, and Luxembourg.

Such encompassing instrument of Roman imperialism with a standard size of 709.68 meters are documented in the Caesarian/Augustan period, to which a range of other indications also leads.

Is the implementation we propose in this paper a result of the imperial order of 44 BCE to survey the entire empire, as mentioned in the *Cosmographia*?

4 **BUILDING UP THE FIELDS: CENTURIATIO AND GEOARCHAEOLOGY IN THE AGER OF ILICI (ELCHE, SPAIN)**

Abstract author(s): Narbarte Hernández, Josu (University of the Basque Country; Aranzadi Science Society) - Iriarte, Eneko (University of Burgos) - Olesti Vila, Oriol (Universitat Autònoma de Barcelona)

Abstract format: Oral

Ilici (nowadays “La Alcludia”, Elche) was a Roman colony founded during the second half of the 1st c. BC, displacing the Iberian population that occupied that area from the 6th c. BC. It was founded through the centuriatio system (20 x 20 actus), very well preserved in the current landscape. This centuriatio is also confirmed by a bronze tabula (Sortitio), where 10 colonist received their plot of land (Olesti-Mayer 2001). From 2017, our team has developed a geoarchaeological approach in the colonial ager, where we tried to identify the changes in the agrarian system due to the new agrarian structure. Following the methodology developed by Eneko Iriarte and his team, six surveys, and their analysis (XRF-CS, ACP, sedimentology), were carried out. Some of the first results have identified the agricultural soils from the Roman period, but also the process of building up of these fields in a colluvial area, confirming the role of the centuriatio as a tool for the territorial management.

5 **ARCHAEOLOGICAL SURVEY, CENTURIATED NETWORKS AND THE SHAPING OF CULTURAL LANDSCAPES: A CASE STUDY IN THE HINTERLAND OF EMPORION-EMPORIAE (NORTH-EASTERN CATALONIA)**

Abstract author(s): Palet, Josep Maria - Carbonell, Arnau - Garcia-Molsosa, Arnau (Institut Català d'Arqueologia Clàssica - ICAC) - Rodrigo, Esther (Departament de Ciències de l'Antiguitat i de l'Edat Mitjana, Universitat Autònoma de Barcelona) - Ejarque, Ana (ISEM, Univ Montpellier, CNRS, IRD) - Mayoral, Alfredo (Institut Català d'Arqueologia Clàssica - ICAC; Université Clermont Auvergne, CNRS, GEOLAB, F-63000) - Orengo, Hèctor A. (Institut Català d'Arqueologia Clàssica - ICAC; Catalan Institution for Research and Advanced Studies - ICREA)

Abstract format: Oral

Current researches on centuriated landscapes are based on diachronical and interdisciplinary approaches. They include photointerpretation, archaeomorphological survey, geoarchaeology, palaeoenvironmental analyses or the study of old maps and written documents, which can offer important insights on the effects a centuriation had on the landscape. Environmental data show a complex relationship between Roman field systems, settlement and landscape change. Landscape analysis can provide enormous cultural assets in the form of cultural landscapes. These new perspectives are presented by assessing a case-study located in the ancient city of Emporion-Emporiae (Empúries) in the Empordà's littoral plain. The area is a highly diverse and dynamic littoral ecosystem subjected to sea influence and fluvial flooding contributing to the formation of beach-barriers, marshes and lagoons and, ultimately, the plain in-filling. Centuriated networks stress the existence of a remarkable landscape organisation of this area, which are also characterised by both, a complex settlement evolution and land-use systems. Paleocological data shows the remarkable imprint of the Roman occupation in the littoral plain, with the removal of littoral woodlands and the expansion of wet pastures and cultivation lands in an increasingly drained floodplain. These methods have allowed moving beyond the pure description of the traces and exploring the concepts behind the making of a centuriated landscape. Recent interpretations move from economic or materialistic approaches to more social and cultural focused explanations. The high impact of centuriations makes them visible in modern land arrangements and defines them as an outstanding evidence of Roman impact in the shaping of present-day cultural landscapes.

6 **AGER IN AFRICA FROM 146 TO 63 BC**

Abstract author(s): Kim, Yeong-chei (Seoul National University)

Abstract format: Oral

Scholars have generally underestimated the level of Roman activities in Africa before the foundation of Caesarian and Augustan colonies, and the land in Africa which the Romans annexed following the destruction of Carthage in 146 BC has been conventionally called public land (ager publicus), although the term ager publicus in Africa is not attested in the epigraphic *lex agraria* dated to 111 BC. While reviewing the massive centuriation systems identified in

modern day Tunisia, this paper analyses agrarian laws relevant to African land from the period between the annexation of Carthage in 146 BC and Servilius Rullus' agrarian proposal in 63 BC, thereby including the Gracchan lex Rubria of 123 or 122 BC and Saturninus' agrarian law in 103 BC. By examining the Roman management and use of the former Carthaginian territory in this period, this paper argues that private ownership steadily developed in Africa in the late second century BC out of the land annexed in 146 BC, and that what was a single legal category of ager in Africa as in the agrarian law of 111 BC was divided into two categories: one of private land and the other of land which remained public land of the Roman people.

7 OVER THE LIMIT. ROMAN AGRARIAN ORGANISATION IN SOUTHERN NUMIDIA

Abstract author(s): Turchetto, Jacopo - Meleri, Andrea - Zanovello, Paola (University of Padova)

Abstract format: Oral

Unlike what happened in relation to the Tunisian and northernmost Algerian districts, the territorial organization of the Numidian sector, located to the south of the Aurès massif (Jibāl al-Awrās) in the province of Biskra (Algeria), has not recently been the subject of specific research. It is a frontier area stretched along the northern edge of the Sahara, crossed by caravan routes which connected the Central-African supply areas with the Mediterranean coastal strip, and which will then be exploited in Roman times to become the backbone of the road network of the North African provinces. Furthermore, although it was a semi-desert territory, the water flowed abundantly from underground springs and aquifers, making this sector very fertile and productive and also acting as an attracting and decisive element in logistic and settlement choices.

It is no coincidence, in fact, that the limes africanus, the southern border of the Empire, ran just behind that sector, and that hydraulic works, systems for collecting water and extensive networks of canalizations were carried out, in support of the territorial organization and agricultural exploitation of that district. Within that framework, territorial infrastructures similar to centuriations also had to be created.

New territorial research in the province of Biskra is moving, among other things, precisely towards a more systematic study of those traces of centuriation, through the analysis of Corona declassified satellite images, multispectral data and field surveys. Specifically, the interest is directed not so much towards a more correct identification of the geometry of the centuriation plot, as towards a better understanding of the cultural characteristics which must have distinguished those agrarian organizations, of their relationship with the defensive line of the limes and, in general terms, with the landscape and the settlement patterns.

8 CENTURIATION, ROMAN EXPANSION AND LANDSCAPE EVOLUTION: TOWARDS A GLOBAL PERSPECTIVE

Abstract author(s): Haas, Tymon (University of Groningen)

Abstract format: Oral

Centuriation, the large-scale geometric re-organization of rural landscapes, is one of the most impressive yet least understood accomplishments of the Romans. The study of these systems has a long and diverse history, and by now at least some three hundred of such these systems are known throughout the Roman world. At the same time, our understanding of this phenomenon beyond the individual case study or region is very limited – despite several attempts at synthetic work (e.g., Clavel-Lévêque & Vignot 1988; Clavel-Lévêque & Orejas 1990; Agri Centuriati 2009). Thus, basic questions about their distribution, functions, chronology and relations to Roman expansion remain unanswered. Departing from an inventory of known centuriations, this paper explores these limitations and proposes a program of comparative research as a means to advance this field of research. with the ultimate aim to further explore the impact of centuriation, both in the context of Roman expansion and the longer-term evolution of landscapes. The potential of such comparative analysis is illustrated on the basis of several examples.

728 URBAN PHENOMENA IN ARCHAEOLOGICAL SITES-ISSUES RELATED TO TRAITS, HOMOGENEITY, DIVERSITY AND SUSTAINABILITY

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Basu, Durga (Department of Archaeology, Calcutta University) - Donnelly, Colm (Queen's University Belfast)

Session format: Regular session

Urban Archaeology is an important element of archaeological studies, dealing with the past material culture, environment and communities of towns and cities. Whilst the definition of urban in relation to rural is contested, urban sites have some distinct traits which vary from region to region, country to country and period to period.

Urban traits can be observed in relation to, for example, evidence for planning, industrial production, commerce, population density and expression through art and architecture. Sometimes all these characteristics are discernable, whilst in other cases one single attribute may be indicative of urban site. Towns and cities perform specialised functions, evidence for which may be taken, contextually, as an urban trait. This session intends to explore variability in these specialized functions between different regions to develop an overview of the variability in urban traits in the past.

The main purpose of this session is to identify the key urban traits evident in the archaeological record and the range of interpretive and methodological issues that these bring to the fore. Papers are welcomed which relate contextually specific urban traits to the challenges of developing strategies for effective urban heritage management.

ABSTRACTS

1 APPROACHING EARLY CITIES: AN ATTRIBUTE-BASED APPROACH TO LATE PREHISTORIC EUROPE

Abstract author(s): Fernández-Götz, Manuel (University of Edinburgh)

Abstract format: Oral

This paper will discuss issues of definitions and functions of early cities, particularly how we can approach the study of large agglomerated settlements from an etic perspective in contexts where written sources are absent or scarce. Following M. E. Smith's approach outlined in 2016 ("How can archaeologists identify early cities?"), published in my edited volume "Eurasia at the Dawn of History: Urbanization and Social Change", I will apply his model of polythetic traits that can potentially be identified archaeologically to the study of late prehistoric megaliths, particularly related to Iron Age Europe. This approach takes into account attributes based on size, social impact/functions, built environment, and social and economic features. In addition to applying the model to some specific case studies, I will argue that we should understand urbanisation as a social process, rather than a final destination, and that approaches should adopt perspectives that are simultaneously contextual and comparative.

2 NEW APPROACHES TO THE URBAN PHENOMENON AT THE END OF THE IRON AGE IN NORTHWESTERN FRANCE

Abstract author(s): Remy, Julie (Chargée de recherche, CNRS, Nantes Université, CReAAH, LARA, UMR 6566) - Le Goff, Elven - Leroux, Gilles (INRAP)

Abstract format: Oral

The last two decades have allowed for a significant renewal of knowledge regarding the urban phenomenon at the end of the Iron Age for a region of Gaul that had long remained outside of these themes. European studies conducted since the 1970s have highlighted a process of urbanization during the Second Iron Age that is illustrated by the early emergence of unfortified settlements in the course of the 3rd and 2nd centuries BC, followed by the development of oppida between the end of the 2nd and beginning of the 1st centuries BC. These elements translate the complexification of the Latin society which is accompanied by an important structuring of the economic and political territories. With the multiplication of studies, the evolution of research testifies to the complexity of the phenomenon with situations that are sometimes diverse and nuanced depending on the geographical sectors and the data acquired. In north-western Gaul, preventive excavations have led to the identification of more than a dozen sites in recent years, making it possible to begin to reason about the spatial organization of occupation, which appears to be systematically dense, but which presents a diversity of forms. In the long term, the collective research program AGGLO (AGGLOMÉRATIONS Laténiennes du Nord-Ouest de la Gaule) aims precisely at characterizing this phenomenon of habitat densification. In a programmed framework, if aerial or geophysical prospection, coupled with documentary assessments have proven effective, for several decades, in identifying potential sites, only excavation allows us to validate the hypotheses.

Agglomerations are not only defined by their own characteristics, be they morphological, social, spatial, material, economic or political, but also through the exchanges and flows that link them. The aim here is also to understand them as active entities within a network.

3 CUI BONO? FUNCTIONS AND INVOLVEMENT OF GUILDS AND ASSOCIATIONS IN THE ROMAN URBANISATION PROCESS

Abstract author(s): Andreeva, Petya (ÖAI/ÖAW)

Abstract format: Oral

The establishment, development and promotion of an extensive urban network was the defining policy of the Roman Empire. The city environment featured a number of key factors in shaping architectural fabrics, organising economic and religious activity, or providing strictly ordered milieu.

One of the significant factors to consider would be the professional collegia and voluntary associations. They were strongly related to the social dynamics and culture contact in the cities and their territories, and therefore to the overall process of Roman urbanisation. Despite their widespread popularity in the Roman provinces, there is still much debate about their precise place and function in the development of urban centres. On the one hand, different kinds of associations provided a social and economic context in which their members managed to integrate into the structures of the civic community. A strong indication of social capital was their participation in public festivals and imperial ceremonies. In turn, the enhanced social function of the associations has been manifested in shaping the urban environment with sanctuaries and temples dedicated to their patron deities, or establishing ties of patronage to the members of urban or even state élite.

Hence, the apparent popularity of collegia might have been a constant factor in changing the social and economic frame of the urban centres. Another relevant question that arises in this context is whether the Roman urbanisation process provided suitable conditions for integration of different associations in the cities, or they were part of the process itself. In turn, the discussion comes to the main question: were the associations an urban characteristic and an important factor involved in a strongly hierarchical urban network? In other words, it is necessary to consider whether they could fit in theories and definitions related to the Roman urbanisation.

4 URBANISM AND ITS CHARACTERISTIC FROM EARLY-HISTORIC TO EARLY-MEDIEVAL PERIOD IN NORTHERN EUROPE AND SOUTH ASIA BY TAKING CHAMPA AS REFERENCE

Abstract author(s): Singha Roy, Arabinda (University of Calcutta)

Abstract format: Oral

Urbanization is a complex process involving certain basic socio-economic changes at the most primitive levels. The urban centres not only represents a distinct development in technology and economy but, in turn, also inaugurate a new social type having almost universal relevance and impact. Thus urbanization is decidedly an indicator of the socio-economic and cultural level of a civilization.

Urbanization in Northern Europe and South Asia had two phases. The Harappan cities in South Asia which emerged in the middle of the 3rd century B.C. collapsed after about six hundred years without leaving any surviving urban centres. In Northern Europe first urban centre emerged in around 6-7th Century BC. It was only after another thousand years or so that towns emerged in in both the continents for the second time. The second phase of urbanization (historical phase in south Asia and middle age in Northern Europe) emerged and flourished in an altogether new socio-economic milieu generated by the widespread use of new technologies and its extension to the field of production. In this phase of south Asian history we have known about different principalities having a capital city. One of which was Champa of Anga territory, one of the famous city in south Asia which has survived with its supremacy since the early historic period to the early medieval period without any evidence of collapse and bring all the characteristic features as well as transformation of urbanization in the south Asia. Similar cities have been found in the Northern part of Europe as well to show continuation of the process of urbanisation without any break or phases.

5 STUCCO AS A CLASSIFIED MATERIAL FOR ANCIENT URBAN BUILDING AND IMAGERIES : A CONNECTING LINK BETWEEN INDIA AND ROMAN WORLD

Abstract author(s): Basu, Durga (Calcutta University)

Abstract format: Oral

Stucco as a building material and a medium for artistic creation is employed in many urban metropolitan cities in Indian Sub-Continent. This material was used right from the beginning of Civilization. In the Indian Sub-continent, the antiquity of stucco goes back to the third millennium B.C.E. when this compound was adopted as a preventive veneer on the structure, by the Harappan people. The available literary and archaeological evidence clearly indicates that in ancient India stucco was used for some specific purpose, besides image making or architectural decoration. Stucco is basically a compound of quick lime and sand. But sometimes Gypsum was added to the compound. In many archaeological sites, stucco was noticed as an essential ingredient for buildings. The existence of stucco either in form of mortar or plaster coating in ancient structures or in the imageries indicates an urban environment and society. Ad-

mittedly from the 1st century C.E. its use as a medium for image-making became very popular in the Gandhara region in the northwestern part of the Indian Sub-continent. Archaeological evidence shows that this region having Hellenistic- Roman elements at its core, became an important centre for stucco art. During the First- second century India had direct contact with the Roman world. Stucco had a long history in the Mediterranean world. Artists working in the Roman world created extensive stucco schemes in both buildings and sculptures. Almost all the classical writers of Imperial Rome mentioned a trail of trade and commercial activity of Rome with India which had perhaps enhanced the effective uses of stucco in India. The paper will deal with the varied use of stucco in both India and Rome.

6 STRATEGIES FOR EFFECTIVE URBAN HERITAGE MANAGEMENT: A COMPARATIVE STUDY OF CASES FROM INDIA & EUROPE

Abstract author(s): Basu, Asmita (Army Institute of Management)

Abstract format: Oral

Traditionally, managing cultural heritage has been the responsibility of the public sector and experts, primarily archaeologists, art historians, architects and conservationists. It has included a method of operation that mainly relates to the monuments and clearly delineated regions with declared historical significance.

Archaeological sites which have been clearly identified as urban sites due to their nature and characteristics require proper heritage management strategies for sustainability.

In the core context, contemporary heritage management is rooted in the rationale of the industrial society and as such, is built on the concept of a powerful public sector and an instrumental rational planning and heritage management, i.e. an expert activity based on apolitical, impartial, and scientific assessments. The transition from an industrial to a knowledge society has significantly altered the environment for urban development planning and heritage management.

Over the last few decades, societal development has been increasingly shaped by economic and cultural globalisation, resulting in competition between cities for external markets (such as investments, visitors, and new residents), as well as a shift in policy and decision-making and implementation process.

This paper aims to highlight the benefits of the application of the principles of Strategic Management for the sustainable development of urban archaeological sites through the case of the Bishnupur temple sites in West Bengal, India in comparison to the strategy application in urban sites in European countries such as Spain and others for a better understanding of the heritage management structure and policies.

7 TRACING THE URBAN PROCESS IN THE LIGHT OF EXCAVATION AT KUNAL, FATEHABAD, HARYANA

Abstract author(s): Bhattacharyya, Banani (Department of Archaeology & Museums, Haryana)

Abstract format: Oral

The identification of the Harappan Civilization in the early twentieth century was considered to be the most significant archaeological discovery in the Indian Subcontinent as it pushed the beginning of settled life by 5000 years. Contemporary to the Mesopotamian and Egyptian Civilizations it was unique in its town planning. Spread over major parts of the western and north-western subcontinent, its influence is seen to the Tajikistan border in the north and the Gulf region in the west with over two thousand sites found till date. The past eight decades of research have brought to light many important details of the culture including the cultural process involving its origin. In this regard position of Kunal is quite interesting. Excavation has revealed the progress towards urbanization from village farming community based life. Kunal a Pre-Harappan site, on the bank of now dried up ancient course of river Saraswati, is located in the Tehsil Ratia, District Fatehabad, Haryana. The core area of the ancient settlement is 3-4 acres though site expands to 9 acres. Excavation process has provided significant traits of Pre-Harappan Culture in our sub-continent at Kunal for the very first time in the history of Harappan studies. Exclusively, the cultural material signifies the habitation of the site back to Pre-Harappan period. Pit Dwellings alongwith hearth marks indicate the early stages before formation/existence of Harappans. There are two cultural phases pre-Harappan and Harappan, To the Harappan period relate the remains of mud-brick structures, platforms, treads and soak pits. All scholars agree on the urban character of the Harappan culture, but opinions differ on the role of the Sarasvati identified with the Hakra—Ghaggar river and also on the identity of the people who created this culture.

8 TRADE ROUTES AND URBAN SITES OF PILAK: HOMOGENEITY, DIVERSITY OTHERS URBAN SITES OF BANGLADESH, BURMA AND JAVA

Abstract author(s): Palit, Projit (Assam University)

Abstract format: Oral

The traders and monks used the trade routes of Surma and Cachar –valley, Lushai hill, Maynamati and Pilak to reach the Burma and Hukawang Valley of China. Traders used the route and invested lot of wealth for making monasteries and urban city for their trade. According to the Arakan (Burma) chronicles, the Magh King Peng used the route and established Pilak as a capital of his kingdom Pleingsa. The site of Pilak is based on the Pancharatha structure and it has five major parts. In the middle it is a structure of circular shape inside and square at outside, surrounded by square cells, the rest of the architectural foundation proceeds in the four directions of South, East, North, and West. On the whole, the entire structure creates a mandala. Constructed entirely out of burned terracotta bricks of different sizes and joined together by fine clay mortar. Bricks are mostly square, rectangular, and sometimes circular with measurements ranging between 15.24cmx10.16cmx6.35cm, 20cmx25cmx5.5cm, and 29cmx18cmx4.5cm. The cruciform structure of Pilak architecture are very closed other similar cruciform architectures of with Paharpur, and Moinamoti of Bangladesh and Ananda temple of Pagan, Central Java (Dieng plateau, Candi shew, Candi kalasan). Interestingly all of these architectures from various places approximately belong to the same time frame and have been built using the same medium. The terracotta relief panels of the Pilak are composed of clay, which upon being fired after completion of the sculptural relief works on its surface, is commonly used as a part of the decoration on the architectural surface of monasteries and temples of Pilak. Treatment-wise and stylistically the panels of Pilak were closer to the panels at Moinamoti monastery, Bangladesh. The artists were either the same individuals or had strong connections among them.

9 EARLY MAJOR URBAN CENTRES IN EASTERN INDIA

Abstract author(s): MITRA, SAYAMTARA (BOLPUR COLLEGE, BOLPUR, BURDWAN UNIVERSITY)

Abstract format: Oral

Recent Archaeological researches reveal adequate data indicating how and when early major urban centres grew in Eastern India.

The city has been variously defined, but its broadly distinguishing features are :

- (1) Its population is denser than in rural areas and confined to a restricted area,
- (2) Only limited part of its area, is utilised for agricultural purposes,
- (3) Its population is predominantly non-agricultural and dependent on rural areas for their source of food and raw materials supply. Hence presence of merchant class fulfilling the necessities of life of the urban citizens.

Thus early urban city broadly functioned as being political and administrative centre, trade and commerce centre and also as a religious centre. On the contrary rural areas where land availability was plentiful, food abundantly available, comparative self-sufficiency obviated the need of merchants class.

In early historical period, Bihar, in eastern India had the potentiality of evolution into cities. The important rivers like Ganga, Gandaka, Kosi, etc. and their tributaries with their banks and adjoining areas, to a large extent, have in course of archaeological excavations revealed the unfolding story of the beginning and successive development of towns and cities in Bihar.

One wonders if archaeological excavations bear silent witness to an evolving early Urban Revolution. Our limited contemporary knowledge on the material transformation of rural habitations into urban ones would tend to indicate this Urban Revolution, if any, was albeit a slow one. But much more in archaeological research is necessary to detect and understand this process.

10 WATER FILTRATION SYSTEM IN AN ANCIENT SITE: SRINGAVERAPURA, A COMPARATIVE STUDY BETWEEN ANCIENT AND MODERN SYSTEM

Abstract author(s): Chatterjee, Anustup (Techno International New Town; NIT, Raipur)

Abstract format: Oral

The primary goals of water treatment plants for over a century have remained the same: produce biologically and chemically safe water that is appealing to consumers, and is noncorrosive and nonscaling. Today, plant design has become very complex due to various factors.

The desire to drink pure and wholesome water dates from ancient times. Early methods of treating foul water were boiling, exposing to the Sun, dipping a hot copper rod repeatedly, and filtration. The earliest water treatment practices

were primarily in batch operations in individual homes. From the sixteenth century onward, centralized treatment facilities for large settlements were realized.

The growth of community water supply systems in India started in the early historic period.

Water from a natural source usually contains many dissolved and suspended solids. Large suspended particles, such as sand, behaving as “discrete” particles can readily be removed by sedimentation or filtration processes but those at the lower end of the size spectrum do not readily settle. These are colloidal particles and can be removed by sedimentation and filtration only after physical and chemical conditioning.

Sringaverapura, identified as an ancient urban site, is located in the district of Allahabad, Uttar Pradesh in eastern India. The ancient site, sprawling, roughly north-south along the left bank of the river Ganges, lies in Singrur region. The excavation in 1977 had continued for three field seasons. The site provides a continuous cultural sequence starting from the end of 2nd Millennium B.C.E to the early medieval times. There are seven Cultural phases of which Pd-IV-B has revealed a massive burnt brick tank consisting of two parts with an elaborate inlet and inter-coming connecting system.

The present paper discusses the water filtration system of the Urban archaeological site of Sringaverapura where the water filtration system developed in first century B.C.E to C.E.

11 TRACING THE URBAN TRAITS IN MEDIEVAL SITE OF GADAG IN SOUTH INDIA

Abstract author(s): Bonu, Debsmita (University of Calcutta)

Abstract format: Oral

Geographical and administrative factors play vital roles in paving the history of an urban centre. The existence of an urban centre is largely related to human society. Urban centres have always played an important role in shaping and transforming society. The major social, economic and political changes in society are more or less responsible for this urban setup only. Thus, an attempt has been made to examine the factors which are responsible for the origin and evolution of urban centres. The present study area, i.e., Gadag district of northern Karnataka came into existence in 1997 when the Dharwar district was bifurcated. Though the district is newly carved in the field of art, literature, culture, spirituality and industry. It has its own heritage as well as legacy. The class-stratified society and concentration of wealth hold already enough provenance of the medieval urbanized Gadag. But an urban centre is always engaged with special functions with regard to the hinterland. Urbanization comparatively develops small and simple communities into specialized central complex societies. From our archaeological viewpoints the parameters frequently applied to situate urbanization are its location, size of settlements, writings, standardized medium of exchange, large representational art, large and heavily embellished structures, and knowledge of science and growth of technology. Finally, trade has been the most important deciding factor which invokes a small town to engage in an urbanized structure which cannot be neglected in this case of the present study area. An effort has been made here to understand if the medieval material culture showed enough maturity when composing the antecedent descendant cultures.

729 EXARC: RECONSTRUCTING PAST NARRATIVES THROUGH EXPERIMENTAL ARCHAEOLOGY

Session theme: 4. People of the Present – Peopling the Past

Session organisers: Fregni, Elpidia Giovanna (Unaffiliated) - Maguire, Rena - O'Neill, Brendan (University College Dublin)

Session format: Regular session

Experimental archaeology can capture the imagination of even the most blasé professional archaeologist. There is a fascination in seeing the material culture of the past re-created, along with associated smells, sounds, touch and taste, making it experiential as much as experimental. In addition experimental archaeology answers vital questions about how objects were made and used, including use-wear studies and collaboration between experienced artisans and archaeological researchers, EXARC's mission is to make the archaeological past widely accessible by creating opportunities for researchers and practitioners to collaborate, exchange information, and share best practices in research and education. This session brings together those aims for like minds who are interested in how experimental/experiential archaeology fuses material culture studies of conventional archaeology with the human story of the past, making it more relatable, as a means of preservation for traditional skills, and for understanding past technology. Talks can address but are not limited to the following topics:

- Best strategies and practices employed for reconstructing or presenting the past to the public
- How real is reconstruction? How close to authenticity is experimental archaeology?
- Reconstruction of material objects: successes and limitations
- Experimental archaeology in the lab and in the field
- The social and spiritual aspects of ancient technologies, putting people at the heart of technology.

1 RECONSIDERING COMBS AND COMB-MAKING IN EARLY MEDIEVAL IRELAND

Abstract author(s): SINES, BILLY (Archaeological Consultancy Services Unit)

Abstract format: Oral

Hair combs are a common find from archaeological contexts dating to Ireland's Early Medieval Period (400-1100 AD). Most combs are composite objects, combining parts made from metal and skeletal material. While the objects they produced may be common, archaeological evidence for the craft of comb-making is not. Outside of Viking contexts such as Dublin, comb-making is often identified by unused components discarded in ditch fills rather than excavated workshops.

To many, the composite design of a comb seems complicated, especially as many view combs as functional, hygiene implements, created solely to remove head lice. Early Irish texts state that comb-making was a low status craft while also mocking and damning the comb-makers. They are low value items, easily disposed of and replaced when broken.

To some, the composite design of a comb appears to be a response to the restrictions caused by their choice of raw materials, demonstrating a high level of craft knowledge. Comb typologies highlight a specific style of comb which is Irish in origin, with possible trade connections to Scotland. Macro and Microscopic analysis has shown that some combs show signs of repair or augmentation, that challenge the idea of them being easily disposed of.

Unfortunately, the results in comb making being overlooked or shrouded in ambiguity, especially when there is little primary evidence for any of the objects suggested as comb-making tools. Using experimental archaeology, the processes required to make a comb can be identified, allowing us to reconsider the craft and challenge the existing assumptions. Experimental archaeology may not give a definitive answer, but it allows us to ask better questions and move away from discussions of dirt and lice and towards concepts of status and identity in Early Medieval Ireland.

2 SEWING WITH SEALSKIN: INVESTIGATING PALEO-INUIT NEEDLE MAKING AND SEWING PRACTICES THROUGH COLLABORATION WITH MODERN INUIT SEAMSTRESSES

Abstract author(s): Siebrecht, Matilda (Groningen University)

Abstract format: Oral

The importance of needles to Paleo-Inuit cultures is well established in Arctic Archaeology, as they were an essential tool in the creation of the warm, waterproof clothing which would have been essential for survival in Arctic environments. A pilot study conducted in 2021 (Siebrecht et al 2021) compared needles from three Dorset Culture sites (c. 800BC - AD1300) in the Foxe Basin (Arctic Canada). The results of this study showed that, although the needles from all sites appeared typologically identical, differences could be observed in a microscopic analysis of traces of manufacture and use. One such result, which had not been considered in previous studies on this topic, was an observed variation in the needle cross-section shapes. The present paper presents the results of a further investigation into this variation, using a combination of experimental archaeology microwear analysis, and - most importantly - collaboration with expert seamstresses from modern Inuit communities. This approach not only allowed a deeper investigation of Dorset needle making and sewing practices than previous typology-focused studies, but also resulted in some fascinating conclusions regarding the use of ethnographic analogy for the investigation of Dorset technologies.

3 IDENTIFYING DISMEMBERMENT BUTCHERY MARKS AND TOOLS IN THE ZOOARCHAEOLOGICAL RECORD: THE EXPERIMENTAL PROCESS

Abstract author(s): Okaluk, Tiffany - Shai, Itzick - Cohen, Haim (Ariel University) - Greenfield, Tina (Cambridge University)

Abstract format: Oral

Butchery analysis aims to understand the social food processing traditions of ancient communities, and reveals the steps and techniques involved in animal carcass processing. Butchery marks on animal bones enable archaeologists to understand the types of tools and their materials that were used in butchery. Experimental butchery studies have contributed to much of what we know regarding ancient butchery and animal processing as it is vital to understand the condition under which the marks are created. Butchery mark identification research has focused almost exclusively on slice marks and percussion marks with very little attention paid to chop marks. Chop marks are high impact marks created with both sharp and blunt force that are intended to sever the bone. The most common definition and identification criteria for chop marks is a smooth cut surface extending into the bone tissue. We have found this definition and identification criteria to be problematic for numerous reasons. This paper discusses the ongoing second stage experimental project to develop more accurate identification criteria for chop marks in the zooarchaeological record, with a focus on the differentiation between chop marks created by stone, copper, and bronze axes. We will outline

the progression of this project and discuss the evolution of the experimental research highlighting the methodological challenges, current experimental research design, and preliminary results.

4 REPLICATING TANGENTIALLY SPLIT OAK PLANKS IN PREHISTORY: OBSERVATION AND UNDERSTANDING THROUGH DOING, A MASTER'S THESIS

Abstract author(s): Darrah, Hamish (Independent Researcher)

Abstract format: Oral

Understanding approaches to the conversion of timber in prehistory is critical to the analysis of wooden material culture from this period. There are many ways in which conversion is achieved. This research aimed to investigate the relatively understudied form of conversion of tangential plank splitting.

A rich assemblage of structural timbers from excavations at the Iron Age site of the Black Loch of Myrton, Dumfries and Galloway, in Scotland, provided a case study which informed the basis of this research. Amongst these timbers, a series of upright tangentially split planks from large oak trees were discovered.

Building on existing research, an actualistic experiment was undertaken to replicate these planks to better comprehend the reasons why prehistoric woodworkers might have chosen to adopt this conversion approach. The research approached the evidence from a biographical perspective, exploring the life history of these planks from their origins as living trees to their use in construction. Specifically, the working and dressing of the planks and associated transportation evidence, tool use and mark evidence were investigated. To explore these issues a large oak tree was split into planks and worked following the evidence from the Black Loch of Myrton.

This presentation considers the successes and the limitations of this thesis in expanding and enriching our understanding of specific aspects of prehistoric craftsmanship.

5 AN EXPERIMENTAL APPROACH TO THE STUDY OF AMBER PROCESSING IN THE NEOLITHIC

Abstract author(s): Cakare, Agnese (Institute of Latvian History, University of Latvia)

Abstract format: Oral

Amber appears relatively late in the archaeological record on eastern shores of the Baltic Sea, being mostly restricted to the Neolithic period, however, the presence of amber artefacts in majority of Latvian settlements and burial sites of this period and its distribution further inland, shows the important role it rapidly assumed in late Stone Age society. There are major Neolithic amber processing centres in the East Baltic, but the rarer distribution of amber working elsewhere in the Baltic Sea region may have left it less "visible" in context of technology research, comparing to materials like flint, bone and antler, which were used both longer and for wider range of purposes.

Traditionally, only typological analyses of amber artefacts have been carried out, fewer studies have focused on technological analyses. Based on the concept of chaîne opératoire, it can be argued that material culture is the knowledge passed down through generations, shared among a group of people. Each artefact is considered as a final product with a characteristic sequence of operations, where specific choices are made at each stage of production. These choices can be defined as culturally derived features/elements that can be observed on the artefact as specific physical characteristics. Thus, allowing to identify analytical units that reflect culturally transmitted knowledge embedded in social traditions, as well as significant differences and similarities in knowledge that can shed light on social relations in time and space.

Using macro-/microscopic analysis, specific features of the techniques described in few available experiments from archaeological collections in the Baltic amber distribution region and replicated in experiments, were identified on the processed amber surface. Comparing with the artefacts from a Neolithic processing centre in Siliņupe (Latvia), it was found that flint tools were widely used for surface treatment, distinguishing four techniques: flaking, pressure flaking, shaving, and scraping.

6 HEMP (CANNABIS SATIVA L.) - A USEFUL PLANT WITH HISTORICAL AND FUTURE PERSPECTIVES. FIRST CULTIVATION- AND PROCESSING EXPERIMENTS

Abstract author(s): Lau, Ronja (Ruhr-Universität-Bochum) - Heeb, Julia (Museumsdorf Düppel)

Abstract format: Oral

During the excavations of the settlement on which the Museum

Village Düppel is based, hemp pollen was found in the pollen samples, dating to the middle ages. In order to show a realistic medieval village context our hemp project was started in 2021. As part of the crop rotation system, a small hemp field of about 400 m² was sowed in April.

One purpose is educational, as it is a good starting point for educational discussions with visitors. However, another important reason is research in textile archaeology, specifically in regards to the production sequences of plant fibres.

As it is the first time for all involved, the first year (2021) was mainly for gaining experience in order to design specific experiments for the next few years. The crop grew to a good height, the tallest one was over 3m.

A third of the field was harvested 109 days, another third 130 day and the last third 161 days after sowing. Water- and field-retting were tried, the main result was that the fibre from the field retting had a much darker colour than the fibre which was retted in water. Other targets for 2023 are the processing of fibres (spinning and weaving). As well as further sowings and harvests to expand the data base.

7 RECONSTRUCTING- AND USING - AN EARLY MEDIEVAL STRAW BRIDLE

Abstract author(s): Maguire, Rena (University College of Dublin)

Abstract format: Oral

Increasing evidence from new research into technical equitation in Ireland indicates the use of plaited and woven straw bridles for horses during Ireland's early medieval period, much of which did not survive in the archaeological record. Evidence exists, however, in texts and eye witness descriptions of rural equestrian practice during the Middle Ages. This craft persisted into the early modern period, with photographic evidence of plaited straw tack fitted to farming vehicles. This was a strongly vernacular solution to harnessing. We do not have any record of how these performed, despite grainy early photographs of the equipment, although a few pieces survive from the 18th and early 19th centuries. Based on one of these few harness sets from the post-medieval period, a working bridle was constructed. This paper sets out the findings of the project - how does it perform? How strong or enduring is it? Can we make suggestions as to social identities of the craftspersons who made them?

8 BRONZE AGE INSIGNIA: TECHNOLOGY AND FUNCTION

Abstract author(s): Hoshko, Tetiana (Kyiv Borys Grinchenko University)

Abstract format: Oral

There are two pairs of bronze products, one of which was found in mound No. 16 of the Hordiivka burial mound and dates back to 1300-1100 BC. Others is kept in the National Museum of the History of Ukraine (NMHU). It probably comes from the Dnieper region. They have clearly defined handles with a crossguard. Manufacturing technology - lost wax casting. The main intrigue of their production is an internal hole with a depth of 2/3 of their length.

It was interesting how these holes were obtained? My hypothesis is based on the remains of wood and carbonized organic matter found inside the rods. Therefore, wooden cores were used to form the cavities. During the experiment, several attempts to pour metal into the mold ended with active burning of the wood. As a result, the casting turned out to be defective.

As a result of the experiment, a hollow casting was obtained. It is similar in quality to "stylet" rods from NMIU, which has high porosity and is very saturated with oxygen. The casting is far from perfect due to the destruction of one of the vents. In addition, the clay mold was fragile and broke when the metal was poured.

About the purpose of these artifacts. My colleagues call them hyper-long hairpins. Extra-long hairpins are known in female burials in Germany, where they rested on the shoulders of those buried with the point up or down. All of them have a straight rod without protruding parts. Therefore, such pins were intended for fastening clothes on the shoulders. Our "stiletto"-rods lay near the hands of the deceased and have clearly defined handles. These items were not part of the costume. I think of them as insignia of power or stiletto rods.

9 EXPERIMENT, ARCHAEOLOGY & ART - THE TURF TO TOOLS PROJECT

Abstract author(s): Markewitz, Darrell (Independent Researcher)

Abstract format: Oral

Turf to Tools (2014, 2016) was originally conceived as "... an ongoing investigation in to landscape, material and craft, inspired by local archeological investigations in Rhynie, Aberdeenshire." The archaeological foundations centred on the work of Dr. Gordon Noble's investigations of Pictish sites, notably the 'Rhynie Man' stone, and later the excavations by Ross Murray at the 'Iron Age Craft Working Site' of Culduthel, nearby. To date, a total of nine bloomery iron smelts have been undertaken for T2T, the two main series at the Scottish Sculpture Workshop at Lumsden (close to Rhynie). These included tests of the unique local Macaulayite ore and peat as a potential fuel. Local materials would be utilized using prototypes established by the archaeology, through methods refined by experimentation, with an aim to replicating a specific object, being the axe depicted with Rhynie Man.

Taken together, this project illustrates an interface between archaeological research and practical experiment, extended into artistic vision.

Presented as pre-recorded video of PowerPoint slides with narration.

Available for ZOOM Q&A as appropriate

10

BY THE HAND OF THE SMELTER: BLOOMERY SMELTING EXPERIMENTS REVEALS TECHNOLOGICAL AND PROVENANCING ASPECTS OF IRON IN THE SOUTHERN LEVANT

Abstract author(s): Eliyahu-Behar, Adi (Land of Israel Studies and Archaeology and Department of Chemical Sciences, Ariel University) - Sauder, Lee (Independent Researcher, Germinal Ironworks,) - Stepanov, Ivan (CEZA) - Keen, Jake (Independent Researcher) - Brauns, Michael (CEZA)

Abstract format: Oral

Iron production is often considered one of humankind's most significant technological advances. While the identification of ironworking remains has improved our understanding of this practice in the early Iron Age in the southern Levant, several major technological and sociopolitical aspects remain unanswered. Particularly significant is the source of the raw material. Several geological iron-rich ore deposits are known in the southern Levant, however, archaeological evidence for their exploitation in antiquity is rare. To identify the use of ore sources, a reliable provenancing method for ferrous metals is required.

This paper describes the use of experimental bloomery iron smelting in order to investigate some of the technological aspects of iron production, particularly the role of raw materials and provenance. A series of systematic smelting experiments was conducted under carefully controlled scientific conditions, by a professional iron smelter. Several aims were put forward for the experiments, the main one being to establish a provenancing method for archaeological iron based on osmium isotopic analysis. The experiments were run utilizing ore deposits from the Negev region in southern Israel, in two types of furnaces: the shaft-tapping furnace and the bowl furnace.

I share some of the decisions made during the process of planning and conducting the experiments and their implications for the results obtained. I then summarize several significant contributions of the experiments to interpreting the archaeological record, as gleaned from previous field and analytical observations.

11

PEOPLE, PLACES, THINGS. A DETAILED INVESTIGATION OF PINCHED CRUCIBLES FROM EARLY MEDIEVAL IRELAND AND BEYOND

Abstract author(s): White, Averil (University College Dublin)

Abstract format: Oral

Through the study of non-ferrous metalworking in early medieval Ireland, it is quite apparent that certain aspects of this technology played an integral role in the production of fine metalwork. Technical Ceramics, i.e., crucibles, moulds, tuyeres, and furnaces are one such integral aspect in non-ferrous metalworking from this period. Crucibles tend to be the best indicator of non-ferrous metalworking on early medieval Irish sites, the pyramidal type being the most common crucible found.

A particular type of crucible which is referred to as pinched, due to the nature in which it was made, has been found on a select number of sites in Ireland, Britain, and Europe between the 7th and 10th centuries. To date, the largest number of this particular type of crucible has been found in Ireland, the main concentration being from Moynagh Lough, Co. Meath. Pinched crucibles were found on 7 Irish sites, 5 British sites and 4 north European sites and it is evident that these particular crucibles were mainly used on sites of considerable wealth. The movement of people between Ireland, Britain and Europe in the early medieval period obviously incorporated the movement of material culture, expertise, and technology. It is through these small, clay pots, that the social aspect of this ancient technology shines through and can tell us about the people behind the craft.

12

NEW TECHNOLOGY, NEW RECIPE? EXPERIMENTAL RECONSTRUCTION OF CLAY PASTES FOR THE PRODUCTION OF LATE CYPRIOT PLAIN WHITE POTTERY FROM ENKOMI

Abstract author(s): Minos, Chase - Dikomitou-Eliadou, Maria (The Cyprus Institute) - Zomeni, Zomenia (Geological Survey Department, Cyprus)

Abstract format: Oral

The Late Cypriot IA period (c. 1650 to 1550 BCE) is characterised by major social, economic and political changes on the island of Cyprus, one of which was the introduction of a new technology, the potter's wheel. In this paper, the introduction of this technology is studied from the perspective of the raw materials used to produce ceramics; specifically, Plain White ware from Enkomi. This urban settlement was an important trading centre located on the east coast of Cyprus, actively involved in the Eastern Mediterranean exchange networks. Plain White pottery is produced during this period with both handmade and wheelmade techniques. Previous research has suggested that the same fabric was used for both techniques of production and that potters were tempering their clays with rounded sand grains, which might have facilitated wheel-fashioning, easing abrasion, and reducing plasticity.

The aim of this study is to test this hypothesis with the compositional and technological characterisation of Plain White pottery fabrics, followed by their experimental reconstruction. Ceramic petrography will be used for assessing

the degree of fabric uniformity among similar Plain White vessel types produced with different potting techniques, and it will guide sediment sampling. At a second stage, the experimental reconstruction of the Plain White fabric(s) will test specifically the effects of rounded sand grains on the plasticity and workability of the ceramic paste(s) for producing pottery with different techniques. The stratified ceramic material from the site of Enkomi provides a unique opportunity to study these technological processes at an intra-site level. Lastly, experimental archaeology underpins the assessment of all those environmental, technological, and social factors that could have contributed to exploring how this new technology became established in Late Bronze Age Cyprus, as well as to what extent this methodology can help to reconstruct past pottery traditions and practices.

13 **SPECULARIA: AN ARCHAEOLOGICAL EXPERIMENTATION PROJECT FOR THE STUDY OF WINDOW GLASS IN THE ROMAN PERIOD**

Abstract author(s): Frère, Géraldine (University of Namur)

Abstract format: Oral

Conducted since 2019, my doctoral research aims at studying the production and consumption of windowpanes in Roman Gaul. Based on a pluridisciplinary methodology, the purpose is to determine how the production and uses of windows glass have been conditioned by technical, socio-economic and cultural factors.

The study of archaeological material from private and public contexts has already revealed several pertinent characteristics of these windows. One of those relates to the morphology of edges. Although some of them are irregular in shape and thickness, others are regular, rough and matte, reflecting the contact between the molten glass and a frame. In addition, we have diagnosed several categories of tools marks; the surface characteristics can also vary considerably. According to the scientific literature, the production technique for shaping these panes was to pour the mass of molten glass into a mold and stretch it with tools. Up to this day, this technique has not been tested yet. In response to these findings, a project of experimental archaeology, Specularia, has been set up in collaboration with glassmakers and Malagne archaeopark in Rochefort, Belgium. The objectives of this project are multiple, starting with determining whether the use of a clay mold, cold or heated beforehand, would facilitate the production. The experiment will also focus on the tools: the results will be correlated with the observations made based on archaeological data. By addressing this question of the chaîne opératoire as a whole, we hope to gain information on the socio-economic aspects of this industry.

The aim of this talk will be to present the different stages of the project, from the construction of the ovens (May 2023) to the production of the glass (July 2023). Through this presentation, the contributions of experimental archaeology to this study, and to archaeological research in general, will be highlighted.

14 **ARCHAEOLOGICAL EXPERIMENT AS A PART OF RESTORATION OF THE HISTORICAL MEMORY OF LOCAL COMMUNITIES - 1620 CESTA K PORÁŽCE PROJECT**

Abstract author(s): Rytír, Ladislav (University of Hradec Králové)

Abstract format: Oral

This paper will introduce archeological experiment which is part of 1620 Cesta k porážce (www.1620.cz) project, which is focused on commemoration of the beginning of the Thirty Years War in Bohemia (Bohemian revolt 1618 - 1620). As a part of commemoration events there was artillery redoubt reconstructed at Rakovník battlefield.

We know some instructions and recommendations are in period Military Handbooks. We verified this information in terms of real difficulty and human resource requirements. We built 120 m of field work, enclosing area of 900m² with gabion protection and artillery platform.

To simulate deployment of workers and how it inflicts speed and quality of work, there was three groups of them: 1 - students (as forced power), 2 - reenactors (as volunteers or forced soldiers) and 3 - paid diggers (as paid power) in total number around 57.

We were focused on work speed, its quality and also durability in conflict and time (redoubt and process of its spontaneous decay up to 10 years).

I will also introduce whole project, which purpose is to commemorate and, to some extent, experience the events of the Thirty Years' War in Rakovník region. Project includes lectures and youtube videos, exhibition, archeological constructions and other cultural achievements aimed at bringing together professionals, enthusiasts and the general public.

15 EXPERIMENTAL ARCHAEOLOGY AND CULTURAL PROTECTION PROGRAMMES: A CASE STUDY FROM NORTH AFRICAN MOUNTAINS

Abstract author(s): Radini, Anita (School of Archaeology, University College Dublin)

Abstract format: Oral

North Africa is home to a vast heritage of traditional crafts, some of which are thousands of years old. Climate change, causing lack of rainfall and desertification, as well as dramatic economic changes are threatening the survival of many traditions. An ever increasing number of communities are forced to relocate, leaving behind their homes, workshops, way of life and familiar grounds. As a consequence, the memory of many traditional crafts that once supported those communities is disappearing fast, in part due to the lack of contacts between the old and the new generations. Many of the natural resources needed for such crafts are also disappearing due to climate change. This paper examines how Experimental Archaeology can be used to bridge generations no longer in contact with one another, supporting the transmission of skills - filling recent gaps of knowledge generated by the relocations of communities. Using a case study on ancient natural colours and dyes, it will describe how surveys of old market products as well as the analysis of fragmentary evidence of material culture recovered from abandoned villages can be used to help communities to preserve the memory of at least a portion of their forgotten traditions by the means of Experimental Archaeology.

16 THE VOUNOUS SYMPOSIUM: BUILDING COMMUNITY THROUGH CRAFT AND EXPERIMENTAL ARCHAEOLOGY

Abstract author(s): Fregni, Elpidia Giovanna (Unaffiliated)

Abstract format: Oral

One can see objects from Bronze Age Cyprus in almost every art or natural history museum in Europe and the US. However, on Cyprus one has little opportunity to see the objects in situ. The export of so much of the island's legacy created a vacuum in which there are few opportunities to experience Cyprus' cultural heritage. The creation of the annual Vounous Symposium has sought to rectify this by recreating the pottery and statuary that are seen in museums worldwide. These objects are made in an open-air environment during the ten-day long symposium using materials that are sourced in the mountains on the island, often from the same sources that were used in prehistory. During the symposium the public is invited to see the artists recreating statuary, working in ceramics and casting metal. Students from local high schools also have the opportunity to intern with the artists and researchers. In addition, there are talks and workshops given by artists and researchers.

Today the symposium has grown from a handful of artists to include over fifty participants that include artists, researchers, and archaeologists. Future plans include the construction of a permanent open-air museum where visitors can take courses in Bronze Age craft techniques.

Vounous serves multiple communities in Northern Cyprus. Through experimental archaeology researchers and the public can understand the technology, techniques, and the use of resources that go into making the objects seen in museum exhibits. Artists gain an understanding of past techniques and the development of their craft, creating a sense of cultural continuity. The greater community benefits from experiencing their local history, creating a sense of connection to the past.

The Vounous project continues to weave a narrative that connects the distant past with the people of North Cyprus, bringing heritage to life.

17 CULTURAL LANDSCAPES AND SOCIAL SPACES (CLASS)

Abstract author(s): O'Neill, Brendan (University College Dublin)

Abstract format: Oral

From the prehistoric period to today people around the world make/made their houses from locally sourced, organic materials. These structures represent complex relationships between people, landscapes, and materials, making them unique focal points to consider concepts of human/landscape interactions and human health and well-being.

One of the aims of CLaSS is to harness the now extensive experience in reconstructing Iron Age and early medieval roundhouses in academic settings and AOAMs to conduct long term qualitative and quantitative research, exploring living conditions and 'daily life'. Taking an interdisciplinary approach, this project has partners in architecture, structural engineering, forestry, ecology, folklore, history and archaeology, each bringing their own particular subject strengths.

Among the various outputs of this project will be public displays themed around the idea of 'living' during these periods and will take place within AOAMs across Ireland and Britain. We are also collecting subject specific representations of these structures to include in a public exhibition in 2024, which will allow audiences to see the kinds of work that academics are engaged in and what this adds to our collective knowledge of the past and present.

This presentation will showcase our approach in bridging the gap between research and public audiences. It will introduce the CLaSS project, provide case-studies of work completed and explore some of the insights already obtained.

18 **MARITIME MINDSCAPES: VIKING AGE SEAFARING IN THE LIGHT OF RECENT EXPERIMENTAL FIELDWORK**

Abstract author(s): Jarrett, Greer (Lund University)

Abstract format: Oral

The seaborne movement of people, animals, goods, knowledge, and beliefs was a ubiquitous aspect of the Viking world. This is indicated by an increasing body of evidence from various disciplines that links people, places and things across maritime space, but this evidence does little more than provide us with points of origin and destination, deposition or burial. Much remains to be understood about maritime travel per se, both from a practical point of view, and from what we might call a cognitive or ontological one, by which I mean the way Viking Age mariners experienced sailing voyages, and how this experience engendered particular mental geographies and afforded culturally-specific worldviews.

In this presentation I will tackle several themes relating to Viking Age travel in light of experimental trial voyages conducted in 2022 along known Viking Age sailing routes, focusing on aspects of route choice, risk judgement, and the location of anchorages and havens. The goal with this approach is to reconstruct the “scapes” of Viking Age seafaring: the seafaring routes and environments, but also the practices and mindscapes entangled with maritime travel. It is hoped that through this approach, we can discover not only where people travelled, but also what these journeys were like, what understandings of the world they were entangled in, and how these afforded the practices observable in the surviving evidence.

I argue that both the voyages themselves and the mental geographies of the voyagers were afforded by the profoundly dynamic, contextual, collective, and uncertain nature of seafaring practice in the Viking Age. These practices were shared between seafaring communities throughout the Viking world, and may in fact have also “travelled” across time, creating a continuous heritage of maritime practice extending from the eve of sailing technology to the end of the 19th century.

19 **SMOKE AND THE WATER. TOWARDS A NEW UNDERSTANDING OF ROMAN UNDERFLOOR HEATING SYSTEMS**

Abstract author(s): Kienzle, Peter (LVR-Archaeological Park Xanten)

Abstract format: Oral

In 1989 the reconstruction of the small Roman baths was completed at the LVR-Archaeological Park at Xanten (Germany). Fired with wood, the baths were heated up regularly for events and special occasions until 2005 when poisonous smoke got into the visitor areas due to cracks in the walls. In preparation for a general refurbishment of the baths, a research project was set up to investigate improvements to the original reconstruction design, operational mistakes and possible similar problems in Roman times.

A 3D-digital model of the baths was created, focussing on the interconnected voids and spaces of the underfloor hypocaust area, the box-tiles in the walls and the flues in the roof space. This complex space was the base of a computer generated airflow model during the heating process.

The first preliminary results of this research show, that our century-old understanding of the technical processes of Roman underfloor heating need thorough re-consideration. Probably, we need to distinguish between “chimneys” made of box-tiles at the far end of the structure and fully box-tiled walls in the caldarium, which do not provide an exit for the smoke. They must be perceived solely as a sort of “active wall insulation” connected to the hot fumes in the hypocaust area.

Further research focuses on the thermal expansion of the suspensura floor slab. When heated up, this floor slab expands its dimension but is restricted by the box-tiled walls. Thus, the thermal expansion process causes destruction of the box-tiles. Since physics have been the same 2000 years ago, the Roman opus signinum floor slabs must have had a smaller thermal expansion coefficient.

The paper will show the importance of putting theoretical knowledge into reality and benefits of combining traditional handcraft buildings with modern technological research.

INTERDISCIPLINARY PERSPECTIVES INTO ROMAN COMMERCE, ECONOMY AND THE ACQUISITION OF NEW TASTES DURING THE ROMAN PERIOD FROM THE 4TH CENTURY BC ONWARDS

Session theme: 1. Artefacts, Buildings & Ecofacts

Session organisers: Riso, Federica - Vandorpe, Patricia (ICAC - Institut Catalan de Arqueologia Classica) - Limina, Valentina (Université Catholique de Louvain)

Session format: Regular session

From the 4th century BC onwards, the expansion of the Roman Empire, eventually, over large parts of Europe had a significant impact on society. The creation of a new transport network and the emergence of cities were two of the most important and lasting changes brought about. As Rome expanded and developed contacts with other cultures far beyond the Mediterranean, new tastes and social practices were also acquired, often manifested in material culture. This session aims to explore Roman commerce and economy through different lines of evidence (e.g. archaeological remains, ceramics, inscriptions, landscape archaeology etc.). In addition, it aims to investigate the role of the ancient transport network in the process of urbanisation and/or the acquisition of new 'tastes'.

We encourage papers focusing on Roman trade without chronological or geographical restrictions. Points of discussion could potentially, but not exclusively, include:

- The role of cities, harbours, rivers and warehouses in the distribution and reuse of amphorae and other shipping containers
- Social and cultural interactions in trade and exchange
- Economic power and the social status of traders
- Methodological issues when dealing with the investigation of ancient trade
- New technologies to investigate ancient trade, networks and transport
- Income, customs, religious beliefs, and identities conveyed by goods, trade and traders
- Dietary habits and stereotypes in the perception of luxury goods
- Access to luxury goods, the reasons why, and how material culture relates to their trade
- Tradition and innovation in practices related to trade and manufacturing

ABSTRACTS

1 AN EXPLORATION OF PLANT FOOD IN ROMAN ITALY: CONNECTIONS, COMMERCE AND FOODWAYS

Abstract author(s): Riso, Federica - Livarda, Alexandra - Orengo, Hector (Institut Català de Arqueologia Classica)

Abstract format: Oral

This paper explores archaeobotanical food plant remains across Roman Italy approaching them as proxies to social relations, trade, and economy. Archaeobotanical material, focusing exclusively on food plant remains, from more than 300 sites dating to between the Early Republican and the Late Imperial periods are included in a relational database and form the primary material of this study. Alongside plant remains, we have been recording recovery, preservation, and taphonomic, as well as contextual details on a sample-by-sample basis. In this paper, we first discuss and intend to filter out biases introduced by the archaeological process of unearthing these remains, and identify spatial and temporal disparities. Taking into account these, we then move on to explore which food plants were being consumed and identify newcomers. Combining these archaeobotanical and their associated archaeological information, we also conduct social network analysis to add further insights into the socio-economic relations forged on the basis of shared identities in food plant consumption. We conclude by highlighting future research directions and the potential of this work.

2 AN INTERDISCIPLINARY APPROACH TO FOOD ECONOMY IN THE WESTERN ROMAN EMPIRE: ARCHAEOBOTANICAL REMAINS AND CERAMIC RESIDUE ANALYSIS OF IESSO

Abstract author(s): Baniou, Theoni (Landscape Archaeology Research Group - GIAP; Catalan Institute of Classical Archaeology - ICAC) - Suryanarayan, Akshyeta (Culture, Archaeology and Socio-Ecological Dynamics - CASEs; Universitat Pompeu Fabra) - Villanueva, Joan - Moraleda, Nuria (Institut de Ciència i Tecnologia Ambientals - ICTA; Universitat Autònoma de Barcelona - UAB) - Livarda, Alexandra (Landscape Archaeology Research Group - GIAP; Catalan Institute of Classical Archaeology - ICAC) - Romani, Núria (Serra Hünter Fellow; Autonomous University of Barcelona - UAB) - Rodrigo, Esther (Serra Hünter Fellow; Autonomous University of Barcelona - UAB)

Abstract format: Oral

This presentation will focus on diet and food economy in the western part of the Roman Empire using the site of Guissona (Roman Iesso), Spain as a case study. Guissona is one of the most important sites in the region, as it is one of the very few archaeological sites in the Iberian Peninsula, and Mediterranean in general, that preserves organic material in anaerobic conditions, allowing much more nuanced insights into the whole spectrum of food resources. Iesso was a Roman town founded in 120 BC and was inhabited until the 7th century AD with a maximum area of 18 hectares. Archaeobotanical work has focused on material retrieved from a series of wells that were located across different sectors of the town. This paper will provide an overview of the plant resources consumed and will discuss how these can inform on social and economic relations and identities within the increasingly connected Roman world. The archaeobotanical data will be complemented with information on foodways as revealed by organic residue analysis from potsherds recovered from the wells but also other parts of the site, reported here for the first time. Ultimately, this paper aims to showcase how multidisciplinary approaches can add depth to investigations of food economies and culinary pathways in the past.

3 IDENTIFYING ROMAN TRADE THROUGH ZOOARCHAEOLOGICAL REMAINS IN NE IBERIA: METHODOLOGICAL PERSPECTIVES (AND SOME LIMITS)

Abstract author(s): Valenzuela-Lamas, Silvia (Archaeology of Social Dynamics, IMF-CSIC, Spanish National Research Council; UNIARQ - Universidade de Lisboa)

Abstract format: Oral

Zooarchaeological remains offer a valuable perspective about meat consumption and animal husbandry practices across time and space. They also reflect the trade of living animals, the translocation of exotic species and the transport of luxury goods. The setting of the Roman Empire enabled an unprecedented scale of transport at all levels, from basic commodities to the most luxurious and exotic items (e.g. seafood in inland sites, wild animals for the circus). This paper will focus on the methods that enable to detect animal trade in Roman times in NE Iberia, and how the assemblages compare with the Iron Age ones. The presentation will offer primary data on the transport and ubiquity of seafood in inland sites from present-day Catalonia, data on exotic species, and also some data about animal mobility in Roman times through strontium isotopes ($^{87}\text{Sr}/^{86}\text{Sr}$). It will also discuss the pitfalls linked with bone preservation, excavation techniques, and other potential problems when analysing Roman faunal assemblages, most notably using strontium isotopes.

4 A MATTER OF TASTE? SHARED TRADE OF SALTED-FISH PRODUCED IN LUSITANIA AND AFRICA PROCONSULARIS (3RD - 5TH CENTURIES AD)

Abstract author(s): Bombico, Sonia (University of Évora; CIDEHUS - Interdisciplinary Centre for History, Culture and Societies) - Nervi, Cristina (Ministero dell'Istruzione, dell'Università e della Ricerca - M.I.U.R.)

Abstract format: Oral

We will analyse different shipwreck contexts in which Lusitanian and North African amphorae for fish products coexist on board, pointing to a joint redistribution trade.

From the mid-3rd century until the middle of the 5th century, it becomes quite frequent for Lusitanian fish containers to be found in mixed cargos alongside with Africa Proconsularis fish amphora types. Sometimes, as the main cargo (Punta Vecchia 1 – Corsica; Fontanamare A – Sardinia), in other cases, as a secondary cargo (Femina Morta and Marzameni F – Sicily). The Lusitanian products also appear in mixed cargos with fish products, not only from North Africa but also from Baetica (Cabrera III – Balearic Islands; Punta Ala A – Italian coast). On the other hand, there are also shipwrecks in which Lusitanian and North African products circulated separately. We highlight the wrecks of Cala Reale A (Sardinia) and Randello (Sicily) with homogeneous main cargos of Lusitanian amphorae.

Lusitanian fish products present an apparent competitive capacity in Late Antiquity, seeming to have successfully adapted to the economic changes that transformed the African provinces into the great factories of Rome's food-stuffs, and appearing to have supplanted Baetican production in consumer markets, during the 4th century.

The interpretation of the economic role of the Iberian Peninsula provinces and Africa Proconsularis in the trade of fish products, in the Western Mediterranean, is a universe to be clarified and quantified. Would they have marketed different fish products? What evidence do the macro-residues preserved in amphorae and the analyses of organic residues provide? What information can we extract from the interpretation of shipwrecks and port contexts? Is it a matter of taste? Can we identify different consumer markets?

In this approach to the topic, we add to the analysis of shipwrecks, two port contexts in Sardinia - Nora and Olbia.

5 FOOD PLANT COMMERCE AND THE DEVELOPMENT OF NEW TASTES IN GERMANIA

Abstract author(s): Vandorpe, Patricia - Livarda, Alexandra - Orengo, Hector - Berganzo, Iban (Institut Català d'Arqueologia Clàssica - ICAC; Landscape Archaeology Research Group - GIAP)

Abstract format: Oral

The incorporation of a large part of Central Europe to the Roman Empire from the first century BCE onwards to form the provinces of Germania Inferior and Superior, brought along a series of changes to the local communities. These, or parts of these, became incorporated into the Roman 'globalised' network that led to the introduction of new ideas, 'forms', materials and tastes, some of which were adopted, adapted or further developed. In this paper we present an investigation of some of these new 'tastes', employing archaeobotanical remains as our primary evidence. To do so we collected all published archaeobotanical material from the provinces of Germania into an object-oriented relational geodatabase with the aim to first identify their distribution through time and space within our study region. The ensuing analysis seeks to establish plant related food patterns of different social groups and their implications in negotiating the new realities of the Roman world. Finally, we discuss how the food plant network in the area can be investigated and how this can help shed new light into Roman economy.

6 ROMAN ROAD (RE)CONSTRUCTION IN GERMANIA INFERIOR AS AN ENVIRONMENTAL AND ECONOMIC PROXY: THE CASE OF CUIJK AND UTRECHT

Abstract author(s): Vanderhoeven, Timo - Kars, Eva (EARTH Integrated Archaeology) - Bongers, Toon (Ghent University)

Abstract format: Oral

In the last 30 years, several sections of the Roman road system have been excavated in the Netherlands. These sections display divergent construction and maintenance patterns related to local topography and overarching military-political factors. This lecture discusses two multidisciplinary studies which produced new insights into transport networks and hydrological events.

The first study discusses the Roman road at Cuijk, part of the main road connecting Atuatuca Tungrorum (Belgium) in the south with Ulpia Noviomagus (The Netherlands) in the north. The road exhibits evidence of flooding during the middle Roman period. Previous research revealed an intensification of hydrological activity in northwestern Europe during the Roman period, resulting from changing land use and climatic factors. At Cuijk, these events elicited subsequent reconstruction and repair of the road.

The second study covers a survey of Roman ceramic building material from two sites around Utrecht. The building material was applied as a foundation layer in the construction of the Limes road shortly after 80 CE. The tiles were macro and microscopically investigated. The material was dated in the first century CE and tentatively connected to the 15th legion, stationed at Castra Vetera (present-day Xanten, Germany) between 43 and 69 CE. This suggests that the ceramic building material from Utrecht could originate from Xanten, circa 130 km downstream of the Rhine.

In this lecture we will discuss how the case studies can serve as a proxy for economic and environmental events. This lecture also highlights the complex nature of Roman roads and the promising result obtained from a multidisciplinary approach. Furthermore, it offers new insights into Roman transport logistics and the importance of road networks, which were decisively and repeatedly reconstructed.

7 THE ROLE OF THE RIVER MEUSE IN THE TRANSPORT NETWORK OF THE MIDDLE-ROMAN PERIOD (70 - 270 CE)

Abstract author(s): Bongers, Toon (EARTH Integrated Archaeology)

Abstract format: Oral

Major rivers, such as the Rhine, served as transport corridors throughout the Roman period. However, the role of smaller inland rivers, such as the Meuse or Scheldt, is less clear. Recent research on the Scheldt basin demonstrated a high degree of connectivity and concluded that the Scheldt and its tributaries could support riverine transport, albeit on a modest scale and with seasonal variations.

This presentation focuses on the adjacent Meuse river, which primarily ran through the military-oriented province of Germania Inferior. The river springs in the fertile loess plateaus of Northern France and quickly reaches the limestone quarries of the Belgian Ardennes. From here, it meanders through the Pleistocene sands of the southern Netherlands, ending up in the North sea with the Rhine. Numerous Roman settlements are found along its banks, yet clear evidence of riverine transport in the Roman period is largely absent. Roman-era sources often refer to the Meuse but offer little information on its role in the transport network. This contrasts sharply with medieval sources that illustrate a viable shipping lane between northern France and Germany.

The role of the river Meuse will be assessed firstly by presenting an overview of the relevant archaeological sources. Secondly, GIS-based spatial network analysis will be used to calculate transport times and costs for several locations within the network and an accessibility map for the entire transport network. The results for the middle Roman period will be compared with the early- (50 BCE – 70 CE) and late-Roman period (270 – 410 CE). However, the novelty of this study lies in the comparison between a multi-modal (i.e., seaways, rivers, and land transport) and a bi-modal transport system (i.e. seaways and roads), which allows us to evaluate the role of rivers in the transport network of north-western Gaul and Germania Inferior.

8 FILLING IN THE GAPS: COMBINING DATA ON MARKET MECHANISMS IN NORTHERN GAUL

Abstract author(s): Clotuche, Raphaël (INRAP - National Institute for Preventive Archaeological Research) - Willem, Sonja (Art and History Museum Brussels)

Abstract format: Oral

Modelling of transport routes has in the past mainly focused on large networks, reflected by the distribution of amphorae and Samian wares. Moreover, Mediterranean models have sometimes been blindly superimposed on other regions, not considering regional mechanisms. Following important work on market mechanisms in Britain (e.g., M. Fulford), the systematic identification of local and regional pottery productions can bring new insights on trade routes and commercial contacts. Even if most of the pottery travels as bulk, their mapping can reveal unknown roads or passageways as well as give evidence for specific contacts e.g., in the context of military control. It can also show the evolution of market mechanisms, testifying for competition and dominance of important regional production centers, a concept that is generally not accepted for the Roman period.

This contribution focusses on different examples from the mapping of pottery in the North of Gaul, with specific interest for contacts with on the one hand the Rhine limes and, on the other hand, Britannia. A special interest goes to the Roman small town of Fanum Martis, where a variety of material studies have permitted to reconsider regional interactions. Pottery data are combined with other indicators, such as epigraphical evidence and different material categories, such as stone (grinders, ornamentation, statues...), gems, carpological data, metal, etc. The most recent information depicts an intricate mechanism of adapting to demands, from a local to an interregional level, filling in the gaps of our understanding of the economical dynamics of these outskirts of the Roman Empire.

9 ECONOMIC INTEGRATION, TRANSPORT AMPHORAE, AND THE MEANING OF CONNECTIVITY IN THE LATE ROMAN EASTERN BALKANS, 4TH-7TH C. CE

Abstract author(s): Watson, Claire (University of Chicago)

Abstract format: Oral

The question of economic integration—connectivity through trade—looms large in current discourse surrounding the Roman Empire. Was the Empire composed of micro-regional economies prioritizing self-sufficiency, or were Roman markets characterized by lasting, substantial trade connections? Answers from scholars like Bang, Tchernia, and Temin have varied widely.

I argue that these debates persist, and lack meaningful resolution, largely because of a lack of clarity regarding what “connectivity” really means. Many definitions tend toward tautology, and connectivity is often considered a binary, rather than an array of possibilities. Studies of connectivity are further hindered by a lack of sensitivity to context. Far more productive than considering connectivity as an objective phenomenon consistent across time, I ask what connectivity means in a specifically Roman context. I propose a framework for resolving these problems and assessing trade connections, using the archaeological record of the Late Roman Eastern Balkan provinces as a case study.

To assess connectivity, I use a concept borrowed from economics: “trade-thickness.” This concept assesses market integration by identifying how many possible trade connections actually see trade in a given period. The application of this concept to transport amphora assemblages from Late Roman sites across Thrace, along with related statistical and spatial analyses, will establish a quantitative and comparison-friendly baseline for defining connectivity via trade in the eastern Balkans in the 4th-7th centuries CE. This baseline may then be used to compare these sites to others across the Roman world, assessing what “connectivity” means—and entails—in a Roman provincial context.

Though connectivity may at times be an intractable concept, the methodology deployed here establishes a means of evaluating degrees of connectivity in the archaeological record, enabling more lucid analyses of the social drivers of this connectivity. Furthermore, it allows for comparison between sites, between provinces, between time periods, and more, all while retaining context-sensitivity.

10 PRIVATE VS. IMPERIAL TRADE - DIFFERENCES IN FINE WARE AND FOODSTUFF TRADE IN THE MEDITERRANEAN

Abstract author(s): Zerzeropulos, Katharina (Institut fuer Ur- und Fruehgeschichte Kiel; ROOTS Cluster of Excellence)

Abstract format: Oral

The paper focuses on one of the aspects of different trade networks within the Mediterranean during the Roman Empire. Trade networks are not universal but always changing and can be distinct for certain forms of products. Differing distribution mechanisms such as piggy-back loads to imperial grain freighters and private trade in foodstuffs could give an insight into the methodology of reconstructing trade route in maritime trade. In order to understand if there is a difference between private and imperial trade routes, several coastal sites in the Mediterranean were investigated for their fine ware and amphora records coming from stratified deposits, allowing to focus on the time of the end of the use of a container, seeming closer to their time of use as for example their production date (if available). The fine wares were chosen due to the status of recording in excavations and their secure place of production. They will stand as a representative for the imperial trade as it can be assumed that many fine wares traveled as piggy-back loads to larger freights. Amphorae on the other hand are used also due to their well-known production sites and the different nature of their transport, namely private enterprises.

The aim is a comparison of access to imports of certain regions in the Mediterranean. By quantifying imports in coastal cities and then distinguishing the regions of origin of these imports, a picture of trade flows can be reached for the time under investigation, which focuses on the time from 50 BCE to 150 CE to show a possible change of mechanisms from the time of the late Republic to the stable period of the pax romana.

As a preliminary result, the above-mentioned undertaking will be presented and put forth to discussion.

11 COSSUTII: A CASE OF TRADE CONNECTIVITY BETWEEN ROME AND GREECE IN THE LATE REPUBLIC

Abstract author(s): Geraci, Silvia (Università di Bologna)

Abstract format: Oral

The period between the 2nd century BC and the first half of the 1st century BC marks the turning point for the intense connectivity between two significant areas of the Mediterranean: Rome and Greece. It comprises the first intense contacts between these two areas: as Polybius highlights, after the Second Punic War the Mediterranean world experiences a global moment, with an increasing of an already existing connectivity. With the beginning of the Principate the perception of the connections will change.

Several scholars examined the relationships in the Mediterranean area, often focusing just on one region or deepening the discussion about the Imperial ages. This paper wants to analyse three different aspects: communications and mobility, economic relationships, and cultural influences on society.

An example that shows how these different aspects of Mediterranean connectivity worked is the case of Cossutii, entrepreneurs in activities connected with the exploitation of quarries and the manufacture of marble. This family reached its peak between the 2nd and the 1st century BC and several individuals, ingenui and liberti, bearing the name Cossutius have been found in inscriptions from all over the Mediterranean, especially in Greece (Athens, Delos, Paros, Erythrae), involved in marble business: architecture, sculpting, excavation, mining and selling.

Eventually, this paper aims to investigate the relations between Rome and Greece in their global sense, chronologically and geographically, through a punctual reference and analysis of literary, epigraphical and archaeological sources.

12 THE LANDSCAPE OF GUBBIO BETWEEN ROMAN POWER AND UMBRIAN IDENTITY

Abstract author(s): Negro, Marianna (University of Cambridge) - Ceccarelli, Letizia (Politecnico di Milano)

Abstract format: Oral

This paper deals with the analysis of the development of Umbrian and Roman landscapes and the relationship between the two in the Gubbio Valley. The results are obtained through the revisitation of the partly unpublished data that was recovered with the Gubbio Survey, carried out in the homonym basin between 1983 and 1987 by the University of Cambridge. Despite the explosion of evidence of Roman period compared with earlier times, the paper aims to challenge the concept of romanisation by concentrating on the agency of the Umbrians.

The Roman landscape of Gubbio is quite different from the rest of Roman Italy, the ritual manifestations of the valley are an example. There is copious evidence of Umbrian rituals, which are mostly distinguished by the deposits of highly schematic votive bronze figurines on upper reaches such as Monte d'Ansciano. This is a distinctively Umbrian ritualisation of the landscape through the agency of material culture, however there is evidence of continuation of ritual activity in a hybrid form; a small number of interesting Roman terracotta figurines are found in the rural landscape of the Gubbio valley, and, despite terracotta figurines being quite a common phenomenon during the Roman times, the Gubbio valley figurines are different in terms of the shape and context in which they were found. Moreover, the copious evidence of Vernice Nera, identified as belonging to the Hellenistic period, indicates that the occupation of the countryside is already well developed in the Umbrian phase of the study, indicating an already forming complex state organisation. Finally, the Iguvine tables are another example of strong Umbrian identity, being still written in Umbrian language even if they were Roman citizens. Therefore, the Umbrians retained their strong social identity reshaping the dominant Roman power, as proved by material culture, language and religion.

13 **LANDSCAPES OF POWER, TRADE NETWORKS AND IDENTITY NEGOTIATION FOR 'INVISIBLE' ECONOMIES: A 'ROMAN' LIFESTYLE REVOLUTION? (2ND BCE - 5TH CE)**

Abstract author(s): Limina, Valentina (Université Catholique de Louvain)

Abstract format: Oral

The paper reconstructs the networks of patronage, friendship, and kinship for some elite groups of Roman Etruria in the centuries of 2nd BCE – 5th CE. It aims to demonstrate that their patrimonies were based on agricultural production and trades relating to spices, frankincense, purple, marble ivory, 'exotic' beasts, etc. Despite the idea of the 'corruption of trade' conveyed by literary sources from the 2nd century BCE, 'prestige foods' and 'luxury goods' were perceived as a must-have of the Roman lifestyle and in the first place among imported merchandise in the Italian Peninsula from the mid-1st century BCE. Unfortunately, the traces of these goods and, more importantly, of the dynamics of their trade are almost invisible at the archaeological level. However, an interdisciplinary approach integrating literary sources, epigraphy, prosopography, and archaeological findings is crucial in the lack of archaeobotanical data; network analysis can detect hidden clues.

Any economic and commercial transaction was based on 'trust', and the construction of a network would have been the safest solution to secure reliable partners for investments and to share the risk entailed by a business. In this sense, the entrepreneurial attitude of elites from Roman Etruria caused them to rely also on networks among individuals who shared the same social backgrounds, culture, and political ideology. The localization of archaeological findings, the identification of the trade agents acting for the protection of family interests and the supervision of negotia in the ports or cities of the Mediterranean lead to the investigation of the networks' structural components and the related landscapes of power. The relationship between luxury goods and negative stereotypes of ethnic identity is a key to understanding the crucial role of elite groups from Roman Etruria at the core of such businesses, embedded in the 'Roman' lifestyle revolution.

14 **A CHAÎNE OPÉRATOIRE APPROACH TO DEFINE BLACK GLOSS WARE CIRCULATION AT THE ETRUSCAN SANCTUARY OF PYRGI IN THE MID-REPUBLICAN PERIOD**

Abstract author(s): Abbondanzieri, Elisa (Dipartimento di Scienze delle Antichità, Sapienza Università di Roma) - Revello Lami, Martina - Vogiatzopoulos, Stamatīs (Department of Archaeological Sciences Universiteit Leiden, Faculteit Archeologie)

Abstract format: Oral

Caere (Cerveteri, RM) is one of the most important cities in Southern Etruria, located about 50 km north of Rome on the Tyrrhenian coast. In 1957 the Sapienza Università di Roma launched a research project on Caere main harbor, Pyrgi, located 13 km far from the settlement and connected to it through a monumental (10 m wide) road. Since then, yearly excavation campaigns have been carried out and led to the discovery of an extensive worshipping area featuring two monumental temples to the north and a more complex context characterized by small sacred buildings and altars to the south. Over the last few years, attention has been paid to the investigation of the north sector of the sacred area. Excavations have brought to light a significant quantity of black-gloss ware in connection with traces of local production (firing supports, misfired vases, wasters, etc.).

Starting from the analysis of different types of black gloss ware vessels and pottery spacers used in the kilns found at Pyrgi, this paper aims to illustrate the methodology applied for the characterization of local productions of black gloss ware. Even though preliminary, the morpho-stylistic study combined with petrographic analyses conducted on selected assemblages of ceramics from Pyrgi already enabled us to preliminarily distinguish different local productions from imported specimens, while providing at the same time valuable data to identify Caeretan exported ceramic vessels along the Tyrrhenian coast, greatly contributing to redefine ancient commercial routes.

15 COOKING POTS AND CONSUMER TASTES IN NORTHERN AND CENTRAL TYRRHENIAN ITALY (3RD CENTURY BC - 4TH CENTURY AD)

Abstract author(s): Goddard, Dominique (University of Cambridge)

Abstract format: Oral

This paper takes a foodways approach to Roman Italy, addressing the impact of transformations in Italy on consumer tastes between the 3rd century BC and 4th century AD through commonware cooking pots. As Italy's network of contact, trade and empire expanded across the Mediterranean and beyond, new regions opened up to facilitate the use of new ingredients, recipes, and technology in cooking practices. The changing shapes of ceramic cooking pots, on account of their everyday nature and use on a broad social scale, can prove to be a valuable indicator of culinary tastes on a wide geographical and temporal scale. These vessels have the ability to tell local stories of taste: when combined with archaeobotanical remains, they can be read against changing patterns of meat consumption and living standards. However, when different datasets are combined across the area under study, a wider picture emerges, allowing for an interrogation of culinary syncretism across Italy.

16 AFRICAN COOKING WARE AND LOCAL/REGIONAL IMITATIONS FROM THREE CONTEXTS OF LISBON AND ITS COMERCIAL DYNAMIC WITHIN THE MUNICIPIUM OF OLISIPO

Abstract author(s): Lopes, Martim (Universitat Rovira I Virgili; CHAM – Center for Humanities) - Calaveiras, Paulo (NOVA/FCSH - Universidade Nova de Lisboa) - Quaresma, José (NOVA/FCSH - Universidade Nova de Lisboa; CHAM – Center for Humanities)

Abstract format: Oral

The Roman town of Olisipo was one the most import ports in the Atlantic facade of Hispania and certainly the most important in the western coast of Lusitania, through an occupation that goes uninterrupted from the Iron Age until the present-day.

Despite the grand quantity of archaeological interventions that were made in the city in the last decades, the data that has been published on the later Roman town, from the 3rd century onwards, is still very scarce, mostly in what regards the African imports, ceramics that are very common across the Lusitanian territory on the 3rd to 5th centuries AD.

This paper intends to approach the African cooking ware from three sectors (Rua das Pedras Negras, Praça da Figueira and Palácio dos Condes de Penafiel), by studying an assemblage that surpasses the five hundred shards. It compiles this data with the results already published from other contexts of the city in an attempt to, with the usage of a statistical approach, recreate the commercial pattern for this ceramic in the city, during the Imperial phase.

Alongside the study the of the African imports, the authors have also identified some fragments of local/regional productions of imitation of African cooking ware, a phenomenon recently identified in the region of Olisipo, being this study another contribution for the comprehension of these productions.

17 REGIONAL POTTERY SUPPLY SYSTEMS BETWEEN THE STARA PLANINA AND THE DANUBE (MOESIA INFERIOR/THRACIA) DURING THE ROMAN PRINCIPATE

Abstract author(s): Diers, Lina (Austrian Archaeological Institute - OeAI, Austrian Academy of Sciences)

Abstract format: Oral

The paper introduces a research project that is currently being conducted at the Austrian Archaeological Institute, Vienna. The project aims to characterise and contextualise the regional economic supply and transport networks between the Stara Planina and the Danube in the Roman provinces of Moesia Inferior/Thracia in the 2nd and 3rd c. AD through the lens of pottery provenance studies. The productions of the various ceramic centres in the territory of the city of Nicopolis ad Istrum (Hotnitsa, Butovo, Pavlikeni, Varbovski Livadi) are examined using various archaeometric methods (petrography, INAA) in order to develop a reference base for provenance determination, which is then backed up by pottery finds from Novae, Nicopolis ad Istrum, and several rural sites along the Yantra, Rositsa, and Osam river valleys. The results are incorporated into research on potential transport routes, transport types, and rural settlement systems through an analysis of river transport possibilities, least-cost path analysis, and evidence for trade networks. The relationship between regional centres like the legionary base of Novae and the Trajanic civilian foundation of Nicopolis ad Istrum is investigated by adding a theoretical level to the project objectives, e.g. questioning the role of urban and rural settlements in both distribution and consumption of ceramic objects. The paper shortly introduces the project aims and questions, discusses potential methodological issues as a base for the session discussion, and presents first results from the 2023 summer pottery analysis campaign in the museums of Svishtov and Veliko Tarnovo, Bulgaria.

18 FOLLOWING TASTES? IMPORTS OF LATE ROMAN COOKING POTTERY (3RD-7TH CENTURY CE) FROM NEA PAPHOS (CYPRUS) IN ECONOMIC NETWORKS

Abstract author(s): Nocon, Kamila (University of Warsaw)

Abstract format: Oral

The micro-economic history of Nea Paphos in southwestern Cyprus has recently been extended by new studies of tableware, cooking pottery, and lamps. These have shown that the town was an important center for the circulation of pottery during the Early Hellenistic to Early Roman periods (late 4th century BC - late 2nd century CE). However, data on the circulation of pottery in later periods, the Middle and Late Roman (3rd-7th centuries CE), are still lacking, and archaeological research on the circulation of cooking pottery and its role in economic networks is limited. The results of an ongoing project on Middle and Late Roman cooking pottery from Nea Paphos suggest that imports of this category of pottery can illustrate complex multi-directional networks of material and social interactions. There is evidence that imported cooking pottery was widely consumed and imported into the city on a large scale. The inhabitants of the city were involved in the exchange of goods with several destinations, including Asia Minor and the Levant. Archaeological evidence suggests that between the 3rd and 7th centuries CE external factors caused a shift in the direction of the circulation of cooking pottery in Nea Paphos.

It is the aim of this study to show that the traditional picture of the circulation and trade of cooking pottery has been incomplete. By shedding new light on the consumption preferences and trade connections of Late Roman Nea Paphos, the present paper aims to fill this gap through a multidisciplinary study of this much-overlooked category of pottery.

19 POTTERY PRODUCTION AND MULTITEMPORAL READINGS OF MATERIAL CULTURE: THE CASE STUDY OF LATE ANTIQUE BRACARA POTTERY (BRAGA, PORTUGAL)

Abstract author(s): Machado, Diego - Martins, Manuela - Magalhães, Fernanda (Unidade de Arqueologia da Universidade do Minho; Laboratório de Paisagens, Património e Território)

Abstract format: Oral

The division of time into historical periods provides a linear appreciation and reading of historical events, while it limits, to some extent, the analysis of certain phenomena. This dual character of periodization has been denounced at least since the first generation of the *École des Annales*, whose members sought a critical reappraisal of documentation, interdisciplinary and original approaches in historical research. Historical disciplines have come to operate with a much wider range of phenomena, such as ideological, economic, social, religious, forms of thought, types of mentality, as well as replacing the absolute linearity of time with the systematic disposition of the discontinuity of time series.

One of the historical moments that has known great disputes for its periodization is the passage from the ancient to the medieval world. While Political History has privileged the conquest of the city of Rome, in 476, as its turning point, the development of economic, social and cultural studies has identified in the period between the 3rd and 8th centuries the constitution of a reality that extends classical society, Late Antiquity, or anticipates the formation of the medieval world, the High or Early Middle Ages.

Our proposal is to analyse the late antique pottery production of Bracara (Braga, Portugal) without a previous chronological restriction, that is, beyond the temporal or chrono-cultural division that the ceramic objects are submitted to. We believe that the negation of an aprioristic character of time in the formulation of historical problematics and, in particular, of material analyses, is capable of producing new knowledge about the societies which produced and consumed them.

A. POMPEIAN PLATTERS ON SITE 42 IN SIRMIIUM, SREMSKA MITROVICA, SERBIA

Abstract author(s): Štimac, Zvezdana (Archaeology department, Faculty of Philosophy, University of Belgrade)

Abstract format: Poster

Sirmium is a Roman city on the river Sava that existed from the 1st century BC until the 6th century AD. It has numerous site and its excavations started in 1957. All the sites in Sirmium have numbers as names. The site 42 was excavated in 1971. It has at least 14 layers characterized as floors. Some of the floors were next to each other meaning that they have the same dating and others are on top of each other. The whole site has dimensions of roughly 17x8 metres. The previous researchers characterized the site as a public building or villa urbana as it is close to the one of the forums in the city, There is also a possibility of the site being a small temple in the first century AD. In the end of the 1st or beginning of the 2nd century there might be a huge fire around the whole city and that is visible on this site. Roman layers date from the 1st century AD until the 4th or 5th century AD. There is around 6000 pottery sherds from the whole site. Majority of the pottery is actually in connection with preparing and cooking food as well as serving food and also preserving food and drinks in amphorae and pitoi. There are around 200 sherds of Pompeian platters which were produced in Campania, Italy and they were distributed around the Roman Empire during the first century and all

the way until fourth century, with possibility of local production as they represented tradition in baking the bread and making stews. They were first used by the Roman army. It is interesting to see if they were made locally or they were traded, or brought with soldiers in the first century.

731 GENERAL SESSION

Session theme: 1. Artefacts, Buildings & Ecofacts

Session chair:

Session format: Regular session

ABSTRACTS

1 OM HAIL! SOME STORIES ABOUT THE BASIC PROBLEM OF ARCHAEOLOGICAL WORK IN ASIA: CYCLICAL TIME VS. LINEAR NOTIONS OF TIME

Abstract author(s): Lange, Perry (Center for History of Science and Technology, Universität Hamburg)

Abstract format: Oral

What is a memorial, how authenticity is perceived and what meanings the concepts of linear and cyclical time perception have in this context, is of great importance for the understanding of cultural heritage in Europe and Asia.

Both time concepts have a direct impact on the perception of monument protection and cultural heritage.

The perception of time is shaped by two phenomena. First there is the very personal experience of a linear, continuous and consciously perceptible development, such as the changes in aging, growing up with their “breaks” and “new beginnings”. But time has always been perceived as a cyclical phenomenon in which changes are repeated with great constancy. Both phenomena, the linear time and the cyclical time, have accompanied mankind from their beginnings and are, in their complexity, decisive cultural catalysts for religious and philosophical questions - until today.

The practical work in Nepal has repeatedly and directly led to irritations in the communication between European and Nepalese experts, employees and institutions when it comes to the question of the value of historical material culture. One reason for these problems is the, in part, significantly different levels of meaning that are assigned to the concept of authenticity.

Why is something “old” valuable when it can - with perfect craftsmanship copied - shine in new splendor - after all, when the “spirit” of the place and not the object is the decisive factor for cultural value retention? And why should an object, space or artifact become more valuable if it is frozen and preserved exactly in its current state?

The lecture deals with the experiences and insights from over five years of work at one of the oldest temple sites in Nepal, the Anantaliṅgeśvara Mahādeva in the Kathmandu valley.

2 SHEPARDING THE FLOCK: GENOMIC CONSEQUENCES TO THE INTRODUCTION OF SMALL RUMINANTS TO EUROPE

Abstract author(s): Daly, Kevin (Trinity College Dublin)

Abstract format: Oral

The introduction of small ruminant livestock (sheep and goat) to Europe in the Neolithic period represents a tremendous demographic event in the history of these domestic species. Their spread within Europe necessitated successive founding events, depleting livestock populations of genetic variation. Removal from the range of their wild progenitor species would have additionally prevented genetic replenishment of variation by recruitment or unsupervised mating. Husbandry practices by early Neolithic European farmers may have also shaped genetic variation, with preferential breeding or selective slaughtering limiting the mating pool of successive generations. Thus, the geographic and temporal journey of small ruminants from Southwest Asia to the Atlantic edge, anthropologically driven, coincided with a genomic transformation.

This study will describe this process using whole genome and imputed genotypes from ancient European goats, revealing how human activity affected the genetic features of this partner species through the occurrence of inbreeding, homozygosity, and admixture from non-European sources. Finally we will report the first ancient goat genomes from the island of Ireland, and probe their relationship to ancient British and continental European goat populations.

3 EXPERIMENTAL TECHNIQUES APPLIED TO ARCHAEOLOGY. BEST PRACTICE FOR THE RESEARCH OF ORGANIC ARCHAEOLOGICAL ELEMENTS

Abstract author(s): González-Campos Baeza, Yolanda - Villalón Torres, David - García Viñas, Esteban - Ramos Soldado, José Luis (Andalusian Institute of Historical Heritage - IAPH) - del Pino Espejo, María José (Pablo de Olavide University - UPO) - Gómez Morón, Auxiliadora - Alzaga García, Milagros - Bernáldez Sánchez, Eloísa (Andalusian Institute of Historical Heritage - IAPH)

Abstract format: Oral

One of the main research frameworks of our project “Arqueomemes: Advances and Innovations in Methods, Techniques and Experimental Analysis Applied to Organic Archaeological Heritage: Paleobiology, Genetics and Archaeometry in Terrestrial and Marine Environments” (P18-FR-2100) has been the development of a guide for the appropriate use of experimental techniques applied to organic archaeological remains within research projects in Andalusia.

Based on our experience, acquired through the collaboration and participation of different professionals from several disciplines, our team has been able to define unified work methodologies in order to easily obtain results as reliable as possible. Thus, the methods tested in these procedures will allow us to develop protocols and/or technical guides for the collection and storage of organic samples from archaeological contexts and their subsequent analysis.

Hence, and as a preliminary step, a survey was carried out, aimed at verifying the following issues:

- to know to what extent archaeologists - both academic and professionals - are aware of the different existing analytical techniques they can use to study organic archaeological remains.
- to identify how these techniques are applied in both the academia and the professional practice, as well as if they are properly applied.
- to understand the needs and demands existing within the archaeological community in order to define these aforementioned protocols.
- to identify how the results are spread.

Based on the data obtained through the analysis of the answers derived from the survey, a work guide for archaeologists is being developed in this moment, including a protocol for the application of experimental techniques for the study of organic archaeological remains.

4 HOW DO WE LEARN COMPLEX KNAPPING METHODS? PRELIMINARY RESULTS

Abstract author(s): Cattabriga, Gloria (University of Ferrara) - Bargalló, Amèlia (IPHES, Institut Català de Paleoeologia Humana i Evolució Social) - Palomo, Antoni (Universitat Autònoma de Barcelona)

Abstract format: Oral

Human beings are not born stone knappers. Stone knapping is not an innate behaviour but a skill that must be acquired through the knowledge of its basic rules and practice. Yet, it is complicate to assess how it can be learnt. Although experiments have been made in this directions – only a handful for what concerns Middle and Upper Palaeolithic knapping methods – it is still considered a thorny topic. Aware of the delicate nature of the matter, we present preliminary results of several experimental knapping sessions as an attempt to shed light on this issue, notably on some of the knapping methods used in the Middle and Upper Palaeolithic. Thus, the Quina, the Levallois and laminar core reductions will be core reduction strategies to be tested. These complex knapping methods approach in different ways to core reduction, following volumetric, hierarchical and non-hierarchical concepts of exploitation. In each session, an expert knapper obtained several lithic items following one of the knapping methods and other participants try to reach the same goals. Since Middle and Upper Palaeolithic beginner knappers were already familiar with the procedure of core reduction, participants must be occasional knappers, knowing the basic rules of this practice without being experts or beginners neither. Throughout the development of the experiment, the expert gradually increased the explanation of each step of core reduction, from ignoring the other participant to fully helping them. The goal was to determine which teaching-learning strategy is sufficient to learn a precise complex stone flaking method. The outcomes will be compared to several archaeological assemblages which are currently being studied and, hopefully, they will furnish some insights on Palaeolithic learning as well.

5 NATIONAL LIST OF ANTIQUITIES STOLEN OR ILLEGALLY EXPORTED ABROAD-THE REGISTER OF CULTURAL PROPERTY LOST IN POLAND. ACCESS AN OPERATION

Abstract author(s): Wisniewski, Mariusz - Modzolewska, Agata (Ministry of Culture and National Heritage, Poland)

Abstract format: Oral

The National List of Antiquities Stolen or Illegally Exported Abroad collects data on museum thefts mostly occurring after 1970 and, since 1992, has also documented losses incurred by religious associations, private collectors and other institutions. The provincial conservator of historical monuments, the bodies of the Police, the Border Guard, National Fiscal Administration, prosecutor's office and directors of museums and libraries that are cultural institutions are

obliged to immediately communicate, for the purpose of listing, to the General Conservator of Monuments information about a monument stolen or exported abroad illegally. This register is also a repository of public information, accessible on the web via the service skradziona.zabytki.pl.

In the past years, the data collected in the National List has been a basis for the efforts to find and recover lost pieces of national heritage as well as fight illicit trafficking of artifacts, including archaeological heritage. Together with the scientific database of Polish war losses, the register provides the structural information for the process of research and restitution.

The National List of Antiquities Stolen or Illegally Exported Abroad is accessible to everybody regardless of their nationality and professional status, and thus we would like to present its use and content; encourage registering and research. We believe the general academic world would benefit from using the skradziona.zabytki.pl service and possibly could have valuable insights for the future. In the presentation, we will explain access, content, data protection and some famous examples of successful use.

6 CONSTRUCTING CONNECTED CONTESTS. OPPORTUNITIES AND CHALLENGES IN BUILDING AN ONLINE DATABASE OF GRAECO-ROMAN ATHLETES AND FESTIVALS

Abstract author(s): Williamson, Christina - van Nijf, Onno - Britton, Tom - Wiznura, Adam (University of Groningen)

Abstract format: Oral

In 2015 a team at the University of Groningen engaged in studying agonistic religious festivals as the base for some of the strongest networks across the Greek world. In order to more closely examine these networks, we developed a database with the aim of incorporating all of the known competitors at games in the post-classical world, largely drawn from epigraphic data. In 2016 we obtained a grant from the University of Groningen to further develop this as an online database, while another grant in 2021 allowed us to include a basic mapping functionality shows distributions and helps visualize the data. The result is <http://connectedcontests.org>. Essential data concern the , family, and origin of the competitor, the name of the festival and the city that hosted it, and a chronology, among other relevant data. With this information we can address questions such as: Where did athletes come from? Which cities did they compete in? How relevant were local festivals in a larger world of festivals? How does the image change over time? The database connects where possible to other online databases, such as the Packhard Humanities epigraphy database, the prosopographic database Trismegistos, and the ancient gazetteer Pleiades. In 2018 Connected Contests led to a major grant awarded by the Dutch Research Council (NWO), Connecting the Greeks. Multi-scalar festival networks in the Hellenistic world, with two PhD projects and a postdoc position (<https://connectingthegreeks.com>). Although it has already led to fruitful studies, Connected Contests is still a work-in-progress with challenges ahead concerning long-term data completion, current web design, and general maintenance in the face of progressive technologies.

7 SOME MASKS FROM THE SANCTUARY OF ARTEMIS ORTHIA AT SPARTA SEEN IN RELATION WITH THE TERRACOTTA FIGURINES

Abstract author(s): Koumpoura, Eirini (NCUA)

Abstract format: Oral

This paper intends to include material presented in the context of the PhD thesis entitled as “Terracotta masks from Greece, Cyprus and the Near East”, and aims for the presentation of some deliberately offered assemblages of masks in the sanctuary of Artemis Orthia at Sparta, considered in connection with the terracotta figurines. The re-examination of the material from the sanctuary has led to the identification of certain new types, whose dating was revised on the basis of the excavation data and the morphological characteristics. Except that it is often perceived that the masks generally constitute not only random faces but faces of certain types, which could directly revoke those of the figurines, these aforementioned, newly identified mask types confirm this perception even further. Their parallels in the form of terracotta figurines are even possible to be sought in the same or in other sanctuaries. Through this structural approach and their safe identification, the percentage of representation of the gods, the attendants of the deities, the demonic beings, the worshippers, and other types is highlighted. And these percentages are subjected to comparison with analogues from other sanctuaries. At the same time, some new data emerge concerning the attributes and the qualities of the worshipped deity or deities, but also the worshippers and even the performed cult practices.

8 PLASTER FACE CASTS AT THE EDGE: RESEMANTISATION OF CIPRIANI'S FACIAL MASKS AT THE ANTHROPOLOGICAL COLLECTIONS OF THE UNIVERSITY OF BOLOGNA

Abstract author(s): Nicolosi, Teresa - Battilani, Patrizia - Belcastro, Maria Giovanna (University of Bologna)

Abstract format: Oral

Anthropological collections were amassed in Europe and in the United States between the mid-19th and the early 20th century. Anthropologists gathered series of human skeletal remains by means of donations, archaeological expeditions, cemetery exhumations and occasionally through robberies. Human skeletal remains were collected to carry out morphometric studies and to describe human variation from a hierarchical point of view, including the study of phenology and racial typology. In addition to skeletal remains, anthropological collections were enriched by a large variety of items that were collected during the same scientific expeditions (e.g., ornaments, clothes, daily use or sacred objects and other ethnographical materials) along with photographs and instruments (e.g., anthropometric instruments, skin and hair colour charts). Among these, plaster face casts, that were originally used to show those alleged racial differences, represent peculiar objects, placed midway between human remains and artifacts.

The present contribution focuses on a series of original replicas of facial masks stored at the Anthropological Collections of the University of Bologna (Italy), realised by the Italian anthropologist Lidio Cipriani (1892-1962) during his scientific missions in Africa and Asia. The work and research of L. Cipriani were strictly linked to his historical and political background, being he one of the 'racist scientists' who signed the so-called Manifesto of Race in 1938 under the Italian Fascist regime. Because of the sensitive nature of these items, many museums have decided to remove them from displays, hiding them in the magazines or exposing some specimens during temporary exhibitions, aiming at 'decolonising' their collections. On the other hand, plaster face casts have a strong educational and social potential. For their peculiar nature, they must be treated with major respect and full awareness but may still be exposed and presented to the public with a proper narrative able to unveil their meaning and value.

9 FIGURING ECSTASY

Abstract author(s): Miller Bonney, Emily (California State University Fullerton)

Abstract format: Oral

The organizers of this session challenge us to reflect on the traditional lenses through which we view female figurines and to turn away from models in which prehistoric figurines are seen as evidence for goddesses and fertility cults. This paper argues that we should consider some renderings as expressions of internal, ecstatic states, as evidence for people's lived experiences in cult activity. An array of femiform vases from Pre- and Protopalatial Crete provide an instructive example of how we can benefit from changing our viewpoint. As evidence for ecstatic rites, which were inherently transitory and intended to transport individuals into a different reality the reflect how ecstasy alters perceptions of the material environment and challenges efforts. On Bronze Age Crete, the evidence, particularly as explicated by Peatfield and Morris, points strongly to the importance of ecstatic or shamanic elements in ritual activities from the end of the Early Bronze Age through the time of the palaces. Both peak sanctuaries and caves have yielded a range of objects that appear to speak to the importance of altered states, whether through hallucinogens or some other means. Altered states would seem particularly salient for a culture that, as Hamilakis and others have emphasized, placed a premium on intense sensory experiences that lowered the barriers of individualism. This paper considers the predecessors to the activities at the peak sanctuaries and looks to the tomb complexes and settlements that were the centers for ritual activity already in the first centuries of the Early Bronze Age. An array of different objects, including most notably the terracotta Goddess of Myrtos, provide evidence for a well-developed reliance on ecstatic conditions as part of spiritual behavior well before the transition to the peaks.

10 PORTABLE ART-IFACTS. CLAY FIGURINES FROM THE NORTHERN BALTIC ANALYSED

Abstract author(s): Lucenius, Jenni (University of Turku) - Brorsson, Torbjörn (Ceramic studies) - Stenbäck, Niklas (The government of Åland)

Abstract format: Oral

Clay figurines are a part of the material culture of hunter-gatherer societies in the Northern European Forest belt during the millennia of the Stone Age. Descriptions of the figurines as either zoomorphs, anthropomorphs or something depicting both, has generated interpretations related to ritual or intangible transformation, rather than social pressure or change. The research project "POTTERY, CHEMISTRY AND PETROGRAPHY: Neolithic figurines and vessels from Åland and the Baltic" investigate the manufacture and the provenance of clay figurines found on the Åland Islands, the Finnish mainland and in Sweden; from both the comb ceramic- and the younger Pitted ware tradition. The methods used are petrographic thin-section analysis and chemical ICP-MA/ES analysis. Results indicate that figurines have had social significance not only within the local communities, but also as portable objects in inter-regional communication. A re-evaluation of the so called Jettböle-type figurines found on Åland raises the question

whether we should look beyond stylistic representation and understand figurines as visual symbols for movement, innovation and (outside) social change?

11 SMALL - BUT WITH A UNIQUE IMPRINT IN HISTORY

Abstract author(s): Blaževicius, Povilas - Grižas, Gytis - Mikšaitė, Sigita (National Museum of Lithuania)

Abstract format: Oral

Like other European countries, Lithuania is constantly confronted with the illegal trade and smuggling of cultural property, which has increased significantly over the last few decades. Several factors have had a major impact: firstly, the growing popularity of metal detectors and legal gaps in the protection of cultural heritage, and secondly, the military conflicts in the region (e.g. the war in Ukraine, which started in 2014). State border guards, police, postal and other services that should be regularly involved in controlling the movement of goods and/or parcels do not yet have sufficient experience in identifying and promptly stopping the illegal “migration” of cultural property, especially archaeological finds. As Lithuania shares borders with Russia and Belarus, this applies not only to the internal but also to the external EU borders. While a few decades ago Lithuania was only a country of transit or origin of smuggling for archaeological artefacts, today it is increasingly becoming a destination country.

In this report, we aim to highlight the challenges faced by museums and the means by which they are joining forces with the institutions responsible for the protection of cultural heritage in Lithuania to help stem the tide of illegal trade and smuggling of archaeological artefacts. The presentation shows how Lithuanian archaeologists are combining educational and exhibition activities, shaping public opinion, providing expert services to state control and law enforcement authorities, etc. Local instruments that can improve the situation and the importance of joining global programmes are also discussed. The report highlights the ambition and the opportunity for museums to integrate specific information on the unique variety of jewellery and metalwork of the Baltic tribes, which is usually the object of illegal trade, into virtual heritage publicity programmes.

12 A LATE START OF THE UPPER PALAEOLITHIC. NEW ADVANCES ON THE EVOLVED AURIGNACIAN IN THE CENTRAL IBERIAN MEDITERRANEAN BASIN

Abstract author(s): Martínez-Alfaro, Álvaro - Eixea, Aleix (Universitat de València, Departament de Prehistòria, Arqueologia i Història Antiga) - Sanchis, Alfred (Museu de Prehistòria de València, Servei d'Investigació Prehistòrica, Diputació de València) - Villaverde, Valentín (Universitat de València, Departament de Prehistòria, Arqueologia i Història Antiga)

Abstract format: Oral

Over the last few years there has been a notable advance in the research of Aurignacian sites in the central Iberian Mediterranean basin. The Evolved Aurignacian is confirmed as the first Early Upper Palaeolithic technocomplex in the region. A phase of greater industrial indefiniteness in a technocomplex with a priori characteristics of pan-European unity. Hence, a review of the main characteristics of the technocomplex at the regional scale is required. The recent fieldwork carried out in Cova de les Malladetes (Barx, Valencia) and Cova de les Cendres (Teulada-Moraira, Alicante), as well as the revision of the unpublished assemblages from Cova Foradada (Oliva, Valencia) and Abric de la Ratlla del Bubo (Crevillent, Alicante) are key to characterising the lithic and bone industry and ornamental assemblages attributed to the Evolved Aurignacian.

The lithic technological approach reveals several laminar reduction strategies. As an operational continuum between the production of blades and bladelets from prismatic cores due to the reduced dimensions of flint nodules. The production of bladelets also corresponds to a separate chaîne opératoire, and is mostly carried out through the reduction of carinated end-scrapers and some burin-cores. And finally, the laminar bipolar knapping. The lithic and bone typological assemblage is consistent with the classical types of the Evolved Aurignacian, the Dufour bladelets subtype Roc-de-Combe are abundant, as well as two massive base tips recovered on antler from the Cova de les Malladetes. Regarding the ornament, various perforated *Lynx* sp. canine were recovered in Aurignacian sequences from the Valencian region, which suggesting a regional production tradition.

In sum, we propose a synthesis that updates our knowledge of the Aurignacian in a region where it had gone unnoticed in contrast with classical sequences from the north of Spain.

13 BALLAGHCULLIA: A MIDDLE BRONZE AGE SETTLEMENT AND CREMATION CEMETERY IN CO. ROSCOMMON, IRELAND

Abstract author(s): Walsh, Patrick (AMS; Dr Ros Ó Maoldúin)

Abstract format: Oral

A previously unknown Middle Bronze Age settlement was discovered and excavated in Ballaghcullia townland, Co. Roscommon, during archaeological works in advance of the N5 Ballaghaderreen to Scramoge Road Project. The

portion of the site that fell within the development contained the remains of at least five houses and geophysical survey suggests that several more exist outside its limit. In the excavated examples, internal hearths, concentrations of stakeholes and structural details such as porches were clearly defined. Artefacts and burnt bone were deposited within the houses in what appear to be structured patterns and all the houses were orientated roughly southeast. A small cemetery, comprising several pits containing cremation deposits, capped by clay and marked by stakes, was located to the south of the settlement. These elements and further structured patterning noted in depositions, the alignment and arrangement of the structures and the positioning of the different elements of the site relative to one another are likely to reflect and have the potential to help further our understanding of Bronze Age cosmological beliefs in Ireland. Along with the excavation of two burnt mounds adjacent the settlement and a paleoenvironmental core taken from a nearby bog, this site offers a previously unparalleled opportunity to investigate the later Bronze Age in this part of Ireland, the importance of which is increased by its location, less than 7km from the major archaeological complex of Rathcroghan.

14 SETTLEMENT AND RITUALS: THE CENTRAL PLACE IN NĚMČICE (CZECH REPUBLIC, MORAVIA)

Abstract author(s): Cizmár, Ivan (Institute of Archaeological Heritage Brno) - Čizmářová, Hana (Moravian museum Brno) - Popelka, Miroslav (Institute of Archaeological Heritage Brno)

Abstract format: Oral

The central agglomeration in NĚmčice represents one of the most important sites in the Iron Age – in the 3rd-2nd centuries BC Central Europe. The settlement area of 36 ha was determined by magnetometer prospection. A number of features were identified including houses, workshops and square enclosures, interpreted as sanctuaries. The artefacts from surface surveys include thousands of gold, silver and bronze coins and a large number of bronze artefacts including waste and semi-products. The glass collection includes hundreds of glass bracelets and beads as well as raw material, waste and semi-products. First excavations on the site after 20 years of surveys focused on the area of glass workshop, which represents the earliest glass working site north of the Alps. The uniqueness of glass personal ornaments, primarily bracelets, lay in the fact that they interconnected the entire La Tène cultural domain from in the 3rd-1st century BC, undoubtedly acting as an important element in the creation of both individual and group identity of inhabitants at the time.

The surprise was the discovery of a sunken hut with a hundreds of pieces of raw amber, beads and their semi-products. The discovery of a new amber workshop is remarkable, as in the period of 3rd-2nd century BC amber workshops appear only occasionally in Transalpine Europe. While amber jewelry is not commonly found at La Tène sites and is known more from individual wealthy graves, glass ornaments are relatively common and this type of artefact was apparently not reserved only for the wealthiest members of society. The excavations also focused on one of the three square enclosures. It is possible to assume the funeral use of the area in the middle La Tène Period. Later, after the end of ritual functions, intensive settlement activities took place here.

15 THE DEVELOPMENT OF THE ROMAN PERIOD ARTZI ROAD SETTLEMENT (ARTZIBAR/ARCE VALLEY, NAVARRE): CONTRIBUTIONS AND RESULTS OF GEOARCHAEOLOGICAL ANALYSIS

Abstract author(s): Mendizabal Sandonís, Oihane (Aranzadi Science Society; University of the Basque Country - UPV/EHU, Classical Studies Department) - Narbarte Hernandez, Josu (University of the Basque Country - UPV/EHU, Research Group on Heritage and Cultural Landscapes; Aranzadi Science Society) - Aiestaran de la Sotilla, Mattin (University of the Basque Country - UPV/EHU, Department of Geography, Prehistory and Archeology, Investigation Group of Prehistory IT-1223-19; Aranzadi Science Society) - Iriarte Avilés, Eneko (Universidad de Burgos, Dpto. Historia, Geografía y Comunicación; Aranzadi Science Society) - Agirre Mauleon, Juantxo (Aranzadi Science Society)

Abstract format: Oral

The Roman-period settlement of Artzi (Artzibar/Valle de Arce, Navarre), with a proven occupation between the 1st century AD and the end of the 4th century AD, is located on the southern slopes of a pre-Pyrenean area on the edge of the road that crosses the mountain range. Moreover, the enclave has continuity at a short distance with phases from the Middle Ages to the 20th century, through the development of a lordship that gives its name to the whole valley. However, there is a hiatus between the Late Antique and Early Medieval periods, which is one of the main unknowns when it comes to its study. In this respect, geoarchaeological sampling has been able to offer interesting data about the origin of the absence or scarcity of materials from Roman phases under the medieval and modern constructions, despite the fact that they are very close to each other and, a priori, seem to be in good locations. The sedimentological results indicate that the sedimentary dynamics of the study area, with an active alluvial activity probably controlled by changes in the climate, could have had a greater impact on the evolution of the settlement than expected.

16

GRASPING THE MEANING: SOCIAL POWER IN MEDIEVAL LANDSCAPE

Abstract author(s): Kozák, Vít (Department of Archaeology and Museology, Faculty of Arts, Masaryk University)

Abstract format: Oral

Research topics of medieval archaeology (eg. medieval towns, deserted villages, castellogy, ...) are to a certain extent separated lines of research producing new knowledge mostly only in terms of their own ‚rules‘. These isolated knowledge lines, orientation on producing historical narratives, limited geographical scale and supposedly atheoretical nature of significant part of medievalist research are some causes of isolation of medieval archaeology from the rest of discipline and social sciences as a scientific field. One of the ways to treat these shortcomings may be by formulating research questions concerning more general phenomena understandable by other social sciences and humanities. In my paper I will discuss power and its various manifestations and transformations in the medieval landscape (case study: Moravia in 6th to 16th century). In order to analyze relationships between anthropogenic features (structures) in landscapes that are reflecting power relationships in a given time and area it is necessary to determine which structures are bearing this kind of meaning. To do so I performed text analysis of archaeological, historical, anthropological and sociological literature concerning main aspects of social power – ideological, economic, military or political. Resulting text analysis presents a basis for creation of weberian ideal types of power connotations and their changes during time of different structures (e.g. castles, mining areas, villages, residences of nobility, monasteries, ...) in landscape. As historical and archaeological literature tend to employ concepts of power rather vaguely, the text analysis and aforementioned ideal types present explicit and theoretically sound means to take in consideration social power in the medieval landscape.

17

DARK AGES AND THEIR MONUMENTS: CRETE DURING THE MUSLIM/ARAB PERIOD

Abstract author(s): Klontza-Jaklova, Vera (MUNI - Ústav archeologie a muzeologie)

Abstract format: Oral

In the past, several periods have been referred to as the ‘Dark Ages.’ Two factors were usually evident when this term was used: The so-called Dark Age followed a collapse or radical change phase in social, economic, or ecological structures and the demise of an epoch supported by numerous historical sources. Thus the early Iron Age in the Aegean, the early Byzantine period, and the Thirty Years’ War in Europe were typically considered as Dark Ages. If we wanted to use this term for the least-known period of the archeology of Crete today, the period of the Cretan Emirate (A.D. 824/829 – 961) would certainly deserve the title.

The Greek-speaking, western and Christian historiography considered that this period demonstrated a decline in the level of civilization. Archaeological research automatically followed. Most coastal sites were a priori dated to the beginnings of Muslim expansion in the Mediterranean.

So we are witnessing a “systemic exclusion” of this period from the island’s history, albeit the Arab sources describe the island as socially and economically vibrant.

Today in Crete, there are no official monuments from this period, but that is all the more reason for us to wonder what the material culture (mobile and immobile) looks like and how to detect it.

How can we approach this period as a heritage issue?

The author presents the map and gazetteer of known remnants of the Arab period is presented:

- Coins (usually found outside archaeological contexts)
- Architecture (e.g. Knossos, Chandax fortification)
- Epigraphy (Inatos inscription)
- Ceramics
- Olive trees dated to the period
- Toponyms (e.g. Sarakina, Amiras)
- Borrowed words (e.g. Fari)

In the proposed contribution, the author suggests methodologies for researching the historical landscapes of the given period (e.g., modeling of settlement dynamics, criteria of targeted archaeological surveys, etc.).

18

„VENIT CONUENTUS LODHOSIAM..“ - NEW PERSPECTIVES ON MONASTIC LIFE IN LÖDÖSE

Abstract author(s): Blomqvist, Philip - Lennblad, Astrid (Lödöse museum)

Abstract format: Oral

According to the Annales Sigtuenses, a Dominican convent was founded in 1243 in Lödöse, a major town in medieval western Sweden. By all accounts, it was active for almost 300 years until it met its demise during the reformation of King Gustav Vasa. The convent was lost to time along with the town of Lödöse which lost its town privileges in the 1640s. Building material from the convent, churches and other monumental buildings were reused in the building of the towns successor Nya Lödöse and the convents exact location was forgotten. In the 1920s, antiquarian and art

historian Carl af Ugglas led an excavation of Lödöse which uncovered the Maria church. The Maria church was built by the Dominican brothers and functioned as a convent church. Further excavation of the surrounding areas took place in the 1960s when tenement houses were going to be built adjacent to the former convents location. The results were never published but all the data and documentation is still in the museums archives.

Since January 2023 archaeologists Philip Blomqvist and Astrid Lennblad have been in charge of a new project to better understand the monastic life in medieval Lödöse. The first aim of the project is to publish and interpret the results from the excavations in the 1960s. Furthermore to bring new perspectives on what has been established as empirical data. After publishing the next stage will be an excavation of the convents living quarters. Using interdisciplinary efforts (e.g. bioarchaeology, paleoethnobotany, geophysics) we aim to uncover new insights into the life of the medieval Dominican friars of Lödöse.

19 SAMI FISH-FARMERS AT THE COAST OF NORDLAND. A COASTAL SAMI AGRICULTURAL SETTLEMENT, WITH ROOTS DATING BACK TO THE MIDDLE AGES

Abstract author(s): Andersen, Oddmund (Árran lulesamisk senter)

Abstract format: Oral

The lecture presents the Coastal Sami population in Tysfjord in Northern Nordland. Written sources from the 16th-17th centuries document that the Sami had a mixed economy, with agriculture and fishing as part of the economy. Agriculture included both animal husbandry and grain cultivation, while fishing took place both in the local fjord and in the commercial fishing in Lofoten and near Senja. In addition, hunting and trapping were part of the economy. The settlement can be documented through settlement mounds. These are cultural monuments consisting of cultural layers formed by a settlement placed at the same site over a long period of time. 14C dating of bottom layers from some of these mounds shows that they go back to the Middle Ages. Archaeological investigations of the cultural layers dated to Middle age have traces of animal husbandry and a pollen analysis documented that the cereal cultivating may have older roots at one of the sites. In this lecture, the results from these investigations are presented. It is argued that the traces from the settlement mounds can be linked to a Sami agricultural settlement at the coast. The investigations can therefore help to expand our understanding of Sami settlement history and in this manner decolonize Sami history.

A. A FEW INTERESTING ZOOARCHAEOLOGICAL CASES FROM ŠIAULIAI MANOR IN LITHUANIA

Abstract author(s): Ziabreva, Viktorija (Klaipeda University, Institute of Baltic region history and archaeology)

Abstract format: Poster

Part of the Šiauliai Economy Manor homestead income had to be given to the maintenance of the Lithuanian-Poland rulers manor. Šiauliai Economy itself was founded in 1589. Since the beginning of the 17th century, the Economy of Šiauliai was constantly given over to manage it for loans to different owners. 1678-1696 it belonged to the king Jonas Sobieskis. The Economy was administered by an administration appointed by the current owners. Archaeological research in this place has been carried out since 1997. The largest zooarchaeological collection was collected during the archaeological researches of V. Ostašenkoviėnė in 2010, 2014 and 2017. A total number of 431 bone fragments of domestic (64.27%) and wild (13.46%) fauna, dated back from the 16th to the beginning of the 19th century, was collected and analyzed from the archaeological cultural layers of the manor. Due to small bone fragments, it was not possible to identify 22.27% of the examined zooarchaeological material. Although most of the bones have been preserved in fragments, there were three cases that deserve separate attention:

1. Ankylosis of the distal interphalangeal joint in a horse – found in the contents of the household pit, dated back from the middle to the second half of the 17th century;
2. Horse's metacarpal bone affected by desmoiditis ossificans ligamentum interosseum from the first half of the 17th century's cultural layer;
3. Horse's third metatarsal affected by spavin (chronic deformans tarsi) from the second half of the 17th – the beginning of the 18th century's cultural layer.

B. BROKEN FEMININITY - SOME THOUGHTS ON A NEWLY DISCOVERED LATE COPPER AGE BADEN IDOL FROM BUDAPEST, HUNGARY

Abstract author(s): Szász, Hajnal (Budapesti Történeti Múzeum)

Abstract format: Poster

A Late Copper Age Baden idol (flat idol) has been discovered recently at a large construction site in Budapest, Hungary. These types of objects are considered still a rather exceptional and rare find, though they are not completely uncommon. The Baden culture complex is well-researched, settlement and cemetery sites have both been excavated.

The aspect of everyday life is, however much better outlined than that of the spiritual one. Their belief system, as rich and colourful as it may have been, remains mostly unknown to this day.

Only three flat idols are known from Budapest, and a few dozen from Hungary. These objects are found almost always in a fragmentary state, usually thrown into a garbage pit. It is obvious that, when found, these are already in a secondary, post-manipulative state, where they were intentionally broken and discarded of. Though in the research community it is thought that these female figure statuettes served as an element in a home altar or in an initiation ritual, their true purpose is still unknown.

Is it connected to a fertility ritual that may have served the whole community, or is it about an individual's transition through various states of womanhood? What sort of spiritual process would require (if at all), to break and discard a stylized representation of a female body (with emphasized sexual traits)? And, where are the men in all this? Only one such object is known from the Carpathian-Basin and Southeast Balkans, representing a male form.

732 EUROPEAN RESEARCH COUNCIL FUNDING OPPORTUNITIES FOR YOU

Session theme: 2. Net Zero Archaeologies – Sustainability in the Past, Present and Future

Session organisers: Diaz-del-Rio Pedro (European Research Council Executive Agency)

Session format: Workshop

This session presents the European Research Council funding schemes (Starting, Consolidator, Advanced, and Synergy grants), the SH6 ERC Panel 'The study of the human past', and the potential ERC grants offer to applicants at different career stages, from post-doctoral researchers to well-established archaeologists.

A description of the schemes and main features of the evaluation process as well as an overview of ERC funding in this area will be followed by presentations by two ERC grantees. They will introduce their ongoing projects and offer some personal insights on the ideas, design, and practicalities behind their successful proposals. An experienced ERC panel member will join us to offer their perspective on the decision-making process. Finally, we will all be available for a question-and-answer session.

Participants:

- Joanna Bruck (University College Dublin)
- Maud Devolder (Ghent University)
- Arkadiusz Marciniak (Adam Mickiewicz University)
- Mette Løvschal (Aarhus University)
